Part No. 060329-10, Rev E
January 2013

OmniSwitch AOS Release 6 CLI Reference Guide

www.alcatel-lucent.com

This user guide documents release 6.4.5 of the OmniSwitch 6400 Series, OmniSwitch 6850E Series, OmniSwitch 6855 Series, and OmniSwitch 9000E Series
The functionality described in this guide is subject to change without notice.

This OmniSwitch product contains components which may be covered by one or more of the following U.S. Patents:

- U.S. Patent No. 6,339,830
- U.S. Patent No. 6,070,243
- U.S. Patent No. 6,061,368
- U.S. Patent No. 5,394,402
- U.S. Patent No. 6,047,024
- U.S. Patent No. 6,314,106
- U.S. Patent No. 6,542,507
- U.S. Patent No. 6,874,090

Chapter 1 **Ethernet Port Commands** 1-1

trap port link 1-4
interfaces speed 1-6
interfaces mode 1-8
interfaces autoneg 1-10
interfaces pause 1-14
interfaces e2e-flow-vlan 1-17
interfaces duplex 1-19
interfaces admin 1-21
interfaces cli-prompt 1-23
interfaces alias 1-25
interfaces ifg 1-26
interfaces no l2 statistics 1-27
interfaces max frame 1-29
interfaces flood 1-31
interfaces flood rate 1-33
interfaces flood action 1-35
interfaces violation-recovery-time 1-37
interfaces violation-recovery-maximum 1-39
interfaces violation-recovery-trap 1-41
interfaces clear-violation-all 1-42
interfaces wait-to-restore 1-43
interfaces transceiver ddm 1-45
interfaces link-monitoring admin-status 1-47
interfaces link-monitoring time-window 1-49
interfaces link-monitoring link-flap-threshold 1-51

interfaces link-monitoring link-error-threshold 1-53
interfaces clear-link-monitoring-stats 1-55
interfaces hybrid preferred-fiber 1-56
interfaces hybrid autoneg 1-57
interfaces hybrid crossover 1-59
interfaces hybrid duplex 1-61
interfaces hybrid speed 1-63
interfaces hybrid pause 1-65
show interfaces 1-68
show interfaces capability 1-72
show interfaces flow control 1-74
show interfaces pause 1-76
show interfaces e2e-flow-vlan 1-78
show interfaces accounting 1-79
show interfaces counters 1-81
show interfaces counters errors 1-83
show interfaces collisions 1-85
show interfaces status 1-87
show interfaces port 1-89
show interfaces violation-recovery 1-92
show interfaces ifg 1-94
show interfaces flood rate 1-96
show interfaces traffic 1-98
show interfaces transceiver 1-100
show interfaces hybrid 1-103
show interfaces hybrid status 1-107
show interfaces hybrid pause 1-109
show interfaces hybrid capability 1-111
show interfaces hybrid accounting 1-114
show interfaces hybrid counters 1-116
show interfaces hybrid counters errors 1-118
show interfaces hybrid collisions 1-120
show interfaces hybrid traffic 1-122
show interfaces hybrid port 1-124
show interfaces hybrid flood rate 1-126
show interfaces hybrid ifg 1-128
show interfaces link-monitoring config 1-130
show interfaces link-monitoring statistics 1-132
debug interfaces set backpressure 1-134
debug interfaces backpressure 1-135
link-fault-propagation group 1-137
link-fault-propagation group source 1-139
link-fault-propagation group destination 1-141
link-fault-propagation group wait-to-shutdown 1-143
show link-fault-propagation group 1-144
interfaces tdr-test-start 1-146
interfaces no tdr-statistics 1-147
show interfaces tdr-statistics 1-148

Chapter 2 UDLD Commands 2-1
udld 2-2

udld port 2-3
udld mode 2-5
udld probe-timer 2-7
udld echo-wait-timer 2-9
clear udld statistics port 2-11
interfaces clear-violation-all 2-12
show udld configuration 2-13
show udld configuration port 2-14
show udld statistics port 2-16
show udld neighbor port 2-18
show udld status port 2-20

Chapter 3 Power over Ethernet (PoE) Commands 3-1
lanpower start 3-3
lanpower stop 3-5
lanpower power 3-6
lanpower maxpower 3-8
lanpower priority 3-10
lanpower priority-disconnect 3-12
lanpower slot-priority 3-14
lanpower redundant-power 3-16
lanpower capacitor-detection 3-17
show lanpower 3-18
show lanpower capacitor-detection 3-21
show lanpower priority-disconnect 3-22
show lanpower slot-priority 3-23

Chapter 4 VLAN Management Commands 4-1
vlan 4-2
vlan stp 4-4
vlan mobile-tag 4-6
vlan authentication 4-8
vlan mtu-ip 4-10
vlan port default 4-11
vlan source-learning 4-13
show vlan 4-15
show vlan port 4-18
show vlan router mac status 4-21
show vlan gvrp 4-23
show vlan ipmvlan 4-26

Chapter 5 802.1Q Commands 5-1
vlan 802.1q 5-2
vlan 802.1q frame type 5-4
show 802.1q 5-6

Chapter 6 Distributed Spanning Tree Commands 6-1
bridge mode 6-4
spantree mode 6-6
bridge protocol 6-8
bridge cist protocol 6-10
bridge port loop-guard 6-12

bridge 1x1 protocol 6-14
bridge mst region name 6-16
bridge mst region revision level 6-18
bridge mst region max hops 6-19
bridge msti 6-21
bridge msti vlan 6-23
bridge priority 6-25
bridge cist priority 6-27
bridge msti priority 6-29
bridge 1x1 priority 6-31
bridge hello time 6-33
bridge cist hello time 6-35
bridge 1x1 hello time 6-37
bridge max age 6-39
bridge cist max age 6-41
bridge 1x1 max age 6-43
bridge forward delay 6-45
bridge cist forward delay 6-47
bridge 1x1 forward delay 6-49
bridge mode 1x1 pvst+ 6-51
bridge bpdu-switching 6-52
bridge path cost mode 6-54
bridge auto-vlan-containment 6-56
bridge port pvst+ 6-58
bridge 6-60
bridge cist 6-62
bridge 1x1 6-64
bridge priority 6-66
bridge cist priority 6-68
bridge msti priority 6-70
bridge 1x1 priority 6-72
bridge path cost 6-74
bridge cist path cost 6-78
bridge msti path cost 6-82
bridge 1x1 path cost 6-85
bridge mode 6-89
bridge cist mode 6-91
bridge 1x1 mode 6-93
bridge connection 6-95
bridge cist connection 6-97
bridge 1x1 connection 6-99
bridge cist admin-edge 6-101
bridge 1x1 admin-edge 6-103
bridge cist auto-edge 6-105
bridge 1x1 auto-edge 6-107
bridge cist restricted-role 6-109
bridge 1x1 restricted-role 6-111
bridge cist restricted-tcn 6-113
bridge 1x1 restricted-tcn 6-115
bridge cist txholdcount 6-117
bridge 1x1 txholdcount 6-118
bridge rrstp 6-119

bridge rrstp ring 6-120
bridge rrstp ring vlan-tag 6-122
bridge rrstp ring status 6-124
show spantree 6-125
show spantree cist 6-131
show spantree msti 6-135
show spantree 1x1 6-140
show spantree ports 6-144
show spantree cist ports 6-153
show spantree msti ports 6-157
show spantree 1x1 ports 6-162
show spantree mst region 6-168
show spantree msti vlan-map 6-170
show spantree cist vlan-map 6-172
show spantree map-msti 6-174
show spantree mst port 6-175
show bridge rrstp configuration 6-178
show bridge rrstp ring 6-179

Chapter 7 Link Aggregation Commands 7-1
static linkagg size 7-3
static linkagg name 7-5
static linkagg admin state 7-6
static agg agg num 7-7
lacp linkagg size 7-9
lacp linkagg name 7-12
lacp linkagg admin state 7-13
lacp linkagg actor admin key 7-15
lacp linkagg actor system priority 7-16
lacp linkagg actor system id 7-17
lacp linkagg partner system id 7-18
lacp linkagg partner system priority 7-20
lacp linkagg partner admin key 7-21
lacp agg actor admin key 7-22
lacp agg actor admin state 7-25
lacp agg actor system id 7-27
lacp agg actor system priority 7-29
lacp agg partner admin state 7-31
lacp agg partner admin system id 7-33
lacp agg partner admin key 7-35
lacp agg partner admin system priority 7-37
lacp agg actor port priority 7-39
lacp agg partner admin port 7-41
lacp agg partner admin port priority 7-43
lacp linkagg wait-to-restore-timer 7-45
lacp agg standby 7-47
lacp linkagg pre-empt 7-49
lacp linkagg pre-empt timer 7-51
dhl num 7-53
dhl num linka linkb 7-55
dhl num admin-state 7-57
dhl num vlan-map linkb 7-58

dhl num pre-emption-time 7-60
dhl num mac-flushing 7-62
show dhl 7-64
show dhl num 7-66
show dhl num link 7-69
show linkagg 7-71
show linkagg port 7-76
linkagg range 7-81
show linkagg range 7-83

Chapter 8 Multi-Chassis Commands 8-1
multi-chassis chassis-id hello-interval 8-2
multi-chassis hello-interval 8-4
multi-chassis chassis-group 8-6
multi-chassis ipc-vlan 8-8
multi-chassis loop-detection 8-10
multi-chassis loop-detection transmit-interval 8-12
multi-chassis vf-link create 8-14
multi-chassis vf-link member-ports 8-16
multi-chassis vf-link default-vlan 8-18
multi-chassis vip-vlan 8-20
show multi-chassis status 8-22
show multi-chassis loop-detection 8-24
show multi-chassis vf-link 8-26
show multi-chassis vf-link member-port 8-28
show multi-chassis consistency 8-30
show multi-chassis consistency linkagg 8-32
clear multi-chassis loop-detection 8-35

Chapter 9 Ethernet Ring Protection Commands 9-1
erp-ring 9-2
erp-ring reset-version-fallback 9-5
erp-ring rpl-node 9-6
erp-ring wait-to-restore 9-8
erp-ring enable 9-9
erp-ring guard-timer 9-10
erp-ring sub-ring 9-11
erp-ring virtual-channel 9-13
erp-ring revertive 9-15
erp-ring clear 9-17
erp-ring ethoam-event 9-18
clear erp statistics 9-20
show erp 9-22
show erp statistics 9-26

Chapter 10 Loopback Detection Commands 10-1
loopback-detection 10-2
loopback-detection port 10-3
loopback-detection transmission-timer 10-5
show loopback-detection 10-6
show loopback-detection port 10-8
show loopback-detection statistics port 10-10

Chapter 11 CPE Test Head Commands 11-1
test-oam 11-3
test-oam direction 11-5
test-oam src-endpoint dst-endpoint 11-6
test-oam port 11-8
test-oam vlan test-frame 11-10
test-oam role 11-12
test-oam duration rate packet-size 11-14
test-oam frame 11-16
test-oam start stop 11-19
show test-oam 11-21
show test-oam statistics 11-25
clear test-oam statistics 11-27
test-oam group 11-28
test-oam group tests 11-30
test-oam feeder-port 11-32
test-oam group src-endpoint dst-endpoint 11-33
test-oam group role 11-35
test-oam group port 11-36
test-oam group direction 11-38
test-oam group duration rate 11-40
test-oam group start 11-42
test-oam group stop 11-43
clear test-oam group statistics 11-44
show test-oam group 11-46
show test-oam group statistics 11-50

Chapter 12 Source Learning Commands 12-1
mac-address-table 12-2
mac-address-table vpls permanent sap 12-4
mac-address-table vpls permanent mesh-sdp 12-6
mac-address-table static-multicast 12-8
mac-address-table aging-time 12-10
source-learning 12-12
source-learning chassis-distributed 12-14
show mac-address-table 12-15
show mac-address-table all 12-18
show mac-address-table vpls 12-20
show mac-address-table vpls sap 12-22
show mac-address-table vpls mesh-sdp 12-24
show mac-address-table static-multicast 12-26
show mac-address-table count 12-29
show mac-address-table vpls count 12-31
show mac-address-table all count 12-33
show mac-address-table aging-time 12-35
show source-learning 12-36
show source-learning chassis-distributed 12-38

Chapter 13 PPPoE Intermediate Agent Commands 13-1
pppoe-ia 13-2
pppoe-ia trust 13-4

pppoe-ia client 13-6
pppoe-ia access-node-id 13-8
pppoe-ia circuit-id 13-10
pppoe-ia remote-id 13-13
clear pppoe-ia statistics 13-15
show pppoe-ia configuration 13-16
show pppoe-ia 13-19
show pppoe-ia statistics 13-21

Chapter 14 GVRP Commands 14-1
gvrp 14-2
gvrp port 14-3
gvrp transparent switching 14-5
gvrp maximum vlan 14-6
gvrp registration 14-7
gvrp applicant 14-9
gvrp timer 14-11
gvrp restrict-vlan-registration 14-13
gvrp restrict-vlan-advertisement 14-15
gvrp static-vlan restrict 14-17
clear gvrp statistics 14-19
show gvrp statistics 14-20
show gvrp last-pdu-origin 14-23
show gvrp configuration 14-24
show gvrp configuration port 14-26
show gvrp configuration linkagg/port 14-28
show gvrp timer 14-31

Chapter 15 MVRP Commands 15-1
vlan registration-mode 15-2
mvrp 15-4
mvrp port 15-5
mvrp linkagg 15-7
mvrp transparent-switching 15-9
mvrp maximum vlan 15-10
mvrp registration 15-11
mvrp applicant 15-13
mvrp timer join 15-15
mvrp timer leave 15-17
mvrp timer leaveall 15-19
mvrp timer periodic-timer 15-21
mvrp periodic-transmission 15-23
mvrp restrict-vlan-registration 15-24
mvrp restrict-vlan-advertisement 15-26
mvrp static-vlan-restrict 15-28
show mvrp configuration 15-30
show mvrp port 15-32
show mvrp linkagg 15-35
show mvrp timer 15-38
show mvrp statistics 15-41
show mvrp last-pdu-origin 15-44
show vlan registration-mode 15-46

show mvrp vlan-restrictions 15-47
show vlan mvrp 15-49
mvrp clear-statistics 15-51

Chapter 16 802.1AB Commands 16-1
lldp destination mac-address 16-3
lldp transmit fast-start-count 16-4
lldp transmit interval 16-5
lldp transmit hold-multiplier 16-6
lldp transmit delay 16-7
lldp reinit delay 16-8
lldp notification interval 16-9
lldp lldpdu 16-10
lldp notification 16-12
lldp network-policy 16-14
lldp med network-policy 16-16
lldp tlv management 16-18
lldp tlv dot1 16-20
lldp tlv dot3 mac-phy 16-22
lldp tlv med 16-24
show lldp config 16-26
show lldp network-policy 16-28
show lldp med network-policy 16-30
show lldp system-statistics 16-32
show lldp statistics 16-34
show lldp local-system 16-36
show lldp local-port 16-39
show lldp local-management-address 16-41
show lldp remote-system 16-42
show lldp remote-system med 16-44
lldp trust-agent 16-47
lldp trust-agent violation-action 16-49
show lldp trusted remote-agent 16-51
show lldp trust-agent 16-53

Chapter 17 Interswitch Protocol Commands 17-1
amap 17-2
amap discovery time 17-3
amap common time 17-5
show amap 17-7

Chapter 18 SIP Commands 18-1
sip-snooping enable 18-2
sip-snooping port enable 18-3
sip-snooping mode 18-5
sip-snooping trusted server 18-7
sip-snooping sip-control 18-9
sip-snooping sos-call number 18-10
sip-snooping sos-call dscp 18-11
sip-snooping udp port 18-12
sip-snooping tcp port 18-13
sip-snooping threshold 18-14

sip-snooping logging-threshold num-of-calls 18-16
show sip-snooping call-records 18-17
clear sip-snooping statistics 18-20
show sip-snooping config 18-21
show sip-snooping ports 18-23
show sip-snooping statistics 18-25
show qos dscp-table 18-28

Chapter 19 IP Commands 19-1
ip interface 19-5
ip managed-interface 19-8
ip interface dhcp-client 19-11
ip interface tunnel 19-13
ip router primary-address 19-15
ip router router-id 19-16
ip static-route 19-17
ip route-pref 19-19
ip default-ttl 19-21
ping 19-22
traceroute 19-25
ip dual-hash mode 19-27
ip directed-broadcast 19-28
ip service 19-29
ip redist 19-31
ip access-list 19-33
ip access-list address 19-34
ip route-map action 19-36
ip route-map match ip address 19-38
ip route-map match ipv6 address 19-40
ip route-map match ip-nexthop 19-42
ip route-map match ipv6-nexthop 19-44
ip route-map match tag 19-46
ip route-map match ipv4-interface 19-48
ip route-map match ipv6-interface 19-50
ip route-map match metric 19-52
ip route-map match route-type 19-54
ip route-map match protocol 19-56
ip route-map set metric 19-58
ip route-map set metric-type 19-60
ip route-map set tag 19-62
ip route-map set community 19-64
ip route-map set local-preference 19-66
ip route-map set level 19-68
ip route-map set ip-nexthop 19-70
ip route-map set ipv6-nexthop 19-72

show efm-oam port remote detail 52-38
show efm-oam port history 52-40
show efm-oam port l1-ping detail 52-42
clear efm-oam statistics 52-44
clear efm-oam log-history 52-45

Chapter 53 Service Assurance Agent Commands 53-1
saa 53-2
saa type ip-ping 53-4
saa type ethoamloopback 53-6
saa type ethoam-two-way-delay 53-9
saa type mac-ping 53-11
saa start 53-14
saa stop 53-16
show saa 53-18
show saa type config 53-20
show saa statistics 53-24
show saa statistics history index 53-30

Chapter 54 MPLS LDP Commands 54-1
configure router ldp shutdown 54-3
configure router ldp interface-parameters interface 54-4
configure router ldp interface-parameters interface shutdown 54-6
configure router ldp interface-parameters hello 54-7
configure router ldp interface-parameters keepalive 54-9
configure router ldp interface-parameters transport-address 54-11
configure router ldp targeted-session hello 54-13
configure router ldp targeted-session keepalive 54-15
configure router ldp graceful-restart-helper 54-17
configure router ldp reconnect-time 54-19
configure router ldp fwd-state-holding-time 54-21
configure router ldp maximum-recovery-time 54-23
configure router ldp neighbor-liveness-time 54-25
oam lsp-ping 54-27
oam lsp-trace 54-30
show router ldp bindings 54-33
show router ldp bindings fec-type 54-36
show router ldp bindings ingress-label 54-39
show router ldp bindings egress-label 54-42
show router ldp bindings prefix 54-45
show router ldp bindings active 54-47
show router ldp bindings vc-type 54-49
show router ldp bindings service-id 54-52
show router ldp discovery 54-54
show router ldp discovery peer 54-57
show router ldp discovery interface 54-60
show router ldp interface 54-63
show router ldp parameters 54-66
show router ldp peer 54-70
show router ldp session 54-73
show router ldp status 54-77

Chapter 55 MPLS Static LSP and FRR Commands 55-1
configure router mpls shutdown 55-3
configure router mpls interface 55-4
configure router mpls interface shutdown 55-5
configure router mpls interface label-map 55-6
configure router mpls interface label-map swap next-hop 55-8

configure router mpls interface label-map pop 55-10
configure router mpls interface label-map shutdown 55-12
configure router mpls static-lsp 55-14
configure router mpls static-lsp shutdown 55-16
configure router mpls static-lsp to 55-18
configure router mpls static-lsp push next-hop 55-20
configure router mpls interface label-map protect-swap next-hop 55-22
show router mpls interface 55-24
show router mpls label 55-27
show router mpls label-range 55-31
show router mpls static-lsp 55-33
show router mpls status 55-36

Chapter 56 Virtual Private LAN Service (VPLS) Commands 56-1
configure service customer create 56-3
configure service customer contact 56-5
configure service customer phone 56-7
configure service customer description 56-9
configure service sdp create 56-11
configure service sdp description 56-13
configure service sdp far-end 56-15
configure service sdp shutdown 56-17
configure service sdp ldp 56-19
configure service sdp signaling 56-21
configure service sdp lsp 56-23
configure service sdp adv-mtu-override 56-25
configure service sdp path-mtu 56-27
configure service vpls create 56-29
configure service vpls description 56-31
configure service vpls shutdown 56-33
configure service vpls def-mesh-vc-id 56-35
configure service vpls send-flush-on-failure 56-37
configure service vpls service-mtu 56-39
configure service vpls mesh-sdp 56-41
configure service vpls mesh-sdp shutdown 56-43
configure service vpls mesh-sdp egress vc-label 56-45
configure service vpls mesh-sdp ingress vc-label 56-47
configure service vpls mesh-sdp static-mac 56-49
configure service l2profile 56-51
configure service port mode access 56-54
configure service port l2profile 56-56
configure service port encap-type 56-58
configure service vpls sap create 56-60
configure service vpls sap description 56-62
configure service vpls sap trusted 56-64
configure service vpls sap shutdown 56-66
configure service vpls sap static-mac 56-68
clear service id fdb 56-70
clear service id mesh-sdp ingress-vc-label 56-72
show service l2profile 56-74
show service port 56-76
show service customer 56-78

show service sdp 56-80
show service id all 56-84
show service id base 56-88
show service id labels 56-91
show service id sap 56-93
show service id sdp 56-96
show service sap-using 56-100
show service sdp-using 56-102
show service egress-label 56-104
show service ingress-label 56-106
show service fdb-info 56-108
show service fdb-mac 56-110

Chapter 57 Switch Logging Commands 57-1
swlog 57-2
swlog syslog-facility-id 57-3
swlog console level 57-5
swlog appid interface level 57-7
swlog remote command-log 57-10

show ni 60-38
show module 60-41
show module long 60-43
show module status 60-45
show power 60-47
show fan 60-49
show temperature 60-51
show stack topology 60-53
show stack status 60-56
hash-control 60-58
show hash-control 60-60
license apply 60-61
show license info 60-62
show license file 60-63
power slot bps connector-priority 60-65
power bps mode 60-67
update bps firmware 60-68
show power bps connector-priority 60-69
show power supply bps 60-71

Chapter 61 Chassis MAC Server (CMS) Commands 61-1
mac-range eeprom 61-2
mac-retention status 61-4
mac-retention dup-mac-trap 61-5
mac release 61-6
show mac-range 61-7
show mac-range alloc 61-9
show mac-retention status 61-11

Chapter 62 Network Time Protocol Commands 62-1
ntp server 62-2
ntp server synchronized 62-4
ntp server unsynchronized 62-5
ntp client 62-6
ntp src-ip preferred 62-7
ntp broadcast-client 62-9
ntp broadcast-delay 62-10
ntp key 62-11
ntp key load 62-13
ntp authenticate 62-14
ntp master 62-15
ntp interface 62-16
ntp max-associations 62-17
ntp broadcast 62-18
ntp peer 62-20
show ntp status 62-22
show ntp client 62-24
show ntp client server-list 62-26
show ntp server client-list 62-28
show ntp server status 62-30
show ntp keys 62-34
show ntp peers 62-36
show ntp server disabled-interfaces 62-38

Chapter 63 Session Management Commands 63-1
session login-attempt 63-3
session login-timeout 63-4
session banner 63-5
session timeout 63-7
session reauth-interval 63-9
session prompt default 63-11
session xon-xoff 63-13

scp-sftp 64-49
show ssh config 64-50
sftp 64-52
sftp6 64-54

tftp 64-56
rz 64-58

Chapter 65 Web Management Commands 65-1
http server 65-2
http ssl 65-3
http port 65-4
https port 65-5
debug http sessiondb 65-6
show http 65-8

Chapter 66 Configuration File Manager Commands 66-1
configuration apply 66-2
configuration error-file limit 66-4
show configuration status 66-6
configuration cancel 66-8
configuration syntax check 66-9
configuration snapshot 66-11
show configuration snapshot 66-14
write terminal 66-18

Chapter 67 SNMP Commands 67-1
snmp station 67-3
snmp source ip preferred 67-5
show snmp station 67-6
snmp community map 67-8
snmp community map mode 67-10
show snmp community map 67-11
snmp security 67-12
show snmp security 67-14
show snmp statistics 67-16
show snmp mib family 67-18
snmp trap absorption 67-19
snmp trap to webview 67-20
snmp trap replay 67-21
snmp trap filter 67-23
snmp authentication trap 67-25
show snmp trap replay 67-26
show snmp trap filter 67-28
show snmp authentication trap 67-30
show snmp trap config 67-31
show snmp object 67-33

Chapter 68 DNS Commands 68-1
ip domain-lookup 68-2
ip name-server 68-3
ipv6 name-server 68-5
ip domain-name 68-7
show dns 68-8

CLI Quick Reference

Index Index-1

About This Guide

This *OmniSwitch AOS Release 6 CLI Reference Guide* is a comprehensive resource to all Command Line Interface (CLI) commands available on the OmniSwitch 6400 Series, OmniSwitch 6855 Series, OmniSwitch 6850E Series, and OmniSwitch 9000E Series switches.

Supported Platforms

This information in this guide applies to the following products:

- OmniSwitch 6850E Series
- OmniSwitch 9000E Series (9700E and 9800E switches)
- OmniSwitch 6400 Series
- OmniSwitch 6855 Series

Note. This *OmniSwitch AOS Release 6 CLI Reference Guide* covers Release 6.4.5, which is supported on the OmniSwitch 6400 Series, OmniSwitch 6855 Series, OmniSwitch 6850E Series, and OmniSwitch 9000E Series switches.

Unsupported Platforms

The information in this guide does not apply to the following products:

- OmniSwitch (original version with no numeric model name)
- OmniSwitch 6850
- OmniSwitch 6600 Family
- OmniSwitch 6800 Family
- OmniSwitch 7700/7800
- OmniSwitch 8800
- OmniSwitch 9000
- Omni Switch/Router
- OmniStack
- OmniAccess

Who Should Read this Manual?

The audience for this user guide is network administrators and IT support personnel who need to configure, maintain, and monitor switches and routers in a live network. Anyone wishing to gain knowledge on the details of all CLI commands available on the OmniSwitch will benefit from the material in this reference guide. However, advanced users who have already familiarized themselves with the OmniSwitch CLI commands will benefit most from the detailed content in this guide.

When Should I Read this Manual?

Read this guide whenever you want detailed information on individual CLI commands. Although this guide provides helpful information during any stage of the configuration process, it is a good idea to first familiarize yourself with the software features available on the switch before investigating the detailed command information in this guide.

Overview information, procedures, and live network examples on switch software features may be found in the *OmniSwitch AOS Release 6 CLI Reference Guide*, *OmniSwitch AOS Release 6 Network Configuration Guide*, and the *OmniSwitch AOS Release 6 Advanced Routing Configuration Guide*. Once you are familiar with the procedures and base CLI commands in these configuration guides you can obtain more detailed information on the individual commands in this guide.

What is in this Manual?

This reference guide includes information on every CLI command available in the switch. Command reference information is included for base software commands as well as commands associated with optional software packages, such as Advanced Routing (multicast routing protocols and OSPF). The information provided for each CLI command includes:

- Command description.
- Syntax.
- Description of all keywords and variables included in the syntax.
- Default values.
- Usage guidelines, which include tips on when and how to use the command.
- Examples of command lines using the command.
- Related commands with descriptions.
- Release history, which indicates the release when the command was introduced.
- SNMP information, such as the MIB files related to a set of CLI commands. In addition each CLI command includes the corresponding MIB variables that map to all parameters included in a command.

What is Not in this Manual?

Primarily a reference, this guide does not provide step-by-step instructions on how to set up particular features on the switch. It also does not provide overview or application examples on software features. For comprehensive information on how to configure particular software features in the switch, consult the appropriate configuration guide.

This guide also does not provide any information on the network management applications, WebView and OmniVista. Further information on WebView and OmniVista can be found in the context-sensitive on-line help available with those applications.

How is the Information Organized?

Each chapter in this guide includes reference material for all commands related to a single software feature, such as server load balancing or link aggregation. Typically commands in a single chapter will share a common prefix.

Text Conventions

The following table contains text conventions and usage guidelines for CLI commands as they are documented in this guide.

bold text	Indicates basic command and keyword syntax. Example: **show snmp station**
italicized text	Indicates user-specific information such as IP addresses, slot numbers, passwords, names, etc. Example: **no snmp station** *ip_address* Italicized text that is not enclosed with straight brackets (**[ ]**) indicates required information.
[ ] (Straight Brackets)	Indicates optional parameters for a given command. Example: **show aaa server [***server_name***]** Here, you can enter either of the following options: **show aaa server** **show aaa server** *server_name* (where *server_name* is the user-specified server name, e.g., **show aaa server myserver1**) Note that this example includes *italicized text*. The optional parameter in this case is a user-specified server name.
{ } (Curly Braces)	Indicates that the user must choose between one or more parameters. Example: **port mirroring {enable | disable}** Here, you must choose one of the following: **port mirroring enable** or **port mirroring disable**

| (Vertical Pipes)	Used to separate parameter choices within a command string. For example, the command string **show health threshold [rx | txrx | memory | cpu]** separates the choices **rx**, **txrx**, **memory,** and **cpu**. Examples: **show health threshold rx** **show health threshold txrx** **show health threshold memory** **show health threshold cpu**
“ ” (Quotation Marks)	Used to enclose text strings that contain spaces. The quotation marks are required input on the command line. Example: **vlan 2 “new test vlan”**

Documentation Roadmap

The OmniSwitch user documentation suite was designed to supply you with information at several critical junctures of the configuration process. The following section outlines a roadmap of the manuals that will help you at each stage of the configuration process. Under each stage, we point you to the manual or manuals that will be most helpful to you.

Stage 1: Using the Switch for the First Time

Pertinent Documentation: *Getting Started Guide*
Release Notes

A hard-copy *Getting Started Guide* is included with your switch; this guide provides all the information you need to get your switch up and running the first time. This guide provides information on unpacking the switch, rack mounting the switch, installing modules, unlocking access control, setting the switch's IP address, and setting up a password. It also includes succinct overview information on fundamental aspects of the switch, such as hardware LEDs, the software directory structure, CLI conventions, and web-based management.

At this time you should also familiarize yourself with the Release Notes that accompanied your switch. This document includes important information on feature limitations that are not included in other user guides.

Stage 2: Gaining Familiarity with Basic Switch Functions

Pertinent Documentation: *Hardware Users Guide*
Switch Management Guide

Once you have your switch up and running, you will want to begin investigating basic aspects of its hard ware and software. Information about switch hardware is provided in the platform-specific *Hardware Users Guide*. This guide provide specifications, illustrations, and descriptions of all hardware components—chassis, power supplies, Chassis Management Modules (CMMs), Network Interface (NI) modules, uplink modules, stacking modules, and cooling fans. It also includes steps for common procedures, such as removing and installing switch components.

The *Switch Management Guide* for your switch platform is the primary user guide for the basic software features on a single switch. This guide contains information on the switch directory structure, basic file and directory utilities, switch access security, SNMP, and web-based management. It is recommended that you read this guide before connecting your switch to the network.

Stage 3: Integrating the Switch Into a Network

Pertinent Documentation: *Network Configuration Guide*
Advanced Routing Configuration Guide

When you are ready to connect your switch to the network, you will need to learn how the OmniSwitch implements fundamental software features, such as 802.1Q, VLANs, Spanning Tree, and network routing protocols. The *Network Configuration Guide* for your switch platform contains overview information, procedures and examples on how standard networking technologies are configured in the OmniSwitch.

The *Advanced Routing Configuration Guide* includes configuration information for networks using advanced routing technologies, such as OSPF and multicast routing protocols (DVMRP and PIM-SM).

Anytime

The *CLI Reference Guide* contains comprehensive information on all CLI commands supported by the switch. This guide includes syntax, default, usage, example, related CLI command, and CLI-to-MIB variable mapping information for all CLI commands supported by the switch. This guide can be consulted anytime during the configuration process to find detailed and specific information on each CLI command.

Related Documentation

The following are the titles and descriptions of all the related OmniSwitch AOS Release 6 user manuals:

- *OmniSwitch 6400 Series Getting Started Guide*

  Describes the hardware and software procedures for getting an OmniSwitch 6400 Series switch up and running. Also provides information on fundamental aspects of OmniSwitch software and stacking architecture.

- *OmniSwitch 6855 Series Getting Started Guide*

  Describes the basic information you need to unpack and identify the components of your OmniSwitch 6855 shipment. Also provides information on the initial configuration of the switch.

- *OmniSwitch 6850E Series Getting Started Guide*

  Describes the hardware and software procedures for getting an OmniSwitch 6850E Series up and running. Also provides information on fundamental aspects of OmniSwitch software architecture.

- *OmniSwitch 9000E Series Getting Started Guide*

  Describes the hardware and software procedures for getting an OmniSwitch 9000E Series switch up and running. Also provides information on fundamental aspects of OmniSwitch software architecture

- *OmniSwitch 6400 Series Hardware Users Guide*

  Complete technical specifications and procedures for all OmniSwitch 6400 Series chassis, power supplies, and fans. Also includes comprehensive information on assembling and managing stacked configurations.

- *OmniSwitch 6855 Series Hardware User Guide*

  Complete technical specifications and procedures for all OmniSwitch 6855 Series chassis, power supplies, and fans.

- *OmniSwitch 6850E Series Hardware Users Guide*

  Complete technical specifications and procedures for all OmniSwitch 6850E Series chassis, power supplies, fans, and Network Interface (NI) modules.

- *OmniSwitch 9000E Series Hardware User Guide*

  Complete technical specifications and procedures for all OmniSwitch 9000E Series chassis, power supplies, and fans.

- *OmniSwitch AOS Release 6 CLI Reference Guide*

  Complete reference to all CLI commands supported on the OmniSwitch 6400, 6850E, 6855, and 9000E. Includes syntax definitions, default values, examples, usage guidelines and CLI-to-MIB variable mappings.

- *OmniSwitch AOS Release 6 Switch Management Guide*

  Includes procedures for readying an individual switch for integration into a network. Topics include the software directory architecture, image rollback protections, authenticated switch access, managing switch files, system configuration, using SNMP, and using web management software (WebView).

- *OmniSwitch AOS Release 6 Network Configuration Guide*

  Includes network configuration procedures and descriptive information on all the major software features and protocols included in the base software package. Chapters cover Layer 2 information (Ethernet and VLAN configuration), Layer 3 information (routing protocols, such as RIP), security options (authenticated VLANs), Quality of Service (QoS), and link aggregation.

- *OmniSwitch AOS Release 6 Advanced Routing Configuration Guide*

  Includes network configuration procedures and descriptive information on all the software features and protocols included in the advanced routing software package. Chapters cover multicast routing (DVMRP and PIM-SM), and OSPF.

- *OmniSwitch AOS Release 6 Transceivers Guide*

  Includes information on Small Form Factor Pluggable (SFPs) and 10 Gbps Small Form Factor Pluggables (XFPs) transceivers.

- Technical Tips, Field Notices

  Includes information published by Alcatel-Lucent’s Customer Support group.

- *Release Notes*

  Includes critical Open Problem Reports, feature exceptions, and other important information on the features supported in the current release and any limitations to their support.

User Manual CD

Some products are shipped with documentation included on a User Manual CD that accompanies the switch. This CD also includes documentation for other Alcatel-Lucent data enterprise products.

All products are shipped with a Product Documentation Card that provides details for downloading documentation for all OmniSwitch and other Alcatel-Lucent data enterprise products.

All documentation is in PDF format and requires the Adobe Acrobat Reader program for viewing. Acrobat Reader freeware is available at www.adobe.com.

Note. In order to take advantage of the documentation CD's global search feature, it is recommended that you select the option for *searching PDF files* before downloading Acrobat Reader freeware.

To verify that you are using Acrobat Reader with the global search option, look for the following button in the toolbar:

Note. When printing pages from the documentation PDFs, de-select Fit to Page if it is selected in your print dialog. Otherwise pages may print with slightly smaller margins.

Technical Support

An Alcatel-Lucent service agreement brings your company the assurance of 7x24 no-excuses technical support. You'll also receive regular software updates to maintain and maximize your Alcatel-Lucent product's features and functionality and on-site hardware replacement through our global network of highly qualified service delivery partners. Additionally, with 24-hour-a-day access to Alcatel-Lucent's Service and Support web page, you'll be able to view and update any case (open or closed) that you have reported to Alcatel-Lucent's technical support, open a new case or access helpful release notes, technical bulletins, and manuals. For more information on Alcatel-Lucent's Service Programs, see our web page at service.esd.alcatel-lucent.com, call us at 1-800-995-2696, or email us at esd.support@alcatel-lucent.com.

1 Ethernet Port Commands

The Ethernet port software is responsible for configuring and monitoring Ethernet ports (10 Mbps, 100 Mbps, 1 Gbps, and 10 Gbps). This includes:

- Performing hardware diagnostics, loading software, and initializing hardware.
- Notifying other software modules in the system when Ethernet links become active or inactive.
- Configuring basic line parameters for Ethernet ports.
- Gathering basic line statistics for Ethernet ports and passing this information to the user interface and configuration manager.

MIB information for the Ethernet Port commands is as follows:

Filename: AlcatelIND1Port.mib
Module: alcatelIND1PortMIB

Filename: IETF_ETHERLIKE.mib
Module: EtherLike-MIB

A summary of the available commands is listed here.

Trap port commands	**trap port link**
Interfaces commands	**interfaces speed** **interfaces mode** **interfaces autoneg** **interfaces pause** **interfaces e2e-flow-vlan** **interfaces duplex** **interfaces admin** **interfaces cli-prompt** **interfaces alias** **interfaces ifg** **interfaces no l2 statistics** **interfaces max frame** **interfaces flood** **interfaces flood rate** **interfaces flood action** **interfaces wait-to-restore** **interfaces transceiver ddm** **show interfaces** **show interfaces capability** **show interfaces flow control** **show interfaces pause** **show interfaces e2e-flow-vlan** **show interfaces accounting** **show interfaces counters** **show interfaces counters errors** **show interfaces collisions** **show interfaces status** **show interfaces port** **show interfaces ifg** **show interfaces flood rate** **show interfaces traffic** **show interfaces transceiver**
Combo port commands	**interfaces hybrid preferred-fiber** **interfaces hybrid autoneg** **interfaces hybrid crossover** **interfaces hybrid duplex** **interfaces hybrid speed** **interfaces hybrid pause** **show interfaces hybrid** **show interfaces hybrid status** **show interfaces hybrid pause** **show interfaces hybrid capability** **show interfaces hybrid accounting** **show interfaces hybrid counters** **show interfaces hybrid counters errors** **show interfaces hybrid collisions** **show interfaces hybrid traffic** **show interfaces hybrid port** **show interfaces hybrid flood rate**

Debug interfaces commands	**debug interfaces set backpressure** **debug interfaces backpressure**
Link monitoring commands	**interfaces link-monitoring admin-status** **interfaces link-monitoring time-window** **interfaces link-monitoring link-flap-threshold** **interfaces link-monitoring link-error-threshold** **interfaces clear-link-monitoring-stats** **show interfaces link-monitoring config** **show interfaces link-monitoring statistics**
Link fault propagation commands	**link-fault-propagation group** **link-fault-propagation group source** **link-fault-propagation group destination** **link-fault-propagation group wait-to-shutdown** **show link-fault-propagation group**
TDR commands	**interfaces tdr-test-start** **interfaces no tdr-statistics** **show interfaces tdr-statistics**
Interface violation commands	**interfaces violation-recovery-time** **interfaces violation-recovery-maximum** **interfaces violation-recovery-trap** **interfaces clear-violation-all** **show interfaces port** **show interfaces violation-recovery**

trap port link

Enables or disables trap link messages for a specific slot or port. If enabled, a message is displayed on the Network Management Station (NMS) whenever the specified port changes state.

trap {*slot* | *slot*/*port***[-***port2***]} port link {enable | disable | on | off}**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
enable	Port link up/down traps are displayed on the NMS.
disable	Port link up/down traps are not displayed on the NMS.
on	Same as **enable**.
off	Same as **disable**.

Defaults

parameter	default
enable | disable | on | off	**disable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to enable or disable trap link messages for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to enable or disable trap link messages on a specific interface or range of interfaces.
- When trap generation is set to **disable**, the events are logged in the switch log file only when the debug level for the application is set to **debug1** or other lower severity level (**debug2** or **debug3**) using the **swlog appid interface level** command.
- Similarly, when trap generation is set to **enable**, the events are logged in the switch log file with a level of **info** if debug level for application is set to **info** or other lower severity level (**debug1**, **debug2** or **debug3**).

Examples

```
-> trap 3/1 port link enable
-> trap 3 port link enable
-> trap 3/1-6 port link enable
```

Release History

Release 6.1; command was introduced.

Related Commands

show interfaces status	Displays interface line settings.
swlog appid interface level	Defines the level at which switch logging information will be filtered for the specified application.

MIB Objects

```
ifLinkUpDownTrapEnable
```

interfaces speed

Configures interface line speed.

interfaces {*slot* | *slot*/*port***[-***port2***]} speed {auto | 10 | 100 | 1000 | 10000 | max {100 | 1000}}**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
auto	The switch automatically sets the line speed to match the attached device (auto-sensing).
10	Sets the interface to 10 Mbps.
100	Sets the interface to 100 Mbps.
1000	Sets the interface to 1 Gigabit.
10000	Sets the interface to 10 Gigabit.
max 100	Sets the maximum speed to 100 megabits.
max 1000	Sets the maximum speed to 1000 megabits (1 Gigabit).

Defaults

parameter	default
auto | 10 | 100 | 1000 | 10000 | max 100 | max 1000}	Auto

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The **auto** option sets the speed to auto-sensing.
- The 10 Gigabit fiber ports only support 10000 Mbps.
- Enter a slot number to configure the interface speed for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the interface speed for a specific interface or range of interfaces.

Examples

```
-> interfaces 3/1 speed auto
-> interfaces 3 speed 100
-> interfaces 3/1-8 speed auto
```

Release History

Release 6.1; command was introduced.

Related Commands

interfaces duplex	Configures duplex mode.
interfaces autoneg	Enables and disables auto negotiation.
show interfaces status	Displays interface line settings.

MIB Objects

```
esmConfTable
   esmPortCfgSpeed
```

interfaces mode

Configures the mode of the ports to allow the switch to act in standalone or stacking mode.

interfaces {*slot* | *slot/port***} mode {uplink | stacking}**

Syntax Definitions

slot	The slot number for a specific module.
slot/port	The slot and port number (3/1).
uplink	Configures the ports as uplinks allowing the switch to act in standalone mode for network connectivity.
stacking	Configures the ports as stacking to allow the switch to be stacked in a virtual chassis.

Defaults

parameter	default
mode	uplink

Platforms Supported

OmniSwitch 6850E, 6855-U24X

Usage Guidelines

- Mode change does not take affect until the switch is rebooted.
- Only supported on the 10-Gigabit SFP+ ports
- Changing the mode of one port automatically changes the other port to the same mode. Mixing port modes is not supported.
- After changing the mode a message will display in approximately 5 seconds indicating success or failure. Re-enter the command if the change is not successful.
- Enter a slot number to configure the mode for all interfaces on a specific slot.
- Enter a slot and port number to configure the mode for a specific interface.

Examples

```
-> interfaces 4/25 mode stacking
WED JUL 01 18:08:29 : HSM-CHASSIS (101) info message:
+++ Ni 4 Port 25,26 are set to stackable for next boot:OK

-> interfaces 4 mode uplink
WED JUL 01 18:08:29 : HSM-CHASSIS (101) info message:
+++ Ni 4 Port 25,26 are set to uplink for next boot:OK
```

Release History

Release 6.4.2; command was introduced.

Related Commands

show stack topology	Displays the current operating topology of switches in a stacked configuration.
show stack status	Displays the current redundant stacking status for a stacked configuration.
show ni	Displays the current status for a switch in standalone mode.

MIB Objects

```
esmPortModeTable
   esmPortModeIndex
   esmPortSavedMode
```

interfaces autoneg

Enables or disables auto negotiation on a single port, a range of ports, or an entire Network Interface (NI).

interfaces {*slot* | *slot*/*port***[-***port2***]} autoneg {enable | disable | on | off}**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
enable	Enables auto negotiation.
disable	Disables auto negotiation.
on	Same as enable.
off	Same as disable.

Defaults

parameter	default
enable | **disable** | **on** | **off**	enable

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Copper Gigabit ports do not support disabling of auto negotiation.
- Enter a slot number to configure auto-negotiation for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure auto-negotiation for a specific interface or range of interfaces.

Examples

```
-> interfaces 3 autoneg disable
-> interfaces 3/1 autoneg disable
-> interfaces 3/1-4 autoneg disable
```

Release History

Release 6.1; command was introduced.

Related Commands

interfaces speed	Configures interface speed.
show interfaces status	Displays interface line settings.
show interfaces capability	Displays auto negotiation, speed, duplex, and crossover settings.

MIB Objects

```
esmConfTable
   esmPortCfgAutoNegotiation
```

interfaces pause

Configures whether or not the switch will transmit, honor, or transmit and honor flow control PAUSE frames on the specified interface. PAUSE frames are used to temporarily pause the flow of traffic between two connected devices to help prevent packet loss when traffic congestion occurs between switches.

interfaces {*slot* | *slot*/*port***[-***port2***]} pause {tx | rx | tx-and-rx | disable}**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
tx	Transmits PAUSE frames to peer switches when traffic congestion occurs on the local interface. Does not honor PAUSE frames from peer switches.
rx	Allows interface to honor PAUSE frames from peer switches and temporarily stop sending traffic to the peer. Does not transmit PAUSE frames to peer switches.
tx-and-rx	Transmits and honors PAUSE frames when traffic congestion occurs between peer switches.
disable	Disables flow control on the interface.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Defaults

By default, flow control is disabled on all switch interfaces.

Usage Guidelines

- Note that if the standalone switch is a 24-port unit, then only the **interfaces pause** command is required to enable end-to-end (E2E) flow control. However, if the switch is a 48-port unit, then a flow control VLAN, which is configured using the **interfaces e2e-flow-vlan** command, is required in addition to enabling RX/TX pause flow control.
- A stack of switches or a chassis-based switch will honor receive pause frames.
- Flow control is only supported on interfaces configured to run in full-duplex mode; half-duplex mode is not supported.
- If both autonegotiation and flow control are enabled on the same local interface, autonegotiation calculates operational flow control settings for that interface. Note that the operational settings, as shown in the following table, override the configured settings as long as autonegotiation and flow control are both enabled for the interface:

Configured Local Tx	Configured Local Rx	Configured Remote Tx	Configured Remote Rx	Operational Local Tx	Operational Local Rx
No	No	No	No	No	No
Yes	Yes	Yes	Yes	Yes	Yes
Yes	No	Yes	No	No	No
No	Yes	No	Yes	Yes	Yes
No	No	No	Yes	No	No
Yes	Yes	No	No	No	No
Yes	No	Yes	Yes	No	No
No	Yes	Yes	No	No	Yes
No	No	Yes	No	No	No
Yes	Yes	No	Yes	Yes	Yes
Yes	No	No	No	No	No
No	Yes	Yes	Yes	Yes	Yes
No	No	Yes	Yes	No	No
Yes	Yes	Yes	No	No	No
Yes	No	No	Yes	Yes	No
No	Yes	No	No	No	No

- If autonegotiation is disabled, the configured flow control settings are applied to the local interface.
- Enter a slot number to configure how flow control PAUSE frames are processed for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure how flow control PAUSE frames are processed on a specific interface or range of interfaces.

Examples

```
-> interfaces 3/1 pause tx
-> interfaces 4/2 pause rx
-> interfaces 1 tx-and-rx
-> interfaces 3/1-6 pause tx
-> interfaces 3/1-6 disable
```

Release History

Release 6.3.2; command was introduced.

Related Commands

interfaces hybrid pause	Configures flow control settings for combo ports.
interfaces e2e-flow-vlan	Configures a dedicated VLAN for carrying end-to-end (E2E) flow control messages to remote systems.
show interfaces pause	Displays interface flow control settings.

MIB Objects

```
esmConfigTable
   esmPortCfgFlow
dot3PauseTable
   dot3PauseAdminMode
```

interfaces e2e-flow-vlan

Configures a dedicated VLAN for carrying end-to-end (E2E) flow control messages to remote systems. Creating this type of VLAN is required to enable E2E flow control on 48-port models.

interfaces e2e-flow-vlan *vlan_id*

interfaces no e2e-flow-vlan

Syntax Definitions

vlan_id	The VLAN ID number for the dedicated flow VLAN.

Platforms Supported

OmniSwitch 6400, 6850E

Defaults

N/A

Usage Guidelines

- Note that if the standalone switch is a 24-port unit, then only the **interfaces pause** command is required to enable end-to-end (E2E) flow control. However, if the switch is a 48-port unit, then a flow control VLAN, which is configured using the **interfaces e2e-flow-vlan** command, is required in addition to enabling RX/TX pause flow control.
- Use the **no** form of this command to remove the flow VLAN from the switch configuration.
- There is only one flow control VLAN allowed per switch.
- No other standard VLAN management commands are allowed once a VLAN is configured as a dedicated flow control VLAN.

Examples

```
-> interfaces e2e-flow-vlan 10
-> interfaces no e2e-flow-vlan
```

Release History

Release 6.3.4; command was introduced.

Related Commands

show interfaces e2e-flow-vlan	Displays the E2E flow control VLAN configuration.
interfaces pause	Configures whether or not the switch will transmit, honor, or transmit and honor flow control PAUSE frames.
show interfaces pause	Displays interface flow control settings.

MIB Objects

```
esmE2EFlowVlan
```

interfaces duplex

Configures duplex mode. In full duplex mode, the interface transmits and receives data simultaneously. In half duplex mode, the interface can transmit *or* receive data at a given time. Auto duplex setting causes the switch to advertise all available duplex modes (half/full/both) for the port during autonegotiation.

interfaces {*slot* | *slot*/*port***[-***port2***]} duplex {full | half | auto}**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
full	Sets interface to full duplex mode.
half	Sets interface to half duplex mode.
auto	Switch will automatically set both the duplex mode settings to auto-negotiation.

Defaults

parameter	default
full | half | auto	**full**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Half duplex mode is not supported on Gigabit modules if a port is detected as Gigabit (1000 Mbps).
- On OS9-GNI-C24 modules, if a link is down and auto negotiation is enabled, then half duplex is not accepted since these modules are Gigabit modules by default.
- Gigabit and 10 Gigabit fiber ports only support full duplex.
- Enter a slot number to configure the duplex mode for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the duplex mode for a specific interface or range of interfaces.

Examples

```
-> interfaces 3/1 duplex auto
-> interfaces 3 duplex half
-> interfaces 3/1-4 auto
```

Release History

Release 6.1; command was introduced.

Related Commands

interfaces speed	Configures interface line speed. Set to **auto** to set speed and duplex mode to auto-sensing.
show interfaces status	Displays interface line settings (for example, speed, and mode).

MIB Objects

```
esmConfTable
   esmPortAutoDuplexMode
```

interfaces admin

Administratively enables or disables interfaces.

interfaces {*slot* | *slot*/*port***[-***port2***]} admin {up | down}**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
up	Enables the interface.
down	Disables the interface.

Defaults

parameter	default
up | **down**	up

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to administratively enable or disable all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to administratively enable or disable a specific interface or range of interfaces.
- The port link status changes based on the **admin** status.

Examples

```
-> interfaces 3/1 admin up
-> interfaces 3 admin down
-> interfaces 3/1-4 admin up
```

Release History

Release 6.1; command was introduced.

Related Commands

show interfaces	Displays general interface information (for example, hardware, MAC address, input errors, and output errors).
show interfaces port	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects

```
ifTable
   ifAdminStatus
```

interfaces cli-prompt

Enables or disables the display of a confirmation prompt when an interface is administratively disabled using the **interfaces admin {up | down}** command**.**

interfaces cli-prompt {enable | disable}

Syntax Definitions

enable	Enables the display of a confirmation prompt when an interface is administratively disabled.
disable	Disables the display of a confirmation prompt when an interface is administratively disabled.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is used in conjunction with the **interfaces admin** command to enable or disable the confirmation prompt.
- By default, the warning prompt will not be displayed.
- If the interface is already operationally down, the warning prompt will not be displayed.
- If a range of interfaces or slots is provided in the interfaces admin down command and the display of confirmation prompt is enabled, then the prompt will be displayed irrespective of the operational status of the interface.
- The configuration of this command can be captured in the snapshot when the display of the warning prompt is enabled.
- The configuration of this command cannot be captured in any interface show commands.

Examples

```
-> interfaces cli-prompt enable
-> interfaces 1/1 admin down
-> Confirm Command (Y/N) :

-> interfaces cli-prompt disable
-> interfaces 1/1 admin down
```

Release History

Release 6.3.4; the command was introduced.

Related Commands

interfaces admin	Administratively enables or disables interfaces.

MIB Objects

N/A

interfaces alias

Configures a description (alias) for a single port.

interfaces *slot/port* **alias** *description*

Syntax Definitions

slot/port	The slot and port number (3/1).
description	A description for the port, which can be up to 40 characters long. Spaces must be contained within quotes (for example, “IP Phone”).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- To remove an alias use a description consisting of two quotes without any spaces (for example, "").
- On combo ports the configuration changes made with the **interfaces alias** command apply to both the fiber and to the copper port. You cannot configure separate aliases.

Examples

```
-> interfaces 3/1 alias switch_port
-> interfaces 2/2 alias "IP Phone"
-> interfaces 3/1 alias ""
```

Release History

Release 6.1; command was introduced.

Related Commands

show interfaces	Displays general interface information (for example, hardware, MAC address, input errors, and output errors).
show interfaces port	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects

```
ifXTable
   ifAlias
```

interfaces ifg

Configures the inter-frame gap on Gigabit Ethernet interfaces.

interfaces {*slot* | *slot*/*port***[-***port2***]} ifg** *bytes*

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
bytes	Inter-frame gap value, in bytes. Valid range is 9–12.

Defaults

parameter	default
bytes	12

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to configure the inter-frame gap value for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the inter-frame gap value for a specific interface or range of interfaces.

Examples

```
-> interfaces 3/1 ifg 10
-> interfaces 3 ifg 10
-> interfaces 3/1-4 ifg 10
```

Release History

Release 6.1; command was introduced.

Related Commands

show interfaces ifg	Displays the inter-frame gap value for one or more ports.

MIB Objects

```
esmConfTable
   esmPortCfgIfg
```

interfaces no l2 statistics

Resets all statistics counters.

interfaces {*slot* | *slot*/*port***[-***port2***]} no l2 statistics [cli]**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
cli	Clears the counters from the CLI only; SNMP statistics continue to maintain cumulative totals.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command requires an upper or lower case “L” character in front of the “2” character. Entering the digit “1” (one) will result in an error message.
- When the **cli** parameter is not specified, both CLI and SNMP statistics are cleared.
- Enter a slot number to reset the statistics counters for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to reset the statistics counters for a specific interface or range of interfaces.

Examples

```
-> interfaces 3/1 no l2 statistics
-> interfaces 3 no l2 statistics
-> interfaces 3/1-6 no l2 statistics
```

Release History

Release 6.1; command was introduced.
Release 6.3.1; **cli** parameter was added.

Related Commands

show interfaces	Displays general interface information, including when statistics were last cleared.
show interfaces accounting	Displays interface accounting information (for example, packets received/transmitted and deferred frames received).
show interfaces counters	Displays interface counters information (for example, unicast, broadcast, and multi-cast packets received/transmitted).
show interfaces counters errors	Displays interface error frame information (for example, CRC errors, transit errors, and receive errors).
show interfaces collisions	Displays interface collision information (for example, number of collisions and number of retries).

MIB Objects

```
alcetherStatsTable
   alcetherClearStats
```

interfaces max frame

Configures the maximum frame size for Gigabit Ethernet interfaces.

interfaces {*slot* | *slot*/*port***[-***port2***]} max frame** *bytes*

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
bytes	Maximum frame size, in bytes. Valid range is 1518–9216.

Defaults

parameter	default
bytes (Gigabit Ethernet Packets)	9216
bytes (Ethernet Packets)	1553

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to configure the maximum frame size for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the maximum frame size on a specific interface or range of interfaces.

Examples

```
-> interfaces 3/1 max frame 1518
-> interfaces 3 max frame 1518
-> interfaces 3/1-3 max frame 1518
```

Release History

Release 6.1; command was introduced.

Related Commands

show interfaces	Displays general interface information (for example, hardware, MAC address, input errors, and output errors).

MIB Objects

```
esmConfTable
   esmPortCfgMaxFrameSize
```

interfaces flood

Enables broadcast, multicast or unknown unicast traffic storm control on the specified interface.

interfaces {*slot* **|** *slot*/*port***[-***port2***]} flood [broadcast | multicast | unknown-unicast | all] [enable | disable]**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
broadcast	Packets with a destination MAC address of FF:FF:FF:FF:FF:FF.
multicast	Packets with a multicast MAC address.
unknown-unicast	Unicast packets with an unknown destination MAC address.
all	Applies to broadcast, multicast, and unknown unicast packets.
enable	Enables broadcast, multicast, or unknown unicast rate limiting.
disable	Disables broadcast, multicast, or unknown unicast rate limiting.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to enable or disable traffic storm control for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to enable or disable traffic storm control on a specific interface or range of interfaces.
- The keyword **all** applies to all traffic types; broadcast, multicast and unknown-unicast.

Examples

```
-> interfaces 3 flood broadcast enable
-> interfaces 1/47 flood broadcast enable
-> interfaces 3 flood multicast enable
-> interfaces 1/45-48 flood multicast enable
-> interfaces 3 flood unknown-unicast enable
-> interfaces 1/47 flood unknown-unicast enable
```

```
-> interfaces 3 flood all enable
-> interfaces 1/47 flood all enable
-> interfaces 1/45-48 flood all enable
```

Release History

Release 6.4.3; command was introduced.

Related Commands

show interfaces flood rate	Displays interface peak flood rate settings.
interfaces flood rate	Configures the peak flood rate for an interface.

MIB Objects

```
esmConfTable
   esmPortMaxFloodRate
   esmPortMaxMcastFloodRate
   esmPortMaxUnknownUcastFloodRate
   esmPortFloodMcastEnable
   esmPortFloodBcastEnable
   esmPortFloodUnknownUcastEnable
   esmPortMaxFloodRateLimit
   esmPortMaxUnknownUcastFloodRateLimit
   esmPortMaxMcastFloodRateLimit
```

interfaces flood rate

Configures flood rate limiting for broadcast, multicast, or unknown unicast traffic on the specified interface.

interfaces {*slot* | *slot/port***[-***port2***]} flood {broadcast | multicast | unknown-unicast | all} rate {mbps** *mbps* **| pps** *pps* **| percentage** *percent* | **default} [low-threshold** *num***]**

Syntax Definitions

slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
mbps	The number of megabits per second.
pps	The number of packets per second.
percent	The percentage of the port speed.
default	Default speed of the port.
num	The low threshold value. The low threshold value must be lesser than the high threshold (rate limiting) value.

Defaults

- The default flood limit settings:

port speed	flood limit
10 mbps	**4 mbps**
100 mbps	**49 mbps**
1 Gig	**496 mbps**
10 Gig	**997 mbps**

- The default value for low threshold is ‘0’. This means, by default, auto recovery is not enabled.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- By default, unknown unicast and multicast traffic is flooded to all Layer 2 ports in a VLAN.
- Enter a slot number to configure flood rate limiting for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure flood rate limiting on a specific interface or range of interfaces.
- The keyword **all** applies to all traffic types, broadcast, multicast and unknown-unicast.

- The CLI command '**interfaces** *slot***[**/*port***[**-*port2***]] flood rate** *num***'** is supported only during boot up process for backward compatibility.
- The high (rate limit value) and low threshold (if) configured will have same threshold type [Mbps or PPS or percentage].
- Low threshold cannot be configured for unknown unicast traffic.
- The violated port is displayed as "Storm" violation in the "show interface port" command.
- The violated port can be recovered by any of the following ways when low threshold is not configured on the port:
  - Use 'interface slot/port admin down', then 'interface slot/port admin up' command on the port.
  - Unplug and replug the cable.
  - Use 'interface slot/port clear-violation-all' command to clear all the violation on the port.
- The global interface violation recovery timer is not applicable for storm threshold violation.

Examples

```
-> interfaces 1/1-5 flood all rate mbps 10
-> interfaces 1/1 flood broadcast rate pps 500
-> interfaces 1/2 flood multicast rate percentage 35
-> interfaces 1/3 flood unknown-unicast rate mbps 5
-> interfaces 1/2 flood multicast rate percentage 35 low-threshold 30
```

Release History

Release 6.1; command was introduced.
Release 6.4.3; **broadcast**, **multicast**, **unknown-unicast**, and **all** parameters added.
Release 6.4.5; **low-threshold** parameter added.

Related Commands

show interfaces flood rate	Displays interface peak flood rate settings.
interfaces flood	Enables traffic storm control on the specified interface.
interfaces flood action	Configures the storm control action when the port reaches the storm violated state.

MIB Objects

```
esmConfTable
   esmPortMaxFloodRate
   esmPortMaxMcastFloodRate
   esmPortMaxUnknownUcastFloodRate
   esmPortFloodMcastEnable
   esmPortFloodBcastEnable
   esmPortFloodUnknownUcastEnable
   esmPortMaxFloodRateLimit
   esmPortMaxUnknownUcastFloodRateLimit
   esmPortMaxMcastFloodRateLimit
```

interfaces flood action

Configures the storm control action when the port reaches the storm violated state.

interfaces {*slot* | *slot/port***[-***port2***]} flood [broadcast | multicast] action [shutdown | trap | default]**

Syntax Definitions

slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
broadcast	Packets with a destination MAC address of FF:FF:FF:FF:FF:FF.
multicast	Packets with a multicast MAC address.
shutdown	When the ingress storm traffic exceeds high threshold value, the port moves to violated state (Storm Violation) and a violation trap is generated. The port state moves to operationally down and admin enable**.** When the ingress traffic reaches the low threshold or goes below the low threshold, the port state moves to normal state, and a trap is generated.
trap	When the ingress storm traffic exceeds high threshold value, the port controls the storm by rate limiting the traffic, and a violation trap is generated. The port remains in the normal state. When the ingress traffic reaches the low threshold, a trap is generated.
default	When the ingress storm traffic exceeds high threshold value, the port controls the storm by rate limiting the traffic. No trap is generated, and the port remains in the normal state.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

For more information on the action performed based on the configured high and low threshold value, refer to “Configuring Ethernet Ports” chapter in *OmniSwitch AOS Release 6 Network Configuration Guide*.

Examples

```
-> interfaces 1/1 flood broadcast action shutdown
-> interfaces 1/1 flood broadcast action trap
-> interfaces 1/1 flood broadcast action default
```

Release History

Release 6.4.5; command introduced.

Related Commands

show interfaces flood rate	Displays interface peak flood rate settings.
interfaces flood rate	Configures flood rate limiting for broadcast, multicast, or unknown unicast traffic on the specified interface.

MIB Objects

```
esmPortFloodThresholdAction
```

interfaces violation-recovery-time

Configures the time interval after which the port is automatically re-activated if the port was shutdown for any violation. This value is configurable on a global basis (applies to all ports on all modules) and on a per-slot or per-port basis.

interfaces [*slot* | *slot*/*port***[-***port2***]] violation-recovery-time {***seconds* | **default}**

interfaces {*slot* | *slot*/*port***[-***port2***]} violation-recovery-time default**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
seconds	The number of seconds after which a port is reactivated. The valid range is 30-600 seconds or specify 0 to disable the recovery timer.
default	Sets the recovery time to the global value for the specified ports. This parameter is only available when a slot, port, or range of ports is specified with this command.

Defaults

- By default, this command configures the global recovery time. The global value applies to all ports on all modules in the switch.
- By default, the violation recovery time is set to 300 seconds.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- When the recovery timer expires, the interface is operationally re-enabled and the violation on the interface is cleared.
- The violation recovery time value does not apply to interfaces that are in a permanent shutdown state. A port in this state is only recoverable using the **interfaces clear-violation-all** command.
- The interface violation recovery mechanism is not supported on link aggregates, but is supported on the link aggregate member ports.
- Set the recovery time to 0 to disable this violation recovery mechanism.
- Enter a slot number to configure the recovery time for all interfaces on a specific slot.
- Enter a slot and port number or a range of ports to configure the recovery time for a specific interface or a range of interfaces.
- When this command is used to configure the recovery time for all ports on a slot or for a specific port or range of ports, the value specified overrides the global maximum recovery time configured for the switch.

- When configuring the time for a specific slot, port, or range of ports, use the **default** parameter to reset this value to the global maximum number of attempts.

Examples

```
-> interfaces violation-recovery-time 600
-> interfaces 2 violation-recovery-time 100
-> interfaces 2/3 violation-recovery-time 200
-> interfaces 2/4-9 violation-recovery-time 500
-> interfaces 2/4-9 violation-recovery-maximum default
-> interfaces 2/3 violation-recovery-time 0
-> interfaces violation-recovery-time 0
```

Release History

Release 6.4.4; command introduced.

Related Commands

interfaces violation-recovery-maximum	Configures the maximum number of recovery attempts before a port is permanently shut down.
show interfaces port	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces violation-recovery	Displays the globally configured recovery time, SNMP recovery trap enable/disable status and maximum recovery attempts.

MIB Objects

```
alaPortViolationRecoveryTable
   alaPortViolationRecoveryTime
```

interfaces violation-recovery-maximum

Configures the maximum number of recovery attempts allowed before the port is permanently shut down. This value is configurable on a global basis (applies to all ports on all modules) and on a per-slot or per-port basis.

interfaces [*slot* | *slot*/*port***[-***port2***]] violation-recovery-maximum** *max_attempts*

interfaces {*slot* | *slot*/*port***[-***port2***]} violation-recovery-maximum default**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
max_attempts	The maximum number of recovery attempts. Valid range is 0-50.
default	Sets the number of recovery attempts to the global value for the specified ports. This parameter is only available when a slot, port, or range of ports is specified with this command.

Defaults

By default, this command configures the global maximum number of recovery attempts. The global value applies to all ports on all modules in the switch.

parameter	default
max_attempts	10

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Set the maximum number of recovery attempts value to 0 to disable this recovery mechanism.
- Enter a slot number to configure the number of recovery attempts for all interfaces on a specific slot.
- Enter a slot and port number or a range of ports to configure the number of recovery attempts for a specific interface or a range of interfaces.
- When this command is used to configure the number of recovery attempts for all ports on a slot or for a specific port or range of ports, the value specified overrides the global maximum number of attempts configured for the switch.
- When configuring the number of recovery attempts for a specific slot, port, or range of ports, use the **default** parameter to reset this value to the global maximum number of attempts.
- The number of recovery attempts increments whenever a port recovers using automatic recovery timer mechanism. When the number of recovery attempts exceeds the configured threshold, the port is permanently shut down.

- Once an interface is permanently shut down, only the **interface clear-violations-all** command can be used to recover the interface.
- The recovery mechanism tracks the number of recoveries within a fixed time window (FTW). The FTW = 2 * maximum recovery number * recovery timer. For example, if the maximum number of recovery attempts is set to 4 and the recovery timer is set to 5, the FTW is 40 seconds (2 * 4 * 5=40).

Examples

```
-> interfaces violation-recovery-maximum 25
-> interfaces 2 violation-recovery-maximum 10
-> interfaces 2/3 violation-recovery-maximum 20
-> interfaces 2/4-9 violation-recovery-maximum 50
-> interfaces 2/4-9 violation-recovery-maximum default
-> interfaces 2/3 violation-recovery-maximum 0
-> interfaces violation-recovery-maximum 0
```

Release History

Release 6.4.4; command was introduced.

Related Commands

interfaces violation-recovery-time	Configures the time interval after which the port is automatically re-activated if the port was shut down for any violation.
show interfaces port	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces violation-recovery	Displays the globally configured recovery time, SNMP recovery trap status, and maximum recovery attempts.

MIB Objects

```
alaPortViolationRecoveryTable
   alaPortViolationRecoveryMaximum
```

interfaces violation-recovery-trap

Enables or disables the sending of a violation recovery trap when any port is re-enabled after the violation recovery time has expired.

interface violation-recovery-trap {enable | disable}

Syntax Definitions

enable	Enables the ports to send violation recovery traps.
disable	Disables the ports from sending violation recovery traps.

Defaults

By default, the sending of a violation recovery trap is disabled.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

This is a global command that is applied to all ports on all modules.

Examples

```
-> interfaces violation-recovery-trap enable
-> interfaces violation-recovery-trap disable
```

Release History

Release 6.4.3; command was introduced.

Related Commands

interfaces violation-recovery-time	Configures the time interval to automatically re-enable the ports that were shutdown due to a violation.
show interfaces violation-recovery	Displays the globally configured recovery time, SNMP recovery trap status, and maximum recovery attempts.

MIB Objects

```
esmViolationRecovery
   esmViolationRecoveryTrap
```

interfaces clear-violation-all

Clears all port violations set by various applications on the switch for the given port.

interfaces {*slot* | *slot/port***[-***port2***]} clear-violation-all**

Syntax Definitions

slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

All application violations associated with a specific port are cleared when this command is used.

Examples

```
-> interfaces 1/3 clear-violation-all
-> interfaces 1 clear-violation-all
-> interfaces 1/3-7 clear-violation-all
```

Release History

Release 6.3.1; command was introduced.

Related Commands

show interfaces port	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects

```
esmConfTable
   esmPortViolationClearAll
```

interfaces wait-to-restore

Configures the wait to restore timer on a specific slot, port, or a range of specified ports. The timer is enabled when a link up event is detected. Other applications are notified of the link up event only after the wait to restore timer has elapsed.

interfaces {*slot* | *slot/port***[-***port2***]} wait-to-restore** *seconds*

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
seconds	The number of seconds the switch waits before notifying other applications. The valid range is 0-300 in multiples of 5.

Defaults

By default, the timer is set to zero (disabled).

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Set the wait-to-restore timer to zero to disable the timer.
- Enter a slot number to configure the timer value for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the timer value for a specific interface or a range of interfaces.

Example

```
-> interfaces 1 wait-to-restore 30
-> interfaces 1/1 wait-to-restore 10
-> interfaces 1/1-7 wait-to-restore 250
```

Release History

Release 6.4.4; command introduced.

Related Commands

show interfaces port	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects

```
esmConfTable
   esmPortWaitToRestoreTimer
```

interfaces transceiver ddm

Configures the DDM administrative status or trap capability.

interfaces transceiver ddm [trap] {enable | disable}

Syntax Definitions

trap	Indicates the enable / disable parameter applies to the traps functionality.
enable	Enables DDM functionality or traps warning/alarm threshold violations.
disable	Disables DDM functionality or traps warning/alarm threshold violations.

Defaults

parameter	default
ddm	**disable**
trap	**disable**

By default, the polling period is set 1 second for the OS6400/6855.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- DDM capability will vary based on the transceiver manufacturer.
- DDM status must be enabled in order to enable traps; traps are enabled separately.
- Information will be read sequentially from a different SFP at the predefined Polling intervals listed in the defaults table above. The number of SFPs in the switch will determine how often each SFP is polled.

Examples

```
-> interfaces transceiver ddm enable
-> interfaces transceiver ddm trap enable
-> interfaces transceiver ddm trap disable
-> interfaces transceiver ddm disable
```

Release History

Release 6.4.2; command was introduced.

Related Commands

show interfaces transceiver	Displays the interface DDM status.

MIB Objects

```
ddmConfiguration
   ddmConfig
   ddmTrapConfig
   ddmNotificationType
```

interfaces link-monitoring admin-status

Enables or disables link monitoring on a specific slot, port, or a range of specified ports.

interfaces {*slot* | *slot/port***[-***port2***]} link-monitoring admin-status {enable | disable}**

Syntax Definitions

slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
enable	Enables link monitoring for the specified port.
disable	Disables link monitoring for the specified port.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Configuring link monitoring parameters are allowed even if the link monitoring status is disabled for the specified ports.
- The Automatic Recovery Timer and link monitoring must not be enabled on Remote Fault Propagation (RFP) enabled ports.
- Enter a slot number to configure link monitoring for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure link monitoring for a specific interface or range of interfaces.

Example

```
-> interfaces 1 link-monitoring admin-status enable
-> interfaces 1/1 link-monitoring admin-status enable
-> interfaces 1/1-7 link-monitoring admin-status enable
-> interfaces 2/5 link-monitoring admin-status disable
-> interfaces 2/5-20 link-monitoring admin-status disable
```

Release History

Release 6.4.4; command introduced.

Related Commands

show interfaces port	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces link-monitoring config	Displays the link monitoring configuration for the specified ports.
show interfaces link-monitoring statistics	Displays the link monitoring statistics for the specified ports.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonStatus
```

interfaces link-monitoring time-window

Configures the monitoring time window on a specific slot, port, or a range of specified ports. This is the length of time during which the link is monitored.

interfaces {*slot* | *slot/port***[-***port2***]} link-monitoring time-window** *seconds*

Syntax Definitions

slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
seconds	The length of time during which the link is monitored. The valid range is 0–3600 seconds.

Defaults

By default, the time window value is set to 300 seconds.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to configure the monitoring time window for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the monitoring time window for a specific interface or a range of interfaces.

Example

```
-> interfaces 1 link-monitoring time-window 20
-> interfaces 1/1 link-monitoring time-window 40
-> interfaces 1/1-7 link-monitoring time-window 2500
```

Release History

Release 6.4.4; command introduced.

Related Commands

show interfaces port	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces link-monitoring config	Displays the link monitoring configuration for the specified ports.
show interfaces link-monitoring statistics	Displays the link monitoring statistics for the specified ports.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonTimeWindow
```

interfaces link-monitoring link-flap-threshold

Configures the number of link flaps allowed on a specific slot, port, or a range of specified ports in the time interval, before the port is shutdown.

interfaces {*slot* | *slot/port***[-***port2***]} link-monitoring link-flap-threshold** *link_flaps*

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
link_flaps	The number of link flaps. The valid range is 2-10.

Defaults

By default, the number of link flaps allowed is set to 5.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to configure the number of link flaps allowed for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the number of link flaps allowed for a specific interface or a range of interfaces.

Example

```
-> interfaces 1 link-monitoring link-flap-threshold 6
-> interfaces 1/1 link-monitoring link-flap-threshold 3
-> interfaces 1/1-7 link-monitoring link-flap-threshold 10
```

Release History

Release 6.4.4; command introduced.

Related Commands

show interfaces port	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces link-monitoring config	Displays the link monitoring configuration for the specified ports.
show interfaces link-monitoring statistics	Displays the link monitoring statistics for the specified ports.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonLinkFlapThreshold
```

interfaces link-monitoring link-error-threshold

Configures the number of MAC errors allowed on a specific slot, port, or a range of specified ports in the time interval, before the port is shutdown. MAC errors refer to lost frames, error frames, alignment frames and cyclic redundancy check (CRC).

interfaces {*slot* | *slot/port***[-***port2***]} link-monitoring link-error-threshold** *mac_errors*

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
mac_errors	The number of MAC errors. The valid range is 1-100.

Defaults

By default, the number of MAC errors allowed is set to 5.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to configure the number of MAC errors allowed on all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the number of MAC errors allowed on a specific interface or on a range of interfaces.

Example

```
-> interfaces 1 link-monitoring link-error-threshold 30
-> interfaces 1/1 link-monitoring link-error-threshold 10
-> interfaces 1/1-7 link-monitoring link-error-threshold 35
```

Release History

Release 6.4.4; command introduced.

Related Commands

show interfaces port	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces link-monitoring config	Displays the link monitoring configuration for the specified ports.
show interfaces link-monitoring statistics	Displays the link monitoring statistics for the specified ports.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonLinkErrorThreshold
```

interfaces clear-link-monitoring-stats

Clears the link monitoring statistics on a specific slot, port, or a range of specified ports.

interfaces {*slot* | *slot/port***[-***port2***]} clear-link-monitoring-stats**

Syntax Definitions

slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to clear monitoring statistics for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to clear monitoring statistics for a specific interface or a range of interfaces.

Example

```
-> interfaces 1 clear-link-monitoring-stats
-> interfaces 1/1 clear-link-monitoring-stats
-> interfaces 1/1-7 clear-link-monitoring-stats
```

Release History

Release 6.4.4; command introduced.

Related Commands

show interfaces port	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces link-monitoring config	Displays the link monitoring configuration for the specified ports.
show interfaces link-monitoring statistics	Displays the link monitoring statistics for the specified ports.

MIB Objects

```
alaLinkMonStatsTable
   alaLinkMonStatsClearStats
```

interfaces hybrid preferred-fiber

Configures one or more combo ports to use the fiber SFP port(s) instead of the equivalent copper 10/100/1000 RJ-45 port(s), when both ports are enabled and have a valid link. In addition, this mode configures automatic failover to copper if a valid copper link is present on RJ-45 side and fiber link fails to come up.

interfaces {*slot* | *slot/port***[-***port2***]} hybrid preferred-fiber**

Syntax Definitions

slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

All combo ports are set to preferred-fiber by default.

Platforms Supported

OmniSwitch 6400, 6850E, 6855

Usage Guidelines

This command is no longer required, preferred-fiber is the only mode supported.

Examples

```
-> interfaces 1/47 hybrid preferred-fiber
-> interfaces 1/47-48 hybrid preferred-fiber
-> interfaces 1 hybrid preferred-fiber
```

Release History

Release 6.1; command was introduced.
Release 6.4.4; preferred-fiber parameter introduced.

Related Commands

show interfaces hybrid status	Displays interface line settings (for example, speed, mode) for combo ports only.

MIB Objects

```
esmHybridConfTable
   esmPortCfgHybridMode
   esmPortCfgHybridType
```

interfaces hybrid autoneg

Enables or disables auto-negotiation on a single combo port, a range of combo ports, or all combo ports on a switch.

interfaces {*slot* | *slot/port***[-***port2***]} hybrid {fiber | copper} autoneg {enable | disable | on | off}**

Syntax Definitions

slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
fiber	Specifies that configuration changes will be made to the SFP port(s).
copper	Specifies that changes will be made to the copper 10/100/1000 RJ-45 port(s).
enable	Enables auto negotiation.
disable	Disables auto negotiation.
on	Same as enable.
off	Same as disable.

Defaults

By default, auto-negotiation is enabled for the interface.

Platforms Supported

OmniSwitch 6400, 6850E, 6855

Usage Guidelines

- Refer to the *Hardware Users Guide* for combo port numbering.
- The MIB table and MIB object listed in the “MIB Objects” section below apply to the inactive configured media only. See the “MIB Objects” section in the **interfaces autoneg** section for the MIB table and MIB object for the active configured media.
- Enter a slot number to configure auto-negotiation for all interfaces on a specific slot.
- Enter a slot and port number or a range of ports to configure auto-negotiation for a specific interface on a specific slot.

Examples

```
-> interfaces 1/47 hybrid copper autoneg disable
-> interfaces 1/47-48 hybrid copper autoneg disable
-> interfaces 1 hybrid copper autoneg disable
```

Release History

Release 6.1; command was introduced.

Related Commands

interfaces hybrid speed	Configures interface speed for combo ports.
interfaces hybrid crossover	Configures crossover port settings for combo ports.
interfaces hybrid speed	Enables or disables flow (pause).
show interfaces hybrid status	Displays interface line settings for combo ports.
show interfaces hybrid capability	Displays auto negotiation, speed, duplex, and crossover settings for combo ports.

MIB Objects

```
esmHybridConfTable
   esmHybridPortCfgAutoNegotiation
```

interfaces hybrid crossover

Configures port crossover settings on a single port, a range of ports, or an entire Network Interface (NI).

interfaces {*slot* | *slot/port***[-***port2***]} hybrid copper crossover {auto | mdix | mdi}**

Syntax Definitions

slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
copper	Specifies that changes will be made to the copper 10/100/1000 RJ-45 port(s).
auto	The interface will automatically detect crossover settings.
mdix	Sets the crossover configuration to Media Dependent Interface with Crossover (MDIX), which is the standard for hubs and switches.
mdi	Sets the crossover configuration to Media Dependent Interface (MDI), which is the standard for end stations.

Defaults

By default, the interface is configured to automatically detect crossover settings.

Platforms Supported

OmniSwitch 6400, 6850E, 6855

Usage Guidelines

- Refer to the *Hardware Users Guide* for combo port numbering.
- You cannot configure crossover settings on fiber ports. These ports use the MDI standard.
- The MIB table and MIB object listed in the “MIB Objects” section below apply to the inactive configured media only.
- Enter a slot number to configure the crossover settings for all interfaces on a specific slot.
- Enter a slot and port number or a range of ports to configure the crossover settings for a specific interface or a range of interfaces.

Examples

```
-> interfaces 1/47 hybrid copper crossover disable
-> interfaces 1/47-48 hybrid copper crossover mdix
```

Release History

Release 6.1; command was introduced.

Related Commands

interfaces hybrid speed	Configures interface speed for combo ports.
interfaces hybrid autoneg	Enables and disables auto negotiation for combo ports.
interfaces hybrid speed	Enables or disables flow (pause) for combo ports.
show interfaces hybrid status	Displays interface line settings for combo ports.
show interfaces hybrid capability	Displays auto negotiation, speed, duplex, and crossover settings for combo ports.

MIB Objects

```
esmHybridConfTable
   esmHybridPortCfgCrossover
```

interfaces hybrid duplex

Configures duplex mode on combo ports. In full duplex mode, the interface transmits and receives data simultaneously. In half duplex mode, the interface can transmit *or* receive data at a given time. Auto duplex setting causes the switch to advertise all available duplex modes (half/full/both) for the port during autonegotiation.

interfaces {*slot* | *slot/port***[-***port2***]} hybrid {fiber | copper} duplex {full | half | auto}**

Syntax Definitions

slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
fiber	Specifies that configuration changes will be made to the SFP port(s).
copper	Specifies that changes will be made to the copper 10/100/1000 RJ-45 port(s).
full	Sets interface to full duplex mode.
half	Sets interface to half duplex mode.
auto	Switch will automatically set both the duplex mode settings to auto-negotiation.

Defaults

By default, the duplex mode is set to full for the interface.

Platforms Supported

OmniSwitch 6400, 6850E, 6855

Usage Guidelines

- Refer to the *Hardware Users Guide* for combo port numbering.
- The MIB table and MIB object listed in the “MIB Objects” section below apply to the inactive configured media only. See the “MIB Objects” section in the **interfaces duplex** section for the MIB table and MIB object for the active configured media.
- Enter a slot number to configure the duplex mode for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the duplex mode for a specific interface or a range of interfaces.

Examples

```
-> interfaces 1/47 hybrid copper duplex auto
-> interfaces 1/47-48hybrid copper duplex half
-> interfaces 1 hybrid copper fiber full
```

Release History

Release 6.1; command was introduced.

Related Commands

interfaces hybrid speed	Configures interface line speed for combo ports. Set to **auto** to set speed and duplex mode to auto-sensing.
show interfaces hybrid status	Displays interface line settings (for example, speed, mode) for combo ports.

MIB Objects

```
esmHybridConfTable
   esmHybridPortCfgDuplexMode
```

interfaces hybrid speed

Configures interface line speed on combo ports.

interfaces {*slot* | *slot/port***[-***port2***]} hybrid {fiber | copper} speed {auto | 10 | 100 | 1000 | 10000 | max {100 | 1000}}**

Syntax Definitions

slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
fiber	Specifies that configuration changes will be made to the SFP port(s).
copper	Specifies that changes will be made to the copper 10/100/1000 RJ-45 port(s).
auto	The switch will automatically set the line speed to match the attached device (auto-sensing).
10	Sets the interface to 10 Mbps.
100	Sets the interface to 100 Mbps.
1000	Sets the interface to 1 Gigabit.
10000	Sets the interface to 10 Gigabit. This option is currently not supported.
max 100	Sets the maximum speed to 100 megabits.
max 1000	Sets the maximum speed to 1000 megabits (1 Gigabit)

Defaults

By default, the line speed is automatically set to match the speed of the attached device.

Platforms Supported

OmniSwitch 6400, 6850E, 6855

Usage Guidelines

- Refer to the *Hardware Users Guide* for combo port numbering.
- The MIB table and MIB object listed in the “MIB Objects” section below apply to the inactive configured media only. See the “MIB Objects” section in the **interfaces speed** section for the MIB table and MIB object for the active configured media.
- Enter a slot number to configure the line speed for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the line speed for a specific interface or a range of interfaces.

Examples

```
-> interfaces 1/47 hybrid copper speed auto
-> interfaces 1/47-48 hybrid copper speed 100
-> interfaces 1/47 hybrid fiber speed 1000
```

Release History

Release 6.1; command was introduced.

Related Commands

interfaces hybrid duplex	Configures duplex mode for combo ports.
interfaces hybrid autoneg	Enables and disables auto negotiation for combo ports.
show interfaces hybrid status	Displays interface line settings for combo ports.

MIB Objects

```
esmHybridConfTable
   esmHybridPortCfgSpeed
```

interfaces hybrid pause

Configures whether or not the switch will transmit, honor, or transmit and accept flow control PAUSE frames on the specified combo port. PAUSE frames are used to temporarily pause the flow of traffic between two connected devices to help prevent packet loss when traffic congestion occurs between switches.

interfaces {*slot* | *slot/port***[-***port2***]} hybrid {fiber | copper} pause {tx | rx | tx-and-rx | disable}**

Syntax Definitions

slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
fiber	Specifies that configuration changes will be made to the SFP port(s).
copper	Specifies that changes will be made to the copper 10/100/1000 RJ-45 port(s).
tx	Transmits PAUSE frames to peer switches when traffic congestion occurs on the local interface. Does not honor PAUSE frames from peer switches.
rx	Allows interface to honor PAUSE frames from peer switches and temporarily stop sending traffic to the peer. Does not transmit PAUSE frames to peer switches.
tx-and-rx	Transmits and honors PAUSE frames when traffic congestion occurs between peer switches.
disable	Disables flow control on the interface.

Platforms Supported

OmniSwitch 6400, 6850E, 6855

Defaults

By default, flow control is disabled on all combo ports.

Usage Guidelines

- Note that if the standalone switch is a 24-port unit, then only the **interfaces pause** command is required to enable end-to-end (E2E) flow control. However, if the switch is a 48-port unit, then a flow control VLAN, which is configured using the **interfaces e2e-flow-vlan** command, is required in addition to enabling RX/TX pause flow control.
- Flow control is only supported on interfaces configured to run in full-duplex mode; half-duplex mode is not supported.

- If both autonegotiation and flow control are enabled on the same local interface, autonegotiation calculates operational flow control settings for that interface. Note that the operational settings, as shown in the following table, override the configured settings as long as autonegotiation and flow control are both enabled for the interface.

Configured Local Tx	Configured Local Rx	Configured Remote Tx	Configured Remote Rx	Negotiated Local Tx	Negotiated Local Rx
No	No	No	No	No	No
Yes	Yes	Yes	Yes	Yes	Yes
Yes	No	Yes	No	No	No
No	Yes	No	Yes	Yes	Yes
No	No	No	Yes	No	No
Yes	Yes	No	No	No	No
Yes	No	Yes	Yes	No	No
No	Yes	Yes	No	No	Yes
No	No	Yes	No	No	No
Yes	Yes	No	Yes	Yes	Yes
Yes	No	No	No	No	No
No	Yes	Yes	Yes	Yes	Yes
No	No	Yes	Yes	No	No
Yes	Yes	Yes	No	No	No
Yes	No	No	Yes	Yes	No
No	Yes	No	No	No	No

- If autonegotiation is disabled, the configured flow control setting is applied to the local interface.
- Enter a slot number to configure the flow control settings for all interfaces on a specific slot.
- Enter a slot and port number or range of port numbers to configure the flow control settings for a specific interface or a range of interfaces.

Examples

```
-> interfaces 3/21 hybrid fiber pause tx
-> interfaces 4/24 hybrid copper pause rx
-> interfaces 1 hybrid fiber tx-and-rx
-> interfaces 3/21-24 hybrid copper pause tx
-> interfaces 3/21-24 hybrid copper disable
```

Release History

Release 6.3.2; command was introduced.

Related Commands

interfaces pause	Configures flow control settings for switch interfaces.

show interfaces

Displays general interface information (for example, hardware, MAC address, input errors, and output errors).

show interfaces [*slot* | *slot*/*port***[-***port2***]]**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

By default, interface information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Examples

```
-> show interfaces 1/2

```

output definitions

Slot/Port	Interface slot and port.
Operational Status	Interface status (up/down).
Last Time Link Changed	The last time the configuration for this interface was changed. (Currently this field is only displayed on OmniSwitch 6800 Series switches.)
Number of Status Change	The total number of times that the configuration of this interface has changed. (Currently this field is only displayed on OmniSwitch 6800 Series switches.)
Type	Interface type (Ethernet/Fast Ethernet/Gigabit Ethernet).
MAC address	Interface MAC address.
Bandwidth	Bandwidth (in megabits).
Duplex	Duplex mode (Half/Full/Auto).
Autonegotiation	The auto negotiation settings for this interface.
Long Accept	Long Frames status (enable/disable).
Runt Accept	Runt Frames status (enable/disable).
Long Frame Size	Long Frame Size (in Bytes).
Runt Size	Runt Frame Size (in Bytes).
Bytes Received	Number of Bytes received.
Rx Unicast Frames	Number of unicast frames received.
Rx Broadcast Frames	Number of broadcast frames received.
Rx M-cast Frames	Number of multicast frames received.
Rx Undersize Frames	Number of undersized frames received.
Rx Oversize Frames	Number of oversized frames received.
Rx Lost Frames	Number of Lost Frames received.
Rx Error Frames	Number of error frames received.
Rx CRC Error Frames	Number of CRC error frames received.
Rx Alignments Err	Number of Alignments Error frames received.
Bytes Xmitted	Number of Bytes transmitted.
Tx Unicast Frames	Number of unicast frames transmitted.
Tx Broadcast Frames	Number of broadcast frames transmitted.
Tx M-cast Frames	Number of multicast frames r transmitted.
Tx Undersize Frames	Number of undersized frames transmitted.
Tx Oversize Frames	Number of oversized frames transmitted.
Tx Lost Frames	Number of Lost Frames transmitted.
Tx Collided Frames	Number of collision frames received or transmitted.
Tx Error Frames	Number of error frames transmitted.

Release History

Release 6.1; command was introduced.

Related Commands

show interfaces accounting	Displays interface accounting information (for example, packets received/transmitted).
show interfaces counters	Displays interface counter information (for example, unicast packets received/transmitted).
show interfaces counters errors	Displays interface error frame information (for example, CRC errors, transit errors, and receive errors).
show interfaces collisions	Displays interface collision information (for example, number of collisions and number of retries).
show interfaces status	Displays the interface line settings (for example, speed and mode).
show interfaces traffic	Displays interface traffic statistics (input/output bytes and packets).

show interfaces capability

Displays default auto negotiation, speed, duplex, flow, and cross-over settings for a single port, a range of ports, or all ports on a Network Interface (NI) module.

show interfaces [*slot* | *slot*/*port***[-***port2***]] capability**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

By default, information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.
- The **show interfaces capability** command displays defaults settings in two rows of data for each port. The first row of data, identified by the label **CAP**, displays the valid user-defined configuration settings available for the port. The second row, identified by the label **DEF**, displays the default settings for the port.

Examples

```
-> show interfaces 5/1 capability
Slot/Port   AutoNeg     Flow   Crossover      Speed    Duplex
-----------+---------+--------+-----------+----------+----------
  5/1  CAP     EN/DIS   EN/DIS  MDI/X/Auto  10/100/1G Full/Half
  5/1  DEF         EN       EN        Auto       Auto     Auto
```

output definitions

Slot	The slot number.
Port	The port number
AutoNeg	In the row labeled **CAP,** the field displays the valid auto negotiation configurations for the port. In the row label **DEF,** the field displays the default auto negotiation settings for the port. The possible values are **EN** (enabled) or **DIS** (disabled).

output definitions (continued)

Flow	In the row labeled **CAP,** the field displays the valid flow configurations for the port. In the row label **DEF,** the field displays the default flow settings for the port. The possible values are **EN** (enabled) or **DIS** (disabled).
Crossover	In the row labeled **CAP,** the field displays the valid cross over configurations for the port. In the row label **DEF,** the field displays the default cross over settings for the port. The possible values are **Auto**, **MDI/X/Auto** (MDI/MDIX/Auto), or **--** (not configurable and/or not applicable).
Speed	In the row labeled **CAP,** the field displays the valid line speed configurations for the port. In the row label **DEF,** the field displays the default line speed settings for the port. The possible values are **10/100**, **100**, **1G**, **10/100/1G**, **10G**, or **Auto**.
Duplex	In the row labeled **CAP,** the field displays the valid duplex configurations for the port. In the row label **DEF,** the field displays the default duplex settings for the port. The possible values are **Full**, **Full/Half**, or **Auto**.

Release History

Release 6.1; command was introduced.

Related Commands

interfaces autoneg	Enables and disables auto negotiation.
interfaces crossover	Configures crossover port settings.
interfaces speed	Configures interface speed.
interfaces duplex	Configures duplex settings.
show interfaces status	Displays interface line settings.

```

show interfaces flow control

Displays interface flow control wait time settings.

show interfaces [*slot* | *slot*/*port***[-***port2***]] flow [control]**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
control	Optional command syntax. It displays the same information as **show interfaces flow**.

Defaults

By default, flow control wait time settings are displayed for all ports on all modules.

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Examples

```
-> show interfaces 3/20-24 flow
Slot/Port   Active   Wait time(usec)   Cfg-Flow     Cfg-Cross
-----------+--------+----------------+--------+-----------
 3/20         -              0           Pause      MDIX
 3/21         -              0           Pause      MDIX
 3/22         -              0           Pause      MDIX
 3/23         -              0              Go      MDIX
 3/24         -              0              Go      MDIX
```

output definitions

Slot/Port	Interface slot and port number
Active	Interface status.
Wait time	Flow control wait time, in microseconds.
Cfg-Flow	Flow control status (**Pause** or **Go**).
Cfg-Cross	The user-configured cross-over setting (**Auto**, **MDI**, or **MDIX**).

Release History

Release 6.1; command was introduced.
Release 6.3.2; command deprecated on the OmniSwitch 6855.
Release 6.4.3; command deprecated on OmniSwitch 6400.

show interfaces e2e-flow-vlan

Displays the end-to-end (E2E) flow control VLAN configuration for the switch.

show interfaces e2e-flow-vlan

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E

Usage Guidelines

- This command is available only on standalone 48-port OmniSwitch 6400 and 6850E switches.
- There is only one dedicated E2E flow control VLAN configured per switch.

Examples

```
-> show interfaces e2e-flow-vlan
Configured End-To-End Flow Vlan - 10
```

Release History

Release 6.3.4; command was introduced.

Related Commands

interfaces e2e-flow-vlan	Configures a dedicated VLAN for carrying end-to-end (E2E) flow control messages to remote systems.
show interfaces pause	Displays the flow control pause configuration for the specified interface(s).

MIB Objects

```
esmE2EFlowVlan
```

show interfaces accounting

Displays interface accounting information (for example, packets received/transmitted and deferred frames received).

show interfaces [*slot* | *slot*/*port***[-***port2***]] accounting**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

By default, accounting information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Examples

```
-> show interfaces 1/2 accounting
1/2 ,
     Rx undersize packets         =                    0,
     Tx undersize packets         =                    0,
     Rx oversize packets          =                    0,
     Tx oversize packets          =                    0,
     Rx packets 64 Octets         =              3073753,
     Rx packets 65To127 Octets    =               678698,
     Rx packets 128To255 Octets   =                21616,
     Rx packets 256To511 Octets   =                21062,
     Rx packets 512To1023 Octets  =                    2,
     Rx packets 1024To1518 Octets =                   84,
     Rx packets 1519to4095 Octets =                    0,
     Rx packets 4096ToMax Octets  =                    0,
     Rx Jabber frames             =                    0
```

output definitions

Rx undersize packets	Number of undersized packets received.
Tx undersize packets	Number of undersized packets transmitted.
Rx oversize packets	Number of oversized packets received.
Tx oversize packets	Number of oversized packets transmitted.

output definitions (continued)

Rx packets Octets	Number of packets received in each listed octet range.
Rx Jabber frames	Number of jabber packets received (longer than 1518 octets).
Tx deferred frames	Number of packets for which transmission was delayed (Ethernet only).

Release History

Release 6.1; command was introduced.

Related Commands

show interfaces	Displays general interface information (for example, hardware, MAC address, and input/output errors).
show interfaces counters	Displays interface counter information (for example, unicast packets received/transmitted).

```

show interfaces counters

Displays interface counters information (for example, unicast, broadcast, and multi-cast packets received/ transmitted).

show interfaces [*slot* | *slot*/*port***[-***port2***]] counters**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

By default, information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.
- These counters do not apply to Gigabit Ethernet traffic.
- This command also displays sampling interval statistics that show an average traffic rate per second for active switch interfaces. These statistics are taken every 5 seconds. The actual statistics shown are those taken from the last completed 5-second time interval.
- Note that the sampling interval time period is set to five seconds and is not a configurable value at this time. In addition, the sampling interval is a global value that applies to all switch ports.

Examples

```
-> show interfaces 3/1 counters

InOctets      = 54367578586897979,  OutOctets     = 5.78E19,
InUcastPkts   = 55654265276,        OutUcastPkts  = 5.78E20,
InMcastPkts   = 58767867868768777,  OutMcastPkts  = 5465758756856,
InBcastPkts   = 576567567567567576, OutBcastPkts  = 786876,
InPauseFrames = 567798768768767,    OutPauseFrames= 786876,
Sampling Interval 5 second
  InPkts / s    =                  11,   OutPkts / s    =                 11,
  Inbits / s    =              111111,   Outbits / s    =             111111,
```

output definitions

InOctets	Number of octets received.
OutOctets	Number of octets transmitted.
InUcastPkts	Number of unicast packets received.
OutUcastPkts	Number of unicast packets transmitted.
InMcastPkts	Number of multicast packets received.
OutMcastPkts	Number of unicast packets transmitted.
InBcastPkts	Number of broadcast packets received.
OutBcastPkts	Number of unicast packets transmitted.
InPauseFrames	Number of MAC control frames received.
OutPauseFrames	Number of MAC control frames transmitted.
Sampling Interval	The sampling interval used to determine the average rate per second.
InPkts / s	The average number of packets received per second.
OutPkts / s	The average number of packets transmitted per second.
Inbits / s	The average number of bits received per second.
Outbits / s	The average number of bits transmitted per second.

Release History

Release 6.1; command was introduced.
Release 6.3.4; **Sampling Interval** fields (**InPkts**, **OutPkts**, **Inbits**, **Outbits**) were added.

Related Commands

show interfaces counters errors	Displays interface error frame information (for example, CRC errors, transit errors, and receive errors).

show interfaces counters errors

Displays interface error frame information (for example, CRC errors, transit errors, and receive errors).

show interfaces [*slot* | *slot*/*port***[-***port2***]] counters errors**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

By default, information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.
- These counters do not apply to Gigabit Ethernet traffic.

Examples

```
-> show interfaces 2/1 counters errors

02/01,
  Alignments Errors = 6.45E13,  FCS Errors = 7.65E12
  IfInErrors        = 6435346,  IfOutErrors= 5543,
  Undersize pkts    = 867568, Oversize pkts= 5.98E8
```

output definitions

Slot/Port	Interface slot and port number.
Alignments Errors	Number of Alignments errors.
FCS Errors	Number of Frame Check Sequence errors.
IfInErrors	Number of received error frames.
IfOutErrors	Number of transmitted error frames.
Undersize pkts	Number of undersized packets.
Oversize pkts	Number of oversized packets (more than 1518 octets).

Release History

Release 6.1; command was introduced.

   dot3StatsFrameTooLong
```

show interfaces collisions

Displays interface collision information (for example, number of collisions and number of retries).

show interfaces [*slot* | *slot*/*port***[-***port2***]] collisions**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

By default, information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.
- These counters do not apply to Gigabit Ethernet traffic.

Examples

```
-> show interfaces 2/1 collisions

02/01,
  Rx Collisions = 6.56E18,  Rx Single Collision = 345464364,
  Rx Multiple Collisions = 6325235326,  Rx Excessive Collisions = 5.65E19
```

output definitions

Slot/Port	Interface slot and port number.
Tx Collisions	Number of transmit collisions.
Tx Single Collision	Number of successfully transmitted frames for which transmission was inhibited by one collision.
Tx Multiple Collisions	Number of successfully transmitted frames for which transmission was inhibited by multiple collisions.
Tx Excessive Retries	Number of frames for which transmission fails due to excessive collisions.
Rx Collisions	Number of receive collisions.
Rx Single Collision	Number of successfully received frames for which reception was inhibited by one collision.

output definitions (continued)

Rx Multiple Collisions	Number of successfully received frames for which reception was inhibited by multiple collisions.
Rx Excessive Retries	Number of frames for which reception fails due to excessive collisions.

Release History

Release 6.1; command was introduced.

Related Commands

show interfaces	Displays general interface information (for example, hardware, MAC address, input errors, and output errors).

   dot3StatsExcessiveCollisions
```

show interfaces status

Displays interface line settings (for example, speed and mode).

show interfaces [*slot* | *slot*/*port***[-***port2***]] status**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

By default, line settings are displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Examples

The following is an example for a non combo port:

```
-> show interfaces 1/2 status
                       DETECTED           CONFIGURED
Slot/ AutoNego  Speed Duplex Hybrid  Speed   Duplex Hybrid  Trap
Port           (Mbps)         Type   (Mbps)         Mode   LinkUpDown
-----+--------+------+------+------+--------+------+------+------
 1/2   Enable   1000   Full    NA      Auto   Auto    NA      -
```

The following is an example for a combo port:

```
-> show interfaces 1/47 status
                       DETECTED           CONFIGURED
Slot/ AutoNego  Speed Duplex Hybrid  Speed   Duplex Hybrid  Trap
Port           (Mbps)         Type   (Mbps)         Mode   LinkUpDown
-----+--------+------+------+------+--------+------+------+------
 1/47  Enable    -      -      -        1000  Full    PF      -
 1/47  Enable    -      -      -       Auto   Auto    PF      -

FF - ForcedFiber PF - PreferredFiber  F - Fiber
FC - ForcedCopper PC - PreferredCopper C - Copper
```

output definitions

Slot/Port	Interface slot/port number.
AutoNego	Autonegotiation status (Enable/Disable).
Detected Speed	Detected line speed (10/100/Auto/1000/10000 Mbps).
Detected Duplex	Detected line duplex (Half duplex/Full duplex/Auto).
Detected Hybrid Type	The detected combo port type, which can be **F** (fiber) or **C** (copper). (This field is only relevant for OmniSwitch 6800 Series switches.)
Configured Speed	Configured line speed (10/100/Auto/1000/10000 Mbps).
Configured Duplex	Configured line duplex (Half duplex/Full duplex/Auto).
Configured Hybrid Type	The configured combo port type, which can be **FF** (Forced Fiber), **PF** (Preferred Fiber), **FC** (Forced Copper), or **PC** (Preferred Copper).
Trap Link Up/Down	Trap Link status (up/down).

Release History

Release 6.1; command was introduced.

Related Commands

trap port link	Enables/disables Trap LinkUpDown.
interfaces speed	Configures interface line speed, sets speed, and duplex mode to auto-sensing.
interfaces duplex	Configures interface duplex mode.
interfaces hybrid preferred-fiber	Configures one or more combo ports to use the fiber SFP port(s) instead of the equivalent copper 10/100/1000 RJ-45 port(s) when both ports are enabled and have a valid link.
interfaces hybrid autoneg	Configures one or more combo ports to use the copper 10/100/1000 RJ-45 port(s) instead of the fiber SFP port(s) when both ports are enabled and have a valid link.

show interfaces port

Displays the administrative status, link status, violations, recovery time, maximum recovery attempts and the value of the wait-to-restore timer for the specified port or ports.

show interfaces [*slot* | *slot*/*port***[-***port2***]] port**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

By default, information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.
- On a combo port with SFP fiber ports, the status of the SFP ports will be displayed. See the **show interfaces hybrid port** command for more information.
- The hash symbol (#) is displayed before the wait-to-restore value if the link state is WAIT (i.e., the wait-to-restore timer is running.

Examples

```
-> show interfaces 1/1 port
Legends: WTR - Wait To Restore
         #   - WTR Timer is Running & Port is in wait-to-restore state
         *   - Permanent Shutdown
Slot/    Admin     Link    Violations  Recovery   Recovery      WTR      Alias
Port     Status   Status                 Time       Max        (sec)
------+----------+---------+----------+----------+----------+----------+--------
1/1     enable      down      none       300         1           0         ""
```

```
-> show interfaces 1 port
Legends: WTR - Wait To Restore
         #   - WTR Timer is Running & Port is in wait-to-restore state
         *   - Permanent Shutdown

Slot/    Admin     Link    Violations  Recovery   Recovery      WTR      Alias
Port     Status   Status                 Time       Max        (sec)

  .
  1/26   enable    down      none          0          0          0        ""
```

output definitions

Slot/Port	Interface slot and port number. An asterisk (*) with slot/port indicates that the port is permanently shutdown.
Admin Status	Port status - **enable**, **disable**. Configured through the **interfaces admin** command.
Link Status	Operational status - **up**, **down**.
Violations	Applications that have blocked the port due to a specific violation.
Recovery Time	The recovery time for the port. Configured through the **interfaces violation-recovery-time** command.
Recovery Max	The maximum recovery attempts for the port Configured through the **interfaces violation-recovery-maximum** command.
WTR (sec)	The wait-to-restore timer value, in seconds, for the port. The value of 0 indicates the timer is disabled. Configured through the **interfaces wait-to-restore** command.
Alias	Interface alias. Configured through the **interfaces alias** command.

Release History

Release 6.1; command was introduced.
Release 6.3.1; **Violations** field was added.
Release 6.4.4; **Recovery Time, Recovery Max, WTR (sec)** fields were added.

Related Commands

show interfaces hybrid port	Displays interface port status (up or down) for combo ports.
show interfaces violation-recovery	Displays the globally configured recovery time, SNMP recovery trap enable/disable status and maximum recovery attempts.

MIB Objects

show interfaces violation-recovery

Displays the globally configured recovery time, SNMP recovery trap enable/disable status and maximum recovery attempts.

show interfaces violation-recovery

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

```
-> show interfaces violation-recovery
UserPorts Shutdown Recovery Time: 200
UserPorts Shutdown Recovery Trap: Enable
UserPorts Shutdown Maximum Recovery: 2
```

output definitions

UserPorts Shutdown Recovery Time	The recovery time configured for the port.
UserPorts Shutdown Recovery Trap	SNMP recovery trap status - **enable**, **disable**.
UserPorts Shutdown Maximum Recovery	The maximum recovery attempts configured for the port before a port is permanently shut down.

Release History

Release 6.4.4; command was introduced.

Related Commands

interfaces violation-recovery-time	Configures the time interval after which the port is automatically re-activated if the port was shut down for any violation.
interfaces violation-recovery-maximum	Configures the maximum number of recovery attempts before a port is permanently shut down.
show interfaces port	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects

show interfaces ifg

Displays interface inter-frame gap values.

show interfaces [*slot* | *slot*/*port***[-***port2***]] ifg**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

By default, information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to display information for all interfaces on that slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Examples

```
-> show interfaces ifg

 Slot/Port   ifg(Bytes)
-----------+-------------
 02/01          12

   esmPortCfgIFG
```

show interfaces flood rate

Displays interface peak flood rate settings.

show interfaces [*slot* | *slot/port* **[-***port2***]] flood rate**

Syntax Definitions

slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

By default, information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Examples

```
-> show interfaces flood rate

Slot/    Bcast      Bcast  Bcast     Ucast    Ucast  Ucast      Mcast  Mcast  Mcast

```

output definitions

Slot/Port	Interface slot and port numbers.
Bcast Value	The broadcast storm value based on the type.
Bcast Type	The type of broadcast (**mbps**, **pps**, **percentage**).

output definitions (continued)

Bcast Status	The status of brodcast, **enable** or **disable**.
Ucast Value	The unknown-unicast storm value based on the type.
Ucast Type	The type of unknown-unicast (**mbps**, **pps**, **percentage**)
Ucast Status	The status of unicast, **enable** or **disable**.
Mcast Value	The multicast storm value based on the type.
Mcast Type	The type of multicast (**mbps**, **pps**, **percentage**)
Mcast Status	The status of multicast, **enable** or **disable**.

Release History

Release 6.1; command was introduced.

Related Commands

interfaces flood	Enables traffic storm control on the specified interface.
interfaces flood rate	Configures the peak flood rate for an interface.

show interfaces traffic

Displays interface traffic statistics.

show interfaces [*slot* | *slot*/*port***[-***port2***]] traffic**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

By default, information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Examples

```
-> show interfaces traffic

Slot/Port   Input packets     Input bytes   Output packets    Output bytes
---------+----------------+-------------+----------------+----------------

01/24         4222877       326616952         46792         742062003/01
```

output definitions

Slot/Port	Interface slot and port numbers.
Input packets	Input packets detected.
Input bytes	Input bytes detected.
Output packets	Output packets detected.
Output bytes	Output bytes detected.

Release History

Release 6.1; command was introduced.

Related Commands

show interfaces	Displays general interface information (for example, hardware, MAC address, and input/output errors).
show interfaces counters	Displays interface counter information (for example, unicast packets received/transmitted).

show interfaces transceiver

Displays the DDM information for the specified transceivers.

show interfaces [*slot* | *slot*/*port***[-***port2***]] transceiver [ddm | w-low | w-high | a-low | a-high | actual]**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
ddm	Displays the administrative and trap status of the DDM feature.
w-low	Displays the Warning Low threshold for temperature, voltage, current, RX power and TX power.
w-high	Displays the Warning High threshold for temperature, voltage, current RX power and TX power.
a-low	Displays the Alarm Low threshold for temperature, voltage, current RX power and TX power.
a-high	Displays the Alarm High threshold for temperature, voltage, current RX power and TX power.
actual	Displays the Actual values for temperature, voltage, current RX power and TX power.

Defaults

By default, information is displayed for all ports on all modules and for all DDM parameter options.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Transceiver DDM capability will vary based on the transceiver manufacturer.
- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.
- The transceiver DDM must be enabled with **interfaces transceiver ddm enable** command before using this command.

Examples

```
-> show interfaces transceiver w-low
Slot/Port Temp C Voltage(V) Current(mA) Output(dBm) Input(dBm)
---------+------+----------+-----------+----------+---------+
1/1         48      5.15         50        2.50      2.50
1/2         47      5.35         49        2.43      2.43
1/3         NA       NA          NA          NA        NA

-> show interfaces transceiver a-high

Slot/Port Temp C Voltage(V) Current(mA) Output(dBm) Input(dBm)
---------+------+----------+-----------+----------+---------+
1/1         50      5.75        75         3.22       3.22
1/2         50      5.95        65         3.22       3.22
1/3         NA       NA          NA          NA        NA

-> show interfaces 1/1 transceiver

Threshold    Temp C Voltage(V) Current(mA) Output(dBm) Input(dBm)
------------+------+----------+-----------+----------+---------+
Actual         50    1.95(WL)     75         4.92(AH)   3.22
Alarm High     120    5.75       100         4.91       4.91
Warning High   90     3.00        90         4.77       4.77
Warning Low    10     2.00        60         0.00       0.00
Alarm Low      -5     1.75        20        -3.01      -10

-> show interfaces transceiver ddm
DDM Status      : enable
DDM Trap Status : disable
```

output definitions

Slot/Port	Interface slot and port numbers.
Temp C	The transceiver temperature, in degrees centigrade.
Voltage (V)	The transceiver supply voltage, in volts.
Current (mA)	The transceiver transmit bias current, in milliamps.
Output (dBm)	The transceiver output power, in decibels.
Input (dBm)	The transceiver received optical power, in decibels.
DDM Status	The administrative status of DDM.
DDM Trap Status	The administrative status of DDM traps.
Actual	The real-time values indicated by the transceiver. Values displayed in parentheses indicate the Warning or Alarm value that has been reached.
Alarm High (AH)	Indicates the value at which the transceiver's functionality may be affected.
Warning High (WH)	Indicates the transceiver is approaching the High Alarm value.
Warning Low (WL)	Indicates the transceiver is approaching the Low Alarm value.
Alarm Low (AL)	Indicates the value at which the transceiver's functionality may be affected.
N/A	Indicates the transceiver does support DDM.

Release History

Release 6.4.2; command was introduced.

Related Commands

interfaces transceiver ddm	Configures the DDM administrative status or trap capability.

show interfaces hybrid

Displays general interface information (for example, hardware, MAC address, input errors, output errors) for combo ports.

show interfaces [*slot* **|** *slot*/*port***[-***port2***]] hybrid {fiber | copper}**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
fiber	Specifies that the status of the SFP port(s) will be displayed.
copper	Specifies that the status of the copper 10/100/1000 RJ-45 port(s) will be displayed.

Defaults

By default, information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6855, 6850E

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Examples

```
   -> show interfaces 1/24 hybrid copper

```

output definitions

Slot/Port	Interface slot and port.
Operational Status	Interface status (up/down).
Last Time Link Changed	The last time the configuration for this interface was changed.
Number of Status Change	The total number of times that the configuration of this interface has changed.
Type	Interface type (Ethernet/Fast Ethernet/Gigabit Ethernet).
MAC address	Interface MAC address.
Bandwidth	Bandwidth (in megabits).
Duplex	Duplex mode (Half/Full/Auto).
Autonegotiation	The auto negotiation settings for this interface.
Long Accept	Long Frames status (enable/disable).
Runt Accept	Runt Frames status (enable/disable).
Long Frame Size	Long Frame Size (in Bytes).

output definitions (continued)

Runt Size	Runt Frame Size (in Bytes).
Bytes Received	Number of Bytes received.
Rx Unicast Frames	Number of unicast frames received.
Rx Broadcast Frames	Number of broadcast frames received.
Rx M-cast Frames	Number of multicast frames received.
Rx Undersize Frames	Number of undersized frames received.
Rx Oversize Frames	Number of r oversized frames received.
Rx Lost Frames	Number of Lost Frames received.
Rx Error Frames	Number of error frames received.
Rx CRC Error Frames	Number of CRC error frames received.
Rx Alignments Err	Number of Alignments Error frames received.
Bytes Xmitted	Number of Bytes transmitted.
Tx Unicast Frames	Number of unicast frames transmitted.
Tx Broadcast Frames	Number of broadcast frames transmitted.
Tx M-cast Frames	Number of multicast frames r transmitted.
Tx Undersize Frames	Number of undersized frames transmitted.
Tx Oversize Frames	Number of oversized frames transmitted.
Tx Lost Frames	Number of Lost Frames transmitted.
Tx Collided Frames	Number of collision frames received or transmitted.
Tx Error Frames	Number of error frames transmitted.

Release History

Release 6.1; command was introduced.

Related Commands

show interfaces hybrid accounting	Displays interface accounting information (for example, packets received/transmitted) for combo ports.
show interfaces hybrid counters	Displays interface counter information (for example, unicast packets received/transmitted) for combo ports.
show interfaces hybrid counters errors	Displays interface error frame information (for example, CRC errors, transit errors, receive errors) for combo ports.
show interfaces hybrid collisions	Displays interface collision information (for example, number of collisions, number of retries) for combo ports.
show interfaces hybrid status	Displays the interface line settings (for example, speed, mode) for combo ports.
show interfaces hybrid traffic	Displays interface traffic statistics (input/output bytes and packets) for combo ports.

show interfaces hybrid status

Displays interface line settings (for example, speed, mode) for combo ports only.

show interfaces [*slot* | *slot*/*port***[-***port2***]] hybrid {fiber | copper} status**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
fiber	Specifies that the status of the SFP port(s) will be displayed.
copper	Specifies that the status of the copper 10/100/1000 RJ-45 port(s) will be displayed.

Defaults

By default, information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6855, 6850E

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Examples

```
-> show interfaces hybrid fiber status

```

output definitions

Slot/Port	Interface slot/port number.
AutoNego	Autonegotiation status (Enable/Disable).
Detected Speed	Detected line speed (10/100/Auto/1000/10000 Mbps).
Detected Duplex	Detected line duplex (Half duplex/Full duplex/Auto).
Detected Hybrid Type	The detected combo port type, which can be **F** (fiber) or **C** (copper).
Configured Speed	Configured line speed (10/100/Auto/1000/10000 Mbps).
Configured Duplex	Configured line duplex (Half duplex/Full duplex/Auto).
Configured Hybrid Type	The configured combo port type, which can be **FF** (Forced Fiber), **PF** (Preferred Fiber), **FC** (Forced Copper), or **PC** (Preferred Copper).
Trap Link Up/Down	Trap Link status (up/down).

Release History

Release 6.1; command was introduced.

Related Commands

trap port link	Enables/disables Trap LinkUpDown.
interfaces hybrid speed	Configures interface line speed on combo ports.
interfaces hybrid duplex	Configures duplex mode on combo ports.
interfaces hybrid preferred-fiber	Configures one or more combo ports to use the fiber SFP port(s) instead of the equivalent copper 10/100/1000 RJ-45 port(s) when both ports are enabled and have a valid link.
interfaces hybrid autoneg	Configures one or more combo ports to use the copper 10/100/1000 RJ-45 port(s) instead of the fiber SFP port(s) when both ports are enabled and have a valid link.

show interfaces hybrid pause

Displays the flow control pause configuration for combo ports.

show interfaces [*slot* | *slot*/*port***[-***port2***]] hybrid {fiber |copper} pause**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
fiber	Specifies that the configuration of the SFP port(s) will be displayed.
copper	Specifies that the configuration of the copper 10/100/1000 RJ-45 port(s) will be displayed.

Defaults

By default, information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855

Usage Guidelines

- Refer to the *Hardware Users Guide* for combo port numbering.
- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Examples

```
-> show interfaces hybrid fiber pause
 Slot/Port   Active  Wait time(usec) Cfg-Pause  Cfg-Cross Hybrid Type
-----------+--------+---------------+---------+-----------+-----------
    1/21        -               0       DIS         MDI         -
    1/22        -               0       DIS         MDI         -

    1/23        -               0       DIS        Auto         -
    1/24     Active         65535     Tx-N-Rx      Auto         C
```

output definitions

Slot/Port	Interface slot and port number
Active	Interface status.
Wait time	The amount of time, in microseconds, the neighbor interface will wait after receiving a PAUSE frame from the local interface.
Cfg-Pause	The flow control setting (**Tx** = transmit, **Rx** = receive, **Tx-N-Rx** = transmit and receive). Configured through the **interfaces hybrid pause** command.
Cfg-Cross	The user-configured cross-over setting (**Auto**, **MDI**, or **MDIX**). Configured through the **interfaces hybrid crossover** command.
Hybrid Type	The configured active media type for the hybrid port (**F** = fiber, **C** = copper, **NA** = not applicable).

Release History

Release 6.3.2; command was introduced.

Related Commands

show interfaces pause	Displays the interface flow control pause settings.

show interfaces hybrid capability

Displays default auto negotiation, speed, duplex, flow, and cross-over settings for a single combo port, a range of combo ports, or all combo ports on a switch.

show interfaces [*slot* | *slot*/*port***[-***port2***]] hybrid {fiber |copper} capability**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
fiber	Specifies that the configuration of the SFP port(s) will be displayed.
copper	Specifies that the configuration of the copper 10/100/1000 RJ-45 port(s) will be displayed.

Defaults

By default, displays information for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855

Usage Guidelines

- This command displays defaults settings in two rows of data for each combo port. The first row of data, identified by the label **CAP**, displays the valid user-defined configuration settings available for the combo port. The second row, identified by the label **DEF**, displays the default settings for the combo port.
- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Examples

```
-> show interfaces hybrid copper capability
   Slot/Port   AutoNeg     Flow   Crossover      Speed    Duplex
-----------+---------+--------+-----------+----------+----------
  1/21 CAP     EN/DIS   EN/DIS  MDI/X/Auto  10/100/1G  Full/Half
  1/21 DEF         EN      DIS        Auto       Auto       Auto
  1/22 CAP     EN/DIS   EN/DIS  MDI/X/Auto  10/100/1G  Full/Half
  1/22 DEF         EN      DIS        Auto       Auto       Auto
  1/23 CAP     EN/DIS   EN/DIS  MDI/X/Auto  10/100/1G  Full/Half
  1/23 DEF         EN      DIS        Auto       Auto       Auto
  1/24 CAP     EN/DIS   EN/DIS  MDI/X/Auto  10/100/1G  Full/Half
  1/24 DEF         EN      DIS        Auto       Auto       Auto
```

```
-> show interfaces 1/24 hybrid copper capability

   Slot/Port   AutoNeg     Flow   Crossover      Speed    Duplex
-----------+---------+--------+-----------+----------+----------
  1/24 CAP     EN/DIS   EN/DIS  MDI/X/Auto  10/100/1G  Full/Half
  1/24 DEF         EN       EN        Auto       Auto       Auto
```

output definitions

Slot	The slot number.
Port	The port number
AutoNeg	In the row labeled **CAP** this field displays the valid auto negotiation configurations for the port. In the row label **DEF** this field displays the default auto negotiation settings for the port. The possible values are **EN** (enabled) or **DIS** (disabled).
Flow	In the row labeled **CAP** this field displays the valid flow configurations for the port. In the row label **DEF** this field displays the default flow settings for the port. The possible values are **EN** (enabled) or **DIS** (disabled).
Crossover	In the row labeled **CAP** this field displays the valid cross over configurations for the port. In the row label **DEF** this field displays the default cross over settings for the port. The possible values are **Auto**, **MDI/X/Auto** (MDI/MDIX/Auto), or **--** (not configurable and/or not applicable).
Speed	In the row labeled **CAP** this field displays the valid line speed configurations for the port. In the row label **DEF** this field displays the default line speed settings for the port. The possible values are **10/100**, **100**, **1G**, **10/100/1G**, or **Auto**.
Duplex	In the row labeled **CAP** this field displays the valid duplex configurations for the port. In the row label **DEF** this field displays the default duplex settings for the port. The possible values are **Full**, **Full/Half**, or **Auto**.

Release History

Release 6.1; command was introduced.

Related Commands

interfaces hybrid autoneg	Enables and disables auto negotiation for combo ports.
interfaces hybrid crossover	Configures crossover port settings for combo ports.
interfaces hybrid speed	Configures interface speed for combo ports.
interfaces hybrid duplex	Configures duplex settings for combo ports.
show interfaces hybrid status	Displays interface line settings for combo ports.

show interfaces hybrid accounting

Displays interface accounting information (for example, packets received/transmitted, deferred frames received) for combo ports.

show interfaces [*slot* | *slot*/*port***[-***port2***]] hybrid {fiber |copper} accounting**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
fiber	Specifies that statistics for the SFP port(s) will be displayed.
copper	Specifies that statistics for the copper 10/100/1000 RJ-45 port(s) will be displayed.

Defaults

By default information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or range of interfaces.

Examples

```
-> show interfaces hybrid copper accounting
 1/24: --------------------- RX --------------------------------- TX ---------
     Undersize    =                    0,  Undersize    =                    0,
     Oversize     =                    0,  Oversize     =                    0,
     Jabber       =                    0,
     : ------------------ RX / TX -----------------------------------------
         64 Octets=               3073380,
  65 ~  127 Octets=                989343,
 128 ~  255 Octets=                103655,
 256 ~  511 Octets=                100026,
 512 ~ 1023 Octets=                  8946,
1024 ~ 1518 Octets=                     0,
1519 ~ 4095 Octets=                     0,
4096 ~  MAX Octets=                     0
```

output definitions

Rx undersize packets	Number of undersized packets received.
Tx undersize packets	Number of undersized packets transmitted.
Rx oversize packets	Number of oversized packets received.
Tx oversize packets	Number of oversized packets transmitted.
Rx packets Octets	Number of packets received in each listed octet range.
Rx Jabber frames	Number of jabber packets received (longer than 1518 octets).
Tx deferred frames	Number of packets for which transmission was delayed (Ethernet only).

Release History

Release 6.1; command was introduced.

Related Commands

show interfaces hybrid counters

Displays interface counters information (for example, unicast, broadcast, multi-cast packets received/transmitted) for combo ports.

show interfaces [*slot* | *slot*/*port***[-***port2***]] hybrid {fiber |copper} counters**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
fiber	Specifies that statistics for the SFP port(s) will be displayed.
copper	Specifies that statistics for the copper 10/100/1000 RJ-45 port(s) will be displayed.

Defaults

By default, information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or range of interfaces.
- These counters do not apply to Gigabit Ethernet traffic.

Examples

```
-> show interfaces 1/24 hybrid copper counters

 1/24,
  InOctets      =            327192315,  OutOctets      =              7457698,

  InMcastPkts   =              1085360,  OutMcastPkts   =                24350,
  InBcastPkts   =              3112659,  OutBcastPkts   =                 5592,
  InPauseFrames =                    0,  OutPauseFrames =                    0,
  Sampling Interval 5 seconds
  InPkts/s      =                    6,  OutPkts/s      =                    2,
  InBits/s      =                 3104,  OutBits/s      =                  608
```

output definitions

InOctets	Number of octets received.
OutOctets	Number of octets transmitted.

output definitions (continued)

InUcastPkts	Number of unicast packets received.
OutUcastPkts	Number of unicast packets transmitted.
InMcastPkts	Number of multicast packets received.
OutMcastPkts	Number of unicast packets transmitted.
InBcastPkts	Number of broadcast packets received.
OutBcastPkts	Number of unicast packets transmitted.
InPauseFrames	Number of MAC control frames received.
OutPauseFrames	Number of MAC control frames transmitted.
Sampling Interval	Packet sampling interval in seconds
InPkts	Total number of packets incoming
OutPkts	Total number of packets outgoing
InBits	Total number of bits incoming
OutBits	Total number of bits outgoing

show interfaces hybrid counters errors

Displays interface error frame information (for example, CRC errors, transit errors, receive errors) for combo ports.

show interfaces [*slot* | *slot*/*port***[-***port2***]] hybrid {fiber |copper} counters errors**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
fiber	Specifies that statistics for the SFP port(s) will be displayed.
copper	Specifies that statistics for the copper 10/100/1000 RJ-45 port(s) will be displayed.

Defaults

By default, information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or range of interfaces.
- These counters do not apply to Gigabit Ethernet traffic.

Examples

```
-> show interfaces 1/47 hybrid copper counters errors

01/47,
  Alignments Errors = 6.45E13,  FCS Errors = 7.65E12
  IfInErrors        = 6435346,  IfOutErrors= 5543,
  Undersize pkts    = 867568, Oversize pkts= 5.98E8
```

output definitions

Slot/Port	Interface slot and port number.
Alignments Errors	Number of Alignments errors.
FCS Errors	Number of Frame Check Sequence errors.
IfInErrors	Number of received error frames.
IfOutErrors	Number of transmitted error frames.

output definitions (continued)

Undersize pkts	Number of undersized packets.
Oversize pkts	Number of oversized packets (more than 1518 octets).

Release History

show interfaces hybrid collisions

Displays interface collision information (for example, number of collisions, number of retries) for combo ports.

show interfaces [*slot* | *slot*/*port***[-***port2***]] hybrid {fiber |copper} collisions**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
fiber	Specifies that statistics for the SFP port(s) will be displayed.
copper	Specifies that statistics for the copper 10/100/1000 RJ-45 port(s) will be displayed.

Defaults

By default, information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or range of interfaces.
- These counters do not apply to Gigabit Ethernet traffic.

Examples

```
-> show interfaces hybrid copper collisions
 1/24,
  Tx Collisions          =                   0,  Tx Single Collision      =  0,
  Tx Multiple Collisions =                   0,  Tx Excessive Collisions  =  0,
  Rx Collisions          =                   0
```

For recieve enabled ports

```
-> show interfaces 1/47 hybrid copper collisions

02/01,
  Rx Collisions = 6.56E18,  Rx Single Collision = 345464364,
  Rx Multiple Collisions = 6325235326,  Rx Excessive Collisions = 5.65E19
```

output definitions

Slot/Port	Interface slot and port number.
Tx Collisions	Number of transmit collisions.
Tx Single Collision	Number of successfully transmitted frames for which transmission was inhibited by one collision.
Tx Multiple Collisions	Number of successfully transmitted frames for which transmission was inhibited by multiple collisions.
Tx Excessive Retries	Number of frames for which transmission fails due to excessive collisions.
Rx Collisions	Number of receive collisions.
Rx Single Collision	Number of successfully received frames for which reception was inhibited by one collision.
Rx Multiple Collisions	Number of successfully received frames for which reception was inhibited by multiple collisions.
Rx Excessive Retries	Number of frames for which reception fails due to excessive collisions.

Release History

Release 6.1; command was introduced.

Related Commands

show interfaces hybrid traffic

Displays interface traffic statistics for combo ports.

show interfaces [*slot* | *slot*/*port***[-***port2***]] hybrid {fiber |copper} traffic**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
fiber	Specifies that statistics for the SFP port(s) will be displayed.
copper	Specifies that statistics for the copper 10/100/1000 RJ-45 port(s) will be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or range of interfaces.

Examples

```
-> show interfaces hybrid fiber traffic

Slot/Port   Input packets     Input bytes      Output packets    Output bytes
---------+-----------------+-----------------+-----------------+----------------

01/45                  0                         0                 0
01/46                  0                         0                0
01/47                  0                         0                0
01/48                  0                         0                 0
```

output definitions

Slot/Port	Interface slot and port numbers.
Input packets	Input packets detected.
Input bytes	Input bytes detected.
Output packets	Output packets detected.
Output bytes	Output bytes detected.

Release History

Release 6.1; command was introduced.

Related Commands

show interfaces hybrid	Displays general interface information (for example, hardware, MAC address, input/output errors) for combo ports.
show interfaces hybrid counters	Displays interface counter information (for example, unicast packets received/transmitted) for combo ports.

show interfaces hybrid port

Displays interface port status (up or down) for combo ports.

show interfaces [*slot* | *slot*/*port***[-***port2***]] hybrid {fiber |copper} port**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
fiber	Specifies that the status of the SFP combo port(s) will be displayed.
copper	Specifies that the status of the copper combo 10/100/1000 RJ-45 port(s) will be displayed.

Defaults

By default, information is displayed for all hybrid ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855

Usage Guidelines

- Enter a slot number to display information for all hybrid interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific hybrid interface or a range of hybrid interfaces.

Examples

```
-> show interfaces hybrid fiber port
Legends: WTR - Wait To Restore
         #   - WTR Timer is Running & Port is in wait-to-restore state

1/24*  enable      down      none           300         10          0 ""
```

output definitions

Slot/Port	Interface slot and port number.
Admin Status	Port status - **enable**, **disable**. Configured through the **interfaces admin** command.
Link Status	Operational status - **up**, **down**.

output definitions (continued)

Violations	Applications that have blocked the port due to a specific violation.
Recovery Time	The recovery time for the port. Configured through the **interfaces violation-recovery-time** command.
Recovery Max	The maximum recovery attempts for the port Configured through the **interfaces violation-recovery-maximum** command.
WTR (sec)	The wait-to-restore timer value, in seconds, for the port. The value of 0 indicates the timer is disabled. Configured through the **interfaces wait-to-restore** command.
Alias	Interface alias. Configured through the **interfaces alias** command.

Release History

Release 6.1; command was introduced.
Release 6.4.4; **Recovery Time**, **Recovery Max**, **WTR (sec)** fields were added.

Related Commands

show interfaces port	Displays interface port status (up or down) for non-combo ports.
show interfaces violation-recovery	Displays the globally configured recovery time, SNMP recovery trap enable/disable status and maximum recovery attempts.

show interfaces hybrid flood rate

Displays interface peak flood rate settings for combo ports.

show interfaces [*slot* | *slot*/*port***[-***port2***]] hybrid {fiber |copper} flood rate**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
fiber	Specifies that the status of the SFP port(s) will be displayed.
copper	Specifies that the status of the copper 10/100/1000 RJ-45 port(s) will be displayed.

Defaults

By default, information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific port.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Examples

```
-> show interfaces hybrid copper flood rate

 Slot/  Bcast    Bcast   Bcast   Ucast    Ucast   Ucast    Mcast   Mcast   Mcast
 Port   Value     Type  Status   Value     Type  Status    Value    Type  Status

-----+----------+-----+-------+----------+-----+-------+----------+-----+-------
 1/21        496  mbps  enable        496  mbps  enable        496  mbps disable
 1/22        496  mbps  enable        496  mbps  enable        496  mbps disable

 1/24         49  mbps  enable         49  mbps  enable         49  mbps disable
```

output definitions

Slot/Port	Interface slot and port numbers.
Bcast Value	The broadcast storm value based on the type.
Bcast Type	The type of broadcast (**mbps**, **pps**, **percentage**).
Bcast Status	The status of brodcast, **enable** or **disable**.

output definitions (continued)

Ucast Value	The unknown-unicast storm value based on the type.
Ucast Type	The type of unknown-unicast (**mbps**, **pps**, **percentage**)
Ucast Status	The status of unicast, **enable** or **disable**.
Mcast Value	The multicast storm value based on the type.
Mcast Type	The type of multicast (**mbps**, **pps**, **percentage**)
Mcast Status	The status of multicast, **enable** or **disable**.

Release History

Release 6.1; command was introduced.

Related Commands

interfaces violation-recovery-trap	Configures the peak flood rate for an interface.
interfaces flood	Enables broadcast, multicast or unknown unicast traffic storm control on the specified interface.

MIB Objects

```
esmConfTable
   esmPortSlot

show interfaces hybrid ifg

Displays interface inter-frame gap values for combo ports.

show interfaces [*slot* | *slot/port***[-***port2***]] hybrid {fiber |copper} ifg**

Syntax Definitions

slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
fiber	Specifies that statistics for the SFP port(s) will be displayed.
copper	Specifies that statistics for the copper 10/100/1000 RJ-45 port(s) will be displayed.

Defaults

By default, information is displayed for all ports on all modules.

Platforms Supported

OmniSwitch 6400, 6850E, 6855

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific port.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Examples

```
-> show interfaces hybrid fiber ifg
 Slot/Port   ifg(Bytes)
-----------+-------------
  1/45          12
  1/46          12
  1/47          12
  1/48          12
  2/45          12
  2/46          12
  2/47          12
  2/48          12
```

output definitions

Slot/Port	Interface slot and port numbers.
ifg	Inter-frame gap value (Gigabit Ethernet interface).

Release History

Release 6.1; command was introduced.

Related Commands

interfaces ifg	Configures the inter-frame gap value.

MIB Objects

```
esmConfTable
   esmPortSlot
   esmPortIF
   esmPortCfgIFG
```

show interfaces link-monitoring config

Displays configuration information for the Link Monitoring feature. This includes the link monitoring status on a specific slot, port or a range of specified ports, time window, link flap threshold, and link error threshold.

show interfaces {*slot* | *slot/port***[-***port2***]} link-monitoring config**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific port.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Example

```
-> show interfaces 1 link-monitoring config

Slot/   Status   Time     Link-flap    Link-error
Port             Window   Threshold    Threshold
                 (sec)
------+--------+--------+------------+-----------
1/1    enabled     10        5           10
1/2    disabled    10        5           10
1/3    disabled   200        8           20
.
.
1/24   disabled   150        2           99

-> show interfaces 1/1-3 link-monitoring config

Slot/   Status   Time      Link-flap    Link-error
Port             Window    Threshold    Threshold
                 (sec)
------+--------+--------+------------+-------------
1/1    enabled     10         5            10
1/2    disabled    10         5            10
1/3    disabled   200         7            99
```

```
-> show interfaces 1/1 link-monitoring config

Slot/   Status    Time     Link-flap    Link-error
Port              Window   Threshold    Threshold
                  (sec)
------+--------+--------+------------+-------------
1/1    enabled     10          5           10

-> show interfaces 1/2 link-monitoring config

Slot/   Status    Time     Link-flap    Link-error
Port              Window   Threshold    Threshold
                  (sec)
------+--------+--------+------------+------------
1/2    disabled    10         5            10
```

Release History

output definitions

Slot/Port	Interface slot and port number.
Status	Link monitoring status (enable/disable).
Time Window	Time interval, in seconds, for which the link is monitored.
Link-flap threshold	Number of link flaps allowed on a specific slot, port, or a range of specified ports in the time interval before the port is shutdown.
Link-error threshold	Number of MAC errors allowed on a specific slot, port, or a range of specified ports in the time interval before the port is shutdown.

Release 6.4.4; command introduced.

Related Commands

show interfaces port	Displays information of the interface port status.
show interfaces link-monitoring statistics	Displays the Link Monitoring statistics.
interfaces link-monitoring admin-status	Enables or disables link monitoring.
interfaces link-monitoring time-window	Configures the monitoring of the time-window of the link.
interfaces link-monitoring link-flap-threshold	Configures the number of link flaps that are allowed before the port is shutdown.
interfaces link-monitoring link-error-threshold	Configures the number of MAC errors that are allowed before the port is shutdown.

MIB Objects

```
alaLinkMonStatsTable
   alaLinkMonStatus
   alaLinkMonTimeWindow
   alaLinkMonLinkFlapThreshold
   alaLinkMonLinkErrorThreshold
```

show interfaces link-monitoring statistics

Displays the Link Monitoring statistics for a specific slot, port, or a range of specified ports.

show interfaces {*slot* | *slot/port***[-***port2***]} link-monitoring statistics**

Syntax Definitions

slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific port.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Example

```
-> show interfaces 1 link-monitoring statistics
Slot/   State     Current  Current  Current   Current  Current  Total  Total
Port              Flap     Error    CRC       Lost     Align    Flap   Error
------+---------+--------+--------+--------+--------+--------+-------+-------+
1/1     shutdown    6       3         2         0         0       15      6
1/2     down        3       2         1         0         0       12      3
.
.
1/24     up         3       2         1          0        0       12      3

-> show interfaces 1/1-2 link-monitoring statistics
Slot/   State     Current  Current  Current   Current  Current  Total  Total
Port              Flap     Error    CRC       Lost     Align    Flap   Error
------+---------+--------+--------+--------+--------+--------+-------+-------+
1/1     shutdown    6       3         2         0         0       15      6
1/2     down        3       2         1         0         0       12      3

-> show interfaces 1/1 link-monitoring statistics
Slot/   State     Current  Current  Current   Current  Current  Total  Total
Port              Flap     Error    CRC       Lost     Align    Flap   Error
------+---------+--------+--------+--------+--------+--------+-------+-------+
1/1     shutdown    6       3         2         0         0       15      6
```

Release History

Release 6.4.4; command introduced.

Related Commands

show interfaces port	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces link-monitoring config	Displays configuration information of the Link Monitoring.
interfaces link-monitoring admin-status	Enables or disables link monitoring.
interfaces clear-link-monitoring-stats	Clears the Link Monitoring statistics.
interfaces link-monitoring link-error-threshold	Configures the number of MAC errors that are allowed before the port is shutdown.

MIB Objects

   alaLinkMonStatsCurrentLinkErrors
   alaLinkMonStatsTotalLinkFlaps
   alaLinkMonStatsTotalLinkErrors
```

debug interfaces set backpressure

Enables and disables fabric back pressure on a Network Interface (NI) or an entire chassis.

debug interfaces set [*slot*] backpressure {enable | disable}

Syntax Definitions

slot	The slot number to enable or disable fabric back pressure.
enable	Enables fabric backpressure.
disable	Disables fabric backpressure.

Defaults

By default, the fabric backpressure is disabled.

Platforms Supported

OmniSwitch 6400

Usage Guidelines

If the slot number is not specified, then the switch back pressure feature will be enabled or disabled on the entire chassis.

Examples

```
-> debug interfaces set backpressure enable
-> debug interfaces set backpressure disable
-> debug interfaces set 3 backpressure enable
-> debug interfaces set 3 backpressure disable
```

Release History

Release 6.1; command was introduced.

Related Commands

debug interfaces backpressure	Displays whether fabric back pressure is enabled or disabled on an NI or an entire chassis.

MIB Objects

N/A

debug interfaces backpressure

Displays whether fabric back pressure is enabled or disabled on a Network Interface (NI) or on the entire chassis.

debug interfaces [*slot*] backpressure

Syntax Definitions

slot	The slot number to display the fabric back pressure state.

Defaults

N/A

Platforms Supported

OmniSwitch 6400

Usage Guidelines

If the slot number is not specified, then the switch back pressure state is displayed for the entire chassis.

Examples

^

```
-> debug interfaces backpressure
 Slot   Backpressure
------+--------------
 1      disable
 2      disable
 3      enable
 4      enable
 5      disable
 6      disable
 7      disable
 8      enable

-> debug interfaces 3 backpressure
 Slot   Backpressure
------+--------------
 3      enable
```

output definitions

Slot	The slot number of the NI.
Backpressure	Displays if the switch fabric back pressure feature is enabled or disabled on this NI. (The default is disabled.)

Release History

Release 6.1; command was introduced.

Related Commands

debug interfaces backpressure	Enables and disables fabric back pressure on an NI or on the entire chassis.

MIB Objects

N/A

link-fault-propagation group

Configures a Link Fault Propagation (LFP) group to associate with source and destination ports.

link-fault-propagation group *group_id* **[admin-state {enable | disable}]**

no link-fault-propagation group {*group_id***[-***group_id2***]}**

Syntax Definitions

group_id	A group ID number. The valid range is 1–8.
*group_id***[-***group_id2***]**	A group ID number to remove. Use a hyphen to specify a range of existing group ID numbers (5-8). Specifying a range is only used to remove group IDs, not to create them.
enable	Enables LFP for the specified group.
disable	Disables LFP for the specified group.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a LFP group or a range of groups.
- Up to eight LFP groups per switch are allowed.
- Once a LFP group is created, assign source and destination ports to that group.

Example

```
-> link-fault-propagation group 1
-> no link-fault-propagation group 4
-> no link-fault-propagation group 4-7
```

Release History

Release 6.4.4; command introduced.

Related Commands

link-fault-propagation group source	Configures the source port assignments for the LFP group.
link-fault-propagation group destination	Configures the destination port assignments for the LFP group.
link-fault-propagation group wait-to-shutdown	Configures the amount of time LFP waits before shutting down the destination ports.
show link-fault-propagation group	Displays the LFP group configuration for the switch.

MIB Objects

```
alaLFPGroupTable
   alaLFPGroupId
   alaLFPGroupRowStatus
```

link-fault-propagation group source

Configures the source port assignments for a Link Fault Propagation (LFP) group.

link-fault-propagation group *group_id* **source {port** *slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]}**

no link-fault-propagation group *group_id* **source {port** *slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]}**

Syntax Definitions

group_id	An existing LFP group ID number. The valid range is 1–8.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports and/or a space to specify multiple port entries (3/1-10 4/1 4/5 5/10).
agg_i*d***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs and/or a space to specify multiple ID entries (1-5 10 12).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a source port association with the specified LFP group.
- Make sure the LFP group specified with this command already exists in the switch configuration.
- Configuring the source ports and destinations ports for the specified LFP group is allowed within the same command (see the examples on this command page).
- A group can have a maximum of 48 source ports and 48 destination ports.
- A maximum of 48 link aggregates is supported, regardless of the number of ports in each aggregate in a group.
- A port/linkagg added as a source/destination port for a particular group cannot be added as a destination/source port for this group or for any other group.
- If a port is recovered due to the Interface Recovery Timer, then the port will revert to the shutdown state if the error persists.

Example

```
-> link-fault-propagation group 1 source port 1/2
-> link-fault-propagation group 1 source port 1/2-5 2/3
-> link-fault-propagation group 1 source linkagg 1
-> link-fault-propagation group 1 source linkagg 1-3
-> link-fault-propagation group 1 source port 2/3 destination port 1/6
-> link-fault-propagation group 1 source port 3/1-5 destination linkagg 6
-> no link-fault-propagation group 1 destination port 1/10
```

Release History

Release 6.4.4; command introduced.

Related Commands

link-fault-propagation group	Configures an LFP group, including the administrative status.
link-fault-propagation group destination	Configures the destination port assignments for the LFP group.
link-fault-propagation group wait-to-shutdown	Configures the amount of time LFP waits before shutting down the destination ports.
show link-fault-propagation group	Displays the LFP group configuration for the switch.

MIB Objects

```
alaLFPGroupTable
   alaLFPGroupId
   alaLFPGroupRowStatus
   alaLFPConfigTable
      alaLFPConfigPort
      alaLFPConfigPortType
      alaLFPConfigRowStatus
```

link-fault-propagation group destination

Configures the destination port assignments for a Link Fault Propagation (LFP) group.

link-fault-propagation group *group_id* **destination {port** *slot/port[-port2]* **| linkagg** *agg_id[-agg_id2]***}**

no link-fault-propagation group *group_id* **destination {port** *slot/port[-port2]* **| linkagg** *agg_id[-agg_id2]***}**

Syntax Definitions

group_id	An existing LFP group ID number. The valid range is 1–8.
slot/port[-port2]	The slot and port number (3/1). Use a hyphen to specify a range of ports and/or a space to specify multiple port entries (3/1-10 4/1 4/5 5/10).
agg_id[-agg_id2]	The link aggregate ID number. Use a hyphen to specify a range of IDs and/or a space to specify multiple ID entries (1-5 10 12).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a destination port association with the specified LFP group.
- Make sure the LFP group specified with this command already exists in the switch configuration.
- Configuring the source ports and destinations ports for the specified LFP group is allowed within the same command (see the examples on this command page).
- A group can have a maximum of 48 source ports and 48 destination ports.
- A maximum of 48 link aggregates is supported regardless of the number of ports in each aggregate in a group.
- A port or link aggregate that is configured as a source port cannot be configured as a destination port for any group. However, a source port can be associated with multiple LFP groups.
- A port or link aggregate that is configured as a destination port cannot be configured as a source port for any group. However, a destination port can be associated with multiple LFP groups.
- If port is recovered due to the Interface Recovery Timer, then the port will revert to the shutdown state if the error persists.

Example

```
-> link-fault-propagation group 1 destination port 1/4
-> link-fault-propagation group 1 destination port 1/5-8 2/3
-> link-fault-propagation group 1 destination linkagg 6
-> link-fault-propagation group 1 destination linkagg 6-10
-> link-fault-propagation group 1 source port 1/2 2/3 destination port 1/6
-> link-fault-propagation group 1 source port 1/2 2/3 destination linkagg 6
-> link-fault-propagation group 1 source linkagg 3 destination port 1/6 1/9
-> link-fault-propagation group 1 source linkagg 3 destination linkagg 1

-> no link-fault-propagation group 1 source port 1/9
-> no link-fault-propagation group 1 destination port 1/10
```

Release History

Release 6.4.4; command introduced.

Related Commands

link-fault-propagation group	Configures an LFP group, including the administrative status.
link-fault-propagation group source	Configures the source port assignments for the LFP group.
link-fault-propagation group wait-to-shutdown	Configures the amount of time LFP waits before shutting down the destination ports.
show link-fault-propagation group	Displays the LFP group configuration for the switch.

MIB Objects

```
alaLFPGroupTable
   alaLFPGroupId
   alaLFPGroupRowStatus
   alaLFPConfigTable
      alaLFPConfigPort
      alaLFPConfigPortType
      alaLFPConfigRowStatus
```

link-fault-propagation group wait-to-shutdown

Configures the wait-to-shutdown timer value for the Link Fault Propagation (LFP) group. This is the amount of time after all the source ports go down that LFP waits before shutting down the destination ports.

link-fault-propagation group *group_id* **wait-to-shutdown** *seconds*

Syntax Definitions

group_id	An existing LFP group ID number. The valid range is 1–8.
seconds	The number of seconds LFP waits before shutting down the destination ports. The valid range is 0-300 in multiples of 5.

Defaults

By default, the timer is set to zero (disabled).

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Set the wait-to-shutdown timer value to 0 to disable the timer.
- Make sure the LFP group specified with this command already exists in the switch configuration.

Example

```
-> link-fault-propagation group 1 wait-to-shutdown 40
-> link-fault-propagation group 3 wait-to-shutdown 70
-> link-fault-propagation group 5 wait-to-shutdown 0
```

Release History

Release 6.4.4; command introduced.

Related Commands

link-fault-propagation group	Configures an LFP group, including the administrative status.
show link-fault-propagation group	Displays the LFP group configuration for the switch.

MIB Objects

```
alaLFPGroupTable
   alaLFPGroupId
   alaLFPGroupWaitToShutdown
   alaLFPGroupRowStatus
```

show link-fault-propagation group

Displays information for the specified Link Fault Propagation (LFP) group.

show link-fault-propagation group [*group_id***]**

Syntax Definitions

group_id	An existing LFP group ID number. The valid range is 1–8.

Defaults

By default, information is displayed for all existing LFP groups.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Enter a LFP group ID number with this command to display information for a specific group.

Example

```
-> show link-fault-propagation group
Group Id : 2
  Source Port(s)          : 0/1-2 1/1-5 1/7,
  Destination Port(s)     : 0/3 1/10-13,
  Group-Src-Ports Status  : up,
  Admin Status            : enable,
  Wait To Shutdown        : 10

Group Id : 6
  Source Port(s)          : 1/2 1/6 1/9,
  Destination Port(s)     : 1/10-11 1/13,
  Group-Src-Ports Status  : down,
  Admin Status            : disable,
  Wait To Shutdown        : 5

Group Id : 7
  Source Port(s)          : 1/1 1/3,
  Destination Port(s)     : 0/3 1/5 1/7 1/11 1/13 1/15 1/17 1/19 1/21 1/23,
  Group-Src-Ports Status  : up,
  Admin Status            : enable,
  Wait To Shutdown        : 100

-> show link-fault-propagation group 2
Group Id : 2
  Source Port(s)          : 0/1-2 1/1-5 1/7,
  Destination Port(s)     : 0/3 1/10-13,
  Group-Src-Ports Status  : up,
  Admin Status            : enable,
  Wait To Shutdown        : 10
```

```
-> show link-fault-propagation group 6
Group Id : 6
  Source Port(s)          : 1/2 1/6 1/9,
  Destination Port(s)     : 1/10-11 1/13,
  Group-Src-Ports Status  : down,
  Admin Status            : enable,
  Wait To Shutdown        : 5
```

Release History

Release 6.4.4; command introduced.

Related Commands

link-fault-propagation group	Configures a LFP group, including the administrative status.
link-fault-propagation group wait-to-shutdown	Configures the amount of time LFP waits before shutting down the destination ports.

MIB Objects

```
alaLFPConfigTable
   alaLFPConfigPort
   alaLFPConfigPortType
alaLFPGroupTable
   alaLFPGroupId
      alaLFPGroupAdminStatus
      alaLFPGroupOperStatus
      alaLFPGroupWaitToShutdown
```

interfaces tdr-test-start

Initiates a Time Domain Reflectometry (TDR) cable diagnostics test on the specified port. The TDR feature sends a signal down a cable to determine the distance to a break or other discontinuity in the cable path. The length of time it takes for the signal to reach the break and return is used to estimate the distance to the discontinuity.

interfaces *slot/port* **tdr-test-start**

Syntax Definitions

slot/port	The slot and port number (3/1).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- TDR is an on-demand, out-of-service test. The test is not automatically triggered; data and protocol traffic is interrupted.
- Only one TDR test can be run at any given time.
- TDR is not supported on link aggregate ports, fiber ports, or stacking ports.
- TDR results are automatically cleared when a new test is started on the port or when the module for the port is reset.

Examples

```
-> interfaces 1/1 tdr-test-start
```

Release History

Release 6.4.4; command was introduced.

Related Commands

interfaces no tdr-statistics	Clears the statistics of the last test performed on the port
show interfaces tdr-statistics	Displays the results of the last TDR test performed on a port.

MIB Objects

```
esmTdrPortTable
   esmTdrPortTest
```

interfaces no tdr-statistics

Clears the statistics of the last TDR test performed on the port.

interfaces {*slot* | *slot/port***[-***port2***]} no tdr-statistics**

Syntax Definitions

slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

There is no global command to clear TDR statistics for all ports on all slots; statistics are cleared at the slot or the slot/port level.

Examples

```
-> interfaces 2/1 no tdr-statistics
-> interfaces 2 no tdr-statistics
-> interfaces 2/1-7 no tdr-statistics
```

Release History

Release 6.4.4; command was introduced.

Related Commands

interfaces tdr-test-start	Initiates the cable diagnostics on a port.
show interfaces tdr-statistics	Displays the results of the last TDR test performed on a port.

MIB Objects

```
esmTdrPortTable
   esmTdrPortClearResults
```

show interfaces tdr-statistics

Displays the results of the last TDR test performed on a port.

show interfaces [*slot* | *slot*/*port***[-***port2***]] tdr-statistics**

Syntax Definitions

slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

By default, TDR statistics are shown for all ports on all modules

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or range of interfaces.

Examples

```
-> show interfaces 1/3 tdr-statistics
Legend: Pair 1 - orange and white
        Pair 2 - green and white
        Pair 3 - blue and white
        Pair 4 - brown and white

Slot/ No of Cable Fuzzy  Pair1 Pair1  Pair2 Pair2  Pair3 Pair3  Pair4 Pair4  Test
port  pairs State Length State Length State Length State Length State Length Result
-----+-----+------+-----+-----+-----+------+------+-----+------+-----+------+------
1/3    4     ok     0     ok     3     ok      3    ok      3     ok    3   success
```

output definitions

Legend	Eight-conductor data cable contains 4 pairs of twisted Pair Copper Cable wires. Each pair consists of a solid (or predominantly) colored wire and a white wire with a strip of the same color. The pairs are twisted together.
Slot/Port	The interface slot and port number.
No of pairs	The number of pairs in the cable for which the test results are valid.

output definitions (continued)

Cable State	State of a cable as returned by the TDR test. The state of the cable wire. (a) **OK** - Wire is working properly (b) **Open** - Wire is broken (c) S**hort** - Pairs of wire are in contact with each other (d) **Crosstalk** - Signal transmitted on one pair of wire creates an undesired effect in another wire. (e) **Unknown** - Cable diagnostic test unable to find the state of a cable.
Fuzzy Length	The error in the estimated length of the cable.
Pair1 State	The state of the Pair 1 cable wire (**OK**, **Open**, **Short**, **Crosstalk**, or **Unknown**)
Pair1 Length	The length of the Pair 1 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
Pair2 State	The state of the Pair 2 cable wire (**OK**, **Open**, **Short**, **Crosstalk**, or **Unknown**)
Pair2 Length	The length of the Pair 2 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
Pair3 State	The state of the Pair 3 cable wire (**OK**, **Open**, **Short**, **Crosstalk**, or **Unknown**)
Pair3 Length	The length of the Pair 3 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
Pair4 State	The state of the Pair 4 cable wire (**OK**, **Open**, **Short**, **Crosstalk**, or **Unknown**)
Pair4 Length	The length of the Pair 4 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
Test Result	The status of the TDR test performed, success or fail.

Release History

Release 6.4.4; command was introduced.

Related Commands

interfaces tdr-test-start	Initiates the cable diagnostics on a port.
interfaces no tdr-statistics	Clears the statistics of the last test performed on the port.

```

2 UDLD Commands

This chapter describes the CLI commands used to configure the UDLD (UniDirectional Link Detection) protocol. UDLD operates at Layer 2 in conjunction with IEEE 802.3 Layer 1 fault detection mechanism. It is a protocol used for detecting and disabling unidirectional Ethernet fiber or copper connections to avoid interface malfunctions, Spanning Tree loops, media faults, etc. It operates in two main modes normal and aggressive.

The two basic mechanisms that UDLD follows are:

- Advertises port's identity and learns about its neighbors. This information is maintained in a cache table.
- It sends continuous echo messages when fast notifications are required.

MIB information for the UDLD commands is as follows:

Filename: AlcatelIND1UDLD.mib
Module: ALCATEL-IND1-UDLD-MIB

A summary of available commands is listed here:

udld
udld port
udld mode
udld probe-timer
udld echo-wait-timer
clear udld statistics port
interfaces clear-violation-all
show udld configuration
show udld configuration port
show udld statistics port
show udld neighbor port
show udld status port

Configuration procedures for UDLD are explained in the “Configuring UDLD” chapter of the *OmniSwitch AOS Release 6 Network Configuration Guide*.

udld

Globally enables or disables UDLD protocol on the switch.

udld {enable | disable}

Syntax Definitions

enable	Globally enables UDLD on the switch.
disable	Globally disables UDLD on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

The port that is shutdown by this command can be reset by using the **interfaces admin** command.

Examples

```
-> udld enable
-> udld disable
```

Release History

Release 6.3.1; command was introduced.

Related Commands

udld port	Enables or disables UDLD status on a specific port or a range of ports.
show udld configuration	Displays the global status of UDLD configuration.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldGlobalStatus
```

udld port

Enables or disables UDLD status on a specific port or a range of ports.

udld port *slot/port***[-***port2***] {enable | disable}**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
port2	The last port number in a range of ports that you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).
enable	Enables UDLD status on a port.
disable	Disables UDLD status on a port.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- The UDLD protocol must be enabled before using this command.
- If the slot/port is a VFL member port, an error message is displayed indicating that the DLD configuration is not allowed on VFL member port.

Examples

```
-> udld port 1/3 enable
-> udld port 1/6-10 enable
-> udld port 2/4 disable
Error Message: UDLD configuration is not allowed on VFL member port.
```

Release History

Release 6.3.1; command was introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldPortConfigTable
   alaUdldConfigUdldStatus
```

udld mode

Configures the operational mode of UDLD on a specific port, a range of ports, or all the ports.

udld port [*slot/port***[-***port2***]] mode {normal | aggressive}**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
port2	The last port number in a range of ports that you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).
normal	Specifies UDLD operation in the normal mode.
aggressive	Specifies UDLD operation in the aggressive mode.

Defaults

parameter	default
normal | aggressive	**normal**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- The UDLD protocol must be enabled before using this command.
- The UDLD protocol is not supported on aggregate ports.
- When two UDLD enabled ports that are configured in aggressive mode gets the link-up asynchronously, then the UDLD port which gets the link-up indication first is considered to be in the shutdown state. In such case, the link should be configured manually after both the links are up to start UDLD detection.
- In case of faulty cable connection, the port which is configured in normal mode of operation is determined to be in the shutdown state.

Examples

```
-> udld mode aggressive
-> udld mode normal
-> udld port 1/3 mode aggressive
-> udld port 2/4 mode normal
-> udld port 2/9-18 mode aggressive
```

Release History

Release 6.3.1; command was introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldPortConfigTable
   alaUdldPortConfigUdldMode
```

udld probe-timer

Configures the probe-message advertisement timer on a specific port, a range of ports, or all the ports. Probe-messages are transmitted periodically after this timer expires.

udld port [*slot/port***[-***port2***]] probe-timer** *seconds*

no udld port [*slot/port***[-***port2***]] probe-timer**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
port2	The last port number in a range of ports that you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).
seconds	The probe-message transmission interval. Valid range is 7 seconds to 90 seconds.

Defaults

parameter	default
seconds	15

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to reset the probe-message timer to the default value. Note that it is not necessary to specify the probe-message interval to reset it.
- The UDLD protocol must be enabled before using this command.
- Configure probe-advertisement timer with values varying in a range of 12 seconds to 18 seconds for better convergence time and to avoid burst of probe advertisements.

Examples

```
-> udld probe-timer 20
-> udld port 1/3 probe-timer 16
-> udld port 1/8-21 probe-timer 18
-> no udld probe-timer
-> no udld port 1/3 probe-timer
```

Release History

Release 6.3.1; command was introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldPortConfigTable
   alaUdldPortConfigUdldProbeIntervalTimer
```

udld echo-wait-timer

Configures the echo based detection timer on a specific port, a range of ports, or all the ports. This is known as link detection period.

udld port [*slot/port***[-***port2***]] echo-wait-timer** *seconds*

no udld port [*slot/port***[-***port2***]] echo-wait-timer**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
port2	The last port number in a range of ports that you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).
seconds	The echo based detection period. Valid range is 4 seconds to 15 seconds.

Defaults

parameter	default
seconds	8

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to reset the echo based detection timer to the default value. Note that it is not necessary to specify the echo based timer to reset it.
- The UDLD protocol must be enabled before using this command.
- An echo message is expected in reply from the neighbor within this time duration, otherwise, the port is considered as faulty.

Examples

```
-> udld echo-wait-timer 9
-> udld port 1/5 echo-wait-timer 12
-> udld port 1/7-16 echo-wait-timer 12
-> no udld echo-wait-timer
-> no udld port 1/3 echo-wait-timer
```

Release History

Release 6.3.1; command was introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldPortConfigTable
   alaUdldPortConfigUdldDetectionPeriodTimer
```

clear udld statistics port

Clears the UDLD statistics for a specific port or for all the ports.

clear udld statistics [port *slot/port***]**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

If the slot/port option is not specified, UDLD statistics for the switch is cleared.

Examples

```
-> clear udld statistics port 1/4
-> clear udld statistics
```

Release History

Release 6.3.1; command was introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld statistics port	Displays the UDLD statistics for a specific port.

MIB Objects

```
alaUdldGlobalClearStats
```

interfaces clear-violation-all

Brings the port out of shutdown state.

interfaces *slot/port***[-***port2***] clear-violation-all**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
port2	The last port number in a range of ports that you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- If any interface is in the admin down state because of UDLD, then the status of the interface can be confirmed using the **show interfaces port** command. The violation field indicates the reason of violation.
- The port may again go into shutdown state if the UDLD operation determine that UDLD violation is still not cleared.

Examples

```
-> interfaces 1/8 clear-violation-all
-> interfaces 1/10-14 clear-violation-all
```

Release History

Release 6.3.1; command was introduced.

Related Commands

show interfaces port	Displays interface port status (up or down).

MIB Objects

```
alaUdldPortStatsTable
   alaUdldPortStatsClear
```

show udld configuration

Displays the global status of UDLD configuration.

show udld configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> show udld configuration
Global UDLD Status : Disabled
```

output definitions

Global UDLD Status	Indicates the UDLD status on the switch. Options include **enabled** or **disabled**.

Release History

Release 6.3.1; command was introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldGlobalStatus
```

show udld configuration port

Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

show udld configuration port [*slot/port***]**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

Defaults

By default, a list of all UDLD ports is displayed.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> show udld configuration port
Slot/Port    Admin State    Oper Mode    Probe-Timer    Echo-Wait-Timer
-----------+--------------+------------+-------------+----------------
1/1           disabled       normal          15           10
1/2           disabled       normal          45           10
1/17          disabled       normal          33            8
1/18          disabled       normal          33            8
1/19          disabled       normal          33            8
1/20          disabled       aggresive       55            8
1/21          disabled       aggresive       55            8
1/22          disabled       aggresive       55            8
1/41          disabled       aggresive       77            8

1/43          enabled        aggresive       77            8
1/44          enabled        aggresive       77            8
1/45          enabled        aggresive       77            8

 -> show udld configuration port 1/44
Global UDLD Status            : enabled,
Port UDLD Status              : enabled,
Port UDLD State               : bidirectional,
UDLD Op-Mode                  : aggresive,
Probe Timer (Sec)             : 77,
Echo-Wait Timer (sec)         : 8
```

output definitions

Slot/Port	Slot number for the module and physical port number on that module.
UDLD-State	Indicates the state of interface determined by UDLD operation, which can be **notapplicable, shutdown, undetermined,** or **bidirectional**.
Oper-Mode	Indicates the operational mode of UDLD protocol. Options include **normal** or **aggressive**.
Global UDLD Status	Indicates the UDLD status on the switch. Options include **enabled** or **disabled**.
Port UDLD Status	Indicates the UDLD status on a port. Options include **enable** or **disable**.
Probe Timer	The probe-message expected after this time period.
Echo-Wait Timer	The detection of neighbor is expected with in this time period.

Release History

Release 6.3.1; command was introduced.

Related Commands

udld mode	Configures the operational mode of UDLD on a specific port, a range of ports, or all the ports.
udld probe-timer	Configures the probe-message advertisement timer on a specific port, a range of ports, or all the ports.
udld echo-wait-timer	Configures the echo based detection timer on a specific port, a range of ports, or all the ports.

```

show udld statistics port

Displays the UDLD statistics for a specific port.

show udld statistics port *slot/port*

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> show udld statistics port 1/42
UDLD Port Statistics
 Hello Packet Send        :8,
 Echo Packet Send         :8,
 Flush Packet Recvd       :0
UDLD Neighbor Statistics
 Neighbor ID    Hello Pkts Recv       Echo Pkts Recv
--------------+--------------------+--------------
      1              8              15
      2              8              15
      3              8              21
      4              8              14
      5              8              15
      6              8              20
```

output definitions

Hello Packet Send	The number of hello messages sent by a port.
Echo Packet Send	The number of echo messages sent by a port.
Flush Packet Recvd	The number of UDLD-Flush message received by a port.
Neighbor ID	The name of the neighbor.
Hello Pkts Recv	The number of hello messages received from the neighbor.
Echo Pkts Recv	The number of echo messages received from the neighbor.

Release History

Release 6.3.1; command was introduced.

Related Commands

udld probe-timer	Configures the probe-message advertisement timer on a specific port, a range of ports, or all the ports.
udld echo-wait-timer	Configures the echo based detection timer on a specific port, a range of ports, or all the ports.

3 Power over Ethernet (PoE) Commands

The Power over Ethernet (PoE) feature is supported on OmniSwitch chassis-based switches using PoE-capable Ethernet modules and a peripheral power shelf as well as on OmniSwitch PoE capable switches. Refer to the *OmniSwitch Hardware Users Guide* for further details.

Note on Terminology. There are several general terms used to describe this feature. The terms *Power over Ethernet (PoE), Power over LAN (PoL), Power on LAN (PoL),* and *Inline Power* are synonymous terms used to describe the powering of attached devices via Ethernet ports. For consistency, this chapter and the *OmniSwitch AOS Release 6 CLI Reference Guide* refer to the feature as *Power over Ethernet (PoE).*

Additional terms, such as *Powered Device (PD)* and *Power Source Equipment (PSE)* are terms that are not synonymous, but are directly related to PoE.

- *PD* refers to any attached device that uses a PoE data cable as its only source of power. Examples include access points such as IP telephones, Ethernet hubs, wireless LAN stations, etc.
- *PSE* refers to the actual hardware source of the electrical current for PoE such as OmniSwitch chassis-based switches with PoE modules or OmniSwitch PoE capable switches.

PoE commands documented in this section comply with IEEE 802.3, 802.af, and pre-802.3at.

MIB information for the PoE commands is as follows:

Filename: AlcatelIND1InLinePowerEthernet_mib
Module: ALCATEL-IND1-INLINE-POWER-MIB

Filename: AaIETF_HUBMIB_POWER_ETHERNET_DRAFT_mib
Module: POWER-ETHERNET-MIB

A summary of the available commands is listed here:

lanpower start
lanpower stop
lanpower power
lanpower maxpower
lanpower priority
lanpower priority-disconnect
lanpower slot-priority
lanpower redundant-power
lanpower capacitor-detection
show lanpower
show lanpower capacitor-detection
show lanpower priority-disconnect
show lanpower slot-priority

lanpower start

Activates Power over Ethernet on a single specified PoE port *or* on all PoE ports in a specified slot.

lanpower start {*slot/port***[-***port2***] |** *slot***}**

Important. Inline power is *not activated* until the **lanpower start** *slot* syntax is issued for the applicable PoE slot(s).

Syntax Definitions

slot/port	Activates inline power on the specified PoE port only. This syntax is used to re-enable power to an *individual port* that has been manually turned off via the **lanpower stop** command.
port2	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1-4 on slot 3).
slot	Activates inline power on all PoE ports in the corresponding slot.

Defaults

Power over Ethernet operational status is globally disabled by default.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Use the *slot/port* syntax to activate power on a particular port. When all ports in a slot are manually turned off, use only the *slot* syntax in the command line. This activates power on all ports in the specified slot. As noted above, inline power is *not active* until the **lanpower start** *slot* syntax is issued for the applicable PoE slot(s).

Examples

```
-> lanpower start 5/11
-> lanpower start 5
-> lanpower start 5/11-14
```

Release History

Release 6.1; command was introduced.

Related Commands

lanpower stop	Manually disconnects power on a single specified PoE port or on all PoE ports in a specified slot.
show lanpower	Displays current inline power status and related statistics for all PoE ports in a specified slot.

MIB Objects

```
alaPethMainPseGroup
   alaPethMainPseAdminStatus
pethPsePortTable
   pethPsePortAdminEnable
```

lanpower stop

Manually disables power on a single specified PoE port *or* on all PoE ports in a specified slot.

lanpower stop {*slot/port***[-***port2***] | *slot***}**

Syntax Definitions

slot/port	Disables inline power on the specified PoE port only.
port2	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1-4 on slot 3).
slot	Disables inline power on all PoE ports in the corresponding slot.

Defaults

Power over Ethernet operational status is globally disabled by default.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> lanpower stop 5/22
-> lanpower stop 5
-> lanpower stop 5/22-27
```

Release History

Release 6.1; command was introduced.

Related Commands

lanpower start	Activates inline power on a single specified PoE port *or* on all PoE ports in a specified slot.
show lanpower	Displays current inline power status and related statistics for all PoE ports in a specified slot.

MIB Objects

```
alaPethMainPseGroup
   alaPethMainPseAdminStatus
pethPsePortTable
   pethPsePortAdminEnable
```

lanpower power

Specifies the maximum amount of inline power, in milliwatts, available to *a specific PoE port*. The value specified is used to supply inline power to devices such as IP telephones and wireless LAN devices.

lanpower {*slot/port* **|** *slot***} power** *milliwatts*

Syntax Definitions

slot/port	A PoE port on which the maximum amount of inline power is being configured.
milliwatts	The maximum amount of inline power, in milliwatts, being made available to the corresponding port. Refer to the *OmniSwitch Hardware Users Guide* PoE specifications.

Defaults

parameter	default	Range
milliwatts (OS6400)	15400	3000-18000
milliwatts (OS6855)	15400	3000-20000
milliwatts (OS6850E/OS9000E)	30000	3000-30000

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Using this command does not immediately allocate the power to the slot or port. Any unused power is still available and remains a part of the overall PoE budget.
- To globally specify the amount of inline power available to *all ports in a slot*, refer to the **lanpower maxpower** command on page 3-8.
- Be sure that the value specified complies with specific power requirements for all attached IP telephones and wireless LAN devices.
- Note that the power value for the **lanpower power** command is specified in milliwatts (mW); the related command, **lanpower maxpower**, is specified in watts (W).

Examples

```
-> lanpower 3/1 power 3025
```

Release History

Release 6.1; command was introduced.

Related Commands

lanpower maxpower	Specifies the maximum amount of inline power, in watts, available to all PoE ports in a specified slot.
show lanpower	Displays current inline power status and related statistics for all PoE ports in a specified slot.

MIB Objects

```
alaPethPsePortTable
   alaPethPsePortPowerMaximum
```

lanpower maxpower

Specifies the maximum amount of inline power, in watts, available to *all PoE ports in a specified slot*.

lanpower *slot* **maxpower** *watts*

Syntax Definitions

slot	The slot containing PoE ports on which the maximum amount of inline power allowed is being configured.
watts	The maximum amount of inline power, in watts, available to all PoE ports in the corresponding slot. Refer to the *OmniSwitch Hardware Users Guide* for additional PoE specifications.

Defaults

parameter	default
900W Power Supply	780W
510W Power Supply	390W
360W Power Supply	240W
OS6855-14/P14	66W/185W
OS6855-24	80W
OS9000E	720W

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- To specify the maximum amount of inline power available to a *single port*, refer to the **lanpower power** command on page 3-6.
- Note that the power value for the **lanpower maxpower** command is specified in watts (W); the related command, **lanpower power**, is specified in milliwatts (mW).

Examples

```
-> lanpower 3 maxpower 200
```

Release History

Release 6.1; command was introduced.

Related Commands

lanpower power	Specifies the maximum amount of inline power, in milli-watts, available to a specific PoE port.
show lanpower	Displays current inline power status and related statistics for all PoE ports in a specified slot.

MIB Objects

```
alaPethMainPseGroup
   alaPethMainPseMaxPower
```

lanpower priority

Specifies an inline power priority level to a port. Levels include critical, high, and low.

lanpower *slot/port* **priority {critical | high | low}**

Syntax Definitions

slot/port	The particular port on which a priority level is being configured.
critical	Intended for ports that have mission-critical devices attached, and therefore require top (i.e., critical) priority. In the event of a power management issue, inline power to critical ports is maintained as long as possible.
high	Intended for ports that have important, but *not* mission-critical, devices attached. If other ports in the chassis have been configured as critical, inline power to high-priority ports is given second priority.
low	Intended for ports that have low-priority devices attached. In the event of a power management issue, inline power to low-priority ports is interrupted first (i.e., before critical- and high-priority ports).

Defaults

parameter	default
low | high | critical	low

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> lanpower 2/16 priority low
```

Release History

Release 6.1; command was introduced.

Related Commands

show lanpower	Displays current inline power status and related statistics for all PoE ports in a specified slot.

MIB Objects

```
pethPsePortGroup
   pethPsePortPowerPriority
```

lanpower priority-disconnect

Enables or disables the priority disconnect function on all ports in a specified slot. Priority disconnect is used by the system software in determining whether an incoming PD will be granted or denied power when there are too few watts remaining in the PoE power budget for an additional device. For detailed information on this function, refer to the "Managing Power over Ethernet (PoE)" chapter in the *OmniSwitch Hardware Users Guide.*

lanpower *slot* **priority-disconnect {enable | disable}**

Syntax Definitions

slot	The particular slot on which the priority disconnect function is being enabled or disabled.
enable	Enables priority disconnect on a specified port. When this function is enabled *and* a power budget deficit occurs in which there is inadequate power for an incoming device, the system software uses priority disconnect rules to determine whether an incoming device will be granted or denied power. For information on priority disconnect rules, refer to the "Managing Power over Ethernet (PoE)" chapter in the *OmniSwitch Hardware Users Guide*.
disable	Disables priority disconnect on a specified port. When priority disconnect is disabled and there is inadequate power in the budget for an additional device, power will be denied to *any* incoming PD, regardless of its priority status.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> lanpower 2 priority-disconnect disable
```

Release History

Release 6.1; command was introduced.

Related Commands

lanpower priority	Specifies an inline power priority level to a port. Levels include critical, high, and low.
show lanpower priority-disconnect	Displays the priority disconnect function status on all ports in a specified slot.

MIB Objects

```
alaPethMainPseTable
  alaPethMainPsePriorityDisconnect
```

lanpower slot-priority

Configures an inline power priority level for a slot. If the power supply of the power shelf goes down, the order of a particular daughter module will be disabled based on priority, thus affecting the power budget available to the whole chassis. Levels include critical, high, and low.

lanpower *slot* **slot-priority {critical | high | low}**

Syntax Definitions

slot	The particular slot on which a priority level is being configured.
critical	Intended for slots that have mission-critical devices attached and therefore require top (i.e., critical) priority. In the event of a power management issue, inline power to critical ports is maintained as long as possible.
high	Intended for slots that have important, but *not* mission-critical devices attached. If other ports in the chassis have been configured as critical, inline power to high-priority ports is given second priority.
low	Intended for slots that have low-priority devices attached. In the event of a power management issue, inline power to low-priority ports is interrupted first (i.e., before critical- and high-priority ports).

Defaults

parameter	default
low | high | critical	**low**

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- Note that if all the POE NI modules are all configured with the same priority level, then priority is determined based on the slot number of the module; the lower the slot number the higher the priority. For example, if slots 1, 2, 7, and 8 are powered by two POE power supplies and one of the power supplies goes down, power is cut to slots 7 and 8 because they have a lower priority than slots 1 and 2.

Examples

```
-> lanpower 1 slot-priority critical
-> lanpower 2 slot-priority high
-> lanpower 3 slot-priority low
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show lanpower slot-priority	Displays the order in which a particular daughter module will be disabled if a power shelf power supply goes down, thus affecting the power budget available to the chassis.

MIB Objects

```
alaPethMainPseTable
   alaPethMainPsePriority
```

lanpower redundant-power

Enables or disables power supply redundancy for Power over Ethernet on the switch.

lanpower redundant-power {enable | disable}

Syntax Definitions

enable	Enables redundant power on the switch.
disable	Disables redundant power on the switch.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

In order to comply with 911 emergency requirements, PoE power redundancy status must be *enabled* at all times. For additional requirements, refer to the “Managing Power over Ethernet (PoE)” chapter in the *OmniSwitch Hardware Users Guide*.

Examples

```
-> lanpower redundant-power enable
```

Release History

Release 6.1.3; command was introduced.

Related Commands

N/A

MIB Objects

```
alaPethMainTable
  alaPethMainPowerRedundancy
```

lanpower capacitor-detection

Enables or disables the capacitor detection method.

lanpower *slot* **capacitor-detection {enable | disable}**

Syntax Definitions

slot	The particular slot on which the capacitor detection method is being enabled or disabled.
enable	Enables the capacitor detection method.
disable	Disables the capacitor detection method.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

The capacitor detection method should only be enabled if there are legacy IP phones attached to the corresponding slot—this feature is *not* compatible with IEEE specifications. Please contact your Alcatel-Lucent sales engineer or Customer Support representative to find out which Alcatel-Lucent IP phones models need capacitive detection enabled.

Examples

```
-> lanpower 3 capacitor-detection enable
```

Release History

Release 6.1; command was introduced.

Related Commands

show lanpower capacitor-detection	Displays capacitor detection method status.

MIB Objects

```
alaPethMainTable
  alaPethMainPseCapacitorDetect
```

show lanpower

Displays current inline power status and related statistics for all PoE ports in a specified slot.

show lanpower *slot*

Syntax Definitions

slot	The slot for which current inline power status and related statistics are to be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> show lanpower 1
Port Maximum(mW) Actual Used(mW)   Status    Priority  On/Off   Class
----+-----------+---------------+-----------+---------+-------+-----------
 1     31000        7000         Powered On    Critical  ON        0
 2     31000        20000        Powered On    Critical  ON        4
 3     15400        7000         Powered On    Low       ON        3

 42     18000            0       Undefined      Low      OFF      -
 43     18000            0       Undefined      Low      OFF      -
 44     18000            0       Undefined      Low      OFF      -
 45     18000            0       Undefined      Low      OFF      -
 46     18000            0       Undefined      Low      OFF      -
 47     18000            0       Undefined      Low      OFF      -
 48     18000            0       Undefined      Low      OFF      -

Slot 1 Max Watts 380
380 Watts Total Power Budget Remaining
380 Watts Total Power Budget Available
1 Power Supplies Available
```

output definitions

Port	A PoE port for which current status and related statistics are being displayed.
Maximum (mW)	The current maximum amount of power available to the corresponding PoE port, in milliwatts. The default value is 15400. To change this setting, use the **lanpower power** command.

output definitions (continued)

Actual Used (mW)	The actual amount of power being used by an attached device (if applicable), in milliwatts. If no device is attached to the corresponding port, this row displays a value of 0.
Status	Displays the current operational status. Options include **Powered On**, **Powered Off**, and **Undefined**.
Priority	The current priority level for the corresponding PoE port. Options include **Critical**, **High**, and **Low**. **Critical** should be reserved for ports that have mission-critical devices attached, and therefore require top (i.e., critical) priority. In the event of a power management issue, inline power to critical ports is maintained as long as possible. **High** indicates ports that have important, but not mission-critical, devices attached. If other ports in the chassis have been configured as critical, inline power to high-priority ports is given second priority. **Low** priority is for ports that have low-priority devices attached. In the event of a power management issue, inline power to low-priority ports is interrupted first (i.e., before critical and high-priority ports). The default value is Low. Priority levels can be changed using the **lanpower priority** command.
On/Off	Displays whether a port has been manually turned on or off by the user. **ON** indicates that the port has been turned on by the user via the **lanpower start** command. **OFF** indicates that the port has been turned off by the user via the **lanpower stop** command.
Class	PoE class detected on attached Powered Device.
Max Watts	The maximum watts available to the corresponding slot. The maximum watts value for a slot can be changed using the **lanpower maxpower** command.
Total Power Budget Remaining	The amount of power budget remaining for PoE modules. If the total power budget remaining is exceeded, a power error will occur and the switch's chassis management software will begin shutting down power to PoE ports according to their priority levels. **Only applicable on OS9000E.**
Total Power Budget Available	The total amount of power remaining, based upon the number of power supplies installed and operating in the power shelf. **Only applicable on OS9000E**
Power Shelf Power Supplies Available	The number of power supplies currently installed and operating in the switch's power shelf. The power shelf is also referred to as Power Source Equipment (PSE).

Release History

Release 6.1; command was introduced.
Release 6.4.4; Class parameter was introduced.

Related Commands

```

4 VLAN Management Commands

VLAN management software handles VLAN configuration and the reporting of VLAN configuration changes to other switch tasks. A VLAN defines a broadcast domain that contains physical ports and can span across multiple switches. All switches contain a default VLAN 1. Physical switch ports are initially assigned to VLAN 1 until they are statically or dynamically assigned to other VLANs.

This chapter includes descriptions of VLAN management commands used to create, modify or remove VLANs. These commands allow you to enable or disable Spanning Tree Protocol (STP) and Authentication on a VLAN, add or remove virtual router interfaces, statically assign physical switch ports to a default VLAN, and display VLAN configuration information.

The VLAN management commands comply with RFC 2674.

MIB information is as follows:

Filename: AlcatelIND1VlanManager.mib
Module: ALCATEL-IND1-VLAN-MGR-MIB

A summary of the available commands is listed here:

vlan
vlan stp
vlan mobile-tag
vlan authentication
vlan source-learning
vlan mtu-ip
vlan port default
show vlan
show vlan port
show vlan router mac status
show vlan gvrp
show vlan ipmvlan

vlan

Creates a new VLAN with the specified VLAN ID (VID) and an optional description.

vlan *vid1***[**-*vid2***] [enable | disable] [name** *description***]**

no vlan *vid1***[**-*vid2***]**

Syntax Definitions

vid1	An existing VLAN ID number (1–4094).
-*vid2*	The last VLAN ID number in a range of VLANs that you want to configure (for example, 10-12 specifies VLANs 10, 11, and 12).
description	Text string up to 32 characters. Use quotes around string if description contains multiple words with spaces between them (for example, “Alcatel-Lucent Marketing VLAN”).
enable	Enable VLAN administrative status.
disable	Disable VLAN administrative status.

Defaults

parameter	default
enable | disable	**enable**
description	VLAN ID

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to delete a VLAN from the configuration. All VLAN ports and routers are detached before the VLAN is removed. Ports return to their default VLANs or VLAN 1, if the VLAN deleted is the port’s configured default VLAN.
- Note that specifying multiple VLAN IDs and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range and a space to separate multiple VLAN ID entries (for example, vlan 10-15 500-510 850).
- A VLAN is not operationally active until at least one active port is assigned to the VLAN.
- When a VLAN is administratively disabled, static port and dynamic mobile port assignments are retained but traffic on these ports is not forwarded. However, VLAN rules remain active and continue to classify mobile port traffic for VLAN membership.
- Ports are manually configured or dynamically assigned to VLANs.

Examples

```
-> vlan 850 name “Marketing Admin”
-> vlan 200
-> vlan 720 disable
-> no vlan 1020
-> vlan 100-105 355 400-410 “Sales Admin”
-> vlan 10 250-260
-> vlan 250-260 disable
-> no vlan 10-15
-> no vlan 10 20 200-210
```

Release History

Release 6.1; command was introduced.
Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.

Related Commands

vlan port default	Statically assigns ports to a VLAN.
show vlan	Displays a list of existing VLANs.
show vlan port	Displays VLAN port assignments.

MIB Objects

```
vlanTable
   vlanNumber
   vlanDescription
   vlanAdmStatus
   vlanOperStatus
   vlanStatus
```

vlan stp

Enables or disables the Spanning Tree status for a VLAN.

vlan *vid1***[-***vid2***] [1x1 | flat] stp {enable | disable}**

Syntax Definitions

vid1	An existing VLAN ID number (1–4094).
-vid2	The last VLAN ID number in a range of VLANs that you want to configure (for example, 10-12 specifies VLANs 10, 11, and 12).
1x1	Specifies that the Spanning Tree status for the VLAN applies when the switch is running in the 1x1 Spanning Tree mode.
flat	Specifies that the Spanning Tree status for the VLAN applies when the switch is running in the flat Spanning Tree mode.
enable	Enables Spanning Tree for the specified VLAN.
disable	Disables Spanning Tree for the specified VLAN.

Defaults

By default, the Spanning Tree status is enabled in both the 1x1 and flat mode when the VLAN is created.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- STP is not active until at least one active port is assigned to the VLAN.
- If the *vid* specified is that of a VLAN that does not exist, the VLAN is automatically created.
- Note that specifying multiple VLAN ID entries and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range and a space to separate multiple VLAN ID entries (for example, vlan 10-15 500-510 850 stp enable).
- Use the optional **1x1** or **flat** parameter with this command to configure the Spanning Tree status only for the Spanning Tree mode specified by the parameter. For example, if the **flat** parameter is specified when disabling STP for VLAN 10, then the Spanning Tree status for VLAN 10 is disabled when the switch is running in the flat mode. However, the current Spanning Tree status for VLAN 10 in the 1x1 mode remains unchanged.
- If this command is used without specifying the **1x1** or **flat** parameter, then the Spanning Tree status for the specified VLAN is changed for both operating modes.
- Up to 252 Spanning Tree instances per switch are supported in the 1x1 Spanning Tree mode. Since each VLAN with Spanning Tree enabled uses one of these instances, only 252 VLANs can have an active Spanning Tree instance at any given time.
- To create more than 252 VLANs in the 1x1 Spanning Tree mode, use the **vlan stp disable**, **vlan 1x1 stp disable**, or **vlan flat stp disable** command to create a VLAN with Spanning Tree disabled.

- When STP is disabled on a VLAN, it remains disabled even if the switch Spanning Tree operating mode is set to **1x1** (one STP instance per VLAN). In addition, all active ports for the disabled VLAN remain in a forwarding state in both the 1x1 and flat Spanning Tree modes.
- If a switch is running in the flat Spanning Tree mode, disabling Spanning Tree on VLAN 1 disables the instance across all VLANs. Disabling STP on any other VLAN disables the instance only for that VLAN.

Examples

```
-> vlan 850 stp enable
-> vlan 720 stp disable
-> vlan 500 1x1 stp disable
-> vlan 500 flat stp enable
-> vlan 100-110 stp disable
-> vlan 500-510 600 720-725 stp enable
-> vlan 250 350 400-410 stp 1x1 enable
-> vlan 10 20 stp flat disable
```

Release History

Release 6.1; command was introduced.
Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.

Related Commands

vlan	Creates a VLAN.
bridge mode	Selects a flat Spanning Tree or 1x1 Spanning Tree operating mode for a switch.

```

vlan mobile-tag

Enables or disables classification of tagged packets received on mobile ports. If a mobile port receives a tagged packet with a VLAN ID that matches the specified VLAN ID, the port and packet are dynamically assigned to that VLAN. If vlan mobile-tag is disabled, the packets tagged with a VLAN ID that does not match the mobile port's default VLAN or a rule VLAN that the traffic qualifies for, the packet is dropped.

vlan *vid1***[-***vid2***] mobile-tag {enable | disable}**

Syntax Definitions

vid1	An existing VLAN ID number (1–4094).
-vid2	The last VLAN ID number in a range of VLANs that you want to configure (for example, 10-12 specifies VLANs 10, 11, and 12).
enable	Enables dynamic assignment of tagged mobile port packets to the specified VLAN.
disable	Disables dynamic assignment of tagged mobile port packets to the specified VLAN.

Defaults

By default, mobile port tagging is disabled when a VLAN is created.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Note that specifying multiple VLAN ID entries and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range and a space to separate multiple VLAN ID entries (for example, vlan 10-15 500-510 850 mobile-tag enable).
- This command is VLAN based but only applies to tagged packets received on mobile ports.
- Packets received on mobile ports tagged with the VLAN ID are discarded.

Examples

```
-> vlan 850 mobile-tag enable
-> vlan 720 mobile-tag enable
-> vlan 1020 mobile-tag disable
-> vlan 500 410-420 mobile-tag enable
-> vlan 201-210 301-310 mobile-tag enable
-> vlan 450 550 mobile-tag disable
```

Release History

Release 6.1; command was introduced.
Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.

Related Commands

vlan	Creates a VLAN.
show vlan	Displays a list of existing VLANs.
show vlan port	Displays VLAN port assignments.

MIB Objects

```
vlanTable
   vlanNumber
   vlanTagMobilePortStatus
```

vlan authentication

Enables or disables authentication for a VLAN.

vlan *vid* **authentication {enable | disable}**

Syntax Definitions

vid	An existing VLAN ID number (1–4094).
enable	Enables authentication for the specified VLAN.
disable	Disables authentication for the specified VLAN.

Defaults

By default, authentication is disabled when a VLAN is created.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Note that specifying multiple VLAN ID entries and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range and a space to separate multiple VLAN ID entries (for example, vlan 10-15 500-510 850 authentication).
- A maximum of 128 authenticated VLANs per switch is supported. See Chapter 41, “AAA Commands,” for more information about configuring Layer 2 Authentication.

Examples

```
-> vlan 850 authentication enable
-> vlan 720 authentication enable
-> vlan 1020 authentication disable
-> vlan 900-905 authentication enable
-> vlan 2 10-15 450-455 authentication enable
-> vlan 420 1500 authentication disable
```

Release History

Release 6.1; command was introduced.
Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.

Related Commands

vlan	Creates a VLAN.
show vlan	Displays list of existing VLANs.
show vlan port	Displays VLAN port assignments.

MIB Objects

```
vlanTable
   vlanNumber
   vlanAuthentStatus
```

vlan mtu-ip

Configures the maximum transmission unit (MTU) packet size allowed for all ports associated with a VLAN. This value is configured on a per VLAN basis, so all IP interfaces assigned to the VLAN apply the same MTU value to packets sent on VLAN ports.

vlan *vid* **mtu-ip** *size*

Syntax Definitions

vid	An existing VLAN ID number (1–4094).
size	Packet size value specified in bytes (1280–9198).

Defaults

By default, the MTU size is set to 1500 bytes (the standard Ethernet MTU size).

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- The MTU size applies to traffic sent on all switch ports that are associated with the specified VLAN regardless of the port speed (for example, 10/100 Ethernet, gigabit Ethernet). Therefore, assign only ports that are capable of handling the MTU size restriction to the VLAN. For example, if the VLAN MTU size is greater than 1500, do not assign 10/100 Ethernet ports to the VLAN.
- By default, packets that exceed the MTU size are dropped. To enable MTU discovery and fragmentation, use the **icmp type** command to enable the “frag needed but DF bit set” control (for example, **icmp type 3 code 4 enable**).

Examples

```
-> vlan 200 mtu-ip 1000
-> vlan 1503 mtu-ip 10222
```

Release History

Release 6.4.1; command was introduced.

Related Commands

show vlan	Displays the VLAN configuration for the switch.

MIB objects

```
vlanTable
   vlanMtu
```

vlan port default

Configures a new default VLAN for a single port or an aggregate of ports. The VLAN specified with this command is referred to as the *configured default VLAN* for the port.

vlan *vid* **port default {***slot/port* | *link_agg***}**

vlan *vid* **no port default {***slot/port* | *link_agg***}**

Syntax Definitions

vid	An existing VLAN ID number (1–4094) of the VLAN to assign as the port's configured default VLAN.
slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3). To enter multiple slots and ports in a single command, use a hyphen to specify a range of ports (for example, 3/1-16) and a space to specify multiple slots (for example, 3/1-16 5/10-20 8/2-9).
link_agg	The link aggregate ID number (0–31) to assign to the specified VLAN. See Chapter 7, "Link Aggregation Commands."

Defaults

VLAN 1 is the default VLAN for all ports.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a port or link aggregate from its configured default VLAN and restore VLAN 1 as the default VLAN.
- Every switch port or link aggregate has only one configured default VLAN. Mobile and 802.1Q tagged ports, however, may have additional VLAN assignments, which are often referred to as *secondary* VLANs.
- Mobile ports that are assigned to a default VLAN other than VLAN 1 are still eligible for dynamic assignment to other VLANs.

Examples

```
-> vlan 10 port default 3/1
-> vlan 20 port default 4/1-24
-> vlan 30 port default 5/1-8 6/12-24
-> vlan 200 port default 29
-> vlan 10 no port default 3/1
-> vlan 20 no port default 4/1-24
-> vlan 30 no port default 5/1-8 6/12-24
-> vlan 200 no port default 29
```

Release History

Release 6.1; command was introduced.

Related Commands

vlan	Creates a VLAN.
show vlan	Displays list of existing VLANs.
show vlan port	Displays VLAN port assignments.

MIB Objects

```
vpaTable
   vpaVlanNumber
   vpaIfIndex
   vpaType
   vpaState
   vpaStatus
```

vlan source-learning

Configures the status of source learning on a VLAN, a range of VLANs, or on an IP Multicast VLAN (IMPVLAN).

vlan {*vid1***[-***vid2***] | impvlan** *ipmvlan-id***} source-learning {enable | disable}**

Syntax Definitions

vid1	The VLAN ID number (2–4094).
-vid2	The last VLAN ID number in a range of VLANs that you want to configure (e.g, 10-12 specifies VLANs 10, 11, and 12).
ipmvlan-id	Specifies the IP Multicast VLAN number. The valid range is 1–4094.
enable	Enables source MAC address learning.
disable	Disables source MAC address learning.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6400, 6855-U24X, 9000E

Usage Guidelines

- The **vlan ipmvlan source-learning** command does not accept multiple VLAN IDs.
- Disabling source learning on a VLAN or IMPVLAN clears all the dynamically learned MAC addresses associated with the VLAN or IMPVLAN from the MAC address table. It causes traffic to flood the VLAN.
- Static MAC addresses associated with a VLAN or IMPVLAN are *not* cleared when source learning is disabled for the VLAN or IMPVLAN.

Examples

```
-> vlan 10-15 source-learning disable
-> vlan ipmvlan 10 source-learning disable
```

Release History

Release 6.4.2; command introduced.

Related Commands

show vlan	Displays the VLAN configuration for the switch.
show vlan ipmvlan	Displays IPMVLAN information for a specific IPMVLAN, a range of IPMVLANs, or all the IPMVLANs.

MIB Objects

```
vlanTable
   vlanEntry
   vlanNumber
   vlanStatus
   vlanMacLearningControlStatus
```

show vlan

Displays a list of VLANs and their attributes configured on the switch.

show vlan [*vid1* **[-***vid2***]]**

Syntax Definitions

vid1	The VLAN ID number (2–4094).
-vid2	The last VLAN ID number in a range of VLANs that you want to configure (for example, 10-12 specifies VLANs 10, 11, and 12).

Defaults

By default, a list of all VLANs and their attributes are displayed.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Specify a VLAN ID with this command to display information about a specific VLAN.
- Note that specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (for example, show vlan 10-15). Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs— is allowed with this command. Multiple entries are not accepted.

Examples

```
-> show vlan
                            stree                        mble  src
vlan  type  admin  oper  1x1   flat auth   ip   ipx   tag   lrn     name
-----+-----+------+-----+----+-----+----+-----+-----+-----+-----+---------
 1    std   on     on     on    on   off   off   NA   off    on     VLAN 1
100   vstk  on    off     off   on   off   off   NA   off    off    VLAN 100

-> show vlan 1

Name                : VLAN 1,
Administrative State: enabled,
Operational State   : enabled,
1x1 Spanning Tree State : enabled,
Flat Spanning Tree State : enabled,
Authentication      : disabled,
IP Router Port      : off,
IPX Router Port     : none,
Mobile Tag          : off,
Source Learning     : enabled
```

```
-> show vlan 100

Name                : VLAN 100,
Administrative State: enabled,
Operational State   : disabled,
1x1 Spanning Tree State : disabled,
Flat Spanning Tree State : enabled,
Authentication      : disabled,
IP Router Port      : off,
IP MTU              : 1500,
IPX Router Port     : none,
Mobile Tag          : off,
Source Learning     : disabled,
Traffic-Type: ethernet-service Customer SVLAN,
Priority-Map: x->0
```

output definitions

vlan	The numerical VLAN ID. Use the **vlan** command to create or remove VLANs.
type	The type of VLAN (**std, vstk, gvrp**, or **ipmv**).
admin	VLAN administrative status: **on** enables VLAN functions to operate; **off** disables VLAN functions without deleting the VLAN. Use the **vlan** command to change the VLAN administrative status.
oper	VLAN operational status: **on** (enabled) or **off** (disabled). The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (for exampl, router interfaces, Spanning Tree) are applied to ports and traffic flow. A VLAN must have an enabled administrative status before it can become operationally enabled.
stree 1x1	VLAN Spanning Tree status for the VLAN in the 1x1 mode: **on** (enabled) allows the Spanning Tree algorithm to determine the state of VLAN ports (forwarding or blocking); **off** (disabled) prevents Spanning Tree algorithm from controlling VLAN ports, leaving active ports in a forwarding state. Configured through the **vlan stp** command.
stree flat	VLAN Spanning Tree status for the VLAN in the flat mode: **on** (enabled) allows the Spanning Tree algorithm to determine the state of VLAN ports (forwarding or blocking); **off** (disabled) prevents Spanning Tree algorithm from controlling VLAN ports, leaving active ports in a forwarding state. Configured through the **vlan stp** command.
auth	VLAN Authentication status: **on** (enabled) or **off** (disabled). Use the **vlan authentication** command to change the VLAN Authentication status.
ip	IP router interface status: **on** (IP interface exists for the VLAN) or **off** (no IP router interface exists for the VLAN). Use the **ip interface** command to define an IP router interface for a VLAN.
mble tag	Mobile tagging status: **on** (enabled); **off** (disabled). Configured through the **vlan mobile-tag** command.
src lrn	Source learning status: **on** (enabled); **off** (disabled). Configured through the **vlan source-learning** command. Note that disabling source learning is not supported on the OmniSwitch 6850E.

output definitions (continued)

name	The user-defined text description for the VLAN. By default, the VLAN ID is specified for the VLAN description.
Traffic-Type	Type of traffic passing through the VLAN port.
Priority-Map	Priority map value set for the VLAN.

Release History

Release 6.1; command was introduced.
Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.
Release 6.2.1; **type** field added.
Release 6.4.2; **src lrn** field added.

Related Commands

show vlan port	Displays VLAN port assignments.
show vlan router mac status	Displays the current MAC router operating mode (single or multiple) and VLAN router interface statistics.
show vlan gvrp	Displays a list of VLANs learned through GVRP and their details.
show vlan ipmvlan	Displays IPMVLAN information for a specific IPMVLAN, a range of IPMVLANs, or all the IPMVLANs.
show ip interface	Displays IP router information.

MIB Objects

```

show vlan port

Displays VLAN port associations (VPAs) for all VLANs, a specific VLAN, or for a specific port. Information is also included that shows the VPA type (configured default VLAN, 802.1Q tagged VLAN, dynamically assigned secondary VLAN, or mirrored port VLAN assignment) and the status of that association (inactive, blocking, forwarding, or filtering).

show vlan [*vid1***[-***vid2***]] port [***slot/port* | *link_agg***]**

Syntax Definitions

vid1	VLAN ID number (1–4094).
-vid2	The last VLAN ID number in a range of VLANs that you want to configure (e.g, 10-12 specifies VLANs 10, 11, and 12).
slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
ling_agg	Enter the link aggregate ID number (0–31) to assign to the specified VLAN.

Defaults

If no parameters are specified with this command, a list of all VLANs and their assigned ports is displayed by default.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- If the *vid* is specified without a *slot/port* or *link_agg*, then all port assignments for that VLAN are displayed.
- If the *slot/port* or *link_agg* is specified without a *vid*, then all VLAN assignments for that port are displayed.
- If both the *vid* and *slot/port* or *link_agg* are specified, then information only for that VLAN and slot/port or link aggregate ID is displayed.
- Note that specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (for example, show vlan 10-15 port). Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs— is allowed with this command. Multiple entries are not accepted.

Examples

```
-> show vlan port
 vlan   port     type      status
+-----+-------+---------+------------+
  1      1/1    default   inactive
  2      1/2    default   blocking
         1/3    mobile    forwarding
        11/4    qtagged   forwarding
```

```
  3      1/2    qtagged   blocking
        11/4    default   forwarding
         2/5    dynamic   forwarding
-> show vlan 10 port
  port   type      status
+------+--------+------------+
  1/1   default   forwarding
  1/2   qtagged   forwarding
  1/3   mobile    forwarding

-> show vlan port 3/2
 vlan     type      status
+------+---------+------------+
   1     default   forwarding
   2     qtagged   forwarding
   5     dynamic   blocking
   3     qtagged   blocking

-> show vlan 500 port 8/16
type       :default
status     :blocking
vlan admin :on
vlan oper  :off
port admin :on
port oper  :off
```

output definitions

vlan	Numerical VLAN ID. Identifies the port's VLAN assignment.
port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
type	The type of VPA: **default** (configured default VLAN assignment for the port), **qtagged** (802.1Q tagged secondary VLAN assignment for the port), **mobile** (dynamic secondary VLAN assignment for the port), **mirror** (port is mirroring the VLAN assignment of another port), or **dynamic** (VPAs that are learnt through GVRP).
status	The VPA status: **inactive** (port is not active), **forwarding** (traffic is forwarding on this VPA), **blocking** (traffic is not forwarding on this VPA), or **filtering** (a mobile port's VLAN is administratively off or the port's default VLAN status is disabled; does not apply to fixed ports).
vlan admin	VLAN administrative status: **on** enables VLAN functions to operate; **off** disables VLAN functions without deleting the VLAN. Use the **vlan** command to change the VLAN administrative status.
vlan oper	VLAN operational status: **on** (enabled) or **off** (disabled). The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (for example, router interfaces, Spanning Tree) are applied to ports and traffic flow. A VLAN must have an enabled administrative status before it can become operationally enabled.

output definitions

port admin	Port administrative status: **on** (enabled) allows the port to send and receive data when it is active; **off** (disabled) prevents the port from sending and receiving traffic even if it has an active connection.
port oper	Port operational status: **on** (enabled) or **off** (disabled). If a port is currently in use, then the operational status is enabled. A port must have an enabled administrative status before it can become operationally enabled.

Release History

Release 6.1; command was introduced.
Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.

Related Commands

show vlan	Displays list of VLANs configured on the switch.
show vlan router mac status	Displays the current MAC router operating mode (single or multiple) and VLAN router interface statistics.
show vlan gvrp	Displays a list of VLANs learned through GVRP and their details.
show vlan ipmvlan	Displays IPMVLAN information for a specific IPMVLAN, a range of IPMVLANs, or all the IPMVLANs.
show ip interface	Displays IP router information.

MIB Objects

```
vlanMgrVpa
vpaTable
   vpaVlanNumber
   vpaIfIndex
   vpaType

   vlanOperStatus
```

show vlan router mac status

Displays current status of multiple MAC router mode, the number of VLANs configured on the switch, the number of VLANs with router interfaces and the number of IP router interfaces configured.

show vlan router mac status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Only single MAC router mode is supported at this time, so multiple MAC router mode always displays as disabled.
- In single MAC router mode, a maximum of 4094 VLANs can have IP router interfaces defined. Note that these limits are subject to the availability of switch resources.

Examples

```
-> show vlan router mac status
  router-mac-multiple   total vlans   router vlans   ip vlans   ipx vlans
----------------------+-------------+--------------+----------+------------
       disabled               7              6           4           NA
```

output definitions

router-mac-multiple	Multiple MAC router mode status: **enabled** or **disabled**. If this mode is disabled, the switch is running in single MAC router mode.
total vlans	The total number of VLANs configured on the switch. Use the **vlan** command to create or remove VLANs.
router vlans	The total number of VLANs configured on the switch that have at least one router interface defined. Use the **ip interface** command to define an IP router interface for a VLAN.
ip vlans	The total number of VLANs configured on the switch that have an IP router interface defined. Use the **ip interface** command to define an IP router for a VLAN.

Release History

Release 6.1; command was introduced.

Related Commands

show vlan	Displays list of VLANs configured on the switch.
show vlan port	Displays VLAN port assignments.
show ip interface	Displays VLAN IP router interface information.

MIB Objects

```
vlanMgrVlanSet
   vlanSetMultiRtrMacStatus

```

show vlan gvrp

Displays a list of VLANs learned through GVRP.

show vlan gvrp [*vid1***[-***vid2***]]**

Syntax Definitions

vid1	The VLAN ID number (2–4094).
-vid2	The last VLAN ID number in a range of VLANs that you want to configure (for example, 10-12 specifies VLANs 10, 11, and 12).

Defaults

By default, all VLANs learned through GVRP are displayed.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Use the *vid* parameter with this command to display information for a specific VLAN or for a specific range of VLANs.

Examples

```
-> show vlan gvrp
                              stree                          mble
vlan  type  admin oper  1x1    flat    auth   ip   ipx   tag     name
----+-----+-----+----+-----+--------+------+------+-----+-----+-------------
 5   gvrp   on    on    on      on      off   NA   off   off    GVRP1
 6   gvrp   on    on    off     off     off   NA   off   off    GVRP12
```

output definitions

vlan	The VLAN ID. Use the **vlan** command to create or remove VLANs.
type	The type of VLAN (**std, vstk, gvrp**, or **ipmv**)
admin	VLAN administrative status: **on** enables VLAN functions to operate; **off** disables VLAN functions without deleting the VLAN. Use the **vlan** command to change the VLAN administrative status.
oper	VLAN operational status: **on** (enabled) or **off** (disabled). The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (for example, router interfaces, Spanning Tree) are applied to ports and traffic flow. A VLAN must have an enabled administrative status before it can become operationally enabled.

output definitions (continued)

stree 1x1	VLAN Spanning Tree status for the VLAN in the 1x1 mode: **on** (enabled) allows the Spanning Tree algorithm to determine the state of VLAN ports (forwarding or blocking); **off** (disabled) prevents Spanning Tree algorithm from controlling VLAN ports, leaving active ports in a forwarding state. Configured through the **vlan stp** command.
stree flat	VLAN Spanning Tree status for the VLAN in the flat mode: **on** (enabled) allows the Spanning Tree algorithm to determine the state of VLAN ports (forwarding or blocking); **off** (disabled) prevents Spanning Tree algorithm from controlling VLAN ports, leaving active ports in a forwarding state. Configured through the **vlan stp** command.
auth	VLAN Authentication status: **on** (enabled) or **off** (disabled). Use the **vlan authentication** command to change the VLAN Authentication status.
ip	IP router interface status: **on** (IP interface exists for the VLAN) or **off** (no IP router interface exists for the VLAN). Use the **ip interface** command to define an IP router interface for a VLAN.
mble tag	Mobile tagging status: **on** (enabled); **off** (disabled). Configured through the **vlan mobile-tag** command.
name	The user-defined text description for the VLAN. By default, the VLAN ID is specified for the VLAN description.

Release History

Release 6.2.1; command was introduced.

Related Commands

show vlan	Displays a list of VLANs configured on the switch.

```

show vlan ipmvlan

Displays IPMVLAN information for a specific IPMVLAN, a range of IPMVLANs, or all the IPMVLANs.

show vlan ipmvlan [*ipmvlan-id1***[-***ipmvlan-id2***]]**

Syntax Definitions

ipmvlan-id1	The IPMVLAN ID number (1–4094).
-ipmvlan-id2	The last IPMVLAN ID number in a range of IPMVLANs that you want to display (for example, 10-12 specifies VLANs 10, 11, and 12).

Defaults

By default, the configuration for all IPMVLANs is displayed.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Use the *ipmvlan-id* parameter with this command to display information for a specific IPMVLAN or a range of IPMVLANs.

Examples

```
-> show vlan ipmvlan
                                        stree
vlan      type      admin    oper    1x1    flat      name

 1202   Vstk ipmtv    on       on     off     off    VLAN 1202
 1203   Entp ipmtv    on       on     off     off    VLAN 1203

-> show vlan ipmvlan 50

Name                : VLAN 50,
IPMV Mode           : Enterprise IPMVLAN
Administrative State: enabled,
Operational State   : disabled,
1x1 Spanning Tree State : disabled,
Flat Spanning Tree State: disabled,
```

```
-> show vlan ipmvlan 51

Name                     : VLAN 51,
IPMV Mode                : Vlan Stacking IPMVLAN
Administrative State     : enabled,
Operational State        : disabled,
1x1 Spanning Tree State  : enabled,
Flat Spanning Tree State: enabled,
```

output definitions

vlan	The IPMVLAN ID.
type	Indicates if the IPMVLAN is in Enterprise mode (**Entp ipmtv**) or VLAN Stacking mode (**Vstk ipmtv**).
admin	Indicates IPMVLAN administrative status: **on** (enables IPMVLAN functions to operate) or **off (**disables IPMVLAN functions without deleting the IPMVLAN).
oper	IPMVLAN operational status: **on** (enabled) or **off** (disabled). Operational status remains disabled until an active port is assigned to the IPMVLAN. When operational status is enabled, IPMVLAN properties (for example, router interfaces, Spanning Tree) are applied to ports and traffic flow. An IPMVLAN must have an enabled administrative status before it can become operationally enabled.
Name	The user-defined text description for the IPMVLAN. By default, the IPMVLAN ID is specified for the IPMVLAN description.
IPMV mode	Indicates the mode (**Enterprise IPMVLAN** or **Vlan Stacking IPMVLAN**) of the IPMVLAN.
Administrative State	Indicates the administrative status of the IPMVLAN, which can be **enabled** or **disabled**.
Operational State	Indicates the operational status of the IPMVLAN, which can be **enabled** or **disabled**.
stree 1x1	VLAN Spanning Tree status for the VLAN in the 1x1 mode: **on** (enabled) allows the Spanning Tree algorithm to determine the state of VLAN ports (forwarding or blocking); **off** (disabled) prevents Spanning Tree algorithm from controlling VLAN ports, leaving active ports in a forwarding state. Configured through the **vlan stp** command.
stree flat	VLAN Spanning Tree status for the VLAN in the flat mode: **on** (enabled) allows the Spanning Tree algorithm to determine the state of VLAN ports (forwarding or blocking); **off** (disabled) prevents Spanning Tree algorithm from controlling VLAN ports, leaving active ports in a forwarding state. Configured through the **vlan stp** command.

Release History

Release 6.2.1; command was introduced.

Related Commands

vlan ipmvlan	Creates an IP Multicast VLAN.
show vlan	Displays a list of VLANs configured on the switch.
show vlan port	Displays VLAN port assignments.

5 802.1Q Commands

Alcatel-Lucent's 802.1Q is an IEEE standard for sending frames through the network tagged with VLAN identification. This chapter details configuring and monitoring 802.1Q tagging on a single port in a switch or an aggregate of ports on a switch.

Alcatel-Lucent's version of 802.1Q complies with the Draft Standard *P802.1Q/D11 IEEE Standards for Local And Metropolitan Area Network: Virtual Bridged Local Area Networks, July 30, 1998*.

MIB information for the 802.1Q commands is as follows:

Filename: alcatelIND1Dot1Q.mib
Module: ALCATEL-IND1-DOT1Q-MIB

A summary of available commands is listed here:

vlan 802.1q
vlan 802.1q frame type
show 802.1q

Note. Before using 802.1Q, the VLAN for 802.1Q must be created using the commands described in Chapter 4, "VLAN Management Commands."

Configuration procedures for 802.1Q are explained in "Configuring 802.1Q," *OmniSwitch AOS Release 6 Network Configuration Guide*.

vlan 802.1q

Creates, deletes, or modifies 802.1Q tagging on a single port or on an aggregate of ports.

vlan *vid* **802.1q {***slot/port* **|** *aggregate_id***} [***description***]**

vlan *vid* **no 802.1q {***slot/port* **|** *aggregate_id***}**

Syntax Definitions

vid	The VLAN identification number for a preconfigured VLAN that will handle the 802.1Q traffic for this port. The valid range is 1 to 4094.
slot	The slot number for the 802.1Q tagging.
port	The port number for the 802.1Q tagging.
aggregate_id	The link aggregation ID, which allows you to configure 802.1Q tagging on an aggregate of ports. The valid range is 1 to 31.
description	An optional textual description (up to 32 characters) for this 802.1Q tag. Spaces must be unclosed within quotation marks (e.g., “802.1Q tag 2”).

Defaults

The default description for 802.1Q tagging on a port is **TAG PORT** *slot/port* **VLAN** *vid* (where the *slot/port* and *vid* are as entered when inputting the command) when you configure 802.1Q tagging on a single port, and **TAG AGGREGATE** *aggregate_id* **VLAN** *vid* (where the *slot/port* and *vid* are as entered when inputting the command) when you configure 802.1q tagging on an aggregate link.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to delete 802.1Q tagging on a port or an aggregate of ports.
- The VLAN specified for the port or aggregate link before 802.1Q tagging can be specified. See Chapter 4, “VLAN Management Commands” for information on how to create a VLAN.
- You *must* enable link aggregation before you can tag an aggregate of ports. See Chapter 7, “Link Aggregation Commands” for more information on link aggregation.
- The port’s default VLAN can never be configured to accepted tagged frames.

Examples

```
-> vlan 2 802.1q 3/1
-> vlan 10 802.1q 100
-> vlan 5 802.1q 4/2 "802.1q tag 2"
-> vlan 6 no 802.1q 3/1
```

Release History

Release 6.1; command was introduced.

Related Commands

vlan 802.1q frame type	Configures a port to accept only VLAN-tagged frames or all frames.
show 802.1q	Displays 802.1Q tagging status and configuration.

MIB Objects

```
QPORTVLANTABLE
   qPortVlanSlot
   qPortVlanPort
   qPortVLanStatus
   qPortVlanTagValue
   qPortVlanDescription
   qAggregateVlanTagValue
   qAggregateVlanAggregateId
   qAggregateVlanStatus
   qAggregateVlanDescription
```

vlan 802.1q frame type

Configures a port to accept all frames or accept only VLAN-tagged frames.

vlan 802.1q *slot/port* **frame type {all | tagged}**

Syntax Definitions

slot	The slot number to configure 802.1Q tagging.
port	The port number to configure 802.1Q tagging.
all	Configures this port to accept all frames.
tagged	Configures this port to accept only VLAN-tagged frames.

Defaults

parameter	default
all | tagged	all

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

If you configure a port to accept only VLAN-tagged frames, then any frames received on this port that do not carry a VLAN ID (i.e., untagged frames or priority-tagged frames) will be discarded by the ingress rules for this port. Frames that are not discarded by this ingress rule are classified and processed according to the ingress rules for this port.

Examples

```
-> vlan 802.1q 3/1 frame type all
```

Release History

Release 6.1; command was introduced.

Related Commands

vlan 802.1q	Creates, modifies, or deletes 802.1Q tagging on a single port or an aggregate of ports.
show 802.1q	Displays 802.1Q tagging status and configuration.

MIB Objects

```
DOT1QPORTVLANTABLE
   dot1dBasePort
   dot1qPortAcceptableFrameTypes
```

show 802.1q

Displays 802.1Q tagging information for a single port or an aggregate of ports.

show 802.1q {*slot*/*port* | *aggregate_id***}**

Syntax Definitions

slot	The slot number to display 802.1Q tagging.
port	The port number to display 802.1Q tagging.
aggregate_id	The link aggregation ID to display 802.1Q tagging. See Chapter 7, "Link Aggregation Commands" for more information on link aggregation.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> show 802.1q 3/4

   Acceptable Frame Type   :      Any Frame Type
   Force Tag Internal      :                off

   Tagged VLANS      Internal Description
   -------------+-------------------------------------------------+
              2      TAG PORT 3/4 VLAN 2

   -> show 802.1q 2

   Tagged VLANS      Internal Description
   -------------+-------------------------------------------------+
              3      TAG AGGREGATE 2 VLAN 3
```

Output fields are described here:

output definitions

Acceptable Frame Type	The acceptable frame type for this port, which can be **Any Frame Type** or **Tagged Only Frame Type**.
Force Tag Internal	This field displays if adding the default VLAN ID (VID) to tagged frames is turned **on** or **off**.

output definitions (continued)

Tagged VLANS	The 802.1Q tag number for this port.
Internal Description	The description of this 802.1Q tag. You can modify this description with the **vlan 802.1q** command, which is described on page 5-2.

Release History

Release 6.1; command was introduced.

Related Commands

vlan 802.1q	Creates, modifies, or deletes 802.1Q tagging on a single port or an aggregate of ports.

6 Distributed Spanning Tree Commands

The Spanning Tree Algorithm and Protocol (STP) is a self-configuring algorithm that maintains a loop-free topology while providing data path redundancy and network scalability. Based on the IEEE 802.1D standard, the Alcatel-Lucent STP implementation distributes the Spanning Tree load between the primary management module and the network interface modules. In the case of a stack of switches, the STP load is distributed between the primary management switch and other switches in the stack. This functionality improves network robustness by providing a Spanning Tree that continues to respond to BPDUs and port link up and down states in the event of a fail over to a backup management module or switch.

In addition to a distributed architecture, this implementation also provides the following Spanning Tree features:

- Automatic configuration of a physical topology into a single Spanning Tree to ensure that there is only one data path between any two switches.
- Fault tolerance within the network topology. The Spanning Tree is reconfigured in the event of a data path or bridge failure or when a new switch is added to the topology.
- Support for four Spanning Tree protocols: 802.1D (STP), 802.1W (RSTP), 802.1Q 2005 (MSTP), and RRSTP.
- A *flat* Spanning Tree operating mode. If STP or RSTP is used, this mode applies a single STP instance across all VLANs. If MSTP is used, this mode applies a single STP instance to each Multiple Spanning Tree Instance (MSTI), which identifies a set of VLANs.
- Support for maximum MSTIs per switch. In addition, there is always one Common and Internal Spanning Tree (CIST) instance 0 on each switch.
- Ring Rapid Spanning Tree Protocol (RRSTP) supports up to a maximum range supported per switch. Note that there can be no alternate connections for the same instance between any two switches within an RRSTP ring topology.
- A *1x1* Spanning Tree operating mode, which applies a single STP instance for each defined VLAN on the switch.
- An STP topology that includes 802.1Q tagged ports and link aggregate logical ports in the calculation of the physical topology.

MIB information for Distributed Spanning Tree commands is as follows:

Filename: AlcatelIND1VlanSTP.MIB
Module: STP-MGMT-MIB

A summary of the available commands is listed here:

Implicit bridge commands	**bridge mode** **bridge protocol** **bridge priority** **bridge port loop-guard** **bridge hello time** **bridge max age** **bridge forward delay** **bridge bpdu-switching** **bridge path cost mode** **bridge auto-vlan-containment** **show spantree**
Explicit bridge commands	**bridge cist protocol** **bridge 1x1 protocol** **bridge cist priority** **bridge msti priority** **bridge 1x1 priority** **bridge cist hello time** **bridge 1x1 hello time** **bridge cist max age** **bridge 1x1 max age** **bridge cist forward delay** **bridge 1x1 forward delay** **show spantree cist** **show spantree msti** **show spantree 1x1**
Implicit port commands	**bridge** **bridge priority** **bridge path cost** **bridge mode** **bridge connection** **show spantree ports**

Explicit port commands	**bridge cist** **bridge 1x1** **bridge cist priority** **bridge msti priority** **bridge 1x1 priority** **bridge cist path cost** **bridge msti path cost** **bridge 1x1 path cost** **bridge cist mode** **bridge 1x1 mode** **bridge cist connection** **bridge 1x1 connection** **bridge cist admin-edge** **bridge 1x1 admin-edge** **bridge cist auto-edge** **bridge 1x1 auto-edge** **bridge cist restricted-role** **bridge 1x1 restricted-role** **bridge cist restricted-tcn** **bridge 1x1 restricted-tcn** **bridge cist txholdcount** **bridge 1x1 txholdcount** **show spantree cist ports** **show spantree msti ports** **show spantree 1x1 ports**
MST region commands	**bridge mst region name** **bridge mst region revision level** **bridge mst region max hops** **show spantree mst region**
MST instance commands	**bridge msti** **bridge msti vlan** **show spantree msti vlan-map** **show spantree cist vlan-map** **show spantree map-msti** **show spantree mst port**
RRSTP commands	**bridge rrstp** **bridge rrstp ring** **bridge rrstp ring vlan-tag** **bridge rrstp ring status** **show bridge rrstp configuration** **show bridge rrstp ring**
PVST+ commands	**bridge port pvst+** **bridge mode 1x1 pvst+**

bridge mode

Selects a flat Spanning Tree or 1x1 Spanning Tree operating mode for the switch. These modes are exclusive; however, it is not necessary to reboot the switch when changing modes.

bridge mode {**flat** | **1x1**}

Syntax Definitions

flat	One Spanning Tree instance per switch.
1x1	One Spanning Tree instance for each VLAN configured on a switch.

Defaults

By default, the bridge mode for the switch is set to 1x1 Spanning Tree.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The Multiple Spanning Tree Protocol (MSTP), as defined in the IEEE 802.1Q 2005 standard, is only supported on switches operating in the flat Spanning Tree mode.
- If standard STP or RSTP is used when the switch is running in the flat mode, a single STP instance is applied across all VLANs. For example, if a port belonging to VLAN 10 and a port belonging to VLAN 20 both connect to the same switch, then STP blocks one of these ports.
- If MSTP is used when the switch is running in the flat mode, a single STP instance is applied to each Multiple Spanning Tree Instance (MSTI). Each MSTI represents a set of VLANs.
- Flat Spanning Tree mode supports fixed (untagged) and 802.1Q tagged ports in each VLAN. However, Bridge Protocol Data Units (BPDUs) are always untagged.
- If **1x1** mode is selected, a single Spanning Tree instance is enabled for each VLAN configured on the switch. For example, if there are five VLANs configured on the switch, then there are five separate Spanning Tree instances. In essence, a VLAN is a virtual bridge that has its own bridge ID and configurable STP parameters, such as protocol, priority, hello time, max age, and forward delay.
- When operating in 1x1 mode, 802.1Q tagged ports participate in an 802.1Q Spanning Tree instance that allows the Spanning Tree to extend across tagged VLANs. As a result, a tagged port may participate in more than one Spanning Tree instance; one for each VLAN that the port carries.
- If a VLAN contains both fixed and tagged ports and the switch is operating in 1x1 Spanning Tree mode, then a hybrid of the two Spanning Tree instances (single and 802.1Q) is applied. If a VLAN appears as a tag on a port, then the BPDU for that VLAN are also tagged. However, if a VLAN appears as the configured default VLAN for the port, then BPDU are not tagged and the single Spanning Tree instance applies.
- Regardless of which mode the switch is running in, it is possible to administratively disable the Spanning Tree status for an individual VLAN (see Chapter 4, “VLAN Management Commands”).

Note. Active ports associated with VLANs that have Spanning Tree disabled on them are excluded from any Spanning Tree calculations. These VLANs remain in a forwarding state.

Examples

```
-> bridge mode flat
-> bridge mode 1x1
```

Release History

Release 6.1; command introduced.

Related Commands

bridge protocol	Selects the Spanning Tree protocol for the specified instance.
bridge bpdu-switching	Enables the switching of Spanning Tree BPDU on a VLAN that has Spanning Tree disabled.
show spantree	Displays VLAN Spanning Tree parameter values.

MIB Objects

```
vStpTable
   vStpNumber
   vStpMode
```

spantree mode

Selects the flat Spanning Tree or per-VLAN Spanning Tree operating mode for the switch. These modes are exclusive; however, it is not necessary to reboot the switch when the STP modes are changed.

spantree mode {**flat | per-vlan}**

Syntax Definitions

flat	One Spanning Tree instance per switch.
per-vlan	One Spanning Tree instance for each VLAN configured on a switch.

Defaults

By default, the Spanning Tree mode for the switch is set to per-VLAN.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The Multiple Spanning Tree Protocol (MSTP), as defined in the IEEE 802.1Q 2005 standard, is only supported on switches operating in the flat Spanning Tree mode.
- If standard STP or RSTP is used when the switch is running in the flat mode, a single STP instance is applied across all VLANs. For example, if a port belonging to VLAN 10 and a port belonging to VLAN 20 connect to the same switch together, then STP blocks one of these ports.
- If MSTP is used when the switch is running in the flat mode, a single STP instance is applied to each Multiple Spanning Tree Instance (MSTI). Each MSTI represents a set of VLANs.
- Flat Spanning Tree mode supports fixed (untagged) and 802.1Q tagged ports in each VLAN. However, Bridge Protocol Data Units (BPDUs) are always untagged.
- If the per-VLAN mode is selected, a single Spanning Tree instance is enabled for each VLAN configured on the switch. For example, if there are five VLANs configured on the switch, then there are five separate Spanning Tree instances. In essence, a VLAN is a virtual bridge that has its own bridge ID and configurable STP parameters, such as protocol, priority, hello time, max-age, and forward delay.
- When operating in per-VLAN mode, 802.1Q tagged ports participate in an 802.1Q Spanning Tree instance that allows the Spanning Tree to extend across tagged VLANs. As a result, a tagged port can participate in more than one Spanning Tree instance; one for each VLAN that the port carries.
- If a VLAN contains both fixed and tagged ports and the switch is operating in per-VLAN Spanning Tree mode, then a hybrid of the two Spanning Tree instances (single and 802.1Q) is applied. If a VLAN appears as a tag on a port, then the BPDU for that VLAN are also tagged. However, if a VLAN appears as the configured default VLAN for the port, then BPDU are not tagged and the single Spanning Tree instance applies.
- Regardless of which mode the switch is running in, it is possible to administratively disable the Spanning Tree status for an individual VLAN (see Chapter 4, “VLAN Management Commands”).

Note. Active ports associated with such a VLAN are excluded from any Spanning Tree calculations and remain in a forwarding state.

Examples

```
-> spantree mode flat
-> spantree mode per-vlan
```

Release History

Release 6.4.5; command introduced.

Related Commands

bridge protocol	Selects the Spanning Tree protocol for the specified instance.
bridge bpdu-switching	Enables the switching of Spanning Tree BPDU on a VLAN that has Spanning Tree disabled.
show spantree	Displays VLAN Spanning Tree parameter values.

MIB Objects

```
vStpTable
   vStpNumber
   vStpMode
```

bridge protocol

Configures the Spanning Tree protocol for the flat mode Common and Internal Spanning Tree (CIST) instance or for an individual VLAN instance if the switch is running in the 1x1 mode.

bridge [*instance***] protocol {stp | rstp | mstp}**

Syntax Definitions

instance	The flat mode CIST instance (1) or an existing 1x1 mode VLAN ID instance number (1–4094).
stp	IEEE 802.1D standard Spanning Tree Algorithm and Protocol.
rstp	IEEE 802.1W Rapid Spanning Tree Protocol.
mstp	IEEE 802.1Q 2005 Multiple Spanning Tree Protocol.

Defaults

RSTP is the default protocol for the flat mode CIST instance and for the 1x1 mode VLAN instance.

parameter	default
instance	flat mode instance

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Specifying an instance number with this command when the switch is running in the 1x1 Spanning Tree mode implies a VLAN ID and configures the protocol for the associated VLAN instance.
- To configure the protocol for the flat mode CIST instance when the switch is running in either the flat or 1x1 mode, do *not* specify an instance number. The CIST is the instance configured by default with this command.
- If the switch is running in the flat mode and STP or RSTP is the active protocol, entering 1 to specify the CIST instance is optional. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted.
- Selecting MSTP is the only option for the flat mode CIST instance and is required to configure Multiple Spanning Tree Instances (MSTI).
- MSTP is only active when the switch is operating in the flat Spanning Tree mode. STP and RSTP are active when the switch is operating in either the flat or 1x1 Spanning Tree mode.
- Delete all existing MSTIs before changing the protocol from MSTP to STP or RSTP.

Note. When changing the protocol to MSTP or from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values. However, if the path cost mode was set to 32-bit prior to the protocol change, the path cost is *not* reset to its default value. See the **bridge path cost mode** command page for more information.

Examples

```
-> bridge mode flat
-> bridge protocol mstp
-> bridge protocol rstp
-> bridge protocol stp

-> bridge mode 1x1
-> bridge 10 protocol rstp
-> bridge 200 protocol stp
-> bridge protocol mstp
WARNING: Changing to MSTP(802.1s) resets flat bridge priority and path
-> bridge protocol rstp
WARNING: Changing from MSTP(802.1s) resets flat bridge priority and path
```

Release History

Release 6.1; command introduced.
Release 6.1.2; default protocol changed to RSTP.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge cist protocol	Explicit command for changing the Spanning Tree protocol for the flat mode instance.
bridge 1x1 protocol	Explicit command for changing the Spanning Tree protocol for a VLAN instance.

MIB Objects

```
vStpInsTable
   vStpInsNumber
   vStpInsMode
   vStpInsProtocolSpecification
```

bridge cist protocol

Configures the Spanning Tree protocol for the flat mode Common and Internal Spanning Tree (CIST) instance (bridge 1).

bridge cist protocol {stp | rstp | mstp}

Syntax Definitions

stp	IEEE 802.1D standard Spanning Tree Algorithm and Protocol.
rstp	IEEE 802.1w Rapid Spanning Tree Protocol.
mstp	IEEE 802.1Q 2005 Multiple Spanning Tree Protocol.

Defaults

RSTP is the default protocol for the flat mode CIST instance and for the 1x1 mode VLAN instance.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the flat mode CIST instance regardless of which operating mode (flat or 1x1) or protocol is active on the switch.
- Use this command to select STP, RSTP, or MSTP as the protocol for the flat mode CIST instance.
- Selecting MSTP is only an option for the flat mode CIST instance and is required to configure Multiple Spanning Tree Instances (MSTI).
- MSTP is only active when the switch is operating in the flat Spanning Tree mode. STP and RSTP are active when the switch is operating in either the flat or 1x1 Spanning Tree mode.
- You can also use bridge instance 1 instead of **cist** keyword to specify the CIST instance.
- If the switch is running in 1x1 mode when this command is used, the specified protocol is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.

Note.
When changing the protocol to MSTP or from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values. However, if the path cost mode was set to 32-bit prior to the protocol change, the path cost is *not* reset to its default value. See the **bridge path cost mode** command page for more information.

When a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge cist protocol rstp
-> bridge cist protocol mstp
-> bridge cist protocol stp

-> bridge mode 1x1
-> bridge cist protocol mstp
WARNING: Changing to MSTP(802.1s) resets flat bridge priority and path
```

Release History

Release 6.1; command introduced.
Release 6.1.2; default protocol changed to RSTP.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge protocol	Implicit command for changing the Spanning Tree protocol for the flat mode instance or for a 1x1 mode VLAN instance.
bridge 1x1 protocol	Explicit command for changing the Spanning Tree protocol for a VLAN instance.

MIB Objects

```
vStpInsTable
   vStpInsNumber
   vStpInsProtocolSpecification
```

bridge port loop-guard

Enables or disables the STP loop-guard on a port or link aggregate.

bridge port {*slot/port* **| linkagg** *linkagg_id* **} loop-guard {enable | disable}**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
linkagg_id	The number corresponding to the link aggregate group. Valid range is a unique integer in the range 0–31.
enable	Enables STP loop-guard.
disable	Disables STP loop-guard.

Defaults

STP loop-guard is disabled by default.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- When you enable loop-guard on a port, it is automatically applied to all the active instances or VLANs associated to the port.
- Loop-guard cannot be enabled on a port if root-guard is already enabled on the port or link aggregate related to the port. Root-guard must be disabled before configuring loop-guard. Similarly, when loop-guard configuration is enabled on a port or chassis, root-guard cannot be configured on the port/s.
- Loop-guard can be enabled on all types of ports including designated (forwarding), non-designated (alternate, secondary, or root) ports. However, STP loop-guard configuration does not affect designated ports. Hence, loop-guard is not effective when applied on designated ports.
- When loop-guard is enabled on root ports, they change to blocking mode when a loop-guard error occurs. In such an instance the alternate or secondary ports takeover until the root port recovers from the error state.
- If a set of ports that are already blocked by loop-guard are grouped together to form a link aggregate, the new link aggregate gets a new designated role. The link aggregate can also obtain a forwarding state depending on the STP state.
- If a spanning tree channel is blocked by loop-guard and spanning tree loses all the state information. The individual physical ports obtain the designated role, even if one or more of the links that formed the channel are unidirectional. New link aggregate might obtain a forwarding state but new port state is defined.
- The ports that are configured as fast-forwarding or edge-ports do not receive BPDUs. Loop-guard is not effective on such ports.

- Loop-guard error state is recovered when the administrative state of the port is enabled or disabled.
- When a VLAN is disabled, all the VLAN port associations recover from the error state.
- The loop-guard feature can be enabled on the ports that have STP (RSTP, MRSTP or MSTP) enabled.
- STP loop-guard on link aggregate protects all ports that are members of the link aggregation group.

Examples

```
-> bridge port 1/2 loop-guard enable
-> bridge port linkagg 1 loop-guard enable
-> bridge port 1/2 loop-guard disable
-> bridge port linkagg 1 loop-guard disable
```

Release History

Release 6.4.4; command introduced.

Related Commands

show spantree ports	Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance.

MIB Objects

       vStpPortConfigIfIndex
       vStpPortConfigLoopGuard
```

bridge 1x1 protocol

Configures the Spanning Tree protocol for an individual VLAN instance.

bridge 1x1 *vid* **protocol {stp | rstp}**

Syntax Definitions

vid	An existing VLAN ID number (1–4096).
stp	IEEE 802.1D standard Spanning Tree Algorithm and Protocol.
rstp	IEEE 802.1w Rapid Spanning Tree Protocol.

Defaults

RSTP is the default protocol for the flat mode CIST instance and for the 1x1 mode VLAN instance.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that applies only to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in flat mode when this command is used, the specified protocol is not active for the specified VLAN instance until the operating mode for the switch is changed to 1x1.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge 1x1 2 protocol stp
-> bridge 1x1 455 protocol rstp
```

Release History

Release 6.1; command introduced.
Release 6.1.2; default protocol changed to RSTP.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge protocol	Implicit command for changing the Spanning Tree protocol for the flat mode instance or for a 1x1 mode VLAN instance.
bridge cist protocol	Explicit command for changing the Spanning Tree protocol for the flat mode instance.

MIB Objects

```
vStpInsTable
   vStpIns1x1VlanNumber
   vStpInsMode
   vStpInsProtocolSpecification
```

bridge mst region name

Defines the name for a Multiple Spanning Tree (MST) region. One of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

bridge mst region name *name*

bridge mst region no name

Syntax Definitions

name	An alphanumeric string up to 32 characters. Use quotes around string if the name contains multiple words with spaces between them (for example “Alcatel-Lucent Marketing”).

Defaults

By default, the MST region name is left blank.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove the MST region name. Note that it is not necessary to specify the region name to remove it.
- To change an existing region name, use this same command but specify a string value that is different than the existing name. It is *not* necessary to first remove the old name.
- Specifying an MST region name is allowed regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values, such as region name, only apply when the switch is operating in the flat Spanning Tree mode and using MSTP.

Examples

```
-> bridge mst region name SalesRegion
-> bridge mst region name “Alcatel-Lucent Marketing”
-> bridge mst region no name
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mst region revision level	Defines the revision level for an MST region.
bridge mst region max hops	Defines the maximum number of hops for the MST region.
bridge msti	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
bridge msti vlan	Defines an association between a range of VLANs and a single MSTI.

MIB Objects

```
vStpMstRegionTable
   vStpMstRegionNumber
   vStpMstRegionConfigName
```

bridge mst region revision level

Defines the revision level for a Multiple Spanning Tree (MST) region. One of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

bridge mst region revision level *rev_level*

Syntax Definitions

rev_level	A numeric value (0–65535) that identifies the MST region revision level for the switch.

Defaults

By default, the MST revision level is set to zero.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Specifying an MST region revision level is allowed regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values, such as revision level, only apply when the switch is operating in the flat Spanning Tree mode and using the MSTP.

Examples

```
-> bridge mst region revision level 1000
-> bridge mst region revision level 2000
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mst region name	Defines the name for an MST region.
bridge mst region max hops	Defines the maximum number of hops for the MST region.
bridge msti	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
bridge msti vlan	Defines an association between a range of VLANs and a single MSTI.

MIB Objects

```
vStpMstRegionTable
   vStpMstRegionNumber
   vStpMstRegionConfigRevisionLevel
```

bridge mst region max hops

Configures the maximum number of hops that are authorized to receive Multiple Spanning Tree (MST) regional information. Use this command to designate how many hops a BPDU is allowed to traverse before it is discarded and related information is aged.

bridge mst region max hops *max_hops*

Syntax Definitions

max_hops	A numeric value (1–40) that designates the maximum number of hops.

Defaults

By default, the maximum number of hops is set to 20.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The value configured with this command is a regional value that applies to all instances and in essence is used to determine the size of the region.
- The maximum hop count value is the initial value of the Remaining Hops parameter in the MST BPDU that originates from the bridge that is serving as the root bridge for the region. Each bridge that in turn receives the MST BPDU decrements the Remaining Hops count value by one and passes the new value along to the next bridge. When the count reaches 0, the BPDU is discarded.
- Specifying an MST maximum hop count is allowed regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values only apply when the switch is operating in the flat Spanning Tree mode and using the MSTP.

Examples

```
-> bridge mst region max hops 40
-> bridge mst region max hops 10
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mst region name	Defines the name for an MST region.
bridge mst region revision level	Defines the revision level for an MST region.
bridge msti	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
bridge msti vlan	Defines an association between a range of VLANs and a single MSTI.

MIB Objects

```
vStpMstRegionTable
   vStpMstRegionNumber
   vStpMstRegionMaxHops
```

bridge msti

Defines a Multiple Spanning Tree Instance (MSTI) number. This number identifies an association between a range of VLANs and a single Spanning Tree instance. In addition, it is possible to assign an optional name to the MSTI for further identification.

bridge msti *msti_id* **[name** *name***]**

bridge no msti *msti_id*

bridge msti *msti_id* **no name**

Syntax Definitions

msti_id	A numeric value (1–4094) that uniquely identifies an MSTI.
name	An alphanumeric string up to 32 characters. Use quotes around string if the name contains multiple words with spaces between them (for example “Alcatel-Lucent Marketing”).

Defaults

By default, a flat mode Common and Internal Spanning Tree (CIST) instance always exists. The MSTI ID number for this instance is 0.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no msti** form of this command to remove the MSTI from the switch configuration.
- Use the **no name** form of this command to remove the optional MSTI name from the specified instance. The instance itself is not removed; only the name.
- Up to 16 MSTIs are allowed per switch; select a number from 1 to 4094 for the MSTI number. In addition, there is always one Common and Internal Spanning Tree (CIST) instance 0 per switch. Initially all VLANs are associated with the CIST instance.
- Creating an MSTI is allowed when the switch is operating in either the 1x1 or flat Spanning Tree mode, as long as MSTP is the selected flat mode protocol. The MSTI configuration, however, is not active unless the switch is running in the flat mode.

Examples

```
-> bridge msti 10
-> bridge msti 20 name BldgOneST10
-> bridge msti 20 no name
-> bridge no msti 10
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mst region name	Defines the name for an MST region.
bridge mst region revision level	Defines the revision level for an MST region.
bridge mst region max hops	Defines the maximum number of hops for the MST region.
bridge msti vlan	Defines an association between a range of VLANs and a single MSTI.

MIB Objects

```
vStpMstInstanceTable
   vStpMstInstanceNumber
   vStpMstInstanceName
   vStpMstInstanceVlanBitmapAddition
   vStpMstInstanceVlanBitmapDeletion
   vStpMstInstanceVlanBitmapState
```

bridge msti vlan

Defines an association between a range of VLANs and a single Multiple Spanning Tree Instance (MSTI). The MSTI-to-VLAN mapping created with this command is one of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

bridge msti *msti_id* **vlan** *vid_range*

bridge msti *msti_id* **no vlan** *vid_range*

Syntax Definitions

msti_id	An existing MSTI ID number (0–4094).
vid_range	A VLAN ID number (1–4094) To associate multiple VLANS in a single command, use a hyphen to specify a range of VLAN IDs and a space to separate multiple VLAN IDs and/or ranges (for example 100-115 122 135 200-210).

Defaults

By default, all VLANs are associated with the flat mode Common and Internal Spanning Tree (CIST) instance, which is also known as MSTI 0.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a VLAN or a range of VLANs from the specified MSTI association.
- Note that the VLAN ID specified with this command does not have to already exist in the switch configuration. This command maps VLAN IDs to MSTIs, but does not create VLANs.
- A VLAN is associated with only one MSTI at a time, but it is possible to move a VLAN from one MSTI to another. In addition, it is also possible to assign only one VLAN to an MSTI; a range of VLANs is not required.
- Configuring an MSTI-to-VLAN mapping is allowed when the switch is operating in either the 1x1 or flat Spanning Tree mode, as long as MSTP is the selected flat mode protocol. However, the MSTI configuration is not active unless the switch is running in the flat mode.

Examples

```
-> bridge msti 10 vlan 100-115
-> bridge msti 20 vlan 122 135 200-210
-> bridge msti 10 no vlan 112 200-204
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mst region name	Defines the name for an MST region.
bridge mst region revision level	Defines the revision level for an MST region.
bridge mst region max hops	Defines the maximum number of hops for the MST region.
bridge msti	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.

MIB Objects

vStpMstVlanAssignmentTable
   vStpMstVlanAssignmentVlanNumber
   vStpMstVlanAssignmentMstiNumber
```

bridge priority

Configures the bridge priority value for the flat mode Common and Internal Spanning Tree (CIST) instance or for a 1x1 mode VLAN instance. Bridge priority is used to determine which bridge the Spanning Tree algorithm designates as the root bridge.

bridge [*instance***] priority** *priority*

Syntax Definitions

instance	The flat mode CIST instance or an existing VLAN ID number (1–4094).
priority	A bridge priority value within the range of 0–65535. Do not use commas in the value. If MSTP is the active protocol on the switch, then a bridge priority value that is a multiple of 4096 is required.

Defaults

By default, the bridge priority value is set to 32768.

parameter	default
instance	flat mode instance

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The bridge priority specifies the priority value for the first two octets of the Bridge ID (eight octets long). The remaining six octets of the Bridge ID contain a dedicated bridge MAC address.
- The lower the bridge priority number, the higher the priority that is associated with the bridge.
- Specifying an instance number with this command when the switch is running in the 1x1 Spanning Tree mode implies a VLAN ID and configures the priority value for the associated VLAN instance.
- To configure the priority value for the flat mode CIST instance when the switch is running in either the flat or 1x1 mode, do *not* specify an instance number. The CIST is the instance configured by default with this command.
- If the switch is running in the flat mode and STP or RSTP is the active protocol, entering 1 to specify the CIST instance is optional. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted. In this case, use the **bridge cist priority** or **bridge msti priority** commands instead.
- Note that when the protocol is changed to MSTP or from MSTP, the bridge priority for the flat mode CIST instance is reset to the default value.

Examples

```
-> bridge mode flat
-> bridge priority 8192
-> bridge priority 2500
ERROR: Valid bridge priority values are multiples of 4096: 0, 4096,
         8192, 12288, 16384 ... 61440

-> bridge mode 1x1
-> bridge 255 priority 16384
-> bridge 355 priority 3500
-> bridge priority 8192
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge cist priority	Explicit command for changing the Spanning Tree priority for the CIST instance when the switch is operating in either the flat or 1x1 mode.
bridge msti priority	Explicit command for changing the Spanning Tree priority for an MSTI when the switch is operating in either the flat or 1x1 mode.
bridge 1x1 protocol	Explicit command for changing the Spanning Tree priority for a VLAN instance when the switch is operating in either the flat or 1x1 mode.

MIB Objects

```
vStpInsTable
   vStpInsNumber
   vStpInsMode
   vStpInsPriority
   vStpInsBridgeAddress
```

bridge cist priority

Configures the Spanning Tree priority value for the flat mode Common and Internal Spanning Tree (CIST) instance. Bridge priority is used to determine which bridge the Spanning Tree algorithm designates as the root bridge.

bridge cist priority *priority*

Syntax Definitions

priority	A bridge priority value within the range of 0–65535. Do not use commas in the value. If MSTP is the active protocol on the switch, then a bridge priority value that is a multiple of 4096 is required.

Defaults

By default, the bridge priority value is set to 32768.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The bridge priority specifies the priority value for the first two octets of the Bridge ID (eight octets long). The remaining six octets of the Bridge ID contain a dedicated bridge MAC address.
- The lower the bridge priority number, the higher the priority that is associated with the bridge.
- This command is an explicit Spanning Tree command that only applies to the CIST instance regardless of which operating mode (flat or 1x1) or protocol is active on the switch.
- If the switch is running in 1x1 mode when this command is used, the specified priority value is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when the protocol is changed to MSTP or from MSTP, the bridge priority for the flat mode CIST instance is reset to the default value.
- In regards to the priority for a Multiple Spanning Tree Instance (MSTI), only the four most significant bits are used.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge mode flat
-> bridge cist priority 16384
-> bridge cist priority 53800
ERROR: Valid bridge priority values are multiples of 4096: 0, 4096,
         8192, 12288, 16384 ... 61440

-> bridge mode 1x1
-> bridge cist priority 16384
-> bridge cist priority 12288
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge priority	Implicit command for changing the Spanning Tree priority for the flat mode CIST instance or a 1x1 mode VLAN instance.
bridge msti priority	Explicit command for changing the Spanning Tree priority for an MSTI when the switch is operating in either the flat or 1x1 mode.
bridge 1x1 protocol	Explicit command for changing the Spanning Tree priority for a VLAN instance when the switch is operating in either the flat or 1x1 mode.

MIB Objects

```
vStpInsTable
   vStpInsNumber
   vStpInsPriority
   vStpInsBridgeAddress
```

bridge msti priority

Configures the bridge priority value for an Multiple Spanning Tree Instance (MSTI). Bridge priority is used to determine which bridge the Spanning Tree algorithm designates as the root bridge.

bridge msti *msti_id* **priority** *priority*

Syntax Definitions

msti_id	An existing MSTI ID number (0–4094).
priority	A bridge priority value that is a multiple of 4096 and within the range of 0–65535. Do not use commas in the value.

Defaults

By default, the bridge priority value is set to 32768.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The bridge priority specifies the priority value for the first two octets of the Bridge ID (eight octets long). The remaining six octets of the Bridge ID contain a dedicated bridge MAC address.
- The bridge priority value for an MSTI is calculated by adding the configured priority value to the Spanning Tree instance number. For example, if the priority value of MSTI 10 equals 32768 (the default), then the Spanning Tree priority value advertised for this instance is 32770 (32768 + 10).
- The lower the bridge priority number, the higher the priority that is associated with the bridge.
- This command is an explicit Spanning Tree command that only applies to the specified MSTI regardless of which operating mode (flat or 1x1) is active on the switch. If MSTP is not the selected flat mode protocol, however, the priority value for any MSTI is not configurable in either mode.
- Note that if zero is entered for the *msti_id* value, the specified priority value is applied to the CIST instance. The flat mode CIST instance 0 is also known as MSTI 0.
- If the switch is running in 1x1 mode when this command is used, the specified priority value is not active for the specified MSTI until the operating mode for the switch is changed to the flat mode.
- Note that when the protocol is changed to MSTP or from MSTP, the bridge priority for the flat mode CIST instance is reset to the default value.
- In regards to the priority for an MSTI, only the four most significant bits are used.

Examples

```
-> bridge mode flat
-> bridge msti 2 priority 4096
-> bridge msti 10 priority 53800
ERROR: Valid bridge priority values are multiples of 4096: 0, 4096,
         8192, 12288, 16384 ... 61440

-> bridge mode 1x1
-> bridge msti 2 priority 61440
-> bridge msti 10 priority 12288
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mode	Selects a flat Spanning Tree or 1x1 (per VLAN) Spanning Tree operating mode for the switch.
bridge priority	Implicit command for changing the Spanning Tree priority for the flat mode CIST instance or a 1x1 mode VLAN instance.
bridge cist priority	Explicit command for changing the Spanning Tree priority for the CIST instance when the switch is operating in either the flat or 1x1 mode.
bridge 1x1 priority	Explicit command for changing the Spanning Tree priority for a VLAN instance when the switch is operating in either the flat or 1x1 mode.

MIB Objects

```
vStpInsTable
   vStpInsMstiNumber
   vStpInsMode
   vStpInsPriority
   vStpInsBridgeAddress
```

bridge 1x1 priority

Configures the bridge priority value for an individual VLAN instance.

bridge 1x1 *vid* **priority** *priority*

Syntax Definitions

vid	An existing VLAN ID number (1–4094).
priority	A bridge priority value within the range of 0–65535. Do not use commas in the value.

Defaults

By default, the bridge priority value is set to 32768.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The bridge priority specifies the priority value for the first two octets of the Bridge ID (eight octets long). The remaining six octets of the Bridge ID contain a dedicated bridge MAC address.
- The lower the bridge priority number, the higher the priority that is associated with the bridge.
- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) or protocol is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified priority value is not active for the specified VLAN instance until the operating mode for the switch is changed to the 1x1 mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge mode flat
-> bridge 1x1 2 priority 16384
-> bridge 1x1 10 priority 53800

-> bridge mode 1x1
-> bridge 1x1 2 priority 16384
-> bridge 1x1 10 priority 53800
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mode	Selects a flat Spanning Tree or 1x1 (per VLAN) Spanning Tree operating mode for the switch.
bridge priority	Implicit command for changing the Spanning Tree priority for the flat mode CIST instance or a 1x1 mode VLAN instance.
bridge cist priority	Explicit command for changing the Spanning Tree priority for the CIST instance when the switch is operating in either the flat or 1x1 mode.
bridge msti priority	Explicit command for changing the Spanning Tree priority for an MSTP MSTI when the switch is operating in either the flat or 1x1 mode.

MIB Objects

```
vStpInsTable
   vStpIns1x1VlanNumber
   vStpInsMode
   vStpInsPriority
   vStpInsBridgeAddress
```

bridge hello time

Configures the Spanning Tree hello time value for the flat mode Common and Internal Spanning Tree (CIST) instance or for a 1x1 mode VLAN instance. This value specifies the amount of time, in seconds, between each transmission of a BPDU on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root.

bridge [*instance***] hello time** *seconds*

Syntax Definitions

instance	The flat mode CIST instance or an existing VLAN ID number (1–4094).
seconds	Hello Time value, in seconds (1–10).

Defaults

By default, the bridge hello time value for is set to 2 seconds.

parameter	default
instance	flat mode instance

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Lowering the Hello Time interval improves the robustness of the Spanning Tree Algorithm. Increasing the Hello Time interval lowers the overhead of the Spanning Tree Algorithm.
- Specifying an instance number with this command when the switch is running in the 1x1 Spanning Tree mode implies a VLAN ID and configures the hello time value for the associated VLAN instance.
- To configure the hello time value for the flat mode CIST instance when the switch is running in either the flat or 1x1 mode, do *not* specify an instance number. The CIST is the instance configured by default with this command.
- If the switch is running in the flat mode and STP or RSTP is the active protocol, entering 1 to specify the CIST instance is optional. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted.
- Note that for Multiple Spanning Tree Instances (MSTI), the hello time value is inherited from the CIST instance and is not a configurable parameter.

Examples

```
-> bridge mode flat
-> bridge hello time 5

-> bridge mode 1x1
-> bridge 10 hello time 8
-> bridge hello time 5
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.

   vStpInsBridgeHelloTime
```

bridge 1x1 hello time

Configures the bridge hello time value for an individual VLAN instance. This value is the amount of time, in seconds, between each transmission of a BPDU on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root.

bridge 1x1 *vid* **hello time** *seconds*

Syntax Definitions

vid	An existing VLAN ID number (1–4094).
seconds	Hello time value in seconds (1–10).

Defaults

By default, the bridge Hello Time value is set to 2 seconds.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Lowering the Hello Time interval improves the robustness of the Spanning Tree Algorithm. Increasing the Hello Time interval lowers the overhead of the Spanning Tree Algorithm.
- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified hello time value is not active for the specified VLAN instance until the operating mode for the switch is changed to the 1x1 mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge mode flat
-> bridge 1x1 2 hello time 5
-> bridge 1x1 10 hello time 10

-> bridge mode 1x1
-> bridge 1x1 255 hello time 5
-> bridge 1x1 455 hello time 10
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge hello time	Implicit command for changing the Spanning Tree hello time value for the flat mode CIST instance or for a 1x1 mode VLAN instance.
bridge cist hello time	Explicit command for changing the Spanning Tree hello time value for the CIST instance when the switch is operating in either the flat or 1x1 mode.

MIB Objects

```
vStpInsTable
   vStpIns1x1VlanNumber
   vStpInsMode
   vStpInsBridgeHelloTime
```

bridge max age

Configures the Spanning Tree bridge max age time for the flat mode Common and Internal Spanning Tree (CIST) instance or for a 1x1 mode VLAN instance. This value is the amount of time, in seconds, that Spanning Tree information learned from the network on any port is retained. When this information has aged beyond the max age value, the information is discarded.

bridge [*instance***] max age** *seconds*

Syntax Definitions

instance	The flat mode CIST instance or an existing VLAN ID number (1–4094).
seconds	Max age time in seconds (6–40).

Defaults

By default, the bridge max age time value is set to 20 seconds.

parameter	default
instance	flat mode instance

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- A low max age time causes the Spanning Tree Algorithm to reconfigure more often.
- Specifying an instance number with this command when the switch is running in the 1x1 Spanning Tree mode implies a VLAN ID and configures the max age value for the associated VLAN instance.
- To configure the max age value for the flat mode CIST instance when the switch is running in either the flat or 1x1 mode, do *not* specify an instance number. The CIST is the instance configured by default with this command.
- If the switch is running in the flat mode and STP or RSTP is the active protocol, entering 1 to specify the CIST instance is optional. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted.
- Note that for Multiple Spanning Tree Instances (MSTI), the max age value is inherited from the CIST instance and is not a configurable parameter.

Examples

```
-> bridge mode flat
-> bridge max age 40

-> bridge mode 1x1
-> bridge 255 max age 40
-> bridge max age 10
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge cist max age	Explicit command for changing the Spanning Tree max age time value for the CIST instance when the switch is operating in either the flat or 1x1 mode.
bridge 1x1 max age	Explicit command for changing the Spanning Tree max age time value for a VLAN instance when the switch is operating in either the flat or 1x1 mode.

MIB Objects

```
vStpInsTable
   vStpInsNumber
   vStpInsMode
   vStpInsBridgeMaxAge
```

bridge cist max age

Configures the bridge max age time value for the flat mode Common and Internal Spanning Tree (CIST) instance. This value is the amount of time, in seconds, that Spanning Tree Protocol information learned from the network on any port is retained. When this information has aged beyond the max age value, the information is discarded.

bridge cist max age *seconds*

Syntax Definitions

seconds	Max age time in seconds (6–40).

Defaults

By default, the bridge max age time value is set to 20 seconds.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- A low max age time causes the Spanning Tree Algorithm to reconfigure more often.
- This command is an explicit Spanning Tree command that only applies to the CIST instance regardless of which operating mode (flat or 1x1) or protocol is active on the switch.
- If the switch is running in 1x1 mode when this command is used, the specified max age time value is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge mode flat
-> bridge cist max age 10
-> bridge cist max age 30

-> bridge mode 1x1
-> bridge cist max age 10
-> bridge cist max age 30
```

Release History

Release 6.1; command introduced.

Related Commands

bridge max age	Implicit command for changing the Spanning Tree max age time value for the flat mode CIST instance or for a 1x1 mode VLAN instance.
bridge 1x1 max age	Explicit command for changing the Spanning Tree max age time value for a VLAN instance when the switch is operating in either the flat or 1x1 mode.

MIB Objects

```
vStpInsTable
   vStpInsNumber
   vStpInsBridgeMaxAge
```

bridge 1x1 max age

Configures the bridge max age time value for an individual VLAN instance. This value is the amount of time, in seconds, that Spanning Tree Protocol information learned from the network on any port is retained. When this information has aged beyond the max age value, the information is discarded.

bridge 1x1 *vid* **max age** *seconds*

Syntax Definitions

vid	An existing VLAN ID number (1–4094).
seconds	Max age time in seconds (6–40).

Defaults

By default, the bridge max age time value is set to 20 seconds.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- A low max age time causes the Spanning Tree Algorithm to reconfigure more often.
- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified max age time value is not active for the specified VLAN instance until the operating mode for the switch is changed to the 1x1 mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge mode flat
-> bridge 1x1 2 max age 10
-> bridge 1x1 10 max age 40

-> bridge mode 1x1
-> bridge 1x1 255 max age 30
-> bridge 1x1 455 max age 10
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.

bridge cist max age	Explicit command for changing the Spanning Tree max age time value for the CIST instance when the switch is operating in either the flat or 1x1 mode.

MIB Objects

```
vStpInsTable
   vStpIns1x1VlanNumber
   vStpInsMode
   vStpInsBridgeMaxAge
```

bridge forward delay

Configures the bridge forward delay time for the flat mode Common and Internal Spanning Tree (CIST) instance or for 1x1 mode VLAN instance. This value is the amount of time, in seconds, that determines how fast a port changes its Spanning Tree state until it reaches a forwarding state. The forward delay time specifies how long a port stays in the listening and learning states, which precede the forwarding state.

bridge [*instance***] forward delay** *seconds*

Syntax Definitions

instance	The flat mode CIST instance or an existing VLAN ID number (1–4094).
seconds	Forward delay time, in seconds (4–30).

Defaults

By default, the bridge forward delay time value is set to 15 seconds.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- A low forward delay time can cause temporary loops in the network, because data may get forwarded before the reconfiguration message has reached all nodes on the network.
- The forward delay time is also used to age out all dynamic MAC address entries in the forwarding table (MAC address table) when a topology change occurs.
- Specifying an instance number with this command when the switch is running in the 1x1 Spanning Tree mode implies a VLAN ID and configures the forward delay time for the associated VLAN instance.
- To configure the forward delay time for the flat mode CIST instance when the switch is running in either the flat or 1x1 mode, do *not* specify an instance number. The CIST is the instance configured by default with this command.
- If the switch is running in the flat mode and STP or RSTP is the active protocol, entering 1 to specify the CIST instance is optional. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted.
- Note that for Multiple Spanning Tree Instances (MSTI), the forward delay time is inherited from the CIST instance and is not a configurable parameter.

Examples

```
-> bridge mode flat
-> bridge forward delay 30

-> bridge mode 1x1
-> bridge 255 forward delay 10
-> bridge forward delay 30
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge cist forward delay	Explicit command for changing the Spanning Tree forward delay time value for the CIST instance when the switch is operating in either the flat or 1x1 mode.
bridge 1x1 forward delay	Explicit command for changing the Spanning Tree forward delay time value for a VLAN instance when the switch is operating in either the flat or 1x1 mode.
show spantree	Displays VLAN Spanning Tree parameter values.

MIB Objects

```
vStpInsTable
   vStpInsNumber
   vStpInsMode
   vStpInsBridgeForwardDelay
```

bridge cist forward delay

Configures the bridge forward delay time value for the flat mode Common and Internal Spanning Tree (CIST) instance. This value is the amount of time, in seconds, that determines how fast a port changes its Spanning Tree state until it reaches a forwarding state. The forward delay time specifies how long a port stays in the listening and learning states, which precede the forwarding state.

bridge cist forward delay *seconds*

Syntax Definitions

seconds	Forward delay time in seconds (4–30).

Defaults

By default, the bridge forward delay time value is set to 15 seconds.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- A low forward delay time can cause temporary loops in the network, because data may get forwarded before the reconfiguration message has reached all nodes on the network.
- The forward delay time is also used to age out all dynamic MAC address entries in the forwarding table (MAC address table) when a topology change occurs.
- This command is an explicit Spanning Tree command that only applies to the flat mode CIST instance regardless of which operating mode (flat or 1x1) or protocol is active on the switch.
- If the switch is running in 1x1 mode when this command is used, the specified forward delay time value is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge mode flat
-> bridge cist forward delay 10
-> bridge cist forward delay 30

-> bridge mode 1x1
-> bridge cist forward delay 25
-> bridge cist forward delay 4
```

Release History

Release 6.1; command introduced.

Related Commands

bridge cist forward delay	Explicit command for changing the Spanning Tree forward delay time value for the CIST instance when the switch is operating in either the flat or 1x1 mode.

MIB Objects

```
vStpInsTable
   vStpIns1x1VlanNumber
   vStpInsMode
   vStpInsBridgeForwardDelay
```

bridge mode 1x1 pvst+

Enables or disables PVST+ mode on the switch, enabling it to operate with Cisco switches.

bridge mode 1x1 pvst+ {enable | disable}

Syntax Definitions

enable	Enables the pvst+ mode.
disable	Disables the pvst+ mode.

Defaults

PVST+ is disabled by default.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- In order to handle PVST+ mode, the ports must be configured in 1x1 mode.
- This command enables the ports to handle PVST+ BPDUs.
- In this mode, the bridge priority field of the bridge ID can only be changed by a multiple of 4096.

Examples

```
-> bridge mode 1x1 pvst+ enable
-> bridge mode 1x1 pvst+ disable
```

Release History

Release 6.3.1; command introduced.

Related Commands

bridge port pvst+	Configures the type of BPDU to be used on a port when PVST+ mode is enabled.

MIB Objects

```
vStpTable
   vStpMode
   vStpModePVST
```

bridge bpdu-switching

Enables the switching of Spanning Tree BPDU on the flat mode Common and Internal Spanning Tree (CIST) instance or for an individual VLAN instance if the switch is running in the 1x1 mode.

bridge [*instance***] bpdu-switching {enable | disable}**

Syntax Definitions

instance	The flat mode CIST instance (bridge 1) or an existing 1x1 mode VLAN ID instance number (bridge 1–4094).
enable	Enables BPDU switching for the specified instance.
disable	Disables BPDU switching for the specified instance.

Defaults

By default, BPDU switching is disabled for an instance.

parameter	default
instance	CIST (flat mode)

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Specifying the BPDU switching status for a VLAN does not depend on the current VLAN Spanning Tree status. For example, setting the BPDU switching status to enabled is allowed on a VLAN that also has Spanning Tree enabled.
- The **bridge bpdu-switching** command is an implicit Spanning Tree command. When issued in the 1x1 mode, the *instance* number specified implies a VLAN ID. When issued in the flat mode, the *instance* number specified implies an MSTI number.
- If an *instance* is not specified with this command, the BPDU switching status is configured for the flat mode CIST instance by default regardless of which mode (flat or 1x1) is active on the switch.
- Note that if the switch is running in the flat mode, specifying a value greater than 1 for the *instance* returns an error message. BPDU switching is only configured for the flat mode instance (bridge 1), regardless of which protocol is active (STP, RSTP, or MSTP).

Examples

```
-> bridge mode flat
-> bridge bpdu-switching enable
-> bridge 1 bpdu-switching disable

-> bridge mode 1x1
-> bridge 100 bpdu-switching enable
-> bridge 100 bpdu-switching disable
```

Release History

Release 6.1; command introduced.

Related Commands

vlan stp	Enables or disables Spanning Tree instance for the specified VLAN.
show spantree	Displays VLAN Spanning Tree parameter values.

MIB Objects

```
vStpInsTable
   vStpInsBpduSwitching
```

bridge path cost mode

Configures the automatic selection of a 16-bit path cost for STP/RSTP ports and a 32-bit path cost for MSTP ports or sets all path costs to use a 32-bit value.

bridge path cost mode {auto | 32bit}

Syntax Definitions

auto	The port path cost value is automatically set depending on which protocol is active on the switch (32-bit for MSTP, 16-bit for STP/RSTP).
32bit	Specifies that a 32-bit value is used for the port path cost value regardless of which protocol is active on the switch.

Defaults

By default, the path cost mode is set to **auto**.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Note that all path cost values, except those for MSTIs, are reset to the default path cost value when this mode is changed.
- When connecting a switch running in the 32-bit path cost mode to a switch running in the 16-bit mode, the 32-bit switch has a higher path cost value and thus an inferior path cost to the 16-bit switch. To avoid this, use the **bridge path cost mode** command to change the 32-bit switch to a 16-bit switch.
- Note that when the protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values. The exception to this is if the path cost mode is set to 32-bit prior to the protocol change, the path cost is not reset to its default value

Examples

```
-> bridge path cost mode 32bit
-> bridge path cost mode auto
```

Release History

Release 6.1; command introduced.

Related Commands

bridge path cost	Defines a Spanning Tree path cost for a port.
bridge protocol	Configures the protocol for the flat mode CIST instance or a 1x1 mode VLAN instance.

MIB Objects

```
vStpBridge
   vStpPathCostMode
```

bridge auto-vlan-containment

Enables or disables Auto VLAN Containment (AVC). When enabled, AVC prevents a port that has no VLANs mapped to an Multiple Spanning Tree Instance (MSTI) from becoming the root port for that instance. Such ports are automatically assigned an infinite path cost value to make them an inferior choice for root port.

bridge [msti *msti_id***] auto-vlan-containment {enable | disable}**

Syntax Definitions

msti_id	An existing MSTI ID number (0–4094).
enable	Enables automatic VLAN containment.
disable	Disables automatic VLAN containment.

Defaults

By default, automatic VLAN containment is disabled.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The AVC feature is not active for any MSTI until it is globally enabled. To globally enable this feature, use the **bridge auto-vlan-containment** command but do not specify an *msti_ id*.
- When AVC is globally enabled, it is active for all MSTIs. To disable AVC for a single instance, use the **disable** form of this command and specify the *msti_id* for the instance.
- Use the **enable** form of this command and specify an *msti_id* to enable AVC for an instance that was previously disabled.
- An administratively set port path cost takes precedence and prevents AVC configuration of the path cost. The exception to this is if the port path cost is administratively set to zero, which resets the path cost to the default value.
- Note that when AVC is disabled that a port assigned to a VLAN not mapped to a specific instance can become the root port for that instance and cause a loss of connectivity between other VLANs.
- AVC does not have any effect on root bridges.

Examples

```
-> bridge auto-vlan-containment enable
-> bridge auto-vlan-containment disable
-> bridge msti 1 auto-vlan-containment disable
-> bridge msti 1 auto-vlan containment enable
```

Release History

Release 6.1.1; command introduced.

Related Commands

bridge path cost	Defines a Spanning Tree path cost for a port.
show spantree msti ports	Displays Spanning Tree port information for a flat mode Multiple Spanning Tree Instance (MSTI).

MIB Objects

```
vStpInsTable
   vStpInsAutoVlanContainment
vStpBridge
   vStpBridgeAutoVlanContainment
```

bridge port pvst+

Configures the type of BPDU to be used on a port when PVST+ mode is enabled.

bridge port {*slot/port* **|** *agg_num***} pvst+ {auto | enable | disable}**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
agg_num	Specifies the aggregate group.
auto	IEEE BPDUs are used until a PVST+ BPDU is detected.
enable	Specifies that PVST+ BPDUs can be used.
disable	Specifies that IEEE BPDUs can be used.

Defaults

parameters	default
auto | enable | disable	**auto**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- In order to handle PVST+ mode, the ports must be configured in 1x1 mode.
- Initially, a port sends or receive IEEE BPDUs. Once a PVST+ BPDU is received, the port sends and receives only PVST+ BPDUs for tagged VLANs and IEEE BPDUs for default VLANs.

Examples

```
-> bridge port 1/3 pvst+ enable
-> bridge port 2/2 pvst+ auto
```

Release History

Release 6.3.1; command introduced.

Related Commands

bridge mode 1x1 pvst+	Enables or disables PVST+ mode on the switch.

MIB Objects

```
vStpPortConfigTable
   vStpPortConfigIfIndex
   vStpPortConfigPVST
```

bridge

Enables or disables the Spanning Tree status on a single port or an aggregate of ports for the specified flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance.

bridge *instance* **{***slot/port* **|** *logical_port***} {enable | disable}**

Syntax Definitions

instance	The CIST instance number or an existing VLAN ID number (1–4094).
slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	The Link aggregate ID number (0–31).
enable	Enables Spanning Tree on the specified port for the specified instance.
disable	Disables Spanning Tree on the specified port for the specified instance.

Defaults

By default, the Spanning Tree status is enabled on eligible ports.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Specifying an instance number with this command when the switch is running in the 1x1 Spanning Tree mode implies a VLAN ID and configures the port Spanning Tree status for the associated VLAN instance.
- If the switch is running in the flat mode and STP or RSTP is the active protocol, enter 1 to specify the CIST instance. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted. In this case, use the **bridge cist** command instead.
- Note that for Multiple Spanning Tree Instances (MSTI), the port Spanning Tree status is inherited from the CIST instance and is not a configurable parameter.
- When STP is disabled on a port, the port is set to a forwarding state for the specified STP instance.
- If STP is disabled on a VLAN in the 1x1 mode, the port Spanning Tree status is ignored and all active ports associated with the VLAN are put in a forwarding state and not included in the Spanning Tree Algorithm. Note that ports at this point are *not* switching BPDU, unless the BPDU switching status for the VLAN is enabled.
- Physical ports that are reserved for link aggregation do not participate in the Spanning Tree Algorithm. Instead, the algorithm is applied to the aggregate logical link (virtual port) that represents a collection of physical ports.

Examples

```
-> bridge mode flat
-> bridge 1 4/1 disable
-> bridge 1 1/24 enable

-> bridge mode 1x1
-> bridge 255 5/10 enable
-> bridge 455 16 enable
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge cist	Explicit command for configuring the Spanning Tree status on a port or an aggregate of ports for the CIST instance when the switch is operating in either the 1x1 or flat mode.
bridge 1x1	Explicit command for configuring the Spanning Tree status on a port or an aggregate of ports for a VLAN instance when the switch is operating in either the 1x1 or flat mode.
vlan stp	Enables or disables the Spanning Tree instance for a VLAN.
bridge bpdu-switching	Enables or disables BPDU switching for the specified VLAN.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortEnable
```

bridge cist

Enables or disables the Spanning Tree status on a single port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance.

bridge cist {*slot/port* **|** *logical_port***} {enable | disable}**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	The Link aggregate ID number (0–31).
enable	Enables Spanning Tree on the specified port for the CIST instance.
disable	Disables Spanning Tree on the specified port for the CIST instance.

Defaults

By default, the Spanning Tree status is enabled on eligible ports.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the port Spanning Tree status for the flat mode CIST instance regardless of which operating mode (flat or 1x1) or protocol is active on the switch.
- If the switch is running in 1x1 mode when this command is used, the Spanning Tree status configured for the port is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- When the Spanning Tree status is disabled on a port, the port is set to a forwarding state for the specified instance.
- If STP is disabled on a VLAN in the 1x1 mode, the port Spanning Tree status is ignored and all active ports associated with the VLAN are put in a forwarding state and not included in the Spanning Tree Algorithm. Note that ports at this point are *not* switching BPDU, unless the BPDU switching status for the VLAN is enabled.
- Physical ports that are reserved for link aggregation do not participate in the Spanning Tree Algorithm. Instead, the algorithm is applied to the aggregate logical link (virtual port) that represents a collection of physical ports.

Examples

```
-> bridge mode flat
-> bridge cist 4/1 enable
-> bridge cist 16 enable

-> bridge mode 1x1
-> bridge cist 5/10 enable
-> bridge cist 22 enable
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge	Implicit command for configuring the Spanning Tree status on a port for the flat mode CIST instance or for a 1x1 mode VLAN instance.
bridge 1x1	Explicit command for configuring the Spanning Tree status on a port or an aggregate of ports for a VLAN instance when the switch is operating in either the 1x1 or flat mode.
vlan stp	Enables or disables the Spanning Tree instance for a VLAN.
bridge bpdu-switching	Enables or disables BPDU switching for the specified VLAN.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortEnable
```

bridge 1x1

Enables or disables the Spanning Tree status on a single port or an aggregate of ports for the specified VLAN instance.

bridge 1x1 *vid* **{***slot/port* **|** *logical_port***} {enable | disable}**

Syntax Definitions

vid	An existing VLAN ID number (1–4096).
slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	The Link aggregate ID number (0–31).
enable	Enables Spanning Tree on the specified port for the specified instance.
disable	Disables Spanning Tree on the specified port for the specified instance.

Defaults

By default, the Spanning Tree status is enabled on eligible ports.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the Spanning Tree status configured for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the 1x1 mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- When the Spanning Tree status is disabled on a port, the port is set to a forwarding state for the specified instance.
- If STP is disabled on a VLAN in the 1x1 mode, the port Spanning Tree status is ignored and all active ports associated with the VLAN are put in a forwarding state and not included in the Spanning Tree Algorithm. Note that ports at this point are *not* switching BPDU, unless the BPDU switching status for the VLAN is enabled.
- Physical ports that are reserved for link aggregation do not participate in the Spanning Tree Algorithm. Instead, the algorithm is applied to the aggregate logical link (virtual port) that represents a collection of physical ports.

Examples

```
-> bridge mode flat
-> bridge 1x1 2 4/1 enable
-> bridge 1x1 3 16 disable

-> bridge mode 1x1
-> bridge 1x1 2 5/10 enable
-> bridge 1x1 3 22 disable
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge	Implicit command for configuring the Spanning Tree status on a port for the flat mode CIST instance or for a 1x1 mode VLAN instance.
bridge cist	Explicit command for configuring the Spanning Tree status on a port or an aggregate of ports for the CIST instance when the switch is operating in either the 1x1 or flat mode.
vlan stp	Enables or disables Spanning Tree instance for the specified VLAN.
bridge bpdu-switching	Enables or disables BPDU switching for the specified VLAN.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortEnable
```

bridge priority

Configures the Spanning Tree priority for a single port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance. The Spanning Tree Algorithm uses the port priority value to determine the most favorable port when a bridge has multiple ports with the same path cost to the root bridge.

bridge *instance* **{***slot/port* | *logical_port***} priority** *priority*

Syntax Definitions

instance	The flat mode CIST instance or an existing VLAN ID number (1–4095).
slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
priority	Port priority value (0–15). The lower the number, the higher the priority.

Defaults

By default, the bridge port priority value is set to 7.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The port priority specifies the value of the priority field contained in the first byte of the Port ID. The second byte contains the physical switch port number.
- Specifying an instance number with this command when the switch is running in the 1x1 Spanning Tree mode implies a VLAN ID and configures the port priority value for the associated VLAN instance.
- If the switch is running in the flat mode and STP or RSTP is the active protocol, enter 1 to specify the CIST instance. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted. In this case, use the **bridge cist priority** command instead.

Examples

```
-> bridge mode flat
-> bridge 1 4/1 priority 0

-> bridge mode 1x1
-> bridge 255 1/24 priority 5
-> bridge 455 3/12 priority 15
```

Release History

Release 6.1; command introduced.

bridge cist priority	Explicit command for configuring the Spanning Tree priority for a port or an aggregate of ports for the CIST instance when the switch is operating in either the 1x1 or flat mode.
bridge msti priority	Explicit command for configuring the Spanning Tree priority for a port or an aggregate of ports for an MSTI when the switch is operating in either the 1x1 or flat mode.
bridge 1x1 priority	Explicit command for configuring the Spanning Tree priority for a port or an aggregate of ports for a VLAN instance when the switch is operating in either the 1x1 or flat mode.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortPriority
```

bridge cist priority

Configures the Spanning Tree priority value for a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance. The Spanning Tree algorithm uses the port priority value to determine the most favorable port when a bridge has multiple ports with the same path cost to the root bridge.

bridge cist {*slot/port* | *logical_port***} priority** *priority*

Syntax Definitions

slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
priority	Port priority value (0–15). The lower the number, the higher the priority.

Defaults

By default, the bridge port priority value is set to 7.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The port priority specifies the value of the priority field contained in the first byte of the Port ID. The second byte contains the physical switch port number.
- This command is an explicit Spanning Tree command that only applies to the port priority value for the flat mode CIST instance regardless of which operating mode (flat or 1x1) or protocol is active on the switch.
- If the switch is running in 1x1 mode when this command is used, the specified port priority value is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge mode flat
-> bridge cist 4/1 priority 2
-> bridge cist 10 priority 15

-> bridge mode 1x1
-> bridge cist 5/10 priority 1
-> bridge cist 16 priority 15
```

Release History

Release 6.1; command introduced.

bridge priority	Implicit command for configuring the Spanning Tree priority value for a port or an aggregate of ports that applies to the specified CIST or VLAN instance.
bridge msti priority	Explicit command for configuring the Spanning Tree priority value for a port or an aggregate of ports for an MSTI when the switch is operating in either the 1x1 or flat mode.
bridge 1x1 priority	Explicit command for configuring the Spanning Tree priority value for a port or an aggregate of ports for a VLAN instance when the switch is operating in either the 1x1 or flat mode.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortPriority
```

bridge msti priority

Configures the Spanning Tree priority value for a port or an aggregate of ports for the specified flat mode Multiple Spanning Tree Instance (MSTI). The Spanning Tree algorithm uses the port priority value to determine the most favorable port when a bridge has multiple ports with the same path cost to the root bridge.

bridge msti *msti_id* **{***slot/port* | *logical_port***} priority** *priority*

Syntax Definitions

msti_id	An existing MSTI ID number (0–4094).
slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
priority	Port priority value (0–15). The lower the number, the higher the priority.

Defaults

By default, the bridge port priority value is set to 7.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The port priority specifies the value of the priority field contained in the first byte of the Port ID. The second byte contains the physical switch port number.
- This command is an explicit Spanning Tree command that only applies to the specified MSTI regardless of which operating mode (flat or 1x1) is active on the switch. If MSTP is not the selected flat mode protocol, however, the port priority value for any MSTI is not configurable in either mode.
- Note that if zero is entered for the *msti_id* value, the specified priority value is applied to the CIST instance. The flat mode CIST instance 0 is also known as MSTI 0.
- The port priority value configured with this command is only applied to the specified MSTI. As a result, a single port can have different priority values for each instance. For example, in flat mode, port 1/24 can have a priority value of 7 for MSTI 2 and a priority value of 5 for MSTI 3.
- If the switch is running in 1x1 mode when this command is used, the specified priority value is not active for the specified MSTI until the operating mode for the switch is changed to the flat mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge mode flat
-> bridge msti 0 1/24 priority 12
-> bridge msti 2 1/24 priority 5

-> bridge mode 1x1
-> bridge msti 0 1/24 priority 12
-> bridge msti 2 1/24 priority 5
```

Release History

Release 6.1; command introduced.

bridge 1x1 priority	Explicit command for configuring the Spanning Tree priority value for a port or an aggregate of ports for a VLAN instance when the switch is operating in either the 1x1 or flat mode.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortPriority
```

bridge 1x1 priority

Configures the Spanning Tree priority value for a port or an aggregate of ports for the specified 1x1 mode VLAN instance. The Spanning Tree algorithm uses the port priority value to determine the most favorable port when a bridge has multiple ports with the same path cost to the root bridge.

bridge 1x1 *vid* **{***slot/port* | *logical_port***} priority** *priority*

Syntax Definitions

vid	An existing VLAN ID number (1–4096).
slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
priority	Port priority value (0–15). The lower the number, the higher the priority.

Defaults

By default, the bridge port priority value is set to 7.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The port priority specifies the value of the priority field contained in the first byte of the Port ID. The second byte contains the physical switch port number.
- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) or protocol is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified priority value for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the 1x1 mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge mode flat
-> bridge 1x1 100 4/1 priority 2
-> bridge 1x1 200 1/24 priority 4

-> bridge mode 1x1
-> bridge 1x1 255 5/10 priority 1
-> bridge 1x1 455 1/16 priority 15
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge priority	Implicit command for configuring the Spanning Tree priority value for a port or an aggregate of ports that applies to the specified CIST or VLAN instance.
bridge path cost	Explicit command for configuring the Spanning Tree priority value for a port or an aggregate of ports for the CIST instance when the switch is operating in either the 1x1 or flat mode.
bridge msti priority	Explicit command for configuring the Spanning Tree priority value for a port or an aggregate of ports for an MSTI when the switch is operating in either the 1x1 or flat mode.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortPriority
```

bridge path cost

Configures the Spanning Tree path cost value for a single port or an aggregate of ports that applies to the specified flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance. This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

bridge *instance* **{***slot/port* | *logical_port***} path cost** *path_cost*

Syntax Definitions

instance	The flat mode CIST instance or an existing VLAN ID number (0–4095).
slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
path_cost	Path cost value (0 - 65535 for 16-bit, 0–200000000 for 32-bit).

Defaults

By default, the path cost is set to zero.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Specifying an instance number with this command when the switch is running in the 1x1 Spanning Tree mode implies a VLAN ID and configures the port path cost for the associated VLAN instance.
- If the switch is running in the flat mode and STP (802.1D) or RSTP (802.1W) is the active protocol, enter 1 to specify the CIST instance. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted. In this case, use the **bridge cist path cost** command instead.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- Use the **bridge path cost mode** command to automatically select the path cost value based on the active Spanning Tree protocol (16-bit for STP and RSTP, 32-bit for MSTP) or to use a 32-bit path cost value regardless of which protocol is active.
- If a 32-bit path cost value is in use and the *path_cost* is set to zero, the following recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
10 MB	2,000,000
100 MB	200,000
1 GB	20,000
10 Gbps	2,000

- Is a 16-bit path cost value is in use and the *path_cost* is set to zero, the following IEEE 802.1D recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
4 Mbps	250
10 Mbps	100
16 Mbps	62
100 Mbps	19
1 Gbps	4
10 Gbps	2

- If a 32-bit path cost value is in use and the *path_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

- If a 16-bit path cost value is in use and the *path_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used. Note that for Gigabit ports the aggregate size is not applicable in this case:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 Mbps	2	60
	4	40
	8	30
100 Mbps	2	12
	4	9
	8	7
1 Gbps	N/A	3
10 Gbps	N/A	1

Examples

```
-> bridge mode flat
-> bridge 1 4/1 path cost 19
-> bridge 1 5/1 path cost 0

-> bridge mode 1x1
-> bridge 455 1/24 path cost 2000
-> bridge 955 3/12 path cost 500
```

Release History

Release 6.1; command introduced.

bridge 1x1 path cost	Explicit command for configuring the Spanning Tree path cost for a port or an aggregate of ports for a VLAN instance when the switch is operating in either the 1x1 or flat mode.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortPathCost
```

bridge cist path cost

Configures the Spanning Tree path cost value for a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance. This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

bridge cist {*slot/port* | *logical_port***} path cost** *path_cost*

Syntax Definitions

slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
path_cost	Path cost value (0 - 65535 for 16-bit, 0–200000000 for 32-bit).

Defaults

By default, the path cost is set to zero.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the port path cost value for the CIST instance regardless of which operating mode (flat or 1x1) or protocol is active on the switch.
- If the switch is running in 1x1 mode when this command is used, the specified path cost value is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- Use the **bridge path cost mode** command to automatically select the path cost value based on the active Spanning Tree protocol (16-bit for STP and RSTP, 32-bit for MSTP) or to use a 32-bit path cost value regardless of which protocol is active.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- If a 32-bit path cost value is in use and the *path_cost* is set to zero, the following recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
10 MB	2,000,000
100 MB	200,000
1 GB	20,000
10 Gbps	2,000

- Is a 16-bit path cost value is in use and the *path_cost* is set to zero, the following IEEE 802.1D recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
4 Mbps	250
10 Mbps	100
16 Mbps	62
100 Mbps	19
1 Gbps	4
10 Gbps	2

- If a 32-bit path cost value is in use and the *path_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

- If a 16-bit path cost value is in use and the *path_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used. Note that for Gigabit ports the aggregate size is not applicable in this case:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 Mbps	2	60
	4	40
	8	30
100 Mbps	2	12
	4	9
	8	7
1 Gbps	N/A	3
10 Gbps	N/A	1

Examples

```
-> bridge mode flat
-> bridge cist 4/1 path cost 19
-> bridge cist 16 path cost 12000

-> bridge mode 1x1
-> bridge cist 5/10 path cost 19
-> bridge cist 11 path cost 12000
```

Release History

bridge msti path cost	Explicit command for configuring the Spanning Tree path cost value for a port or an aggregate of ports for an MSTI when the switch is operating in either the 1x1 or flat mode.
bridge 1x1 path cost	Explicit command for configuring the Spanning Tree path cost value for a port or an aggregate of ports for a VLAN instance when the switch is operating in either the 1x1 or flat mode.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortPathCost
```

bridge msti path cost

Configures the Spanning Tree path cost value for a port or an aggregate of ports for the specified flat mode Multiple Spanning Tree Instance (MSTI). This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

bridge mist *msti_id* **{***slot/port* | *logical_port***} path cost** *path_cost*

Syntax Definitions

msti_id	An existing MSTI ID number (0–4094).
slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
path_cost	Path cost value (0 - 65535 for 16-bit, 0–200000000 for 32-bit).

Defaults

By default, the path cost is set to zero.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the specified MSTI regardless of which operating mode (flat or 1x1) is active on the switch. If MSTP is not the selected flat mode protocol, however, the path cost value for any MSTI is not configurable.
- Note that if zero is entered for the *msti_id* value, the specified path cost value is applied to the CIST instance. The flat mode CIST instance 0 is also known as MSTI 0.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- The path cost value configured with this command is only applied to the specified instance. As a result, a single port can have a different path cost for each instance. For example, in flat mode, port 1/24 can have a path cost of 20000 for MSTI 2 and a path cost of 200000 for MSTI 3.
- If the switch is running in 1x1 mode when this command is used, the specified path cost value is not active for the specified MSTI until the operating mode for the switch is changed to the flat mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- When MSTP is the active protocol on the switch, only a 32-bit path cost value is used. You cannot use a 16-bit path cost value is option when the MSTP protocol is active on the switch.

- If zero is entered for the *path_cost* value, then the following default path cost values are used based on the link speed:

Link Speed	IEEE 802.1D Recommended Value
10 MB	2,000,000
100 MB	200,000
1 GB	20,000
10 Gbps	2,000

- If the *path_cost* value for a link aggregate is set to zero, the following default values are used based on link speed and link aggregate size:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

Examples

```
-> bridge mode flat
-> bridge msti 0 4/1 path cost 200000
-> bridge msti 2 4/1 path cost 20000

-> bridge mode 1x1
-> bridge msti 0 1/24 path cost 200000
-> bridge msti 2 1/24 path cost 20000
```

```

bridge 1x1 path cost

Configures the Spanning Tree path cost value for a port or an aggregate of ports for the specified 1x1 mode VLAN instance. This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

bridge 1x1 *vid* **{***slot/port* | *logical_port***} path cost** *path_cost*

Syntax Definitions

vid	An existing VLAN ID number (1–4094).
slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
path_cost	Path cost value (0 - 65535 for 16-bit, 0–200000000 for 32-bit).

Defaults

By default, the path cost is set to zero.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified path cost for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the 1x1 mode.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- Use the **bridge path cost mode** command to automatically select the path cost value based on the active Spanning Tree protocol (16-bit for STP and RSTP, 32-bit for MSTP) or to use a 32-bit path cost value regardless of which protocol is active.
- All Spanning Tree commands are saved in their explicit format when a configuration snapshot is taken of the switch.
- If a 32-bit path cost value is in use and the *path_cost* is set to zero, the following IEEE 892.1S recommended default path cost values are used based on link speed:

Link Speed	IEEE 802.1D Recommended Value
10 MB	2,000,000
100 MB	200,000
1 GB	20,000
10 Gbps	2,000

- If a 16-bit path cost value is in use and the *path_cost* is set to zero, the following IEEE 802.1D recommended default path cost values are used based on the link speed:

Link Speed	IEEE 802.1D Recommended Value
4 Mbps	250
10 Mbps	100
16 Mbps	62
100 Mbps	19
1 Gbps	4
10 Gbps	2

- If a 32-bit path cost value is in use and the *path_cost* for a link aggregate is set to zero, the following default values are used based on the link speed and link aggregate size:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

- If a 16-bit path cost value is in use and the *path_cost* for a link aggregate is set to zero, the following default values are used based on the link speed and link aggregate size:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 Mbps	2	60
	4	40
	8	30
100 Mbps	2	12
	4	9
	8	7
1 Gbps	N/A	3
10 Gbps	N/A	1

Note. The aggregate size is not applicable for Gigabit ports when a 16-bit path cost value is set.

Examples

```
-> bridge mode flat
-> bridge 1x1 200 4/1 path cost 4
-> bridge 1x1 300 16 path cost 200000

-> bridge mode 1x1
-> bridge 1x1 400 5/10 path cost 19
-> bridge 1x1 500 1/24 path cost 20000
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge path cost	Implicit command for configuring the Spanning Tree path cost value for a port or an aggregate of ports that applies to the specified CIST or VLAN instance.
bridge cist path cost	Explicit command for configuring the Spanning Tree path cost value for a port or an aggregate of ports for the CIST instance when the switch is operating in either the 1x1 or flat mode.
bridge msti path cost	Explicit command for configuring the Spanning Tree path cost value for a port or an aggregate of ports for an MSTI when the switch is operating in either the 1x1 or flat Spanning Tree mode.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortPathCost
```

bridge mode

Configures Manual mode (forwarding or blocking) or Dynamic mode to manage the state of a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance. Dynamic mode defers the configuration of the port state to the Spanning Tree Protocol.

bridge *instance* **{***slot/port* | *logical_port***} mode {forwarding | blocking | dynamic}**

Syntax Definitions

instance	The CIST instance or an existing VLAN ID number (1–4094).
slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
forwarding	Set port state to forwarding.
blocking	Set port state to blocking.
dynamic	Port state is determined by Spanning Tree Protocol.

Defaults

By default, the port Spanning Tree mode is set to dynamic.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Specifying an instance number with this command when the switch is running the 1x1 Spanning Tree operating mode implies a VLAN ID and configures the port Spanning Tree mode (**forwarding**, **blocking**, or **dynamic**) for the associated VLAN instance.
- If the switch is running in the flat mode and STP (802.1D) or RSTP (802.1W) is the active protocol, enter 1 to specify the CIST instance. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted. In this case, use the **bridge cist mode** command instead.
- For Multiple Spanning Tree Instances (MSTI), the port Spanning Tree mode is inherited from the CIST instance. The spanning tree mode cannot be configured explicitly when the CIST instance is active.
- When a port state is manually set to forwarding or blocking, the port remains in that state until it is changed using this command.
- Ports manually configured to operate in a forwarding or blocking state do not participate in the Spanning Tree Algorithm.

Examples

```
-> bridge mode flat
-> bridge 1 4/1 mode forwarding

-> bridge mode 1x1
-> bridge 200 4/1 mode dynamic
-> bridge 300 1/24 mode forwarding
```

Release History

Release 6.1; command introduced.

Related Commands

bridge cist mode	Explicit command for configuring the Spanning Tree mode on a port or an aggregate of ports for the CIST instance when the switch is operating in either the 1x1 or flat mode.
bridge 1x1 mode	Explicit command for configuring the Spanning Tree mode on a port or an aggregate of ports for a VLAN instance when the switch is operating in either the 1x1 or flat mode.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortManualMode
```

bridge cist mode

Configures Manual mode (forwarding or blocking) or Dynamic mode to manage the state of a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance. Dynamic mode defers the management of the port state to the Spanning Tree algorithm.

bridge cist {*slot/port* | *logical_port***} mode {dynamic | blocking | forwarding}**

Syntax Definitions

slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
dynamic	Port state is determined by Spanning Tree algorithm.
blocking	Sets port state to blocking.
forwarding	Sets port state to forwarding.

Defaults

By default, the port Spanning Tree mode is set to dynamic.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the port Spanning Tree mode for the CIST instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in 1x1 mode when this command is used, the specified port mode is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- Ports manually configured to operate in a forwarding or blocking state do not participate in the Spanning Tree algorithm.
- When port state is manually set to forwarding or blocking, the port remains in that state until it is changed using this command.

Examples

```
-> bridge mode flat
-> bridge cist 4/1 mode forwarding
-> bridge cist 10 mode blocking

-> bridge mode 1x1
-> bridge cist 2/2 mode blocking
-> bridge cist 11 mode forwarding
```

Release History

Release 6.1; command introduced.

bridge 1x1 mode	Explicit command for configuring the Spanning Tree mode for a port or an aggregate of ports for the specified VLAN instance when the switch is operating in either the 1x1 or flat Spanning Tree mode.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortManualMode
```

bridge 1x1 mode

Configures Manual mode (forwarding or blocking) or Dynamic mode to manage the state of a port or an aggregate of ports for the specified 1x1 mode VLAN instance. Dynamic mode defers the management of the port state to the Spanning Tree algorithm.

bridge 1x1 *vid* **{***slot/port* | *logical_port***} mode {dynamic | blocking | forwarding}**

Syntax Definitions

vid	An existing VLAN ID number (1–4094).
slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
dynamic	Port state is determined by Spanning Tree algorithm.
blocking	Sets port state to blocking.
forwarding	Sets port state to forwarding.

Defaults

By default, the port Spanning Tree mode is set to dynamic.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified mode for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the 1x1 mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- Ports manually configured to operate in a forwarding or blocking state do not participate in the Spanning Tree algorithm.
- When port state is manually set to forwarding or blocking, the port remains in that state until it is changed using this command.

Examples

```
-> bridge mode flat
-> bridge 1x1 255 4/1 mode forwarding
-> bridge 1x1 355 1/24 mode dynamic

-> bridge mode 1x1
-> bridge 1x1 255 2/2 mode blocking
-> bridge 1x1 355 3/12 mode forwarding
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge mode	Implicit command for configuring the Spanning Tree mode for a port or an aggregate of ports for the CIST instance or for a VLAN instance.
bridge cist mode	Explicit command for configuring the Spanning Tree mode for a port or an aggregate of ports for the CIST instance when the switch is operating in either the 1x1 or flat Spanning Tree mode.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortManualMode
```

bridge connection

Configures the connection type for a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance.

bridge *instance* **{***slot/port* | *logical_port***} connection {noptp | ptp | autoptp}**

Syntax Definitions

instance	The flat mode CIST instance or an existing VLAN ID number (1–4094).
slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31). *This parameter is not available on OmniSwitch 6855 switches.*
noptp	Defines port connection type as no point-to-point link.
ptp	Defines port connection type as point-to-point link.
autoptp	Specifies that switch software automatically defines connection type as point-to-point or no point-to-point.

Defaults

By default the link connection type is set to auto point-to-point.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Specifying an instance number with this command when the switch is running the 1x1 Spanning Tree operating mode implies a VLAN ID and configures the port connection type for the associated VLAN instance.
- If the switch is running in the flat mode and STP or RSTP is the active protocol, enter 1 to specify the CIST instance. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted. In this case, use the **bridge cist connection** command instead.
- Note that for Multiple Spanning Tree Instances (MSTI), the port connection type is inherited from the CIST instance and is not a configurable parameter.
- A port is considered connected to a point-to-point LAN segment if the port belongs to a link aggregate of ports or if autonegotiation determines if the port should run in full duplex mode or if full duplex mode was administratively set. Otherwise, the port is considered connected to a no point-to-point LAN segment.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point-to-point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

Examples

```
-> bridge mode flat
-> bridge 1 1/24 connection noptp

-> bridge mode 1x1
-> bridge 200 8/2 connection ptp
-> bridge 300 10 connection autoptp
```

Release History

vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortAdminConnectionType
   vStpInsPortOperConnectionType
```

bridge cist connection

Configures the connection type for a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

bridge cist {*slot/port* **|** *logical_port***} connection {noptp | ptp | autoptp}**

Syntax Definitions

slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
noptp	Defines port connection type as no point-to-point link.
ptp	Defines port connection type as point-to-point link.
autoptp	Specifies that switch software automatically defines connection type as point-to-point or no point-to-point.

Defaults

By default, the link connection type is set to auto point-to-point.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the port connection type for the CIST instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in 1x1 mode when this command is used, the specified port connection type is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- A port is considered connected to a point-to-point LAN segment if the port belongs to a link aggregate of ports or if autonegotiation determines the port should run in full duplex mode or if full duplex mode was administratively set. Otherwise, the port is considered connected to a no point-to-point LAN segment.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point-to-point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

Examples

```
-> bridge mode flat
-> bridge cist 7/24 connection noptp

-> bridge mode 1x1
-> bridge cist 2/2 connection noptp
```

bridge 1x1 connection

Configures the connection type for a port or an aggregate of ports for a 1x1 mode VLAN instance.

bridge 1x1 *vid* **{***slot/port* | *logical_port***} connection {noptp | ptp | autoptp }**

Syntax Definitions

vid	An existing VLAN ID number (1–4094).
slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
noptp	Defines port connection type as no point-to-point link.
ptp	Defines port connection type as point-to-point link.
autoptp	Specifies that switch software automatically defines connection type as point-to-point or no point-to-point *and* whether or not the port is an edge port.

Defaults

By default, the link connection type is set to auto point-to-point.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified connection type for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the 1x1 mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- A port is considered connected to a point-to-point LAN segment if the port belongs to a link aggregate of ports or if autonegotiation determines the port should run in full duplex mode or if full duplex mode was administratively set. Otherwise, the port is considered connected to a no point-to-point LAN segment.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point-to-point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

Examples

```
-> bridge mode flat
```

```
-> bridge 1x1 255 7/24 connection noptp

-> bridge mode 1x1
-> bridge 1x1 200 2/2 connection noptp
```

Release History

Release 6.1; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch
bridge connection	Implicit command for configuring the Spanning Tree connection type for a port or an aggregate of ports for the CIST instance or for a VLAN instance.
bridge cist admin-edge	Configures the administrative edge port status for a port or aggregate of ports for the CIST instance.
bridge cist auto-edge	Configures whether or not Spanning Tree automatically determines the operational edge status of a port or an aggregate of ports for the CIST instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortAdminConnectionType
   vStpInsPortOperConnectionType
```

bridge cist admin-edge

Configures the administrative edge port status for a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

bridge cist {*slot/port* | *logical_port***} admin-edge {on | off | enable | disable}**

Syntax Definitions

slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
on	Turns on the administrative edge port status for the specified port-CIST instance.
off	Turns off the administrative edge port status for the specified port-CIST instance.
enable	Enables the administrative edge port status for the specified port-CIST instance.
disable	Disables the administrative edge port status for the specified port-CIST instance.

Defaults

By default, the administrative edge port status is disabled (off).

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the port connection type for the CIST instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the 1x1 mode when this command is used, the specified edge port status is not active for the CIST instance until the switch is configured to run in the flat Spanning Tree mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point-to-point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

- Configure ports that connect to a host (PC, workstation, server, and so on) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point-to-point connection type.

Examples

```
-> bridge mode flat
-> bridge cist 15 admin-edge enable
-> bridge cist 8/23 admin-edge disable

-> bridge mode 1x1
-> bridge cist 2/2 admin-edge enable
-> bridge cist 8/23 admin-edge off
```

Release History

Release 6.1.3; command introduced.

Related Commands

bridge 1x1 admin-edge	Configures the administrative edge port status for a port or an aggregate of ports for a specific VLAN instance.
bridge cist auto-edge	Configures whether or not Spanning Tree automatically determines the operational edge status of a port or an aggregate of ports for the flat mode CIST instance.
bridge 1x1 auto-edge	Configures whether or not Spanning Tree determines the operational edge port status for a port or an aggregate of ports for the specified 1x1 mode VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortAdminEdge
```

bridge 1x1 admin-edge

Configures the administrative edge port status for a port or an aggregate of ports for a 1x1 mode VLAN instance.

bridge 1x1 *vid* **{***slot/port* **|** *logical_port***} admin-edge {on | off | enable | disable}**

Syntax Definitions

vid	An existing VLAN ID number (1–4094).
slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
on	Turns on the administrative edge port status for the specified port-VLAN instance.
off	Turns off the administrative edge port status for the specified port-VLAN instance.
enable	Enables the administrative edge port status for the specified port-VLAN instance.
disable	Disables the administrative edge port status for the specified port-VLAN instance.

Defaults

By default, the administrative edge port status is disabled (off).

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified edge port status for the port is not active for the VLAN instance until the switch is configured to run in the 1x1 Spanning Tree mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as point-to-point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

- Configure ports that connect to a host (PC, workstation, server, and so on) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point-to-point connection type.

Examples

```
-> bridge mode flat
-> bridge 1x1 4 15 admin-edge on
-> bridge 1x1 255 8/23 admin-edge disable

-> bridge mode 1x1
-> bridge 1x1 3 2/2 admin-edge enable
-> bridge 1x1 255 10 admin-edge off
```

Release History

Release 6.1.3; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch
bridge cist admin-edge	Configures the administrative edge port status for a port or aggregate of ports for the CIST instance.

bridge 1x1 auto-edge	Configures whether or not Spanning Tree determines the operational edge port status for a port or an aggregate of ports for the specified 1x1 mode VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortAdminEdge
```

bridge cist auto-edge

Configures whether or not Spanning Tree automatically determines the operational edge port status of a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

bridge cist {*slot/port* | *logical_port***} auto-edge {on | off | enable | disable}**

Syntax Definitions

slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
on	Spanning Tree automatically determines edge port status.
off	Spanning Tree does not automatically determine edge port status.
enable	Spanning Tree automatically determines edge port status.
disable	Spanning Tree does not automatically determine edge port status.

Defaults

By default, automatic edge port status configuration is enabled (on).

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the CIST instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the 1x1 mode when this command is used, the specified edge port status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as point-to-point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point-to-point connection type.

Examples

```
-> bridge mode flat
-> bridge cist 15 auto-edge on
-> bridge cist 8/23 auto-edge disable

-> bridge mode 1x1
-> bridge cist 2/2 auto-edge enable
-> bridge cist 10 auto-edge off
```

Release History

Release 6.1.3; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch
bridge 1x1 auto-edge	Configures whether or not Spanning Tree determines the operational edge port status for a port or an aggregate of ports for the specified 1x1 mode VLAN instance.
bridge cist admin-edge	Configures the administrative edge port status for a port or aggregate of ports for the CIST instance.
bridge 1x1 admin-edge	Configures the administrative edge port status for a port or an aggregate of ports for a specific VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortAutoEdge
```

bridge 1x1 auto-edge

Configures whether or not Spanning Tree determines the operational edge port status for a port or an aggregate of ports for the specified 1x1 mode VLAN instance.

bridge 1x1 *vid* **{***slot/port* | *logical_port***} auto-edge {on | off | enable | disable}**

Syntax Definitions

vid	An existing VLAN ID number (1–4094).
slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
on	Spanning Tree automatically determines edge port status.
off	Spanning Tree does not automatically determine edge port status.
enable	Spanning Tree automatically determines edge port status.
disable	Spanning Tree does not automatically determine edge port status.

Defaults

By default, automatic edge port status configuration is enabled (on).

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified edge port status for the port is not active for the VLAN instance until the switch is running in the 1x1 Spanning Tree mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as point-to-point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point-to-point connection type.

Examples

```
-> bridge mode flat
-> bridge 1x1 3 15 auto-edge on
-> bridge 1x1 255 8/23 auto-edge disable

-> bridge mode 1x1
-> bridge 1x1 4 2/2 auto-edge enable
-> bridge 1x1 255 10 auto-edge off
```

Release History

Release 6.1.3; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge cist auto-edge	Configures whether or not Spanning Tree automatically determines the operational edge status of a port or an aggregate of ports for the CIST instance.
bridge cist admin-edge	Configures the administrative edge port status for a port or aggregate of ports for the CIST instance.
bridge 1x1 admin-edge	Configures the administrative edge port status for a port or an aggregate of ports for a specific VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortAutoEdge
```

bridge cist restricted-role

Configures whether or not to prevent a port (or an aggregate of ports) from becoming the root port. When this parameter is enabled, the port does not become the root even if the port is the most likely candidate for the root. Once another port is selected as the root port, the restricted port becomes the Alternate Port.

bridge cist {*slot/port* **|** *logical_port***} {restricted-role | root-guard} {on | off | enable | disable}**

Syntax Definitions

slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
root-guard	Optional command syntax. Enter **root-guard** instead of **restricted-role**; both parameters specify the same functionality for this command.
on	Turns on (enables) the restricted role status for the specified port.
off	Turns off (disables) the restricted role status for the specified port.
enable	Enables the restricted role status for the specified port.
disable	Disables the restricted role status for the specified port.

Defaults

By default, the port is not restricted from becoming the root port.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- When running in flat mode, this is a per-port setting and is applicable to any CIST or MSTI instances configured on that port.
- Note that preventing an eligible root port from becoming the root may impact connectivity within the network.
- Network administrators exclude certain ports from becoming the root to prevent bridges external to the core region of the network from influencing the Spanning Tree topology.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge mode flat
-> bridge cist 15 restricted-role on
-> bridge cist 8/23 root-guard disable

-> bridge mode 1x1
-> bridge cist 2/2 root-guard enable
-> bridge cist 10 restricted-role off
```

Release History

Release 6.1.3; command introduced.
Release 6.3.3; **root-guard** parameter was added.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge 1x1 restricted-role	Configures the restricted role status for a port or an aggregate of ports for the 1x1 mode VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortRestrictedRole
```

bridge 1x1 restricted-role

Configures whether or not to prevent a port (or an aggregate of ports) for the specified 1x1 mode VLAN instance from becoming the root port. When this parameter is enabled, the port does not become the root even if the port is the most likely candidate for the root. Once another port is selected as the root port, the restricted port becomes the Alternate Port.

bridge 1x1 *vid* **{***slot/port* | *logical_port***} {restricted-role | root-guard} {on | off | enable | disable}**

Syntax Definitions

vid	An existing VLAN ID number (1–4094).
slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
root-guard	Optional command syntax. Enter **root-guard** instead of **restricted-role**; both parameters specify the same functionality for this command.
on	Turns on (enables) the restricted role status for the specified port-VLAN instance.
off	Turns off (disables) the restricted role status for the specified port-VLAN instance.
enable	Enables the restricted role status for the specified port-VLAN instance.
disable	Disables the restricted role status for the specified port-VLAN instance.

Defaults

By default, the port is not restricted from becoming the root port.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Note that preventing an eligible port from becoming the root may impact connectivity within the network.
- Network administrators exclude certain ports from becoming the root to prevent bridges external to the core region of the network from influencing the Spanning Tree topology.
- This command is an explicit Spanning Tree command that only applies to the VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the restricted status of the port is not active for the VLAN instance until the switch is running in the 1x1 Spanning Tree mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge mode flat
-> bridge 1x1 3 15 restricted-role on
-> bridge 1x1 255 8/23 root-guard disable

-> bridge mode 1x1
-> bridge 1x1 4 2/2 root-guard enable
-> bridge 1x1 255 10 restricted-role off
```

Release History

Release 6.1.3; command introduced.
Release 6.3.3; **root-guard** parameter was added.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge cist restricted-role	Configures the restricted role status for a port or an aggregate of ports for the flat mode CIST instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortRestrictedRole
```

bridge cist restricted-tcn

Configures the restricted TCN status for a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST). When this parameter is enabled, the port does not propagate topology changes and notifications to/from other ports.

bridge cist {*slot/port* **|** *logical_port***} restricted-tcn {on | off | enable | disable}**

Syntax Definitions

slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
on	Turns on (enables) the restricted TCN status for the specified port-CIST instance.
off	Turns off (disables) the restricted TCN status for the specified port-CIST instance.
enable	Enables the restricted TCN status for the specified port-CIST instance.
disable	Disables the restricted TCN status for the specified port-CIST instance.

Defaults

By default, the restricted TCN status for the port is disabled.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enabling the restricted TCN status is used by network administrators to prevent bridges external to the core region of the network from causing unnecessary MAC address flushing in that region.
- Note that enabling the restricted TCN status for a port may impact Spanning Tree connectivity.
- This command is an explicit Spanning Tree command that only applies to the CIST instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the 1x1 mode when this command is used, the specified restricted TCN status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge mode flat
-> bridge cist 15 restricted-tcn on
-> bridge cist 8/23 restricted-tcn disable

-> bridge mode 1x1
-> bridge cist 2/2 restricted-tcn enable
-> bridge cist 10 restricted-tcn off
```

Release History

Release 6.1.3; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge 1x1 restricted-tcn	Configures the restricted TCN status for a port or an aggregate of ports for the specified 1x1 mode VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortRestrictedTcn
```

bridge 1x1 restricted-tcn

Configures the restricted TCN status for a port or an aggregate of ports for the specified 1x1 mode VLAN instance. When this parameter is enabled, the port does not propagate topology changes and notifications to/from other ports.

bridge 1x1 *vid* **{***slot/port* | *logical_port***} restricted-tcn {on | off | enable | disable}**

Syntax Definitions

vid	An existing VLAN ID number (1–4094).
slot/port	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	Link aggregate ID number (0–31).
on	Turns on (enables) the restricted TCN status for the specified port-VLAN instance.
off	Turns off (disables) the restricted TCN status for the specified port-VLAN instance.
enable	Enables the restricted TCN status for the specified port-VLAN instance.
disable	Disables the restricted TCN status for the specified port-VLAN instance.

Defaults

By default, the restricted TCN is set to disable.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enabling the restricted TCN status is used by network administrators to prevent bridges external to the core region of the network from causing unnecessary MAC address flushing in that region.
- Note that enabling the restricted TCN status for a port may impact Spanning Tree connectivity.
- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified restricted TCN status for the port is not active for the VLAN instance until the switch is running in the 1x1 Spanning Tree mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge mode flat
-> bridge 1x1 2 15 restricted-tcn on
-> bridge 1x1 255 8/23 restricted-tcn disable

-> bridge mode 1x1
-> bridge 1x1 5 2/2 restricted-tcn enable
-> bridge 1x1 255 10 restricted-tcn off
```

Release History

Release 6.1.3; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge cist restricted-tcn	Configures the restricted TCN status for a port or an aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortRestrictedTcn
```

bridge cist txholdcount

This command is used to rate limit the transmission of BPDU through a given port for the flat mode Common and Internal Spanning Tree (CIST) instance.

bridge cist txholdcount *value*

Syntax Definitions

value	A numeric value (1–10) that controls the transmission of BPDU through the port.

Defaults

By default, the **txholdcount** value is set to 3.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the CIST instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the 1x1 mode when this command is used, the specified **txholdcount** status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge cist txholdcount 3
```

Release History

Release 6.1.3; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge 1x1 txholdcount	Explicit command used to rate limit the transmission of BPDU for the specified VLAN instance when the switch is operating in either the 1x1 or flat Spanning Tree mode.

MIB Objects

```
vStpInsTable
   vStpInsBridgeTxHoldCount
```

bridge 1x1 txholdcount

Configures a rate limit value that controls the transmission of BPDU through a given port for the 1x1 mode VLAN instance.

bridge 1x1 *vid* **txholdcount {***value***}**

Syntax Definitions

value	A numeric value (1–10) that controls the transmission of BPDU through the port.

Defaults

By default, the **txholdcount** value is set to 3.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is an explicit Spanning Tree command that only applies to the specified VLAN instance regardless of which operating mode (flat or 1x1) is active on the switch.
- If the switch is running in the flat mode when this command is used, the specified **txholdcount** status for the port is not active for the VLAN instance until the switch is running in the 1x1 Spanning Tree mode.
- Note that when a configuration snapshot is taken of the switch, all Spanning Tree commands are saved in their explicit format.

Examples

```
-> bridge 1x1 3 txholdcount 3
```

Release History

Release 6.1.3; command introduced.

Related Commands

bridge mode	Selects the Spanning Tree operating mode (flat or 1x1) for the switch.
bridge cist txholdcount	Explicit command used to rate limit the transmission of BPDU for the CIST instance when the switch is operating in either the 1x1 or flat Spanning Tree mode.

MIB Objects

```
vStpInsTable
   vStpInsBridgeTxHoldCount
```

bridge rrstp

Enables or disables RRSTP on a switch.

bridge rrstp

no bridge rrstp

Syntax Definitions

N/A

Defaults

By default, RRSTP is disabled on the switch.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to disable RRSTP on the switch.
- RRSTP can be enabled on the switch only when the **flat** mode is active. If you try to enable RRSTP in 1x1 mode, you get an error message: “Failed to enable RRSTP because STP Mode is 1x1”.

Examples

```
-> bridge mode flat
-> bridge rrstp
-> no bridge rrstp

-> bridge mode 1x1
-> bridge rrstp
ERROR: Failed to enable Rrstp because STP Mode is 1x1
```

Release History

Release 6.2.1; command introduced.

Related Commands

bridge rrstp ring	Creates a RRSTP ring consisting of two ports.
show bridge rrstp configuration	Displays the current RRSTP status for the switch.

MIB Objects

```
vStpInfo
   VStpRrstpGlobalState
```

bridge rrstp ring

Creates a RRSTP ring consisting of two ports.

bridge rrstp ring *ring_id* **port1 {***slot/port* **| linkagg** *agg_num***} port2 {***slot/port* **| linkagg** *agg_num***} vlan-tag** *vlan_id* **[status {enable | disable}]**

no bridge rrstp ring [*ring_id***]**

Syntax Definitions

ring_id	A numeric value (1–128) that identifies the RRSTP ring.
slot/port	The slot number of the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
agg_num	The number corresponding to the static aggregate group. Must be a unique integer in the range 0–31.
vlan_id	VLAN identifier with which ring ports should be 802.1q tagged before ring creation.
enable	Enables the RRSTP ring.
disable	Disables the RRSTP ring**.**

Defaults

Parameters	Defaults
enable | disable	**disable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a specific RRSTP ring.
- This command is used to create a ring or modify ports in an existing ring or modify the ring status.
- The ring ports must be 802.1q tagged with the VLAN before using this command.
- Note that there can be no alternate connections for the same instance between any two switches within an RRSTP ring topology.
- If RRSTP ring consists of NNI ports then they must be tagged with SVLAN (VLAN stacking) and not with standard VLAN before ring creation. For tagged RRSTP frame generation same SVLAN must be specified as ring vlan-tag. Also RRSTP ring ports must be of same type (both ring ports should be NNI ports or both should be conventional ports).
- RRSTP ring cannot be created on UNI ports.

Examples

```
-> bridge rrstp ring 1 port1 1/1 port2 1/3 vlan-tag 10 status enable
-> no bridge rrstp ring 1
```

Release History

Release 6.2.1; command introduced.

Related Commands

bridge rrstp	Enables or disables RRSTP on a switch.
show bridge rrstp ring	Displays information for all the rings or a specific ring present in the system.

MIB Objects

```
vStpRrstpRingConfigTable
   vStpRrstpRingId
   vStpRrstpRingPort1
   vStpRrstpRingPort2
   vStpRrstpRingVlanTag
   vStpRrstpRingState
   vStpRrstpRingRowStatus
```

bridge rrstp ring vlan-tag

Modifies the unique VLAN tag associated with the ring. The previous ring VLAN tag is replaced when this command is used.

bridge rrstp ring *ring_id* **vlan-tag** *vid*

Syntax Definitions

ring_id	A numeric value (1–128) that identifies the RRSTP ring.
vid	The VLAN identification number of an existing VLAN with which ring ports are 802.1Q tagged. The RRSTP ring frames shall be 802.1Q tagged with this VLAN.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The RRSTP ring can have only one VLAN tag associated with it.
- Untagged RRSTP frames shall be generated if the specified **vlan-tag** is the default VLAN of the ports.
- The ring ports must be 802.1Q tagged with the new **vlan-tag** before modifying the ring **vlan-tag**.
- RRSTP frames have 802.1Q priority similar to STP BPDUs. In order to retain this priority, use the **qos trust ports** command.

Examples

```
-> bridge rrstp ring 1 vlan-tag 10
-> bridge rrstp ring 5 vlan-tag 20
-> bridge rrstp ring 11 vlan-tag 11
```

Release History

Release 6.3.1; command introduced.

Related Commands

bridge rrstp ring	Creates a RRSTP ring consisting of two ports.
show bridge rrstp ring	Displays information for all the rings or a specific ring present in the system.

MIB Objects

```
vStpRrstpRingConfigTable
   vStpRrstpRingId
   vStpRrstpRingVlanTag
```

bridge rrstp ring status

Modifies the RRSTP status of an existing ring.

bridge rrstp ring *ring_id* **status {enable | disable}**

Syntax Definitions

ring_id	A numeric value (1–128) that identifies the RRSTP ring.
enable	Enables the RRSTP ring.
disable	Disables the RRSTP ring**.**

Defaults

Parameters	Defaults
enable | disable	**disable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

The RRSTP status can also be modified by using the **bridge rrstp ring** command.

Examples

```
-> bridge rrstp ring 1 status enable
```

Release History

Release 6.3.1; command introduced.

Related Commands

bridge rrstp ring	Creates a RRSTP ring consisting of two ports.
show bridge rrstp ring	Displays information for all the rings or a specific ring present in the system.

MIB Objects

```
vStpRrstpRingConfigTable
   vStpRrstpRingId
   vStpRrstpRingState
   vStpRrstpRingRowStatus
```

show spantree

Displays Spanning Tree bridge information for the flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance.

show spantree [*instance***]**

Syntax Definitions

instance	The flat mode CIST instance or an existing VLAN ID number (1–4095).

Defaults

parameter	default
instance	all instances

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If an instance number is *not* specified, this command displays the Spanning Tree status, protocol, and priority values for all instances.
- Specifying an instance number with this command when the switch is running the 1x1 Spanning Tree operating mode implies a VLAN ID and displays Spanning Tree bridge information for the associated VLAN instance.
- If the switch is running in the flat mode and STP (802.1D) or RSTP (802.1W) is the active protocol, enter 1 to specify the CIST instance. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted. In this case, use the **show spantree cist** or **show spantree msti** commands instead.

Examples

```
-> bridge mode flat
-> bridge protocol rstp

-> show spantree
  Spanning Tree Path Cost Mode : AUTO
 Vlan STP Status Protocol Priority
-----+----------+--------+--------------
    1      ON       RSTP   32768 (0x8000)
  400      ON       RSTP   32768 (0x8000)
 4044      ON       RSTP   32768 (0x8000)
```

```
-> bridge protocol mstp
WARNING: Changing to MSTP(802.1s) resets flat bridge priority and path

-> show spantree

  Spanning Tree Path Cost Mode : AUTO
 Msti STP Status Protocol Priority (Prio:SysID)
-----+----------+--------+--------------------
    0      ON      MSTP   32768 (0x8000:0x0000)
    2      ON      MSTP   32770 (0x8000:0x0002)

-> show spantree 1

```

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (**32 BIT** or **AUTO**) Configured through the **bridge path cost mode** command.
VLAN	The VLAN ID when RSTP or STP mode is configured.
MSTI	The MSTI ID when MSTP mode is configured.
Bridge	The CIST instance, referred to as bridge 1 when either STP (802.1D) or RSTP (802.1W) is the active protocol in the flat mode.
STP Status / Spanning Tree Status	The Spanning Tree state for the CIST instance (**ON** or **OFF**).
Protocol	The Spanning Tree protocol applied to the instance (**STP** or **RSTP**). Configured through the **bridge protocol** command.
Mode	The Spanning Tree operating mode for the switch (**1x1** or **flat**). Configured through the **bridge mode** command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the **bridge priority** command.
Bridge ID	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
Designated Root	The bridge identifier for the root of the Spanning Tree for this instance.
Cost to Root Bridge	The cost of the path to the root for this Spanning Tree instance.
Root Port	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
Next Best Root Cost	The cost of the next best root port for this Spanning Tree instance.
Next Best Root Port	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.
Tx Hold Count	The count to limit the transmission of BPDU through the port.
Topology Changes	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
Topology age	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance (**hh:mm:ss** or **dd days and hh:mm:ss**).
Max Age	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. Configured through the **bridge max age** command.
Forward Delay	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. Configured through the **bridge forward delay** command.
Hello Time	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. Configured through the **bridge hello time** command.

output definitions (continued)

System Max Age	The Max Age value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.
System Hello Time	The Hello Time value for the root bridge.

show spantree cist

Displays the Spanning Tree bridge configuration for the flat mode Common and Internal Spanning Tree (CIST) instance.

show spantree cist

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guideline

This is an explicit Spanning Tree command that displays Spanning Tree bridge information for the flat mode CIST instance regardless of which mode (1x1 or flat) is active on the switch. Note that minimal information is displayed when this command is used in the 1x1 mode, as the CIST is not active in this mode. See second example below.

Examples

```
-> bridge mode flat
-> show spantree cist

Spanning Tree Parameters for Cist

```

output definitions

STP Status	The Spanning Tree state for the instance (**on** or **off**).
Protocol	The Spanning Tree protocol applied to the CIST (**STP, RSTP,** or **MSTP**). Configured through the **bridge protocol** command.
Mode	The Spanning Tree operating mode for the switch (**1x1** or **flat**). Configured through the **bridge mode** command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the **bridge priority** command.
Bridge ID	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
CST Designated Root	The bridge identifier for the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Cost to CST Root	The cost of the path to the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Next CST Best Cost	The cost of the next best root port for the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Designated Root	The bridge identifier for the root of the Spanning Tree for this instance.
Cost to Root Bridge	The cost of the path to the root for this Spanning Tree instance.
Root Port	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
Next Best Root Cost	The cost of the next best root port for this Spanning Tree instance.
Next Best Root Port	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.
Tx Hold Count	The count to limit the transmission of BPDU through the port.
Topology Changes	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
Topology age	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance (**hh:mm:ss** or **dd days and hh:mm:ss**).
Max Age	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. Configured through the **bridge max age** command.

output definitions (continued)

Forward Delay	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. Configured through the **bridge forward delay** command.
Hello Time	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. Configured through the **bridge hello time** command.
System Max Age	The Max Age value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.

Release History

Release 6.1; command introduced.
Release 6.1.3; **Tx Hold Count** field added.

Related Commands

show spantree	Implicit command for displaying the Spanning Tree bridge configuration for the flat mode CIST instance or a 1x1 mode VLAN instance.
show spantree msti	Explicit command for displaying the Spanning Tree bridge configuration for an MSTI regardless of which mode (1x1 or flat) is active on the switch.
show spantree 1x1	Explicit command for displaying the Spanning Tree bridge configuration for a VLAN instance regardless of which mode (1x1 or flat) is active on the switch.

show spantree msti

Displays Spanning Tree bridge information for a Multiple Spanning Tree Instance (MSTI).

show spantree msti [*msti_id***]**

Syntax Definitions

msti_id	An existing MSTI ID number (0-4094).

Defaults

parameter	default
instance	all MSTIs

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If an *msti_id* number is *not* specified, this command displays the Spanning Tree status, protocol, and priority values for all MSTIs.
- This is an explicit Spanning Tree command that displays Spanning Tree bridge information for an MSTI regardless of which mode (1x1 or flat) is active on the switch.
- Note that minimal information is displayed when this command is used in the 1x1 mode, as MSTIs are not active in this mode. In addition, this command fails if MSTP is not the selected flat mode protocol.
- Note that MSTI 0 also represents the CIST instance that is always present on the switch. To view the CIST instance using this command, specify zero (0) for the *msti_id* number.

Examples

```
-> bridge mode flat
-> bridge protocol mstp
-> show spantree msti
  Spanning Tree Path Cost Mode : AUTO
 Msti STP Status Protocol Priority (Prio:SysID)
-----+----------+--------+--------------------
    0      ON    MSTP   32768 (0x8000:0x0000)
    2      ON    MSTP   32770 (0x8000:0x0002)
    3      ON    MSTP   32771 (0x8000:0x0003)

-> show spantree msti 0

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (**32 BIT** or **AUTO**) Configured through the **bridge path cost mode** command.
Msti	The Multiple Spanning Tree Instance (MSTI) number. MSTI 0 represents the CIST. Configured through the **bridge msti** command.
STP Status	The Spanning Tree state for the instance (**ON** or **OFF**).
Protocol	The Spanning Tree protocol applied to the instance (**STP, RSTP,** or **MSTP**). This value is not configurable for an MSTI. Configured through the **bridge protocol** command.
Mode	The Spanning Tree operating mode for the switch (**1x1** or **flat**). Configured through the **bridge mode** command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the **bridge msti priority** command.
Bridge ID	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
CST Designated Root	The bridge identifier for the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Cost to CST Root	The cost of the path to the root for the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Next CST Best Cost	The cost of the next best root port for the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Designated Root	The bridge identifier for the root of the Spanning Tree for this instance.
Cost to Root Bridge	The cost of the path to the root for this Spanning Tree instance.
Root Port	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
Next Best Root Cost	The cost of the next best root port for this Spanning Tree instance.

output definitions (continued)

Next Best Root Port	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.
TxHoldCount	The count to limit the transmission of BPDU through the port.
Topology Changes	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
Topology age	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance (**hh:mm:ss** or **dd days and hh:mm:ss**).
Max Age	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. MSTIs inherit this value from the CIST instance.
Forward Delay	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. MSTIs inherit this value from the CIST instance.
Hello Time	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. MSTIs inherit this value from the CIST instance.
System Max Age	The Max Age value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.

Release History

Release 6.1; command introduced.
Release 6.1.3; **Tx Hold Count** field added.

Related Commands

show spantree	Implicit command for displaying the Spanning Tree bridge configuration for the flat mode CIST instance or a 1x1 mode VLAN instance.
show spantree cist	Explicit command for displaying the Spanning Tree bridge configuration for the CIST instance regardless of which mode (1x1 or flat) is active on the switch.
show spantree 1x1	Explicit command for displaying the Spanning Tree bridge configuration for a VLAN instance regardless of which mode (1x1 or flat) is active on the switch.

show spantree 1x1

Displays Spanning Tree bridge information for a 1x1 mode VLAN instance.

show spantree 1x1 [*vid***]**

Syntax Definitions

vid	An existing VLAN ID number (1-4094).

Defaults

parameter	default
vid	all VLAN instances

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If a *vid* number is *not* specified, this command displays the Spanning Tree status, protocol, and priority values for all VLAN instances.
- Specify a *vid* number with this command to display Spanning Tree bridge information for a specific VLAN instance.
- Specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (for example, **show spantree 1x1 10-15**). Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs— is allowed with this command. Multiple entries are not accepted.
- This is an explicit Spanning Tree command that displays Spanning Tree bridge information for a VLAN instance regardless of which mode (1x1 or flat) is active on the switch. Note that minimal information is displayed when this command is used in the flat mode, as VLAN instances are not active in this mode.

Examples

```
-> show spantree

  Spanning Tree Path Cost Mode : AUTO
Bridge STP Status Protocol Priority(Prio:SysID)
------+----------+--------+--------------------
    1      ON      RSTP   32768 (0x8000:0x0000)

-> show spantree 1x1
  Spanning Tree Path Cost Mode : AUTO

```

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (**32 BIT** or **AUTO**) Configured through the **bridge path cost mode** command.
Vlan	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the **vlan** commands
STP Status	The Spanning Tree state for the instance (**ON** or **OFF**).
Protocol	The Spanning Tree protocol applied to the VLAN instance (**STP** or **RSTP**). Note that MSTP is not supported for a VLAN instance. Configured through the **bridge protocol** command.
Mode	The Spanning Tree operating mode for the switch (**1x1** or **flat**). Configured through the **bridge mode** command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the **bridge priority** command.
Bridge ID	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.

output definitions (continued)

Designated Root	The bridge identifier for the root of the Spanning Tree for this instance.
Cost to Root Bridge	The cost of the path to the root for this Spanning Tree instance.
Root Port	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
Next Best Root Cost	The cost of the next best root port for this Spanning Tree instance.
Next Best Root Port	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.
Tx Hold Count	The count to limit the transmission of BPDU through the port.
Topology Changes	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
Topology age	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance (**hh:mm:ss** or **dd days and hh:mm:ss**).
Max Age	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. Configured through the **bridge max age** command.
Forward Delay	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. Configured through the **bridge forward delay** command.
Hello Time	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. Configured through the **bridge hello time** command.
System Max Age	The Max Age value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.

Release History

Release 6.1; command introduced.
Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.
Release 6.1.3; **Tx Hold Count** field added.
Release 6.4.4; **Loop Guard** and **Note** fields added.

Related Commands

show spantree	Implicit command for displaying the Spanning Tree bridge configuration for the flat mode CIST instance or a 1x1 mode VLAN instance.
show spantree cist	Explicit command for displaying the Spanning Tree bridge configuration for the CIST instance regardless of which mode (1x1 or flat) is active on the switch.
show spantree msti	Explicit command for displaying the Spanning Tree bridge information for an MSTI when the switch is operating in the 1x1 or flat Spanning Tree mode.

show spantree ports

Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance.

show spantree [*instance***] ports [forwarding | blocking | active | configured]**

Syntax Definitions

instance	The CIST instance or an existing VLAN ID number (1–4094).
forwarding	Displays Spanning Tree operational port parameters for ports that are forwarding for the specified instance.
blocking	Displays Spanning Tree operational port parameters for ports that are blocked for the specified instance.
active	Displays a list of active ports associated with the specified instance.
configured	Displays Spanning Tree administrative port parameters for all ports associated with the specified instance. Note that this parameter is only available if an *instance* value is specified with this command.

Defaults

parameter	default
instance	all instances
forwarding | blocking | active | configured	all ports

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If an instance number is *not* specified, this command displays the Spanning Tree operational status, path cost, and role for all ports and their associated instances.
- Specifying an instance number with this command when the switch is running the 1x1 Spanning Tree operating mode implies a VLAN ID and displays Spanning Tree port information for the associated VLAN instance.
- If the switch is running in the flat mode and STP (802.1D) or RSTP (802.1W) is the active protocol, enter 1 to specify the CIST instance. If MSTP is the active protocol, however, entering 1 for the instance number is not accepted. In this case, use the **show spantree cist ports** or **show spantree msti ports** commands instead.
- The **configured** keyword is only available when an instance number is specified with this command. In addition, this keyword cannot be used in combination with either the **forwarding** or **blocking** keywords.

Examples

```
-> show spantree 1x1

  Spanning Tree Path Cost Mode : AUTO
 ** Inactive 1x1 mode instances: **
 Vlan STP Status Protocol Priority
-----+----------+--------+-------------
    1      ON       RSTP   32768 (0x8000)
    2      ON       RSTP   32768 (0x8000)
    3      ON       RSTP   32768 (0x8000)

-> bridge mode flat
-> show spantree ports

output definitions

Vlan	The CIST instance, referred to as bridge 1 when either STP (802.1D) or RSTP (802.1W) is the active protocol in the flat mode.
Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Oper St	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: **disabled**, **blocking**, **learning**, and **forwarding**.
Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the **bridge path cost** command.
Desig Cost	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
Role	The role of the port for this Spanning Tree instance. Possible port roles are: **ROOT** - root, **DIS** - disable, **DESG** - designated, **ALT** - alternate**, MSTR** - master (valid only when MSTP mode is active), and **BKP** - backup.
Prim. Port	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
Op Cnx	Operational connection type: **PTP, NPT**, or **NS** (nonsignificant)**.** Shows the current operational state of the port connection type. See the **bridge connection** command for more information.
Op Edg	Operational connection type: **EDG.** Shows the current operational state of the port connection type. See the **bridge connection** command on page 6-95 for more information.
Loop Guard	Operational status of the loop-guard on a particular port or link aggregate (**ENA** or **DIS**)
Desig Bridge ID	The bridge identifier for the designated bridge for this port segment.
Note	Specifies if an Error has occured on the particular loop-guard enabled port. (**ERR**)

output definitions

Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Port Pri	The Spanning Tree priority for the port (0–15). The lower the number, the higher the priority. Configured through the **bridge priority** command.
Adm St	The Spanning Tree administrative status of the port: **enabled** or **disabled**. Configured through the **bridge** command to enable or disable Spanning Tree on a port.
Man. Mode	The manual mode setting for the port: **yes** indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; **no** indicates that the Spanning Tree Algorithm is managing the port state. Configured through the **bridge mode** command.
Config Cost	The configured path cost value for this port. Configured through the **bridge path cost** command.
Adm Cnx	The administrative connection type: **PTP, NPT,** or **AUT**. Configured through the **bridge connection** command.
Adm Edg	The edge port administrative status: **yes** indicates that the port is an admin edge port; **no** indicates that the port is not an admin edge port. Configured through the **bridge connection** command.
Aut Edg	The edge port automatic status: **yes** indicates that the port is an automatic edge port; **no** indicates that the port is not an automatic edge port. Configured through the **bridge cist auto-edge** or **bridge 1x1 auto-edge** command.
Rstr Tcn	The restricted TCN capability: **yes** indicates that the port supports the restricted TCN capability; **no** indicates that the port does not support the restricted TCN capability. Configured through the **bridge cist restricted-tcn** or **bridge 1x1 restricted-tcn** command.
Rstr Role	The restricted role port status: **yes** indicates that the port is a restricted role port; **no** indicates that the port is not a restricted role port. Configured through the **bridge cist restricted-role** or **bridge 1x1 restricted-role** command.
10G Opt.	Indicates whether the 10 GB port interoperability status is enabled (**ENA**) or disabled (**DIS**).

output definitions

PVST+ Cfg	Indicates the current PVST+ port configuration (**auto, enable** or **disable)**.
PVST+ Stat	Indicates the current status of the PVST+ port (**On** or **Off**).

output definitions

Msti	The Multiple Spanning Tree Instance (MSTI) instance number. Configured through the **bridge msti** command. **Note.** MSTI 0 also represents the CIST instance that is always present on the switch.
Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Oper Status	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: **DIS** - disabled, **BLOCK** - blocking, **LIST** - listening, **LEARN** - learning, and **FORW** - forwarding.
Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the **bridge path cost** command.
Role	The role of the port for this Spanning Tree instance. Possible port roles are: **ROOT -** root, **DIS -** disable, **DESG -** designated, **ALT -** alternate**, MSTR -** master (valid only when MSTP mode is active), and **BKP** - backup.
Loop Guard	Operational status of the loop-guard on a particular port or link aggregate (**ENA** or **DIS**).
Note	Indicates whether a loop-guard error (**ERR**) has occured on the MSTI instance.

output definitions

Vlan	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the **vlan** commands
Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Oper Status	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: **disabled**, **blocking**, **listening**, **learning**, and **forwarding**.
Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the **bridge path cost** command.
Desig Cost	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
Role	The role of the port for this Spanning Tree instance. Possible port roles are: **ROOT** - root, **DIS** - disable, **DESG** - designated, **ALT** - alternate**, MSTR** - master (valid only when MSTP mode is active), and **BKP** - backup.
Prim. Port	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
Op Cnx	Operational connection type: **PTP, NPT**, or **NS** (nonsignificant)**.** Shows the current operational state of the port connection type. See the **bridge connection** command for more information.

output definitions (continued)

Op Edg	Operational connection type: **EDG.** Shows the current operational state of the port connection type. See the **bridge connection** command on page 6-95 for more information.
Desig Bridge ID	The bridge identifier for the designated bridge for the port segment.
Loop Guard	Operational status of the loop-guard on a particular port or link aggregate (**ENA** or **DIS**)
Note	Specifies if an Error has occured on the particular loop-guard enabled port. (**ERR**)

output definitions

Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Port Pri	The Spanning Tree priority for the port. The lower the number, the higher the priority. Configured through the **bridge priority** command.
Adm St	The Spanning Tree administrative status of the port: **enabled** or **disabled**. Configured through the **bridge** command to enable or disable Spanning Tree on a port.
Man. Mode	The manual mode setting for the port: **yes** indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; **no** indicates that the Spanning Tree Algorithm is managing the port state. Configured through the **bridge mode** command.
Config Cost	The configured path cost value for this port. Configured through the **bridge path cost** command.
Adm Cnx	The administrative connection type: **PTP, NPT,** or **AUT.** Configured through the **bridge connection** command.
Adm Edg	The edge port administrative status: **yes** indicates that the port is an admin edge port; **no** indicates that the port is not an admin edge port. Configured through the **bridge connection** command.
Aut Edg	The edge port automatic status: **yes** indicates that the port is an automatic edge port; **no** indicates that the port is not an automatic edge port. Configured through the **bridge cist auto-edge** or **bridge 1x1 auto-edge** command.
Rstr Tcn	The restricted TCN capability: **yes** indicates that the port supports the restricted TCN capability; **no** indicates that the port does not support the restricted TCN capability. Configured through the **bridge cist restricted-tcn** or **bridge 1x1 restricted-tcn** command.

output definitions (continued)

Rstr Role	The restricted role port status: **yes** indicates that the port is a restricted role port; **no** indicates that the port is not a restricted role port. Configured through the **bridge cist restricted-role** or **bridge 1x1 restricted-role** command.
OS8800 10G Opt.	Indicates whether the 10 GB port interoperability status is enabled (**ENA**) or disabled (**DIS**).
PVST+ Cfg	Indicates the current PVST+ port configuration (**auto, enable** or **disable)**.
PVST+ Stat	Indicates the current status of the PVST+ port (**On** or **Off**).

Release History

Release 6.1; command introduced.
Release 6.3.1; **PVST+** field added.
Release 6.4.4;**Loop Guard** and **Note** fields added.

Related Commands

show spantree cist ports	Implicit command for displaying Spanning Tree port information for the flat mode CIST when the switch is operating in the 1x1 or flat Spanning Tree mode.
show spantree msti ports	Explicit command for displaying Spanning Tree port information for an MSTI when the switch is operating in the 1x1 or flat Spanning Tree mode.
show spantree 1x1 ports	Explicit command for displaying Spanning Tree port information for a VLAN instance when the switch is operating in the 1x1 or flat Spanning Tree mode.

show spantree cist ports

Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance.

show spantree cist ports [forwarding | blocking | active | configured]

Syntax Definitions

forwarding	Displays Spanning Tree operational port parameters for ports that are forwarding for the CIST instance.
blocking	Displays Spanning Tree operational port parameters for ports that are blocked for the CIST instance.
active	Displays a list of active ports associated with the specified instance.
configured	Displays Spanning Tree administrative port parameters for the CIST instance.

Defaults

parameter	default
forwarding | blocking | active | configured	all ports

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This is an explicit Spanning Tree command that displays Spanning Tree port information for the flat mode CIST instance regardless of which mode (1x1 or flat) is active on the switch.
- Note that minimal information is displayed when this command is used in the 1x1 mode, as the CIST is not active in this mode.

Examples

```
-> show spantree cist ports

show spantree msti ports

Displays Spanning Tree port information for a flat mode Multiple Spanning Tree Instance (MSTI).

show spantree msti [*msti_id***] ports [forwarding | blocking | active | configured]**

Syntax Definitions

msti_id	An existing MSTI ID number (0-4094).
forwarding	Displays Spanning Tree operational port parameters for ports that are forwarding for the CIST instance.
blocking	Displays Spanning Tree operational port parameters for ports that are blocked for the CIST instance.
active	Displays a list of active ports associated with the specified instance.
configured	Displays Spanning Tree administrative port parameters for the CIST instance.

Defaults

parameter	default
msti_id	all MSTIs
forwarding | blocking | active | configured	all ports

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If an *msti_id* number is *not* specified, this command displays the Spanning Tree port operational status, path cost, and role values for all associated MSTIs.
- This is an explicit Spanning Tree command that displays Spanning Tree port information for an MSTI regardless of which mode (1x1 or flat) is active on the switch.
- The **configured** keyword is only available when an instance number is specified with this command. In addition, this keyword cannot be used in combination with either the **forwarding** or **blocking** keywords.

Note.

- Minimal information is displayed when this command is used in the 1x1 mode, as MSTIs are not active in this mode. In addition, if MSTP is not the selected flat mode protocol, this command fails.
- MSTI 0 also represents the CIST instance that is always present on the switch. To view the CIST instance using this command, specify zero (0) for the *msti_id* number.

Examples

```
-> show spantree msti ports

Msti  Port   Oper Status  Path Cost   Role   Loop Guard   Note
-----+------+------------+-----------+-----+------------+---------
0      1/1     DIS          0           DIS     DIS

output definitions

Msti	The Multiple Spanning Tree Instance (MSTI) number. MSTI 0 represents the CIST. Configured through the **bridge msti** command.
Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Oper St	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: **disabled**, **blocking**, **listening**, **learning**, and **forwarding**.
Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the **bridge msti path cost** command.

output definitions (continued)

Desig Cost	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
Role	The role of the port for this Spanning Tree instance. Possible port roles are: **ROOT -** root, **DIS -** disable, **DESG -** designated, **ALT -** alternate**, MSTR -** master (valid only when MSTP mode is active), and **BKP** - backup.
Prim. Port	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
Op Cnx	Operational connection type: **PTP, NPT**, or **NS** (nonsignificant). Shows the current operational state of the port connection type. See the **bridge connection** command for more information.
Op Edg	Operational connection type: **EDG.** Shows the current operational state of the port connection type. See the **bridge connection** command on page 6-95 for more information.
Loop Guard	Operational status of the loop-guard on a particular port or link aggregate (**ENA** or **DIS**).
Desig Bridge ID	The bridge identifier for the designated bridge for this port segment.
Note	Indicates whether a loop-guard error (**ERR**) has occured on the MSTI instance.

```

output definitions

Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Port Pri	The Spanning Tree priority for the port (0–15). The lower the number, the higher the priority. Configured through the **bridge msti priority** command.

output definitions (continued)

Adm St	The Spanning Tree administrative status of the port: **enabled** or **disabled**. Configured through the **bridge** command to enable or disable Spanning Tree on a port.
Man. Mode	The manual mode setting for the port: **yes** indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; **no** indicates that the Spanning Tree Algorithm is managing the port state. Configured through the **bridge mode** command.
Config Cost	The configured path cost value for this port. Configured through the **bridge msti path cost** command.
Adm Cnx	The administrative connection type: **PTP, NPT,** or **AUT.** Configured through the **bridge connection** command.
Adm Edg	The edge port administrative status: **yes** indicates that the port is an admin edge port; **no** indicates that the port is not an admin edge port**.** Configured through the **bridge connection** command.
Aut Edg	The edge port automatic status: **yes** indicates that the port is an automatic edge port; **no** indicates that the port is not an automatic edge port. Configured through the **bridge cist auto-edge** or **bridge 1x1 auto-edge** command.
Rstr Tcn	The restricted TCN capability: **yes** indicates that the port supports the restricted TCN capability; **no** indicates that the port does not support the restricted TCN capability. Configured through the **bridge cist restricted-tcn** or **bridge 1x1 restricted-tcn** command.
Rstr Role	The restricted role port status: **yes** indicates that the port is a restricted role port; **no** indicates that the port is not a restricted role port. Configured through the **bridge cist restricted-role** or **bridge 1x1 restricted-role** command.
OS8800 10G Opt.	Indicates whether the 10 GB port interoperability status is enabled (**ENA**) or disabled (**DIS**).

show spantree 1x1 ports

Displays Spanning Tree port information for a 1x1 mode VLAN instance.

show spantree 1x1 [*vid*] ports [forwarding | blocking | active | configured]

Syntax Definitions

vid	An existing VLAN ID number (1-4094).
forwarding	Displays Spanning Tree operational port parameters for ports that are forwarding for the CIST instance.
blocking	Displays Spanning Tree operational port parameters for ports that are blocked for the CIST instance.
active	Displays a list of active ports associated with the specified instance.
configured	Displays Spanning Tree administrative port parameters for the CIST instance.

Defaults

parameter	default
vid	all VLAN instances
forwarding | blocking | active | configured	all ports

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If a *vid* number is *not* specified, this command displays the Spanning Tree port operational status, path cost, and role values for all VLAN instances.
- Specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (for example, **show spantree 1x1 10-15 ports**). Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs— is allowed with this command. Multiple entries are not accepted.
- This is an explicit Spanning Tree command that displays Spanning Tree port information for a VLAN instance regardless of which mode (1x1 or flat) is active on the switch.
- Note that minimal information is displayed when this command is used in the flat mode, as VLAN instances are not active in this mode.
- The **configured** keyword is only available when an instance number is specified with this command. In addition, this keyword cannot be used in combination with either the **forwarding** or **blocking** keywords.

Examples

```
-> show spantree 1X1 ports

output definitions

Vlan	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the **vlan** commands
Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Oper St	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: **disabled**, **blocking**, **listening**, **learning**, and **forwarding**.
Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the **bridge 1x1 path cost** command.
Desig Cost	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
Role	The role of the port for this Spanning Tree instance. Possible port roles are: **ROOT -** root, **DIS -** disable, **DESG -** designated, **ALT -** alternate**, MSTR -** master (valid only when MSTP mode is active), and **BKP** - backup.
Prim. Port	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
Op Cnx	Operational connection type: **PTP, NPT**, or **NS** (nonsignificant). Shows the current operational state of the port connection type. See the **bridge connection** command for more information.
Op Edg	Operational connection type: **EDG.** Shows the current operational state of the port connection type. See the **bridge connection** command on page 6-95 for more information.
Loop Guard	Operational status of the loop-guard on a particular port or link aggregate (**ENA** or **DIS**).
Desig Bridge ID	The bridge identifier for the designated bridge for the segment related to this port.
Note	Indicates whether a loop-guard error (**ERR**) has occured on the MSTI instance.

output definitions

Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Port Pri	The Spanning Tree priority for the port (0–15). The lower the number, the higher the priority. Configured through the **bridge 1x1 priority** command.
Adm St	The Spanning Tree administrative status of the port: **enabled** or **disabled**. Configured through the **bridge** command to enable or disable Spanning Tree on a port.
Man. Mode	The manual mode setting for the port: **yes** indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; **no** indicates that the Spanning Tree Algorithm is managing the port state. Configured through the **bridge mode** command.
Config Cost	The configured path cost value for this port. Configured through the **bridge 1x1 path cost** command.
Adm Cnx	The administrative connection type: **PTP, NPT,** or **AUT**. Configured through the **bridge connection** command.
Adm Edg	The edge port administrative status: **yes** indicates that the port is an admin edge port; **no** indicates that the port is not an admin edge port**.** Configured through the **bridge connection** command.

output definitions (continued)

Aut Edg	The edge port automatic status: **yes** indicates that the port is an automatic edge port; **no** indicates that the port is not an automatic edge port. Configured through the **bridge cist auto-edge** or **bridge 1x1 auto-edge** command.
Rstr Tcn	The restricted TCN capability: **yes** indicates that the port supports the restricted TCN capability; **no** indicates that the port does not support the restricted TCN capability. Configured through the **bridge cist restricted-tcn** or **bridge 1x1 restricted-tcn** command.
Rstr Role/Root Guard	The restricted status of the port: **Yes** indicates that the port is restricted from becoming the root; **No** indicates that the port is not restricted from becoming the root. Configured through the **bridge cist restricted-role** or **bridge 1x1 restricted-role** command.
10G Opt.	Indicates whether the 10 GB port interoperability status is enabled (**ENA**) or disabled (**DIS**).
PVST+ Cfg	The type of BPDU used on the port: **AUTO** indicates that IEEE BPDUs are used until a PVST+ BPDU is detected; **ENA** indicates that PVST+ BPDUs are used; **DIS** indicates that IEEE BPDUs are used. Configured through the **bridge port pvst+** command.
PVST+ Stat	Indicates whether or not the PVST+ interoperability status is enabled (**ENA**) or disabled (**DIS**) for the port. Configured throught the command.

Release History

Release 6.1; command introduced.
Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.
Release 6.1.3; fields added.
Release 6.3.3; fields added.
Release 6.4.4; **Loop Guard** and **Note** output fields added.

Related Commands

show spantree ports	Implicit command for displaying Spanning Tree port information for the flat mode CIST instance or a 1x1 mode VLAN instance.
show spantree cist ports	Explicit command for displaying Spanning Tree port information for a CIST instance when the switch is operating in the 1x1 or flat Spanning Tree mode.
show spantree msti ports	Explicit command for displaying Spanning Tree port information for an MSTI when the switch is operating in the 1x1 or flat Spanning Tree mode.

show spantree mst region

Displays the Multiple Spanning Tree (MST) region information for the switch.

show spantree mst region

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Three MST region attributes (configuration name, revision level, and configuration digest) define an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same values for these attributes are all considered part of the same region. Currently each switch can belong to one MST region at a time.
- This command is available when the switch is operating in either the 1x1 or flat Spanning Tree mode.

Examples

```
-> show spantree mst region

 Configuration Name       = ,
 Revision Level           = 0,
 Configuration Digest     = 0xac36177f 50283cd4 b83821d8 ab26de62,
 Revision Max hops        = 20,
 Cist Instance Number     = 0
```

output definitions

Configuration Name	An alphanumeric string that identifies the name of the MST region. Use the **bridge mst region name** command to define this value.
Revision Level	A numeric value that identifies the MST region revision level for the switch.
Configuration Digest	An MST region identifier consisting of a 16 octet hex value (as per the IEEE 802.1Q 2005 standard) that represents all defined MSTIs and their associated VLAN ranges. Use the **bridge msti** and **bridge msti vlan** commands to define VLAN to MSTI associations.

output definitions (continued)

Revision Max hops	The number of maximum hops authorized for region information. Configured through the **bridge mst region max hops** command.
Cist Instance Number	The number of the CIST instance, which is currently zero as there is only one region per switch. Therefore, only one CIST exists per switch. **Note:** This instance is known as the flat mode instance and is known as bridge 1 when using STP or RSTP.

Release History

Release 6.1; command introduced.

Related Commands

show spantree msti vlan-map	Displays the range of VLANs associated to the specified MSTI.
show spantree cist vlan-map	Displays the range of VLANs associated to the CIST instance.
show spantree map-msti	Displays the MSTI that is associated to the specified VLAN

MIB Objects

```
vStpMstRegionTable
   vStpMstRegionNumber
   vStpMstRegionConfigDigest
   vStpMstRegionConfigName
   vStpMstRegionConfigRevisionLevel
   vStpMstRegionCistInstanceNumber
   vStpMstRegionMaxHops
```

show spantree msti vlan-map

Displays the range of VLANs associated with the specified Multiple Spanning Tree Instance (MSTI).

show spantree mst [*msti_id***] vlan-map**

Syntax Definitions

msti_id	An existing MSTI ID number (0–4094).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If an *msti_id* is not specified, then the VLAN to MSTI mapping for all defined MSTIs is displayed.
- This command is available when the switch is operating in either the 1x1 or flat Spanning Tree mode.
- Initially all VLANs are associated with the flat mode CIST instance (also known as MSTI 0).

Examples

```
-> show spantree msti vlan-map

 Cist
 Name                :
 VLAN list           : 1-9,14-4094

 Msti 1
 Name                :
 VLAN list           : 10-11

 Msti 2
 Name                :
 VLAN list           : 12-13

-> show spantree msti 2 vlan-map

 Spanning Tree Msti Vlan map
----------------------------

 Msti 2
 Name                :
 VLAN list           : 12-13
```

output definitions

Cist Instance	Identifies MSTI VLAN mapping information for the CIST instance.
Msti	The MSTI ID number that identifies an association between a Spanning Tree instance and a range of VLANs.
Name	An alphanumeric value that identifies an MSTI name. Use the **bridge msti** command to define an MSTI name.
VLAN list	The range of VLAN IDs that are associated with this MSTI.

Release History

Release 6.1; command introduced.

Related Commands

show spantree mst region	Displays the MST region information for the switch.
show spantree cist vlan-map	Displays the range of VLANs associated to the CIST instance.

MIB Objects

```
vStpMstInstanceTable
   vStpMstInstanceNumber
   vStpMstInstanceName
   vStpMstInstanceVlanBitmapState
```

show spantree cist vlan-map

Displays the range of VLANs associated with the flat mode Common and Internal Spanning Tree (CIST) instance.

show spantree cist vlan-map

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is available when the switch is operating in either the 1x1 or flat Spanning Tree mode.
- Initially all VLANs are associated with the flat mode CIST instance 0 (also known as MSTI 0).

Examples

```
-> show spantree cist vlan-map

Cist
  Name          : ,
  VLAN list     : 1-9,14-4094
```

output definitions

Name	An alphanumeric value that identifies the name of the CIST. Use the **bridge msti** command to define a name for this instance.
VLAN list	The range of VLAN IDs that are associated with the CIST instance.

Release History

Release 6.1; command introduced.

Related Commands

show spantree mst region	Displays the MST region information for the switch.
show spantree msti vlan-map	Displays the range of VLANs associated to the specified MSTI.

   vStpMstInstanceNumber
   vStpMstInstanceName
   vStpMstInstanceVlanBitmapState
```

show spantree map-msti

Displays the Multiple Spanning Tree Instance (MSTI) that is associated to the specified VLAN.

show spantree mst *vid* **vlan-map**

Syntax Definitions

vid	An existing VLAN ID number (1–4094).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command is available when the switch is operating in either the 1x1 or flat Spanning Tree mode.
- Initially all VLANs are associated with the flat mode CIST instance (also known as MSTI 0).

Examples

```
-> show spantree 200 map-msti

 Vlan   Msti/Cist(0)
------+--------------------------
   200     0
```

Release History

Release 6.1; command introduced.

Related Commands

show spantree mst region	Displays the MST region information for the switch.
show spantree msti vlan-map	Displays the range of VLANs associated to the specified MSTI.
show spantree cist vlan-map	Displays the range of VLANs associated to the CIST instance.

MIB Objects

```
vStpMstVlanAssignmentTable
   vStpMstVlanAssignmentVlanNumber
   vStpMstVlanAssignmentMstiNumber
```

show spantree mst port

Displays a summary of Spanning Tree connection information and instance associations for the specified port or a link aggregate of ports.

show spantree mst port {*slot/port* **|** *logical_port***}**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
logical_port	The link aggregate ID number (0–31).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Note. MST 0 also represents the flat mode CIST instance, that all ports are associated with when the switch is running in the flat Spanning Tree mode.

Examples

```
-> bridge mode flat
-> show spantree mst port 1/2

MST   Role   State Pth Cst  Edge Boundary Op Cnx Loop Guard  Note  Vlans
-----+------+-----+--------+----+--------+------+----------+------+-----
    0   DIS    DIS      0    YES    YES     NS         DIS           1

-> bridge mode 1x1
-> show spantree mst port 1/10
MST   Role   State Pth Cst  Edge Boundary Op Cnx Loop Guard  Note  Vlans
-----+------+-----+--------+----+--------+------+----------+------+-----
    0   ROOT  ENA        0   YES    YES     NS         DIS           1
    2   DIS   DIS        0   YES    YES     NS         DIS
```

output definitions

MST	Indicates the MSTI ID.
Role	The role of the port for this Spanning Tree instance. Possible port roles are: **ROOT -** root, **DIS -** disable, **DESG -** designated, **ALT -** alternate**, MSTR -** master (valid only when MSTP mode is active), and **BKP -** backup.

output definitions

State	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: **disabled**, **blocking**, **listening**, **learning**, and **forwarding**.
Pth Cst	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.
Edge	Indicates whether or not the port is an **edge port** (**YES** or **NO**).
Boundary	Indicates whether or not the port is a **boundary port** (**YES** or **NO**). A boundary port connects an MST bridge to a LAN that belongs to a different MST region.
Op Cnx	Operational connection type: **PTP, NPT**, or **NS** (nonsignificant)**.** Shows the current operational state of the port connection type. See the **bridge connection** command for more information.
Loop Guard	Operational status of the loop-guard on a particular port or link aggregate (**ENA** or **DIS**)
Note	Indicates whether a loop-guard error (**ERR**) has occured on the MSTI instance.
Vlans	The VLAN ID of the default VLAN for the port.

Release History

Release 6.1; command introduced.

Related Commands

show spantree cist ports	Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance.
show spantree msti ports	Displays Spanning Tree port information for a flat mode Multiple Spanning Tree Instance (MSTI).
show spantree 1x1 ports	Displays Spanning Tree port information for a 1x1 mode VLAN instance.

MIB Objects

```
vStpPortConfigTable
   vStpPortConfigIfIndex
   vStpPortConfigLoopGuard

vStpInsTable
   vStpIns1x1VlanNumber

vStpPortTable
   vStpPortState
   vStpPortPathCost
   vStpPortRole
```

show bridge rrstp configuration

Displays the current RRSTP status for the switch.

show bridge rrstp configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

```
-> show bridge rrstp configuration
RRSTP Global state is Enabled
```

Release History

Release 6.2.1; command introduced.

Related Commands

bridge rrstp	Enables or disables RRSTP on a switch.
show bridge rrstp ring	Displays information for all the rings or a specific ring present in the system.

MIB Objects

```
vStpInfo
   VStpRrstpGlobalState
```

show bridge rrstp ring

Displays information for all the rings or for a specific ring that exists in the switch configuration.

show bridge rrstp ring [*ring_id***]**

Syntax Definitions

ring_id	An existing ring ID number (1–128).

Defaults

By default displays information for all rings.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the *ring_id* parameter with this command to display information for a specific ring.

Examples

```
-> show bridge rrstp ring

      RingId     Vlan-Tag     Ring-Port1     Ring-Port2     Ring Status
  -----------+------------+---------------+--------------+---------------
       2          1000          1/19           1/10         enabled
       6            20           1/1            1/8        disabled
     128             1           0/1           0/31         enabled
```

output definitions

RingId	The numeric ID of the RRSTP ring.
Vlan-Tag	The VLAN to which the RRSTP ring frames are tagged.
Ring-Port-1	The first port in the RRSTP ring.
Ring-Port-2	The second port in the RRSTP ring.
Ring Status	The current state of the RRSTP ring (**Enabled** or **Disabled**).

Release History

Release 6.2.1; command introduced.
Release 6.3.1; **ring** parameter and **Vlan-Tag** field added.

Related Commands

bridge rrstp ring	Creates a RRSTP ring consists of two ports.
show bridge rrstp configuration	Displays the current RRSTP status for the switch.

MIB Objects

```
vStpRrstpRingConfigTable
   vStpRrstpRingId
   vStpRrstpRingPort1
   vStpRrstpRingPort2
   vStpRrstpRingVlanTag
   vStpRrstpRingState
   vStpRrstpRingRowStatus
```

7 Link Aggregation Commands

Link aggregation is a way of combining multiple physical links between two switches into one logical link. The aggregate group operates within Spanning Tree as one virtual port and can provide more bandwidth than a single link. It also provides redundancy. If one physical link in the aggregate group goes down, link integrity is maintained.

There are two types of aggregate groups: static and dynamic. Static aggregate groups are manually configured on the switch with static links. Dynamic groups are set up on the switch but they aggregate links as necessary according to the Link Aggregation Control Protocol (LACP).

The dynamic aggregation software is compatible only with the following IEEE standard:

802.3ad — Aggregation of Multiple Link Segments

MIB information for the link aggregation commands is as follows:

Filename: AlcatelIND1LAG.MIB
Module: ALCATEL-IND1-LAG-MIB

A summary of available commands is listed here:

Static link aggregates	**static linkagg size** **static linkagg name** **static linkagg admin state** **static agg agg num**
Dynamic link aggregates	**lacp linkagg size** **lacp linkagg name** **lacp linkagg admin state** **lacp linkagg actor admin key** **lacp linkagg actor system priority** **lacp linkagg actor system id** **lacp linkagg partner system id** **lacp linkagg partner system priority** **lacp linkagg partner admin key** **lacp agg actor admin key** **lacp agg actor admin state** **lacp agg actor system id** **lacp agg actor system priority** **lacp agg partner admin state** **lacp agg partner admin system id** **lacp agg partner admin key** **lacp agg partner admin system priority** **lacp agg actor port priority** **lacp agg partner admin port** **lacp agg partner admin port priority** **lacp linkagg wait-to-restore-timer**
Dual Home Link (DHL) Active-Standby	**lacp agg standby** **lacp linkagg pre-empt** **lacp linkagg pre-empt timer**
Dual Home Link (DHL) Active-Active	**dhl num** **dhl num linka linkb** **dhl num admin-state** **dhl num vlan-map linkb** **dhl num pre-emption-time** **dhl num mac-flushing** **show dhl** **show dhl num** **show dhl num link**
Static and dynamic	**show linkagg** **show linkagg port** **linkagg range** **show linkagg range**

static linkagg size

Creates a static aggregate group between two switches. A static aggregate group contains static links. Creates a static linkagg, where size, admin state and name are local to the chassis links.

static linkagg *agg_num* **size** *size* **[name** *name***] [admin state {enable | disable}] [multi-chassis active] min-size** *num***]**

no static linkagg *agg_num*

Syntax Definitions

agg_num	The number corresponding to the static aggregate group. Must be a unique integer in the range 0–31 (stackable products) or 0–127 (chassis-based products).
size	The maximum number of links allowed in the aggregate group. Values may be 2, 4, or 8.
name	The name of the static aggregate group. May be any alphanumeric string up to 255 characters long. Spaces must be contained within quotes. For example, “Static Group 1”.
on	Specifies that the static aggregate group is active and is able to aggregate links.
off	Specifies that the static aggregate group is inactive and not able to aggregate links.
enable	Specifies that the static aggregate group is active and is able to aggregate links.
disable	Specifies that the static aggregate group is inactive and not able to aggregate links.
multi-chassis active	Specifies that the aggregate qualifies as MC-LAG.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a static aggregate group from the configuration.
- The maximum number of link aggregate groups allowed on the switch (static and dynamic combined) is 32 for stackable products and 128 for chassis-based products.

- Note that a maximum of 256 link aggregation ports are supported. The number of link aggregation ports per group will determine the maximum number of groups that can be configured. The table below provides some example configurations:

Number of Ports in Group	Maximum Number of Groups
2	128
4	64
8	32

- If the static aggregate has any attached ports you must delete the attached ports with the **static agg agg num** command before you can remove the static link aggregate ID.
- Use the **lacp linkagg size** command to create a dynamic aggregation (that is, LACP) group. See page 4-197 for more information about this command.
- The **multi-chassis active** parameter must be specified at aggregate creation time. It must not be changeable while the aggregate exists after its creation.
- The **multi-chassis active** parameter should be set on both the chassis if it is a MC-LAG.

Examples

```
-> static linkagg 3 size 8 multi-chassis active
-> static linkagg 4 size 2 admin state disable
-> no static linkagg 3
```

Release History

Release 6.1; command was introduced.
Release 6.4.5; **multi-chassis active** parameter added.

Related Commands

show linkagg	Displays information about static and dynamic (LACP) link aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggSize
   alclnkaggAggLacpType
   alclnkaggAggMcLagType
   alclnkaggAggName
   alclnkaggAggAdminState
```

static linkagg name

Configures a name for an existing static aggregate group.

static linkagg *agg_num* **name** *name*

static linkagg *agg_num* **no name**

Syntax Definitions

agg_num	The number corresponding to the static aggregate group.
name	The name of the static aggregation group, an alphanumeric string up to 255 characters. Spaces must be contained within quotes (for example, “Static Group 1”).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the **no** form of this command to remove a name from a static aggregate.

Examples

```
-> static linkagg 2 name accounting
-> static linkagg 2 no name
```

Release History

Release 6.1; command was introduced.

Related Commands

static linkagg size	Creates a static aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggName
```

static linkagg admin state

Configures the administrative state (whether the static aggregate group is active or inactive) of a static aggregate group.

static linkagg *agg_num* **admin state {enable | disable}**

Syntax Definitions

agg_num	The number corresponding to the static aggregate group.
enable	Specifies that the static aggregate group is active and is able to aggregate links.
disable	Specifies that the static aggregate group is inactive and not able to aggregate links.

Defaults

parameter	default
enable | **disable**	enable

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

When the administrative state is set to **disable**, the static aggregate group is disabled.

Examples

```
-> static linkagg 2 admin state disable
```

Release History

Release 6.1; command was introduced.

Related Commands

static linkagg size	Creates a static aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggAdminState
```

static agg agg num

Configures a slot and port for a static aggregate group.

static agg [ethernet | fastethernet | gigaethernet] *slot/port* **agg num** *agg_num*

static agg no [ethernet | fastethernet | gigaethernet] *slot/port*

Syntax Definitions

ethernet	Documents that the port is 10 Mbps Ethernet.
fastethernet	Documents that the port is 100 Mbps Fast Ethernet.
gigaethernet	Documents that the port is Gigabit Ethernet.
slot	The slot number for this aggregate.
port	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
agg_num	The number corresponding to the static aggregate group.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove one or more ports from a static aggregate group.
- Mobile ports cannot be aggregated.
- A port may belong to only one aggregate group.
- Ports in a static aggregate must all be the same speed. For example, all 10 Mbps, all 100 Mbps, all 1 Gigabit, or all 10 Gigabit).
- Ports that belong to the same static aggregate group do not have to be configured sequentially and can be on any Network Interface (NI) or unit within a stack.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See Chapter 1, "Ethernet Port Commands," for information on CLI commands to configure Ethernet ports.

Examples

```
-> static agg 2/1 agg num 4
-> static agg no 2/1
```

Release History

Release 6.1; command was introduced.

Related Commands

static linkagg size	Creates a static aggregate group.
show linkagg port	Displays information about link aggregation ports.

MIB Objects

```
alclnkaggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortLacpType
   alclnkaggAggPortSelectedAggNumber
```

lacp linkagg size

Creates a dynamic aggregate group that uses the Link Aggregation Control Protocol (LACP) to establish and maintain link aggregation. The **size** parameter is required to create the link aggregate group.

lacp linkagg *agg_num* **size** *size*
[name *name***]**
[admin state {enable | disable}]
[actor admin key *actor_admin_key***]**
[actor system priority *actor_system_priority***]**
[actor system id *actor_system_id***]**
[partner system id *partner_system_id***]**
[partner system priority *partner_system_priority***]**
[partner admin key *partner_admin_key***]**
[multi-chassis active]

no lacp linkagg *agg_num*

Syntax Definitions

agg_num	The number corresponding to the dynamic aggregate group. Must be a unique integer in the range 0–31 (stackable products) or 0–127 (chassis-based products).
size	The maximum number of links that may belong to the aggregate. Values may be 2, 4, or 8.
name	The name of the dynamic aggregate group. May be any alphanumeric string up to 255 characters long. Spaces must be contained within quotes (for example, “Dynamic Group 1”).
multi-chassis active	Specifies that the aggregate qualifies as MC-LAG.
enable	Specifies that the dynamic aggregate group is active and is able to aggregate links.
disable	Specifies that the dynamic aggregate group is inactive and not able to aggregate links.
actor_admin_key	The administrative key value associated with the dynamic aggregate group. Possible values are 0–65535.
actor_system_priority	The priority of the dynamic aggregate group. Possible values are 0–65535.
actor_system_id	The MAC address of the dynamic aggregate group on the switch.
partner_system_id	The MAC address of the remote system’s aggregate group to which the switch’s aggregate group is attached.
partner_system_priority	The priority of the remote system to which the aggregation group is attached. Possible values are 0–65535.
partner_admin_key	The administrative key for the aggregation group’s remote partner. Possible values are 0–65535.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a dynamic aggregate group from the configuration.
- The maximum number of link aggregate groups allowed on the switch (static and dynamic combined) is 32 for stackable products and 128 for chassis-based products.
- Note that a maximum of 256 link aggregation ports are supported. The number of link aggregation ports per group will determine the maximum number of groups that can be configured. The table below provides some example configurations:

Number of Ports in Group	Maximum Number of Groups
2	**128**
4	**64**
8	**32**

- If the dynamic group has any attached ports, you must disable the group with the **lacp linkagg admin state** command before you can delete it.
- Optional parameters for the dynamic aggregate group may be configured when the aggregate is created or the dynamic aggregate group may be modified later.
- Use the **static linkagg size** command to create static aggregate groups. See page 4-191 for more information about this command.

Examples

```
-> lacp linkagg 2 size 4 multi-chassis active
-> lacp linkagg 3 size 2 admin state disable actor system priority 65535
```

Release History

Release 6.1; command was introduced.

Related Commands

show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

`alclnkaggAggTable`

```
alclnkaggAggNumber
alclnkaggAggSize
alclnkaggAggLacpType
alclnkaggAggName
alclnkaggAggMcLagType
alclnkaggAggAdminState
alclnkaggAggActorAdminKey
alclnkaggAggActorSystemPriority
alclnkaggAggActorSystemID
alclnkaggAggPartnerSystemID
alclnkaggAggPartnerSystemPriority
alclnkaggAggPartnerAdminKey
```

lacp linkagg name

Configures a name for a dynamic aggregate group.

lacp linkagg *agg_num* **name** *name*

lacp linkagg *agg_num* **no name**

Syntax Definitions

agg_num	The number corresponding to the dynamic aggregate group.
name	The name of the dynamic aggregate group. May be any alphanumeric string up to 255 characters long. Spaces must be contained within quotes (for example, “Dynamic Group 1”).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the **no** form of this command to remove a name from a dynamic aggregate group.

Examples

```
-> lacp linkagg 2 name finance
-> lacp linkagg 2 no name
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggName
```

lacp linkagg admin state

Configures the administrative state of the dynamic aggregate (whether it is up and active, or down and inactive) group.

lacp linkagg *agg_num* **admin state {enable | disable}**

Syntax Definitions

agg_num	The number corresponding to the dynamic aggregate group.
enable	Specifies that the dynamic aggregate group is active and is able to aggregate links.
disable	Specifies that the operation of a dynamic aggregate group cannot be performed.

Defaults

parameter	default
enable | **disable**	enable

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

When the administrative state is set to **disable**, the operation of a dynamic aggregation (LACP) group cannot be performed.

Examples

```
-> lacp linkagg 2 admin state disable
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.
show linkagg port	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggAdminState
```

lacp linkagg actor admin key

Configures the administrative key associated with a dynamic aggregate group.

lacp linkagg *agg_num* **actor admin key** *actor_admin_key*

lacp linkagg *agg_num* **no actor admin key**

Syntax Definitions

agg_num	The number corresponding to the dynamic aggregate group.
actor_admin_key	The administrative key value associated with the dynamic aggregate group. The valid range is 0–65535.

Defaults

parameter	default
actor_admin_key	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the **no** form of this command to remove an actor admin key from a dynamic aggregate group.

Examples

```
-> lacp linkagg 3 actor admin key 2
-> lacp linkagg 3 no actor admin key
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggActorAdminKey
```

lacp linkagg actor system priority

Configures the priority of the dynamic aggregate group.

lacp linkagg *agg_num* **actor system priority** *actor_system_priority*

lacp linkagg *agg_num* **no actor system priority**

Syntax Definitions

agg_num	The number corresponding to the link aggregate group.
actor_system_priority	The priority of the switch's dynamic aggregate group in relation to other aggregate groups. Possible values are 0–65535.

Defaults

parameter	default
actor_system_priority	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to return the value to its default.
- Ports with the same system priority value can join the same dynamic aggregate group.

Examples

```
-> lacp linkagg 3 actor system priority 100
-> lacp linkagg 3 no actor system priority
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggActorSystemPriority
```

lacp linkagg actor system id

Configures the MAC address of a dynamic aggregate group on the switch.

lacp linkagg *agg_num* **actor system id** *actor_system_id*

lacp linkagg *agg_num* **no actor system id**

Syntax Definitions

agg_num	The number corresponding to the dynamic aggregate group.
actor_system_id	The MAC address of the dynamic aggregate group on the switch in the hexadecimal format *xx:xx:xx:xx:xx:xx*.

Defaults

parameter	default
actor_system_id	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the **no** form of this command to remove an actor system ID from a dynamic aggregate group.

Examples

```
-> lacp linkagg 3 actor system id 00:20:da:81:d5:b0
-> lacp linkagg 3 no actor system id
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggActorSystemID
```

lacp linkagg partner system id

Configures the MAC address of the remote system's dynamic aggregate group to which the local switch's dynamic aggregate group is attached.

lacp linkagg *agg_num* **partner system id** *partner_system_id*

lacp linkagg *agg_num* **no partner system id**

Syntax Definitions

agg_num	The number corresponding to the dynamic aggregate group on the switch.
partner_system_id	The MAC address of the remote switch's dynamic aggregate group in the hexadecimal format *xx:xx:xx:xx:xx:xx*.

Defaults

parameter	default
partner_system_id	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a partner system ID from a dynamic aggregate group.
- The *partner_system_id* and the *partner_system_priority* specify the remote system's priority.

Examples

```
-> lacp linkagg 2 partner system id 00:20:da4:32:81
-> lacp linkagg 2 no partner system id
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggPartnerSystemID
```

lacp linkagg partner system priority

Configures the priority of the remote switch's dynamic aggregate group to which the local switch's aggregate group is attached.

lacp linkagg *agg_num* **partner system priority** *partner_system_priority*

lacp linkagg *agg_num* **no partner system priority**

Syntax Definitions

agg_num	The number corresponding to the dynamic aggregate group.
partner_system_priority	The priority of the remote switch's dynamic aggregate group to which the local switch's aggregate group is attached. Possible values are 0–65535.

Defaults

parameter	default
partner_system_priority	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the **no** form of this command to return to the priority value to its default.

Examples

```
-> lacp linkagg 3 partner system priority 65535
-> lacp linkagg 3 no partner system priority
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggPartnerSystemPriority
```

lacp linkagg partner admin key

Configures the administrative key for the dynamic aggregation group's remote partner.

lacp linkagg *agg_num* **partner admin key** *partner_admin_key*

lacp linkagg *agg_num* **no partner admin key**

Syntax Definitions

agg_num	The number corresponding to the dynamic aggregate group.
partner_admin_key	The administrative key for the dynamic aggregation group's remote partner. Possible values are 0–65535.

Defaults

parameter	default
partner_admin_key	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the **no** form of this command to remove a partner admin key from a dynamic aggregate group.

Examples

```
-> lacp linkagg 3 partner admin key 1
-> lacp linkagg 3 no partner admin key
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggPartnerAdminKey
```

lacp agg actor admin key

Configures an actor administrative key for a port, which allows the port to join a dynamic aggregate group.

lacp agg [ethernet | fastethernet | gigaethernet] *slot/port* **actor admin key** *actor_admin_key*
[actor admin state {[[no] active] [[no] timeout] [[no] aggregate] [[no] synchronize] [[no] collect] [[no] distribute] [[no] default] [[no] expire] | none}]
[actor system id *actor_system_id***]**
[actor system priority *actor_system_priority***]**
[partner admin system id *partner_admin_system_id***]**
[partner admin key *partner_admin_key***]**
[partner admin system priority *partner_admin_system_priority***]**
[partner admin state {[[no] active] [[no] timeout] [[no] aggregate] [[no] synchronize] [[no] collect] [[no] distribute] [[no] default] [[no] expire] | none}]
[actor port priority *actor_port_priority***]**
[partner admin port *partner_admin_port***]**
[partner admin port priority *partner_admin_port_priority***]**

lacp agg no [ethernet | fastethernet | gigaethernet] *slot/port*

Syntax Definitions

ethernet	Documents that the port is 10 Mbps Ethernet.
fastethernet	Documents that the port is 100 Mbps Fast Ethernet.
gigaethernet	Documents that the port is Gigabit Ethernet.
slot	The slot number for this aggregate.
port	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
actor_admin_key	The administrative key associated with this dynamic aggregate group. Possible values are 0–65535.
actor admin state	See the **lacp agg actor admin state** command on page 4-213.
actor_system_id	The MAC address of this dynamic aggregate group on the switch.
actor_system_priority	The priority of the dynamic aggregate group. Possible values are 0–255.
partner_admin_system_id	The MAC address of the remote switch's dynamic aggregate group.
partner_admin_key	The administrative key for the dynamic aggregation group's remote partner. Possible values are 0–65535.
partner_admin_system_priority	The priority of the remote system to which the dynamic aggregation group is attached. Possible values are 0–255.
partner admin state	See the **lacp agg partner admin state** command on page 4-219.
actor_port_priority	The priority of the actor port. Possible values are 0–255.

partner_admin_port	The administrative state of the partner port. Possible values are 0–65535.
partner_admin_port_priority	The priority of the partner port. Possible values are 0–255.

Defaults

parameter	default
[active] [timeout]	active, timeout, aggregate

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a slot and port from a dynamic aggregate group.
- Mobile ports cannot be aggregated.
- A port may belong to only one aggregate group.
- Ports in a dynamic aggregate must all be in the same speed (for example, all 100 Mbps. 1 Gigabit. or all 10 Gigabit).
- Ports that belong to the same dynamic aggregate group do not have to be configured sequentially and can be on any Network Interface (NI).
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See Chapter 1, "Ethernet Port Commands," for information on CLI commands to configure Ethernet ports.

Examples

```
-> lacp agg 3/1 actor admin key 0
-> lacp agg no 3/1
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregates.

MIB Objects

```

alclnkaggAggPortActorPortPriority
alclnkaggAggPortPartnerAdminPort
alclnkaggAggPortPartnerAdminPortPriority
```

lacp agg actor admin state

Configures the system administrative state of the slot and port for the dynamic aggregate group on the local switch. The state values correspond to bits in the actor state octet in the LACPDU frame.

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port* **actor admin state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}**

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port*
actor admin state {[[no] active] [[no] timeout] [[no] aggregate] [[no] synchronize] [[no] collect] [[no] distribute] [[no] default] [[no] expire] | none}

Syntax Definitions

ethernet	Documents that the port is 10 Mbps Ethernet.
fastethernet	Documents that the port is 100 Mbps Fast Ethernet.
gigaethernet	Documents that the port is Gigabit Ethernet.
slot	The slot number for this aggregate.
port	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
active	Specifies that bit 0 in the actor state octet is enabled. When this bit is set, the dynamic aggregate group is able to exchange LACPDU frames. By default, this value is set.
timeout	Specifies that bit 1 in the actor state octet is enabled. When this bit is set, a short timeout is used for LACPDU frames. When this bit is disabled, a long timeout is used for LACPDU frames. By default, this value is set.
aggregate	Specifies that bit 2 in the actor state octet is enabled. When this bit is set, the system considers this port to be a potential candidate for aggregation. If this bit is not enabled, the system considers the port to be individual (it can only operate as a single link). By default, this value is set.
synchronize	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 3) is set by the system, the port is allocated to the correct dynamic aggregation group. If this bit is not set by the system, the port is not allocated to the correct dynamic aggregation group.
collect	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 4) is set by the system, incoming LACPDU frames are collected from the individual ports that make up the dynamic aggregate group.
distribute	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 5) is set by the system, distributing outgoing frames on the port is disabled.

default	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 6) is set by the system, it indicates that the actor is using the defaulted partner information administratively configured for the partner.
expire	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 7) is set by the system, the actor cannot receive LACPDU frames.
none	Resets all administrative states to their default configurations.

Defaults

parameter	default
[active] [timeout]	active, timeout, aggregate

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to restore the LACPDU bit settings to their default configuration.
- When the actor admin state is set to **none**, all bit values are restored to their default configurations.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See Chapter 1, "Ethernet Port Commands," for information on CLI commands to configure Ethernet ports.

Examples

```
-> lacp agg 4/2 actor admin state synchronize no collect distribute
-> lacp agg 4/2 actor admin state no synchronize collect
-> lacp agg 4/2 actor admin state none
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```
alclnkaggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortActorAdminState
```

lacp agg actor system id

Configures the system ID (that is, MAC address) for the local port associated with a dynamic aggregate group.

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port* **actor system id** *actor_system_id*

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port* **no actor system id**

Syntax Definitions

ethernet	Documents that the port is 10 Mbps Ethernet.
fastethernet	Documents that the port is 100 Mbps Fast Ethernet.
gigaethernet	Documents that the port is Gigabit Ethernet.
slot	The slot number for this aggregate.
port	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
actor_system_id	The MAC address of the dynamic aggregate group on the switch in the hexadecimal format *xx:xx:xx:xx:xx:xx*.

Defaults

parameter	default
actor_system_id	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove an actor system ID from a slot and port associated with a dynamic aggregate group.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See Chapter 1, "Ethernet Port Commands," for information on CLI commands to configure Ethernet ports.

Examples

```
-> lacp 3/1 actor system id 00:20:da:06:ba:d3
-> lacp 3/1 no actor system id
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```
alclnkaggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortActorSystemID
```

lacp agg actor system priority

Configures the system priority of the port on the switch that belongs to the dynamic aggregate group.

lacp agg [ethernet | fastethernet | gigaethernet] *slot/port* **actor system priority** *actor_system_priority*

lacp agg [ethernet | fastethernet | gigaethernet] *slot/port* **no actor system priority**

Syntax Definitions

ethernet	Documents that the port is 10 Mbps Ethernet.
fastethernet	Documents that the port is 100 Mbps Fast Ethernet.
gigaethernet	Documents that the port is Gigabit Ethernet.
slot	The slot number for this aggregate.
port	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
actor_system_priority	The priority of the dynamic aggregate group. Possible values are 0–255.

Defaults

parameter	default
actor_system_priority	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove an actor system priority value from a slot and port associated with a dynamic aggregate group.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See Chapter 1, "Ethernet Port Commands," for information on CLI commands to configure Ethernet ports.

Examples

```
-> lacp agg ethernet 3/2 actor system priority 65
-> lacp agg ethernet 3/2 no actor system priority
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregates.

MIB Objects

```
AlcLnkAggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortActorSystemPriority
```

lacp agg partner admin state

Configures the system administrative state of the slot and port for the dynamic aggregate group on the remote switch. The state values correspond to bits in the actor state octet in the LACPDU frame.

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port* **partner admin state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}**

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port* **partner admin state {[[no] active] [[no] timeout] [[no] aggregate] [[no] synchronize] [[no] collect] [[no] distribute] [[no] default] [[no] expire] | none}**

Syntax Definitions

ethernet	Documents that the port is 10 Mbps Ethernet.
fastethernet	Documents that the port is 100 Mbps Fast Ethernet.
gigaethernet	Documents that the port is Gigabit Ethernet.
slot	The slot number for this aggregate.
port	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
active	Specifies that bit 0 in the partner state octet is enabled. When this bit is set, the dynamic aggregate group is able to exchange LACPDU frames. By default, this value is set.
timeout	Specifies that bit 1 in the partner state octet is enabled. When this bit is set, a short timeout is used for LACPDU frames. When this bit is disabled, a long timeout is used for LACPDU frames. By default, this value is set.
aggregate	Specifies that bit 2 in the partner state octet is enabled. When this bit is set, the system considers this port to be a potential candidate for aggregation. If this bit is not enabled, the system considers the port to be individual (it can only operate as a single link). By default, this value is set.
synchronize	Specifies that bit 3 in the partner state octet is enabled. When this bit is set, the port is allocated to the correct dynamic aggregation group. If this bit is not enabled, the port is not allocated to the correct aggregation group. By default, this value is disabled.
collect	Specifying this keyword has no effect because the system always determines its value. When this bit (bit 4) is set by the system, incoming LACPDU frames are collected from the individual ports that make up the dynamic aggregate group.
distribute	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 5) is set by the system, distributing outgoing frames on the port is disabled.
default	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 6) is set by the system, it

	indicates that the partner is using the defaulted actor information administratively configured for the actor.
expire	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 7) is set by the system, the partner cannot receive LACPDU frames.
none	Resets all administrative states to their default configurations.

Defaults

parameter	default
[active] [timeout]	active, timeout, aggregate

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to restore the LACPDU bit settings to their default configuration.
- When the partner admin state is set to **none**, all bit values are restored to their default configurations.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See Chapter 1, "Ethernet Port Commands," for information on CLI commands to configure Ethernet ports.

Examples

```
-> lacp agg 4/2 partner admin state synchronize collect distribute
-> lacp agg 4/2 partner admin state no synchronize no collect
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```

lacp agg partner admin system id

Configures the partner administrative system ID for a dynamic aggregate group port.

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port* **partner admin system id** *partner_admin_system_id*

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port* **no partner admin system id**

Syntax Definitions

ethernet	Documents that the port is 10 Mbps Ethernet.
fastethernet	Documents that the port is 100 Mbps Fast Ethernet.
gigaethernet	Documents that the port is Gigabit Ethernet.
slot	The slot number for this aggregate.
port	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
partner_admin_system_id	The MAC address of the remote dynamic aggregate group in the hexadecimal format *xx:xx:xx:xx:xx:xx*.

Defaults

parameter	default
partner_admin_system_id	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a partner administrative system ID from a slot and port associated with a dynamic aggregate group.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See Chapter 1, "Ethernet Port Commands," for information on CLI commands to configure Ethernet ports.

Examples

```
-> lacp agg 3/1 partner admin system id 00:20:da:05:f6:23
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```
AlcLnkAggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortPartnerAdminSystemID
```

lacp agg partner admin key

Configures the partner administrative key for a dynamic aggregate group port.

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port* **partner admin key** *partner_admin_key*

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port* **no partner admin key**

Syntax Definitions

ethernet	Documents that the port is 10 Mbps Ethernet.
fastethernet	Documents that the port is 100 Mbps Fast Ethernet.
gigaethernet	Documents that the port is Gigabit Ethernet.
slot	The slot number for this aggregate.
port	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
parnter_admin_key	The administrative key for the dynamic aggregation group's remote partner. Possible values are 0–65535.

Defaults

parameter	default
partner_admin_key	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a partner admin key value from a slot and port associated with a dynamic aggregate group.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See Chapter 1, "Ethernet Port Commands," for information on CLI commands to configure Ethernet ports.

Examples

```
-> lacp agg 2/1 partner admin key 0
-> lacp agg 2/1 no partner admin key
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```
AlcLnkAggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortPartnerAdminKey
```

lacp agg partner admin system priority

Configures the partner system priority for a dynamic aggregate group port.

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port* **partner admin system priority** *partner_admin_system_priority*

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port* **no partner admin system priority**

Syntax Definitions

ethernet	Documents that the port is 10 Mbps Ethernet.
fastethernet	Documents that the port is 100 Mbps Fast Ethernet.
gigaethernet	Documents that the port is Gigabit Ethernet.
slot	The slot number for this aggregate.
port	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
partner_admin_system_priority	The priority of the remote switch's dynamic aggregate group to which the aggregation group is attached. Possible values are 0–255.

Defaults

parameter	default
partner_admin_system_priority	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a *partner_system_priority* value from a slot and port associated with a dynamic aggregate group.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See Chapter 1, "Ethernet Port Commands," for information on CLI commands to configure Ethernet ports.

Examples

```
-> lacp agg 2/1 partner admin system priority 65
-> lacp agg 2/1 no partner admin system priority
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```
AlcLnkAggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortAdminSystemPriority
```

lacp agg actor port priority

Configures the priority for an actor port.

lacp agg [ethernet | fastethernet | gigaethernet] *slot/port* **actor port priority** *actor_port_priority*

lacp agg [ethernet | fastethernet | gigaethernet] *slot/port* **no actor port priority**

Syntax Definitions

ethernet	Documents that the port is 10 Mbps Ethernet.
fastethernet	Documents that the port is 100 Mbps Fast Ethernet.
gigaethernet	Documents that the port is Gigabit Ethernet.
slot	The slot number for this aggregate.
port	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
actor_port_priority	The priority of the actor port. Possible values are 0–255.

Defaults

parameter	default
actor_port_priority	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove an *actor_port_priority* value from a slot and port associated with a dynamic aggregate group.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See Chapter 1, "Ethernet Port Commands," for information on CLI commands to configure Ethernet ports.

Examples

```
-> lacp agg 2/1 actor port priority 100
-> lacp agg 2/1 no actor port priority
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```

lacp agg partner admin port

Configures the administrative status of a partner port.

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port* **partner admin port** *partner_admin_port*

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port* **no partner admin port**

Syntax Definitions

ethernet	Documents that the port is 10 Mbps Ethernet.
fastethernet	Documents that the port is 100 Mbps Fast Ethernet.
gigaethernet	Documents that the port is Gigabit Ethernet.
slot	The slot number for this aggregate.
port	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
partner_admin_port	The administrative state of the partner port. Possible values are 0–65535.

Defaults

parameter	default
partner_admin_port	0

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a *partner_admin_port* value from a slot and port associated with a dynamic aggregate group.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See Chapter 1, "Ethernet Port Commands," for information on CLI commands to configure Ethernet ports.

Examples

```
-> lacp agg 2/1 partner admin port 255
-> lacp agg 2/1 no partner admin port
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```
AlcLnkAggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortPartnerAdminPort
```

lacp agg partner admin port priority

Configures the priority for a partner port.

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port* **partner admin port priority** *partner_admin_port_priority*

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port* **no partner admin port priority**

Syntax Definitions

ethernet	Documents that the port is 10 Mbps Ethernet.
fastethernet	Documents that the port is 100 Mbps Fast Ethernet.
gigaethernet	Documents that the port is Gigabit Ethernet.
slot	The slot number for this aggregate.
port	The port that the switch will initially use as the Spanning Tree virtual port for this aggregate.
partner_admin_port_priority	The priority of the partner port. Possible values are 0–255.

Defaults

parameter	default
partner_admin_port_priority	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a *partner_admin_port_priority* value from a slot and port associated with a dynamic aggregate group.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See Chapter 1, "Ethernet Port Commands," for information on CLI commands to configure Ethernet ports.

Examples

```
-> lacp agg 2/1 partner admin port priority 100
-> lacp agg 2/1 no partner admin port priority
```

Release History

Release 6.1; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```
AlcLnkAggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortPartnerAdminPortPriority
```

lacp linkagg wait-to-restore-timer

Configures the wait-to-restore (WTR) timer value on the dynamic linkagg. It is disabled by default. When enabled, if the port joining the Linkagg is not the first one, the port attach in Linkagg is delayed by the WTR Timer for the required minutes.

lacp linkagg wait-to-restore timer *num*

Syntax Definitions

num	The number of minutes to delay LACP sync up to coincide with L3 convergence time. The valid range is 1-12 minutes.

Defaults

parameter	default
num	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- When WTR is enabled on dynamic Linkagg and if the port joining the Linkagg is not the first one, the port attach in Linkagg is delayed by the WTR Timer. Assuming that there was a first port attached in the Linkagg and another port was waiting in WTR, if the earlier port goes down then second port stops its WTR timer and joins the LACP Linkagg.
- **lacp linkagg wait-to-restore timer** is not supported on Static Linkagg.

Examples

```
-> lacp linkagg 1 wait-to-restore timer 5
-> lacp linkagg 1 wait-to-restore timer 100
ERROR: Allowed range for WTR Timer is from 1 to 12 minutes
```

Release History

Release 6.4.5; command introduced.

Related Commands

show linkagg	Displays information about static and dynamic (LACP) aggregate groups.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```
alclnkaggAggWTRTimer
   alclnkaggAggEntry
```

lacp agg standby

Configures the standby status for a switch port. When this status is enabled, the port is eligible to participate in a dual-home link aggregate as a standby port.

lacp agg [ethernet | fastethernet | gigaethernet] *slot*/*port* **standby {enable | disable}**

Syntax Definitions

ethernet	Documents that the port is 10 Mbps Ethernet.
fastethernet	Documents that the port is 100 Mbps Fast Ethernet.
gigaethernet	Documents that the port is Gigabit Ethernet.
slot	The slot number for the standby port.
port	The port number for the standby port.

Defaults

By default, the standby functionality is disabled on a switch port.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- A dual home link aggregate consists of one active primary port and one standby port. Enabling the standby status makes a port eligible to serve as the standby port in this type of aggregate. Use this command to enable the standby status before the port is associated with the link aggregate.
- The **ethernet**, **fastethernet**, and **gigaethernet** keywords do not modify a port's configuration. See Chapter 1, "Ethernet Port Commands," for information on CLI commands to configure Ethernet ports.

Examples

```
-> lacp agg 2/1 standby enable
-> lacp agg 2/1 standby disable
```

Release History

Release 6.4.3; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```
AlcLnkAggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortStandbyState
```

lacp linkagg pre-empt

Configures the pre-emption status for a dynamic dual-home link aggregate. When the pre-emption status is enabled, the switch will restore a downed primary port as the primary link when the port comes back up and after a configurable period of time (pre-emption delay time).

lacp linkagg *agg_num* **pre-empt {enable | disable}**

Syntax Definitions

agg_num	The number corresponding to the dynamic aggregate group.
enable	Enables the pre-emption status for the aggregate group.
disable	Disables the pre-emption status for the aggregate group.

Defaults

By default, the pre-emption status is disabled.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The dynamic aggregate group number specified with this command must already exist in the switch configuration. In addition, the aggregate should have Spanning Tree disabled.
- The amount of time the switch waits to restore a port as the primary link is determined by the value of a pre-emption delay timer. This timer value is configurable using the **lacp linkagg pre-empt timer** command.
- If the primary port fails again before the length of the pre-emption timer has elapsed, the timer value is reset and will start again when the port comes back up.
- If the pre-emption status is disabled, the standby port retains the primary status even when the original primary port comes back up. The original primary port then becomes the standby link.

Examples

```
-> lacp linkagg 2 pre-empt enable
-> lacp linkagg 2 pre-empt disable
```

Release History

Release 6.4.3; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
lacp agg standby	Configures the standby status for a port. A standby port is required to configure a dual-home link aggregate.
lacp linkagg pre-empt timer	Configures the pre-emption delay timer value for the dynamic dual-home link aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alcLnkAggPreemptState
```

lacp linkagg pre-empt timer

Configures the pre-emption delay timer value for a dynamic dual-home link aggregate. This value is the length of time the switch will wait before restoring a port to primary link status.

lacp linkagg *agg_num* **pre-empt timer** *seconds*

Syntax Definitions

agg_num	The number corresponding to the dynamic aggregate group.
seconds	The pre-emption delay timer value, in seconds. The range is 30–300.

Defaults

By default, the timer value is set to 30 seconds.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- When the primary port for a dual-home link aggregate fails and then comes back up, the switch will wait the length of the pre-emption timer value before restoring the port as the primary link for the aggregate.
- The pre-emption delay timer is only used when the pre-emption status for the specified aggregate group is enabled. The timer starts when a failed primary port comes back up.
- If the primary port goes down before the timer runs out, the timer is reset and then started again the next time the port comes back up.

Examples

```
-> lacp linkagg 2 pre-empt timer 120
-> lacp linkagg 3 pre-empt timer 300
```

Release History

Release 6.4.3; command was introduced.

Related Commands

lacp linkagg size	Creates a dynamic aggregate group.
lacp agg standby	Configures the standby status for a port. A standby port is required to configure a dual-home link aggregate.
lacp linkagg pre-empt timer	Configures the pre-emption delay timer value for the dynamic dual-home link aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alcLnkAggPreemptValue
```

dhl num

Configures a Dual-homed Link (DHL) session associated with the specified session ID number.

dhl num *dhl_num* **[name** *name***]**

no dhl num *dhl_num*

Syntax Definitions

dhl_num	The DHL session ID number. Valid range is 1–1000.
name	The name of the DHL session.

Defaults

By default, if a name is not assigned to a DHL session, the session is configured as DHL-1.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a DHL session ID from the switch configuration.
- Use the optional **name** parameter to specify a name for the DHL session.
- Only one DHL session can be configured per switch.
- Once the DHL session ID is created, assign a link A port and a link B port to the session. This is required before administratively enabling the DHL session is allowed.

Examples

```
-> dhl num 1 name dhl_session1
-> no dhl num 1
```

Release History

Release 6.4.4; command was introduced.

Related Commands

dhl num linka linkb	Associates a pair of links (port or linkagg) with the DHL session.
dhl num admin-state	Configures the administrative status of the DHL session.
show dhl num	Displays information about a specific DHL session.

MIB Objects

```
alaDHLSessionTable
   alaDHLSessionIndex
   alaDHLSessionDescr
```

dhl num linka linkb

Configures two ports or two link aggregates or a combination of both as linkA and linkB for the specified DHL session. Only two links are allowed per DHL session; only one DHL session per switch is allowed.

dhl num *dhl_num* **linka {port** *slot/port* **| linkagg** *agg_id***} linkb {port** *slot/port* **| linkagg** *agg_id***}**

no dhl num *dhl_num* **linka {port** *slot/port* **| linkagg** *agg_id***} linkb {port** *slot/port* **| linkagg** *agg_id***}**

Syntax Definitions

dhl_num	An existing DHL session ID number.
slot	The slot number number to designate as a link for the DHL session.
port	The physical port number to designate as a link for the DHL session.
agg_id	The link aggregate ID number to designate as a link for the DHL session.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove the linkA and linkB ports from the specified session ID. Before attempting to remove the links, administratively disable the DHL session.
- Make sure that DHL linkA *and* linkB are associated with each VLAN that the DHL session will protect. Any VLAN not associated with either link or only associated with one of the links is unprotected.
- DHL linkA *and* linkB should belong to the same default VLAN. In addition, select a default VLAN that is one of the VLANs that the DHL session will protect. For example, if the session is going to protect VLANs 10-20, then assign one of those VLANs as the default VLAN for linkA and linkB.
- Only one DHL session per switch is allowed. Each session can have only two links (linkA and linkB). Specify a physical switch port or a link aggregate (linkagg) ID as a DHL link. The same port or link aggregate is not configurable as both linkA or linkB.
- DHL is not supported on mobile, 802.1x-enabled, GVRP, or UNI ports. DHL is also not supported on a port that is a member of a link aggregate or a port the is enabled for transparent bridging.
- The administrative state of a DHL session is not configurable until a linkA port and a linkB port are associated with the specified DHL session ID number.
- Changing the port designations for linkA and linkB is not recommended while the DHL session is enabled.
- Removing a link aggregate from the switch configuration is not allowed if the aggregate is configured as a link for a DHL session.

Examples

```
-> dhl num 1 linka port 1/1 linkb port 1/2
-> dhl num 1 linka  linkagg 1  linkb port 1/2
-> dhl num 1 linka port 1/1 linkb linkagg 1
-> dhl num 1 linka  linkagg 1  linkb linkagg 2
-> no dhl num 1 linka port 1/1 linkb port 1/2
```

Release History

Release 6.4.4; command was introduced.

Related Commands

dhl num	Configures a session ID for the DHL session.
dhl num admin-state	Configures the administrative status for the DHL session.
show dhl	Displays the global status of the DHL configuration.
show dhl num	Displays information about a specific DHL session.
show dhl num link	Displays information about a specific link.

MIB Objects

```
AlaDHLLinksTable
   alaDHLLinksSessionIndex
   alaDHLLinkslinkA
   alaDHLLinkslinkB
```

dhl num admin-state

Enables or disables the administrative state of a DHL session.

dhl num *dhl_num* **admin-state {enable | disable}**

Syntax Definitions

dhl_num	An existing DHL session ID number.
enable	Enables the DHL session.
disable	Disables the DHL session.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The DHL session ID specified with this command must already exist in the switch configuration.
- The administrative state is not configurable until a linkA port and a linkB port are associated with the specified DHL session ID number.

Examples

```
-> dhl num 1 admin-state enable
-> dhl num 1 admin-state disable
```

Release History

Release 6.4.4; command was introduced.

Related Commands

dhl num	Configures a session ID for the DHL session.
dhl num admin-state	Configures the administrative status for the DHL session.
show dhl	Displays the global status of the DHL configuration.
show dhl num	Displays information about a specific DHL session.

MIB Objects

```
alaDHLSessionTable
   alaDHLSessionAdminStatus
```

dhl num vlan-map linkb

Configures a VLAN-MAP (a single VLAN or a range of VLANs) from a common pool of VLANs to operate on DHL link B.

dhl num *dhl_num* **vlan-map linkb {***vlan_id***[-***vlan_id***]}**

no dhl num *dhl_num* **vlan-map linkb {***vlan_id***[-***vlan_id***]}**

Syntax Definitions

dhl_num	Specifies the DHL session ID number.
*vlan_id***[-***vlan_id***]**	A VLAN ID number or a range of VLAN IDs to map to linkB. The valid range is 1- 4094.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- A DHL session has to be created before a VLAN-MAP can be configured.
- When the DHL session is active, the common VLAN that both the dual homed links belong to is treated as a protected VLAN. The VLAN containing only one dual homed link is treated as an unprotected VLAN. Traffic is forwarded only on the dual homed links belonging to the protected VLAN.
- If a VLAN is removed globally and if the VLAN belongs to a particular dual homed link, then the VLAN will automatically be removed from the dual homed link.
- If one dual homed link, for example linkA, is moved out of a protected VLAN, then the VLAN becomes unprotected and the VPA is removed from the second dual homed link, for example linkB.
- If the admin state of a VLAN is changed to disabled, and if the VLAN is part of a protected VLAN, then the disabled VLAN is removed from the operational DHL VLAN list but will be present in the protected VLAN list.
- If the admin state of a dual homed link, for example linkA, is changed to disabled, then the protected VLANs of the disabled linkA is moved to the other link, for example linkB. When linkA is re-enabled, then the VLANs are moved back to linkA.
- If the VLAN-MAP of linkB is removed, then the VPAs for the linkB will also be removed and the VLANs configured on linkB is moved to linkA.
- If a VLAN is configured as default on one dual homed link, for example linkA, then the same VLAN cannot be configured as tagged on the other link, for example linkB.

Examples

```
-> vlan 10-30
-> vlan 10-20 802.1q 1/1
-> vlan 4
-> vlan port default 1/1-2
-> dhl num 1 name dhl_session1
-> dhl num 1 linka port 1/1 linkb port 1/2
-> dhl num 1 vlan-map linkb 18-20
-> no dhl num 1 vlan-map linkb 18-20
```

Release History

Release 6.4.4; command was introduced.

Related Commands

dhl num	Configures a session ID for the DHL session.
dhl num admin-state	Configures the administrative status for the DHL session.
show dhl	Displays the global status of the DHL configuration.
show dhl num	Displays information about a specific DHL session.
show dhl num link	Displays information about a specific link.

MIB Objects

```
alaDHLVlanMapTable
   alaDHLVlanMapSessionIndex
   alaDHLVlanMapVlanStart
   alaDHLVlanMapVlanEnd
   alaDHLVlanMapRowStatus
```

dhl num pre-emption-time

Configures the pre-emption timer for the DHL session. A pre-emption timer is a recovery-delay timer that is used to delay the switchover of VLANs to their primary links. It is the delay in the resumption of traffic when a link that is down is brought up.

dhl num *dhl_num* **pre-emption-time** *num*

Syntax Definitions

dhl_num	Specifies the number of the DHL session.
num	Specifies the number of seconds for the delay in the switchover of VLANs to their primary links. The valid range is 0 - 600.

Defaults

parameter	default
num	30 seconds

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Pre-emption timer is applicable only when a failed port is brought up. If both ports are down, the pre-emption timer is activated only when the second port is brought up.
- If the pre-emption value is set to 0, then there will be no delay in the VLANs being moved back to their primary link.
- If a link fails when the pre-emption value is active, that is when the pre-emption value is not equal to 0, then the time will be halted.
- When the pre-emption timer is active for a particular link and port and if the other port goes down, then the VLANs of the port that is down is automatically moved to the port for which the pre-emption timer is active.
- When DHL ports spanned across the NIs or DHC ports are on the same NI but data port is on different NI, it is advised to configure mac-flush mechanism (either Raw/MVRP) for faster convergence.

Examples

```
-> dhl num 1 pre-emption-time 40sec
```

Release History

Release 6.4.4; command was introduced.

Related Commands

dhl num	Configures a session ID for the DHL session.
show dhl	Displays the global status of the DHL configuration.
show dhl num	Displays information about a specific DHL session.
show dhl num link	Displays information about a specific link.

MIB Objects

```
alaDHLSessionTable
   alaDHLSessionPreemptionTime
```

dhl num mac-flushing

Configures the MAC-flushing technique for the DHL session. The MAC-flushing technique is used to correct any stale MAC entries that are caused when a dual homed link goes down.

dhl num *dhl_num* **mac-flushing {none | raw | mvrp}**

Syntax Definitions

dhl_num	Specifies the number of the DHL session.
none	Flushing of the MAC address tables does not occur.
raw	Method of flushing when VPAs of the links moved across them due to link up/down or configuration change (VLAN-map). The switch determines the MAC addresses within the affected VLANs
mvrp	Method of flushing when one link fails, and the other link issues 'join' declarations to establish connectivity. These new joins are flagged as 'new' and they are forwarded by the core devices causing flushing on the core network for the active VLANs.

Defaults

parameter	default
none | raw | mvrp	**none**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Before enabling MVRP on dual homed links, the Registrar Mode should be set to 'forbidden', failing which an error message is displayed when configuring DHL. If the Registrar Mode is set to 'not forbidden, then changes cannot be made to the MVRP configuration on the dual homed links.
- If the mac-flushing technique is set to MVRP and if MVRP is not enabled on the dual homed links, then the **show dhl** command displays the active mac-flushing technique as **none**. When MVRP is enabled on the dual homed links, then the mac-flushing technique changes to **MVRP** and the Registrar Mode of the links is automatically set to ‘forbidden’.
- If VLANs are moved across the dual homed links as a result of configuration changes, then mac-flushing is automatically enabled, if configured, excepting dual homed links that are changed on the fly.

Examples

```
-> dhl num 1 mac-flushing none
-> dhl num 1 mac-flushing raw
```

Release History

Release 6.4.4; command was introduced.

Related Commands

```

output definitions

DHL session Name	The user-defined text description of the DHL session.
Admin state	The current administrative status of the DHL session.
Operational state	The operational state of the DHL session.

output definitions

Pre-emption time	The delay-interval in seconds to move the VLANs back to their original links.
Mac-flushing	Mac-flushing technique on the DHL session.
Active Mac-flushing	The active Mac-flushing technique that is enabled on the specified DHL session.
Protected VLANs	The common VLANs that contain both the dual homed links, for example linkA and linkB.
LinkA	A dual homed link that is part of a pair of DHL links that can be configured per switch.
Port	The port number of linkA.
Operational state	The operational state of the port. The operational states are UP or DOWN.
Un protected VLANs	The VLANs containing only one dual homed link.
Active VLANs	The VLANs that are in an active state.
LinkB	A dual homed link that is part of a pair of DHL links that can be configured per switch.
Port	The port number of linkB.
Operational state	The operational state of the port. The operational states are UP or DOWN.
Un protected VLANs	The VLANs containing only one dual homed link.
VLAN-map	The DHL VLAN map for linkB. This specifies the VLANs that are operational on DHL linkB from the common pool of VLANs between DHL linkA and linkB.
Operational VLANs	The VLANs that are in an operational state.

Release History

Release 6.4.4; command was introduced.

   alaDHLVlanMapVlanEnd
```

show linkagg

Displays information about static and dynamic (LACP) aggregate groups.

show linkagg [*agg_num***] port [***slot***/***port***]**

Syntax Definitions

agg_num	Specifies the aggregate group. Configured through the **static linkagg size** or **lacp linkagg size** command.
slot	The slot number for this aggregate.
port	The port number for this aggregate.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If no aggregation number is specified, information for all aggregate groups is displayed. If an aggregate number is specified, information about that aggregate group is displayed only. The fields included in the display depend on whether the aggregate group is a static or dynamic.
- Use the **show linkagg port** command to display information about aggregate group ports.

Examples

No aggregate group is specified:

```
-> show linkagg 100
Number  Aggregate  SNMP Id  Size  Min Size Admin State  Oper State Att/Sel Ports
-------+----------+--------+----+------------+------------+----------------
   1     Static    40000001   8    1      ENABLED      UP             2   2
   2     Dynamic   40000002   4   1       ENABLED      DOWN           0   0
   3     Dynamic   40000003   8    1      ENABLED      DOWN           0   2
   4     Dynamic   40000004   8    1      ENABLED      UP             3   3
   5     Static    40000005   2    1       DISABLED     DOWN           0   0
```

Output fields are defined here:

output definitions

Number	The aggregate group number.
Aggregate	The type of aggregate group, which can be **Static** or **Dynamic**.
SNMP Id	The SNMP ID associated with the aggregate group.
Size	The number of links in this aggregate group.

output definitions (continued)

Admin State	The current administrative state of the aggregate group, which can be **ENABLED** or **DISABLED**. You can modify this parameter with the **static linkagg admin state** command (see page 4-194) for static aggregate groups and with the **lacp linkagg admin state** command (see page 4-201) for dynamic aggregate groups.
Operational State	The current operational state of the aggregate group, which can be **UP** or **DOWN**.
Sel Ports	The number of ports that could possibly attach to the aggregate group.
Att Ports	The number of ports actually attached to this aggregate group.
Sel Ports	The number of ports that could possibly attach to the aggregate group.

A static aggregate is specified:

```
-> show linkagg 5
Static Aggregate
  SNMP Id                  : 40000005,
  Aggregate Number         : 5,
  SNMP Descriptor          : Omnichannel Aggregate Number 5 ref 40000005 size 2,
  Name                     : AGG5,
  Admin State              : ENABLED,
  Operational State        : DOWN,
  Aggregate Size           : 2,
  Aggregate minimum size   : 1,
  Number of Selected Ports : 0,
  Number of Reserved Ports : 0,
  Number of Attached Ports : 0,
  Primary Port             : NONE
```

output definitions

SNMP Id	The SNMP ID associated with this static aggregate group.
Aggregate Number	The group number.
SNMP Descriptor	The standard MIB name for this static aggregate group.
Name	The name of this static aggregate group. You can modify this parameter with the **static linkagg name** command (see page 4-193).
Admin State	The administrative state of this static aggregate group, which can be **ENABLED** or **DISABLED**. You can modify this parameter with the **static linkagg admin state** command (see page 4-194).
Operational State	The operational state of this static aggregate group, which can be **UP** or **DOWN**.
Aggregate Size	The number of links configured for this static aggregate group.
Number of Selected Ports	The number of ports that could possibly attach to this static aggregate group.
Number of Reserved Ports	The total number of ports reserved for use in link aggregation by this static aggregate group. (**Note**: This field is not relevant for static aggregate groups.)

output definitions (continued)

Number of Attached Ports	The number of ports actually attached to this static aggregate group.
Primary Port	The port number of the first port to join this static aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.

A dynamic aggregate group is specified:

```
-> show linkagg 1
Dynamic Aggregate
  SNMP Id                   : 40000001,
  Aggregate Number          : 1,
  SNMP Descriptor           : Dynamic Aggregate Number 1 ref 40000001 size 2,
  Name                      : AGG 2,
  Admin State               : ENABLED,
  Operational State         : UP,
  Aggregate Size            : 2,
  Aggregate minimum size    : 1,
  Number of Selected Ports  : 1,
  Number of Reserved Ports  : 1,
  Number of Attached Ports  : 8,1
  Primary Port              : NONE
LACP
  MACAddress                : [e8:e7:32:3e:a3:94],
  Actor System Id           : [00:e0:b1:94:d0:38],
  Actor System Priority     : 0,
  Actor Admin Key           : 1,
  Actor Oper Key            : 1,
  Partner System Id         : [e8:e7:32:39:ca:00],
  Partner System Priority   : 0,
  Partner Admin Key         : 0,
  Partner Oper Key          : 1,
  Pre-emption               : DISABLED,
  Pre-empt Value            : 30
  Wait-to-restore timer     : 5
```

output definitions

SNMP Id	The SNMP ID associated with this dynamic aggregate group.
Aggregate Number	The group number of this dynamic aggregate group.
SNMP Descriptor	The standard MIB name for this dynamic aggregate group.
Name	The name of this dynamic aggregate group. You can modify this parameter with the **lacp linkagg name** command (see page 4-200).
Admin State	The administrative state of this dynamic aggregate group, which can be **ENABLED** or **DISABLED**. You can modify this parameter with the **lacp linkagg admin state** command (see page 4-201).
Operational State	The operational state of this dynamic aggregate group, which can be **UP** or **DOWN**.
Aggregate Size	The number of links configured for this dynamic aggregate group.
Number of Selected Ports	The number of ports available to this dynamic aggregate group.
Number of Reserved Ports	The total number of ports reserved for use in link aggregation by this dynamic aggregate group.

output definitions (continued)

Number of Attached Ports	The number of ports actually attached to this dynamic aggregate group.
Primary Port	The port number of the first port to join this dynamic aggregate group. If the first port to join the aggregate group is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.
MACAddress	The MAC address associated with the primary port.
Actor System Id	The MAC address of this dynamic aggregate group. You can modify this parameter with the **lacp linkagg actor system id** command (see page 4-205).
Actor System Priority	The priority of this dynamic aggregate group. You can modify this parameter with the **lacp linkagg actor system priority** command (see page 4-204).
Actor Admin Key	The administrative key associated with this dynamic aggregate group. You can modify this parameter with the **lacp linkagg actor admin key** command (see page 4-203).
Actor Oper Key	The operational key associated with this dynamic aggregate group.
Partner System Id	The MAC address of the remote dynamic aggregate group. You can modify this parameter with the **lacp linkagg partner system id** command (see page 4-206).
Partner System Priority	The priority of the remote system to which this dynamic aggregation group is attached. You can modify this parameter with the **lacp linkagg partner system priority** command (see page 4-208).
Partner Admin Key	The administrative key for this dynamic aggregation group's remote partner. You can modify this parameter with the **lacp linkagg partner admin key** command (see page 4-209).
Partner Oper Key	The operational key of the remote system to which the dynamic aggregation group is attached.
Pre-emption	The pre-emption status of the link agg ID.
Pre-empt Value	The value of the pre-emption timer.
Wait-to-restore timer	The value of WTR delay. Configures the wait-to-restore timer value on the dynamic linkagg. It is disabled by default. When enabled, if the port joining the Linkagg is not the first one, the port attach in Linkagg is delayed by WTR Timer by the required minutes. You can modify this parameter with the **lacp linkagg wait-to-restore-timer** command (see page 7-45).

Release History

Release 6.1; command was introduced.
Release 6.4.3: **Pre-emption** and **Pre-empt Value** fields added.
Release 6.4.5; **Wait-to-restore timer** status added in output.

Related Commands

static linkagg size	Creates a static aggregate group.
lacp linkagg size	Creates a dynamic aggregate group.

show linkagg port

Displays the aggregate group information about a particular slot and port.

show linkagg [*agg_num***] port [***slot/port***]**

Syntax Definitions

agg_num	Specifies the aggregate group. Configured through the **static linkagg size** or **lacp linkagg size** command
slot	The slot number for this aggregate.
port	The port number for this aggregate.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If no *slot/port* is specified, the information for all ports is displayed. If a particular slot or port is specified, the fields displayed depend upon whether or not the port belongs to a static aggregate group or dynamic (LACP) aggregate group.
- If no *agg_num* is specified, the information for all aggregates is displayed.

Examples

```
-> show linkagg port
Slot/Port Aggregate SNMP Id   Status   Agg  Oper Link Prim Standby
---------+---------+-------+----------+----+----+----+----+--------
   1/9    Static      1009  ATTACHED     1  UP   UP   YES   NO
   1/10   Static      1010  ATTACHED     1  UP   UP   NO    YES
   1/11   Static      1011  ATTACHED     2  UP   UP   YES   NO

-> show linkagg 1 port
Slot/Port Aggregate SNMP Id   Status   Agg  Oper Link Prim Standby
---------+---------+-------+----------+----+----+----+----+--------
   1/9    Static      1009  ATTACHED     1  UP   UP   YES   NO
   1/10   Static      1010  ATTACHED     1  UP   UP   NO    YES
```

output definitions

Slot/Port	The slot/port associated with the aggregate group.
Aggregate	The type of aggregate group associated with the port, either **Static** or **Dynamic**.

output definitions

SNMP Id	The SNMP ID associated with the aggregate group.
Status	The current status of the port (**ATTACHED, CONFIGURED**, **PENDING**, **SELECTED**, or **RESERVED**).
Agg	The number of the aggregate groups associated with this port.
Oper	The current operational state of the port (**UP** or **DOWN**).
Link	The current operational state of the link from this port to its remote partner (**UP** or **DOWN**).
Prim	Whether or not the port is the primary port in the link agg.
Standby	Whether or not the port is a standby port. A standby port is one of two ports that participate in a dynamic dual-home link aggregate. Configured through the **lacp agg standby** command.

A port that belongs to a static aggregate is specified:

```
-> show linkagg port 4/1
Static Aggregable Port
  SNMP Id                       : 4001,
  Slot/Port                     : 4/1,
  Administrative State          : ENABLED,
  Operational State             : DOWN,
  Port State                    : CONFIGURED,
  Link State                    : DOWN,
  Selected Agg Number           : 2,
  Port position in the aggregate: 0,
  Primary port                  : NONE
```

output definitions

SNMP Id	The SNMP ID associated with this port.
Slot/Port	The slot and port number.
Administrative State	The current administrative state of this port (**ENABLED** or **DISABLED**).
Operational State	The current operational state of the port (**UP** or **DOWN**).
Port State	The current operational state of the port (**CONFIGURED**, **PENDING**, **SELECTED**, or **RESERVED**).
Link State	The current operational state of the link from this port to its remote partner (**UP** or **DOWN**).
Selected Agg Number	The number associated with the static aggregate group to which the port is attached.
Port position in the aggregate	The rank of this port within the static aggregate group (0–15).
Primary Port	The port number of the first port to join this static aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.

A port that belongs to a dynamic aggregate is specified:

```
-> show linkagg port 2/1
Dynamic Aggregable Port
  SNMP Id                       : 2001,
  Slot/Port                     : 2/1,
```

```
  Administrative State          : ENABLED,

  Partner Oper State            : act0.tim0.agg1.syn0.col1.dis1.def1.exp0
  Standby State                 : ENABLED
```

output definitions

SNMP Id	The SNMP ID associated with this port.
Slot/Port	The slot and port number.
Administrative State	The current administrative state of this port (**ENABLED** or **DISABLED**).
Operational State	The current operational state of the port (**UP** or **DOWN**).
Port State	The current operational state of the port (**CONFIGURED**, **PENDING**, **SELECTED**, or **AGGREGATED**).
Link State	The current operational state of the link from this port to its remote partner (**UP** or **DOWN**).
Selected Agg Number	The number associated with the dynamic aggregate group to which the port is attached.
Primary Port	The port number of the first port to join this dynamic aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.
Actor System Priority	The actor system priority of this port. Configured through the **lacp agg actor system priority** command.
Actor System Id	The actor system ID (that is, MAC address) of this port. Configured through the **lacp agg actor system id** command.
Actor Admin Key	The actor administrative key value for this port. Configured through the **lacp agg actor admin key** command.

output definitions (continued)

Actor Oper Key	The actor operational key associated with this port.
Partner Admin System Priority	The administrative priority of the remote system to which this port is attached. Configured through the **lacp agg partner admin system priority** command.
Partner Oper System Priority	The operational priority of the remote system to which this port is attached.
Partner Admin System Id	The administrative MAC address associated with the remote partner's system ID. This value is used along with Partner Admin System Priority, Partner Admin Key, and Partner Admin Port Priority to manually configure aggregation. Configured through the **lacp agg partner admin system id** command.
Partner Oper System id	The MAC address that corresponds to the remote partner's system ID.
Partner Admin Key	The administrative value of the key for the remote partner. This value is used along with Partner Admin System Priority, Partner Admin System, Partner Admin Port, and Partner Admin Port Priority to manually configure aggregation. Configured through the **lacp agg partner admin key** command.
Partner Oper Key	The current operational value of the key for the protocol partner.
Attached Agg ID	The ID of the aggregate group that the port has attached itself to. A value of zero indicates that the port is not attached to an aggregate group.
Actor Port	The port number locally assigned to this port.
Actor Port Priority	The actor priority value assigned to the port. Configured through the **lacp agg actor port priority** command.
Partner Admin Port	The administrative value of the port number for the protocol partner. This value is used along with Partner Admin System Priority, Partner Admin System ID, Partner Admin Key, and Partner Admin Port Priority to manually configure aggregation. Configured through the **lacp agg partner admin port** command.
Partner Oper Port	The operational port number assigned to the port by the port's protocol partner.
Partner Admin Port Priority	The administrative port priority of the protocol partner. This value is used along with Partner Admin System Priority, Partner Admin System ID, and Partner Admin Key to manually configure aggregation. Configured through the **lacp agg partner admin port priority** command.
Partner Oper Port Priority	The priority value assigned to the this port by the partner.
Actor Admin State	The administrative state of the port. Configured through the **lacp agg actor admin state** command.
Actor Oper State	The current operational state of the port.
Partner Admin State	The administrative state of the partner's port. Configured through the **lacp agg partner admin state** command.

output definitions (continued)

Partner Oper State	The current operational state of the partner's port.
Standby State	The standby state of the port. This value indicates if the port will participate as a standby port in a dynamic dual-home link aggregate. Configured through the **lacp agg standby** command.

Release History

Release 6.1; command was introduced.
Release 6.3.4; *agg_num* parameter added.
Release 6.4.3; **Standby** field added.

Related Commands

static agg agg num	Configures a slot and port for a static aggregate group.
lacp agg actor admin key	Configures a slot and port for a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

linkagg range

Modifies the range of standard and MC-LAG link aggregation identifiers.

linkagg range local {*agg_num-agg_num* } **peer** {*agg_num-agg_num*} **multi-chassis** {*agg_num-agg_num*}

Syntax Definitions

agg_num	The first or last identifier in the range.
local	The range of standard local aggregate identifiers.
peer	The range of standard peer aggregate identifiers.
multi-chassis	The range of MC-LAG aggregate identifiers.

Defaults

parameter	default
local	0 - 127 when multi-chassis is disabled and 0 - 31 when multi-chassis is enabled
peer	Not applicable when multi-chassis is disabled and 32 - 63 when multi-chassis is enabled
MC-LAG	Not applicable when multi-chassis is disabled and 65 - 127 when multi-chassis is enabled

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- The local range configured on the local chassis must match the remote range configured on the peer chassis and vice-versa. Otherwise, the multi-chassis feature will not be operational.
- The switch must be rebooted for the ranges to take affect.
- The local range configured on the local chassis must match the remote range configured on the peer chassis and vice-versa. Otherwise, the multi-chassis feature will not be operational.
- None of the ranges can overlap.
- The end of the range must always be greater than the start. In other words, each range must have at least one aggregate number assigned to it.
- The range specified for the MC-LAG aggregates must be the same on both chassis.
- Use this command in conjunction with the MC-LAG feature to change the maximum number of MC-LAG link aggregates that can be configured.
- The maximum number of combined standard and MC-LAG link aggregates is 128.

Examples

```
-> linkagg range local 0-47 peer 48-95 multi-chassis 96-127
-> linkagg range local 48-95 peer 0-47 multi-chassis 96-127
```

Release History

Release 6.4.5; command introduced.

Related Commands

show linkagg range Displays the link aggregate range.

MIB Objects

alclnkAggPeerRangeOperMax
alclnkAggMcLagRangeConfiguredMin
alclnkAggMcLagRangeConfiguredMax
alclnkAggMcLagRangeOperMin
alclnkAggMcLagRangeOperMax
```

show linkagg range

Displays information about the configured or operational link aggregate range identifiers for standard and MC-LAG link aggregates.

show linkagg range [operation | config]

Syntax Definitions

operation	Indicates the values currently in effect in the system.
config	Indicates the values that takes effect after the next reset.

Defaults

N/A

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- Use the **operation** parameter to display only the operational link aggregate identifiers.
- Use the **config** parameter to display only the configured link aggregate identifiers.
- A chassis reboot is required for the configured values to become operational.

Examples

```
> show linkagg range

LAG                   Operational              Configured
                      Min         Max          Min           Max

                       Configured
                       Min       Max
--------------------+--------+--------
Local                    0        47
Peer                    48        95
Multi-Chassis           96       127
```

Release History

Release 6.4.5; command introduced.

Output Definations

Operational	Operational parameters that are currently being used by the system.
Configured	Parameters that are configured and that are implemented after switch reset.
local	0 - 127 when multi-chassis is disabled and 0 - 31 when multi-chassis is enabled.
peer	Not applicable when multi-chassis is disabled and 32 - 63 when multi-chassis is enabled.
MC-LAG	Not applicable when multi-chassis is disabled and 65 - 127 when multi-chassis is enabled.

8 Multi-Chassis Commands

Multi-Chassis Virtual-Fabric Aggregation (MC-VFA) enables dual homing of any standard based edge switches to two or more aggregation switches without running the Spanning Tree protocols between the edge and aggregation devices. The feature operates in a mode whereby all ports that are members of the multi-chassis aggregates are actively forwarding traffic. The overall system provides fast fail-over with a bound convergence time for all cases when edge uplinks fail.

MIB information for the Multi-Chassis commands is as follows:

Filename: ALCATEL-IND1-MULTI-CHASSIS-MIB.mib
Module: alcatelIND1MultiChassisMIB

A summary of available commands is listed here:

multi-chassis chassis-id hello-interval
multi-chassis hello-interval
multi-chassis hello-interval
multi-chassis chassis-group
multi-chassis ipc-vlan
multi-chassis loop-detection
multi-chassis loop-detection transmit-interval
multi-chassis vf-link create
multi-chassis vf-link member-ports
multi-chassis vf-link default-vlan
multi-chassis vip-vlan
show multi-chassis status
show multi-chassis loop-detection
show multi-chassis vf-link
show multi-chassis vf-link member-port
show multi-chassis consistency
show multi-chassis consistency linkagg
clear multi-chassis loop-detection

multi-chassis chassis-id hello-interval

Assigns a globally unique chassis identifier to the switch and enables the switch to operate in multi-chassis mode.

multi-chassis chassis-id *chassis_id* **[hello-interval** *interval***]**

no multi-chassis chassis-id *chassis_id* **[hello-interval** *interval***]**

Syntax Definitions

chassis_id	Chassis identifier within the multi-chassis operational range 1 - 2. The chassis identifier must be globally unique within the set of switches configured to provide multi-chassis services.
interval	Time interval, in seconds, in which multi-chassis control hello messages are to be sent to the peer switch.The range is [1 - 10].

Defaults

parameter	default
chassis_id	0 (standalone or no multi-chassis operation allowed)
interval	5 seconds

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- A globally unique chassis identifier within the range [1 - 2] must be assigned through the management interface for the multi-chassis feature to be operational. Use the **no** form of this command to change the chassis ID back to “0” (the default). If the chassis identifier is equal to “0”, then the switch operates in a standalone mode and all multi-chassis related configuration commands are no longer active for the switch.
- Switches having the same chassis identifier are not allowed to operate in a multi-chassis mode. If a duplicate chassis identifier is configured, the multi-chassis functionality will remain in a “down” operational state.
- Configuration to the chassis ID value is effective after the switch reboot.
- The hello protocol parameters must match between peer chassis as well.
- MC-LAG is only supported between two peer switches of the same type and when both switches are running the same version of AOS Release 6. For example, MC-LAG is not supported between an OmniSwitch 9000E and another OmniSwitch version.

Examples

```
-> multi-chassis chassis-id 1
-> no multi-chassis chassis-id 1
-> multi-chassis chassis-id 1 hello-interval 1
```

Release History

Release 6.4.5; command introduced.

Related Commands

show multi-chassis status	Displays the configured and operational parameters related to the multi-chassis feature on the switch.
show multi-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.

MIB Objects

```
multiChassisConfig
    multiChassisConfigChassisId
    multiChassisConfigHelloInterval
```

multi-chassis hello-interval

Configures the multi-chassis hello-interval parameter on the switch. Hello packets are sent periodically on the virtual fabric link (VFL) interfaces to establish a relationship and bidirectional communication between multi-chassis peer switches. The hello-interval value determines how often these packets are sent.

multi-chassis hello-interval *interval*

Syntax Definitions

interval	Time interval, in seconds, in which multi-chassis control hello messages are to be sent to the peer switch within the range 1 - 10.

Defaults

parameter	default
interval	5 seconds

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- This command is available only on switches that are configured with a valid multi-chassis chassis ID number (1-2).
- The hello-interval is a mandatory consistency parameter between two multi-chassis peer switches. The MC-LAG protocol will not be established between the peer switches if each switch is configured with a different hello-interval value. The hello protocol parameters must match between peer chassis as well. Consistency parameters are parameters that are checked to verify that they meet the rules of the parameter and are termed to be consistent and bring up MC-LAG.
- lf the switches are configured with different hello-interval values, any change to the hello-interval value is effective after the switch reboot.

Examples

```
-> multi-chassis hello-interval 2
```

Release History

Release 6.4.5; command introduced.

Related Commands

multi-chassis chassis-id hello-interval	Assigns a globally unique chassis identifier to the switch and enables or disables the switch to operate in multi-chassis mode.
multi-chassis ipc-vlan	Configures the IPC-VLAN parameter, which is used for multi-chassis control communication, on the local switch.
show multi-chassis status	Displays the configured and operational parameters related to the multi- chassis feature on the switch.
show multi-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.

MIB Objects

```
multiChassisConfig
   multiChassisConfigHelloInterval
```

multi-chassis chassis-group

Assigns a globally unique chassis group identifier to a multi-chassis peer switch. Each switch in a multi-chassis domain must use the same group ID. The group ID uniquely identifies a pair of switches operating in a multi-chassis mode.

multi-chassis chassis-group *num*

Syntax Definitions

num	Chassis group identifier. The valid range is 0–255.

Defaults

parameter	default
num	0

Platforms Supported

OmniSwitch 9000E

Usage Guidelines:

- The chassis group identifier is a mandatory consistency parameter between two multi-chassis peer switches. The MC-LAG protocol will not be established between the peer switches if each switch is configured with a different chassis-group identifier number.
- This command is only available on switches that are configured with a valid multi-chassis chassis ID.
- Use the **no** form of this command to set the chassis group ID to zero (the default).
- Each multi-chassis domain must use a different group ID number to differentiate the domain within the network environment. This helps to avoid duplicate MAC address scenarios in a network topology that may contain more than one MC-LAG domain (for example, in a back-to-back MC-LAG topology).
- Two chassis that are part of the same multi-chassis pair must have the same chassis group ID, whereas chassis belonging to different pairs must have different chassis group ID.
- There is no automatic detection or correction if two different multi-chassis domains are configured with the same group ID. Ensure each domain within the network uses a group ID number that is only associated with that domain. If the user modifies the chassis group ID at runtime causing an inconsistency, the Multi-Chassis Manager (MCM) protocol goes down after the 30 seconds consistency window. If MCM protocol goes down, the *show multi-chassis status* displays the status as “down” and the chassis behaves like an independent chassis. The applications gets a multi-chassis down event and will not be aware of the other chassis.

Examples

```
-> multi-chassis chassis-group 2
-> no multi-chassis num
```

Release History

Release 6.4.5; command introduced.

Related Commands

multi-chassis chassis-id hello-interval	Assigns a globally unique chassis identifier to the switch and enables or disables the switch to operate in multi-chassis mode.
multi-chassis ipc-vlan	Configures the IPC-VLAN parameter, which is used for multi-chassis control communication, on the local switch.
show multi-chassis status	Displays the configured and operational parameters related to the multi- chassis feature on the switch.
show multi-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.

MIB Objects

```
multiChassisConfig
   multiChassisConfigChassisGroup
```

multi-chassis ipc-vlan

Configures the multi-chassis control VLAN on the switch. The multi-chassis control VLAN must be configured with the same VLAN ID on all the switches that will operate in multi-chassis mode.

multi-chassis ipc-vlan *vid*

Syntax Definitions

vid	A VLAN ID number. The valid range is 2 - 4094.

Defaults

parameter	default
vid (Multi-chassis control VLAN)	4094

Platforms Supported

OmniSwitch 9000E

Usage Guidelines.

- This command is only supported on switches that are configured with a valid multi-chassis chassis ID number (1 or 2).
- Specify a VLAN ID that does not exist in the switch configuration. This command will automatically create the VLAN as a multi-chassis control VLAN.
- The control VLAN is a mandatory consistency parameter between two multi-chassis peer switches. The MC-LAG protocol will not come up between the peer switches if each switch is configured with a different parameter.
- Any configuration to the VLAN ID value is effective after the switch reboot.
- The VLAN configured as multi-chassis control VLAN is shown as a different VLAN type.
- No front-panel ports (user ports) can be manually configured as members of the multi-chassis control VLAN and that VLAN cannot be disabled.
- Spanning tree configuration commands are not allowed on the multi-chassis control VLAN.
- VLAN 1 is not allowed to be configured as the multi-chassis control VLAN.

Examples

```
-> multi-chassis ipc-vlan 4094
```

Release History

Release 6.4.5; command introduced.

Related Commands

multi-chassis chassis-id hello-interval	Assigns a globally unique chassis identifier to the switch and enables or disables the switch to operate in multi-chassis mode.
multi-chassis hello-interval	Configures the multi-chassis hello-interval parameter on the switch.
show multi-chassis status	Displays the configured and operational parameters related to the |multi- chassis feature on the switch.
show multi-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.

MIB Objects

```
multiChassisConfig
   multiChassisConfigIpcVlan
```

multi-chassis loop-detection

Configures the multi-chassis loop-detection function on the switch that is used to detect loops and automatically disable offending ports where the loop-detection control packets originated by the local switch are received.

multi-chassis loop-detection {enable|disable}

Syntax Definitions

enable	Enables loop-detection operation.
disable	Disables loop-detection operation.

Defaults

parameter	default
loop-detection	enable

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- This command is only available on switches that are configured with a valid multi-chassis chassis ID number (1 or 2).
- While configuring the multi-chassis feature on an existing network, it is recommended to keep the default settings.
- Loop-detection is enabled by default on switches that operate in multi-chassis mode, that is, whose operational chassis identifier is within the range 1 -2. The feature is disabled by default on switches that operate in standalone mode, that is, whose operational chassis identifier is “0”.
- Disabling loop detection is not recommended when configuring MC-LAG in an existing network.
- Configure the multi-chassis feature parameters on the local chassis for loop-detection.
- Proprietary MAC addresses are used as the source addresses for loop detection control packets. Some of the OmniSwitch platforms are aware of these addresses will not learn them. However, other vendor switches will learn these addresses at the rate of one MAC address per VLAN.

Examples

```
-> multi-chassis loop-detection enable
-> multi-chassis loop-detection disable
```

Release History

Release 6.4.5; command introduced.

Related Commands

show multi-chassis loop-detection	Displays the configured and operational parameters related to the multi- chassis loop-detection feature on the switch.
multi-chassis loop-detection transmit-interval	Displays the loop detection status and parameter values for the switch.
clear multi-chassis loop-detection	Clears the MC-LAG loop detection information maintained by the switch.

MIB Objects

```
multiChassisConfig
   multiChassisConfigLoopDetectionAdminStatus
```

multi-chassis loop-detection transmit-interval

Configures the loop detection transmit-interval parameter. When loop detection is enabled, the switch generates multicast loop detection PDU (LDPDU) on each active VLAN. The loop detection transmit- interval determines how often the LDPDU are sent.

multi-chassis loop-detection transmit-interval *interval*

Syntax Definitions

interval	The interval, in seconds the switch waits between each transmission of loop detection packets. The valid range is 1–10 seconds.

Defaults

parameter	default
interval	1 second

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- This command is available only on switches that are configured with a valid multi-chassis chassis ID number (1 or 2).
- Increasing the transmit interval time as the number of configured VLANs increases is recommended to minimize the amount of bandwidth consumed by loop detection control packets. For example, if thousands of VLANs are configured on a switch, set the transmit interval to a number close to or equal to 10 seconds instead of using the default value, that is, 1 second.

Examples

```
-> multi-chassis loop-detection transmit-interval 2
-> multi-chassis loop-detection transmit-interval 3
```

Release History

Release 6.4.5; command introduced.

Related Commands

show multi-chassis loop-detection	Displays the configured and operational parameters related to the multi- chassis loop-detection feature on the switch.
multi-chassis loop-detection	Configures the multi-chassis loop-detection function on the switch.

MIB Objects

```
multiChassisConfig
   multiChassisLoopDetectionTransmitInterval
```

multi-chassis vf-link create

Configures a VFL between peer switches to enable them to operate in multi-chassis mode. It defines its administrative status.

multi-chassis vf-link create

no multi-chassis vf-link

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- This command is only available on switches that are configured with a valid multi-chassis chassis ID number (1 or 2).
- Use the **no** form of this command to remove the VFL configuration from the switch.
- Although the switch supports runtime configuration of the VFL and its member ports, configuring the VFL at the same time as the chassis ID is configured and before rebooting the switch is recommended.
- The VFL can be brought up when the administravie status of both the link and the multi-chassis feature is enabled.

Examples

```
-> multi-chassis vf-link create
-> no multi-chassis vf-link
```

Release History

Release 6.4.5; command introduced.

Related Commands

multi-chassis vf-link member-ports	Adds a port to the list of member ports of the virtual fabric link.
multi-chassis vf-link default-vlan	Configures the default VLAN on the virtual fabric link.
show multi-chassis vf-link	Displays a summary of the configured and operational parameters related to the virtual fabric link on the switch.
show multi-chassis vf-link member-port	Displays detailed information about the configured and operational parameters related to the virtual fabric link member ports on the switch.

MIB Objects

```
multiChassisLinkTable
   multiChassisLinkIfIndex
   multiChassisLinkOperStatus
   multiChassisLinkActivePortNum
   multiChassisLinkRowStatus
```

multi-chassis vf-link member-ports

Configures member ports for the virtual fabric link (VFL).

multi-chassis vf-link member-ports *slot/port*

no multi-chassis vf-link member-ports *slot/port*

Syntax Definitions

slot/port	Slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

Defaults

N/A

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- This command is only available on switches that are configured with a valid multi-chassis chassis ID number (1 or 2).
- A maximum of 8 interfaces can be configured as virtual fabric link members.
- Currently, only ports capable of operating at 10 Gbps (XNI-U32 only on OmniSwitch 9000E) and in full duplex mode can support the virtual fabric link operation. Ports on other types of modules are not eligible to become virtual fabric link member ports.
- If an eligible port is operationally down when the port is configured as a member of the VFL, the configuration is accepted. When that port then becomes operational, however, the switch will verify the port is operating at the required speed and duplex mode before accepting the port as a member. If these conditions are not met, the VFL configuration is removed from the port and a syslog message and SNMP trap are generated.
- Although the switch supports runtime configuration of the virtual fabric link and its member ports, it is recommended to configure the virtual fabric link at the same time the chassis identifier is configured and before rebooting the switches in multi-chassis mode.
- The virtual fabric link member ports become operational only when a switch comes up running in the multi-chassis mode. In other words, runtime configuration of a chassis identifier on a switch currently operating in standalone mode does not activate the member ports.
- For resiliency reasons, it is recommended configuring at least four interfaces as virtual fabric link members. An ideal set up would be to have two interfaces configured per network interface card. Within each network interface card, using an interface in the lower port range (that is, ports 1 through 16) and one interface in the upper port range (that is, ports 17 through 32) is recommended.

Examples

```
-> multi-chassis vf-link member-port 3/1
-> no multi-chassis vf-link member-port 3/2
```

Release History

Release 6.4.5; command introduced.

Related Commands

multi-chassis vf-link create	Configures a virtual fabric link between two peer switches to enable them to operate in multi-chassis mode.
multi-chassis vf-link default-vlan	Configures the default VLAN on the virtual fabric link.
show multi-chassis vf-link	Displays a summary of the configured and operational parameters related to the virtual fabric link on the switch.
show multi-chassis vf-link member-port	Displays detailed information about the configured and operational parameters related to the virtual fabric link member ports on the switch.

MIB Objects

```
multiChassisLinkMemberPortTable
   multiChassisLinkMemberPortLinkIfIndex
   multiChassisLinkMemberPortIfindex
   multiChassisLinkMemberPortOperStatus
   multiChassisLinkMemberPortRowStatus
```

multi-chassis vf-link default-vlan

Configures the default VLAN on the virtual fabric link.

multi-chassis vf-link default-vlan *vlan*

no multi-chassis vf-link default-vlan *vlan*

Syntax Definitions

vlan	VLAN to be configured as the default VLAN on the virtual fabric link in the range 1 - 4094.

Defaults

parameter	default
vlan (Virtual fabric-link default-vlan)	1

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- This command is only supported on switches that are configured with a valid multi-chassis chassis ID number (1 or 2).
- Use the no form of this command to remove the default VLAN assignment from the VFL.
- When configuration is not provided, the default or untagged VLAN on the VFL is VLAN 1.
- When no configuration is explicitly provided, the default or untagged VLAN for the virtual fabric link is VLAN 1.
- A VLAN must be created in advance using the **vlan** command to allow the VLAN as the default VLAN on the virtual fabric link.
- Specify a VLAN ID that already exists in the switch configuration.
- If the VLAN currently configured as the default VLAN for the virtual fabric link is removed using VLAN management commands (**no vlan** *vlan_id*), VLAN 1 is automatically reinstated as the default VLAN for the virtual fabric link.

Examples

```
-> multi-chassis vf-link default-vlan 2
-> no multi-chassis vf-link default-vlan
-> no vlan 2
```

Release History

Release 6.4.5; command introduced.

Related Commands

show multi-chassis vf-link	Displays a summary of the configured and operational parameters related to the virtual fabric link on the switch.
show multi-chassis vf-link member-port	Displays detailed information about the configured and operational parameters related to the virtual fabric link member ports on the switch.

MIB Objects

```
multiChassisLinkTable
   multiChassisLinkfIndex
   multiChassisLinkMemberPortLinkIfIndex,
   multiChassisLinkMemberPortOperDefaultVlan
```

multi-chassis vip-vlan

Configures a virtual IP (VIP) VLAN, which is a special type of VLAN used to provide the underlying LAN infrastructure for the support of basic IP/Layer 3 services on a multi-chassis link aggregation group.

multi-chassis vip-vlan *vid* **[{admin-state {enable|disable}} { name {num}{***"string"* **string} {** *mtu-ip num***}][{ 1x1 | flat }** *stp* **{enable | disable}]**

no multi-chassis vip-vlan *vid*

Syntax Definitions

vid	VLAN to be created as a virtual IP VLAN within the range [1 - 4094].
admin-state	The admin state of the VIP VLAN to enable or disable.
name	Description to the VIP VLAN with number or string.
mtu-ip	Maximum Transmission Unit(MTU) value to the VIP VLAN.
1x1	Specifies that the Spanning Tree status for the VIP- VLAN applies when the switch is running in the 1x1 Spanning Tree mode.
flat	Specifies that the Spanning Tree status for the VIP-VLAN applies when the switch is running in the flat Spanning Tree mode.
enable	Enables Spanning Tree for the specified VIP- VLAN.
disable	Disables Spanning Tree for the specified VIP-VLAN.

Defaults

N/A

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- This command is only supported on switches that are configured with a valid multi-chassis chassis ID number (1 or 2).
- Use the **no** form of this command to remove a VIP VLAN from the switch configuration.
- The virtual IP VLANs are distinguished from the others by a distinct type of VLAN using the VLAN management show commands.
- Specify a VLAN ID that does not exist in the switch configuration. This command will automatically create the VLAN as a VIP VLAN.
- Although VIP VLANs are identified as a special VLAN type for MC-LAG purposes, assigning non-MC-LAG ports to this type of VLAN is supported. In addition, assigning MC-LAG ports to standard VLANs (non-VIP VLANs) is supported.

- The IP interfaces configured on a virtual IP VLAN have limited functionality. Routing protocols and VRRP cannot be configured on such IP interfaces.
- The **no multi-chassis vip-vlan** command is processed directly by the VLAN Manager sub-system.
- The IP interfaces configured on a virtual IP VLAN have limited functionality. Routing protocols and VRRP cannot be configured on such IP interfaces.
- Currently IPv6 interfaces cannot be configured on a virtual IP VLAN.
- There are two IP addresses associated with a VIP VLAN IP interface: a management address and a virtual IP address.

  > The management address is a unique IP address used by each switch within a multi-chassis domain to provide management services. Each peer switch must have a unique management IP address.

  > The virtual IP address is used to route packets that terminate on the multi-chassis peer switches. Unlike the management address, the VIP address must be the same on each peer switch.

Examples

```
-> multi-chassis vip-vlan 3
-> no multi-chassis vip-vlan 3
```

Release History

Release 6.4.5; command introduced.

Related Commands

show vlan	Displays a list of VLANs configured on the switch.
multi-chassis chassis-id hello-interval	Assigns a unique chassis identifier to the switch and enables or disables the switch to operate in multi-chassis mode.
ip interface	Configures an IP interface for a VLAN. Use this command to configure an IPv4 interface for a VIP VLAN.

MIB Objects

```
vlanTable
   vlanEntry
```

show multi-chassis status

Displays the configured and operational parameters related to the multi-chassis feature on the switch.

show multi-chassis status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

N/A

Examples

```
-> show multi-chassis status
Multi-Chassis Operational Configured
----------------+-----------+---------
Chassis ID 1  2
Chassis Role Primary N/A
Status UP N/A
Chassis-Type     OS9802E       N/A
Hello Interval 5s 5s
IPC VLAN 4904 4094
Chassis-Group     10            10
```

Output fields are defined here:

output definitions

Operational	Operational parameters that are currently being used by the system.
Configured	Parameters that are configured and that are implemented after switch reset.
Chassis ID	Chassis identifier within the multi-chassis operational range [1 - 2]. The chassis identifier must be globally unique within the set of switches configured to operate together providing multi-chassis services.
Chassis Role	The chassis role determines which of the switches operating in multi-chassis mode is the master of the combined system. The role information can be used by various software components as needed.
Status	The current status of the multi-chassis feature, which can be **Down**, **Up**, or **Inconsistent**.
Chassis-Type	The peer switch chassis type.(OS9000E).

output definitions

Hello Interval	Time interval, in seconds, at which multi-chassis control hello messages are to be sent to the peer switch within the range [1 - 10].
IPC VLAN	Multi-chassis control VLAN used for all multi-chassis control communication between the peer switches within the range [2 - 4094].
Chassis-Group	The multi-chassis group ID for the switch. Peer switches must use the same group ID.

Release History

Release 6.4.5; command introduced.

Related Commands

multi-chassis chassis-id hello-interval	Assigns a globally unique chassis identifier to the switch and enables or disables the switch to operate in multi-chassis mode.
multi-chassis hello-interval	Configures the multi-chassis hello-interval parameter on the switch.
multi-chassis ipc-vlan	Configures the IPC-VLAN parameter, which is used for multi-chassis control communication, on the local switch.
show multi-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.

MIB Objects

```
multiChassisOperation
   multiChassisOperChassisId
   multiChassisOperChassisRole
   multiChassisOperStatus
   multiChassisOperHelloInterval
   multiChassisOperIpcVlan
multiChassisConfig
   multiChassisConfigChassisId
   multiChassisConfigHelloInterval
   multiChassisGroup
   multiChassisType
```

show multi-chassis loop-detection

Displays the configured and operational parameters related to the multi-chasiss loop-detection feature on the switch.

show multi-chassis loop-detection

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

If a loop is detected, disable loop detection and then use **clear multi-chassis loop-detection** command to clear the loop detection information from the ports that were downed. This will ensure that **multi-chassis loop-detection** command displays the most current status for such ports.

Examples

```
-> show multi-chassis loop-detection
Status              : Enabled,
Transmit Interval   : 2s,
Total Transmit Count: 135701,
Total Loop Count    : 11,
Port Down List      : 7/1
```

Output fields are defined here:

output definitions

Status	Administrative status of the loop-detection feature. Can be **Enabled** or **Disabled**
Transmit Interval	Transmit interval, in seconds, which determines the time interval between the transmission of successive loop-detection packets on each VLAN active on the switch within the range [1 - 10].
Total Transmit Count	Total number of control packets transmitted on all VLANs configured on the switch.
Total Loop Count	Total number of control packets that were transmitted and received, that is. looped back to the originator on all VLANs.
Port Down List	List of ports that were brought down because a loop was detected.

Release History

Release 6.4.5; command introduced.

Related Commands

multi-chassis loop-detection	Configures the multi-chassis loop-detection function on the switch.
multi-chassis loop-detection transmit-interval	Configures the loop-detection transmit interval, which determines the time interval between the transmission of successive loop-detection packets on each VLAN active on the switch.
clear multi-chassis loop-detection	Clears the MC-LAG loop detection information maintained by the switch.

MIB Objects

```
multiChassisLoopDetection
   multiChassisLoopDetectionTransmitCount
   multiChassisLoopDetectionCount
   multiChassisLoopDetectionPortDownList
   multiChassisLoopDetectionAdminStatus
   multiChassisLoopDetectionTransmitInterval
```

show multi-chassis vf-link

Displays a summary of the configured and operational parameters related to the virtual fabric link on the switch.

show multi-chassis vf-link

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

N/A

Examples

```
-> show multi-chassis vf-link
VFLink ID   Oper     Primary Port   Config Port   Active Port   Def Vlan
----------+--------+--------------+-------------+-------------+---------
0           Up       1/2            4             4             5
```

Output fields are defined here:

output definitions

VFLink ID	Virtual Fabric Link identifier. Currently a single virtual fabric link with identifier equal to zero is supported.
Oper	The current status of the Virtual Fabric Link, which can be **Disabled**, **Down** or **Up**. The **Disabled** state occurs whenever the multi-chassis feature is disabled because the operational chassis identifier currently effective is the standalone chassis identifier, that is, zero.
Primary Port	Identifies the primary port of the virtual fabric link. This concept is relevant because all the non-unicast traffic, that is, broadcast, multicast and unknown unicast is distributed across ports of the network interface module that hosts the virtual fabric link's primary port.
Config Port	Number of physical ports configured as virtual fabric link member ports in the range [0 - 8].
Active Port	Number of physical ports that are operational or active members of the virtual fabric link in the range [0 - 8].
Def Vlan	Default VLAN on the virtual fabric link within the range [1 - 4094].

Release History

Release 6.4.5; command introduced.

Related Commands

multi-chassis vf-link create	Configures a virtual fabric link between two peer switches to enable them to operate in multi-chassis mode.

```

show multi-chassis vf-link member-port

Displays detailed information about the configured and operational parameters related to the virtual fabric link member ports on the switch.

show multi-chassis vf-link member-port [*slot/port***]**

Syntax Definitions

slot/port	Specify the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

Defaults

N/A

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

N/A

Examples

```
-> show multi-chassis vf-link member-port
VFLink ID   Slot/Port   Oper      Is Primary
----------+-----------+---------+------------
0           1/1         Up        No
0           1/2         Up        Yes
0           1/17        Up        No
0           1/18        Up        No

-> show multi-chassis vf-link member-port 3/1
VFLink ID   Slot/Port   Oper      Is Primary
----------+-----------+---------+------------
0           1/2         Up        Yes
```

Output fields are defined here:

output definitions

VFLink ID	Virtual Fabric Link identifier. Currently a single virtual fabric link with identifier equal to zero is supported.
Slot/Port	The slot/port that defines each of the physical ports that are members of the virtual fabric link.

output definitions

Oper	The current status of each virtual fabric link member port, which can be **Disabled**, **Down** or **Up**.The **Disabled** state occurs whenever the multi-chassis feature is disabled because the operational chassis identifier currently effective is the standalone chassis identifier, that is, zero.
Is Primary	Specifies whether a physical port is the primary port of the virtual fabric link. It may assume the values **Yes** or **No**.

Release History

Release 6.4.5; command introduced.

Related Commands

multi-chassis vf-link create	Configures a virtual fabric link between two peer switches to enable them to operate in multi-chassis mode.

show multi-chassis consistency

Displays the system level mandatory consistency parameters of both the local and peer switches.

show multi-chassis consistency

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

N/A

Examples

```
-> show multi-chassis consistency
Consistency           Local     Peer      Status
--------------------+---------+---------+---------
Chassis-ID            1         2         OK
Chassis-Type          OS9802E   OS9802E   OK
Hello-Interval        5         5         OK
IPC-VLAN              4094      4094      OK
CHASSIS_GROUP         0         0         OK
STP-Path-Cost-Mode    Auto      Auto      OK
STP-Mode              Per-VLAN  Per-VLAN  OK
```

Output fields are defined here:

output definitions

Consistency	Provides a list of global mandatory consistency parameters for the local and remote switches operating in multi-chassis mode.
Local	Value of a given consistency parameter on the local switch.
Peer	Value of a given consistency parameter on the peer switch.
Status	Specifies the overall status of a consistency parameter within the entire multi-chasiss system comprised by the individual switches. The possible values are **OK**, **NOK**, and **N/A** if there is a mismatch of any of the parameters listed in this command or if the chassis identifier of the two switches is the same, the multi-chassis operational status will not be “Up”. In this case the "Status" column shown in this output indicates which parameter has a problem. The N/A value in the "Peer" column indicates that the information is unavailable from the peer. This will always be the case when the multi-chassis operational status is **Down.**

output definitions

Chassis ID	Globally unique chassis identifier. The valid range for the multi-chassis operational range is [1 - 2], whereas the value for standalone operation is zero.
Chassis-Type	The peer switch chassis type.
Hello Interval	Time interval, in seconds, at which multi-chassis control hello messages are to be sent to the peer switch within the range [1 - 10].
STP-Path-Cost-Mode	Specifies the STP path cost mode whose possible values are Auto and 32Bit.
STP-Mode	Specifies the STP mode whose possible values are **Per-VLAN** and **Flat**

Release History

Release 6.4.5; Command introduced.

spantree mode	Assigns a flat Spanning Tree or per-vlan Spanning Tree operating mode for the switch. These modes are exclusive; however, it is not necessary to reboot the switch when the STP modes are changed.
multi-chassis chassis-id hello-interval	Assigns a globally unique chassis identifier to the switch and enables or disables the switch to operate in multi-chassis mode.
multi-chassis hello-interval	Configures the multi-chassis hello-interval parameter on the switch.
multi-chassis ipc-vlan	Configures the IPC-VLAN parameter, which is used for multi-chassis control communication, on the local switch.
show multi-chassis status	Displays the configured and operational parameters related to the multi- chassis feature on the switch.
show multi-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.

MIB Objects

```
multiChassisGlobalConsistency
   multiChassisLocalChassisId
   multiChassisPeerlChassisId
   multiChassisIdConsistency
   multiChassisLocalHelloInterval
   multiChassisPeerHelloInterval
   multiChassisHelloIntervalConsistency

   multiChassisPeerStpPathCostMode
   multiChassisStpPathCostModeConsistency
   multiChassisLocalStpMode
   multiChassisPeerStpMode
   multiChassisStpModeConsistency
vlanTable
   vlanEntry
```

show multi-chassis consistency linkagg

Displays the per-multi-chassis aggregate level optional consistency parameters of both the local and peer switches.

show multi-chassis consistency linkagg *agg_num* **[vlan-list]**

Syntax Definitions

agg_num	The number corresponding to the static or dynamic multi-chassis aggregate group within the range [0-127] and subject to the settings specified through the linkagg range command.
vlan-list	Lists the local and peer VLANs associated with the aggregate.

Defaults

N/A

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- This command provides data related to multi-chassis aggregates only. It cannot be used for ordinary aggregates. To determine the type of an aggregate and classify this aggregate as a multi-chassis aggregate, use the **linkagg range** command.
- Use the **linkagg range** command to identify the ranges assigned to aggregate.
- Mismatch of any of the parameters listed in this command represent network mis-configurations and may cause traffic problems. In case of mismatch the "Status" column shown in this output will indicate which parameter has a problem.

Examples

```
-> show multi-chassis consistency linkagg
Local  Peer
Linkagg  Exist  Exist  Status
-------+------+------+-------
98       Yes    No     N/A

-> show multi-chassis consistency linkagg 3
Consistency Local Peer Status
----------------------+--------------------+------------------+---------
Chassis-ID 1  2  OK
Agg-ID 3  3  OK
LAG-Type LACP  SATIC  NOK
LACP-System-ID 00:d0:95:a3:ec:67 00:d0:95:a3:ec:67  OK
LACP-Priority 100 100 OK
Default-Vlan1 1 OK
VLAN-List Configured Configured NOK
```

Output fields are defined here:

output definitions

Consistency	Provides a list of per-multi-chassis aggregate optional consistency parameters for the local and remote switches operating in multi-chassis mode.
Local	Value of a given consistency parameter on the local switch.
Peer	Value of a given consistency parameter on the peer switch.
Status	Specifies the overall status of a consistency parameter within the entire multi-chasiss system comprised by the individual switches. The possible values are **OK**, **NOK**, and **N/A**. or In case of mismatch of any of the parameters listed in this command or if the chassis identifier of the two switches is the same, the multi-chassis operational status will not become Up. In this case the "Status" column shown in this output will indicate which parameter has a problem. The N/A value in the "Peer" column indicates that the information is unavailable from the peer. This will always be the case when the multi-chassis operational status is **Down**.
Chassis-ID	Globally unique chassis identifier. The valid range for the multi-chassis operational range is [1 - 2], whereas the value for standalone operation is zero.
Agg-ID	The number corresponding to the static or dynamic multi-chassis aggregate group within the range [0-127].
LAG-Type	Defines the aggregate type as static or dynamic (that is, LACP)
LACP-System-ID	Specifies the system identifier (MAC address format) used by the LACP protocol.
LACP-Priority	Provides the system priority used by the LACP protocol.
Default-Vlan	Specifies the value of the default VLAN configured on the multi-chassis aggregate within the range [1 - 4094].
VLAN List	Indicates whether other types of VLANs (distinct from the default VLAN) are configured on the multi-chassis aggregate.
Local Count	The number of VLANs on the local chassis.
Peer Count	The number of VLANs on the peer chassis.

Release History

Release 6.4.5; command introduced.

Related Commands

clear multi-chassis loop-detection

Clears the configured and operational parameters related to the multi-chasiss loop-detection feature on the switch.

clear multi-chassis loop-detection

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

If a loop is detected, disable the loop detection and use the **clear multi-chassis loop-detection** command to clear the loop detection information from the ports that were downed. This ensures that **show multi-chassis loop-detection** command displays the recent status for such ports.

Examples

```
-> clear multi-chassis loop-detection
```

Release History

Release 6.4.5; command introduced.

Related Commands

multi-chassis loop-detection	Configures the multi-chassis loop-detection function on the switch.
show multi-chassis loop-detection	Displays the configured and operational parameters related to the multi-chasiss loop-detection feature on the switch.

MIB Objects

```
multiChassisLoopDetection
```

9 Ethernet Ring Protection Commands

Ethernet Ring Protection (ERP) is a protection switching mechanism for Ethernet ring topologies, such as multi-ring and ladder networks. The implementation of ERP on Alcatel-Lucent OmniSwitch is based on ERP Version 2 (ITU-T G.8032/Y.1344 to 2010) using the Ring Automatic Protection Switching (R-APS) protocol to coordinate and prevent network loops within a bridged Ethernet ring.

ERP v2 supports multi rings and ladder to ladder networks. ERPv2 functionalities allow configuration of Sub-Rings within a Master Ethernet Ring, interconnected nodes and shared links between the rings.

MIB information for Ethernet Ring Protection commands is as follows:

Filename: AlcatelIND1Erp.mib
Module: ALCATEL-IND1-ERP-MIB

A summary of available commands is listed here:

erp-ring
erp-ring reset-version-fallback
erp-ring rpl-node
erp-ring wait-to-restore
erp-ring enable
erp-ring guard-timer
erp-ring sub-ring
erp-ring virtual-channel
erp-ring revertive
erp-ring clear
erp-ring ethoam-event
clear erp statistics
show erp
show erp statistics

erp-ring

Creates an Ethernet Ring Protection (ERP) using the specified ports and service VLAN ID. The service VLAN transmits ERP control traffic, such as Ring Automatic Protection Switching (R-APS) messages, through the ring. The specified level number identifies an APS Management Entity Group (MEG) to which the service VLAN belongs.

erp-ring *ring_id* **port1 {***slot/port* **| linkagg** *agg_num***} port2 {***slot/port* | **linkagg** *agg_num***} service-vlan** *vlan_id* **level** *level_num* **[guard-timer** *guard_timer***] [enable | disable]**

no erp-ring *ring_id*

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
slot/port	The slot number for the module and the physical port number on that module.
agg_num	The link aggregate ID number.
vlan_id	The service VLAN ID number.The valid range is 1 to 4094.
level_num	The MEG level number for the service VLAN. The valid range is 0 to 7.
guard-timer	The guard timer value, in centi seconds, for the ring node.
enable	Administratively enables the ERP ring**.**
disable	Administratively disables the ERP ring.

Defaults

parameter	default
guard_timer	50
**enable	disable**	disable

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a ring from the switch configuration. Administratively disable the ring ports before deleting the ring to avoid creating any network loops. Once the ring is deleted, ensure that the same ports are administratively enabled under Spanning Tree control.
- The specified ring identification number must be unique within a switch.
- ERP is not supported on mobile ports, mirroring ports, link aggregate member ports, high availability ports, Multicast VLAN receiver ports (ERP is supported on Multicast VLAN sender ports only), VLAN Stacking user network interface (UNI) ports, or RRSTP ring ports.

- If a port is tagged with the service VLAN ID or the service VLAN is the default VLAN for the port, then the port is not eligible to become an ERP ring port.
- Specify an existing VLAN ID for the service VLAN ID. Use the same VLAN ID and level number for the service VLAN on each switch that participates in the ERP ring.
- If the ERP switch participates in an Ethernet OAM Maintenance Domain (MD), configure the ERP service VLAN to use the same level number that is used for the Ethernet OAM MD.
- Specify a static VLAN ID for the ERP service VLAN; dynamic VLANs are not configurable as service VLANs.
- The service VLAN can belong to only one ERP ring at a time. A maximum of 8 rings are allowed per switch.
- The specified service VLAN ID must not participate in a Spanning Tree instance that is associated with non-ERP VLANs. Ideally, change the Spanning Tree configuration for the VLAN ID prior to using this command.
- An ERP ring port can belong to only one ERP ring at a time.
- Create an NNI-SVLAN binding before establishing an ERPv2 ring on that SVLAN-NNI binding.The SVLAN-NNI binding can be created with the **ethernet service svlan nni** command.
- ERP is not supported over MC-LAG if the slot/port is an MC-LAG port.
- ERP is not supported if the slot/port is an MC-LAG member port, and an error message is displayed that it is an MC-LAG aggregable port.
- ERP is also not supported if the slot/port is a VFL member port and an error message is displayed specifing that it is an VFL aggregable port.

Examples

```
-> erp-ring 1 port1 1/1 port2 2/4 service-vlan 10 level 2 enable
-> erp-ring 2 port1 linkagg 1 port2 2/10 service-vlan 20 level 2
-> erp-ring 3 port1 linkagg 2 port2 linkagg 4 service-vlan 30 level 7
-> no erp-ring 2
```

Release History

Release 6.3.4; command introduced.

Related Commands

show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.
ethernet-service svlan nni	Creates an NNI-SVLAN binding.

MIB Objects

```
alaErpRingTable
   alaErpRingServiceVid
   alaErpRingMEGLevel
   alaErpRingStatus
   alaErpRingPort1
   alaErpRingPort2
   alaErpRingGuardTimer
   alaErpRingRowStatus
```

erp-ring reset-version-fallback

Reverts the ERP ring to ERPv2 mode after upgradation and is issued on all the devices of the ring, starting from the RPL owner.

erp-ring *ring_id* **reset-version-fallback**

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.

Defaults

NA

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines:

- This command must be issued after the ERP devices are upgraded from AOS 6.4.4 to AOS 6.4.5 as part of the ERPv2 upgradation process. To configure ERPv2 ring this command must be issued on all the nodes starting from the RPL node.
- Use the **show erp ring** command to verify the ERP version running on the switch.
- If this command is issued when the switch is already running ERPv2, then the following error message is displayed. **"ERROR: Ring** *ring_id* **is running as ERP protocol V2"**

Examples

```
-> erp-ring 1 reset-version-fallback
```

Release History

Release 6.4.5; command introduced.

Related Commands

show erp	Displays the ERP ring configuration for the switch.

MIB Objects

```
alaErpRingTable
   alaErpRingActiveVersion
   alaErpRingResetVersionFallback
```

erp-ring rpl-node

Configures a switch as a RPL node. This command also identifies the ERP port as an RPL connection port. The RPL remains blocked to prevent loops within the ERP ring.

erp-ring *ring_id* **rpl-node {port** *slot/port* **| linkagg** *agg_num***}**

no erp-ring *ring_id* **rpl-node**

Syntax Definitions

ring_id	An existing ERP ring ID number. The range is 1 to 2147483647.
slot	The slot number for the module.
port	The physical port number on the module.
agg_num	The link aggregate ID number.

Defaults

NA

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove the RPL designation for the specified ring.
- The RPL node can be configured only when the ring is disabled. RPL configurations applied to the Ethernet ring while it is enabled, is rejected.
- The specified ERP ring ID must exist in the switch configuration.
- This command applies only to ERP ring ports; ports not configured as ERP ring ports are not eligible to become RPL ports.
- Only one of the two ring ports configured for the switch can be designated as an RPL node port.
- For RPL configuration on member ports of VFL, if the slot/port is a VFL or MC-LAG member port an error message is displayed.

Examples

```
-> erp-ring 1 rpl-node port 2/1
-> erp-ring 2 rpl-node linkagg 2
-> no erp-ring 2 rpl-node
```

Release History

Release 6.3.4; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
erp-ring wait-to-restore	Configures the wait-to-restore timer value for the Ring Protection Link (RPL) node.
show erp	Displays the ERP ring configuration for the switch.

MIB Objects

```
alaErpRingPortEntry
   alaErpRingPortIfIndex
   alaErpRingPortType
```

erp-ring wait-to-restore

Configures the wait-to-restore timer value for the RPL switch. This timer determines the interval in minutes the RPL switch waits before returning the RPL ports to a blocked state after the ERP ring has recovered from a link failure.

erp-ring *ring_id* **wait-to-restore** *wtr_timer*

no erp-ring *ring_id* **wait-to-restore**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1 to 2147483647.
wtr_timer	The number of minutes to wait before restoring the RPL to a blocked state. The valid range is 1 to 12 minutes.

Defaults

By default, the wait-to-restore timer value is set to 5 minutes.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to set the timer back to the default setting of 5 minutes.
- The specified ERP ring ID must exist in the switch configuration.
- This command applies only on a switch that serves as the RPL node for the ERP ring.

Examples

```
-> erp-ring 1 wait-to-restore 6
-> no erp-ring 1 wait-to-restore
```

Release History

Release 6.3.4 ; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
erp-ring rpl-node	Configures a Ring Protection Link (RPL) port connection.
show erp	Displays the ERP ring configuration for the switch.

MIB Objects

```
alaErpRingId
   alaErpRingWaitToRestoreTimer
```

erp-ring enable

Enables or disables an ERP ring identified by the specified ring ID. This command applies to enabling or disabling existing ERP rings.

erp-ring *ring_id* **{enable** | **disable}**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1to2147483647.

Defaults

By default, ERP rings are disabled when they are created.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The specified ring ID must exist in the switch configuration.
- Enabling a ring is also allowed at the time the ring is created.

Examples

```
-> erp-ring 1 enable
-> erp-ring 1 disable
```

Release History

Release 6.3.4 ; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
show erp	Displays the ERP ring configuration for the switch.

MIB Objects

```
alaErpRingId
   alaErpRingStatus
```

erp-ring guard-timer

Configures the guard timer value for the specified ERP ring node. The guard timer is used to prevent ring nodes from receiving outdated Ring Automatic Protection Switching (R-APS) messages. During the amount of time determined by this timer, all received R-APS messages are ignored by the ring protection control process.

erp-ring *ring_id* **guard-timer** *guard_timer*

no erp-ring *ring_id* **guard-timer**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1–2147483647.
guard_timer	The guard timer value. The valid range is 1–200 centi-secs.

Defaults

parameter	default
guard_timer	50

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to set the timer back to the default value of 50 centi-secs.
- The specified ring ID must exist in the switch configuration.

Examples

```
-> erp-ring 1 guard-timer 10
-> no erp-ring 1 guard-timer
```

Release History

Release 6.3.4 ; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
show erp	Displays the ERP ring configuration for the switch.

MIB Objects

```
alaErpRingId
   alaErpRingGuardTimer
```

erp-ring sub-ring

Creates an Ethernet Ring Protection (ERP) sub-ring.

erp-ring *ring_id* **sub-ring-port {***slot/port* **| linkagg** *agg_num***} service-vlan** *vlan_id* **level** *level_num* **[guard-timer** *guard_timer***] [enable | disable]**

no erp-ring *ring_id* **{***slot/port* **| linkagg** *agg_num***}**

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
slot/port	The slot number for the module and the physical port number on that module.
agg_num	The link aggregate ID number.
vlan_id	The service VLAN ID number.The valid range is 1 to 4094.
level_num	The MEG level number for the service VLAN. The valid range is 0 to 7.
guard-timer	The guard timer value, in centi-secs, for the ring node.
enable	Administratively enables the ERP sub-ring**.**
disable	Administratively disables the ERP sub-ring.

Defaults

parameter	default
guard_timer	50
**enable	disable**	disable

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a sub-ring from the switch configuration. Adminstratively disable ring ports before deleting the ring to avoid creating any network loops. Once the ring is deleted, ensure that the same ports are administratively enabled under Spanning Tree control.
- The specified ring identification number must be unique within a switch.
- ERP is not supported on mobile ports, mirroring ports, link aggregate member ports, high availability ports, Multicast VLAN receiver ports (ERP is supported on Multicast VLAN sender ports only), VLAN Stacking user network interface (UNI) ports, or RRSTP ring ports.
- VLAN tagging must be enabled before the ERPv2 ring is enabled.
- Specify an existing VLAN ID for the service VLAN ID. Use the same VLAN ID and level number for the service VLAN on each switch that participates in the ERP ring.

- If the ERP switch participates in an Ethernet OAM Maintenance Domain (MD), configure the ERP service VLAN to use the same level number that is used for the Ethernet OAM MD.
- Specify a static VLAN ID for the ERP service VLAN; dynamic VLANs are not configurable as service VLANs.
- The service VLAN can belong to only one ERP ring at a time. A maximum of four rings are allowed per switch.
- An ERP ring port can belong to only one ERP ring at a time.
- An ERP type NNI-SVLAN binding must exist before establishing an ERP ring.

Examples

```
-> erp-ring 1 sub-ring-port 1/1 service-vlan 10 level 2 enable
-> erp-ring 2 sub-ring-port linkagg 1 port2 2/10 service-vlan 20 level 2
-> no erp-ring 2
```

Release History

Release 6.4.5; command introduced.

Related Commands

erp-ring	Creates an Ethernet Ring Protection (ERP) ring.
show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.
ethernet-service svlan nni	Creates a NNI-SVLAN binding.

MIB Objects

```

   alaErpRingId
   alaErpRingServiceVid
   alaErpRingMEGLevel
   alaErpRingStatus
   alaErpRingPort1
   alaErpRingPort2
   alaErpRingGuardTimer
   alaErpRingRowStatus
```

erp-ring virtual-channel

Enables or disables an Ethernet Ring Protection (ERP) Ring Virtual Channel.

erp-ring *ring_id* **virtual-channel [enable | disable]**

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
enable	Administratively enables the ERP virtual channel**.** If enabled, Ring Automatic Protection Switching (R-APS) protocol messages are encapsulated and transmitted over a virtual channel configured on the major ring.
disable	Administratively disables the ERP virtual channel. If disabled, R-APS messages are terminated at the interconnection nodes between the rings but not blocked at the Ring Protection Link (RPL) of the sub-ring.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The specified ring identification number must be unique within a switch.
- The ring identified by Ring ID must be created before configuring the virtual channel state for ring node.

Examples

```
-> erp-ring 2 virtual-channel disable
-> erp-ring 1 virtual-channel enable
```

Release History

Release 6.4.5; command introduced.

Related Commands

erp-ring	Creates an Ethernet Ring Protection (ERP) ring.
erp-ring sub-ring	Creates an Ethernet Ring Protection (ERP) ring sub ring.
show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.

MIB Objects

```
alaErpRingTable
   alaErpRingId
   alaErpRingVirtualChannel
```

erp-ring revertive

This command is only applicable for the RPL-owner switch. Enables or disables revertive mode on the specified node.

erp-ring *ring_id* **revertive [enable | disable]**

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
enable	Administratively enables Revertive Mode**.** Now, if the RPL is unblocked due to a failure within the ring, the RPL automatically reverts to the "Blocked" state when the failed link recovers.
disable	Administratively disables Revertive Mode. Now, if the RPL is unblocked due to a failure within the ring, the RPL does not automatically revert to "Blocked" state when the failed link recovers.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The specified ring identification number must be unique within a switch.
- The ring identified by the Ring ID must be created using the **erp-ring** command, before configuring the revertive mode for ring node.

Examples

```
-> erp-ring 1 revertive enable
-> erp-ring 2 revertive disable
```

Release History

Release 6.4.5; command introduced.

Related Commands

erp-ring	Creates an Ethernet Ring Protection (ERP) ring.
erp-ring sub-ring	Creates an Ethernet Ring Protection (ERP) ring sub ring.
erp-ring clear	Clears any pending state (for example, non-revertive restoring).
show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.

MIB Objects

```
alaErpRingTable
   alaErpRingId
   alaErpRingRevertive
```

erp-ring clear

This command is only applicable for the RPL-owner switch. Clears any pending state (for example, non-revertive restoring).

erp-ring *ring_id* **clear**

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
clear	Clears any pending state on the ring.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The specified ring identification number must be unique within a switch.

Examples

```
-> erp-ring 1 clear
```

Release History

Release 6.4.5; command introduced.

Related Commands

erp-ring	Creates an Ethernet Ring Protection (ERP) ring.
erp-ring sub-ring	Creates an Ethernet Ring Protection (ERP) ring sub ring.

show erp statistics	Displays ERP ring statistics.

MIB Objects

```
alaErpRingTable
   alaErpRingId
   alaErpRingClearAction
```

erp-ring ethoam-event

Configures a ring port to accept a “loss of connectivity” event from Ethernet OAM for a remote endpoint.

erp-ring *ring_id* **ethoam-event {***slot/port* **| linkagg** *agg_num***} remote-endpoint** *mep_id*

no erp-ring *ring_id* **ethoam-event {***slot/port* **| linkagg** *agg_num***}**

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
slot/port	The slot number for the module and the physical port number on that module.
agg_num	The link aggregate ID number.
mep_id	The remote endpoint ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The specified ring identification number must be unique within a switch.

Examples

```
-> erp-ring 1 ethoam-event 1/1 remote-endpoint 10
-> erp-ring 1 ethoam-event linkagg 1 remote-endpoint 10
```

Release History

Release 6.4.5; command introduced.

Related Commands

erp-ring	Creates an Ethernet Ring Protection (ERP) ring.
erp-ring sub-ring	Creates an Ethernet Ring Protection (ERP) ring sub ring.
show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.

MIB Objects

```
alaErpRingTable
   alaErpRingId
   alaErpRingPortIfIndex
   alaErpRingPortEthOAMEvent
   alaErpRingPortRmepId
```

clear erp statistics

Clears ERP statistics for all rings, a specific ring, or a specific ring port.

clear erp statistics [ring *ring_id* **[port** *slot/port* **| linkagg** *agg_num***]]**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1 to 2147483647.
slot/port	The slot number for the module and the physical port number on that module.
agg_num	The link aggregate ID number.

Defaults

By default, statistics are cleared for all ERP rings in the switch configuration.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a ring ID to clear the statistics for a specific ring.
- Enter a ring ID and a ring port number or link aggregate ID to clear the statistics for a specific port or link aggregate.
- The specified ring ID must exist in the switch configuration.
- The specified port must belong to the ring identified by the ring ID.

Examples

```
-> clear erp statistics
-> clear erp statistics ring 5
-> clear erp statistics ring 5 port 1/2
-> clear erp statistics ring 5 linkagg 10
```

Release History

Release 6.3.4 ; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.

MIB Objects

```
alaErpClearStats
alaErpRingTable
   alaErpRingId
   alaErpRingClearStats
alaErpRingPortTable
   alaErpRingPortIfIndex
   alaErpRingPortClearStats
```

show erp

Displays the ERP configuration information for all rings, a specific ring, or for a specific ring port.

show erp [ring *ring_id* **| [port** *slot/port* **| linkagg** *agg_num***]]**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1 to 2147483647.
slot/port	The slot number for the module and the physical port number on that module.
agg_num	The link aggregate ID number.

Defaults

By default, configuration information is displayed for all ERP rings in the switch configuration.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a ring ID to display the configuration for a specific ring.
- Enter a ring port number or a link aggregate ID to display the configuration for a specific port or link aggregate.
- The specified ring ID must exist in the switch configuration.

Examples

Output for Normal Ring :

```
-> show erp ring 1
Ring Id                 : 1,
Ring Type               : Normal Ring,
Ring Port1              : 1/1,
Ring Port2              : 1/2,
Ring Status             : enabled,
Service VLAN            : 500,
Revertive Mode          : enabled,
WTR Timer (min)         : 5,
Guard Timer (centi-sec) : 50,
Virtual Channel         : enabled,
MEG Level               : 1,
Ring State              : idle,
Active ERP version      : Ver 2,
Ring Node Type          : non-rpl,
Last State Change       : FRI AUG 31 07:33:26 2012  (sysUpTime 00h:29m:29s)
```

Output for Sub Ring :

```
-> show erp ring 2
Ring Id                 : 2,
Ring Type               : Sub-ring,
Sub-ring Port           : 1/4,
Ring Status             : enabled,
Service VLAN            : 700,
Revertive Mode          : enabled,
WTR Timer (min)         : 5,
Guard Timer (centi-sec) : 50,
Virtual Channel         : enabled,
MEG Level               : 1,
Ring State              : protection,
Active ERP version      : Ver 2,
Ring Node Type          : non-rpl,
Last State Change       : MON SEP 03 02:54:15 2012  (sysUpTime 01h:31m:44s)
```

Command output when ERP version 1 is active:

```
-> show erp ring 1
Ring Id                 : 1,
Ring Type               : Normal Ring,
Ring Port1              : 1/5,
Ring Port2              : 1/6,
Ring Status             : disabled,
Service VLAN            : 190,
Revertive Mode          : enabled,
WTR Timer (min)         : 5,
Guard Timer (centi-sec) : 50,
Virtual Channel         : enabled,
MEG Level               : 1,
Ring State              : init,
Active ERP version      : Ver 1,
Ring Node Type          : non-rpl,
Last State Change       : TUE NOV 27 21:27:44 2012  (sysUpTime 00h:00m:00s)
```

```
-> show erp

Total number of rings configured = 4
```

output definitions

Ring ID	The ERP ring ID number.
Ring Ports	The slot and port number of the ring ports.
Ring Status	The ring status **(enabled** or **disabled)**.
Service VLAN	The Service VLAN ID.
WTR Timer	The wait-to-restore timer value in minutes for RPL node.
Guard Timer	The guard timer value in centi-secs for the ring node.
MEG Level	The Service VLAN Management Entity Group (MEG) level.
Ring State	Indicates the state of the ring.
Active ERP Version	Specifies the active ERP version on the Switch - **ERP Version 1** or **ERP Version 2.**
Ring Node Type	Indicates the type of the ring node.
Last State Change	Indicates the time when the last state change occurred.

```
-> show erp port 1/1

Ring-Id : 1

Ring Port Status     : forwarding,
Ring Port Type       : non-rpl,
Ethoam Event         : disabled,
Remote-endpoint Id   : none
```

output definitions

Ring ID	The ERP ring ID number.
Ring Port Status	The status of the ring port (**blocking** or **forwarding**).
Ring Port Type	The type of ring port (**RPL** or **non-RPL**).
Ethoam Event	Indicates whether or not the ring port will accept Ethernet OAM loss of connectivity events (**enabled** or **disabled)**.
Remote-endpoint ID	The remote Ethernet OAM MEP ID number from which this port accepts loss of connectivity events. This field displays only when the ring port is configured to receive such events.

Release History

Release 6.3.4 ; command introduced.
Release 6.4.5; **Active ERP version** field added

Related Commands

show erp statistics	Displays ERP ring statistics.

```

show erp statistics

Displays the ERP statistics for all rings, a specific ring, or a specific ring port.

show erp statistics [ring *ring_id* **[port** *slot/port* **| linkagg** *agg_num***]]**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1 to 2147483647.
slot/port	The slot number for the module and the physical port number on that module.
agg_num	The link aggregate ID number.

Defaults

By default, statistics are displayed for all ERP rings in the switch configuration.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a ring ID to display the statistics for a specific ring.
- Enter a ring ID and a ring port number or link aggregate ID to display the statistics for a specific port or link aggregate.
- The specified ring ID must exist in the switch configuration.
- The specified port must belong to the ring identified by the ring ID.

Examples

```
-> show erp statistics

Signal_Fail_PDUs No_Request_PDUs No_Req_Block_PDUs     Invalid_PDUs

Ring  Port Sent  Recv Drop Sent  Recv    Drop   Sent     Recv     Drop   Receive
-----+----+----+----+----+------+------+-------+------+---------+-------+--------
  1   1/1   0    0     0    0    0      0       0      2066       0       0

  1   1/2    0   0     0     0   0     0        0      2066       0       0

  2   1/4    0  2024   0    0     6      0       0      49       0       0
```

output definitions

Ring ID	The ERP ring ID number.
Ring Port	The slot and port number of the ring port.

output definitions (continued)

R-APS	The type of Ring Automatic Switching Protocol (R-APS) event message (**NR** = no request, **RB** = RPL is blocked, **SF** = signal failure). APS is the protocol ERP uses to monitor and control ring links.
Send	Total number of R-APS messages sent.
Recv	Total number of R-APS messages received.
Drop	Total number of R-APS messages dropped.

Release History

10 Loopback Detection Commands

Loopback Detection (LBD) automatically detects and prevents forwarding loops on ports that have forwarded network traffic which has looped back to the originating switch. LBD detects and prevents Layer 2 forwarding loops on a port either in the absence of other loop detection mechanisms such as STP/ RSTP/MSTP, or when these mechanisms cannot detect it (e.g., a client's equipment may drop BPDUs, or the STP protocol may be restricted to the network edge). On a linkagg port, if one port of linkagg is getting shutdown due to LBD then all the ports of linkagg will go to shutdown state.

Loopback Detection is enabled system wide and on a per-port basis.Once a loop is discovered, the port from which the loop originated is placed into an “Inactive” state and when the two ports of a switch is connected to each other via a hub, either the ports will be shutdown or it will be in normal state.

When loopback occurs, a trap is sent and the event is logged. The port can manually be enabled again when the problem is resolved.

MIB information for the Loopback Detection commands is as follows:

Filename: alcatelIND1LBD.mib
Module: ALCATEL-IND1-LBD-MIB

A summary of available commands is listed here:

loopback-detection
loopback-detection port
loopback-detection transmission-timer
show loopback-detection
show loopback-detection port
show loopback-detection statistics port

loopback-detection

Enables or disables Loopback Detection (LBD) globally on the switch.

loopback-detection {enable | disable}

Syntax Definitions

enable	Enables LBD on the switch.
disable	Disables LBD on the switch.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- LBD can be enabled globally and per port without any dependency but loopback-detection will be operational only if LBD is enabled globally and also on the specific port.
- LBD can be configured for a port and the configuration can be applied and retained, whether or not LBD is enabled globally. However, LBD functionality on a port is available only when LBD is enabled globally on the switch.

Examples

```
-> loopback-detection enable
```

Release History

Release 6.4.5; command was introduced.

Related Commands

loopback-detection port	Enables or disables LBD on a specific port.
show loopback-detection	Displays LBD configuration information.

MIB Objects

```
alaLdbConfigTable
   alaLdbGLobalConfigStatus
```

loopback-detection port

Enables or disables LBD on a specific port.

loopback-detection port *slot/port* [*-port2*] **{enable | disable}**

Syntax Definitions

slot/port	The slot number and the physical port number of the module that is being configured for LBD.
-port2	Specifies the last port in the range of ports.
enable	Enables LBD on the specified port.
disable	Disables LBD on the specified port.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Loopback Detection must be enabled globally to enable LBD functionality on a specific port.
- LBD can be configured for a port and the configuration can be applied and retained, whether or not LBD is enabled globally. However, LBD functionality on a port is available only when LBD is enabled globally on the switch.

Examples

```
-> loopback-detection port 1/1 enable
-> loopback-detection port 1/1-8 enable
```

Release History

Release 6.4.5; command was introduced.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection	Displays LBD configuration information.

MIB Objects

```
alaLdbPortConfigTable
   alaLdbPortConfigEntry
   alaLdbPortConfigIndex
   alaLdbPortConfigLdbAdminStatus
   alaLdbPortConfigLdbOperStatus
```

loopback-detection transmission-timer

Configures the LBD transmission timer on the switch.The transmission time is the time period between the consecutive LBD packet transmissions.

loopback-detection transmission-timer *seconds*

Syntax Definitions

seconds	The time period in seconds between LBD packet transmissions. The valid range is from 5 to 600 seconds.

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If the timer value is not configured, the default value of 30 seconds is assigned to the transmission period.
- The timer can be modified at any time. However, the new timer value will come into effect only after the timer is restarted.

Examples

```
-> loopback-detection transmission-timer 200
```

Release History

Release 6.4.5; command was introduced.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection	Displays LBD configuration information.

MIB Objects

```
alaLdbConfigTable
   alaLdbGLobalConfigTransmissionTimer
```

show loopback-detection

Displays the global LBD configuration information for the switch.

show loopback-detection

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use this command to display the global configuration of LDB.
- To view information for a specific port, use the **show loopback-detection port** command.

Examples

```
-> show loopback-detection

Global LBD Status                          : Enabled
Global LBD Transmission Timer              : 200 sec

-> show loopback-detection port 1/1

Global LBD Status                          : Enabled
Global LBD Transmission Timer              : 200 sec
Port LBD Status                            : Enabled
Port LBD State                             : Normal
```

output definitions

Global LBD Status	The current status of LBD of the switch (**Enabled** or **Disabled**).
Globas LBD Transmission Timer	Displays the time interval in seconds between LBD packet transmissions.

Release History

Release 6.4.5; command was introduced.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection port	Displays LBD configuration information for all ports on the switch.

MIB Objects

```
alaLdbConfigTable
   alaLdbGLobalConfigStatus
```

show loopback-detection port

Displays global LBD configuration information on the switch. When slot and port number is mentioned, the LBD configuration information of the specific port is displayed.

show loopback-detection port [*slot/port*]

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use this command to view LBD information of a specific port on a switch.

Examples

```
-> show loopback-detection port
Slot/Port     Admin State       OperState
------------+---------------+-----------------

1/2           enabled         Normal

-> show loopback-detection port 1/1
Global LBD Status                          : Enabled
Global LBD Transmission Timer              : 200 sec
Port LBD Status                            : Enabled
Port LBD State                             : Normal
```

output definitions

Global LBD Status	The current status of LBD of the switch (**Enabled** or **Disabled**).
Globas LBD Transmission Timer	Displays the time interval in seconds between LBD packet transmissions.
Slot/Port	The slot/port number LBD port.
Admin State	The administrative state of the port (**Enabled** or **Disabled**).
Oper State	The operational state of the port (**Normal** or **Inactive**).

Release History

Release 6.4.5; command was introduced.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection	Displays LBD configuration information for the switch or for a specific port.

MIB Objects

```
alaLdbConfigTable
   alaLdbGLobalConfigStatus
```

show loopback-detection statistics port

Displays LBD statistics information for a specific port on the switch.

show loopback-detection statistics port [*slot/port*]

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use this command to view LDB statistics of a specific port on a switch.

Examples

```
-> show loopback-detection statistics port 1/1

LBD Port Statistics
LBD Packet Send               : 1
Invalid LBD Packet Received   : 0
```

output definitions

Slot/Port	The slot/port number LBD port.
LBD Packet Send	The number of LBD packet sent from the port.
Invalid LBD Packet Received	The number of invalid LBD packets received on the port.

Release History

Release 6.4.5; command was introduced.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection	Displays LBD configuration information for the switch or for a specific port.

MIB Objects

```
alaLdbConfigTable
   alaLdbGLobalConfigStatus
```

11 CPE Test Head Commands

The Customer Provider Edge (CPE) Test Head traffic generator and analyzer is a Test-OAM (Operation, Administration, and Maintenance) tool used in the Metro Ethernet Network to validate the customer Service Level Agreements (SLA). This functionality allows the operator to validate the Metro Ethernet Network between customer end points, which is critical when provisioning or troubleshooting network services.

The implementation of CPE Test Head supports unidirectional, ingress tests. Traffic is generated at the UNI port as if the traffic was generated from a test head connected to the UNI port. This validates the actual customer SLA by subjecting the test traffic to the ingress QoS defined at the UNI port (Ethernet SAP profile or QoS policy rules for priority and bandwidth control) and the egress QoS defined at the egress NNI port and carrier network.

The CPE test is non-disruptive to traffic running on other UNI ports that are associated with the same SAP profile as the test UNI port. All UNI ports, including CPE test ports, are subject to any SAP profile or QoS configuration associated with the port. This is important to consider when analyzing test results.

The feature provides a multi-stream test capability. The feature supports a stack containing up to eight switches.

Multi-stream test requires an extra port which is known as the feeder port. The feeder port can be any port with any configuration. When a multi-stream test starts, the port is made out of service. The port is made operational again and the configuration is retained when the test is stopped.

MIB information for the CPE Test Head commands are:

Filename: alcatelIND1testoam.mib
Module: ALCATEL-IND1-TEST-OAM-MIB

A summary of available commands is listed here:

Single-test	**test-oam** **test-oam direction** **test-oam src-endpoint dst-endpoint** **test-oam port** **test-oam vlan test-frame** **test-oam role** **test-oam duration rate packet-size** **test-oam frame** **test-oam start stop** **show test-oam** **show test-oam statistics** **clear test-oam statistics**
Multi-test	**test-oam group** **test-oam group tests** **test-oam feeder-port** **test-oam group src-endpoint dst-endpoint** **test-oam group role** **test-oam group port** **test-oam group direction** **test-oam group duration rate** **test-oam group start** **test-oam group stop** **clear test-oam group statistics** **show test-oam group** **show test-oam group statistics**

test-oam

Configures the CPE test name and an optional description. The test name is used to identify and configure a CPE test profile.

test-oam *string* **[descr** *description***]**

no test-oam *string*

Syntax Definitions

string	The name of the CPE test, an alphanumeric string between 1 and 32 characters. This name is used to identify a specific CPE test and is also referred to as the test ID.
description	The description to assign to the test name, an alphanumeric string between 1 and 32 characters.

Defaults

parameter	default
description	DEFAULT

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- Use the **no** form of this command to remove the specified CPE test configuration.
- This command creates a CPE test profile that is identified by the test name. Make sure the name specified does not exist in the switch configuration.
- A maximum of 32 tests can be configured.
- Only one test can be active on the switch at any given time.

Examples

```
-> test-oam Test1
-> test-oam Test2 descr second-test
-> no test-oam Test2
```

Release History

Release 6.4.5; command was introduced.

Related Commands

show test-oam	Displays the CPE test configuration and status.
show test-oam statistics	Displays CPE test statistics.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamConfigTestDescription
   alaTestOamConfigRowStatus
```

test-oam direction

Configures the CPE test direction.

test-oam *string* **[direction {unidirectional | bidirectional}]**

Syntax Definitions

string	The name of the CPE test, an alphanumeric string between 1 and 32 characters. This name is used to identify a specific CPE test and is also referred to as the test ID.
direction	The direction of the cpe test.

Defaults

parameter	default
unidirectional | bidirectional	unidirectional

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

This command assignes the direction to the cpe test.

Examples

```
-> test-oam Test1 direction unidirectional
```

Release History

Release 6.4.5; command was introduced.

Related Commands

show test-oam	Displays the CPE test configuration and status.
show test-oam statistics	Displays CPE test statistics.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamConfigDirection
```

test-oam src-endpoint dst-endpoint

Configures the source and destination endpoints for the specified test.

test-oam *string* **[src-endpoint** *src-string***] [dst-endpoint** *dst-string***]**

Syntax Definitions

string	The name of an existing CPE test.
src-string	The management IP address or DNS host name of the switch that transmits test traffic.
dst-string	The management IP address or DNS host name of the switch that receives test traffic. This is the switch on which traffic analysis is done.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- Using the DNS host name of the switch is highly recommended, as this name is unique and is mapped to an IP address configured for the switch.
- This command automatically overwrites the source and destination endpoint values previously configured for the specified CPE test.

Examples

```
-> test-oam Test1 src-endpoint SW1 dst-endpoint SW2
-> test-oam Test1 src-endpoint SW1
-> test-oam Test1 dst-endpoint SW2
```

Release History

Release 6.4.5; command was introduced.

Related Commands

test-oam port	Configures the port on which the CPE test will run.
show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamConfigSourceEndpoint
   alaTestOamConfigDestinationEndpoint
```

test-oam port

Configures the port on which the CPE test will run. Use this command on the switch that will generate the test traffic. If the switch is going to receive test traffic, configuring a test port is not necessary.

test-oam *string* **port** *slot/port*

Syntax Definitions

string	The name of an existing CPE test.
slot/port	The port on which the CPE test will generate traffic.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- In an Ethernet Service environment, the UNI port is designated as the test port on the generator switch to simulate traffic coming in on the port as if it was sent from a test head device. This will subject the test traffic to the SAP profile.
- Note that the customer traffic is disrupted on ports configured as CPE test ports. Configuring a port that is not in use is recommended. In addition, if the test port is a UNI port associated with an SAP profile, only that UNI port is used for the test. Traffic on other UNI ports associated with the same profile is *not* disrupted by the CPE test.
- All UNI ports, including CPE test ports, are subject to any SAP profile or QoS configuration associated with the port. This should be considered when test results are analyzed.
- This command automatically overwrites the port value previously configured for the specified CPE test.
- If VFL or MCLAG is already configured on DUT, then an error message is displayed that the Test-oam configuration is not allowed on DUT's having MCLAG and VFL configuration.
- It is recommended to configure the ports of the same speed for the feeder and generator.

Examples

```
-> test-oam Test1 port 1/2
```

Release History

Release 6.4.5; command was introduced.

Related Commands

test-oam vlan test-frame	Configures the source mac-address, destination mac-address, and the SVLAN for the test-frame used in the test.
show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamConfigPort
```

test-oam vlan test-frame

Configures the SVLAN and the source and destination MAC addresses for the test frame. Use this command to configure these test parameters on both the generator (local) switch and the analyzer (remote) switch for the specified CPE test.

test-oam *string* **[vlan** *svlan***] [[test-frame [src-mac** *src-address***] [dst-mac** *dst-address***]]**

Syntax Definitions

string	The name of an existing CPE test.
svlan	The service VLAN ID. This is used for traffic analysis and test-frame accounting.
src-address	Source mac-address of the test-frame.
dst-address	Destination mac-address of the test-frame.

Defaults

parameter	default
src-address	00:00:00:00:00:00
dst-address	00:00:00:00:00:00

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- Although the source and destination MAC addresses are optional parameters with this command, the test will not run if these addresses are set to all zeros (the default).
- Make sure that routing is disabled on the specified SVLAN.
- Avoid configuring any IEEE reserved MAC addresses as the destination MAC address for the test.
- This command automatically overwrites the SVLAN, source MAC, or destination MAC values previously configured for the specified CPE test.

Examples

```
-> test-oam Test1 vlan 100 test-frame src-mac 00:01:02:00:00:02 dst-mac
00:00:01:00:00:90
-> test-oam Test1 vlan 100
-> test-oam Test1 test-frame src-mac 00:01:02:00:00:02 dst-mac 00:00:01:00:00:90
-> test-oam Test1 test-frame src-mac 00:01:02:00:00:02
-> test-oam Test test-frame dst-mac 00:00:01:00:00:90
```

Release History

Release 6.4.5; command was introduced.

Related Commands

test-oam role	Configures the switch as a generator or analyzer for the test.
show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamConfigVlan
   alaTestOamConfigFrameSrcMacAddress
   alaTestOamConfigFrameDstMacAddress
```

test-oam role

Configures the role the switch will perform for the specified CPE test. The type of role assigned determines whether the switch transmits (generator) or receives (analyzer) test frames.

test-oam *string* **role {generator | analyzer}**

Syntax Definitions

string	The name of an existing CPE test.
generator	Configures the switch as the test generator.
analyzer	Configures the switch as the test analyzer.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- Use this command on the switch that will perform the specified role.
- Configuring a generator and an analyzer switch for each test is required.
- It is recommended to configure the ports of the same speed for the feeder and generator.
- Only one role can be assigned to the switch for a particular test.
- This command automatically overwrites the previously configured switch role for the specified CPE test.

Examples

```
-> test-oam Test1 role generator
-> test-oam Test2 role analyzer
```

Release History

Release 6.4.5; command was introduced.

Related Commands

test-oam duration rate packet-size	Configures the test frame duration, rate, and packet-size for the test.
show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamConfigRole
```

test-oam duration rate packet-size

Configures the duration, rate, and packet-size for the specified test. Use this command to configure these test parameters on the generator switch.

test-oam *string* **[duration** *secs***] [rate** *rate***] [packet-size** *bytes***]**

Syntax Definitions

string	The name of an existing CPE test.
secs	The duration of the test, in seconds. This is the amount of time the generator will actively transmit test packets to the remote (analyzer) switch. The valid time range is 5–3600 seconds
rate	The rate, in kbps or mbps, at which test traffic is generated. The minimum value allowed is 64 kbps to line rate. The granularity of the transmit rate is 64 Kbps for 100 Mbps port and 2 Mbps for 1Gig ports.
bytes	The packet size, in bytes. The valid range is 64–9212 bytes.

Defaults

Parameter	Default
secs	5 secs
rate	64 kbps
bytes	64 byte

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- This command automatically overwrites any duration, rate, and packet size parameter values previously configured for the specified CPE test.
- The status of the CPE test will change to “ended” when the test duration time expires.
- This command automatically overwrites the duration, rate, or packet size values previously configured for the specified CPE test.
- For ipv6 test frames the minimum packet size should be 74 for UDP and 86 for TCP.

Examples

```
-> test-oam Test1 duration 10 rate 64k packet-size 64
-> test-oam Test1 rate 64k
-> test-oam Test1 duration 10
-> test-oam Test1 packet-size 64
```

Release History

Release 6.4.5; command was introduced.

Related Commands

test-oam frame	Configures the test frame parameter values for the CPE test.
show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamConfigDuration
   alaTestOamConfigGeneratorBandwidth
   alaTestOamConfigGeneratorPacketSize
```

test-oam frame

Configures the test frame parameter values for the specified CPE test. Use this command on the switch that will generate the test frame traffic.

test-oam *string* **frame**
[vlan-tag *vlan-id* **[drop-eligible {true|false}] [priority** *num***] |**
[ether-type {
[ipv4 {src-ip *src-ipv4* **dst-ip** *dest-ipv4***} [data-pattern** *pattern***] [protocol {udp | tcp {src-port** *port* **dst-port** *port***}}] [ttl** *ttl***] [tos** *tos***]]|**
[ipv6 {src-ip *src-ipv6* **dst-ip** *dest-ipv6***} [data-pattern** *pattern***] [hop-limit** *hop-limit***] [flow-label** *flow-label***] [next-header {udp|tcp {src-port** *port* **dst-port** *port***}}] [traffic-class** *traffic-class***]]**
]}

Syntax Definitions

string	The name of an existing CPE test.
vlan-id	The VLAN ID of the frame.
drop-eligible	The drop-eligible value, either true or false.
priority	The priority value. The valid range is 0–7.
ether-type	The ether-type is configured for L2 packet. The ether-type can be ipv4 or ipv6.
ipv4	Use ipv4 to configure the frame type as ipv4. The related ipv4 parameters must be configured.
src-ipv4	The source IP address for an IPv4 test frame.
dest-ipv4	The destination IP address for an IPv4 test frame.
pattern	The data pattern present in the generated test frame. The valid range is 0x0000–0xffff.
protocol	configure protocol type, either udp or tcp.
udp	Specifies the UDP protocol.
tcp	Specifies the TCP protocol.
src-port	The source port of the generated test frame.
dst-port	The destination port of the generated test frame.
ttl	The time-to-live value. The valid range is 0–255.
tos	The type-of-service value for QoS features. The valid range is 0x0–0xff.
ipv6	Use ipv6 to configure the frame type as ipv6. The related ipv6 parameters must be configured.
src-ipv6	The source IP address for an IPv6 test frame.
dest-ipv6	The destination IP address for an IPv6 test frame.

hop-limit	Configure the maximum hop-limit.
flow-label	Configure the flow-level for the flow-specific treatment.
next-header	Configure the next transport layer protocol (udp/tcp).
traffic-class	Configure the Differentiated Services Code Point (DSCP) value for traffic management.

Defaults

Parameter	Default
priority	7
drop-eligible	false
ttl	64
tos	0x0
pattern	0x0000

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- Specify the Ether type in hexadecimal format to configure a Layer 2 test frame.
- Specify **ipv4** or **ipv6** as the Ether type to configure a Layer 3 test frame. When this option is selected, entering a source and destination IP address is required.
- For **ipv6** as ether type, the minimum packet size must be 74 for UDP and 86 for TCP.
- Do not specify reserved Ether type values.
- This command automatically overwrites the test packet parameter values previously configured for the specified CPE test.

Examples

If the ether-type is a hexadecimal number (Layer 2 test frame):

```
-> test-oam Test1 frame vlan-tag 1 priority 2 drop-eligible 0 ether-type 0x0100
data-pattern 0x0010
```

If the ether-type is IPV4 (Layer 3 test frame):

```
-> test-oam Test1 frame vlan-tag 1 priority 2 drop-eligible 0 ether-type ipv4 src-
ip 1.1.1.1 dst-ip 2.2.2.2 ttl 4 tos 0x01 protocol udp src-port 2000 dst-port 3000
data-pattern 0x0010
```

If the ether-type is IPV6:

```
-> test-oam  Test1 frame vlan-tag 10 priority 5 ipv6 src-ip 10::1 dst-ip 20::1 tcp
src-port 2000 dst-port 3000
```

Release History

Release 6.4.5; command was introduced.

Related Commands

test-oam start stop	Start or stop the CPE test.
show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
alaTestOamEtherConfigTable
alaTestOamIpv4ConfigTable
```

test-oam start stop

Starts or stops the CPE test operation.

test-oam *string* **{[vlan** *vlan-id***] [port** *slot/port***] [packet-size** *bytes***] start | stop}**

Syntax Definitions

string	The name of an existing CPE test.
vlan-id	The service VLAN ID. This value is required only for traffic analysis and test frame accounting and is not related to the VLAN tag specified for the actual test frame.
slot/port	The switch port on which the test is run.
bytes	The size of the test packet, in bytes. The valid packet size range is 64–9212 bytes.
start	Starts the CPE test operation.
stop	Stops the CPE test operation.

Defaults

Parameter	Default
bytes	64

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- Ensure that routing is disabled on the specified service VLAN.
- The optional **vlan**, **port,** and **packet-size** parameters specify “active” parameter values that are applied when the specified CPE test is started. If these same parameters are defined within a CPE test profile, they are considered “configured” parameter values. Active parameter values override configured parameter values when the test is started.
- If no active parameter values are specified with this command, the test is started using the configured values defined in the CPE test profile. However, if active parameter values are not specified and the CPE test does not contain any configured values for these parameters, the test will not run.
- Specifying any of the optional parameter values does not change the configured values associated with the CPE test.
- If the specified port resides on a switch that will transmit test traffic, the port will generate the test frames. However, if the switch is an analyzer switch, specifying a port is not required.
- Start the specified test on the analyzer switch first and then on the generator switch.

- The test will stop when the test duration time expires or when the test is manually stopped using the **test-oam stop** command.
- Manually restart the test if the test is interrupted by a takeover, restart, or hot swap.
- The previous statistics related to the test will be cleared automatically once the test is started.

Examples

```
-> test-oam Test1 start
-> test-oam Test1 vlan 100 start
-> test-oam Test1 port 1/1 start
-> test-oam Test1 packet-size 100 start
-> test-oam Test1 vlan 100 port 1/1 packet-size 100 start
-> test-oam Test1 stop
```

Release History

Release 6.4.5; command was introduced.

Related Commands

show test-oam statistics	Displays CPE test statistics.
show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamConfigVlan
   alaTestOamConfigPort
   alaTestOamConfigGeneratorPacketSize
   alaTestOamConfigTestIdState
```

show test-oam

Displays the CPE test configuration and status.

show test-oam [tests | *string***]**

Syntax Definitions

tests	Displays information for all the CPE tests**.**
string	The name of an existing CPE test.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- Use the **tests** parameter to display information for all CPE tests configured on the switch.
- Use the *string* parameter to display detailed information for a specific CPE test.

Examples

```
-> show test-oam tests
Total Test-Ids: 4
Test-Id  Port  Src-Mac           Dst-Mac            Vlan  Direction     Status
---------+-----+-----------------+------------------+-----+-------------+-----------
Test1    1/1  00:11:22:33:44:55 00:22:33:44:55:66  100   unidirectional ended
Test2    1/2  00:44:22:33:44:55 00:66:33:44:55:66  200   unidirectional stopped
Test3    2/3  00:00:00:00:00:03 00:00:00:00:00:04  200   unidirectional not-started
Test4    1/1  00:00:00:00:00:07 00:00:00:00:00:08  100   unidirectional running
```

output definitions

Test-Id	The CPE test name (ID). Configured through the **test-oam** command.
Port	The port on which the test is run. Configured through the **test-oam port** command.
Src-Mac	The source MAC address of the test frame. Configured through the **test-oam vlan test-frame** command.
Dst-Mac	The destination MAC address of the test frame. Configured through the **test-oam vlan test-frame** command.
Vlan	The service VLAN (SVLAN) associated with the test. Configured through the **test-oam vlan test-frame** command.
Direction	The direction of the test traffic. Note that only unidirectional traffic tests are supported.
Status	The operational status of the test

```
-> show test-oam Test1
Legend: dei-drop eligible indicator
TEST Parameters for Test1:
  Source Endpoint      : SW1,
  Destination Endpoint : SW2,
  Test Description     : Ether Test,

      Traffic-Class    : 0xff
```

```
Flow-Label       : 0x0
```

output definitions

Source Endpoint	The host name for the source (generator) switch. Configured through the **test-oam src-endpoint dst-endpoint** command.
Destination Endpoint	The host name for the destination (analyzer) switch. Configured through the **test-oam src-endpoint dst-endpoint** command.
Test Description	Description for the test name. Configured through the **test-oam** command.
Direction	The direction of the test traffic. Note that only unidirectional traffic tests are supported.
Source MAC	The source MAC address for the test frame. Configured through the **test-oam vlan test-frame** command.
Destination MAC	The destination MAC address for the test frame. Configured through the **test-oam vlan test-frame** command.
Duration	The amount of time the test will run. Configured through the **test-oam duration rate packet-size** command.
Vlan	The service VLAN (SVLAN) associated with the test. Configured through the **test-oam vlan test-frame** command.
Role	The role of the switch for this test (**generator** or **analyzer**). Configured through the **test-oam role** command
Port	The port on which the test is run. Configured through the **test-oam port** command.
Tx Rate	The rate at which packets are transmitted on the test port. Configured through the **test-oam duration rate packet-size** command.
Frame Size	The size of the test frame. Configured through the **test-oam duration rate packet-size** command.
State	The administrative state of the test (**stop** or **start**). Configured through the **test-oam start stop** command.
Status	The operational status of the test (**running**, **ended**, **stopped**, or **not started**).
Frame Configuration	The test frame type (**ether**, **ipv4, or ipv6**) and associated parameter values. Configured through the **test-oam frame** command.

Release History

Release 6.4.5; command was introduced.

Related Commands

show test-oam statistics	Displays CPE test statistics.

MIB Objects

```
alaTestOamConfigTable
alaTestOamEtherConfigTable
alaTestOamIpv4ConfigTable
```

show test-oam statistics

Displays the statistics for all CPE tests or for a specific test name. Use this command on both the generator and analyzer switch to determine test results.

show test-oam [*string***] statistics**

Syntax Definitions

string	The name of an existing CPE test.

Defaults

By default, statistics are displayed for all CPE tests.

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- Use the *string* parameter with this command to display statistics for a specific CPE test.
- The statistics displayed depend on the role the switch is performing for the test (generator or analyzer). For example, the analyzer switch may not show any packet count in the **TX** fields because it is the receiving switch.

Examples

```
-> show test-oam Test1 statistics
Test-Id            TX-Ingress   TX-Egress    RX-Ingress
-----------------+------------+------------+-----------
Test1              1200366      1200366           0

-> show test-oam statistics
Test-Id            TX-Ingress   TX-Egress    RX-Ingress
-----------------+------------+------------+--------------
Test1              1200366      1200366          0
Test2                0            0          1200366
```

output definitions

Test-Id	The CPE test name (ID).
TX-Ingress	The number of ingress test packets generated on the ingress UNI.
TX-Egress	The number of egress test packets transmitted on the egress NNI.
RX-Ingress	The number of test packets received on the ingress NNI. This value is relevant on the receiving (analyzer) switch for the specific test.

Release History

Release 6.4.5; command was introduced.

Related Commands

show test-oam	Displays the CPE test configuration and status.
clear test-oam statistics	Clears CPE test statistics.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamTxIngressCounter
   alaTestOamTxEgressCounter
   alaTestOamRxIngressCounter
```

clear test-oam statistics

Clears the statistics for all CPE tests or for a specific test name.

clear test-oam [*string***] statistics**

Syntax Definitions

string	The name of an existing CPE test.

Defaults

By default, statistics are cleared for all CPE tests.

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

Use the *string* parameter with this command to clear the statistics for a specific CPE test.

Examples

```
-> clear test-oam Test1 statistics
-> clear test-oam statistics
```

Release History

Release 6.4.5; command was introduced.

Related Commands

show test-oam statistics	Displays CPE test statistics.
show test-oam	Displays the CPE test configuration and status.

MIB Objects

```
alaTestOamConfigTable
   alaTestOamConfigTestName
   alaTestOamStatsClearStats
```

test-oam group

Configures the CPE test group name and an optional description. The group name is used to identify and configure a CPE test group.

test-oam group *string* **[descr** *description***]**

no test-oam group *string*

Syntax Definitions

string	The name of the CPE test group, an alphanumeric string between 1 and 32 characters. This name is used to identify a specific CPE test-oam group.
description	The description to assign to the CPE test group, an alphanumeric string between 1 and 32 characters.

Defaults

parameter	default
description	DEFAULT

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- Use the **no** form of this command to remove the specified CPE test group.
- This command creates a CPE test group that is identified by the test-oam name. Make sure the name specified does not exist in the switch configuration.
- To configure a CPE test group, the individual test must be configured.
- A maximum of eight tests can be configured to run concurrently.
- Only one CPE test group can be active on the switch at any given time.

Examples

```
-> test-oam group Testgroup1
-> test-oam group Testgroup2 descr second-testgroup
-> no test-oam group Testgroup1
```

Release History

Release 6.4.5; command was introduced.

Related Commands

show test-oam group	Displays the configuration and status of the CPE test groups.
show test-oam group statistics	Displays the statistics for all CPE test groups or for a specific CPE test group.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamConfigGroupDescription
   alaTestOamGroupConfigRowStatus
```

test-oam group tests

This defines the list of CPE test group tests that need to be added in the test-oam group.

test-oam group *string* **[tests** *string1.....string8***]**

test-oam group *string* **[no tests** *string1.....string8***]**

Syntax Definitions

string	The name of the CPE test group, an alphanumeric string between 1 and 32 characters. This name is used to identify a specific CPE test group.
string1.....string8	The name of the configured test-oam tests.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- This command defines the list of test-oam tests that need to run concurrently.
- The test must exist, while configuring the test-oam list.
- A maximum of eight tests can be configured to run concurrently.
- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of test-oam group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.
- use the **no** form of the command to remove the test-oam tests from the CPE test group.

Examples

```
-> test-oam test1
-> test-oam test2
-> test-oam test3
-> test-oam test4
-> test-oam test5
-> test-oam test6
-> test-oam test7
-> test-oam test8

```

Release History

Release 6.4.5; command was introduced.

Related Commands

show test-oam group	Displays the configuration and status of the CPE test groups.
show test-oam group statistics	Displays the statistics for all CPE test groups or for a specific CPE test group.

MIB Objects

```
alaTestOamGroupFlowConfigTable
   alaTestOamConfigGroupId
   alaTestOamConfigTestId
   alaTestOamGroupFlowConfigRowStatus
```

test-oam feeder-port

This configures the feeder port globally in the system for CPE test group to feed the test traffic to generator port.

test-oam feeder-port *slot/port*

no test-oam feeder-port

Syntax Definitions

slot/port	The port to be used to feed the test traffic only to generator port.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- This command configures the feeder port globally in the system.
- The feeder port cannot be the generator port and the generator port cannot be the feeder port.
- It is recommended to configure the ports of the same speed for the feeder and generator.
- When a CPE test group is running, the modification to the feeder port shall not be allowed.
- use the **no** form of the command to remove the feeder port from the system for CPE test group.

Examples

```
-> test-oam feeder-port 1/4
-> no test-oam feeder-port
```

Release History

Release 6.4.5; command was introduced.

Related Commands

test-oam group port	Configures the port on which the CPE test group will run.
show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGloabalFeederPort
```

test-oam group src-endpoint dst-endpoint

Configures the source and destination endpoints for the CPE test group.

test-oam group *string* **[src-endpoint** *src-string* **dst-endpoint** *dst-string***] [src-endpoint** *src-string***] [dst-endpoint** *dst-string***]**

Syntax Definitions

string	The name of an existing CPE test group.
src-string	The management IP address or DNS host name of the switch that will transmit test traffic.
dst-string	The management IP address or DNS host name of the switch that will receive test traffic. This is the switch on which traffic analysis is done.

Defaults

parameter	default
src-endpoint	DEFAULT
dst-endpoint	DEFAULT

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- Using the DNS host name of the switch is highly recommended, as this name is unique and is mapped to an IP address configured for the switch.
- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of test-oam group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

Examples

```
-> test-oam group Testgroup1 src-endpoint SW1 dst-endpoint SW2
-> test-oam group Testgroup1 src-endpoint SW1
-> test-oam group Testgroup1 dst-endpoint SW2
```

Release History

Release 6.4.5; command was introduced.

Related Commands

test-oam group duration rate	Configures the duration and rate for the specified CPE test group.
show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamGroupConfigSourceEndpoint
   alaTestOamGroupConfigDestinationEndpoint
```

test-oam group role

Configures the role the switch will perform for the specified CPE test group. The type of role assigned determines whether the switch transmits (generator) or receives (analyzer) test frames.

test-oam group *name* **role {generator | analyzer}**

Syntax Definitions

name	The name of an existing CPE test group.
generator	Configures the switch as the test generator.
analyzer	Configures the switch as the test analyzer.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

Examples

```
-> test-oam group Testgroup1 role generator
-> test-oam group Testgroup2 role analyzer
```

Release History

Release 6.4.5; command was introduced.

Related Commands

test-oam group duration rate	Configures the duration and rate for the specified CPE test group.
show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamGroupConfigRole
```

test-oam group port

Configures the port on which the CPE test group will run. Use this command on the switch that will generate the test traffic.

test-oam group *string* **port** *slot/port*

Syntax Definitions

string	The name of an existing CPE test group.
slot/port	The port on which the CPE test will generate traffic.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- Configuring a port that is not in use is recommended. In addition, if the test port is a UNI port associated with an SAP profile, only that UNI port is used for the test. Traffic on other UNI ports associated with the same profile is *not* disrupted by the CPE test.
- This command automatically overwrites the port value previously configured for the specified CPE test group.
- The feeder port cannot be the generator port and the generator port cannot be the feeder port.
- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

Examples

```
-> test-oam group Testgroup1 port 1/2
```

Release History

Release 6.4.5; command was introduced.

Related Commands

test-oam group start	Starts the traffic test for the CPE test group on the configured port or the given port.
test-oam group stop	Stops the traffic test for the CPE test group on the configured port or the given port.
show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamGroupConfigPort
```

test-oam group direction

Configures the test direction of the test-oam group.

test-oam group *string* **[direction unidirectional]**

Syntax Definitions

string	The name of an existing CPE test group.
direction	The direction of the CPE test group.

Defaults

parameter	default
direction	unidirectional

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

Examples

```
-> test-oam group Testgroup1 direction unidirectional
```

Release History

Release 6.4.5; command was introduced.

Related Commands

test-oam group duration rate	Configures the duration and rate for the specified CPE test group.
show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamGroupConfigDirection
```

test-oam group duration rate

Configures the duration and rate for the specified test-oam group. Use this command to configure these test parameters on the generator switch.

test-oam group *string* **[duration** *secs***] [rate** *rate***]**

Syntax Definitions

string	The name of an existing CPE test group.
secs	The duration of the test, in seconds. This is the amount of time the generator will actively transmit test packets to the remote (analyzer) switch. The valid time range is 5–3600 seconds.
rate	The rate, in kbps or mbps, at which test traffic is generated. The minimum value allowed is 64 kbps to line rate. The granularity of the transmit rate is 64 Kbps for 100 Mbps port and 2 Mbps for 1Gig ports.

Defaults

Parameter	Default
secs	5 secs
rate	64 kbps

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- This command automatically overwrites any duration and rate parameter values previously configured for the specified CPE test group.
- The status of the CPE test group will change to “ended” when the test duration time expires.
- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

Examples

```
-> test-oam group Testgroup1 duration 10
-> test-oam group Testgroup1 rate 64k
-> test-oam group Testgroup1 duration 10 rate 64k
```

Release History

Release 6.4.5; command was introduced.

Related Commands

show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamGroupConfigDuration
   alaTestOamGroupConfigGeneratorBandwidth
```

test-oam group start

Starts the traffic test for the test-oam group on the configured port or the given port.

test-oam group *string* **[port** *slot/port***] start**

Syntax Definitions

string	The name of an existing CPE test group.
slot/port	The port on which the CPE test group will generate traffic.
start	Enables the test.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

Examples

```
-> test-oam group Testgroup1 port 1/2 start
-> test-oam group Testgroup2 start
```

Release History

Release 6.4.5; command was introduced.

Related Commands

test-oam group stop	Stops the traffic test for the CPE test group on the configured port or the given port.
show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamGroupConfigPort
   alaTestOamGroupConfigState
```

test-oam group stop

Stops the traffic test for the CPE test group on the configured port or the given port.

test-oam group *string* **stop**

Syntax Definitions

string	The name of an existing CPE test group.
stop	Disables the test.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

Examples

```
-> test-oam group Testgroup1 stop
-> test-oam group Testgroup2 stop
```

Release History

Release 6.4.5; command was introduced.

Related Commands

test-oam group start	Starts the traffic test for the CPE test group on the configured port or the given port.
show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamGroupConfigPort
   alaTestOamGroupConfigState
```

clear test-oam group statistics

This clears the statistics of the CPE test group.

clear test-oam group *string* **statistics**

Syntax Definitions

string	The name of an existing CPE test group.
statistics	Clears the statistics for the give CPE test group.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- When a CPE test group is running, the modification of a test which is part of the group shall not be allowed.
- When a CPE test group is running, the modification of CPE test group parameters shall not be allowed.
- When a CPE test group is running, the modification of a feeder port shall not be allowed.

Examples

```
-> clear test-oam group Testgroup1 statistics (Clears the statistics for the
specified test-oam group)
-> clear test-oam group statistics (Clears the statistics for all the test-oam
groups)
```

Release History

Release 6.4.5; command was introduced.

Related Commands

show test-oam group statistics	Displays the statistics for all test-oam groups or for a specific CPE test group.
show test-oam group	Displays the configuration and status of the CPE test groups.

MIB Objects

```
alaTestOamGroupConfigTable
   alaTestOamConfigGroupId
   alaTestOamGroupConfigStatsClear
```

```
alaTestOamGlobalGroupClearStats
```

show test-oam group

Displays the configuration and status of the CPE test groups.

show test-oam group [tests | *string***]**

Syntax Definitions

tests	Displays information for all the CPE test groups**.**
string	The name of an existing CPE test group.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- Use the **tests** parameter to display information for all CPE test groups configured on the switch.
- Use the *string* parameter to display detailed information for a specific CPE test group.

Examples

```
-> show test-oam group tests
Total Test-Groups: 4
Feeder Port      : 1/2
Test-Group      Port  Duration     Rate    Nb of      Direction       Status
                      (secs)             Flows
-------------+-------+---------+---------+-------+---------------+-------------
TestGroup1      1/1     10        100M       8     unidirectional    not-started
TestGroup2      1/3     30         -         3     unidirectional          ended
TestGroup3      2/4     40         -         2     unidirectional        running
```

output definitions

Test-Groups	The CPE test group. Configured through the **test-oam group** command.
Port	The port on which the test is run.
Duration	The amount of time the test will run.
Rate	The rate at which packets are transmitted on the test port. Configured through the **test-oam group duration rate** command.
Nb of Flows	Number of test flows configured for the respective CPE test group.
Direction	The direction of the test traffic. Note that only unidirectional traffic tests are supported.
Status	The operational status of the test

```
-> show test-oam group TestGroup2

TEST Parameters for TestGroup2:
  Source Endpoint         : SW1,
  Destination Endpoint    : SW2,
  Test Group Description  : DEFAULT,
  Direction               : unidirectional,
  Role                    : generator,
  Tx Rate                 : -,
  Duration                : 20 (secs),
  Port                    : 1/2,
  State                   : stop,
  Status                  : stopped

Flow1:
      Test Name       : test_1,
      Vlan            : 1001
      Tx Rate         : 1M,
      Source MAC      : 00:00:00:00:01:01,

      Vlan            : 1002
      Tx Rate         : 10M,
      Source MAC      : 00:00:00:00:02:01,
      Destination MAC : 00:00:00:00:02:02,
      Frame size      : 1518,

Flow3:
      Test Name       : test_3,
      Vlan            : 1003
      Tx Rate         : 15M,
      Source MAC      : 00:00:00:00:03:01,
      Destination MAC : 00:00:00:00:03:02,
      Frame size      : 1518,

Flow4:
      Test Name       : test_4,
      Vlan            : 1004
      Tx Rate         : 5M,
      Source MAC      : 00:00:00:00:04:01,
      Destination MAC : 00:00:00:00:04:02,
      Frame size      : 1518,
```

output definitions

Test-Groups	The CPE test group. Configured through the **test-oam group** command.
Port	The port on which the test is run.
Source Endpoint	The host name for the source (generator) switch. Configured through the **test-oam group src-endpoint dst-endpoint** command.
Destination Endpoint	The host name for the destination (analyzer) switch. Configured through the **test-oam group src-endpoint dst-endpoint** command.

output definitions

Source Mac	The source MAC address of the test frame. Configured through the **test-oam vlan test-frame** command.
Destination Mac	The destination MAC address of the test frame. Configured through the **test-oam vlan test-frame** command.
Duration	The amount of time the test will run.
Role	The role of the switch for this test (**generator** or **analyzer**). Configured through the **test-oam role** command
Rate	The rate at which packets are transmitted on the test port. Configured through the **test-oam group duration rate** command.
Frame Size	The size of the test frame. Configured through the **test-oam group duration rate** command.
Direction	The direction of the test traffic. Note that only unidirectional traffic tests are supported.
Status	The operational status of the test

Release History

Release 6.4.5; command was introduced.

show test-oam group statistics

Displays the statistics for all CPE test groups or for a specific CPE test group. Use this command on both the generator and analyzer switch to determine test results.

show test-oam group [*string***] statistics**

Syntax Definitions

string	The name of an existing CPE test group.

Defaults

By default, statistics are displayed for all CPE test groups.

Platforms Supported

OmniSwitch 6400, 6850E, 6855-U24X, 9000E

Usage Guidelines

- Use the *string* parameter with this command to display statistics for a specific CPE test group.
- The statistics displayed depend on the role the switch is performing for the test (generator or analyzer). For example, the analyzer switch may not show any packet count in the **TX** fields because it is the receiving switch.

Examples

```
-> show test-oam group TestGroup4 statistics
Test-Group         Flow          TX-Ingress        TX-Egress    RX-Ingress
-------------+--------------+------------------+---------------+------------
TestGroup4        flow1              19017            19017     0
TestGroup4        flow2              19017            19017     0

-> show test-oam group statistics
Test-Group        Flow           TX-Ingress       TX-Egress    RX-Ingress
-------------+-------------+------------------+---------------+-----------
TestGroup1        flow1              19017           19017      0
TestGroup1        flow2              19017           19017      0
TestGroup1        flow3              19017           19017      0
TestGroup1        flow4              19017           19017      0
TestGroup1        flow5              19017           19017      0
TestGroup1        flow6              19017           19017      0
TestGroup1        flow7              19017           19017      0
TestGroup1        flow8              19017           19017      0
TestGroup2        flow1              19017           19017      0
TestGroup2        flow2              19017           19017      0
TestGroup2        flow3              19017           19017      0
TestGroup2        flow4              19017           19017      0
TestGroup3        flow1              19017           19017      0
TestGroup4        flow8              19017           19017      0
```

output definitions

Test-Group	The CPE test group.
TX-Ingress	The number of ingress test packets generated on the ingress UNI.
TX-Egress	The number of egress test packets transmitted on the egress NNI.
RX-Ingress	The number of test packets received on the ingress NNI. This value is relevant on the receiving (analyzer) switch for the specific test.

12 Source Learning Commands

Source Learning is responsible for creating, updating, and deleting source and destination MAC Address entries in the MAC Address Table. This chapter includes descriptions of Source Learning commands used to create or delete static MAC addresses, define the aging time value for static and dynamically learned MAC addresses, and display MAC Address Table entries and statistics.

MIB information for Source Learning commands is as follows:

Filename: AlcatelInd1MacAddress.mib
Module: ALCATEL-IND1-MAC-ADDRESS-MIB

A summary of the available commands is listed here:

mac-address-table
mac-address-table vpls permanent sap
mac-address-table vpls permanent mesh-sdp
mac-address-table static-multicast
mac-address-table aging-time
source-learning chassis-distributed

show mac-address-table all
show mac-address-table vpls
show mac-address-table vpls sap
show mac-address-table vpls mesh-sdp
show mac-address-table static-multicast
show mac-address-table count
show mac-address-table vpls count
show mac-address-table all count
show mac-address-table aging-time
show source-learning
show source-learning chassis-distributed

mac-address-table

Configures a destination unicast MAC address. The configured (static) MAC address is assigned to a non-mobile switch port or link aggregate ID and VLAN. Packets received on ports associated with the specified VLAN that contain a destination MAC address that matches the static MAC address are forwarded to the specified port. Static destination MAC addresses are maintained in the Source Learning MAC address table.

mac-address-table [permanent] *mac_address* **{***slot/port* | **linkagg** *link_agg***}** *vid* **[bridging | filtering]**

no mac-address-table [permanent | learned] [*mac_address* **{***slot/port* | **linkagg** *link_agg***}** *vid***]**

Syntax Definitions

permanent	Defines a permanent static MAC Address that is not removed when the switch reboots.
learned	Specifies that the MAC address is a dynamically learned address.
mac_address	Enter the destination MAC Address to add to the MAC Address Table (e.g., 00:00:39:59:f1:0c).
slot/port	Enter the slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
link_agg	Enter a link aggregate ID number (0–31). See Chapter 7, "Link Aggregation Commands."
vid	VLAN ID number (1–4094).
bridging	Specifies that all packets to or from this MAC address are bridged.
filtering	Specifies that all packets to or from this MAC address are dropped.

Defaults

parameter	default
permanent	permanent
bridging | **filtering**	bridging

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a MAC address from the Source Learning MAC Address Table.
- The specified slot/port or link aggregate ID must already belong to the specified VLAN. Use the **vlan port default** command to assign a port or link aggregate ID to a VLAN before you configure the static MAC address. Only traffic from other ports associated with the same VLAN is directed to the static MAC address slot/port.

- Select the **filtering** parameter to set up a denial of service to block potential hostile attacks. Traffic sent to or from a filtered MAC address is dropped. Select the **bridging** parameter for regular traffic flow to or from the MAC address.
- If a packet received on a port associated with the same VLAN contains a source address that matches a static MAC address, the packet is discarded.
- Static MACs are not supported on mobile ports.
- Only static MAC address entries with a **permanent** management status are captured when a snapshot of the switch's running configuration is taken.
- Use the **mac-address-table aging-time** command (see page 12-10) to set the aging time value for all static and dynamically learned MAC addresses. This is the value applied to static MAC addresses defined using the **mac-address-table timeout** form of this command.

Examples

```
-> mac-address-table permanent 00:00:39:59:f1:0c 4/2 355
-> no mac-address-table
-> no mac-address-table 5/1 755
-> no mac-address-table permanent
```

Release History

Release 6.1; command was introduced.

Related Commands

mac-address-table aging-time	Configures aging time, in seconds, for static and dynamically learned MAC addresses.
show mac-address-table	Displays Source Learning MAC Address Table information.
show mac-address-table count	Displays Source Learning MAC Address Table statistics.
show mac-address-table aging-time	Displays the current aging time value for the Source Learning MAC Address Table.

MIB Objects

```
slMacAddressTable
   slMacAddress
   slMacAddressManagement
   slMacAddressDisposition
```

mac-address-table vpls permanent sap

Configures a static MAC address and associates that address with the specified Service Access Point (SAP) ID for the specified Virtual Private LAN Service (VPLS).

mac-address-table vpls *service-id* **permanent** *mac-address* **sap {***sap-id* **| linkagg** *sap-id***}**

no mac-address-table vpls *service-id* **permanent** *mac-address*

no mac-address-table vpls *service-id* **learned [sap** *sap-id* **| linkagg** *sap-id***]** *mac-address*

Syntax Definitions

service-id	An existing VPLS ID number.
mac-address	A 48-bit MAC address (*aa:bb:cc:dd:ee:ff*). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.
sap-id	The access slot and port number or link aggregate ID (0–31) and encapsulation value for an existing SAP (e.g., 1/10:0, 1/12:all, 20:150, 10:all).
learned	Specifies that the MAC address is a dynamically learned address. This option is only available with the **no** form of this command.

Defaults

N/A

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- Use the **no** form of this command to remove the configured static MAC from the source learning FDB.
- The specified VPLS ID and SAP ID must already exist in the VPLS configuration for the switch. See the “VPLS Commands” chapter in this guide for information about how to configure a VPLS and SAP.
- A SAP ID is comprised of an access (customer-facing) port or link aggregate and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.
- Static MACs associated with a SAP are classified as local MACs. A local MAC is used by the associated VPLS so that MAC addresses are not learned on the edge device.
- A MAC address can participate in only one static MAC address entry (local or remote) for a specific VPLS.
- Static MAC addresses configured on one edge device are not propagated to other edge devices associated with the same VPLS instance. Each edge device has an independent forwarding database for the associated VPLS.

Examples

```
-> mac-address-table vpls 10 permanent 00:00:da:3e:44:01 sap 1/2:100
-> mac-address-table vpls 10 permanent 00:00:da:3e:44:01 sap linkagg 10:100
```

```
-> no mac-address-table vpls 10 00:00:da:3e:44:01
-> no mac-address-table vpls 10 permanent 00:00:da:3e:44:01
-> no mac-address-table vpls 20 learned 00:2a:3e:11:22:10
-> no mac-address-table vpls 30 learned 1/10:all 00:2a:3e:11:22:09
-> no mac-address-table vpls 40 learned linkagg 10:all 00:2a:3e:11:22:08
```

Release History

Release 6.4.2; command was introduced.

Related Commands

show mac-address-table all	Displays Source Learning MAC Address Table contents for the VLAN and VPLS domain.
show mac-address-table vpls sap	Displays the Source Learning MAC Address Table contents for the specified VPLS Service Access Point binding.

MIB Objects

```
slMacAddressGlobalTable
   slMacDomain
   slLocalType
   slOriginId
   slServiceId
   slMacAddressGbl
```

mac-address-table vpls permanent mesh-sdp

Configures a static MAC address and associates that address with the specified Service Distribution Point (SDP) ID binding with the specified Virtual Private LAN Service (VPLS).

mac-address-table vpls *service-id* **permanent** *mac-address* **mesh-sdp** *sdp-id***[***:vc-id***]**

no mac-address-table vpls *service-id* **permanent** *mac-address*

no mac-address-table vpls *service-id* **learned [mesh-sdp** *sdp-id***[***:vc-id***]]** *mac-address*

Syntax Definitions

service-id	An existing VPLS ID number.
mac-address	A 48-bit MAC address (*aa:bb:cc:dd:ee:ff*). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.
sdp-id	An existing SDP ID number that is bound to the specified service ID number.
vc-id	*Optional*. The VC ID number appended to the specified SDP ID number.
learned	Specifies that the MAC address is a dynamically learned address. This option is only available with the **no** form of this command.

Defaults

parameter	default
vc-id	*service-id* value

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- Use the **no** form of this command to remove the configured static MAC from the source learning FDB.
- The specified VPLS ID and SDP ID must already exist in the VPLS configuration for the switch. See the “VPLS Commands” chapter in this guide for information about how to configure a VPLS and SDP.
- Static MACs associated with SDPs are classified as remote MACs. A remote MAC is used by the associated VPLS so that MAC addresses are not learned on the edge device.
- A MAC address can participate in only one static MAC address entry (local or remote) for a specific VPLS.
- Static MAC addresses configured on one edge device are not propagated to other edge devices associated with the same VPLS instance. Each edge device has an independent forwarding database for the associated VPLS.

Examples

```
-> mac-address-table vpls 10 permanent 00:00:da:3e:44:01 mesh-sdp 10
-> no mac-address-table vpls 10 learned 00:00:da:3e:44:01
-> no mac-address-table vpls 20 learned mesh-sdp 20 00:2a:d5:11:2a:31
```

Release History

Release 6.4.2; command was introduced.

Related Commands

   slMacDomain
   slLocalType
   slOriginId
   slServiceId
   slMacAddressGbl
```

mac-address-table static-multicast

Configures a static multicast MAC address and assigns the address to one or more egress ports. Packets received on ports associated with the specified VLAN that contain a destination MAC address that matches the static multicast address are forwarded to the specified egress ports. Static multicast MAC addresses are maintained in the Source Learning MAC address table.

mac-address-table static-multicast *multicast_address* **{***slot1/port1***[-***port1a***] [***slot2/port2***[-***port2a***]...]** | **linkagg** *link_agg***}** *vid*

no mac-address-table static-multicast [*multicast_address* **{***slot1/port1***[-***port1a***] [***slot2/port2***[-***port2a***]...]** | **linkagg** *link_agg***}** *vid***]**

Syntax Definitions

multicast_address	Enter the destination multicast MAC Address to add to the MAC Address Table (e.g., 01:00:39:59:f1:0c).
*slot1/port1***[-***port1a***]**	The egress slot and port combination that is assigned to the static multicast MAC address. You may enter multiple ports and port ranges.
*slot2/port2***[-***port2a***]**	Additional egress slot and port combinations may be assigned to the static multicast MAC address. You may enter multiple ports and port ranges.
link_agg	Enter a link aggregate ID number (0–29). See Chapter 7, "Link Aggregation Commands."
vid	VLAN ID number (1–4094).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a static multicast MAC address from the Source Learning MAC Address Table. Note that if no parameters are specified with this form of the command, then all static multicast addresses are removed.
- Note that a MAC address is considered a multicast MAC address if the least significant bit of the most significant octet of the address is enabled. For example, MAC addresses with a prefix of 01, 03, 05, 13, etc., are multicast MAC addresses.
- If a multicast prefix value is not present, then the address is treated as a regular MAC address and not allowed when using the **mac-address-table static-multicast** command. Also note that multicast addresses within the following ranges are not supported:

  01:00:5E:00:00:00 to 01:00:5E:7F:FF:FF
  01:80:C2:XX.XX.XX
  33:33:XX:XX:XX:XX

- The configured (static) multicast MAC address is assigned to a non-mobile switch port or link aggregate ID and VLAN. Static multicast MACs are not supported on mobile ports.
- In addition to configuring the same static multicast address for multiple ports within a given VLAN, it is also possible to use the same multicast address across multiple VLANs.
- The specified slot/port or link aggregate ID must already belong to the specified VLAN. Use the **vlan port default** command to assign a port or link aggregate ID to a VLAN before you configure the static MAC address. Only traffic from other ports associated with the same VLAN is directed to the static multicast MAC address slot/port.
- If the **configuration snapshot** or **write memory** command is entered after a static multicast MAC address is configured, the resulting ASCII file or **boot.cfg** file will include the following additional syntax for the **mac-address-table static-multicast** command:

  group *num*

  This syntax indicates the number of the multicast group that the switch has assigned to the multicast MAC address for the given VLAN association. Each multicast address – VLAN association is treated as a unique instance and assigned a group number specific to that instance. Up to 1022 such instances are supported per switch.
- Note that if the port assigned to a multicast MAC address is down or administratively disabled when the **configuration snapshot** or **write memory** command is used, the multicast MAC address is not saved to the resulting ASCII file or **boot.cfg** file.

Examples

```
-> mac-address-table static-multicast 02:00:39:59:f1:0c 4/2 355
-> mac-address-table static-multicast 01:00:00:3a:44:11 1/12-24 255
-> mac-address-table static-multicast 03:00:00:3a:44:12 1/10 2/1-6 3/1-8 1500
-> mac-address-table static-multicast 04:00:00:3a:44:13 linkagg 10 455
-> no mac-address-table static-multicast 03:00:00:3a:44:12 1/10 1500
-> no mac-address-table static-multicast 04:00:00:3a:44:13 linkagg 10 455
-> no mac-address-table static-multicast
```

Release History

Release 6.1.2; command was introduced.

Related Commands

show mac-address-table	Displays Source Learning MAC Address Table information.
show mac-address-table static-multicast	Displays a list of static multicast MAC addresses that are configured in the Source Learning MAC Address Table.

MIB Objects

```
slMacAddressTable
   slMacAddress
   slMacAddressManagement
   slMacAddressDisposition
```

mac-address-table aging-time

Configures aging time, in seconds, for static and dynamically learned MAC addresses. When a MAC address has aged beyond the aging-time value, the MAC address is discarded.

mac-address-table aging-time *seconds*

no mac-address-table aging-time

Syntax Definitions

seconds	Aging time value (in seconds). Do not use commas in value. The range is 60—1000000.

Defaults

By default, the aging time is set to 300 seconds.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to set the aging-time back to the default value of 300 seconds.
- The aging time value is a global value that applies to all VLANs. Configuring this value on a per VLAN basis is not supported on this platform.
- Note that an inactive MAC address may take up to twice as long as the aging time value specified to age out of the MAC address table. For example, if an aging time of 60 seconds is specified, the MAC will age out any time between 60 and 120 seconds of inactivity.
- If the **timeout** parameter is not specified when using the **mac-address-table** command (see page 12-2) to configure a static MAC address, then the aging time value is not applied to the static MAC address.

Examples

```
-> mac-address-table aging-time 1200
-> no mac-address-table aging-time
```

Release History

Release 6.1; command was introduced.
Release 6.1.1; **vlan** parameter not supported.

Related Commands

mac-address-table	Configures a static destination Unicast MAC address for a VLAN bridge.
show mac-address-table	Displays Source Learning MAC Address Table information.
show mac-address-table count	Displays Source Learning MAC Address Table statistics.
show mac-address-table aging-time	Displays the current aging time value for the Source Learning MAC Address Table.

MIB Objects

```
slMacAddressAgingTable
   slMacAgingValue
```

source-learning

Configures the status of source MAC address learning on a single port, a range of ports, or on a link aggregate of ports.

source-learning {port *slot/port1***[-***port2***] | linkagg** *linkagg_num***} {enable | disable}**

Syntax Definitions

slot/port1	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
-port2	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1, 2, 3, and 4 on slot 3).
linkagg_num	Specifies the link aggregate port ID.
enable	Enables source learning.
disable	Disables source learning.

Defaults

By default, source learning is enabled on all ports.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Configuring source learning is not supported on mobile ports, Learned Port Security ports, individual ports which are members of a link aggregate, or Access Guardian (802.1x) ports.
- When port-based source learning is configured for a link aggregate ID, it affects all the ports that are members of the link aggregate.
- When source-learning is disabled on a port or link aggregate, all dynamically learned MAC addresses are removed from the MAC address table.
- Static MAC addresses associated with a port or link aggregate are *not* cleared when source learning is disabled. Also, new static MAC address configurations are allowed on ports or link aggregates even when source learning is disabled on them.
- Disabling source learning on a port or link aggregate is useful on a ring configuration where switch A does not have to learn MAC addresses from switch B or for a Transparent LAN Service, where service provider does not require the MAC addresses of the Customer network.

Examples

```
-> source-learning port 1/2 disable
-> source-learning port 1/3-9 disable
-> source-learning linkagg 10 disable
```

Release History

Release 6.4.2; command added.

Related Commands

show source-learning	Displays Source Learning status of each port or linkagg ports on a switch.

Related MIB Objects

```
slMacAddressTable
slMacLearningControlTable
  slMacLearningControlEntry
  slMacLearningControlStatus
```

source-learning chassis-distributed

Enables or disables the distributed MAC source learning mode for the chassis. Enabling this mode increases the number of learned MAC addresses supported to 16K per module and up to 64K per chassis.

source-learning chassis-distributed {enable | disable}

Syntax Definitions

enable	Enables distributed MAC source learning mode.
disable	Disables distributed MAC source learning mode.

Defaults

By default distributed MAC source learning mode is disabled for the chassis.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- After the distributed MAC mode is either enabled or disabled using this command, immediately save the switch configuration using the **write memory** command and then reboot the switch.
- Distributed MAC source learning is not supported on an OmniSwitch stackable switches.
- When the distributed MAC source learning mode is disabled (the default), the maximum number of learned MAC addresses allowed per OmniSwitch chassis-based switch is 16K.

Examples

```
-> source-learning chassis-distributed enable
-> source-learning chassis-distributed disable
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show source-learning chassis-distributed	Displays the current status of the distributed MAC source learning mode.

MIB Objects

```
slMacAddressTable
   slDistributedMacMode
```

show mac-address-table

Displays Source Learning MAC Address Table information.

show mac-address-table [permanent | learned | quarantined] [*mac_address***] [slot** *slot* | *slot/port***] [link-agg** *link_agg***] [***vid* | *vid1-vid2***]**

Syntax Definitions

permanent	Display static MAC addresses with a permanent status.
learned	Display dynamically learned MAC addresses.
quarantined	Display MAC addresses quarantined by the Quarantine Manager and Remediation (QMR) application.
mac_address	Enter a MAC Address (e.g., 00:00:39:59:f1:0c).
slot	Enter the slot number for a module to specify that the command should include all ports on that module (e.g., 6 specifies all ports on the module found in slot 6 of the switch chassis).
slot/port	Enter the slot number and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
link_agg	Enter a link aggregate ID number (0–31). See Chapter 7, "Link Aggregation Commands."
vid	A single VLAN ID number (1–4094).
vid1-vid2	A range of VLAN IDs that you want to configure (e.g. 10-12 specifies VLANs 10, 11, and 12).

Defaults

By default, information is displayed for all MAC addresses contained in the table.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs— is allowed with this command. Multiple entries are not accepted.
- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the **show mac-address-table** command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.

Examples

```
-> show mac-address-table
Legend: Mac Address: * = address not valid

 Domain  Vlan/SrvcId   Mac Address       Type      Protocol  Operation  Interface
--------+-----------+------------------+----------+---------+----------+-----------

   VLAN   13         00:d0:95:b2:3d:fa  learned       ---      bridging    2/8
   VLAN   14         00:00:0a:00:00:00  quarantined   ---      filtered    5/1
   VLAN   14         00:00:0a:00:00:01  quarantined   ---      filtered    5/1
   VLAN   14         00:00:0a:00:00:02  quarantined   ---      filtered    5/1
   VLAN   14         00:00:0a:00:00:03  quarantined   ---      filtered    5/1

Total number of Valid MAC addresses above = 14

-> show mac-address-table quarantined
Legend: Mac Address: * = address not valid

 Domain  Vlan/SrvcId   Mac Address       Type       Protocol  Operation  Interface
--------+-----------+------------------+-----------+---------+----------+----------
   VLAN   14         00:00:0a:00:00:00  quarantined    ---      filtered     5/1
   VLAN   14         00:00:0a:00:00:01  quarantined    ---      filtered     5/1
   VLAN   14         00:00:0a:00:00:02  quarantined    ---      filtered     5/1
   VLAN   14         00:00:0a:00:00:03  quarantined    ---      filtered     5/1

Total number of Valid MAC addresses above = 14
```

output definitions

Domain	The domain to which the MAC address belongs (**VLAN** or **VPLS**).
VLAN/SrvcId	Vlan ID number or VPLS ID number associated with the MAC address.
Mac Address	MAC address that is currently learned or statically assigned.
Type	MAC address management status: **learned, permanent, or quarantined**. Configured through the **mac-address-table** command.
Protocol	Protocol type for the MAC address entry. Note that if the hardware source learning mode is active for the port, this field is blank.

output definitions

Operation	The disposition of the MAC address: **bridging** (default) or **filtering**. Configured through the **mac-address-table** command.
Interface	The slot number for the module and the physical port number on that module that is associated with the static or dynamically learned MAC address. If the interface is a link aggregate ID, zero is displayed as the slot number (e.g., 0/29).

Release History

Release 6.1; command was introduced.
Release 6.1.3; *vid* parameter modified to support a range of VLAN IDs.
Release 6.3.1; **quarantined** type added.
Release 6.4.2; **Domain** field added and **SrvcId** added to **Vlan** field.

Related Commands

show mac-address-table all	Displays MAC addresses associated with both VLANs and Virtual Private LAN Service (VPLS) services.
show mac-address-table count	Displays Source Learning MAC Address Table statistics.
show mac-address-table aging-time	Displays the current aging time value for the Source Learning MAC Address Table.

MIB Objects

```
slMacAddressTable
   slMacAddress
   slMacAddressManagement
   slMacAddressDisposition
   slMacAddressProtocol
```

show mac-address-table all

Displays MAC addresses associated with both VLANs and Virtual Private LAN Service (VPLS) services.

show mac-address-table all [permanent | learned]

Syntax Definitions

permanent	Displays static MAC addresses with a permanent status.
learned	Displays dynamically learned MAC addresses.

Defaults

By default, information is displayed for all MAC addresses contained in the table.

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the **show mac-address-table** command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.

Examples

```
SW-D-> show mac-address-table all

Legend: Mac Address: * = address not valid

 Domain  Vlan/SrvcId   Mac Address       Type     Protocol  Operation  Interface
--------+-----------+-----------------+----------+--------+----------+-------------
   VLAN    13        00:d0:95:e9:cf:86  learned     ---     bridging    16/1
   VLAN    13        00:e0:b1:9c:8a:3c  learned     ---     bridging    16/1
   VLAN    15        00:e0:b1:87:8d:68  learned     ---     bridging    16/12
   VLAN    15        00:e0:b1:9c:87:2f  learned     ---     bridging    16/12
   VPLS    1000      00:01:bd:01:01:01  learned     ---    servicing   sdp:222:1000
   VPLS    1000      00:01:bd:01:01:02  learned     ---    servicing   sdp:222:1000
   VPLS    1000      00:01:bd:01:01:03  learned     ---    servicing   sdp:222:1000
   VPLS    1000      00:01:bd:01:01:04  learned     ---    servicing   sdp:222:1000
   VPLS    1000      00:01:bd:01:01:05  learned     ---    servicing   sdp:222:1000

Total number of Valid MAC addresses above = 14
```

output definitions

Domain	The domain to which the MAC address belongs (**VLAN** or **VPLS**).
VLAN/SrvcId	Vlan ID number or VPLS ID number associated with the MAC address.
Mac Address	MAC address that is currently learned or statically assigned.

Type	MAC address management status: **learned, permanent, or quarantined**.
Protocol	Protocol type for the MAC address entry. Note that if the hardware source learning mode is active for the port, this field is blank.
Operation	The disposition of the MAC address: **bridging** (default), **filtering**, or **servicing**.
Interface	The slot/port number that is associated with the MAC address. If the interface is a link aggregate ID, zero is displayed as the slot number (e.g., 0/29). If the MAC is associated with a VPLS service, this field contains the mesh-SDP or SAP binding information.

Release History

Release 6.4.2; command was introduced.

Related Commands

mac-address-table	Configures a static destination Unicast MAC address for a VLAN bridge.
mac-address-table vpls permanent sap	Configures a static MAC address for a VPLS SAP.
mac-address-table vpls permanent mesh-sdp	Configures a static MAC address for a VPLS mesh-SDP binding.

MIB Objects

```
slMacAddressGlobalTable
   slMacAddressGbl
   slMacAddressGblmanagement
   slMacAddressGblDisposition
```

show mac-address-table vpls

Displays Source Learning MAC Address Table contents for VPLS services.

show mac-address-table vpls [*service-id***] [permanent | learned] [***mac-address***]**

Syntax Definitions

service-id	An existing VPLS ID number.
permanent	Display static MAC addresses.
learned	Display dynamically learned MAC addresses.
mac-address	A 48-bit MAC address (*aa:bb:cc:dd:ee:ff*). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.

Defaults

By default, all MAC addresses for all services are displayed.

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

Use the optional parameters with this command to display information for specific services and MAC address types.

Example

```
-> show mac-address-table vpls 1002 00:01:db:07:03:02
Legend: Mac Address: * = address not valid

Domain Vlan/SrvcId   Mac Address      Type    Protocol   Operation  Interface
------+------------+-----------------+--------+--------+----------+--------------
VPLS   1002         00:01:db:07:03:02 learned   ---      servicing  sap:0/16:1006

-> show mac-address-table vpls 1002 permanent
Legend: Mac Address: * = address not valid

Domain  Vlan/SrvcId   Mac Address      Type    Protocol Operation   Interface
-------+-----------+-----------------+---------+------+----------+--------------
VPLS    1002        00:00:00:00:00:05 permanent  ---    servicing  sap:0/16:1005

Total number of Valid MAC addresses above = 1

-> show mac-address-table vpls 1002 learned
Legend: Mac Address: * = address not valid

Domain  Vlan/SrvcId   Mac Address      Type    Protocol Operation   Interface
-------+-----------+-----------------+---------+------+----------+--------------
VPLS    1002        00:01:bd:01:02:01 learned    ---    servicing  sdp:222:1002
```

```
VPLS   1002       00:01:bd:01:02:02   learned   ---    servicing  sdp:222:1002
VPLS   1002       00:01:bd:01:02:03   learned   ---    servicing  sdp:222:1002

```

show mac-address-table vpls sap

Displays Source Learning MAC Address Table information for the specified VPLS Service Access Point (SAP) binding.

show mac-address-table vpls *service-id* **sap {***sap-id* **| linkagg** *sap-id***}** *mac-address*

Syntax Definitions

service-id	An existing VPLS ID number.
sap-id	The access slot and port number or link aggregate ID (0–31) and encapsulation value for an existing SAP (e.g., 1/10:0, 1/12:all, 20:150, 10:all).
mac-address	A 48-bit MAC address (*aa:bb:cc:dd:ee:ff*). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.

Defaults

N/A

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- The specified VPLS ID and SAP ID must already exist in the VPLS configuration for the switch. See the “VPLS Commands” chapter in this guide for information about how to configure a VPLS and SAP.
- A SAP ID is comprised of an access (customer-facing) port or link aggregate and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

Example

```
-> show mac-address-table vpls 1002 sap linkagg 16:1006
Legend: Mac Address: * = address not valid

Domain Vlan/SrvcId    Mac Address      Type  Protocol Operation Interface
-----+-----------+-----------------+--------+-------+---------+------------
VPLS   1002      00:01:db:07:03:02  learned  ---    servicing  sap:0/16:1006

Total number of Valid MAC addresses above = 1
```

output definitions

Domain	The domain to which the MAC address belongs: **VLAN** or **VPLS**.
VLAN/SrvcId	The VPLS ID number associated with the MAC address.
Mac Address	MAC address that is currently learned or statically assigned.
Type	MAC address management status: **learned** or **permanent**.
Protocol	Protocol type for the MAC address entry. Note that if the hardware source learning mode is active for the port, this field is blank.

output definitions

Operation	The disposition of the MAC address: **bridging** (default), **filtering**, or **servicing**.
Interface	The VPLS SAP binding to which the MAC address is associated.

Release History

Release 6.4.2; command introduced

Related Commands

mac-address-table vpls permanent sap	Configures a static MAC address for a VPLS SAP binding.
show source-learning chassis-distributed	Displays the Source Learning MAC Address Table contents for VPLS service MAC addresses.

Related MIB Objects

   slServiceId
   slServiceId
   slMacAddressGbl
   slMacAddressGblmanagement
   slOriginId
   slSubId
```

show mac-address-table vpls mesh-sdp

Displays Source Learning MAC Address Table information for the specified VPLS mesh-SDP binding.

show mac-address-table vpls *service-id* **mesh-sdp** *sdp-id***[***:vc-id***]** *mac-address*

Syntax Definitions

service-id	An existing VPLS ID number.
sdp-id	An existing SDP ID number that is bound to the specified service ID number.
vc-id	*Optional*. The VC ID number appended to the specified SDP ID number.
mac-address	A 48-bit MAC address (*aa:bb:cc:dd:ee:ff*). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.

Defaults

parameter	default
vc-id	*service-id* value

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

The specified VPLS ID and SDP ID must already exist in the VPLS configuration for the switch. See the "VPLS Commands" chapter in this guide for information about how to configure a VPLS and SAP.

Example

```
SW-D-> show mac-address-table vpls 1002 mesh-sdp 222
Legend: Mac Address: * = address not valid

Domain Vlan/SrvcId  Mac Address       Type    Protocol  Operation  Interface
------+-----------+-----------------+--------+---------+----------+-------------
VPLS    1002       00:01:bd:01:02:01 learned   ---      servicing  sdp:222:1002
VPLS    1002       00:01:bd:01:02:02 learned   ---      servicing  sdp:222:1002
VPLS    1002       00:01:bd:01:02:03 learned   ---      servicing  sdp:222:1002
VPLS    1002       00:01:bd:01:02:04 learned   ---      servicing  sdp:222:1002
VPLS    1002       00:01:bd:01:02:05 learned   ---      servicing  sdp:222:1002
VPLS    1002       00:01:bd:01:02:06 learned   ---      servicing  sdp:222:1002

Total number of Valid MAC addresses above = 6
```

output definitions

Domain	The domain to which the MAC address belongs: **VLAN** or **VPLS**.
VLAN/SrvcId	The VPLS ID number associated with the MAC address.

output definitions (continued)

Mac Address	MAC address that is currently learned or statically assigned.
Type	MAC address management status: **learned** or **permanent**.
Protocol	Protocol type for the MAC address entry. Note that if the hardware source learning mode is active for the port, this field is blank.
Operation	The disposition of the MAC address: **bridging** (default), **filtering**, or **servicing**.
Interface	The VPLS mesh-SDP binding to which the MAC address is associated.

Release History

Release 6.4.2; command introduced

Related Commands

mac-address-table vpls permanent mesh-sdp	Configures a static MAC for a VPLS mesh-SDP binding.
show source-learning chassis-distributed	Displays Source Learning MAC Address Table information for VPLS service MAC addresses.

Related MIB Objects

```

   slMacAddress
   slMacAddressManagement
   slMacAddressDisposition
   slMacAddressProtocol
```

show mac-address-table static-multicast

Displays the static multicast MAC address configuration for the switch.

show mac-address-table static-multicast [*multicast_address***] [slot** *slot* **|** *slot/port***] [linkagg** *link_agg***] [***vid* | *vid1-vid2***]**

Syntax Definitions

multicast_address	Enter a multicast MAC Address (e.g., 01:00:39:59:f1:0c).
slot	Enter the slot number for a module to specify that the command should include all ports on that module (e.g., 6 specifies all ports on the module found in slot 6 of the switch chassis).
slot/port	Enter the slot number and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
link_agg	Enter a link aggregate ID number (0–29). See Chapter 12, "Link Aggregation Commands."
vid	VLAN ID number (1–4094).
vid1-vid2	The last VLAN ID number in a range of VLANs that you want to configure (e.g. 10-12 specifies VLANs 10, 11, and 12).

Defaults

By default, information is displayed for all static multicast MAC addresses contained in the MAC address table.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs— is allowed with this command. Multiple entries are not accepted.
- Note that if a static multicast MAC address is configured on a port link that is down or disabled, the configured multicast address does not appear in the **show mac-address-table static-multicast** command display.
- The **show mac-address-table** command display, however, includes all static multicast addresses regardless of whether or not the port assigned to the address is up or down. See the second example below.
- When the **show mac-address-table** command is used to display MAC addresses known to the switch, an asterisk appears to the left of all static MAC addresses that are configured on a port link that is down or disabled. The asterisk indicates that MAC address is invalid. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.

Examples

In the example below, the static multicast address 01:00:00:00:00:01 is associated with port 1/1, which is down. As a result, this address does not appear in the **show mac-address-table static-multicast** display but is included in the **show mac-address-table** display with an asterisk.

```
-> show mac-address-table static-multicast
Legend: Mac Address: * = address not valid

Domain  Vlan/SrvcId   Mac Address      Type        Protocol   Operation  Interface
-------+-----------+-----------------+-----------+----------+----------+----------
  VLAN   1          01:00:00:00:00:02 static-mcast  ---       bridging      2/6

Total number of Valid MAC addresses above = 1

-> show mac-address-table
Legend: Mac Address: * = address not valid

Domain  Vlan/SrvcId   Mac Address      Type        Protocol   Operation  Interface
-------+-----------+-----------------+-----------+----------+----------+----------
* VLAN   1          01:00:00:00:00:01 static-mcast  0         bridging      1/1
  VLAN   24         00:d0:95:e4:cf:5a learned       ---       bridging      1/2
  VLAN   24         00:d0:95:e5:af:52 learned       ---       bridging      1/2
  VLAN   24         00:e0:4c:bc:ce:a1 learned       ---       bridging      1/2
  VLAN   1          01:00:00:00:00:02 static-mcast  ---       bridging      2/6
  VLAN   1          00:d0:95:e2:77:38 learned       ---       bridging      3/19

Total number of Valid MAC addresses above = 5
```

output definitions

Domain	The domain to which the MAC address belongs: **VLAN** or **VPLS**.
VLAN/SrvcId	The VPLS ID number associated with the MAC address.
Mac Address	The multicast MAC address that is statically assigned to the VLAN and slot/port.
Type	Indicates the MAC address is a static multicast (**static-mcast**) address. Configured through the **mac-address-table static-multicast** command.
Protocol	Protocol type for the MAC address entry.
Operation	The disposition of the MAC address: **bridging** (default) or **filtering**. Note that this value is always set to **bridging** for static multicast addresses.
Interface	The slot number for the module and the physical port number on that module that is associated with the static multicast MAC address. If the interface is a link aggregate ID, zero is displayed as the slot number (e.g., 0/29).

Release History

Release 6.1.2; command was introduced.
Release 6.1.3; *vid* parameter modified to support a range of VLAN IDs.

Related Commands

show mac-address-table	Displays Source Learning MAC Address Table information.
show mac-address-table count	Displays Source Learning MAC Address Table statistics.

MIB Objects

```
slMacAddressTable
   slMacAddress
   slMacAddressManagement
   slMacAddressDisposition
   slMacAddressProtocol
```

show mac-address-table count

Displays Source Learning MAC Address Table statistics for VLAN MAC addresses.

show mac-address-table count [*mac_address***] [slot** *slot* | *slot/port***] [linkagg** *link_agg***] [***vid* | *vid1-vid2***]**

Syntax Definitions

mac_address	A 48-bit MAC address (*aa:bb:cc:dd:ee:ff*). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.
slot | *slot/port*	Slot number for the module or the slot number and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
link_agg	Enter a link aggregate ID number (0–31). See Chapter 7, "Link Aggregation Commands."
vid	VLAN ID number (1–4094).

Defaults

By default, the count statistics are displayed for all MAC addresses contained in the MAC address table.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- To display statistics for all ports on one slot, specify only the slot number for the **slot** parameter value.
- Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs— is allowed with this command. Multiple entries are not accepted.

Examples

```
-> show mac-address-table count
Mac Address Table count:
  Permanent Address Count             = 1
  DeleteOnReset Address Count         = 0
  DeleteOnTimeout Address Count       = 0
  Dynamic Learned Address Count       = 6
  Static Multicast Address Count      = 0,
  Total MAC Address In Use            = 7

-> show mac-address-table count 10-20
Mac Address Table count:
  Permanent Address Count             = 0
  DeleteOnReset Address Count         = 0
  DeleteOnTimeout Address Count       = 0
  Dynamic Learned Address Count       = 28
  Static Multicast Address Count      = 0,
  Total MAC Address In Use            = 28
```

output definitions

Permanent Address Count	The number of static MAC addresses configured on the switch with a **permanent** management status (MAC address is never aged out).
DeleteOnReset Address Count	The number of static MAC addresses configured on the switch with a **reset** management status (MAC address is deleted on the next switch reboot).
DeleteOnTimeout Address Count	The number of static MAC addresses configured on the switch with a **timeout** management status (MAC address ages out according to the MAC address table aging timer value).
Dynamic Learned Address Count	The number of MAC addresses learned by the switch. These are MAC addresses that are not statically configured addresses.
Total MAC Address In Use	The total number of MAC addresses (learned and static) that are known to the switch.

Release History

Release 6.1; command was introduced.
Release 6.1.3; *vid* parameter modified to support a range of VLAN IDs.

Related Commands

show mac-address-table	Displays Source Learning MAC Address Table information.
show mac-address-table aging-time	Displays the current aging time value for the Source Learning MAC Address Table.
show mac-address-table all count	Displays the Source Learning MAC Address Table statistics for both VLAN and VPLS MAC addresses.
show mac-address-table vpls count	Displays the Source Learning MAC Address Table statistics for VPLS service MAC addresses.

show mac-address-table vpls count

Displays Source Learning MAC address table statistics for VPLS service MAC addresses.

show mac-address-table vpls *service-id* **count] [***mac-address***]**

Syntax Definitions

service-id	An existing VPLS ID number.
mac-address	A 48-bit MAC address (*aa:bb:cc:dd:ee:ff*). Valid addresses are any non-broadcast, non-multicast MAC, and non-IEEE reserved addresses.

Defaults

By default, all VPLS addresses are counted.

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

Enter a MAC address to display statistics for a specific VPLS service MAC address.

Example

```
SW-D-> show mac-address-table vpls 1002 count
Mac Address Table Count:
  Permanent VPLS Address Count       = 1,
  Dynamic Learned VPLS Address Count = 13,
  Total MAC Address In Use           = 14
```

output definitions

Permanent VPLS Address Count	The number of static VPLS MAC addresses configured on the switch with a **permanent** management status (MAC address is never aged out).
Dynamic Learned VPLS Address Count	The number of VPLS MAC Addresses learned by the switch. These addresses are not user-configured permanent addresses.
Total MAC Address In Use	The total number of MAC addresses (learned and static) that are known to the switch.

Release History

Release 6.4.2; command introduced

Related Commands

show mac-address-table all count	Displays Source Learning MAC Address Table statistics for both VLAN and VPLS service MAC addresses.
show mac-address-table count	Displays Source Learning MAC Address Table statistics for VLAN MAC addresses.

Related MIB Objects

```
slMacAddressGlobalTable
     slServiceId
     slMacAddressGbl
   slMacAddressGblmanagement
```

show mac-address-table all count

Displays Source Learning MAC Address Table statistics for both VLAN and VPLS MAC addresses.

show mac-address-table all count

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- This command displays dynamically learned and permanent MAC address for both VLANs and VPLS services. For more information on VPLS, see the “VPLS Commands“ chapter in this guide.
- Use the **show mac-address-table count** command to display statistics for VLAN MAC addresses only.

Examples

```
-> show mac-address-table all count
Mac Address Table Count:
  Permanent Address Count            = 0,
  DeleteOnReset Address Count        = 0,
  DeleteOnTimeout Address Count      = 0,
  Dynamic Learned Address Count      = 5,
  Static Multicast Address Count     = 0,
  Permanent VPLS Address Count       = 1,
  Dynamic Learned VPLS Address Count = 21038,
  Total MAC Address In Use           = 21044
```

output definitions

Permanent Address Count	The number of static MAC addresses configured on the switch with a **permanent** management status (MAC address is never aged out).
DeleteOnReset Address Count	The number of static MAC addresses configured on the switch with a **reset** management status (MAC address is deleted on the next switch reboot).
DeleteOnTimeout Address Count	The number of static MAC addresses configured on the switch with a **timeout** management status (MAC address ages out according to the MAC address table aging timer value).
Dynamic Learned Address Count	The number of MAC addresses learned by the switch. These are MAC addresses that are not statically configured addresses.

output definitions (continued)

Static Multicast Address Count	The number of static multicast addresses configured on the switch.
Permanent VPLS Address Count	The number of static VPLS MAC addresses configured on the switch with a **permanent** management status (MAC address is never aged out).
Dynamic Learned VPLS Address Count	The number of VPLS MAC Addresses learned by the switch. These addresses are not user-configured permanent addresses.
Total MAC Address In Use	The total number of MAC addresses (learned and static) that are known to the switch.

Release History

Release 6.4.2; command was introduced.

Related Commands

show mac-address-table count	Displays Source Learning MAC Address Table statistics for VLAN MAC addresses.
show mac-address-table vpls count	Displays Source Learning MAC Address Table statistics for VPLS service MAC addresses.

show mac-address-table aging-time

Displays the current aging time value.

show mac-address-table aging-time

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- The MAC Address Table aging time applies to static MAC addresses that were defined using the **time-out** parameter (see page 12-2) and to dynamically learned MAC addresses.
- Note that the aging time is the same for all VLANs and Virtual Private LAN Service (VPLS) services because it is not configurable on a per-VLAN or per-service basis. The aging time value on this platform is a global parameter that applies to all VLANs and VPLS services.

Examples

```
-> show mac-address-table aging-time
Mac Address Aging Time (seconds) = 300
```

Release History

Release 6.1; command was introduced.
Release 6.1.1; **vlan** parameter not supported.
Release 6.4.2; aging time value applied to VPLS services.

Related Commands

show mac-address-table	Displays Source Learning MAC Address Table information.
show mac-address-table count	Displays Source Learning MAC Address Table statistics.

MIB Objects

```
slMacAddressAgingTable
   slMacAgingValue
```

show source-learning

Displays the source learning status of a port or link aggregate of ports.

show source-learning [port *slot/port***[**-*port2***] | linkagg** *linkagg_num***]**

Syntax Definitions

slot/port1	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
-port2	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1, 2, 3, and 4 on slot 3).
linkagg_num	Specifies the link aggregate identifier.

Defaults

By default, the source learning status for all switch ports and link aggregates is displayed.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **port** *slot/port* or **linkagg** *linkagg_num* parameters to display the source learning status for a specific port or link aggregate ID.
- When the source learning status is configured for a link aggregate ID, it affects all the ports that are members of the link aggregate. However, source learning status cannot be configured on individual ports which are members of the link aggregate.

Example

```
-> show source-learning
port  source-learning
-----+-------------
1/1    disabled
1/2    enabled
1/3    disabled

-> show source-learning port 1/2
port   source-learning
-----+-------------
1/2    disabled

-> show source-learning linkagg 10
port   source-learning
-----+-------------
0/10     disabled
```

output definitions

port	The slot/port number for a switch port or a link aggregate ID number. If the interface is a link aggregate ID, zero is displayed as the slot number (e.g., 0/29).
source-learning	The source learning status of the port or link aggregate (**enabled** or **disabled**). Configured through the **source-learning** command.

Release History

Release 6.4.2; command introduced

Related Commands

source-learning	Configures the status of source MAC address learning on a single port, a range of ports or on a link aggregate of ports.

Related MIB Objects

```
slMacAddressTable
slMacLearningControlTable
  slMacLearningControlEntry
  slMacLearningControlStatus
```

show source-learning chassis-distributed

Displays the current status (enabled or disabled) of the distributed MAC source learning mode.

show source-learning chassis-distributed

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- This command is not supported on OmniSwitch stackable switches.
- When the distributed MAC mode is enabled, the MAC address table size is increased to allow more learned MAC addresses (16K per module; up to 64K per chassis).
- When the distributed MAC mode is disabled (the default), the maximum number of learned MAC addresses defaults to 16K for all OmniSwitch chassis-based switches.

Examples

```
-> show source-learning chassis-distributed
Distributed MAC Mode Configuration = disabled

-> show source-learning chassis-distributed
Distributed MAC Mode Configuration = enabled
```

Release History

Release 6.1.3; command was introduced.

Related Commands

source-learning chassis-distributed	Enables or disables the distributed MAC source learning mode.

MIB Objects

```
slMacAddressTable
   slDistributedMacMode
```

13 PPPoE Intermediate Agent Commands

Point-to-Point Protocol over Ethernet (PPPoE) provides the ability to connect a network of hosts to a Remote Access Concentrator. For example, Broadband Network Gateway over a simple bridging access device. In PPPoE model, each host utilizes its own Point-to-Point Protocol (PPP) stack and the user is presented with a familiar user interface. By using PPPoE, Access control, billing, and type of service can be configured on a per-user, rather than a per-site, basis.

PPPoE Intermediate Agent (PPPoE-IA) solution is designed for the PPPoE access method and is based on the Access Node implementing a PPPoE-IA function to insert access loop identification in PPPoE discovery packets (PADI/PADR/PADT) received from the user side.

MIB information for the PPPoE-IA commands is as follows:

Filename: alcatel-ind1-pppoe-ia-mib.mib
Module: ALCATEL-IND1-PPPOEIA-MIB

A summary of the available commands is listed here.

pppoe-ia
pppoe-ia trust
pppoe-ia client
pppoe-ia access-node-id
pppoe-ia circuit-id
pppoe-ia remote-id
clear pppoe-ia statistics
show pppoe-ia configuration
show pppoe-ia
show pppoe-ia statistics

Configuration procedures for PPPoE-IA are explained in the “Configuring PPPoE Intermediate Agent” chapter of the *OmniSwitch AOS Release 6 Network Configuration Guide*.

pppoe-ia

Configures the global PPPoE-IA status for the switch and the individual PPPoE-IA status for a port or link aggregate. The link aggregate can be either static or dynamic.

pppoe-ia [port *slot*/*port*[-*port2*] **| linkagg** *agg_id***] {enable | disable}**

Syntax Definitions

slot/port**[**-*port2***]**	The slot and port number (3/1) of the interface to configure. Use a hyphen to specify a range of ports (3/1-8).
agg_id	The link aggregate identification number.
enable	Enables PPPoE-IA for the switch or on a port.
disable	Disables PPPoE-IA for the switch or on a port.

Defaults

By default, PPPoE-IA is disabled for the switch and on all ports.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- All PPPoE-IA parameters are configurable irrespective of the per-port PPPoE-IA status (enabled or disabled).
- PPPoE-IA must be enabled globally as well as on a port.
- PPPoE-IA is not supported on port mirroring destination ports. However, the configurations are accepted.
- PPPoE-IA is not supported on aggregable ports.

Examples

```
-> pppoe-ia enable
-> pppoe-ia disable
-> pppoe-ia port 1/1 enable
-> pppoe-ia port 2/4-10 disable
-> pppoe-ia linkagg 1 enable
```

Release History

Release 6.4.5; command introduced.

Related Commands

show pppoe-ia configuration	Displays the global configuration for PPPoE-IA.
show pppoe-ia	Displays the PPPoE-IA configuration for a physical port, physical port range, link aggregate port, or all the physical or link-aggregate ports.
show pppoe-ia statistics	Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

MIB Objects

```
alaPPPoEIAPortConfigTable
   alaPPPoEIAPortConfigStatus
   alaPPPoEIAGlobalStatus
```

pppoe-ia trust

Configures a port or a link aggregate port as a trusted port for PPPoE-IA. A trusted port is a port that is connected to the Broadband Network Gateway whereas a client port is connected to the host.

pppoe-ia {port *slot*/*port*[-*port2*] **| linkagg** *agg_id***} trust**

Syntax Definitions

slot/port**[-***port2***]**	The slot and port number (3/1) of the interface to configure. Use a hyphen to specify a range of ports (3/1-8).
agg_id	The link aggregate identification number.

Defaults

By default, all ports are client ports.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- All PPPoE-IA parameters are configurable irrespective of per-port PPPoE-IA status (enabled or disabled).
- PPPoE-IA must be enabled globally as well as on a port.
- For PPPoE-IA to work, it must be enabled on a client port as well as a trusted port.
- PPPoE-IA is not supported on aggregable ports.
- PPPoE-IA is not supported on port mirroring destination ports; however, the configurations are accepted.

Examples

```
-> pppoe-ia port 1/1 trust
-> pppoe-ia linkagg 7 trust
```

Release History

Release 6.4.5; command introduced.

Related Commands

pppoe-ia	Enable or disable PPPoE-IA globally on the switch or on a port or link aggregate.
pppoe-ia client	Configures a port or a link aggregate port as a client port for PPPoE-IA.
show pppoe-ia configuration	Displays the global configuration for PPPoE-IA.
show pppoe-ia	Displays the PPPoE-IA configuration for a physical port, physical port range, link aggregate port, or all the physical or link-aggregate ports.
show pppoe-ia statistics	Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

MIB Objects

```
alaPPPoEIAPortConfigTable
   alaPPPoEIAPortConfigTrustMode
```

pppoe-ia client

Configures a port or a link aggregate port as a client port for PPPoE-IA. A client port is a port that is connected to the host whereas a trusted port is connected to the Broadband Network Gateway.

pppoe-ia {port *slot*/*port*[-*port2*] **| linkagg** *agg_id***} client**

Syntax Definitions

slot/port**[-***port2***]**	The slot and port number (3/1) of the interface to configure. Use a hyphen to specify a range of ports (3/1-8).
agg_id	The link aggregate identification number.

Defaults

By default, all ports are client ports.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- All PPPoE-IA parameters are configurable irrespective of per-port PPPoE-IA status (enabled or disabled).
- PPPoE-IA must be enabled globally as well as on a port.
- For PPPoE-IA to work, it must be enabled on a client port as well as a trusted port.
- PPPoE-IA is not supported on aggregable ports.
- PPPoE-IA is not supported on port mirroring destination ports; however, the configurations are accepted.

Examples

```
-> pppoe-ia port 1/2-6 client
-> pppoe-ia linkagg 2 client
```

Release History

Release 6.4.5; command introduced.

Related Commands

pppoe-ia	Enable or disable PPPoE-IA globally on the switch or on a port or link aggregate.
pppoe-ia trust	Configures a port or a link aggregate port as a trusted port for PPPoE-IA.
show pppoe-ia configuration	Displays the global configuration for PPPoE-IA.
show pppoe-ia	Displays the PPPoE-IA configuration for a physical port, physical port range, link aggregate port, or all the physical or link-aggregate ports.
show pppoe-ia statistics	Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.

MIB Objects

```
alaPPPoEIAPortConfigTable
   alaPPPoEIAPortConfigTrustMode
```

pppoe-ia access-node-id

Globally configures a format to form an identifier that uniquely identifies an access node.

pppoe-ia access-node-id {base-mac | system-name | mgnt-address | user-string *string***}**

Syntax Definitions

base-mac	The base MAC address of the switch.
system-name	The configured name of the switch.
mgnt-address	The IP address of the management interface of the switch.
string	The value of user configured string.

Defaults

By default, PPPoE-IA uses the base MAC address of the switch as the Access-Node-Identifier.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The access-node-identifier can have a maximum of 32 characters. The access-node-identifier longer than 32 characters is truncated to 32 characters.
- The access-node-identifier when configured as user-string must not contain spaces.
- The value of user string must not be NULL.
- In case of management address format, IP address of the Loopback0 interface (if configured and active) or the first active IP interface address is used as the management address. If none of them are available, IP address ‘0.0.0.0’ is used as management address.
- If the access-node-identifier is configured as any other format other than user-string format, then the string value configuration is not allowed through SNMP or Web View application.
- It is mandatory to provide the string value through SNMP using Multi-varbind for the user-string format.

Examples

```
-> pppoe-ia access-node-id base-mac
-> pppoe-ia access-node-id user-string accessnode1
```

Release History

Release 6.4.5; command introduced.

Related Commands

pppoe-ia	Enable or disable PPPoE-IA globally on the switch or on a port or link aggregate.
show pppoe-ia configuration	Displays the global configuration for PPPoE-IA.

MIB Objects

```
alaPPPoEIAGlobalAccessNodeIDFormatType
alaPPPoEIAGlobalAccessNodeIDStringValue
```

pppoe-ia circuit-id

Globally configures a Circuit-ID format that forms an identifier that uniquely identifies an access node and an access loop that receives the PPPoE Active Discovery Initiation (PADI) or PPPoE Active Discovery Request (PADR) or PPPoE Active Discovery Terminate (PADT) from the user end.

pppoe-ia circuit-id {default | ascii [base-mac | system-name | interface | vlan | cvlan | interface-alias | user-string *string* **| delimiter** *char***]}**

Syntax Definitions

default	The default value of the Circuit-ID. Default format of Circuit-ID is "access-node-id eth slot/port:[vlan]"
ascii	Circuit-ID format used to configure Circuit-ID string using the five parameters and delimiter. Maximum five parameters can be selected from the given seven options: base-mac, system-name, interface, vlan, cvlan, interface-alias, and user-string.
base-mac	The base MAC address of the switch.
system-name	Name configured for the switch.
interface	The interface on which the PPPoE message is received.
vlan	VLAN interface on which the PPPoE message is received.
cvlan	Inner-VLAN or customer VLAN of the PPPoE message.
interface-alias	Configured alias of the interface on which the PPPoE message is received.
string	The value of user configured string.
delimiter	A user configurable delimiter used to separate the fields of an ASCII string forming the Circuit-ID.
char	The value (a character) of the user configurable delimiter. The available delimiters are: “:” (colon), “|” (pipe), “/” (forward slash), “\” (backward slash), “-” (hyphen), “'_” (underscore), “ ” (space), “#” (hash), “.” (full stop), “,” (comma), “;” (semicolon).

Defaults

- By default, the value of the Circuit-ID is "access-node-id eth slot/port[:vlan-id]". For example, if the value of access-node-id is "vxTarget", the default value of Circuit-ID is "vxTarget eth 1/1:10", if the packet is received on the interface 1/1 in vlan 10.
- By default, the delimiter used is “:”.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Circuit-ID identification is configurable only globally and cannot be configured on a per-port or per-VLAN basis.
- The Circuit-ID can have a maximum of 63 characters. The Circuit-ID longer than 63 characters is truncated to 63 characters.
- At most, five fields out of the available seven are encoded for the Circuit-ID in the order specified by the user.
- If the access-node-identifier is configured as any other format other than user-string format, then the string value configuration is not allowed through SNMP or Web View application.
- It is mandatory to provide the string value through SNMP using Multi-varbind for the user-string format.
- The value of user string must not be NULL.
- You can configure the same Circuit-ID format multiple times (for example, base MAC address of the switch can be configured multiple times in ASCII format of Circuit-ID).
- If the Circuit-ID format is default, irrespective of the ASCII fields (if configured), the Circuit-ID configuration is not visible in **show pppoe-ia configuration** output.

Examples

```
-> pppoe-ia circuit-id ascii base-mac vlan
-> pppoe-ia circuit-id ascii system-name interface user-string cid1
-> pppoe-ia circuit-id ascii system-name delimiter #
```

Release History

Release 6.4.5; command introduced.

Related Commands

pppoe-ia access-node-id	Configures the access node ID for the switch.
pppoe-ia	Enable or disable PPPoE-IA globally on the switch or on a port or link aggregate.
show pppoe-ia configuration	Displays the global configuration for PPPoE-IA.

MIB Objects

```

alaPPPoEIAGlobalCircuitIDField4StrVal
alaPPPoEIAGlobalCircuitIDField5
alaPPPoEIAGlobalCircuitIDField5StrVal
alaPPPoEIAGlobalCircuitIDDelimiter
```

pppoe-ia remote-id

Globally configures a format to form an identifier that uniquely identifies the user attached to the access loop.

pppoe-ia remote-id {base-mac | system-name | mgnt-address | user-string *string***}**

Syntax Definitions

base-mac	The base MAC address of the switch.
system-name	The name configured for the switch.
mgnt-address	The management IP address of the switch.
string	The value configured for user string.

Defaults

By default, the base MAC address of the switch is used as the format for Remote-ID.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Remote-ID is configurable only globally and cannot be configured on a per-port or per-VLAN basis.
- Remote-ID can have a maximum of 63 characters. The Remote-ID longer than 63 characters is truncated to 63 characters.
- In case of management address format, IP address of the Loopback0 interface (if configured and active) or the first active IP interface address is used as the management address. If none of them are available, IP address ‘0.0.0.0’ is used as management address.
- If the Remote-ID is configured as any other format other than user-string format, then the string value configuration is not allowed through SNMP or Web View application.
- It is mandatory to provide the string value through SNMP using Multi-varbind for the user-string format.
- The value of user string must not be NULL.

Examples

```
-> pppoe-ia remote-id base-mac
-> pppoe-ia remote-id user-string remoteuser1
```

Release History

Release 6.4.5; command introduced.

Related Commands

pppoe-ia	Enable or disable PPPoE-IA globally on the switch.
show pppoe-ia configuration	Displays the global configuration for PPPoE-IA.

MIB Objects

```
alaPPPoEIAGlobalRemoteIDFormatType
alaPPPoEIAGlobalRemoteIDStringValue
```

clear pppoe-ia statistics

Clears the statistics for all the physical or link-aggregate ports, a single port or a link aggregate port, or a range of physical ports for PPPoE-IA.

clear pppoe-ia statistics [port {*slot/port*[*-port2*] | **linkagg** *agg_id***]**

Syntax Definitions

slot/port**[-***port2***]**	The slot and port number (3/1) of the interface to configure. Use a hyphen to specify a range of ports (3/1-8).
agg_id	The link aggregate identification number.

Defaults

By default, clears the statistics for all ports and link aggregates.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the **port** or **linkagg** parameters to clear statistics for a specific port number or link aggregate ID.

Examples

```
-> clear pppoe-ia statistics
-> clear pppoe-ia statistics port 1/10
-> clear pppoe-ia statistics port 2/1-5
-> clear pppoe-ia statistics linkagg 13
```

Release History

Release 6.4.5; command introduced.

Related Commands

show pppoe-ia statistics	Displays the PPPoE-IA statistics for a physical port, link aggregate port, physical port range, or all the physical or link-aggregate ports.
show pppoe-ia	Displays the PPPoE-IA port or link aggregate configuration for the switch.

MIB Objects

show pppoe-ia

Displays the following:

- PPPoE-IA configuration for a physical or link-aggregate port, physical port range, or all the physical or link-aggregate ports.
- Port or port range configuration for ports with PPPoE-IA enabled or disabled
- Ports that are configured as trust or client port for PPPoE-IA.

show pppoe-ia [port {*slot*/*port*[*-port2*] **| linkagg** *agg_id***] [enabled | disabled | trusted | client]**

Syntax Definitions

slot/port**[-***port2***]**	The slot and port number (3/1) of the interface to configure. Use a hyphen to specify a range of ports (3/1-8).
agg_id	The link aggregate identification number.
enabled	PPPoE-IA enabled port.
disabled	PPPoE-IA disabled port.
trusted	Port configured as trust.
client	Port configured as client.

Defaults

By default, displays information for all PPPoE-IA ports and link aggregates.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the optional command parameters to display information for a specific port or link aggregate.

Examples

```
Default Configuration
-> show pppoe-ia port
Slot/Port    Status      Mode
----------+----------+------------
1/1        enabled     client
1/2        disabled    trusted
1/3        disabled    client
1/4        enabled     trusted
.
.
.
1/24        enabled     client
0/0         enabled     client
0/1         disabled    trusted
```

```
-> show pppoe-ia linkagg 1 enabled
ERROR: PPPoE-IA is disabled on linkagg 1

-> show pppoe-ia port 1/1 trusted
Slot/Port   Status
----------+----------
1/3        enabled

-> show pppoe-ia port 1/1-5 client
Slot/Port   Status
----------+----------
1/1        enabled
1/2        disabled
1/5        disabled
```

output definitions

Slot/Port	Interface slot and port number.
Status	PPPoE-IA enabled or disabled port.
Mode	Port configured as trusted or client port for PPPoE-IA.

Release History

Release 6.4.5; command introduced.

Related Commands

pppoe-ia	Enable or disable PPPoE-IA globally on the switch or on a port or link aggregate.
pppoe-ia trust	Configures a port or a link aggregate port as a trusted port for PPPoE-IA.
pppoe-ia client	Configures a port or a link aggregate port as a client port for PPPoE-IA.

MIB Objects

```

output definitions

Slot/Port	Interface slot and port number.
PADI Rx	Valid PADI (PPPoE Active Discovery Initiation) packets received on the client port.
PADR Rx	Valid PADR (PPPoE Active Discovery Request) packets received on the client port.

output definitions (continued)

PADT Rx	Valid PADT (PPPoE Active Discovery Terminate) packets received on the client port.
PADI Discard	Invalid (malformed or PDU length exceeds 1484) PADI packets received on the client port or no enabled trust port in the same VLAN as the client port.
PADR Discard	Invalid (malformed or PDU length exceeds 1500) PADR packets received on client port or no enabled trust port in the same VLAN as the client port.
PADT Discard	Invalid (malformed or PDU length exceeds 1500) PADT packets received on client port or no enabled trust port in the same VLAN as the client port.
PADO Discard	Total PADO (PPPoE Active Discovery Offer) packets received on the client port.
PADS Discard	Total PADS (PPPoE Active Discovery Session-confirmation) packets received on the client port.

Release History

Release 6.4.5; command introduced.

Related Commands

clear pppoe-ia statistics	Clears the statistics for all the physical or link-aggregate ports, a single port or a link aggregate port, or a range of physical ports for PPPoE-IA.

14 GVRP Commands

The GARP VLAN Registration Protocol (GVRP) facilitates control of virtual local area networks (VLANs) within a larger network. It is an application of General Attribute Registration Protocol (GARP) that provides the VLAN registration service. The GARP provides a generic framework whereby devices in a bridged LAN can register and de-register attribute values, such as VLAN identifiers.

GVRP is compliant with 802.1q and dynamically learns and further propagates VLAN membership information across a bridged network. It dynamically maintains and updates the registration and de-registration of VLANs and prunes unnecessary broadcast and unicast traffic. Through propagation of GVRP information, a switch can continuously update its knowledge on the set of VLANs that currently have active nodes and on ports through which those nodes can be reached.

A summary of the available commands is listed here:

gvrp
gvrp port
gvrp transparent switching
gvrp maximum vlan
gvrp registration
gvrp applicant
gvrp timer
gvrp restrict-vlan-registration
gvrp restrict-vlan-advertisement
gvrp static-vlan restrict
clear gvrp statistics
show gvrp statistics
show gvrp last-pdu-origin
show gvrp configuration
show gvrp configuration port
show gvrp configuration linkagg/port
show gvrp timer

gvrp

Enables GVRP on the switch globally.

gvrp

no gvrp

Syntax Definitions

N/A

Defaults

By default, GVRP is disabled on the switch.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to disable GVRP globally on the switch.
- Disabling GVRP globally will delete all the learned VLANs.
- GVRP is supported only when the switch is operating in the flat Spanning Tree mode; it is not supported in the 1x1 mode.

Examples

```
-> gvrp
-> no gvrp
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show gvrp configuration	Displays the global configuration for GVRP.

MIB Objects

```
dot1qGvrpStatus
```

gvrp port

Enables GVRP on a specific port or an aggregate of ports on the switch.

gvrp {linkagg *agg_num* | **port** *slot/port***}**

no gvrp {linkagg *agg_num* | **port** *slot/port***}**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
agg_num	The number corresponding to the aggregate group.

Defaults

By default, GVRP is disabled on the ports.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to disable GVRP on the specified ports.
- GVRP can be enabled on ports regardless of whether it is globally enabled or not. However, for the port to become an active participant, you should enable GVRP globally on the switch.
- When GVRP is globally enabled on the switch and is not enabled on the port, that port is excluded from the GVRP process.
- GVRP can be enabled only on fixed ports, 802.1 Q ports, and aggregate ports. Other ports (mirror ports, aggregable ports, mobile ports, and MSTI Trunking ports) do not support GVRP.
- To use the *agg_num* parameter, the link aggregate group should be created and enabled.

Examples

```
-> gvrp port 3/2
-> no gvrp port 3/2
-> gvrp linkagg 2
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show gvrp configuration port	Displays the GVRP configuration for all the ports.
show gvrp configuration linkagg/port	Displays the GVRP configuration for a specific port or an aggregate of ports.

MIB Objects

```
dot1qPortVlanTable
   dot1qPortGvrpStatus
```

gvrp transparent switching

Enables transparent switching on the switch. When transparent switching is enabled, the switch propagates GVRP information to other switches but does not register itself in the GVRP process.

gvrp transparent switching

no gvrp transparent switching

Syntax Definitions

N/A

Defaults

By default, transparent switching is disabled on the switch.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to disable transparent switching on the device.
- If GVRP is globally disabled and transparent switching is enabled, the router will flood the GVRP messages.
- If GVRP is globally disabled and transparent switching is disabled, the router will discard the GVRP messages.
- If GVRP is globally enabled transparent switching will not have any effect on the functional behavior of the device.

Examples

```
-> gvrp transparent switching
-> no gvrp transparent switching
```

Release History

Release 6.2.1; command was introduced.
Release 6.3.1; support for OmniSwitch chassis-based switches added.

Related Commands

show gvrp configuration	Displays the global configuration for GVRP.

MIB Objects

```
alaGvrpTransparentSwitching
```

gvrp maximum vlan

Configures the maximum number of dynamic VLANs that can be created by GVRP.

gvrp maximum vlan *vlanlimit*

Syntax Definitions

vlanlimit	The maximum number of VLANs to be created by GVRP. The valid range is 32–4094.

Defaults

parameter	default
vlanlimit	256

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- This command can be used even when GVRP is not enabled on the switch. However, GVRP should be enabled on the switch for creating dynamic VLANs.
- If the VLAN limit to be set is less than the current number of dynamically learnt VLANs, then the new configuration will take effect only after the GVRP is disabled and enabled again on the switch. If this operation is not done, the VLANs learnt earlier will be maintained.

Examples

```
-> gvrp maximum vlan 100
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show gvrp configuration	Displays the global configuration for GVRP.

MIB Objects

```
alaGvrpMaxVlanLimit
```

gvrp registration

Configures the GVRP registration mode for a specific port or an aggregate of ports.

gvrp registration {normal | **fixed** | **forbidden} {linkagg** *agg_num* | **port** *slot/port***}**

no gvrp registration {linkagg *agg_num* | **port** *slot/port***}**

Syntax Definitions

normal	Specifies that both registration and de-registration of VLANs are allowed. VLANs can be mapped either dynamically (through GVRP) or statically (through management application) on such a port.
fixed	Specifies that only static mapping of VLANs is allowed on the port but de-registration of previously created dynamic or static VLANs is not allowed.
forbidden	Specifies that dynamic VLAN registration or de-registration is not allowed on the port. Any dynamic VLAN created earlier will be de-registered.
agg_num	The number corresponding to the aggregate group.
slot/port	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

Defaults

parameter	default
normal | fixed | forbidden	**normal**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to set the registration mode to the default value.
- GVRP should be enabled on the port before configuring the GVRP registration mode.
- The registration mode for the default VLANs of all the ports in the switch will be set to fixed.
- To use the *agg_num* parameter, the link aggregate group should be created and enabled.

Examples

```
-> gvrp registration forbidden port 3/2
-> no gvrp registration port 3/2
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show gvrp configuration linkagg/port	Displays the GVRP configuration for a specific port or an aggregate of ports.

MIB Objects

```
alaGvrpPortConfigtable
   alaGvrpPortConfigRegistrarMode
```

gvrp applicant

Configures the applicant mode of a specific port or an aggregate of ports on the switch. The applicant mode determines whether or not GVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.

gvrp applicant {participant | non-participant | active} {linkagg *agg_num* | **port** *slot/port***}**

no gvrp applicant {linkagg *agg_num* | **port** *slot/port***}**

Syntax Definitions

participant	Specifies that GVRP PDU exchanges are only allowed when the port is in the STP forwarding state.
non-participant	Specifies that no GVRP PDU exchanges are allowed on the port, regardless of the STP status of the port.
active	Specifies that GVRP PDU exchanges are allowed when the port is either in the STP forwarding or STP blocking state.
agg_num	The number corresponding to the aggregate group.
slot/port	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

Defaults

parameter	default
participant | non-participant | active	**participant**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to set the applicant mode to the default value.
- GVRP should be enabled on the port before configuring the GVRP applicant mode.
- To use the *agg_num* parameter, the link aggregate group should be created and enabled.

Examples

```
-> gvrp applicant active port 2/2
-> no gvrp applicant port 2/2
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show gvrp configuration linkagg/port	Displays the GVRP configuration for a specific port or an aggregate of ports.

MIB Objects

```
alaGvrpPortConfigtable
   alaGvrpPortConfigApplicantMode
```

gvrp timer

Configures the Join, Leave, or LeaveAll timer values for the switch ports.

gvrp timer {join | leave | leaveall} *timer-value* **{linkagg** *agg_num* | **port** *slot/port***}**

no gvrp timer {join | leave | leaveall} {linkagg *agg_num* | **port** *slot/port***}**

Syntax Definitions

join	Specifies the value of the Join timer in milliseconds.
leave	Specifies the value of the Leave timer in milliseconds.
leaveall	Specifies the value of the LeaveAll timer in milliseconds.
timer-value	The value of the specified timer in milliseconds. The valid range is 1–2,147,483,647 for Join timer, 3–2,147,483,647 for Leave timer, and 3–2,147,483,647 for LeaveAll timer.
agg_num	The number corresponding to the aggregate group.
slot/port	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

Defaults

parameter	default
timer-value **(join)**	600 ms
timer-value **(leave)**	1800 ms
*timer-value (***leaveall)**	30000 ms

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to set the timer for a particular slot or port to the default value.
- GVRP should be enabled on the port before configuring the timer value for that port.
- Leave timer value should be greater than or equal to three times the Join timer value.
- Leaveall timer value should be greater than or equal to the Leave timer value.
- To use the *agg_num* parameter, the link aggregate group should be created and enabled.

Examples

```
-> gvrp timer join 300 port 3/2
-> no gvrp timer join 3/2
-> gvrp timer leave 900 port 3/2
-> no gvrp timer leave port 3/2
-> gvrp timer leaveall 950 port 3/2
-> no gvrp timer leaveall port 3/2
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show gvrp timer	Displays the timer values configured for all the ports or a specific port.
show gvrp configuration linkagg/port	Displays the GVRP configuration for a specific port or an aggregate of ports.

MIB Objects

```
alaGvrpPortConfigTable
   alaGvrpPortConfigJoinTimer
   alaGvrpPortConfigLeaveTimer
   alaGvrpPortConfigLeaveAllTimer
```

gvrp restrict-vlan-registration

Restricts GVRP processing from dynamically registering the specified VLAN(s) on the switch.

gvrp restrict-vlan-registration {linkagg *agg_num* | **port** *slot/port***}** *vlan-list*

no gvrp restrict-vlan-registration {linkagg *agg_num* | **port** *slot/port***}** *vlan-list*

Syntax Definitions

agg_num	The number corresponding to the aggregate group.
slot/port	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
vlan-list	The VLAN ID or the VLAN ID range (e.g., 1-10).

Defaults

By default, GVRP dynamic VLAN registration is not restricted.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to allow registration of dynamic VLAN IDs through GVRP processing.
- GVRP should be enabled on the port before restricting dynamic VLAN registrations on that port.
- This command can be used only if the GVRP registration mode is set to normal.
- If the specified VLAN already exists on the switch, the VLAN is mapped to the receiving port.
- To use the *agg_num* parameter, the link aggregate group should be created and enabled.

Examples

```
-> gvrp restrict-vlan-registration port 3/1 5
-> no gvrp restrict-vlan-registration port 3/1 5
-> gvrp restrict-vlan-registration port 3/1 6-10
-> no gvrp restrict-vlan-registration port 3/1 6-10
```

Release History

Release 6.2.1; command was introduced.

Related Commands

gvrp registration	Configures the GVRP registration mode for the switch ports.
show gvrp configuration linkagg/port	Displays the GVRP configuration for a specific port or an aggregate of ports.

MIB Objects

```
alaGvrpPortConfigTable
   alaGvrpPortConfigRestrictedRegistrationBitmap
   alaGvrpPortConfigAllowRegistrationBitmap
   alaGvrpPortConfigRegistrationBitmap
```

gvrp restrict-vlan-advertisement

Restricts the advertisement of VLANs on a specific port or an aggregate of ports.

gvrp restrict-vlan-advertisement {linkagg *agg_num* | **port** *slot/port***}** *vlan-list*

no gvrp restrict-vlan-advertisement {linkagg *agg_num* | **port** *slot/port***}** *vlan-list*

Syntax Definitions

agg_num	The number corresponding to the aggregate group.
slot/port	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
vlan-list	The VLAN ID or the VLAN ID range (e.g., 1-10).

Defaults

By default, VLAN advertisement is not restricted.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to allow the propagation of VLANs.
- GVRP should be enabled on the port before restricting VLAN advertisements on that port.
- This command affects the GVRP processing only if the applicant mode is set to participant or active.
- To use the *agg_num* parameter, the link aggregate group should be created and enabled.

Examples

```
-> gvrp restrict-vlan-advertisement port 3/1 4
-> no gvrp restrict-vlan-advertisement port 3/1 4
-> gvrp restrict-vlan-advertisement port 3/1 6-9
-> no gvrp restrict-vlan-advertisement port 3/1 6-9
-> gvrp restrict-vlan-advertisement linkagg 3 10
-> no gvrp restrict-vlan-advertisement linkagg 3 10
```

Release History

Release 6.2.1; command was introduced.

Related Commands

gvrp applicant	Configures the applicant mode for the switch port.
show gvrp configuration linkagg/port	Displays the GVRP configuration for a specific port or an aggregate of ports.

MIB Objects

```
alaGvrpPortConfigTable
   alaGvrpPortConfigRestrictedApplicantBitmap
   alaGvrpPortConfigAllowApplicantBitmap
   alaGvrpPortConfigApplicantBitmap
```

gvrp static-vlan restrict

Restricts a port from becoming a member of a statically created VLAN or a range of VLANs.

gvrp static-vlan restrict {linkagg *agg_num* | **port** *slot/port***}** *vlan-list*

no gvrp static-vlan restrict {linkagg *agg_num* | **port** *slot/port***}** *vlan-list*

Syntax Definitions

agg_num	The number corresponding to the aggregate group.
slot/port	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
vlan-list	The VLAN ID or the VLAN ID range (e.g., 1-10).

Defaults

By default, ports are assigned to the static VLAN based on GVRP PDU processing.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to set the specified port and VLAN to the default value.
- GVRP should be enabled on the port before restricting static VLAN registrations on that port.
- This command does not apply to dynamic VLANs.
- To use the *agg_num* parameter, the link aggregate group should be created and enabled.

Examples

```
-> gvrp static-vlan restrict port 3/2 5
-> no gvrp static-vlan restrict port 3/2 5
-> gvrp static-vlan restrict port 3/2 6-9
-> no gvrp static-vlan restrict port 3/2 6-9
-> gvrp static-vlan restrict linkagg 3 4-5
-> no gvrp static-vlan aggregate linkagg 3 4-5
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show gvrp configuration linkagg/port	Displays the GVRP configuration for a specific port or an aggregate of ports.

MIB Objects

   alaGvrpPortConfigRegistrationToStaticVlanLearn
   alaGvrpPortConfigRegistrationToStaticVlanRestrict
```

clear gvrp statistics

Clears GVRP statistics for all the ports, an aggregate of ports, or a specific port.

clear gvrp statistics [linkagg *agg_num* | **port** *slot/port***]**

Syntax Definitions

agg_num	The number corresponding to the aggregate group.
slot/port	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

Defaults

By default, the GVRP statistics are deleted for all the ports.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Use the *agg_num* or *slot/port* parameter with this command to clear GVRP statistics for a specific port.

Examples

```
-> clear gvrp statistics port 3/2
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show gvrp statistics	Displays the GVRP statistics or all the ports, an aggregate of ports, or a specific port.

MIB Objects

```
   alaGvrpGlobalClearStats
alaGvrpPortStatsTable
   alaGvrpPortStatsClearStats
```

show gvrp statistics

Displays the GVRP statistics for all the ports, an aggregate of ports, or a specific port.

show gvrp statistics [linkagg *agg_num* | **port** *slot/port***]**

Syntax Definitions

agg_num	The number corresponding to the aggregate group.
slot/port	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

Defaults

By default, the GVRP statistics are displayed for all ports.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Use the *agg_num* or *slot/port* parameter with this command to display GVRP statistics for a specific port.

Examples

```
-> show gvrp statistics port 1/21
Port 1/21:
  Join Empty Received     : 8290,
  Join In Received        : 1526,

  Garp Msgs Received      : 10141,
  Garp Msgs Transmitted   : 2698,
  Invalid Msgs Received   : 0

Port 1/3:
  Join Empty Received     : 0,
  Join In Received        : 0,
  Empty Received          : 0,
```

output definitions

Join Empty Received	The number of Join Empty messages received.
Join In Received	The number of Join In messages received.
Empty Received	The number of Empty messages received.
Leave Empty Received	The number of Leave Empty messages received.
Leave In Received	The number of Leave In messages received.
Leave All Received	The number of Leave All messages received.
Join Empty Transmitted	The number of Join Empty messages transmitted.
Join In Transmitted	The number of Join In messages transmitted.
Empty Transmitted	The number of Empty messages transmitted.
Leave Empty Transmitted	The number of Leave Empty messages transmitted.

output definitions

Join Empty Received	The number of Join Empty messages received.
Leave In Transmitted	The number of Leave In messages transmitted.
Leave All Transmitted	The number of Leave All messages transmitted.
Failed Registrations	The number of failed registrations.
Total PDU Received	The number of total PDUs received.
Total PDU Transmitted	The number of total PDUs transmitted.
Invalid Msgs Received	The number of invalid messages received.
Total Msgs Received	The number of total messages received.
Total Msgs Transmitted	The number of total messages transmitted.

Release History

Release 6.2.1; command was introduced.
Release 6.3.1; **Total PDU Received, Total PDU Transmitted, Invalid Msgs Received, Total Msgs Received, Total Msgs Transmitted** fields are added.

Related Commands

show gvrp last-pdu-origin

Displays the source MAC address of the last GVRP message received on a specific port or an aggregate of ports.

show gvrp last-pdu-origin {linkagg *agg_num* | **port** *slot/port***}**

Syntax Definitions

agg_num	The number corresponding to the aggregate group.
slot/port	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> show gvrp last-pdu-origin port 1/21
Last-PDU Origin : 00:d0:95:ee:f4:64
```

output definitions

Last-PDU Origin	The source MAC address of the last PDU message received on the specific port.

Release History

Release 6.2.1; command was introduced.

Related Commands

N/A

MIB Objects

```
Dot1qPortvlantable
   dot1qPortGvrpLastPduOrigin
```

show gvrp configuration

Displays the global configuration for GVRP.

show gvrp configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> show gvrp configuration
GVRP Enabled                    : yes,
Transparent Switching Enabled   : no,
Maximum VLAN Limit              : 256
```

output definitions

GVRP Enabled	Indicates whether or not GVRP is globally enabled.
Transparent Switching Enabled	Indicates whether transparent switching is enabled (**Yes**) or disabled (**No**). When enabled, GVRP messages are flooded even if GVRP is disabled for the switch.
Maximum VLAN Limit	The maximum number of VLANs that can be learned by GVRP in the system.

Release History

Release 6.2.1; command was introduced.

Related Commands

gvrp	Enables GVRP on the device globally.
gvrp transparent switching	Enables transparent switching on the device.
gvrp maximum vlan	Configures the maximum number of dynamic VLANs that can be learned by GVRP.

```

output definitions

GVRP Enabled	Indicates whether or not GVRP is globally enabled (**Yes** or **No**).
Registrar Mode	Indicates the registrar mode (**NORMAL**, **FIXED**, or **FORBIDDEN**) of the port.
Applicant Mode	Indicates the applicant mode (**PARTICIPANT, NON-PARTICIPANT**, or **ACTIVE**) of the port.
Join Timer	Displays the Join timer value.
Leave Timer	Displays the Leave timer value.
LeaveAll Timer	Displays the LeaveAll timer value.
Legacy Bpdu	Indicates the status of conventional/customer BPDU processing on network ports (**ENABLED** or **DISABLED**).
VLAN Id	The numerical VLAN ID.
Static Registration	Indicates if the port is restricted (**RESTRICT**) or not restricted (**LEARN**) from becoming a member of the static VLAN.
Restricted Registration	Indicates if the VLAN is restricted (**TRUE**) or not restricted (**FALSE**) from dynamic registration on the port.
Restricted Applicant	Indicates if the restricted applicant mode is enabled (**TRUE**) or not (**FALSE**).

Release History

Release 6.2.1; command was introduced.

Related Commands

gvrp port	Enables GVRP on a specific port or an aggregate of ports on the switch.
gvrp registration	Configures the GVRP registration mode for a specific port or an aggregate of ports.
gvrp applicant	Configures the applicant mode of a specific port or an aggregate of ports on the switch.
gvrp timer	Configures the Join, Leave, or LeaveAll timer values for the switch ports.
gvrp restrict-vlan-registration	Restricts GVRP processing from dynamically registering the specified VLAN(s) on the switch.
gvrp restrict-vlan-advertisement	Restricts the advertisement of VLANs on a specific port or an aggregate of ports.
gvrp static-vlan restrict	Restricts a port from becoming a member of a statically created VLAN or a range of VLANs.
show gvrp configuration port	Displays the GVRP configuration status for all the ports.

MIB Objects

```

show gvrp timer

Displays the timer values configured for all the ports or a specific port.

show gvrp timer [[join | leave | leaveall] {linkagg *agg_num* | **port** *slot/port***}]**

Syntax Definitions

join	Displays the Join timer value.
leave	Displays the Leave timer value.
leaveall	Displays the LeaveAll timer value.
agg_num	The number corresponding to the aggregate group.
slot/port	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

Defaults

By default the timer values configured on all the ports are displayed.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **join**, **leave**, or **leaveall** parameter with this command to view the specific timer values configured on all the ports.
- Use the *agg_num* or *slot/port* parameter with this command to display the timer values configured for a specific port.

Examples

```
-> show gvrp timer
Legend : All timer values are in milliseconds
  Port     Join Timer    Leave Timer    LeaveAll Timer
--------+-------------+-------------+--------------

15 MVRP Commands

MVRP (Multiple VLAN Registration Protocol) provides a mechanism for maintaining the contents of Dynamic VLAN Registration Entries for each VLAN, and for propagating the information they contain to other Bridges. MVRP uses MRP (Multiple Registration Protocol) as the underlying mechanism, for the maintenance and propagation of the VLAN information.

MVRP acts as an MRP application, sending and receiving MVRP information encapsulated in an Ethernet frame on a specific MAC address. MVRP allows both end stations and Bridges in a Bridged Local Area Network to issue and revoke declarations relating to membership of VLANs. Note that if MVRP is configured on a switch, GVRP cannot be configured on that switch.

A summary of the available commands is listed here:

vlan registration-mode
mvrp
mvrp port
mvrp linkagg
mvrp transparent-switching
mvrp maximum vlan
mvrp registration
mvrp applicant
mvrp timer join
mvrp timer leave
mvrp timer leaveall
mvrp timer periodic-timer
mvrp periodic-transmission
mvrp restrict-vlan-registration
mvrp restrict-vlan-advertisement
mvrp static-vlan-restrict
show mvrp configuration
show mvrp port
show mvrp linkagg
show mvrp timer
show mvrp statistics
show mvrp last-pdu-origin
show vlan registration-mode
show mvrp vlan-restrictions
show vlan mvrp
mvrp clear-statistics

vlan registration-mode

Configures VLAN dynamic registration mode to either GVRP or MVRP and deletes all static configuration of previous mode along with the dynamic data.

vlan registration-mode {gvrp | mvrp}

Syntax Definitions

gvrp	Dynamic registration protocol mode is GVRP.
mvrp	Dynamic registration protocol mode is MVRP.

Defaults

parameter	default
gvrp| mvrp	**mvrp**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Before configuring MVRP, change the VLAN registration mode to MVRP.
- When the mode is changed from MVRP to GVRP or GVRP to MVRP, all static and dynamic configurations of the previous mode is deleted.
- An INFO message “All [GVRP/MVRP] static and dynamic configurations has been deleted” is given to the user on changing the mode from GVRP to MVRP.
- On configuring the same mode, no INFO message is given to the user.
- While running in MVRP mode, all GVRP configurations is rejected and when in GVRP mode, all MVRP configuration is rejected.
- Even though the default mode of the switch is MVRP, when you are upgrading the image from a previous release which does not support MVRP, the GVRP commands is accepted by the switch. The VLAN registration mode is internally changed to GVRP.

Examples

```
-> vlan registration-mode mvrp
INFO: All GVRP configurations and learnings have been deleted.

-> vlan registration-mode gvrp
INFO: All MVRP configurations and learnings have been deleted.
```

Release History

Release 6.4.3; command was introduced.

Related Commands

show vlan registration-mode	Displays the VLAN registration operational mode.

MIB Objects

```
alaVlanRegistrationProtocolType
```

mvrp

Enables or disables MVRP globally on the switch.

mvrp {enable | disable}

Syntax Definitions

enable	Enables MVRP globally on the switch.
disable	Disables MVRP globally on the switch.

Defaults

By default, MVRP is disabled on the switch.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Disabling MVRP globally will delete all the MVRP learned VLANs.
- MVRP is supported only when the switch is operating in the flat Spanning Tree mode and it is not supported in the 1x1 mode.

Examples

```
-> mvrp enable
-> mvrp disable
```

Release History

Release 6.4.3; command was introduced.

Related Commands

vlan registration-mode	Configures VLAN dynamic registration mode to either GVRP or MVRP and deletes all static configuration of previous mode along with the dynamic data.
show mvrp configuration	Displays the global configuration for MVRP.

MIB Objects

`alaMvrpGlobalStatus`

mvrp port

Enables or disables MVRP on specific ports on the switch.

mvrp port *slot/port* **[–** *port2***] {enable | disable}**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (For example, 3/1 specifies port 1 on slot 3).
enable	Enables MVRP on a port.
disable	Disables MVRP on a port.

Defaults

By default, mvrp is disabled on all the ports.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- MVRP can be enabled on switch ports regardless of whether it is globally enabled on the switch. However, for the port to become an active participant in the MVRP operation, MVRP has to be enabled globally on the switch.
- When MVRP is globally enabled on the switch and is not enabled on the port, that port is excluded from the MVRP protocol operation.
- MVRP can be enabled only on fixed ports, 802.1 Q ports, aggregate ports, and VLAN Stacking Network ports. Other ports (mirroring ports, aggregable ports, mobile ports, VPLS Access ports, VLAN Stacking User ports) do not support MVRP.
- MVRP should not be enabled on ERP ring ports.

Examples

```
-> mvrp port 1/2 enable
-> mvrp port 1/2 disable
-> mvrp port 1/1-10 enable
-> mvrp port 1/1-10 disable
```

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp statistics	Displays the MVRP statistics for all the ports, aggregates, or specific ports.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortStatus
```

mvrp linkagg

Enables or disables MVRP on specific aggregates on the switch.

mvrp linkagg *agg_num* **[-***agg_num2***] {enable | disable}**

Syntax Definitions

agg_num	The number corresponding to the aggregate group.
enable	Enables MVRP on a port.
disable	Disables MVRP on a port.

Defaults

By default, mvrp is disabled on all the ports.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- MVRP can be enabled on switch ports regardless of whether it is globally enabled on the switch. However, for the port to become an active participant in the MVRP operation, MVRP has to be enabled globally on the switch.
- When MVRP is globally enabled on the switch and is not enabled on the port, that port is excluded from the MVRP protocol operation.
- MVRP can be enabled only on fixed ports, 802.1 Q ports, aggregate ports, and VLAN Stacking Network ports. Other ports (mirroring ports, aggregable ports, mobile ports, VPLS Access ports, VLAN Stacking User ports) do not support MVRP.
- To use the *agg_num* parameter, the link aggregate group has to be created.
- MVRP not supported on VFL aggregate. If mvrp is configured on a vfl linkagg, an error message is displayed informing that the port is an VFL aggregate.

Examples

```
-> mvrp linkagg 10 enable
-> mvrp linkagg 10 disable
-> mvrp linkagg 2-5 enable
-> mvrp linkagg 1-5 disable
```

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp statistics	Displays the MVRP statistics for all the ports, aggregates, or specific ports.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortStatus
```

mvrp transparent-switching

Enables or disables transparent switching on the switch. When transparent switching is enabled, the switch propagates MVRP information to other switches but does not participate in the MVRP protocol.

mvrp transparent-switching {enable | disable}

Syntax Definitions

enable	Enables transparent switching globally on a switch.
disable	Disables transparent switching globally on a switch.

Defaults

By default, transparent switching is disabled on the switch.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If MVRP is globally disabled and transparent switching is enabled, the switch floods the MVRP messages.
- If MVRP is globally disabled and transparent switching is disabled, the switch discards the MVRP messages.
- If MVRP is globally enabled, transparent switching has no effect on the functional behavior of the switch.

Examples

```
-> mvrp transparent-switching enable
-> mvrp transparent-switching disable
```

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp configuration	Displays the global configuration for MVRP.

MIB Objects

```
alaMvrpTransparentSwitching
```

mvrp maximum vlan

Configures the maximum number of dynamic VLANs that can be created by MVRP.

mvrp maximum vlan *vlanlimit*

Syntax Definitions

vlanlimit	The maximum number of VLANs to be created by MVRP. The valid range is 32–4094.

Defaults

The default value is 256.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command can be used even when MVRP is not enabled on the switch. However, MVRP has to be enabled on the switch for creating dynamic VLANs.
- If the VLAN limit to be set is less than the current number of dynamically learnt VLANs, then the new configuration takes effect only after the MVRP is disabled and enabled again on the switch. If this operation is not done, the VLANs learnt earlier is retained.

Examples

```
-> mvrp maximum vlan 100
```

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp configuration	Displays the global configuration for MVRP.
show vlan mvrp	Displays the list of VLANS learned through MVRP and their details.

MIB Objects

```
alaMvrpMaxVlanLimit
```

mvrp registration

Configures the MVRP registration mode for specific ports or aggregates.

mvrp {port *slot/port* **[–** *port2***] | linkagg** *agg_num* **[-***agg_num2***]} registration {normal | fixed | forbidden}**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (For example, 3/1 specifies port 1 on slot 3).
agg_num	The number corresponding to the aggregate group.
normal	Specifies that both registration and de-registration of VLANs are allowed. VLANs can be mapped either dynamically (through MVRP) or statically (through management application) on such a port.
fixed	Specifies that only static mapping of VLANs is allowed on the port but de-registration of previously created dynamic or static VLANs is not allowed.
forbidden	Specifies that dynamic VLAN registration or de-registration is not allowed on the port. Any dynamic VLAN created earlier is deregistered.

Defaults

parameter	default
normal | fixed | forbidden	**normal**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

To use the *agg_num* parameter, the link aggregate group has to be created and enabled.

Examples

```
-> mvrp port 1/2 registration forbidden
-> mvrp port 1/5 registration normal
-> mvrp linkagg 10 registration fixed
-> mvrp linkagg 20 registration forbidden
-> mvrp port 2/5-10 registration normal
```

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigRegistrarMode
```

mvrp applicant

Configures the applicant mode of specific ports on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.

mvrp {port *slot/port* **[–** *port2***] | linkagg** *agg_num* **[-***agg_num2***]} applicant {participant | non-participant | active}**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (For example, 3/1 specifies port 1 on slot 3).
agg_num	The number corresponding to the aggregate group.
participant	Specifies that MVRP PDU exchanges are only allowed when the port is in the STP forwarding state.
non-participant	Specifies that MVRP PDU's are not sent in this mode and PDU's received are processed and learning happens as expected.
active	Specifies that MVRP PDU exchanges are allowed when the port is in the STP forwarding state or STP blocking state.This is applicable for both advertisement and registration.

Defaults

parameter	default
participant | non-participant | active	**active**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

To use the *agg_num* parameter, the link aggregate group has to be created and enabled.

Examples

```
-> mvrp port 1/2 applicant active
-> mvrp port 1/3 applicant participant
-> mvrp port 1/4 applicant non-participant
-> mvrp linkagg 10 applicant active
-> mvrp linkagg 15 applicant participant
-> mvrp linkagg 20 applicant non-participant
```

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigtable
   alaMvrpPortConfigApplicantMode
```

mvrp timer join

Specifies the join time interval between transmit opportunities for the dynamically registering VLANs on the switch.

mvrp {port *slot/port* **[–** *port2***] | linkagg** *agg_num* **[-***agg_num2***]} timer join** *timer-value*

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (For example, 3/1 specifies port 1 on slot 3).
agg_num	The number corresponding to the aggregate group.
timer-value	Specifies the value of the join timer in milliseconds.The valid range is 250 milliseconds to 1073741773 milliseconds.

Defaults

parameter	default
timer-value	*600 milliseconds*

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.
- To use the *agg_num* parameter, the link aggregate group has to be created and enabled.

Examples

```
-> mvrp port 1/2 timer join 600
-> mvrp port 1/2-12 timer join 600
-> mvrp linkagg 3 timer join 600
-> mvrp linkagg 3-6 timer join 600
```

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp timer	Displays the timer values configured for all the ports or a specific port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigJoinTimer
   alaMvrpPortConfigLeaveTimer
   alaMvrpPortConfigLeaveAllTimer
   alaMvrpPortConfigPeriodicTimer
```

mvrp timer leave

Specifies the period of time that the switch has to wait in the Leave state before changing to the unregistered state.

mvrp {port *slot/port* **[–** *port2***] | linkagg** *agg_num* **[-***agg_num2***]} timer leave** *timer-value*

Syntax Definitions

slot	The slot number for the module.
port	The physical port number on the module.
agg_num	The number corresponding to the aggregate group.
timer-value	Specifies the value of the Leave Timer in milliseconds. The valid range is 750 milliseconds to 2147483647 milliseconds.

Defaults

parameter	default
timer-value	*1800 milliseconds*

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.
- Leave timer value has to be greater than or equal to twice the Join timer value, plus six times the timer resolution (that is, 16.66 milliseconds). Leave timer has to be at least be greater than twice the join timer plus100 milliseconds.
- To use the *agg_num* parameter, the link aggregate group has to be created and enabled.

Examples

```
-> mvrp port 1/2 timer leave 1800
-> mvrp port 1/2-12 timer leave 1800
-> mvrp linkagg 3 timer leave 1800
-> mvrp linkagg 3-6 timer leave 1800
```

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp timer	Displays the timer values configured for all the ports or a specific port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigJoinTimer
   alaMvrpPortConfigLeaveTimer
   alaMvrpPortConfigLeaveAllTimer
   alaMvrpPortConfigPeriodicTime
```

mvrp timer leaveall

Specifies the frequency with which the LeaveAll messages are communicated.

mvrp {port *slot/port* **[–** *port2***] | linkagg** *agg_num* **[-***agg_num2***]} timer leaveall** *timer-value*

Syntax Definitions

slot	The slot number for the module.
port	The physical port number on the module.
agg_num	The number corresponding to the aggregate group.
timer-value	Specifies the value of the LeaveAll Timer in milliseconds. The valid range is 750 milliseconds to 2147483647 milliseconds.

Defaults

parameter	default
timer-value	*30000 milliseconds*

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.
- Leaveall timer value has to be greater than or equal to the Leave timer value. It is recommended to have the leaveall timer 15 times greater than the leave timer.
- To use the *agg_num* parameter, the link aggregate group has to be created and enabled.

Examples

```
-> mvrp port 1/2 timer leaveall 30000
-> mvrp port 1/2-12 timer leaveall 30000
-> mvrp linkagg 3 timer leaveall 30000
-> mvrp linkagg 3-6 timer leaveall 30000
```

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp timer	Displays the timer values configured for all the ports or a specific port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigJoinTimer
   alaMvrpPortConfigLeaveTimer
   alaMvrpPortConfigLeaveAllTimer
   alaMvrpPortConfigPeriodicTimer
```

mvrp timer periodic-timer

Specifies the MVRP periodic-timer time interval for the dynamically registering VLANs on the switch.

mvrp {port *slot/port* **[–** *port2***] | linkagg** *agg_num* **[-***agg_num2***]} timer periodic-timer** *timer-value*

Syntax Definitions

slot	The slot number for the module.
port	The physical port number on the module.
agg_num	The number corresponding to the aggregate group.
timer-value	Specifies the value of the Periodic Timer in seconds. The valid range is between 1 to 2147483647 milliseconds.

Defaults

parameter	default
timer-value	*1 second*

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.
- To use the *agg_num* parameter, the link aggregate group has to be created and enabled.

Examples

```
-> mvrp port 1/2 timer periodic-timer 1
-> mvrp port 1/2 timer periodic-timer 1
-> mvrp linkagg 3 timer periodic-timer 1
-> mvrp linkagg 3-6 timer periodic-timer 1
```

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp timer	Displays the timer values configured for all the ports or a specific port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigJoinTimer
   alaMvrpPortConfigLeaveTimer
   alaMvrpPortConfigLeaveAllTimer
   alaMvrpPortConfigPeriodicTimer
```

mvrp periodic-transmission

Enables the periodic transmission status on a port or aggregate of ports.

mvrp {port *slot/port* **[–** *port2***] | linkagg** *agg_num* **[-***agg_num2***]} periodic-transmission {enable|disable}**

Syntax Definitions

slot	The slot number for the module.
port	The physical port number on the module.
agg_num	The number corresponding to the aggregate group.
enable	Enables periodic transmission status on a port.
disable	Disables periodic transmission status on a port.

Defaults

By default, periodic-transmission status would be disabled on all the ports.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

To use the *agg_num* parameter, the link aggregate group has to be created and enabled.

Examples

```
-> mvrp port 1/2 periodic-transmission enable
-> mvrp port 1/2 periodic-transmission disable
-> mvrp linkagg 10 periodic-transmission enable
-> mvrp linkagg 10 periodic-transmission disable
```

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigPeriodicTransmissionStatus
```

mvrp restrict-vlan-registration

Restricts MVRP processing from dynamically registering the specified VLAN or VLANs on the switch.

mvrp {port *slot/port* **[–** *port2***] | linkagg** *agg_num* **[-***agg_num2***]} restrict-vlan-registration vlan** *vlan-list*

no mvrp {port *slot/port* **[–** *port2***] | linkagg** *agg_num* **[-***agg_num2***]} restrict-vlan-registration vlan** *vlan-list*

Syntax Definitions

slot	The slot number for the module.
port	The physical port number on the module.
agg_num	The number corresponding to the aggregate group.
vlan-list	The VLAN ID or the VLAN ID range (For example, 1-10).

Defaults

By default, MVRP dynamic VLAN registrations are not restricted.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to allow registration of dynamic VLAN IDs through MVRP processing.
- If the specified VLAN exists on the switch, the VLAN is mapped to the receiving port.
- To use the *agg_num* parameter, the link aggregate group has to be created and enabled.

Examples

```
-> mvrp port 1/2 restrict-vlan-registration vlan 5
-> no mvrp port 1/2 restrict-vlan-registration vlan 5
-> mvrp linkagg 10 restrict-vlan-registration vlan 6-10
-> no mvrp port 3/1 restrict-vlan-registration vlan 6-10
```

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortRestrictVlanConfigTable
   alaMvrpPortRestrictRowStatus
   alaMvrpPortRestrictVlanAttributeType
   alaMvrpPortRestrictVlanID
```

mvrp restrict-vlan-advertisement

Restricts the advertisement of VLANs on a specific port or an aggregate of ports.

mvrp {port *slot/port* **[–***port2***] | linkagg** *agg_num* **[-***agg_num2***]} restrict-vlan-advertisement**

vlan *vlan-list*

no mvrp {| port *slot/port* **[–***port2***] | linkagg** *agg_num* **[-***agg_num2***]} restrict-vlan-advertisement**

vlan *vlan-list*

Syntax Definitions

slot	The slot number for the module.
port	The physical port number on the module.
agg_num	The number corresponding to the aggregate group.
vlan_list	The list of VLAN IDs or the VLAN ID range (For example, 1-10).

Defaults

By default, MVRP VLAN advertisement is not restricted.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command affects the MVRP processing only if the applicant mode is set to participant or active.
- Use the **no** form of this command to allow the propagation of VLANs.
- To use the *agg_num* parameter, the link aggregate group has to be created and enabled.

Examples

```
-> mvrp port 1/2 restrict-vlan-advertisement vlan 5
-> no mvrp port 1/2 restrict-vlan-advertisement vlan 5
-> mvrp linkagg 10 restrict-vlan-advertisement vlan 6-10
-> no mvrp port 1/2 restrict-vlan-advertisement vlan 6-10
-> no mvrp port 1/1-2 restrict-vlan-advertisement vlan 6-10
```

Release History

Release 6.4.3; command was introduced.

Related Commands

mvrp applicant	Configures the applicant mode of specific ports on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.
mvrp timer join	Configures the applicant mode of specific link aggregates on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortRestrictVlanConfigTable
   alaMvrpPortRestrictRowStatus
   alaMvrpPortRestrictVlanAttributeType
   alaMvrpPortRestrictVlanID
```

mvrp static-vlan-restrict

Restricts a port from becoming a member of a statically created VLAN or a range of VLANs.

mvrp {linkagg *agg_num* **[-***agg_num2***] | port** *slot/port* **[–** *port2***]} static-vlan-restrict vlan** *vlan-list*

no mvrp {linkagg *agg_num* **[-***agg_num2***] | port** *slot/port* **[–** *port2***]} static-vlan-restrict vlan** *vlan-list*

Syntax Definitions

agg_num	The number corresponding to the aggregate group.
slot	The slot number for the module.
port	The physical port number on the module.
vlan_list	The list of VLAN IDs or the VLAN ID range (For example, 1-10).

Defaults

By default, ports are assigned to the static VLAN based on MVRP PDU processing.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command applies only to static VLANs and does not apply to dynamic VLANs.
- Use the **no** form of this command to set the specified port and VLAN to the default value.
- Use the *agg_num* or *slot/port* parameter with this command to display GVRP statistics for a specific port.

Examples

```
-> mvrp port 1/2 static-vlan-restrict vlan 5
-> no mvrp port 1/2 static-vlan-restrict vlan 5
-> mvrp port 1/2 static-vlan-restrict vlan 6-9
-> no mvrp port 1/2 static-vlan-restrict vlan 6-9
-> mvrp linkagg 3 static-vlan-restrict vlan 4-5
-> no mvrp linkagg 3 static-vlan-restrict aggregate vlan 4-5
```

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortRestrictVlanConfigTable
   alaMvrpPortRestrictRowStatus
   alaMvrpPortRestrictVlanAttributeType
   alaMvrpPortRestrictVlanID
   alaMvrpPortConfigRegistrationToStaticVlan
   alaMvrpPortConfigRegistrationToStaticVlanLearn
   alaMvrpPortConfigRegistrationToStaticVlanRestrict
```

show mvrp configuration

Displays the global configuration for MVRP.

show mvrp configuration

Syntax Definitions

NA

Defaults

NA

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

NA

Examples

```
-> show mvrp configuration
MVRP Enabled                  : yes,
Transparent Switching Enabled : no,
Maximum VLAN Limit            : 256
```

output definitions

MVRP Enabled	Indicates whether MVRP is globally enabled.
Transparent Switching Enabled	Indicates whether transparent switching is enabled (**Yes**) or disabled (**No**). When enabled, MVRP messages are flooded even if MVRP is disabled for the switch.
Maximum VLAN Limit	The maximum number of VLANs that can be learned by MVRP in the system.

Release History

Release 6.4.3; command was introduced.

Related Commands

mvrp	Enables or disables MVRP globally on the switch.
vlan registration-mode	Configures VLAN dynamic registration mode to either GVRP or MVRP and deletes all static configuration of previous mode along with the dynamic data.
mvrp port	Enables or disables transparent switching on the switch. When transparent switching is enabled, the switch propagates MVRP information to other switches but does not participate in the MVRP protocol.
mvrp maximum vlan	Configures the maximum number of dynamic VLANs that can be created by MVRP.

MIB Objects

```
alaMvrpGlobalStatus
alaMvrpTransparentSwitching
alaMvrpMaxVlanLimit
```

show mvrp port

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

show mvrp port {*slot/port* **[-***port2***]} [enabled | disabled]**

Syntax Definitions

slot	The slot number for the module.
port	The physical port number on the module.
enabled	To display only the enabled ports.
disabled	To display only the disabled ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

LeaveAll Timer (msec) : 30000,
Periodic Timer (sec) : 1,
Periodic Tx Status : enabled

-> show mvrp port 1/1 enabled
ERROR: MVRP is disabled on port 1/1
```

output definitions

Port	Displays the slot/port number.
Join Timer	Displays the value of Join Timer in milliseconds.
Leave Timer	Displays the value of the Leave Timer in milliseconds.
LeaveALL Timer	Displays the value of the LeaveAll Timer in milliseconds.
Periodic Timer	Displays the value of the Periodic Timer in seconds.
Registration Mode	Indicates the registration mode of the port. • **Normal**: Registrar responds normally to incoming MRP messages. • **Fixed**: Registrar ignores all MRP messages and remains in the IN state for all the dynamic VLAN-port associations. • **Forbidden**: Registrar ignores all MRP messages and remains in MT State.

output definitions (continued)

Applicant Mode	Indicates the applicant mode of the port. • **Participant**: MVRP PDU exchanges are only allowed when the port is in the STP forwarding state. • **Non-participant**: MVRP PDU's are not sent in this mode and PDU's received are processed and learning happens as expected. • **Active**: MVRP PDU exchanges are allowed when the port is in the STP forwarding state or STP blocking state.
Periodic Tx Status	The transmission status of MVRP, **enabled** or **disabled**.

Release History

Release 6.4.3; command was introduced.

Related Commands

mvrp port	Enables or disables MVRP on specific ports on the switch.
mvrp transparent-switching	Enables or disables MVRP on specific aggregates on the switch
vlan registration-mode	Configures VLAN dynamic registration mode to either GVRP or MVRP and deletes all static configuration of previous mode along with the dynamic data.

MIB Objects

show mvrp timer

Displays the timer values configured for all the ports or a specific port.

show mvrp {port *slot/port* **[–** *port2***] | linkagg** *agg_num* **[-***agg_num2***]} timer {join | leave | leaveall | periodic-timer}**

Syntax Definitions

slot	The slot number for the module.
port	The physical port number on the module.
agg_num	The number corresponding to the aggregate group.
join	To display only the join timer.
leave	To display only the leave timer.
leaveall	To display only the leaveall timer.
periodic-timer	To display only the periodic-timer.

Defaults

NA

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **join**, **leave**, **leaveall**, or **periodic-timer** parameter with this command to view the specific timer values configured on all the ports.
- Use the *agg_num* or *slot/port* parameter with this command to display the timer values configured for a specific port.

Examples

```
-> show mvrp timer
Port    Join Timer     Leave Timer    LeaveAll Timer   Periodic Timer
        (msec)         (msec)          (sec)             (msec)
--------+--------------+--------------+---------------+----------------

```

output definitions

Port	Displays the slot/port number.
Join Timer	Displays the value of Join Timer in milliseconds.
Leave Timer	Displays the value of the Leave Timer in milliseconds.
LeaveALL Timer	Displays the value of the LeaveAll Timer in milliseconds.
Periodic Timer	Displays the value of the Periodic Timer in seconds.

Release History

Release 6.4.3; command was introduced.

Related Commands

mvrp timer join	Specifies the join time interval between transmit opportunities for the dynamically registering VLANs on the switch.
mvrp timer leave	Specifies the period of time that the switch has to wait in the Leave state before changing to the unregistered state.
mvrp timer leaveall	Specifies the frequency with which the LeaveAll messages are communicated.
mvrp timer periodic-timer	Specifies the MVRP periodic-timer time interval for the dynamically registering VLANs on the switch.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigJoinTimer
   alaMvrpPortConfigLeaveTimer
   alaMvrpPortConfigLeaveAllTimer
   alaMvrpPortConfigPeriodicTimer
```

show mvrp statistics

Displays the MVRP statistics for all the ports, aggregates, or specific ports.

show mvrp {port *slot/port* **[–** *port2***] | linkagg** *agg_num* **[-***agg_num2***] } statistics**

Syntax Definitions

slot	The slot number for the module.
port	The physical port number on the module.
agg_num	The number corresponding to the aggregate group.

Defaults

NA

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If no port or link aggregate is specified the MVRP statistics are displayed for all ports.
- Use the *agg_num* or *slot/port* parameter with this command to display the MVRP statistics for a specific port.

Examples

```
-> show mvrp port 1/21 statistics
Port 1/21:

```

output definitions

New Received	The number of new MVRP messages received on the switch.
Join In Received	The number of MVRP Join In messages received on the switch
Join Empty Received	The number of MVRP Join Empty messages received on the switch.
Leave In Received	The number of MVRP Leave In messages received on the switch.
In Received	The total MVRP messages received on the switch.
Empty Received	The number of MVRP Empty messages received on the switch.
Leave All Received	The number of MVRP Leave All messages received on the switch.
New Transmitted	The number of new MVRP messages sent by the switch.

output definitions (continued)

Join In Transmitted	The number of MVRP Join In messages sent by the switch
Join Empty Transmitted	The number of MVRP Join Empty messages sent by the switch.
Leave Transmitted	The number of MVRP Leave messages sent by the switch.
In Transmitted	The number of MVRP In messages sent by the switch.
Empty Transmitted	The number of MVRP empty messages sent by the switch.
LeaveAll Transmitted	The number of Leave All messages sent by the switch.
Failed Registrations	The number of failed registrations.
Total Mrp PDU Received	The number of total MRP PDUs received by the switch.
Total Mrp Msgs Received	The number of total MRP messages received by the switch.
Total Mrp Msgs Transmitted	The number of total MRP messages sent by the switch.
Invalid Msgs Received	The number of invalid messages received by the switch.

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp configuration	Clears MVRP statistics for all the ports, an aggregate of ports, or a specific port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configuration for a specific port or an aggregate of ports.

->show mvrp port 1/21 last-pdu-origin
Port     Last PDU Origin
--------+------------------
1/1      00:d0:95:ee:f4:64
```

output definitions

Port	Displays the slot/port number.
Last PDU origin	The source MAC address of the last PDU message received on the specific port.

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp linkagg	Displays the MVRP configuration for a specific port or an aggregate of ports.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortStatsTable
   alaMvrpPortLastPduOrigin
```

show vlan registration-mode

Displays the VLAN registration operational mode.

show vlan registration-mode

Syntax Definitions

NA

Defaults

NA

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

None

Examples

```
-> show vlan registration-mode
VLAN dynamic registration mode : mvrp
```

output definitions

VLAN dynamic registration mode	Displays the VLAN dynamic registration mode, mvrp or **gvrp**.

Release History

Release 6.4.3; command was introduced.

Related Commands

vlan registration-mode	Configures VLAN dynamic registration mode to either GVRP or MVRP and deletes all static configuration of previous mode along with the dynamic data.

MIB Objects

```
alaVlanDynamicRegistrationProtocolType
```

show mvrp vlan-restrictions

Displays the VLAN MVRP configuration on a specific port or an aggregate of ports.

show mvrp {port *slot/port* **[–** *port2***] | linkagg** *agg_num* **[-***agg_num2***]} vlan-restrictions**

Syntax Definitions

agg_num	The number corresponding to the aggregate group.
slot	The slot number for the module.
port	The physical port number on the module.

Defaults

NA

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the *agg_num* or *slot/port* parameter with this command to display the MVRP statistics for a specific port.

Examples

```
-> show mvrp port 1/21 vlan-restrictions
VLAN Id             Static      Restricted      Restricted
                 Registration   Registration    Applicant
--------------+--------------+--------------+-----------
     1               LEARN          FALSE         FALSE
     2               LEARN          FALSE         FALSE
     3               LEARN          FALSE         FALSE
     4               LEARN          FALSE         FALSE
     5               LEARN          FALSE         FALSE
     6               LEARN          FALSE         FALSE
     7               LEARN          FALSE         FALSE
    11               RESTRICT       FALSE         FALSE
    12               RESTRICT       FALSE         FALSE
    53               LEARN          TRUE          FALSE
    55               LEARN          FALSE         TRUE
```

output definitions

VLAN ID	The VLAN identification number for a preconfigured VLAN that handles the MVRP traffic for this port.
Static Registration	Indicates if the port is restricted (**RESTRICT**) or not restricted (**LEARN**) from becoming a member of the static VLAN.
Restricted Registration	Indicates if the VLAN is restricted (**TRUE**) or not restricted (**FALSE**) from dynamic registration on the port.
Restricted Applicant	Indicates if the VLAN is restricted for advertisement from the port (**TRUE**) or not (**FALSE**).

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configuration for a specific port or an aggregate of ports.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigRestrictedRegistrationBitmap
   alaMvrpPortConfigRestrictedApplicantBitmap
   alaMvrpPortConfigRegistrationToStaticVlan
```

show vlan mvrp

Displays the list of VLANS learned through MVRP and their details.

show vlan mvrp [vlan-id | vlan-range]

Syntax Definitions

vlan-id	VLAN ID number you want to display (1-4094)
vlan-range	The VLAN ID range (For example, 1-10)

Defaults

NA

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

None

Examples

```
-> show vlan mvrp
                        stree     mble
vlan  type admin oper 1x1   flat  auth  ip  ipx  tag  name
----+-----+-----+----+-----+--------+-------+------+-----+-----+-----------
5     mvrp  on    on   on    on   off   NA  off  off  MVRP1
6     mvrp  on    on   off   off  off   NA  off  off  MVRP12
```

output definitions

VLAN	The VLAN ID. Use the **vlan** command to create or remove VLANs.
Type	The type of VLAN (**std**, **vstk**, **gvrp**, **mvrp**, or **ipmv**)
Admin	VLAN administrative status: on enables VLAN functions to operate; off disables VLAN functions without deleting the VLAN. Use the **vlan** command to change the VLAN administrative status.
Oper	VLAN operational status: **on** (enabled) or **off** (disabled). The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (For example, router interfaces, Spanning Tree) are applied to ports and traffic flow. A VLAN has to have an enabled administrative status before it can become operationally enabled.
stree lxl	Specifies that the MVRP status for the VLAN applies when the switch is running in the 1x1 MVRP mode.

output definitions (continued)

stree Flat	Specifies that the MVRP status for the VLAN applies when the switch is running in the flat MVRP mode.
Auth	VLAN Authentication status: **on** (enabled) or **off** (disabled). Use the **vlan authentication** command to change the VLAN Authentication status.
IP	IP router interface status: **on** (IP interface exists for the VLAN) or **off** (no IP router interface exists for the VLAN). Use **the ip interface command** to define an IP router interface for a VLAN.
mble Tag	Mobile tagging status: **on** (enabled); **off** (disabled). Configured through the **vlan mobile-tag** command.
Name	The user-defined text description for the VLAN. By default, the VLAN ID is specified for the VLAN description.

Release History

Release 6.4.3; command was introduced.

Related Commands

mvrp maximum vlan	Configures the maximum number of dynamic VLANs that can be created by MVRP.

MIB Objects

```
vlanMgrVlan
vlanTable
   vlanNumber
   vlanDescription
   vlanAdmStatus
   vlanOperStatus
   vlanStatus
   vlanStpStatus
   vlanAuthentStatus
   vlanIpAddress
   vlanIpMask
   vlanIpEnacp
   vlanIpForward
   vlanIpStatus
   vlanTagMobilePortStatus
```

mvrp clear-statistics

Clears MVRP statistics for all the ports, an aggregate of ports, or a specific port.

mvrp [port *slot/port* **[–***port2***] | linkagg** *agg_num* **[-***agg_num2***]] clear-statistics**

Syntax Definitions

slot	The slot number for the module.
port	The physical port number on the module.
agg_num	The number corresponding to the aggregate group.

Defaults

If no ports are specified, the MVRP statistics are deleted for all the ports.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the *agg_num* or *slot/port* parameter with this command to clear MVRP statistics for a specific port.

Examples

```
-> mvrp clear-statistics
-> mvrp port 1/2 clear-statistics
-> mvrp linkagg 10 clear-statistics
```

Release History

Release 6.4.3; command was introduced.

Related Commands

show mvrp statistics	Displays the MVRP statistics for all the ports, aggregates, or specific ports.

MIB Objects

```
alaMvrpGlobalClearStats
   alaMvrpPortStatsTable
   alaMvrpPortStatsClearStats
```

16 802.1AB Commands

Alcatel-Lucent 802.1AB is an IEEE standard for exchanging information with neighboring devices and maintaining a database of the information. The information is exchanged using the LLDPDU (Link Layer Discovery Protocol Data Unit) in TLV (Time, Length, Value) format. This chapter details configuring and monitoring 802.1AB on a switch.

Alcatel-Lucent version of 802.1AB complies with the IEEE 802.1AB-2005 Station and Media Access Control Discovery and ANSI-TIA 1057-2006 Link Layer Discovery Protocol for Media End Point Devices.

MIB information for the 802.1AB commands is as follows:

Filename: IEEE_LLDP_Base.mib
Module: LLDP-MIB

Filename: IEEE_LLDP_Dot1.mib
Module: LLDP-EXT-DOT1-MIB

Filename: IEEE_LLDP_Dot3.mib
Module: LLDP-EXT-DOT3-MIB

Filename: ANSI_TIA_LLDP_MED.mib
Module: LLDP-EXT-DOT3-MIB

Link Layer Discovery Protocol (LLDP) Security Mechanism in AOS prevents rogue LLDP agent from being connected to OmniSwitch. This ensures secured access to the device and the network.

LLDP Security Mechanism ensures having only one trusted LLDP agent on a network port. When more than one LLDP agent is learned on a port, the port is moved to violation state.

MIB information for the LLDP commands is as follows:

Filename: AlcatelINDLLDP.mib
Module: LLDP (IEEE802.1ab)

A summary of the available commands is listed here.

LLDP	**lldp destination mac-address** **lldp transmit fast-start-count** **lldp transmit interval** **lldp transmit hold-multiplier** **lldp transmit delay** **lldp reinit delay** **lldp network-policy** **lldp med network-policy** **lldp notification interval** **lldp lldpdu** **lldp notification** **lldp tlv management** **lldp tlv dot1** **lldp tlv dot3 mac-phy** **lldp tlv med** **show lldp config** **show lldp network-policy** **show lldp med network-policy** **show lldp system-statistics** **show lldp statistics** **show lldp local-system** **show lldp local-port** **show lldp local-management-address** **show lldp remote-system** **show lldp remote-system med**
LLDP Security Mechanism	**lldp trust-agent** **lldp trust-agent violation-action** **show lldp trusted remote-agent** **show lldp trust-agent**

Configuration procedures for 802.1AB are explained in the “Configuring 802.1AB” chapter of the *OmniSwitch AOS Release 6 Network Configuration Guide*.

lldp destination mac-address

Sets the lldp destination mac-address sent in LLPDUs.

lldp destination mac-address {nearest-bridge | nearest-edge}

Syntax Definitions

nearest-bridge	Specifies the destination mac-address as 01:80:C2:00:00:0E.
nearest-edge	Specifies the destination mac-address as 01:20: DA: 02:01:73.

Defaults

parameter	default
mac-address	**nearest-bridge**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

The **nearest-edge** MAC address is used in conjunction with the Auto Download Configuration feature to advertise the management VLAN.

Examples

```
-> lldp destination mac-address nearest-edge
-> lldp destination mac-address nearest-bridge
```

Release History

Release 6.4.4; command introduced.

Related Commands

show lldp local-system	Displays local system information.

MIB Objects

```
lldpDestMac
```

lldp transmit fast-start-count

Configures the fast start count for an LLDP Media Endpoint Device (MED).The fast start count specifies the number of LLDPDUs to be sent as soon as a MED is detected by the switch. The LLDPDUs contain the LLDP MED Network Policy TLVs.

lldp transmit fast-start-count *num*

Syntax Definitions

num	Specifies the number of LLDPDUs to send when a MED is detected. The valid range is 1–10.

Defaults

parameter	default
num	3

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

The LLDP MED fast start is only applicable when the MED is detected by the switch.

Examples

```
-> lldp transmit fast-start-count 4
```

Release History

Release 6.4.3; command introduced.

Related Commands

lldp network-policy	Configures a MED Network Policy on the switch for a specific application type.
lldp med network-policy	Associates an existing MED Network Policy with one or more LLDP ports.
show lldp local-system	Displays local system information.

MIB Objects

```
lldpXMedFastStartRepeatCount
```

lldp transmit interval

Sets the transmit time interval for LLDPDUs. This is the amount of time the switch waits between each transmission of an LLDPDU.

lldp transmit interval *seconds*

Syntax Definitions

seconds	The transmit interval value, in seconds. The valid range is 5–32768.

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command applies only to LLDP-enabled ports.
- LLDP also multiplies the transmit time interval by the transmit hold multiplier to determine the time to live (TTL) value that is advertised in the LLDPDU.

Examples

```
-> lldp transmit interval 40
```

Release History

Release 6.3.1; command introduced.

Related Commands

lldp transmit hold-multiplier	Sets the transmit hold multiplier value. This value is used to calculate the Time To Live (TTL) value that is advertised in an LLDPDU.
show lldp local-system	Displays local system information.

MIB Objects

```
lldpConfiguration
   lldpMessageTxInterval
```

lldp transmit hold-multiplier

Sets the transmit hold multiplier value. This value is used to calculate the Time To Live (TTL) value that is advertised in an LLDPDU.

lldp transmit hold-multiplier *num*

Syntax Definitions

num	The transmit hold multiplier value. The valid range is 2–10.

Defaults

parameter	default
num	4

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command applies only to LLDP-enabled ports.
- LLDP multiples the transmit hold multiplier by the transmit interval value to determine the TTL value that is advertised in an LLDPDU.

Examples

```
-> lldp transmit hold-multiplier 6
```

Release History

Release 6.3.1; command introduced.

Related Commands

lldp transmit interval	Sets the transmit time interval for LLDPDUs. This is the amount of time the switch waits between each transmission of an LLDPDU.
show lldp local-system	Displays local system information.

MIB Objects

```
lldpConfiguration
   lldpMessageTxHoldMultiplier
```

lldp transmit delay

Sets the minimum amount of time that must elapse between successive LLDPDUs that are transmitted as the result of a value or status change in the LLDP local systems MIB.

lldp transmit delay *seconds*

Syntax Definitions

seconds	The transmit delay value, in seconds. The valid range is 1–8192.

Defaults

parameter	default
seconds	2

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command applies only to LLDP-enabled ports.
- The following formula determines the recommended transmit delay value:

  1 <= transmit delay <= (0.25 * transmit interval).

Examples

```
-> lldp transmit delay 20
```

Release History

Release 6.3.1; command introduced.

Related Commands

lldp transmit interval	Sets the transmit time interval for LLDPDUs. This is the amount of time the switch waits between each transmission of an LLDPDU.
show lldp local-system	Displays local system information.

MIB Objects

```
lldpConfiguration
   lldpTxDelay
```

lldp reinit delay

Sets the amount of time that must elapse before an LLDP port is re-initialized after the status for the port was disabled.

lldp reinit delay *seconds*

Syntax Definitions

seconds	The re-initialize value, in seconds. The valid range is 1–10.

Defaults

parameter	default
seconds	2

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

This command applies only to LLDP-enabled ports.

Examples

```
-> lldp reinit delay 4
```

Release History

Release 6.3.1; command introduced.

Related Commands

lldp transmit delay	Sets the minimum time interval between successive LLDPDUs that are transmitted as the result of a value or status change in the LLDP local systems MIB.
show lldp local-system	Displays local system information.

MIB Objects

```
lldpConfiguration
   lldpReinitDelay
```

lldp notification interval

Sets the amount of time that must elapse before an LLDP notification about a remote systems MIB change is generated.

lldp notification interval *seconds*

Syntax Definitions

seconds	The notification time interval, in seconds. The valid range is 5–3600.

Defaults

parameter	default
seconds	5

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command applies only to LLDP-enabled ports that also have the LLDP notification status enabled.
- Within a given notification time interval, generating more than one notification event is not allowed.

Examples

```
-> lldp notification interval 25
```

Release History

Release 6.3.1; command introduced.

Related Commands

lldp notification	Enables or disables the LLDP notification status for one or more switch ports. LLDP notifications are sent when there is a change to the remote systems MIB.
show lldp local-system	Displays local system information.

MIB Objects

```
lldpConfiguration
   lldpNotificationInterval
```

lldp lldpdu

Configures the LLDPDU status for one or more switch ports. The status determines if the specified switch ports will transmit, receive, transmit and receive, or drop LLDPDUs.

lldp {*slot/port* **|** *slot* **| chassis} lldpdu {tx | rx | tx-and-rx | disable}**

Syntax Definitions

slot/port	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
slot	The slot number for a specific module.
chassis	All ports on the switch.
tx	Transmits LLDPDUs.
rx	Receives LLDPDUs.
tx-and-rx	Transmits and receives LLDPDUs.
disable	Disables the LLDPDU status.

Defaults

parameter	default
tx | rx | tx-and-rx | disable	**tx-and-rx**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If the LLDPDU status is disabled, LLDPDUs are not transmitted and any that are received are dropped.
- Using the *slot* or **chassis** parameter with this command overrides the existing status configuration for any individual ports on the specified slot number or for all ports on the switch.

Examples

```
-> lldp 1/2 lldpdu tx-and-rx
-> lldp 3 lldpdu rx
-> lldp chassis lldpdu disable
```

Release History

Release 6.3.1; command introduced.

Related Commands

lldp notification	Enables or disables the LLDP notification status for one or more switch ports. LLDP notifications are sent when there is a change to the remote systems MIB.
show lldp local-port	Displays information about local system ports.
show lldp config	Displays the general LLDP configuration information for LLDP ports.

MIB Objects

```
lldpPortConfigTable
   lldpPortConfigPortNum
   lldpPortConfigAdminStatus
```

lldp notification

Enables or disables the LLDP notification status for one or more switch ports. LLDP notifications are sent when there is a change to the remote systems MIB.

lldp {*slot/port* **|** *slot* | **chassis} notification {enable | disable}**

Syntax Definitions

slot/port	The slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
slot	The slot number for a specific module.
chassis	All switch ports.
enable	Enables the notification of local system MIB changes.
disable	Disables the notification.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The LLDPDU administrative status must be in the receive state before using this command.
- Using the *slot* or **chassis** parameter with this command overrides the existing notification status configuration for any individual ports on the specified slot number or for all ports on the switch.

Examples

```
-> lldp 1/2 notification enable
-> lldp 1 notification disable
```

Release History

Release 6.3.1; command introduced.

Related Commands

lldp notification interval	Sets the time interval that must elapse before a notification about the local system MIB change is generated.
lldp lldpdu	Configures the LLDPDU status for one or more switch ports. The status determines if the specified switch ports will transmit, receive, transmit and receive, or drop LLDPDUs.

MIB Objects

```
lldpPortConfigTable
   lldpPortConfigPortNum
   lldpPortConfigNotificationEnable
```

lldp network-policy

Configures a local Network Policy on the switch for a specific application type.

lldp network-policy *policy_id* - [*policy_id2*] **application {voice | voice-signaling | guest-voice | guest-voice-signaling | softphone-voice | video-conferencing | streaming-video | video-signaling} vlan {untagged | priority-tag |** *vlan-id***} [l2-priority** *802.1p_value***] [dscp** *dscp_value***]**

no lldp network-policy *policy_id* - [*policy_id2*]

Syntax Definitions

policy_id - [*policy_id2*]	A network policy identifier (0-31) which is associated to a port.
voice	Specifies a voice application type.
voice-signaling	Specifies a voice-signaling application type.
guest-voice	Specifies a guest-voice application type.
guest-voice-signaling	Specifies a guest-voice-signaling application type.
softphone-voice	Specifies a softphone-voice application type.
video-conferencing	Specifies a video-conferencing application type.
streaming-video	Specifies a streaming-video application type.
video-signaling	Specifies a video-signaling application type.
untagged	Specifies that a VLAN port is untagged.
priority-tag	Specifies the internal priority that would be assigned to the VLAN**.**
vlan_id	VLAN identifier. Valid range is 1–4094.
802.1p_value	The Layer-2 priority value assigned to the VLAN. Valid range is 0–7.
dscp_value	Priority value assigned to the DSCP (Differentiated Service Code Point) header. Valid range is 0–63.

Defaults

parameter	default
802.1p_value	**0**
dscp_value	**0**

- By default the VLAN ID is configured in the voice network profile.
- By default the 802.1p_value is 5 for voice application.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove the configured network policy from the system.
- When a network policy is deleted, all the associated values and port bindings are also deleted.
- A maximum of 32 network policies can be configured on a single VLAN.
- Once a policy is created, the application type, VLAN ID, 802.1p, and DSCP values can be modified.
- If a network policy ID is bound to a port, it cannot be modified.
- Use a hyphen to specify a range of Policy IDs and a space to separate multiple Policy IDs in the command.
- The range for Policy IDs is supported only with the **no** form of this command.

Examples

```
-> lldp network-policy 10 application voice vlan 20
-> lldp network-policy 11 application guest-voice-signaling vlan untagged
l2-priority 3
-> lldp network-policy 20 application voice vlan priority-tag dscp 39
-> lldp network-policy 20 application voice-signaling vlan 23 l2-priority 2 dscp 43
-> no lldp network-policy 10
-> no lldp network-policy 10-20
```

Release History

Release 6.4.3; command introduced.

Related Commands

lldp tlv med	Configures whether or not LLDP-MED TLVs are included in transmitted LLDPDUs.
show lldp network-policy	Displays the network policy details for a given policy ID.
show lldp med network-policy	Displays the network policy configured on a slot or port. If no option is specified, network policies configured on all ports of the chassis are displayed.

MIB Objects

```
aLldpXMedLocMediaPolicyTable
   alaLldpXMedLocMediaPolicyId
   alaLldpXMedLocMediaPolicyAppType
   alaLldpXMedLocMediaPolicyVlanType
   alaLldpXMedLocMediaPolicyVlanID
   alaLldpXMedLocMediaPolicyPriority
   alaLldpXMedLocMediaPolicyDscp
   alaLldpXMedLocMediaPolicyUnknown
   alaLldpXMedLocMediaPolicyTagged
   alaLldpXMedLocMediaPolicyRowStatus
```

lldp med network-policy

Associates an existing network policy to a port, slot, or chassis.

lldp {*slot/port* **|** *slot* | **chassis} med network-policy** *policy_id* - [*policy_id2*]

no lldp {*slot/port* **|** *slot* | **chassis} med network-policy** *policy_id* - [*policy_id2*]

Syntax Definition

slot/port	The slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
slot	The slot number for a specific module.
chassis	All switch ports.
policy_id - [*policy_id2*]	A network policy identifier (0–31).

Defaults

NA

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to disassociate a network policy from a port.
- The network policy should already be configured in the system before associating it with a port.
- A maximum of 8 network policies can be associated to a port.
- Two or more network policy IDs with the same application type cannot be associated to a port.

Examples

```
-> lldp chassis med network-policy 22
-> lldp 1 med network-policy 1-4 5 6
-> lldp 2/3 med network-policy 12
-> no lldp 2/3 med network-policy 12
```

Release History

Release 6.4.3; command introduced.

Related Commands

lldp tlv med	Configures whether or not LLDP-MED TLVs are included in transmitted LLDPDUs.
show lldp network-policy	Displays the MED Network Policy details for a given policy ID.
show lldp med network-policy	Displays the network policy configured on a slot or port. If no option is specified, network policies configured on all ports of the chassis are displayed.

MIB Objects

```
alaLldpXMedLocMediaPolicyPortTable
   alaLldpXMedLocMediaPolicyPortIfIndex
   alaLldpXMedLocMediaPolicyId
   alaLldpXMedLocMediaPolicyPortRowStatus
```

lldp tlv management

Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.

lldp {*slot/port* **|** *slot* **| chassis} tlv management {port-description | system-name | system-description | system-capabilities | management-address} {enable | disable}**

Syntax Definitions

slot/port	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
slot	The slot number for a specific module.
port-description	Enables or disables the transmission of port description TLV in LLDPDU.
system-name	Enables or disables the transmission of system name TLV in LLDPDU.
system-description	Enables or disables transmission of system description TLV in LLDPDU.
system-capabilities	Enables or disables transmission of system capabilities TLV in LLDPDU.
management-address	Enables or disables transmission of management address on per port.
enable	Enables management TLV LLDPDU transmission.
disable	Disables management TLV LLDPDU transmission.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- Using the *slot* or **chassis** parameter with this command overrides the existing configuration for any individual ports on the specified slot number or for all ports on the switch.

Examples

```
-> lldp 1/2 tlv management port-description enable
-> lldp 2 tlv management management-address enable
-> lldp 3 tlv management system-name disable
```

Release History

Release 6.3.1; command introduced.

Related Commands

lldp lldpdu	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.
show lldp local-system	Displays local system information.
show lldp local-port	Displays local port information.
show lldp remote-system	Displays port information of remote system.

MIB Objects

```
lldpPortConfigTable
   lldpLocPortPortNum
   lldpPortConfigTLVsTxEnable
lldpConfigManAddrTable
   lldpConfigManAddrPortsTxEnable
```

lldp tlv dot1

Specifies the switch to control per port 802.1 TLVs to be incorporated in the LLDPDUs.

lldp {*slot/port* **|** *slot* **| chassis} tlv dot1 {port-vlan | vlan-name} {enable | disable}**

Syntax Definitions

slot/port	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
slot	The slot number for a specific module.
port-vlan	Enables or disables transmission of port VLAN TLV in LLDPDU.
vlan-name	Enables or disables transmission of VLAN name TLV in LLDPDU.
enable	Enables 802.1 TLV LLDPDU transmission.
disable	Disables 802.1 TLV LLDPDU transmission.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- Using the *slot* or **chassis** parameter with this command overrides the existing configuration for any individual ports on the specified slot number or for all ports on the switch.
- If one TLV is included then the other TLV is automatically included when you use this command.

Examples

```
-> lldp 5/1 tlv dot1 port-vlan enable
-> lldp 3 tlv dot1 vlan-name enable
-> lldp 3 tlv dot1 vlan-name disable
```

Release History

Release 6.3.1; command introduced.

Related Commands

lldp tlv management	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.
show lldp statistics	Displays per port statistics.
show lldp local-port	Displays per port information.

MIB Objects

```
lldpPortConfigTable
   lldpPortConfigPortNum
lldpXdot1ConfigPortVlanTable
   lldpXdot1ConfigPortVlanTxEnable
lldpXdot1ConfigVlanNameTable
   lldpXdot1ConfigVlanNameTxEnable
```

lldp tlv dot3 mac-phy

Configures whether or not 802.3 TLVs are included in transmitted LLDPDUs.

lldp {*slot/port* **|** *slot* | **chassis} tlv dot3 mac-phy {enable | disable}**

Syntax Definitions

slot/port	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
slot	The slot number for a specific module.
chassis	All ports on the switch.
enable	Enables the transmission of 802.3 TLVs in LLDPDUs.
disable	Disables the transmission of 802.3 TLVs in LLDPDUs.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The ports specified with this command must already be configured to transmit LLDPDUs.
- Using the *slot* or **chassis** parameter with this command overrides the existing configuration for any individual ports on the specified slot number or for all ports on the switch.

Examples

```
-> lldp 2/4 tlv dot3 mac-phy enable
-> lldp 2 tlv dot3 mac-phy disable
```

Release History

Release 6.3.1; command introduced.

Related Commands

lldp lldpdu	Configures the LLDPDU status for one or more switch ports. The status determines if the specified switch ports will transmit, receive, transmit and receive, or drop LLDPDUs.
lldp tlv management	Configures whether or not management TLVs are included in transmitted LLDPDUs.
lldp tlv dot1	Configures whether or not 802.1 TLVs are included in transmitted LLDPDUs.
show lldp statistics	Displays per port statistics.

MIB Objects

```
lldpPortConfigTable
   lldpPortConfigPortNum
lldpXdot3PortConfigTable
   lldpXdot3PortConfigTLVsTxEnable
```

lldp tlv med

Configures whether or not LLDP-MED TLVs are included in transmitted LLDPDUs.

lldp {*slot/port* **|** *slot* **| chassis} tlv med {power | capability | network policy} {enable | disable}**

Syntax Definitions

slot/port	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
slot	The slot number for a specific module.
chassis	All ports on the switch.
power	Includes the extended POE TLV in transmitted LLDPDUs.
capability	Includes the Capabilities TLV in transmitted LLDPDUs.
network policy	Includes the Network Policy TLV in transmitted LLDPDUs.
enable	Enables the transmission of LLDP-MED TLV in LLDPDUs.
disable	Disables the transmission of LLDP-MED TLV in LLDPDUs.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The ports specified with this command must already be configured to transmit LLDPDUs.
- Using the *slot* or **chassis** parameter with this command overrides the existing configuration for any individual ports on the specified slot number or for all ports on the switch.
- The **lldp tlv med power** version of this command applies only to PoE units.
- Before enabling the Power MED TLV, use the **lanpower start** command to activate PoE on a port or on all ports in a specific slot.

Examples

```
-> lldp 4/4 tlv med power enable
-> lldp 4/3 tlv med capability enable
-> lldp 4 tlv med power disable
-> lldp 4 tlv med network-policy enable
-> lldp chassis tlv med network-policy enable
```

Release History

Release 6.3.1; command introduced.
Release 6.4.3; **network policy** option added.

Related Commands

lldp lldpdu	Configures the LLDPDU status for one or more switch ports. The status determines if the specified switch ports will transmit, receive, transmit and receive, or drop LLDPDUs.
lldp tlv management	Configures whether or not management TLVs are included in transmitted LLDPDUs.
lldp tlv dot1	Configures whether or not 802.1 TLVs are included in transmitted LLDPDUs.
lldp tlv dot3 mac-phy	Configures whether or not 802.3 TLVs are included in transmitted LLDPDUs.
show lldp med network-policy	Displays the MED Network Policy configuration.

MIB Objects

```
lldpPortConfigTable
   lldpPortConfigPortNum
lldpXMedPortConfigTable
   lldpXMedPortConfigTLVsTxEnable
```

show lldp config

Displays the general LLDP configuration information for LLDP ports.

show lldp {*slot* | *slot/port***} config**

Syntax Definitions

slot	The slot number for a specific module.
slot/port	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

Defaults

By default, a list of all LLDP ports with their configuration parameters is displayed.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

Examples

```
-> show lldp config
----------+-----------------------------------------+-----------------+-------
          |  Admin   |  Notify  |  Std TLV |   Mgmt   |  802.1   |  802.3 |   MED
 Slot/Port|  Status  |   Trap   |   Mask   | Address  |   TLV    |   Mask |   Mask
----------+----------+----------+----------+----------+----------+------+------
   2/1      Rx + Tx    Disabled     0x00     Disabled   Disabled     0x00 0x00
   2/2      Rx + Tx    Disabled     0x00     Disabled   Disabled     0x00 0x00
   2/3      Rx + Tx    Disabled     0x00     Disabled   Disabled     0x00 0x00
   2/4      Rx + Tx    Disabled     0x00     Disabled   Disabled     0x00 0x00
   2/5      Rx + Tx    Disabled     0x00     Disabled   Disabled     0x00 0x00
```

output definitions

Slot/Port	The LLDP slot and port number.
Admin Status	Indicates the Administrative status of the LLDP port.The options are - **Disabled**, **Rx**, **Tx**, and **Rx+Tx**.
Notify Trap	Indicates if the Notify Trap feature is disabled or enabled on a particular port
Std TLV Mask	The standard TLV mask set for the port.
Mgmt Address	Indicates whether transmission of the per port IPv4 management address is enabled or disabled.
802.1 TLV	Indicates whether 802.1 TLV status is enabled or disabled on the LLDP port.

output definitions

802.3 Mask	The standard 802.3 mask set for the port.
MED Mask	The standard MED mask set for the port.

Release History

Release 6.4.3; command introduced.

Related Commands

lldp lldpdu	Configures the LLDPDU status for one or more switch ports. The status determines if the specified switch ports will transmit, receive, transmit and receive, or drop LLDPDUs.
lldp notification	Enables or disables the LLDP notification status for one or more switch ports. LLDP notifications are sent when there is a change to the remote systems MIB.
lldp tlv management	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.
lldp tlv dot3 mac-phy	Configures whether or not 802.3 TLVs are included in transmitted LLDPDUs.

MIB Objects

```
lldpPortConfigTable
   lldpPortConfigPortNum
   lldpPortConfigAdminStatus
   lldpPortConfigNotificationEnable
   lldpLocPortPortNum
   lldpPortConfigTLVsTxEnable
lldpConfigManAddrTable
   lldpConfigManAddrPortsTxEnable
lldpXdot3PortConfigTable
   lldpXdot3PortConfigTLVsTxEnable
```

show lldp network-policy

Displays the MED Network Policy details for a given policy ID.

show lldp network-policy [*policy_id***]**

Syntax Definitions

policy_id	Policy identifier for a network policy definition. Valid range is between 0 and 31.

Defaults

By default, all configured policies are displayed.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Network policy should be configured on the system before using this command.
- Enter a policy ID with this command to display information for a specific policy.

Examples

```
-> show lldp network-policy
Legend: 0 Priority Tagged Vlan
        - Untagged Vlan

Network         Application       Vlan    Layer2   DSCP
Policy ID        Type              Id    Priority  Value
-----------+----------------------+------+--------+-------
     1      voice                   4000   7        33
    12      guest-voice                -   -        44
    21      streaming-voice            0   4        11
    31      guest-voice-signaling     23   2        1

-> show lldp network-policy 1
Legend: 0 Priority Tagged Vlan
        - Untagged Vlan

Network         Application       Vlan    Layer2   DSCP
Policy ID        Type              Id    Priority  Value
-----------+----------------------+------+--------+-------
     1      voice                   4000   7        33
```

output definitions

Network Policy ID	Policy identifier for a network policy definition.
Application Type	Indicates the type of application configured on the port or VLAN.
VLAN ID	The VLAN ID assigned to the port on which the network policy is configured.
Layer2 Priority	Layer 2 priority to be used for the specified application type.
DSCP Value	DSCP value to be used to provide Diffserv node behavior for the specified application type.

Release History

Release 6.4.3; command introduced.

Related Commands

lldp network-policy	Configures a local network policy on a switch for an application type.

MIB Objects

```
alaLldpXMedLocMediaPolicyTable
   alaLldpXMedLocMediaPolicyId
   alaLldpXMedLocMediaPolicyAppType
   alaLldpXMedLocMediaPolicyVlanType
   alaLldpXMedLocMediaPolicyVlanId

   alaLldpXMedLocMediaPolicyDscp
   alaLldpXMedLocMediaPolicyUnknown
   alaLldpXMedLocMediaPolicyTagged
```

show lldp med network-policy

Displays the network policy configured on a slot or port. If no option is specified, network policies configured on all ports of the chassis are displayed.

show lldp [*slot* | *slot/port***] med network-policy**

Syntax Definitions

slot	Specifies the slot number on a specific module or chassis.
slot/port	Specifies the slot number for the module and physical port number on that module (for example 3/1 specifies port 1 of slot 3).

Defaults

By default, all ports with associated policies are displayed.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Network policy should be configured on the system before using this command.
- Enter a slot or slot/port number with this command to display information for a specific slot or port.

Examples

```
-> show lldp med network-policy

  slot/port         Network Policy ID
-------------+------------------------
    1/1            1 3 5 7 21 23 30 31
    1/2            1 2 3 4 7 8 9 10
    .
    .
    .
    2/1            1 3 5
    .
    .

-> show lldp 1/1 med network-policy

Legend: 0 Priority Tagged Vlan
        - Untagged Vlan

Slot/    Network         Application       Vlan    Layer2   DSCP
 Port    Policy ID        Type              Id    Priority  Value
-------+-----------+---------------------+------+--------+-------
  1/1        1       guest-voice-signaling  -      -        0
```

output definitions

Slot/Port	Slot number for the module and physical port number on that module.
Network Policy ID	Policy identifier for a network policy definition.
Application Type	Indicates the type of application configured on the port or VLAN.
VLAN ID	The VLAN ID assigned to the port on which the network policy is configured.
Layer2 Priority	Layer 2 priority to be used for the specified application type.

Release History

Release 6.4.3; command introduced.

Related Commands

lldp tlv med	Configures whether or not LLDP-MED TLVs are included in transmitted LLDPDUs.
lldp network-policy	Configures a local network policy on a switch for an application type.

MIB Objects

```
alaLldpXMedLocMediaPolicyPortTable
   alaLldpXMedLocMediaPolicyPortIfIndex
   alaLldpXMedLocMediaPolicyId
```

show lldp system-statistics

Displays system-wide statistics.

show lldp system-statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

```
-> show lldp system-statistics
 Local LLDP Agent System Statistics:
  Remote Systems Last Change  = 0 days 0 hours 3 minutes and 10 seconds,
  Remote Systems MIB Inserts  = 2,
  Remote Systems MIB Deletes  = 0,
  Remote Systems MIB Drops    = 0,
  Remote Systems MIB Age Outs = 0
```

output definitions

Remote Systems Last Change	The last change recorded in the tables associated with the remote system.
Remote Systems MIB Inserts	The total number of complete inserts in the tables associated with the remote system.
Remote Systems MIB Deletes	The total number of complete deletes in tables associated with the remote system.
Remote Systems MIB Drops	The total number of LLDPDUs dropped because of insufficient resources.
Remote Systems MIB Age Outs	The total number of complete age-outs in the tables associated with the remote system.

Release History

Release 6.3.1; command introduced.

Related Commands

lldp notification	Enables or disables the LLDP notification status for one or more switch ports. LLDP notifications are sent when there is a change to the remote systems MIB.
lldp notification interval	Sets the amount of time that must elapse before an LLDP notification about a remote systems MIB change is generated.

MIB Objects

```
lldpStatistics
   lldpStatsRemTablesLastChangeTime
   lldpStatsRemTablesInserts
   lldpStatsRemTablesDeletes
   lldpStatsRemTablesDrops
   lldpStatsRemTablesAgeouts
```

show lldp statistics

Displays per port statistics.

show lldp [*slot*|*slot/port***] statistics**

Syntax Definitions

slot	The slot number for a specific module.
slot/port	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

Defaults

By default, statistics are displayed for all LLDP ports.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a slot or slot/port number to display statistics for a specific slot or port.
- If the statistics are zero they are not displayed.

Examples

```
-> show lldp statistics
----------+--------------------------------------+--------------------+----------
       |           LLDPDU                      |     TLV      | Device
 Slot/Port|  Tx         Rx       Errors    Discards |  Unknown   Discards | Ageouts
----------+--------+----------+----------+----------+----------+----------+-----
  1/23       52          0          0          0          0          0          0
  2/47       50         50          0          0          0          0          0
  2/48       50         50          0          0          0          0          0
```

output definitions

Slot/Port	Slot number for the module and physical port number on that module.
LLDPDU Tx	The total number of LLDPDUs transmitted on the port.
LLDPDU Rx	The total number of valid LLDPDUs received on the port.
LLDPDU Errors	The total number of invalid LLDPDUs discarded on the port.
LLDPDU Discards	The total number of LLDPDUs discarded on the port.
TLV Unknown	The total number of unrecognized LLDP TLVs on the port.
TLV Discards	The total number of LLDP TLVs discarded on the port.
Device Ageouts	The total number of complete age-outs on the port.

Release History

Release 6.3.1; command introduced.

Related Commands

lldp lldpdu	Configures the LLDPDU status for one or more switch ports. The status determines if the specified switch ports will transmit, receive, transmit and receive, or drop LLDPDUs.
lldp tlv management	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.

MIB Objects

```

show lldp local-system

Displays local system information.

show lldp local-system

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

```
-> show lldp local-system
Local LLDP Agent System Data:
  Chassis ID Subtype          = 4 (MAC Address),
  Chassis ID                  = 00:d0:95:e9:c9:2e,
  System Name                 = OS6850E,
  System Description          = 6.3.1.636.R01 Development, September 07, 2007.,
  Capabilities Supported       = Bridge, Router,
  Capabilities Enabled         = Bridge, Router,
  LLDPDU Transmit Interval    = 30 seconds,
  TTL Hold Multiplier         = 4,
  LLDPDU Transmit Delay       = 2 seconds,
  Reintialization Delay       = 2 seconds,
  MIB Notification Interval = 5 seconds,
  Fast Start Count            = 4,
  Management Address Type     = 1 (IPv4),
  Management IP Address       = 10.255.11.100,
```

output definitions

Chassis ID Subtype	The subtype that describe chassis ID.
Chassis ID	The chassis ID (MAC address).
System Name	The name of the system.
System Description	The description of the system.
Capabilities Supported	The capabilities of the system.
Capabilities Enabled	The enabled capabilities of the system.
LLDPDU Transmit Interval	The LLDPDU transmit interval.
TTL Hold Multiplier	The hold multiplier used to calculate TTL.

output definitions (continued)

LLDPDU Transmit Delay	The minimum transmit time between successive LLDPDUs.
Reintialization Delay	The minimum time interval before the reinitialization of local port objects between port status changes.
MIB Notification Interval	The minimum time interval between consecutive notifications of local system MIB change.
Fast Start Count	Specifies the number of LLDPDUs to be sent as soon as a MED is detected by system.
Management Address Type	The type of management address used in LLDPDU.
Management IP Address	The management IP address. This will be the Loopback0 IP address if configured, otherwise it is the first IP interface configured on the switch.

Release History

Release 6.3.1; command introduced.
Release 6.4.3; **Fast Start Count** field added to output.

Related Commands

lldp transmit fast-start-count	Configures the fast start count for an LLDP Media Endpoint Device (MED).The fast start count specifies the number of LLDPDUs to be sent as soon as a MED is detected by the switch. The LLDPDUs contain the LLDP MED Network Policy TLVs.
lldp reinit delay	Sets the amount of time that must elapse before an LLDP port is re-initialized after the status for the port was disabled.
lldp transmit hold-multiplier	Sets the transmit hold multiplier value. This value is used to calculate the Time To Live (TTL) value that is advertised in an LLDPDU.
lldp transmit delay	Sets the minimum amount of time that must elapse between successive LLDPDUs that are transmitted as the result of a value or status change in the LLDP local systems MIB.

```

show lldp local-port

Displays local LLDP port information.

show lldp [*slot/port* **|** *slot***] local-port**

Syntax Definitions

slot/port	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
slot	The slot number for a specific module.

Defaults

By default, a list of all LLDP ports is displayed.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

Examples

```
-> show lldp local-port
Local Slot 1/Port 1 LLDP Info:
  Port ID                     = 1001 (Locally assigned),
  Port Description            = Alcatel 1/1 6.3.1.636.R01,
Local Slot 1/Port 2 LLDP Info:
  Port ID                     = 1002 (Locally assigned),
  Port Description            = Alcatel 1/2 6.3.1.636.R01,
.
.
.
Local Slot 2/Port 48 LLDP Info:
  Port ID                     = 2048 (Locally assigned),
  Port Description            = Alcatel 2/48 6.3.1.636.R01,
```

output definitions

Port ID	The port ID (Port MAC).
Port Description	The description of the port (which includes the port number and the AOS version).

Release History

Release 6.3.1; command introduced.

Related Commands

lldp tlv management	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.
lldp tlv dot1	Specifies the switch to control per port 802.1 TLVs to be incorporated in the LLDPDUs.

MIB Objects

```
lldpLocPortTable
   lldpLocPortNum
   lldpLocPortIdsubtype
   lldpLocPortId
   lldpLocPortDesc
```

show lldp local-management-address

Displays the local management address information.

show lldp local-management-address

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

```
-> show lldp local-management-address
Local LLDP Agent Management Address:
  Management Address Type     = 1 (IPv4),
  Management IP Address       = 10.255.11.100
```

output definitions

Management Address Type	The address type used to define the interface number (IPv4 or IPv6).
Management IP Address	The management IP address. The Loopback0 IP address is configured for the management IP address to be transmitted.

Release History

Release 6.3.1; command introduced.

Related Commands

lldp tlv management	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.
show lldp local-system	Displays local system information.

MIB Objects

show lldp remote-system

Displays remote system information for a single port or all ports on a slot.

show lldp [*slot/port* **|** *slot***] remote-system**

Syntax Definitions

slot/port	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
slot	The slot number for a specific module.

Defaults

By default, a list of all LLDP ports is displayed.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

Examples

```
-> show lldp remote-system
Remote LLDP Agents on Local Slot/Port 1/22:
  Remote ID 1:
    Chassis ID Subtype          = 4 (MAC Address),
    Chassis ID                  = 00:d0:95:ea:7c:3a,
    Port ID Subtype             = 3 (MAC address),
    Port ID                     = 00:d0:95:ea:7c:45,
    Port Description            = (null),
    System Name                 = (null),
    System Description          = (null),
    Capabilities Supported      = Bridge, Router,
    Capabilities Enabled        = Bridge, Router,
    MED Device Type             = Network Connectivity,
    MED Capabilities            = Capabilities | Power via MDI-PSE (09),
    MED Extension TLVs Present  = Network Policy, Inventory Management,
    Remote port MAC/PHY AutoNeg = Supported, Enabled, Capability 0x6c01,
    Mau Type=1000BaseTFD - Four-pair Category 5 UTP, full duplex mode
```

output definitions

Remote LLDP Agents on Local Slot/Port	The Slot number to which the remote system entry is associated and the physical port number on that module.
Chassis ID Subtype	The sub type that describes chassis ID.
Chassis ID	The chassis ID (MAC address).
Port ID Subtype	The sub type that describes port ID

output definitions (continued)

Port ID	The port ID (Port MAC).
Port Description	The description of the port (which includes the port number and the AOS version).
System Name	The name of the system.
System Description	The description of the system.
Capabilities Supported	The capabilities of the system such as bridge or router.
Capabilities Enabled	The enabled capabilities of the system.
MED Device Type	The type of device such as Network Connectivity or Endpoint Device.
MED Capabilities	MED capabilities supported.
MED Extension TLVs Present	MED Extension TLVs present.
Remote port MAC/PHY AutoNeg	The MAC/PHY settings of the remote port such as speed, duplex, and auto-negotiation.

Release History

Release 6.3.1; command introduced.
Release 6.3.4; **remote-system** parameter was introduced.

Related Commands

show lldp local-port	Displays per port information.
show lldp local-system	Displays local system information.

MIB Objects

```
lldpRemTable

   lldpRemManAddrIfId
```

show lldp remote-system med

Displays remote system MED information for a single port or all ports on a slot.

show lldp [*slot/port* **|** *slot***] remote-system [med {network-policy | inventory}]**

Syntax Definitions

slot/port	Slot number for the module and physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
slot	The slot number for a specific module.
network-policy	Display network-policy TLVs from remote Endpoint Devices
inventory	Display inventory management TLVs from remote Endpoint Devices

Defaults

By default, a list of all LLDP ports is displayed.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

Examples

```
-> show lldp 1/22 remote-system med network-policy
Slot/  Remote   Application      Unknown    Tagged    Vlan     Layer2   DSCP
Port    ID         Type         Policy Flag Flag       Id     Priority  Value
------+------+--------------+-----------+---------+------+----------+------
 1/22   1        Voice(01)         Defined  Untagged   345       4        34
 1/22   2        Guest Voice(4)    Defined  Untagged    50       3        46
```

output definitions

Slot/Port	The Slot number to which the remote system entry is associated and the physical port number on that module.
Remote ID	The Index of the Remote Device.
Application Type	The Application type of the peer entity. 1. Voice 2. Voice Signaling 3. Guest Voice 4. Guest Voice Signaling 5. Softphone Voice 6. Video Conferencing 7. Streaming Video 8. Video Signaling

output definitions (continued)

Unknown Policy Flag	Whether the network policy for the specified application type is currently defined or unknown.
Tagged Flag	Whether the specified application type is using a **tagged** or an **untagged** VLAN.
VLAN ID	The VLAN identifier (VID) for the port.
Layer 2 Priority	Layer 2 priority to be used for the specified application type.
DSCP Value	DSCP value to be used to provide Diffserv node behavior for the specified application type.

```
-> show lldp 1/22 remote-system med inventory
Remote LLDP Agents on Local Slot/Port 1/22:

lldp trust-agent

Enables or disables the security mechanism globally (chassis level) or for a slot or a single port. By enabling LLDP security mechanism on a port, LLDP CMM task brings the LLDP status of the port as trusted and monitors the port for any LLDP security violation.

lldp {*slot/port***|** *slot* | **chassis} trust-agent {enable** | **disable} [chassis-id-subtype {chassis-component** | **interface-alias** | **port-component** | **mac-address** | **network-address** | **interface-name** | **locally-assigned** | **any}]**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
slot	The slot number for the module (for example, 3 specifies slot 3)
chassis	Specifies all the ports in the chassis.
enable	Enables LLDP security mechanism.
disable	Disables LLDP security mechanism.
chassis-component	The chassis component is used for validating the remote agent.
interface-alias	The alias configured for the interface is used for validating the remote agent.
port-component	The port component is used for validating the remote agent.
mac-address	The MAC address is used for validating the remote agent.
network-address	The network address is used for validating the remote agent.
interface-name	The interface name is used for validating the remote agent.
locally-assigned	The locally assigned component is used for validating the remote agent, that is the chassis information, which can be locally assigned (the local configuration)
any	The remote agent with any chassis ID sub type is accepted as a trust agent.

Defaults

'**any**' - If the chassis ID sub type is not configured for validating the remote agent, by default, the first remote agent is accepted as a trust agent considering any of the chassis ID sub types.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- By enabling security on chassis/slot level, the ports that come under the respective level are monitored for any LLDP security violation.
- If the chassis ID sub type is not configured for validating the remote agent, then the LLDP learns the first remote agent with available chassis ID TLV (Time, Length, Value) received in the PDU.
- After a link up is received on a LLDP security enabled port, LLDP CMM waits for three times the LLDP timer interval (30 seconds). If no LLDP PDU is received after link up that has no remote agent, the port is moved to a violation state.
- If a trusted remote agent already exists, and if no LLDP remote agent is learned even after three times the LLDP timer interval (30 seconds), the port is moved to a violation state. If a new LLDP remote agent is learned after the link toggle, then the port is moved to a violation state.
- If the same chassis ID and port ID already exist in the trusted remote agent database but on a different port, then the port remote agent is learned and the port is moved to a violation state. If a new LLDP remote agent is learned on a port that has a trusted LLDP remote agent, then the port is moved to a violation state.

Examples

```
-> lldp chassis trust-agent enable

-> lldp chassis trust-agent chassis-id-subtype chassis-component
```

Release History

Release 6.4.4; command introduced.

Related Commands

lldp trust-agent violation-action	Sets the action to be performed when a violation is detected.
show lldp trusted remote-agent	Displays information on trusted remote-agents.
show lldp trust-agent	Displays information on local LLDP agent or port.

MIB Objects

```
alaLldpTrustAdminStatus
   alaLldpTrustChassisIdSubType
```

lldp trust-agent violation-action

Sets the action to be performed when a violation is detected.

lldp {*slot/port***|** *slot* **| chassis} trust-agent violation-action {trap-and-shutdown | trap | shutdown}**

Syntax Definitions

slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
slot	The slot number for the module (for example, 3 specifies slot 3)
chassis	All switch ports.
trap-and-shutdown	Shuts down the port and sends a trap notification when a violation is detected.
trap	Sends a trap notification when a violation is detected.
shutdown	Shuts down the port when a violation is detected.

Defaults

By default, trust agent violation action is set to ‘trap’.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If the port is in a shutdown state, clear the violation on the port by using the command “**interfaces** *slot***[***/port***[***-port2***]] clear-violation-all**”
- Clearing the violation on a port does not clear the trusted remote agent existing on that port. To clear the trusted remote agent, disable the LLDP security mechanism on the port.
- If the port is in a shutdown state due to violation and the port link is toggled, only the link goes up. The port still remains in the violation state and the trusted remote agent existing on that port is not cleared.

Examples

```
-> lldp chassis trust-agent violation-action trap

-> lldp 3 trust-agent violation-action shutdown
```

Release History

Release 6.4.4; command introduced.

Related Commands

lldp trust-agent	Sets the status of trust admin status for a port.
show lldp trusted remote-agent	Displays information on trusted remote-agents.
show lldp trust-agent	Displays information on local LLDP agent or port.

MIB Objects

```
alaLldpTrustAction
```

show lldp trusted remote-agent

Displays information on trusted remote-agents.

show lldp [*num* | *slot/port***] trusted remote-agent**

Syntax Definitions

num	The slot number for the module (for example, 3 specifies slot 3)
slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the slot/port or slot parameter to display information for a specific port or for all ports on a specific module.
- LLDP trust agent must be enabled globally on the chassis or individually on a port in order to get the **show lldp trusted remote-agent** command output.

Examples

```
-> lldp chassis trust-agent enable

-> lldp chassis trust-agent chassis-id-subtype mac-address

-> show lldp trusted remote-agent

Trusted Remote LLDP Agents on Local Slot/Port: 1/7
  Chassis ID Subtype          = 4 (MAC Address),
  Chassis ID                  = 00:e0:b1:7a:e6:3c,
  Port ID Subtype             = 7 (Locally assigned),
  Port ID                     = 1017
```

output definitions

Trusted Remote LLDP Agents on Local Slot/Port	The slot number to which the remote trusted agent is associated and the physical port number on that module.
Chassis ID Subtype	The sub type that describes the chassis ID.
Chassis ID	The chassis ID (MAC address).
Port ID Subtype	The sub type that describes port ID.
Port ID	The port ID (Port MAC).

Release History

Release 6.4.4; command introduced.

Related Commands

lldp trust-agent	Sets the status of trust admin status for a port.
lldp trust-agent violation-action	Sets the action to be performed when a violation is detected.
show lldp trust-agent	Displays information on local LLDP agent/port.

MIB Objects

N/A

show lldp trust-agent

Displays information of the local LLDP agent or port.

show lldp [*slot* | *slot/port***] trust-agent**

Syntax Definitions

slot	The slot number for the module (for example, 3 specifies slot 3)
slot/port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the *slot/port* or *num* (slot number) values to display information for a specific port or for all ports on a specific module.
- LLDP trust agent must be enabled globally on the chassis or individually on a port in order to get the **show lldp trust-agent** command output correctly.
- If LLDP security is disabled this command correctly displays the ‘Admin Status’ as ‘Disabled’; however the other output parameters will display their default values.

Examples

```
-> lldp chassis trust-agent enable

-> lldp chassis trust-agent chassis-id-subtype chassis-component

-> show lldp trust-agent

Slot/Port  Admin Status   Violation Action  Violation Status   Chassis Subtype
---------+--------------+-----------------+------------------+-----------------
   1/1     Enabled        Trap Only         Trusted            1(Chassis Component)
   1/2     Enabled        Trap Only         Trusted            1(Chassis Component)
   1/3     Enabled        Trap Only         Trusted            1(Chassis Component)
   1/4     Disabled       Shutdown          Violated           1(Chassis Component)
   1/5     Enabled        Shutdown          Trusted            1(Chassis Component)
   1/6     Enabled        Trap-and-Shutdown Trusted            1(Chassis Component)
   1/7     Disabled       Trap-and-Shutdown Violated           1(Chassis Component)
   1/8     Enabled        Trap Only         Trusted            1(Chassis Component)
   1/9     Enabled        Trap Only         Trusted            1(Chassis Component)
   1/10    Enabled        Trap Only         Trusted            1(Chassis Component)
```

output definitions

Slot/Port	The LLDP slot and port number.
Admin Status	Indicates the administrative status of the LLDP port, **Enabled** or **Disabled**
Violation Action	Indicates the action performed when a violation is detected. The options are - **Trap Only**, **Trap-and-Shutdown**, and **Shutdown Only**.
Violation Status	The violation status of the port, **Trusted** or **Violated**
Chassis Subtype	The sub type that describes the chassis ID.

Release History

Release 6.4.4; command introduced.

Related Commands

lldp trust-agent	Sets the status of trust admin status for a port.
lldp trust-agent violation-action	Sets the action to be performed when a violation is detected.
show lldp trusted remote-agent	Displays information on trusted remote-agents.

MIB Objects

N/A

17 Interswitch Protocol Commands

Alcatel-Lucent Interswitch Protocols (AIP) are used to discover and advertise adjacent switch information. Only one protocol is supported:

- Alcatel-Lucent Mapping Adjacency Protocol (AMAP), used to discover the topology of OmniSwitches and Omni Switch/Routers (Omni S/R).

This chapter includes descriptions of AMAP commands.

MIB information for AMAP commands is as follows:

Filename: alcatelIND1InterswitchProtocol.MIB
Module: ALCATEL-IND1-INTERSWITCH-PROTOCOL-MIB

A summary of the available commands is listed here:

Mapping Adjacency Protocol	**amap** **amap discovery time** **amap common time** **show amap**

amap

Enables or disables the Alcatel-Lucent Mapping Adjacency Protocol (AMAP) on the switch. AMAP discovers adjacent switches by sending and responding to Hello update packets on active Spanning Tree ports.

amap {enable | disable}

Syntax Definitions

enable	Enables AMAP.
disable	Disables AMAP.

Defaults

By default, AMAP is enabled on the switch.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Adjacent switches are defined as those having a Spanning Tree path between them and no other switch between them on the same Spanning Tree path that has AMAP enabled.

Examples

```
-> amap disable
-> amap enable
```

Release History

Release 6.1; command was introduced.

Related Commands

amap discovery time	Sets the discovery transmission time interval used by active Spanning Tree ports in the discovery transmission state.
amap common time	Sets the common transmission time interval used by active Spanning Tree ports in the common transmission state.
show amap	Displays adjacent switches and associated MAC addresses, ports, VLANs, and IP addresses.

MIB Objects

```
aipAMAPstate
```

amap discovery time

Sets the discovery transmission time interval. In the discovery transmission state, an active port sends AMAP Hello packets to detect adjacent switches. The discovery transmission time specifies the number of seconds to wait between each Hello packet transmission.

amap discovery [time] *seconds*

Syntax Definitions

seconds	Discovery transmission time value, in seconds (1–65535). Do not use commas in the value.

Defaults

By default, the discovery transmission time is set to 30 seconds.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use of the **time** command keyword is optional.
- When AMAP is enabled, all active Spanning Tree ports start out in the discovery transmission state.
- Ports that receive Hello packets before three discovery transmission times expire, send a Hello reply and transition to the common transmission state.
- Ports that do not receive Hello packets before three discovery transmission times expire, revert to the passive reception state.
- Ports in the passive reception state do not send Hello packets and do not use any timer to determine how long to wait for Hello packets.
- The discovery transmission time value is also used by ports in the common transmission state to determine how long to wait for Hello packets (see page 17-5).

Examples

```
-> amap discovery 1200
-> amap discovery time 600
```

Release History

Release 6.1; command was introduced.

Related Commands

amap	Enables (default) or disables AMAP on a switch.
amap common time	Sets the common transmission time interval used by active Spanning Tree ports in the common transmission state.
show amap	Displays adjacent switches and associated MAC addresses, ports, VLANs, and IP addresses.

MIB Objects

`aipAMAPdisctime`

amap common time

Sets the common phase transmission time interval. In the common transmission state, an active port sends AMAP Hello packets to determine adjacent switch failures and disconnects. The common transmission time specifies the number of seconds to wait between each Hello packet transmission.

amap common [time] *seconds*

Syntax Definitions

seconds	Common transmission time value in seconds (1–65535). Do not use commas in the value.

Defaults

By default, the common transmission time is set to 300 seconds.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use of the **time** command keyword is optional.
- To avoid synchronization with adjacent switches, the common transmission time is jittered randomly by plus or minus ten percent. For example, if the default time is used (300 seconds), the jitter is plus or minus 30 seconds.
- The common transmission time value is only used by ports in the common transmission state.
- If a Hello packet is received from an adjacent switch before the common transmission time has expired, the switch sends a Hello reply and restarts the common transmission timer.
- A port reverts to the discovery transmission state if a Hello response is not received after the discovery time interval (see page 17-3) has expired.

Examples

```
-> amap common 1200
-> amap common time 600
```

Release History

Release 6.1; command was introduced.

Related Commands

amap	Enables (default) or disables AMAP on a switch.
amap discovery time	Sets the discovery transmission time interval used by the active Spanning Tree ports in the discovery transmission state.
show amap	Displays adjacent switches and associated MAC addresses, ports, VLANs, and IP addresses.

MIB Objects

`aipAMAPcommontime`

show amap

Displays adjacent switches and associated MAC addresses, ports, VLANs, IP addresses, and system names.

show amap

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Remote switches that stop sending Hello packets and are connected to an AMAP switch via a hub may take up to two times the common transmission time to age out of the AMAP database, and no longer appear in this show command display.

Examples

```
-> show amap
AMAP is currently enabled,
AMAP Common    Phase Timeout Interval (seconds) = 300,
AMAP Discovery Phase Timeout Interval (seconds) = 30

Remote Host Description = falconCmm
Remote Host Base MAC    = 00:00:00:00:00:00
Local  Interface        = 1/2, VLAN  = 200
Remote Interface        = 3/1, VLAN  = 200
Remote IP Address Configured = 1
  2.0.0.10

Remote Host Description = falconCmm
Remote Host Base MAC    = 00:d0:95:6b:09:40
Local  Interface        = 3/1, VLAN  = 1
Remote Interface        = 6/1, VLAN  = 1
Remote IP Address Configured = 1
  2.0.0.11
```

output definitions

AMAP is currently	The AMAP status: **enabled** (default) or **disabled**. Use the **amap** command to change the AMAP status for the switch.
AMAP Common Phase Timeout Interval (seconds)	The number of seconds to wait between each Hello packet transmission during the common phase. Use the **amap common time** command to change this value.

output definitions (continued)

AMAP Discovery Phase Time-out Interval (seconds)	The number of seconds to wait between each Hello packet transmission during the discovery phase. Use the **amap discovery time** command to change this value.
Remote Host Description	The system name for the adjacent switch.
Remote Host Base MAC	The chassis base MAC address for the adjacent switch.
Local Interface	The local switch port/VLAN that received the AMAP packet.
Remote Interface	The adjacent switch port/VLAN that sent the AMAP packet.
Remote IP Address Configured	The number of IP addresses configured on the adjacent switch. The actual IP address values are listed below this field.

Release History

Release 6.1; command was introduced.

Related Commands

amap	Enables (default) or disables AMAP on a switch.
amap discovery time	Sets the discovery transmission time interval used by active Spanning Tree ports in the discovery transmission state.
amap common time	Sets the common transmission time interval used by the active Spanning Tree ports in the common transmission state.

18 SIP Commands

SIP Snooping feature address the key challenge of real time delivery and monitoring requirements for media streams from SIP devices. SIP snooping feature provides plug and play support to the device, where it automatically identifies the ports used. It also enhances the security of device.

SIP Snooping prioritizes voice and video traffic over non-voice traffic. To summarize, SIP Snooping:

- Identifies and marks the SIP and its corresponding media streams. Each media stream contains Real Time Protocol (RTP) and Real Time Control Protocol (RTCP) flows. Marking is done using the DSCP field in the IP header.
- Provides user configured QOS treatment for SIP/RTP/RTCP traffic flows based on its marking.
- Also snoops voice quality metrics of media streams from their RTCP packets and displays them to the user with knowledge of media reception quality in real time and helps to diagnose the problems on their quality. Also in addition, trap will be generated when voice quality parameters like Jitter, Round trip time, Packet-lost, R-factor and MOS values of media streams crosses user configured threshold.

Note. SIP Snooping is not supported in OS 6400 and OS 6855 –P14/C14

This chapter includes descriptions of SIP commands.

MIB information for SIP commands is as follows:

Filename: AlcatelIND1SIPSnooping.MIB
Module: ALCATEL-IND1-CHASSIS-MIB

A summary of the available commands is listed here:

---

sip-snooping enable
sip-snooping port enable
sip-snooping mode
sip-snooping trusted server
sip-snooping sip-control
sip-snooping sos-call number
sip-snooping sos-call dscp
sip-snooping udp port
sip-snooping tcp port
sip-snooping threshold
sip-snooping logging-threshold num-of-calls
show sip-snooping call-records
clear sip-snooping statistics
show sip-snooping config
show sip-snooping ports
show sip-snooping statistics
show qos dscp-table

---

sip-snooping enable

Enables or disables the SIP snooping on the switch.

sip-snooping {enable | disable}

Syntax Definitions

enable	Enables SIP snooping
disable	Disables SIP snooping

Defaults

By default, SIP-snooping is disabled on the switch.

Platforms Supported

OmniSwitch 6850E,9000E,6855-U24X

Usage Guidelines

- If SIP snooping is disabled at a port level, enabling SIP snooping globally will not override the configuration of that port.
- If SIP-snooping is disabled and enabled, it is mandatory that the phones re-register for successful DSCP marking.

Examples

```
-> sip-snooping enable
-> sip-snooping disable
```

Release History

Release 6.4.5; command was introduced.

Related Commands

sip-snooping port enable	Configures the status of SIP snooping on a single port, a range of ports, or on a link aggregate of ports.
show sip-snooping ports	Shows the SIP snooping port level data.
show sip-snooping config	

MIB Objects

`aluSIPSnoopingStatus`

sip-snooping port enable

Configures the status of SIP snooping on a single port, a range of ports, or on a link aggregate.

sip-snooping[{port *slot/port1***[**-*port2***] | linkagg** *linkagg_num***] {enable|disable}**

Syntax Definitions

slot/port1	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
-port2	The last port number in a range of ports that you want to configure on the same slot (e.g, 3/1-4 specifies ports 1, 2, 3, and 4 on slot 3).
linkagg_num	Specifies the link aggregate port ID.
enable	Enables SIP snooping to mirror all SIP PDU that ingress on that port
disable	Disables SIP snooping and will not mirror SIP PDU that ingress on that port.

Defaults

By default, SIP-snooping is disabled on the switch.

Platforms Supported

OmniSwitch 6850E,9000E,6855-U24X

Usage Guidelines

- Use this command for port/linkagg level SIP Snooping configuration on the switch.
- SIP snooping must be enabled globally to activate port/linkagg level configuration.
- Even after SIP snooping is globally disabled, port/linkagg level configuration is saved. This configuration will be used when SIP snooping is enabled globally again.
- Port level configuration is not allowed of a member port of a linkagg.
- If a port join a linkagg, port level configuration is overridden by linkagg configuration. Port level configuration will be activated if it leaves the linkagg.

Examples

```
-> sip-snooping port 1/5-6 enable
-> sip-snooping linkagg 10 enable
```

Release History

Release 6.4.5; command was introduced.

Related Commands

show sip-snooping ports	Shows the SIP snooping port level data.

sip-snooping mode

Configure port/linkagg mode of SIP snooping on the switch.

sip-snooping[{port *slot/port* **[-port2] | linkagg** *agg_num* **mode {force-edge | force-non-edge | automatic}**

Syntax Definitions

slot/port1[-port2]	The slot and port number (3/1). Use a hyphen to specify a range of ports and/or a space to specify multiple port entries (3/1-10 4/1 4/5 5/10).
agg_num	The link aggregate ID number.
force-edge	Media TCAM entries to be created for dialogs that transverse the specific port
force-non-edge	No Media TCAM entries for dialogs that transverse the specific port.
automatic	Sets to default mode. The port's edge/non-edge mode is derived by the switch/router based on LLDP received or not on the port.

Defaults

parameter	default
mode	automatic

Platforms Supported

OmniSwitch 6850E,9000E,6855-U24X

Usage Guidelines

- Use this command for port/linkagg level SIP Snooping configuration on the switch.
- Force-edge-port/force-nonedge-port option to overwrite default port mode learnt by either received or not received switch/router capability through LLDP.
- Port level configuration is not allowed of a member port of a linkagg.
- If a port joins a linkagg, port level configuration is overridden by linkagg configuration. Port level configuration will be activated if it leaves the linkagg.

Examples

```
-> sip-snooping port 1/5-6 mode force-edge
-> sip-snooping linkagg 1 mode force-non-edge
```

Release History

Release 6.4.5; command was introduced.

Related Commands

```

sip-snooping trusted server

Configure the IP addresses of the trusted servers on a switch.

sip-snooping trusted-server [*ip_address1 ip_address2 ip_address ...ip_address8***]**
no sip-snooping trusted-server *all*
no sip-snooping trusted-server [*ip_address***]**

Syntax Definitions

ip_address1**[-***ip_address2***]**	The IP Addresses of the trusted-server.
all	Specifies all the IP addresses.

Defaults

By default, no trusted servers are configured.
All SIP based calls using any call server will be supported.

Platforms Supported

OmniSwitch 6850E,9000E,6855-U24X

Usage Guidelines

- This command is used to configure the IP addresses of the trusted servers. If trusted server is configured, then only the calls initiated through those servers will be supported.
- A maximum of 8 trusted servers can be configured.
- If no trust servers are configured, all SIP based calls using any call server will be supported.
- Use "**No**" form of the command to remove any trusted IP or all trusted IPs, which were configured earlier.
- No command is used to remove all trusted server IP configured earlier

Examples

```
-> sip-snooping trusted-server 192.254.32.22 192.254.32.33
-> no sip-snooping trusted-server 192.254.32.22
-> no sip-snooping trusted-server all
```

Release History

Release 6.4.5; command was introduced.

```

sip-snooping sip-control

Configures SIP control DSCP marking.

sip-snooping sip-control dscp *num*

sip-snooping sip-control no dscp

Syntax Definitions

num	The DSCP number.

Defaults

By default no marking/priotizing or rate limit is performed. The packet gets its priority as normal packet. Either from the qos port configuration (trust the packet DSCP or untrusted) or from a user configured policy.

Platforms Supported

OmniSwitch 6850E,9000E,6855-U24X

Usage Guidelines

- This command is used for the SIP control DSCP marking. A in-built rate limiter of 1 mbps is configured to rate limit SIP PDUs being marked by the switch.
- The allowed DSCP range is 0-63.
- Use **no** form of the command is to set default mode.

Examples

```
-> sip-snooping sip-control dscp 40
-> sip-snooping sip-control no dscp
```

Release History

Release 6.4.5; command was introduced.

Related Commands

show sip-snooping config	Shows the configuration done for SIP snooping.

MIB Objects

```
aluSIPSnoopingSIPControlDSCP
```

sip-snooping sos-call number

Configures the SOS call strings in SIP snooping.

sip-snooping sos-call number <*string1*> <*string2*> **…** <*string4*>
no sip-snooping sos-call number <*string*>
no sip-snooping sos-call number all

Syntax Definitions

<*string1*> **…** <*string4*> Specifies the SOS call number.

Defaults

None

Platforms Supported

OmniSwitch 6850E,9000E,6855-U24X

Usage Guidelines

- This command is used for the configuration of the SOS call strings. A maximum of 4 SOS call strings can be configured for an exact match on the “to” URI (user part only)
- No support of regular expression. If no string is specified, no SOS call can be identified in the system.
- Use **NO** form of this command to remove an already configured sos-call string.

Examples

```
-> sip-snooping sos-call number “911” “2233”
-> no sip-snooping sos-call number “911”
-> no sip-snooping sos-call number all
```

Release History

Release 6.4.5; command was introduced.

Related Commands

aluSIPSnoopingSOSCallNumber2
aluSIPSnoopingSOSCallNumber3
aluSIPSnoopingSOSCallNumber4
```

sip-snooping sos-call dscp

Configures the SOS-Call RTP/RTCP DSCP Marking.

sip-snooping sos-call dscp *num*

Syntax Definitions

num	Specifies the DSCP number.

Defaults

The default configuration is 46 EF.

Platforms Supported

OmniSwitch 6850E,9000E,6855-U24X

Usage Guidelines

- This command is used for the configuration of the SOS-Call RTP/RTCP DSCP Marking. An in-built rate limiter of 128 kbps is configured to rate limit uni direction media stream being marked by the switch.
- SOS calls are identified only for the Audio media type. All other media type calls to be considered normal calls.

Examples

```
-> sip-snooping sos-call dscp 56
```

Release History

Release 6.4.5; command was introduced.

Related Commands

show sip-snooping config	Shows the configuration done for SIP snooping.

MIB Objects

`aluSIPSnoopingSOSCallDSCP`

sip-snooping udp port

Configures the UDP port for SIP Snooping.

sip-snooping udp-port <*udp-port1*> < *udp-port 2*> **...** < *udp-port 8*>
no sip-snooping udp-port <*udp-port*>
no sip-snooping udp-port all

Syntax Definitions

< *udp-port 1*> **...** < *udp-port 8*> Specifies the SIP snooping UDP port.

Defaults

By default no UDP ports and SIP mirroring is performed with the method name and SIP2.0 strings.

Platforms Supported

OmniSwitch 6850E,9000E,6855-U24X

Usage Guidelines

- A maximum of 8 UDP ports can be configured on a switch.
- Use **NO** form of this command to remove any UDP port configured earlier.

Examples

```
-> sip-snooping udp-port 5260 5060
-> no sip-snooping udp-port 5260
-> no sip-snooping udp-port all
```

Release History

Release 6.4.5; command was introduced.

```

sip-snooping tcp port

Configure the Server listening TCP ports for SIP Snooping.

sip-snooping tcp-port <*tcp-port1*> < *tcp-port 2*> **...** < *tcp-port 8*>
no sip-snooping tcp-port <*tcp-port*>
no sip-snooping tcp-port all

Syntax Definitions

< *tcp-port 1*> **...** < *tcp-port 8*> Specifies the SIP snooping TCP port.

Defaults

By default, TCP port is 5260.

Platforms Supported

OmniSwitch 6850E,9000E,6855-U24X

Usage Guidelines

- A maximum of 8 TCP ports can be configured on a switch.
- The default port will be overwritten, if the user configures any other port.
- Use **NO** form of this command to remove any TCP port configured earlier.

Examples

```
-> sip-snooping tcp-port 5260 5060
-> no sip-snooping tcp-port 5260
-> no sip-snooping tcp-port all
```

Release History

Release 6.4.5; command was introduced.

Related Commands

```

sip-snooping threshold

Configure the various thresholds of SIP snooping.

sip-snooping threshold {audio | video | other} {jitter *jitter_ms_num* **| packet-lost** *% num* **| round-trip-delay** *round_trip_delay_ms_num* **| R-factor** *Rfactor_num*| **MOS** *mos_num***}**

Syntax Definitions

audio	Specify threshold for audio.
video	Specify threshold for video.
other	Specify threshold for other.
jitter	Specify jitter in milliseconds.
packet-lost	Specify packet lost in percentage.
round-trip-delay	Set round trip delay in milliseconds.
R-factor	Specify R-factor number.
MOS	Specify MOS number

Defaults

parameter	default
RTCP monitoring	Enable
Jitter Threshold (audio/video/other)	50/100/100 ms
Packet-lost Threshold (audio/video/other)	10 /20/20 %
RTT Threshold (audio/video/other)	180 /250/250 ms
R-factor Threshold (audio/video/other)	70/80/80
MOS Threshold (audio/video/other)	3.6/3.0/3.0

Platforms Supported

OmniSwitch 6850E,9000E,6855-U24X

Usage Guidelines

- This command is used for the configuration of various thresholds.
- The valid range for jitter is 0-300
- The valid range for packet-loss is 0-99%.
- The allowed range for round-trip-delay is 0-500 milliseconds.
- The allowed range for R-factor is 0-100.

- The allowed range for MOS is 0-5.
- Setting value to 0 would disable threshold checking for that parameter.

Examples

```
-> sip-snooping threshold audio jitter 50
-> sip-snooping threshold audio packet-lost 10
-> sip-snooping threshold video jitter 80
-> sip-snooping threshold video round-trip-delay 180
```

Release History

sip-snooping logging-threshold num-of-calls

Configures the threshold for the number of calls to be logged on to the flash file.

sip-snooping logging-threshold num-of-calls *num*

Syntax Definitions

num	Specifies the maximum number of calls to be logged.

Defaults

By default, 200 calls can be logged.

Platforms Supported

OmniSwitch 6850E,9000E,6855-U24X

Usage Guidelines

This command is used to configure the threshold for the number of calls to be logged on to the flashfile.

Examples

```
-> sip-snooping logging-threshold num-of-calls 300
```

Release History

Release 6.4.5; command was introduced.

Related Commands

show sip-snooping call-records

Displays the SIP-snooping active/ended call records.

show sip-snooping call-records {active-calls|ended-calls} [full | threshold-violation]

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6850E,9000E,6855-U24X

Usage Guidelines

- This command is used to show the SIP-snooping active/ended call records.

Examples

```

```

show sip-snooping ports

Shows the SIP snooping port level data.

show sip-snooping ports

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6850E,9000E,6855-U24X

Usage Guidelines

This command is used to show the SIP-snooping port-level data.

Examples

```
-> show sip-snooping ports
Legend : sip snooping : * status disabled (Sip-snooping globally disabled)
Port       sip-snooping         Edge/Non-edge
-----------------------------------------------------------
1/1        enable               automatic
1/2        disable              automatic
1/3        enable (*)           force-edge
1/3        enable (*)           force-non-edge
```

output definitions

Port	Displays ports configured for sip-snooping.
sip-snooping	Displays the status of sip-snooping on the port, **enable** or **disable**.
Edge/Non-edge	Displays the edge status of the port.

Release History

Release 6.4.5; command was introduced.

Related Commands

show sip-snooping statistics	Shows the SIP snooping statistics.

MIB Objects

```

show sip-snooping statistics

Shows the SIP snooping statistics.

show sip-snooping statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6850E,9000E,6855-U24X

Usage Guidelines

This command is used to show the SIP-snooping statistics.

Examples

```
-> show sip-snooping statistics
Total calls processed                  : ,
Total audio streams                    : ,
Total video streams                    : ,
Total other streams                    : ,
Total audio streams that crossed threshold       : ,
Total video streams that crossed threshold       : ,
Total other streams that crossed threshold       : ,
Active Streams that crossed threshold            : ,
Number of Active calls                 : ,
Number of active audio streams         : ,
Number of active video streams         : ,
Number of active other streams         : ,
Number of SIP packet received by hardware :
Number of SIP packet received by software :
Number of SIP packet received per method: INVITE(100) ACK(101) BYE(200)
UPDATE(40) PRACK(20)
Number of SIP response packet received:
Number of discarded/malformed/unsupported SIP packets:
Number of discarded SIP packets not from/to trusted servers:
Number of dropped SIP packet due the software error:
(NI overflow, NI/CMM, CMM overflow)
Total Emergency Calls                  :
```

output definitions

Total calls processed	Total calls processed for SIP Snooping.
Total audio streams	Displays the total audio streams.
Total video streams	Displays the total video streams.

output definitions (continued)

Total other streams	Displays the total other streams.
Total audio streams that crossed threshold	Displays the total audio streams that have exceeded threshold.
Total video streams that crossed threshold	Displays the total video streams that have exceeded threshold.
Total other streams that crossed threshold	Displays the total other streams that have exceeded threshold.
Number of Active calls	Displays the number of active calls.
Number of Active audio streams	Displays the number of active audio streams.
Number of Active video streams	Displays the number of active video streams.
Number of Active other streams	Displays the number of active other streams.
Number of SIP packet received by hardware	Displays the total SIP packet received by hardware.
Number of SIP packet received by software	Displays the total SIP packet received by software.
Number of SIP packet received by per method	Displays the method by which the SIP packet is received. The various per method are Invite, Ack, Bye, Update and Prack.
Number of SIP response packet received	Displays the total number of SIP response packet received.
Number of discarded/ malformed/unsupported SIP packets	Displays the total number of discarded, malformed or unsupported SIP packets.
Number of discarded SIP packets not from/to trusted servers	Displays the total number of discarded SIP packets not from or to trusted servers
Number of dropped SIP packet due the software error	Displays the Total number of SIP packets dropped due the software error. (i.e. NI overflow, NI/CMM, CMM overflow etc.)
Total Emergency Calls	Displays the total number of Emergency Calls.

Release History

Release 6.4.5; command was introduced.

show qos dscp-table

Shows the QoS DSCP table configured.

show qos dscp-table

Syntax Definitions

N/A.

Defaults

N/A.

Platforms Supported

OmniSwitch 6850E,9000E,6855-U24X

Usage Guidelines

- This command is used to show the QoS DSCP table configured.
- This commnd functionality does not work with un-trusted port.

Examples

```
-> show qos dscp-table
DSCP           Priority      Drop-Precedence
-------------------------------------------
34              4               Low
35              4               Low
36              4               Low
37              3               Medium
```

output definitions

DSCP	Displays SIP Snooping DSCP number.
Priority	Displays the priority number of the DSCP table.
Drop-Precedence	Displays the drop precedence of the DSCP table.

Release History

Release 6.4.5; command was introduced.

Related Commands

sip-snooping threshold	Configures the priority and drop-precedence to be associated with the configured DSCP table.

19 IP Commands

This chapter details Internet Protocol (IP) commands for the switch. IP is a network-layer (Layer 3) protocol that contains addressing information and some control information that enables packets to be forwarded. IP is documented in RFC 791 and is the primary network-layer protocol in the Internet protocol suite. Along with the Transmission Control Protocol (TCP), IP represents the heart of the Internet protocols.

IP is enabled on the switch by default and there are few options that can, or need to be, configured. This chapter provides instructions for basic IP configuration commands. It also includes commands for several Layer 3 and Layer 4 protocols that are associated with IP:

- Address Resolution Protocol (ARP)—Used to match the IP address of a device with its physical (MAC) address.
- Internet Control Message Protocol (ICMP)—Specifies the generation of error messages, test packets, and informational messages related to IP. ICMP supports the **ping** command used to determine if hosts are online.
- Transmission Control Protocol (TCP)—A major data transport mechanism that provides reliable, connection-oriented, full-duplex data streams. While the role of TCP is to add reliability to IP, TCP relies upon IP to do the actual delivering of datagrams.
- User Datagram Protocol (UDP)—A secondary transport-layer protocol that uses IP for delivery. UDP is not connection-oriented and does not provide reliable end-to-end delivery of datagrams. But some applications can safely use UDP to send datagrams that do not require the extra overhead added by TCP.
- Web Cache Communication Protocol (WCCP)—It provides a mechanism to redirect traffic flows to a cluster of cache servers transparently. The WCCPv2 enabled routers would redirect the traffic on configured protocol (TCP/UDP) ports to the cache engine instead of the intended hosts directly.

The IP commands also include protection from Denial of Service (DoS) attacks. The goal of this feature is to protect a switch from well-known DoS attacks and to notify the administrator or manager when an attack is underway. Also, notifications can be sent when port scans are being performed.

Note. Packets can be forwarded using IP if all devices are on the same VLAN, or if IP interfaces are created on multiple VLANs to enable routing of packets. However, IP routing requires one of the IP routing protocols: Routing Information Protocol (RIP) or Open Shortest Path First (OSPF). See the following chapters for the appropriate CLI commands: Chapter 22, “RIP Commands,” Chapter 27, “OSPF Commands.” For more information on VLANs and RIP see the applicable chapter in the Configuration Guide. For more information on OSPF, see the “Configuring OSPF” chapter in the *OmniSwitch AOS Release 6 Advanced Routing Configuration Guide*.

MIB information for the IP commands is as follows:

Filename: IpForward.mib
Module: IpForward

Filename: Ip.mib
Module: Ip

Filename: AlcatelIND1Ip.mib
Module: alcatelIND1IPMIB

Filename: AlcatelIND1Iprm.mib
Module: alcatelIND1IPRMMIB

A summary of the available commands is listed here:

IP	**ip interface** **ip managed-interface** **ip interface dhcp-client** **ip interface tunnel** **ip router primary-address** **ip router router-id** **ip static-route** **ip route-pref** **ip default-ttl** **ping** **traceroute** **ip dual-hash mode** **ip directed-broadcast** **ip service** **show ip traffic** **show ip interface** **show ip managed-interface** **show ip route** **show ip route-pref** **show ip router database** **show ip emp-route** **show ip config** **show ip protocols** **show ip service**

IP and ARP Spoofing	**ip dos anti-spoofing** **ip dos anti-spoofing arp-only** **ip dos anti-spoofing address** **ip dos anti-spoofing address arp-only** **ip dos anti-spoofing clear stats** **ip dos anti-spoofing address clear stats** **show ip dos anti-spoofing**

ip interface

Configures an IP interface to enable IP routing on a VLAN. Without an IP interface, traffic is bridged within the VLAN or across connections to the same VLAN on other switches.

ip interface *name* **[address** *ip_address***] [mask** *subnet_mask***] [admin [enable | disable]] [vlan** *vid* **| {rtr-port [***agg_num* | *slot/port***] rtr-vlan** *num* **[type {tagged | untagged}}] [forward | no forward] [local-proxy-arp | no local-proxy-arp] [eth2 | snap] [primary | no primary] [local-host-dbcast [enable | disable]**

no ip interface *name*

Syntax Definitions

name	Text string up to 32 characters. Use quotes around string if description contains multiple words with spaces between them (for example “Alcatel-Lucent Marketing”). This value is case sensitive.
ip_address	An IP host address (for example, 10.0.0.1, 171.15.0.20) to specify the IP router network.
subnet_mask	A valid IP address mask (for example, 255.0.0.0, 255.255.0.0) to identify the IP subnet for the interface.
admin enable	Enables the administrative status for the IP interface.
admin disable	Disables the administrative status for the IP interface.
vid	An existing VLAN ID number (1–4094).
rtr-port	The physical port associated with the IP interface (device type "RTR-PORT"). The rtr-port can be the "slot/ port" to identify the port or the "agg-num" in case of a link aggregation port. This parameter is mandatory for an RTR-PORT IP interface.
rtr-vlan	An unused VLAN on the system to be associated with this IP interface. This parameter is mandatory for an RTR-PORT IP interface.
type	Tagged or untagged, specifying whether to handle 802.1q frames or untagged frames on the specified port. This parameter is optional and defaults to type "untagged" if not specified.
forward	Enables forwarding of IP frames to other subnets.
no forward	Disables forwarding of IP frames. The router interface still receives frames from other hosts on the same subnet.
local-proxy-arp	Enables Local Proxy ARP on the specified interface.
no local-proxy-arp	Disables Local Proxy ARP on the specified interface.
eth2	Specifies Ethernet-II encapsulation.
snap	SNAP encapsulation.
primary	Designates the specified IP interface as the primary interface for the VLAN.

no primary	Removes the configured primary IP interface designation for the VLAN. The first interface bound to the VLAN becomes the primary by default.
local-host-dbcast enable	Accepts and processes packets destined for the directed broadcast address of the interface.
local-host-dbcast disable	Drops packets destined for the directed broadcast address of the interface.

Defaults

parameter	default
ip_address	0.0.0.0
subnet_mask	IP address class
admin [enable | disable]	**enable**
vid	none (unbound)
type	**untagged**
forward | no forward	**forward**
local-proxy-arp | no local-proxy-arp	**no local-proxy-arp**
eth2 | snap	**eth2**
primary | no primary	First interface bound to a VLAN.
local-host-dbcast [enable | disable]	**disable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove an IP interface.
- IP multinetting is supported. As a result, it is possible to configure up to eight IP interfaces per VLAN. Each interface is configured with a different subnet, thus allowing traffic from each configured subnet to coexist on the same VLAN.
- When Local Proxy ARP is enabled for any one IP router interface associated with a VLAN, the feature is applied to the entire VLAN. It is not necessary to enable it for each interface. However, if the IP interface that has this feature enabled is moved to another VLAN, Local Proxy ARP is enabled for the new VLAN and must be enabled on another interface for the old VLAN.
- When Local Proxy ARP is enabled, all traffic is routed instead of bridged within the VLAN. ARP requests return the MAC address of the IP router interface. The same MAC address is assigned to each interface configured for a VLAN.
- Local Proxy ARP takes precedence over any switch-wide ARP or Proxy ARP function. It is not necessary to have Proxy ARP configured to use Local Proxy ARP. The two features are independent of each other.

- By default, the first interface bound to a VLAN becomes the primary interface for that VLAN. Use the **primary** keyword with this command to configure a different IP interface as the primary.
- To create an IP interface for network management purposes, specify **Loopback0** (case sensitive) as the name of the interface. The Loopback0 interface is not bound to any VLAN, so it will always remain operationally active. The Loopback0 address can be configured in the same subnet as an existing IP interface.
- For setting the rtr-port IP interface, the IP interface must be associated with the rtr-port, rtr-vlan (an unused VLAN) and the type (tagged for handling 802.1q frames on the port or untagged to handle untagged frames).

Examples

```
-> ip interface “Marketing”
-> ip interface “Payroll address” 18.12.6.3 vlan 255
-> ip interface “Human Resources” 10.200.12.101 vlan 500 no forward snap
-> ip interface “Distribution” 11.255.14.102 vlan 500 local-proxy-arp primary
-> ip interface IP1 rtr-port 1/2 rtr-vlan 20 type untagged
-> ip interface IP2 rtr-port 3 rtr-vlan 40 type tagged
```

Release History

Release 6.1; command introduced.
Release 6.4.5; **rtr-port** and **rtr-vlan** parameters added.

Related Commands

show ip interface	Displays the status and configuration of IP interfaces.

```

ip managed-interface

Specifies the source IP address for the outgoing packets sent by the applications.

ip managed-interface {*Loopback0* | *interface-name***} application [ldap-server] [tacacs] [radius] [snmp] [sflow] [ntp] [syslog] [dns] [telnet] [ftp] [ssh] [tftp] [all]**

no ip managed-interface {*Loopback0* | *interface-name***} application [ldap-server] [tacacs] [radius] [snmp] [sflow] [ntp] [syslog] [dns] [telnet] [ftp] [ssh] [tftp] [all]**

Syntax Definitions

Loopback0	Specifies the Loopback0 IP address, if configured.
Interface-name	Specifies the name of the interface.
ldap-server	Configures the source IP address to be used by the LDAP Server.
tacacs	Configures the source IP address to be used by TACACS.
radius	Configures the source IP address to be used by RADIUS.
snmp	Configures the source IP address to be used by SNMP.
sflow	Configures the source IP address to be used by sFlow.
ntp	Configures the source IP address to be used by NTP.
syslog	Configures the source IP address to be used by Syslog.
dns	Configures the source IP address to be used by DNS.
telnet	Configures the source IP address to be used by TELNET.
ftp	Configures the source IP address to be used by FTP.
ssh	Configures the source IP address to be used by SSH.
tftp	Configures the source IP address to be used by TFTP.
all	Configures the source IP address to be used by all the application protocols.

Defaults

Application	Default behavior (selecting the source IP address)
LDAP-SERVER	Loopback0, if configured or the outgoing interface
TACACS	Outgoing interface
RADIUS	Loopback0, if configured or the outgoing interface
SNMP	Loopback0, if configured or the outgoing interface
sFlow	Loopback0, if configured or the outgoing interface
NTP	Loopback0, if configured or the outgoing interface
Syslog	Outgoing interface
DNS	Outgoing interface
Telnet	Outgoing interface
FTP	Outgoing interface
SSH	Outgoing interface
TFTP	Outgoing interface

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use this command to configure the source IP address to be used by the application to send the outgoing packets.
- Use the **no** form of this command to revert to the default behavior of choosing the source IP address.
- Use **all** in this command to configure a common source IP address to those applications that use the default source IP address.
- This command supports only the default VRF.

Examples

```
-> ip managed-interface loopback0 application ntp
-> no ip managed-interface loopback0 application ntp
```

Release History

Release 6.4.3; command introduced.

Related Commands

show ip managed-interface	Displays the application name and the corresponding interface name.
show ip interface	Displays the configuration and status of IP interfaces.
ip interface	Configures an IP interface to enable IP routing on a VLAN.

MIB Objects

```
alaIpManagedIntfTable
   AlaIpManagedIntfAppIndex
   alaIpManagedIntfEntry
   alaIpManagedIntfName
   alaIpManagedRowStatus
```

ip interface dhcp-client

Configures a DHCP client IP interface that is to be assigned an IP address from a DHCP server.

ip interface dhcp-client [vlan *vid***] [release | renew] [option-60** *opt60_string***] [admin {enable | disable}]**

no ip interface dhcp-client

Syntax Definitions

dhcp-client	Reserved IP interface name indicating this interface use DHCP to obtain an IP address from a DHCP server.
vid	An existing VLAN ID number (1–4094).
release	Releases the DHCP server assigned IP address.
renew	Renews the DHCP server assigned IP address.
opt60_string	The option-60 field value to be included in DHCP discover/request packets.
enable	Enables the administrative status for the IP interface.
disable	Disables the administrative status for the IP interface.

Defaults

parameter	default
opt60_string	OmniSwitch-xxxx (xxxx = Platform, for example, 6850E)
enable | disable	enable

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove the dhcp-client IP interface.
- Only one DHCP client IP interface can be assigned per switch but it can belong to any VLAN and any VRF instance.
- If the system name has not been configured, it will be updated using the option-12 field. If the option-12 string is greater than 19 characters the remaining characters will be truncated.
- The minimum lease time accepted on the dhcp-client interface is 5 minutes.

Examples

```
-> ip interface dhcp-client vlan 100
```

```
-> ip interface dhcp-client admin enable
-> ip interface dhcp-client release
-> ip interface dhcp-client renew
-> ip interface dhcp-client option-60 OmniSwitch
-> no ip interface dhcp-client
```

Release History

Release 6.4.3; command introduced.

Related Commands

show ip interface	Displays the status and configuration of IP interfaces.

MIB Objects

```
alaIpInterfaceTable
   alaIpInterfaceDhcpStatus
   alaIpInterfaceDhcpIpRelease
   alaIpInterfaceDhcpIpRenew
   alaIpInterfaceDhcpOption60String
```

ip interface tunnel

Configures the end points for the GRE and IPIP tunnels.

ip interface *name* **tunnel [source** *ip_address***] [destination** *ip_address***] [protocol {ipip | gre}]**

Syntax Definitions

name	Text string up to 32 characters. Use quotes around string if description contains multiple words with spaces between them (for example “Alcatel-Lucent Marketing”). This value is case sensitive.
source *ip_address*	Source IP address of the tunnel.
destination *ip_address*	Destination IP address of the tunnel.
ipip	Specifies the tunneling protocol as IPIP.
gre	Specifies the tunneling protocol as GRE.

Defaults

parameter	default
ipip | gre	**ipip**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- You can configure an interface as either a vlan or tunnel interface.
- The maximum number of GRE tunnel interfaces that can be configured on a switch is 8.
- The maximum number of IPIP tunnel interfaces that can be configured on a switch is 127 (16 on an OmniSwitch 6400).

Examples

```
-> ip interface “tnl-1” tunnel source 23.23.23.1 destination 155.2.2.2 protocol gre
-> ip interface “tnl-1” tunnel source 23.23.23.1 destination 155.2.2.2 protocol
ipip
```

Release History

Release 6.1; command introduced.
Release 6.3.1; **tunnel** parameter added.

Related Commands

show ip interface	Displays the status and configuration of IP interfaces.

MIB Objects

```
alaIpInterfaceTable
   alaIpInterfaceName
   alaIpInterfaceTunnelSrc
   alaIpInterfaceTunnelDst
   alaIpInterfaceDeviceType
```

ip router primary-address

Configures the router primary IP address. By default, the router primary address is derived from the first IP interface that becomes operational on the router.

ip router primary-address *ip_address*

Syntax Definitions

ip_address	32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The router primary address be a valid IP unicast host address.
- The router primary IP address is used by BGP to derive its unique BGP Identifier, if the router router-id is not a valid IP unicast address.
- It is recommended that the primary address be explicitly configured on dual CMM chassis or stacked routers.

Examples

```
-> ip router primary-address 172.22.2.115
```

Release History

Release 6.1; command introduced.

Related Commands

ip router router-id	Configures the router ID for the router.

MIB Objects

```
alaDcrTmConfig
   alaDrcTmIpRouterPrimaryAddress
```

ip router router-id

Configures the router ID for the router. By default, the router primary address of the router is used as the router ID. However, if a primary address has not been explicitly configured, the router ID defaults to the address of the first IP interface that becomes operational.

ip router router-id *ip_address*

Syntax Definitions

ip_address	32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The router ID can be any 32-bit number.
- If the router ID is not a valid IP unicast host address, the BGP identifier is derived from the router primary address.
- It is recommended that the router ID be explicitly configured on dual CMM chassis or stacked routers.
- The router ID is used by OSPF and BGP to uniquely identify the router in the network.

Examples

```
-> ip router router-id 172.22.2.115
```

Release History

Release 6.1; command introduced.

Related Commands

ip router primary-address	Configures the router primary IP address.

MIB Objects

```
alaDcrTmConfig
   alaDrcTmIpRouterId
```

ip static-route

Creates/deletes an IP static route or recursive static route. Static routes are user-defined; they carry a higher priority than routes created by dynamic routing protocols. That is, static routes always have priority over dynamic routes, regardless of the metric value.

ip static-route *ip_address* **[mask** *mask***] {gateway | follows}** *ip_address* **[metric** *metric***] [tag** *tag-num***] [name** *tag-name***]**

no ip static-route *ip_address* **[mask** *mask***] {gateway | follows}** *ip_address* **[metric** *metric***][tag** *tag-num***] [name** *tag-name***]**

Syntax Definitions

ip_address	Destination IP address of the static route.
mask	Subnet mask corresponding to the destination IP address.
gateway *ip_address*	IP address of the next hop used to reach the destination IP address.
follows *ip_address*	The recursive static route follows this IP address. The recursive route will use the same gateway/nexthop that is used to reach this host address.
metric	Metric or cost (hop count) for the static route. You can set a priority for the static route by assigning a metric value. The lower the metric value, the higher the priority. Valid range is 1–65535.
tag-num	The tag number.
tag-name	The name of the tag.

Defaults

parameter	default
metric	1

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Static routes do not age out of the routing tables; however, they can be deleted. Use the **no** form of this command to delete a static route.
- Use the **follows** parameter to create a recursive static route. The route to this IP address can be dynamically learned.
- A static route is not active unless the gateway it is using is active.
- The subnet mask is not required if you want to use the natural subnet mask. By default, the switch imposes a natural mask on the IP address.

- Use the **ip static-route** command to configure default route. For example, to create a default route through gateway 171.11.2.1, you would enter: **ip static-route** 0.0.0.0 **mask** 0.0.0.0 **gateway** 171.11.2.1.
- A name can be assigned to the static route to identify it quickly at a later time.
- If you want to classify certain static routes and filter them, then a tag value can be allocated to those routes and route-map match statement to filter those routes. If the tag or name value is not specified, then the previously configured values for the tag and name will remain unchanged.
- To remove the previously configured tag value, configure the same route with tag value as 0. This will be equivalent to untagging the route.
- To remove the previously configured name value, configure the static route with the name field as "". Unconfiguring the static route will delete both the tag and name values.
- To view the tag and name of the configured static routes, use the **show ip router database** command.

Examples

```
-> ip static-route 171.11.1.1 gateway 171.11.2.1
-> ip static-route 10.0.1.1/32 gateway 30.0.1.1 tag 123
-> ip static-route 10.0.2.1/32 gateway 30.0.2.1 tag 345 name RouteToServer
-> ip static-route 10.0.3.0/24 gateway 30.0.3.1 name HRDept
```

Release History

Release 6.1; command introduced.
Release 6.4.3; **follows** parameter was added.
Release 6.4.5; **tag-num** and **tag-name** parameters added.

Related Commands

show ip route	Displays the IP Forwarding table.
show ip router database	Displays the IP router database contents.

MIB Objects

```
alaIprmStaticRoute
   alaIprmStaticRouteDest
   alaIprmStaticRouteMask
   alaIprmStaticRouteNextHop
   alaIprmStaticRouteMetric
   alaIprmStaticRouteTag
   alaIprmStaticRouteName
```

ip route-pref

Configures the route preference of a router.

[vrf *name***] ip route-pref {static | rip | ospf | isisl2 | isisl1 | ibgp | ebgp | import} value**

Syntax Definitions

name	The alphanumeric name (1–20 characters) assigned to the VRF instance.
static	Configures the route preference of static routes.
ospf	Configures the route preference of OSPF routes.
isisl2	Configures the route preference of ISIS L2 routes.
isisl1	Configures the route preference of ISIS L1 routes.
rip	Configures the route preference of RIP routes.
ebgp	Configures the route preference of external BGP routes.
ibgp	Configures the route preference of internal BGP routes.
import	Configures the route preference for the routes that are imported.
value	Route preference value.

Defaults

parameter	default
static *value*	2
ospf *value*	110
isisl2 *value*	118
isisl1 *value*	115
rip *value*	120
ebgp *value*	190
ibgp *value*	200
import *value*	210

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Route preference of local routes cannot be changed.

Examples

```
-> ip route-pref ebgp 20
```

```
-> ip route-pref rip 60
-> ip route-pref import 200
```

Release History

Release 6.1.1; command introduced.
Release 6.1.3; **ebgp** and **ibgp** parameters added.
Release 6.4.5; **vrf** and **import** parameters added.

Related Commands

show ip route-pref	Displays the configured route-preference of a router.
ip import vrf	Configures a route map to import routes from GRT to the destination VRF.
show ip import	Displays the import route configuration details.

MIB Objects

   alaIprmRtPrefEbgp
   alaIprmRtPrefIbgp
   alaIprmRtPrefImport
```

ip default-ttl

Configures the Time To Live value (TTL) for IP packets. The TTL value is the maximum number of hops an IP packet will travel before being discarded.

ip default-ttl *hops*

Syntax Definitions

hops	TTL value, in hops. Valid range is 1–255.

Defaults

parameter	default
hops	64

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

This value represents the default value inserted into the TTL field of the IP header for datagrams originating from this switch whenever a TTL value is not supplied by the transport layer protocol.

Examples

```
-> ip default-ttl 30
```

Release History

Release 6.1; command introduced.

Related Commands

show ip config	Displays IP configuration parameters.

MIB Objects

```
IpDefaultTTL
```

ping

Tests whether an IP destination can be reached from the local switch. This command sends an ICMP echo request to a destination and then waits for a reply. To ping a destination, enter the **ping** command and enter either the destination IP address or hostname. The switch pings the destination using the default frame count, packet size, interval, and timeout parameters (6 frames, 64 bytes, 1 second, and 5 seconds respectively). You can also customize any or all of these parameters as described in the command.

ping {*ip_address* | *hostname***} [source-interface** *ip_interface***] [[sweep-range** *start_size* | *end_size* | *diff_size***] | [count** *count***] [size** *packet_size***]] [interval** *seconds***] [timeout** *seconds***] [tos** *tos_val***] [dont-fragment] [data-pattern** *hex_string***]**

Syntax Definitions

ip_address	IP address of the system to ping.
hostname	DNS name of the system to ping.
ip_interface	IP interface name (maximum 32 characters) of the source interface.
start_size	Size of the first echo packet that is sent. The valid range is from 4 to 60000.
end_size	Maximum size of the echo packet that is sent. The range is greater than the start size and less than 60000.
diff_size	The increment factor of size for the next echo packet. The diff size must be greater than 0 and less than end size.
count	Number of packets to be transmitted. The range is between 1 and 4294967295 (0xFFFFFFFF).
packet_size	Size of the data portion of the packet sent for this ping, in bytes. The valid range is 1–60000.
interval *seconds*	The time interval in seconds with which the ICMP packets are sent out. The range is between 1 and the maximum integer value (4294967295).
timeout *seconds*	Number of seconds the program has to wait for a response before timing out.The range is between 1 and the maximum integer value (4294967295).
tos_val	Specifies the type of service for the probe. The valid range is between 0 and 255.
dont-fragment	Specifies whether the Don't Fragment (DF) bit is to be set on the ping packet. The value 1 sets the Don't Fragment bit in the packet and 0 unsets the same.
hex_string	Specifies the data pattern in a plain string of two characters. Different data patterns are used to troubleshoot framing errors and clocking problems on serial lines. For example, **ab, xy, 12** and so on.

Defaults

parameter	default
ip_interface	Outgoing IP interface as per route lookup
start_size	4
end_size	> 4
diff_size	5
count	6
packet_size	64 bytes (default 6)
interval *seconds*	1
timeout *seconds*	1
tos_val	0
dont-fragment	0
hex_string	Repeating sequence of ASCII characters from 0x4 to 0xff

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If you change the default values they will only apply to the current ping. The next time you use the ping command, the default values will be used unless you again enter different values.
- When specifying the source-interface, specify either the name of any operational interface or the Loopback0 interface. The IP address of the source interface must be reachable from the destination.
- When you specify the *sweep-range* in the **ping** command, you cannot configure the *count* and *size* parameters.
- The Don't Fragment (DF) bit must not be larger than the MTU of the IP interface.
- The command does not support Loose, Strict, and route record options.
- The command is VRF aware and is available only from CLI. It does not support IPv6.
- Ping is supported only in CLI. This command is not supported in WebView.
- The command is VRF aware and is available only from CLI. It does not support IPv6.

Examples

```
-> ping 20.1.1.2 source-interface Loopback0 interval 2 data-pattern ab sweep-range
500 1000 100 tos 7 dont-fragment

PING 20.1.1.2: 500 data bytes
508 bytes from 20.1.1.2: icmp_seq=0. time=69. ms
608 bytes from 20.1.1.2: icmp_seq=1. time=70. ms
708 bytes from 20.1.1.2: icmp_seq=2. time=69. ms
```

```
808 bytes from 20.1.1.2: icmp_seq=3. time=69. ms
908 bytes from 20.1.1.2: icmp_seq=4. time=69. ms
```

Release History

Release 6.4.1; command introduced.

Release 6.4.3; **source-interface**, **sweep-range**, **dont-fragment**, and **data-pattern** parameters were added.

Related Commands

traceroute	Finds the path taken by an IP packet from the local switch to a specified destination.

traceroute

Finds the path taken by an IP packet from the local switch to a specified destination. This command is used to discover the paths that packets take to a remote destination, as well as where routing breaks down.

traceroute {*ip_address* **|** *hostname***} [source-interface** *ip_interface***] [min-hop** *min_hop_count***] [max-hop** *max_hop_count***] [probes** *probe_count***] [time-out** *seconds***] [port-number** *port_number***]**

Syntax Definitions

ip_address	IP address of the host whose route you want to trace.
hostname	DNS name of the host whose route you want to trace.
ip_interface	IP interface name (maximum 32 characters) of the source interface.
min_hop_count	Minimum hop count for the first traceroute packet. The value must be greater than 0 and less than the max hop count.
max_hop_count	Maximum hop count for the destination address. The range is between 1 and the maximum integer value (4294967295).
probe_count	The number of probes to be sent at each TTL level hop-count. The range is between 1 and the maximum integer value (4294967295).
seconds	The period in seconds to wait for the response of each probe packet.
port_number	The destination port number used for probing packets. The value must be greater than 1024.This value is incremented by one in each probe. The valid range is between 1024 and 65535.

Defaults

parameter	default
min_hop_count	1
max_hop_count	30
probe_count	3
seconds	5 *seconds*
port_number	33334

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- When using this command, enter the name of the destination as part of the command line (either the IP address or host name).
- When specifying the source-interface, specify either the name of any operational interface or Loopback0 interface. The IP address of the source interface must be reachable from the destination.
- Use the optional **max-hop** parameter to set a maximum hop count to the destination. If the trace reaches this maximum hop count without reaching the destination, the trace stops.
- Tracetoure is supported only in CLI. This command is not supported in WebView.

- The command is VRF aware and is available only from CLI. It does not support IPv6.

Examples

```
-> traceroute 192.168.1.1 max-hop 5 min-hop 1 port-number 1025 source-interface
Loopback0 timeout 5

traceroute to 192.168.1.1, 5 hops max, 40 byte packets
 1  10.135.33.1  2 ms  2 ms  11 ms
 2  10.250.2.1  6 ms  6 ms  4 ms
 3  192.168.2.2  4 ms  4 ms  3 ms
 4  192.168.1.1  3 ms  3 ms  3 ms
```

Release History

Release 6.4.1; command introduced.
Release 6.4.3; **source-interface**, **min-hop**, **probes**, **time-out**, and **port-number** parameters were added.

Related Commands

show ip route	Displays the IP Forwarding table.

ip dual-hash mode

Enable or disable the dual-hashing mode.

ip dual-hash mode {enable | disable}

Syntax Definitions

enable	Enables the dual-hash mode.
disable	Disables the dual-hash mode.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

- The CLI enables dual-hash for both IPv4 as well as IPv6 multicast and unicast streams.
- Enabling dual-hash mode reduces the chances of collision. However, it does not eliminate collision.
- Dual-hash configuration is independent of VRF ID. If the value is modified from one VRF instance, its updated value is reflected in all the instances.
- Dual-hash configuration is effective only after switch reboot.

Examples

```
-> ip dual-hash mode enable
-> ip dual-hash mode disable
```

Release History

Release 6.4.5; command introduced

Related Commands

show ip config	Displays the IP configuration.

MIB Objects

```
alaIpDualHashMode
```

ip directed-broadcast

Enables or disables IP directed broadcasts routed through the switch. An IP directed broadcast is an IP datagram that has all zeros or all 1's in the host portion of the destination address. The packet is sent to the broadcast address of a subnet to which the sender is not directly attached.

ip directed-broadcast {on | off}

Syntax Definitions

N/A

Defaults

The default value is **off**.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Directed broadcasts are used in denial-of-service "smurf" attacks. In a smurf attack, a continuous stream of ping requests are sent from a falsified source address to a directed broadcast address, resulting in a large stream of replies, which can overload the host of the source address. By default, the switch drops directed broadcasts. Directed broadcasts must not be enabled.

Examples

```
-> ip directed-broadcast off
```

Release History

Release 6.1; command introduced.

Related Commands

show ip interface	Displays the status and configuration of IP interfaces.
show ip managed-interface	Displays the IP Forwarding table.
show ip config	Displays IP configuration parameters.

MIB Objects

```
alaIpDirectedBroadcast
```

ip service

Enables (opens) or disables (closes) well-known TCP/UDP service ports (SSH, telnet, FTP, and so on). Selectively enabling or disabling these types of ports provides an additional method for protecting against denial of service (DoS) attacks.

ip service {all | *service_name* **| port** *service_port***}**

no ip service {all | *service_name* **| port** *service_port***}**

Syntax Definitions

all	Configures access to all TCP/UDP ports.
service_name	The name of the TCP/UDP service to enable or disable. (Refer to the table in the following "Usage Guidelines" section for a list of supported service names.)
service_port	A TCP/UDP service port number. Configures access by port number rather than by service name. (Refer to the table in the following "Usage Guidelines" section for a list of supported service names.)

Defaults

All TCP/UDP ports are open by default.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command only applies to TCP/UDP service ports opened by default. It does not affect ports that are opened by applications, such as RIP, BGP, and so on.
- Use the **all** option with this command to configure access to all well-known TCP/UDP service ports.
- To designate which port to enable or disable, specify either the name of a service or the well-known port number associated with that service. Specifying a name and a port number in a single command line is not supported.
- When using service names, it is possible to specify more than one service in a single command line by entering each service name separated by a space. See the following examples.
- When specifying a service port number, the **port** keyword is required and that only one port number is allowed in a single command.
- The following table lists the **ip service** command options for specifying TCP/UDP services and also includes the well-known port number associated with each service:

service name	port
ftp	21
ssh	22

service name	port
telnet	23
http	80
secure-http	443
avlan-http	260
avlan-secure-http	261
avlan-telnet	259
udp-relay	67
network-time	123
snmp	161
avlan-http-proxy	262

Examples

```
-> ip service all
-> ip service ftp telnet snmp
-> ip service port 261
-> no ip service ftp snmp
-> no ip service all
```

Release History

Release 6.1; command introduced.

Related Commands

show ip service	Displays a list of all well-known TCP/UDP ports and their current status (enabled or disabled).

MIB Objects

```
alaIpServiceTable
   alaIpServiceType
   alaIpServicePort
   alaIpServiceStatus
alaIpPortServiceTable
   alaIpPortServicePort
   alaIpPortServiceStatus
```

ip redist

Controls the conditions for redistributing IPv4 routes between different protocols.

[vrf *name***] ip redist {local | static | rip | ospf | isis | bgp | import} into {rip | ospf | isis | bgp} route-map** *route-map-name* **[status {enable | disable}]**

no ip redist {local | static | rip | ospf | isis | bgp | import} into {rip | ospf | isis | bgp} [route-map *route-map-name***]**

Syntax Definitions

local	Redistributes local routes.
static	Redistributes static routes.
import	Redistibute imported routes into other routing protocols.
rip	Specifies RIP as the source or destination (into) protocol.
ospf	Specifies OSPF as the source or destination (into) protocol.
isis	Specifies IS-IS as the source or destination (into) protocol.
bgp	Specifies BGP as the source or destination (into) protocol.
route-map-name	Name of an existing route map that will control the redistribution of routes between the source and destination protocol.
enable	Enables the administrative status of the redistribution configuration.
disable	Disables the administrative status of the redistribution configuration.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a route map redistribution configuration. If a route map name is not specified, all route maps associated with the redistribution configuration are removed.
- The source and destination protocols must be loaded and enabled before redistribution occurs.
- If the metric calculated for the redistributed route, is greater than 15 (RIP_UNREACHABLE) or greater than the metric of an existing pure RIP route, the new route is not redistributed.
- Use the **ip route-map** commands described in this chapter to create a route map. Refer to the "Configuring IP" chapter in the *OmniSwitch AOS Release 6 Network Configuration Guide* for more information about how to create a route map.

- By default, import routes are least preferred.

Examples

```
-> ip redist rip into bgp route-map rip-to-bgp1
-> ip redist rip into bgp route-map rip-to-bgp2
-> no ip redist rip into bgp route-map rip-to-bgp2
-> ip redist ospf into rip route-map ospf-to-rip
-> ip redist ospf into rip route-map ospf-to-rip disable
-> ip redist import into ospf route-map R1 status enable
```

Release History

Release 6.1.3; command introduced.
Release 6.2.1; **isis** parameter support added.
Release 6.4.5; **vrf** and **import** parameters added.

Related Commands

show ip redist	Displays the route map redistribution configuration.
ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
ip import vrf	Configures a route map to import routes from GRT to the destination VRF.
show ip import	Displays the import route configuration details.

MIB Objects

```
alaRouteMapRedistProtoTable
   alaRouteMapRedistSrcProtoId
   alaRouteMapRedistDestProtoId
   alaRouteMapRedistRouteMapIndex
   alaRouteMapRedistStatus
   alaRouteMapRedistAddressType
   alaRouteMapRedistRowStatus
```

ip access-list

Creates an access list for adding multiple IPv4 addresses to route maps.

ip access-list *access-list-name*

no ip access-list *access-list-name*

Syntax Definitions

access-list-name	Name of the access list (up to 20 characters).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the **no** form of this command to delete the access list.

Examples

```
-> ip access-list access1
-> no ip access-list access1
```

Release History

Release 6.1.3; command introduced.

Related Commands

ip access-list address	Adds IPv4 addresses to the specified IPv4 access list.
show ip access-list	Displays the details of the access list.

MIB Objects

```
alaRouteMapAccessListNameTable
   alaRouteMapAccessListName
   alaRouteMapAccessListNameIndex
   alaRouteMapAccessListNameAddressType
   alaRouteMapAccessListNameRowStatus
```

ip access-list address

Adds multiple IPv4 addresses to the specified IPv4 access list.

ip access-list *access-list-name* **address** *address/prefixLen* **[action {permit | deny}] [redist-control {all-subnets | no-subnets | aggregate}]**

no ip access-list *access-list-name* **address** *address/prefixLen*

Syntax Definitions

access-list-name	Name of the access list.
address/prefixLen	IP address/prefix length to be added to the access list.
permit	Permits the IP address.
deny	Denies the IP address.
all-subnets	Permits or denies all the subnet routes that match the network portion of the IP address as specified by the mask length.
no-subnets	Permits or denies only those routes that exactly match the IP address and the mask length.
aggregate	Permits an aggregate route if there are one or more routes that match or are subnets of this address.

Defaults

parameter	default
permit | **deny**	**permit**
all-subnets | **no-subnets** | **aggregate**	**all-subnets**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the address from the access list.
- The *access-list-name* must exist before you add multiple addresses to it.
- The **action** parameters (**permit** and **deny**) determine if a route that matches the **redist-control** configuration for the IP address is allowed or denied redistribution.
- The **redist-control** parameters (**all-subnets, no-subnets**, and **aggregate**) defines the criteria used to determine if a route matches an address in the access list.
- Configuring the combination of **redist-control aggregate** with **action deny** is not allowed.

- Use this command multiple times with the same access list name to add multiple addresses to the existing access list.

Examples

```
-> ip access-list access1 address 10.0.0.0/8 action permit
-> ip access-list access1 address 11.1.0.0/16 action permit
-> ip access-list access1 address 10.1.1.0/24 redist-control aggregate
-> no ip access-list access1 address 10.0.0.0/8
```

Release History

Release 6.1.3; command introduced.

Related Commands

ip access-list	Creates an access list for adding multiple IPv4 addresses to route maps.
show ip access-list	Displays the contents of an IPv4 access list.

MIB Objects

```
alaRouteMapAccessListTable
   alaRouteMapAccessListIndex
   alaRouteMapAccessListAddress
   alaRouteMapAccessListAddressType
   alaRouteMapAccessListPrefixLength
   alaRouteMapAccessListAction
   alaRouteMapAccessListRedistControl
   alaRouteMapAccessListRowStatus
```

ip route-map action

Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.

ip route-map *route-map-name* **[sequence-number** *number***] action {permit | deny}**

no ip route-map *route-map-name* **[sequence-number** *number***]**

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
permit	Selects a route.
deny	Filters a route.

Defaults

parameter	default
number	50
permit | deny	**permit**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the entire route map by specifying only the *route-map-name*.
- Use the **no** form of this command to delete a specific sequence in the route map by specifying the **sequence-number**.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- Use this command to change the status of an existing route map to permit or deny.

Examples

```
-> ip route-map route1 sequence-number 10 action permit
-> no ip route-map route1
```

Release History

Release 6.1.3; command introduced.

Related Commands

show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapSequenceTable
   alaRouteMapSequenceIndex
   alaRouteMapSequenceNumber
   alaRouteMapSequenceAction
   alaRouteMapSequenceRowStatus
```

ip route-map match ip address

Matches the route with the specified IPv4 address or an address defined in the specified IPv4 access list.

ip route-map *route-map-name* **[sequence-number** *number***] match ip-address {***access-list-name* **|** *ip_address/prefixLen* **[redist-control {all-subnets | no-subnets | aggregate}] [permit | deny]**

no ip route-map *route-map-name* **[sequence-number** *number***] match ip-address {***access-list-name* **|** *ip_address/prefixLen* **[redist-control {all-subnets | no-subnets | aggregate}] [permit | deny]**

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
access-list-name	The name of an IPv4 access list that contains IPv4 addresses to match.
ip_address/prefixLen	The destination IP address along with the prefix length of the routes to be selected.
all-subnets	Selects all the subnet routes that match the network portion of the IP address as specified by the mask length.
no-subnets	Selects only those routes that exactly match the IP address and the mask length.
aggregate	Creates an aggregate route if there are one or more routes that match the IP address.
permit	Permits a route based on the IP address or prefix constrained by redist-control.
deny	Denies a route based on the IP address or prefix constrained by redist-control.

Defaults

parameter	default
number	50
permit | deny	**permit**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **match ip-address redist-control** parameter in the route map.
- Specify either the name of an existing IPv4 access list or an IPv4 address/prefix length with this command.

- Configuring the combination of **redist-control aggregate** with **deny** is not allowed.
- Multiple addresses in the same route map sequence are matched using the longest prefix match.
- If the best matching address is type **deny**, then the route is not selected. If the best matching address is type permit and the route map action is deny, the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name*, **sequence-number,** and *access-list-name* (if used) must exist before you configure this **match** criteria.

Examples

```
-> ip route-map 3 match ip-address 10.1.1.1/8 redist-control no-subnets deny
-> no ip route-map 3 match ip-address 10.1.1.1 redist-control no-subnets deny
-> ip route-map route1 sequence-number 10 match ip-address list1
-> no ip route-map route1 sequence-number 10 match ip-address list1
```

Release History

Release 6.1.3; command introduced.

Related Commands

ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
ip access-list	Creates an access list for adding multiple IPv4 addresses to route maps.
ip access-list address	Adds IPv4 addresses to the specified IPv4 access list.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match ipv6 address

Matches the route with the specified IPv6 address or an address defined in the specified IPv6 access list.

ip route-map *route-map-name* **[sequence-number** *number***] match ipv6-address** {access-list-name | *ipv6_address/prefixLen* **[redist-control {all-subnets | no-subnets | aggregate}] [permit | deny]**

no ip route-map *route-map-name* **[sequence-number** *number***] match ipv6-address** *ipv6_address/prefix-Len* **[redist-control {all-subnets | no-subnets | aggregate}] [permit | deny]**

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
access-list-name	The name of an IPv4 access list that contains IPv4 addresses to match.
ipv6_address/prefixLen	The destination IPv6 address along with the prefix length of the routes to be selected.
all-subnets	Selects all the subnet routes that match the network portion of the IP address as specified by the mask length.
no-subnets	Selects only those routes that exactly match the IP address and the mask length.
aggregate	Creates an aggregate route if there are one or more routes that match the IPv6 address.
permit	Permits a route based on the IPv6 address or prefix constrained by redist-control.
deny	Denies a route based on the IPv6 address or prefix constrained by redist-control.

Defaults

parameter	default
number	50
permit | deny	**permit**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **match ipv6-address redist-control** parameter in the route map.
- Specify either the name of an existing IPv6 access list or an IPv6 address/prefix length with this command.

- Configuring the combination of **redist-control aggregate** with **deny** is not allowed.
- Multiple addresses in the same route map sequence are matched using the longest prefix match.
- If the best matching address is type **deny**, then the route is not selected. If the best matching address is type permit and the route map action is **deny**, the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map 3 match ipv6-address 2001::1/64 redist-control no-subnets deny
-> no ip route-map 3 match ipv6-address 2001::1/64 redist-control no-subnets deny
-> ip route-map route1 sequence-number 10 match ipv6-address list1
-> no ip route-map route1 sequence-number 10 match ipv6-address list1
```

Release History

Release 6.1.3; command introduced.

Related Commands

ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
ipv6 access-list	Creates an access list for adding multiple IPv6 addresses to route maps.
ipv6 access-list address	Adds IPv6 addresses to the specified IPv6 access list.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match ip-nexthop

Matches any routes that have a next-hop router address permitted by the specified access list name or the IP address specified in the route map.

ip route-map *route-map-name* **[sequence-number** *number***] match ip-nexthop {***access-list-nam***e** | *ip_address/prefixLen* **[permit | deny]}**

no ip route-map *route-map-name* **[sequence-number** *number***] match ip-nexthop {***access-list-nam***e** | *ip_address/prefixLen* **[permit | deny]}**

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
access-list-name	The access list that matches the route nexthop IP address.
ip_address/prefixLen	The IP address along with the prefix length that matches any nexthop IP address within the specified subnet.
permit	Permits a route based on the IP nexthop.
deny	Denies a route based on the IP nexthop.

Defaults

parameter	default
number	50
permit | deny	**permit**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **match ip-nexthop** parameter in the route map.
- If the best matching nexthop is type deny, then the route is not selected. If the best matching nexthop is type permit and the route map action is deny, the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name*, **sequence-number,** and *access-list-name* must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match ip-nexthop list1
-> no ip route-map route1 sequence-number 10 match ip-nexthop list1
-> ip route-map route1 sequence-number 10 match ip-nexthop 10.0.0.0/8
-> no ip route-map route1 sequence-number 10 match ip-nexthop 10.0.0.0/8
```

Release History

Release 6.1.3; command introduced.

Related Commands

ip access-list	Creates an access list for adding multiple IPv4 addresses to route maps.
ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match ipv6-nexthop

Matches any routes that have an IPv6 next-hop router address permitted by the specified access list name or the IPv6 address specified in the route map.

ip route-map *route-map-name* **[sequence-number** *number***] match ipv6-nexthop {***access-list-name* **|** *ipv6_address/prefixLen* **[permit | deny]}**

no ip route-map *route-map-name* **[sequence-number** *number***] match ipv6-nexthop {***access-list-name* **|** *ipv6_address/prefixLen* **[permit | deny]}**

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
access-list-name	The access list that matches the route nexthop IPv6 address.
ipv6_address/prefixLen	The IPv6 address along with the prefix length that matches any nexthop IPv6 address within the specified subnet.
permit	Permits a route based on the IPv6 nexthop.
deny	Denies a route based on the IPv6 nexthop.

Defaults

parameter	default
number	50
permit | deny	**permit**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **match ipv6-nexthop** parameter in the route map.
- If the best matching nexthop is type deny, then the route is not selected. If the best matching nexthop is type permit but the route map action is deny, the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name*, **sequence-number,** and *access-list-name* must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match ipv6-nexthop list1
-> no ip route-map route1 sequence-number 10 match ipv6-nexthop list1
-> ip route-map route1 sequence-number 10 match ipv6-nexthop 2001::/64
-> no ip route-map route1 sequence-number 10 match ipv6-nexthop 2001::/64
```

Release History

Release 6.1.3; command introduced.

   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match tag

Matches the tag value specified in the route map with the one that the routing protocol learned the route on.

ip route-map *route-map-name* **[sequence-number** *number***] match tag** *tag-number* **[name** *tag-name***]**

no ip route-map *route-map-name* **[sequence-number** *number***] match tag** *tag-number* **[name** *tag-name***]**

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
tag-number	The tag number.
tag-name	The name of the tag.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **match tag** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match tag 4
-> no ip route-map route1 sequence-number 10 match tag 4
```

Release History

Release 6.1.3; command introduced.
Release 6.4.5; **tag-name** parameter added.

Related Commands

ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex

   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match ipv4-interface

Matches the IPv4 interface name specified in the route map with the one that the routing protocol learned the route on.

ip route-map *route-map-name* **[sequence-number** *number***] match ipv4-interface** *interface-name*

no ip route-map *route-map-name* **[sequence-number** *number***] match ipv4-interface** *interface-name*

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
interface-name	Specifies the name of the outgoing interface of the route.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **match ipv4-interface** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match ipv4-interface int4
-> no ip route-map route1 sequence-number 10 match ipv4-interface int4
```

Release History

Release 6.1.3; command introduced.

Related Commands

ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

```

ip route-map match ipv6-interface

Matches the IPv6 interface name specified in the route map with the one that the routing protocol learned the route on.

ip route-map *route-map-name* **[sequence-number** *number***] match ipv6-interface** *interface-name*

no ip route-map *route-map-name* **[sequence-number** *number***] match ipv6-interface** *interface-name*

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
interface-name	Specifies the name of the outgoing interface of the route.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **match ipv6-interface** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match ipv6-interface int6
-> no ip route-map route1 sequence-number 10 match ipv6-interface int6
```

Release History

Release 6.1.3; command introduced.

Related Commands

ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match metric

Matches the metric value specified in the route map with the actual metric value of the route.

ip route-map *route-map-name* **[sequence-number** *number***] match metric** *metric* **[deviation** *deviation***]**

no ip route-map *route-map-name* **[sequence-number** *number***] match metric** *metric* **[deviation** *deviation***]**

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
metric	The metric value that matches a specified metric.
deviation	The deviation value. If deviation is included, the route metric can have any value within the range (metric-deviation to metric+deviation).

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **match metric** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match metric 4
-> no ip route-map route1 sequence-number 10 match metric 4
```

Release History

Release 6.1.3; command introduced.

Related Commands

ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match route-type

Matches the specified route type with actual route type of the route.

ip route-map *route-map-name* **[sequence-number** *number***] match route-type {internal | external [type1 | type2] | level1 | level2}**

no ip route-map *route-map-name* **[sequence-number** *number***] match route-type {internal | external [type1 | type2] | level1 | level2}**

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
internal	Matches OSPF/BGP internal routes.
external	Matches OSPF/BGP external routes.
type1	Matches OSPF external Type-1 routes, which gives the full metric calculation for the complete path including internal as well as external cost.
type2	Matches OSPF external Type-2 routes, which gives the external redistribution metric only to the ASBR.
level1	Matches IS-IS Level-1 routes only.
level2	Matches IS-IS Level-2 routes only.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **match route-type** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 match route-type internal
-> no ip route-map 111 sequence-number 50 match route-type internal
```

Release History

Release 6.1.3; command introduced.
Release 6.2.1; **level1** and **level2** parameter support added.

Related Commands

ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match protocol

Matches the protocol specified in the route map with the protocol of the route.

ip route-map *route-map-name* **[sequence-number** *number***] match protocol {local | static | rip | ospf | isis | bgp}**

no ip route-map *route-map-name* **[sequence-number** *number***] match protocol {local | static | rip | ospf | isis | bgp}**

Syntax Definitions

route-map-name	The name of the route map.
number	A number that links together the route maps. The range is 1–100.
local	Matches a local interface route.
static	Matches a static route.
rip	Matches a RIP route.
ospf	Matches an OSPF route.
ISIS	Matches an ISIS route.
bgp	Matches a BGP route.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **match protocol** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match protocol local
-> no ip route-map route1 sequence-number 10 match protocol local
```

Release History

Release 6.1.3; command introduced.

Related Commands

ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set metric

Configures the metric value of the route being distributed.

ip route-map *route-map-name* **[sequence-number** *number***] set metric** *metric*
[effect {add | subtract | replace | none}]

no ip route-map *route-map-name* **[sequence-number** *number***] set metric** *metric*
[effect {add | subtract | replace | none}]

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
metric	Configures the metric value of the route being distributed. A value of 0 is not allowed.
add	Adds the configured metric value to the actual metric value.
subtract	Subtracts the configured metric value from the actual metric value.
replace	Replaces the actual metric value with the configured metric value.
none	Uses the routes the actual metric value. The configured metric value is ignored. Use any value except 0.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **set metric** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **set** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 set metric 30 effect add
-> no ip route-map 111 sequence-number 50 set metric 30 effect add
```

Release History

Release 6.1.3; command introduced.

Related Commands

ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set metric-type

Configures the metric type for the redistributed route.

ip route-map *route-map-name* **[sequence-number** *number***] set metric-type {internal | external [type1 | type2]}**

no ip route-map *route-map-name* **[sequence-number** *number***] set metric-type {internal | external [type1 | type2]}**

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
internal	Sets the metric type to internal for routes redistributed into BGP.
external	Sets the metric type to external for routes redistributed into BGP.
type1	Sets the metric type to external type1 for routes redistributed into OSPF, which gives the full metric calculation for the complete path including internal as well as external cost.
type2	Sets the metric type to external type2 for routes redistributed into OSPF, which gives the external redistribution metric only to the ASBR.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **set metric-type** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **set** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 set metric-type internal
-> no ip route-map 111 sequence-number 50 set metric-type internal
```

Release History

Release 6.1.3; command introduced.

Related Commands

```

ip route-map set tag

Configures the tag value of the selected routes.

ip route-map *route-map-name* **[sequence-number** *number***] set tag** *tag-number*

no ip route-map *route-map-name* **[sequence-number** *number***] set tag** *tag-number*

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
tag-number	Configures the tag number.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **set tag** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** exist before you configure this **set** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 set tag 23
-> no ip route-map 111 sequence-number 50 set tag 23
```

Release History

Release 6.1.3; command introduced.

Related Commands

ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set community

Configures the community name of the route being redistributed into BGP.

ip route-map *route-map-name* **[sequence-number** *number***] set community** *community-string*

no ip route-map *route-map-name* **[sequence-number** *number***] set community** *community-string*

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
community-string	Defines a community for an aggregate route. Community names range from 0 to 70 characters.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **set community** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** exist before you configure this **set** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 set community 29
-> no ip route-map 111 sequence-number 50 set community 29
```

Release History

Release 6.1.3; command introduced.

Related Commands

ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set local-preference

Configures the local preference value for a route being distributed into BGP.

ip route-map *route-map-name* **[sequence-number** *number***] set local-preference** *value*

no ip route-map *route-map-name* **[sequence-number** *number***] set local-preference** *value*

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
value	Configures the local-preference value for routes being redistributed in to BGP. The value is between 0 and 4294967295.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **set local-preference** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** exist before you configure this **set** criteria.
- The local preference attribute is used to set preference to an exit point from the local autonomous system (AS).
- If there are multiple exit points from the AS, the local preference attribute is used to select the exit point for a specific route.

Examples

```
-> ip route-map 111 sequence-number 50 set local-preference 4
-> no ip route-map 111 sequence-number 50 set local-preference 4
```

Release History

Release 6.1.3; command introduced.

Related Commands

ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set level

Configures the level of the ISIS route being redistributed.

ip route-map *route-map-name* **[sequence-number** *number***] set level {level1 | level2 | level1-2}**

no ip route-map *route-map-name* **[sequence-number** *number***] set level {level1 | level2 | level1-2}**

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
level1	Matches IS-IS Level-1 routes only.
level2	Matches IS-IS Level-2 routes only.
level1-2	Matches IS-IS Level1-2 routes**.**

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **set level** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** exist before you configure this **set** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 set level level1
-> no ip route-map 111 sequence-number 50 set level level1
```

Release History

Release 6.2.1; command introduced.

Related Commands

ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set ip-nexthop

Configures the IP address of the next hop in a route map.

ip route-map *route-map-name* **[sequence-number** *number***] set ip-nexthop** *ip_address*

no ip route-map *route-map-name* **[sequence-number** *number***] set ip-nexthop** *ip_address*

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
ip_address	IP address of the next hop.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **set ip-nexthop** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** exist before you configure this **set** criteria.

Examples

```
-> ip route-map 222 sequence-number 50 set ip-nexthop 128.251.17.224
-> no ip route-map 222 sequence-number 50 set ip-nexthop 128.251.17.224
```

Release History

Release 6.1.5; command introduced.

Related Commands

ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaIPRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence

   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set ipv6-nexthop

Configures the IPv6 address of the next hop in a route map.

ip route-map *route-map-name* **[sequence-number** *number***] set ipv6-nexthop** *ipv6_address*

no ip route-map *route-map-name* **[sequence-number** *number***] set ipv6-nexthop** *ipv6_address*

Syntax Definitions

route-map-name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
ipv6_address	IPv6 address of the next hop.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the **set ipv6-nexthop** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** exist before you configure this **set** criteria.

Examples

```
-> ip route-map 222 sequence-number 50 set ipv6-nexthop 2001::1
-> no ip route-map 222 sequence-number 50 set ipv6-nexthop 2001::1
```

Release History

Release 6.1.5; command introduced.

Related Commands

ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaIPRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

vrf

Configures and selects a virtual routing and forwarding (VRF) instance on the switch.

vrf [*name* | **default]**

no vrf *name*

Syntax Definitions

name	The alphanumeric name (1–20 characters) assigned to the VRF instance.
default	Optional. Selects the default VRF instance.

Defaults

A default VRF instance exists in the switch configuration. All applications that are not VRF aware belong to this instance.

Parameter	Default
name | **default**	default VRF instance

Platforms Supported

OmniSwitch 9000E, 6855-U24X

Usage Guidelines

- Use the **no** form of this command to delete a VRF instance. Deleting the default instance is not allowed. In addition, any interfaces configured for a VRF instance are automatically removed when the instance is deleted.
- To return to the default VRF instance from within the context of another instance, enter the **vrf** command with or without the optional **default** parameter (for example, **vrf** or **vrf default**).
- Configuring a VRF instance name is case sensitive. In addition, if the name specified does not exist, a VRF instance is automatically created. As a result, it is possible to create instances or delete the wrong instance by accident. Use the **show ip dynamic-proxy-arp** command to verify the VRF instance configuration before adding or removing instances.
- If the name of an existing instance is specified with this command, VRF changes the command prompt to reflect the specified instance name. All CLI commands entered at this point are applied within the context of the active VRF instance.
- It is also possible to configure other instances from within the CLI context of the default VRF instance by entering the **vrf** command followed by the instance name. For example, entering **vrf IpOne ip interface intf100 address 100.1.1.1/24 vlan 100** is applied to the IpOne instance even though IpOne is not the active CLI context.

Examples

```
-> vrf IpOne
IpOne: ->

IpOne: -> vrf IpTwo
IpTwo: ->

IpTwo: -> vrf
->

IpTwo: -> vrf default
->

-> vrf IpOne ip interface intf100 address 100.1.1.1/24 vlan 100
->
```

Release History

Release 6.4.1; command introduced.

Related Commands

show vrf	Displays the VRF instance configuration for the switch.

MIB Objects

```
alaVirutalRouterNameTable
   alaVirtualRouterName
```

ip export route-map

Configures a route map to export routes from the source VRF to Global Routing Table (GRT). Only those FDB (Forwarding Routing Database) routes that match the conditions of the route map is exported to GRT.

[vrf *name***] ip export route-map** *route-map-name*

[vrf *name***] no ip export**

Syntax Definitions

name	The alphanumeric name (1–20 characters) assigned to the VRF instance. Routes are exported from the specified VRF to GRT.
route-map-name	Name of the configured route map. This route map controls export of routes from the source VRF FRD to GRT.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- If VRF is not configured, the routes are exported from the Default VRF to GRT.
- Use the **no** form of this command to disable exporting of routes from the VRF to GRT.
- Create a route-map and define protocol preference for the export policy route map by using **ip route-map** command. This route map controls export of routes from the VRF FDB to GRT. Refer to "Configuring IP" chapter in the *OmniSwitch AOS Release 6 Network Configuration Guide* for more information on how to create a route map.
- Route map configured for an export policy can contain any of the following filter and set options:
  - Filter options: ip-address, ip-next-hop, tag, protocol, ipv4-interface, metric, route-type
  - Set option: tag, metric
- Only one route map can be configured as export policy in a VRF.
- You cannot modify a route map that is tagged to an export policy.
- Route leaking between VRFs only supports IPv4 routes.

Examples

```
-> ip export route-map R1

-> vrf vrf2 ip export route-map R1

-> vrf vrf1
```

```
vrf1::-> ip export route-map R1

-> no ip export
```

Release History

Release 6.4.5; command introduced.

Related Commands

vrf	Configures and selects a virtual routing and forwarding (VRF) instance on the switch.
ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
ip route-map match protocol	Matches the protocol specified in the route map with the protocol of the route.
show ip export	Displays the configured route map for exporting routes to GRT.
show ip global-route-table	Displays the Global Routing Table (GRT) for all the routes that are exported from the VRFs. This command can be executed only in default VRF.
show ip route-map	Displays the IP route maps configured on the switch.

MIB Objects

```
alaIprmConfig
   alaIprmExportRouteMap
```

ip import vrf

Configures a route map to import routes from GRT to the destination VRF from a given source VRF. The route-map is used to filter routes.

[vrf *name***] ip import vrf {***src-vrf-name* **| default} route-map** *route-map-name*

[vrf *name***] no ip import vrf {***src-vrf-name* **| default}**

Syntax Definitions

name	The alphanumeric name (1–20 characters) assigned to the VRF instance.
src-vrf-name	The export (source) VRF instance name. The routes will be imported from the specified VRF.
default	Default VRF. The routes will be imported from the default VRF.
route-map-name	Name of the configured route map. This route map controls the import of routes from GRT to the destination VRF RDB.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove importing of routes from GRT from the specified export VRF.
- Create a route-map and define the criteria that a route must match by using **ip route-map match** command. This route map controls export of routes from the VRF FDB (Forwarding Routing Database) to GRT based on the match. Refer to “Configuring IP” chapter in the *OmniSwitch AOS Release 6 Network Configuration Guide* for more information on how to create a route map.
- Route map configured for the import policy can contain any of the following filter and set options:
  - Filter options: ip-address, ip-next-hop, tag, metric
  - Set option: tag, metric
- Only one route map can be configured for an import policy for each export VRF.
- You cannot modify a route map tagged to an import policy.
- Leaked routes are only for forwarding. If a local route is leaked, that interface is not accessible in the importing VRF. Another switch will not be able to ping the interface in the import VRF.
- Leaked routes are only for forwarding plane. If a local route is leaked, that interface is not present in the importing VRF's control plane. Hence, switch will not be able to ping the interface in the import VRF as the ping is handled in the control plane.

Examples

```
-> ip import vrf V1 import route-map R2
-> no ip import VRF V1
```

Release History

Release 6.4.5; command introduced.

Related Commands

vrf	Configures and selects a virtual routing and forwarding (VRF) instance on the switch.
ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
ip route-map match protocol	Matches the protocol specified in the route map with the protocol of the route.
show ip import	Displays the route map and the source VRF combination configured for importing routes.
show ip global-route-table	Displays the Global Routing Table (GRT) for all the routes that are exported from the VRFs. This command can be executed only in default VRF.
show ip route-map	Displays the IP route maps configured on the switch.

MIB Objects

```
alaIprmImportVrfTable
   alaIprmImportVrfName
   alaIprmImportVrfRouteMap
   alaIprmImportVrfRowStatus
```

show ip export

Displays the configured route map for exporting routes to GRT.

[vrf *name***] show ip export**

Syntax Definitions

name	The alphanumeric name (1–20 characters) assigned to the VRF instance.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

If a VRF is specified, configured export route map for that VRF is displayed.

Examples

```
-> show ip export
Configured Route Map = r1
```

Release History

Release 6.4.5; command introduced.

Related Commands

ip export route-map	Configures a route map to export routes from the source VRF to Global Routing Table (GRT).

MIB Objects

```
alaIprmConfig
   alaIprmExportRouteMap
```

show ip import

Displays the route map and the source VRF combination configured for importing routes.

[vrf *name***] show ip import**

Syntax Definitions

name	The alphanumeric name (1–20 characters) assigned to the VRF instance.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

If a VRF is specified, the import route map configurations for that VRF is displayed.

Examples

```
-> show ip import
Export Vrf Name      RouteMap
--------------------+-------------------
customer1            leak-in
customer2            import-filter
vrf3                 in-filter
```

output definitions

VRF Name	The name of the export/source VRF from where the routes are imported.
RouteMap	The route-map name.

Release History

Release 6.4.5; command introduced.

Related Commands

ip import vrf	Configures a route map to import routes from GRT to the destination VRF from a given source VRF.

MIB Objects

```
alaIprmImportVrfTable
   alaIprmImportVrfName
   alaIprmImportVrfRouteMap
   alaIprmImportVrfRowStatus
```

show ip global-route-table

Displays the Global Routing Table (GRT) for all the routes that are exported from the VRFs. This command can be executed only in default VRF.

show ip global-route-table [export-vrf *name***]**

Syntax Definitions

name	The alphanumeric name (1–20 characters) assigned to the VRF instance.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

```
-> show ip global-route-table
Total 3 routes From All VRFs

Export VRF Name Dest Address  Subnet Mask     Gateway Addr   Metric   Tag
---------------+-------------+--------------+--------------+-------+-------
customer2        10.1.0.0     255.0.0.0       12.1.1.2        1       100
customer2        11.0.0.0     255.255.0.0     12.1.1.3        2       5
customer3        12.0.0.0     255.255.255.0   129.168.1.2     1       0
```

output definitions

VRF Name	The name of the VRF from where the routes were exported.
Destination	The address of the route.
Gateway	The next hop for the destination address.
Metric	The metric of the exported route.
Tag	The tag of the exported route.

Release History

Release 6.4.5; command introduced.

Related Commands

ip export route-map	Configures a route map to export routes from the source VRF to Global Routing Table (GRT).
show ip export	Displays the configured route map for exporting routes to GRT.

MIB Objects

```
alaGrtRouteTable
   alaGrtRouteDest
   alaGrtRouteMaskLen
   alaGrtRouteNextHop
   alaGrtRouteMetric
   alaGrtRouteTag
   alaGrtRouteVrfName
```

arp

Adds a permanent entry to the ARP table. To forward packets, the switch dynamically builds an ARP Table to match the IP address of a device with its physical (MAC) address. These entries age out of the table when the timeout value is exceeded. This command is used to add a permanent entry to the table. Permanent entries do not age out of the table.

arp *ip_address hardware_address* **[alias] [arp-name** *name***]**

no arp *ip_address* **[alias]**

Syntax Definitions

ip_address	IP address of the device you are adding to the ARP table.
hardware_address	MAC address of the device in hexadecimal format (for example,, 00.00.39.59.f1.0c).
alias	Specifies that the switch will act as an alias (or proxy) for this IP address. When the alias option is used, the switch responds to all ARP requests for the specified IP address with its own MAC address. You can also enable the proxy feature for an IP interface using the **ip interface** command. When enabled, ARP requests return the MAC address of the IP router interface and all traffic within the VLAN is routed.
name	The name to assign to this ARP entry.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete a permanent ARP entry.
- Using the **arp alias** command is not related to proxy ARP as defined in RFC 925. Instead, **arp alias** is similar to the Local Proxy ARP feature, except that it is used to configure the switch as a proxy for only *one* IP address.
- Because most hosts support the use of address resolution protocols to determine cache address information (called dynamic address resolution), you generally do not need to specify permanent ARP cache entries.
- Only the IP address is required when deleting an ARP entry from the table.

Examples

```
-> arp 171.11.1.1 00:05:02:c0:7f:11
```

Release History

Release 6.1; command introduced.

Related Commands

clear arp-cache	Deletes all dynamic entries from the ARP table.
ip interface	Enables or disables the Local Proxy ARP feature for an IP interface. When enabled, all traffic within the VLAN is routed. ARP requests return the MAC address of the IP router interface.
show arp	Displays the ARP table.

MIB Objects

```
ipNetToMediaTable
   ipNetToMediaIfIndex
   ipNetToMediaNetAddress
   ipNetToMediaPhyAddress
   ipNetToMediaType
alaIpNetToMediaTable
   alaIpNetToMediaPhyAddress
   alaIpNetToMediaProxy
```

clear arp-cache

Deletes all dynamic entries from the ARP table.

clear arp-cache

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This commands only clears dynamic entries. If permanent entries have been added to the table, they must be removed using the **no** form of the **arp** command.
- Dynamic entries remain in the ARP table until they time out after a period of 8 minutes.

Examples

```
-> clear arp-cache
```

Release History

Release 6.1; command introduced.

Related Commands

arp	Adds a permanent entry to the ARP table.
show arp	Displays the ARP table.

MIB Objects

```
alaIpClearArpCache
```

ip dos arp-poison restricted-address

Adds or deletes an ARP Poison restricted address.

ip dos arp-poison restricted-address *ip_address*

no ip dos arp-poison restricted-address *ip_address*

Syntax Definitions

ip_address	32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the **no** form of the command to remove an already configured ARP Poison restricted address.

Examples

```
-> ip dos arp-poison restricted-address 192.168.1.1
-> no ip dos arp-poison restricted-address 192.168.1.1
```

Release History

Release 6.3.1; command introduced.

Related Commands

show ip dos arp-poison	Displays the number of attacks detected for configured ARP poison restricted-addresses.

MIB Objects

```
alaDoSArpPoisonTable
   alaDoSArpPoisonIpAddr
   alaDosArpPoisonRowStatus
```

arp filter

Configures an ARP filter that will determine if ARP Request packets containing a specific IP address are processed by the switch or discarded.

arp filter *ip_address* **[mask** *ip_mask***] [***vid***] [sender | target] [allow | block]**

no arp filter *ip_address*

Syntax Definitions

ip_address	The IP address to use for filtering ARP packet IP addresses.
ip_mask	An IP mask that identifies which part of the ARP packet IP address is examined for filtering (for example, mask 255.0.0.0 filters on the first octet of the ARP packet IP address).
vid	A VLAN ID that specifies that only ARP packets for a specific VLAN are filtered.
sender	The sender IP address in the ARP packet is used for ARP filtering.
target	The target IP address in the ARP packet is used for ARP filtering.
allow	ARP packets that meet filter criteria are processed.
block	ARP packets that meet filter criteria are discarded.

Defaults

parameter	default
vid	0 (no VLAN)
ip_mask	255.255.255.255
sender | **target**	**target**
allow | **block**	**block**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete an ARP filter.
- If there are no filters configured for the switch, all ARP Request packets received are processed.
- Up to 200 filters are allowed on each switch.
- If sender or target IP address in an ARP Request packet does not match any filter criteria, the packet is processed by the switch.
- ARP filtering is used in conjunction with the Local Proxy ARP application; however, ARP filtering is available for use on its own and/or with other applications.

Examples

```
-> arp filter 171.11.1.1
-> arp filter 172.0.0.0 mask 255.0.0.0
-> arp filter 198.0.0.0 mask 255.0.0.0 sender
-> arp filter 198.172.16.1 vlan 200 allow
-> no arp filter 171.11.1.1
```

Release History

Release 6.1; command introduced.

Related Commands

clear arp filter	Clears all ARP filters from the filter database.
ip interface	Enables or disables the Local Proxy ARP feature on an IP interface. When enabled, all traffic within the VLAN is routed. ARP requests return the MAC address of the IP router interface.
show arp summary	Displays the ARP filter configuration.

MIB Objects

```
alaIpArpFilterTable
   alaIpArpFilterIpAddr
   alaIpArpFilterIpMask
   alaIpArpFilterVlan
   alaIpArpFilterMode
   alaIpArpFilterType
```

clear arp filter

Clears the ARP filter database of all entries.

clear arp filter

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

This commands clears all ARP filters configured on the switch. To remove an individual filter entry, use the **no** form of the **arp filter** command.

Examples

```
-> clear arp filter
```

Release History

Release 6.1; command introduced.

Related Commands

arp filter	Configures an ARP filter to allow or block the processing of specified ARP Request packets.
show arp summary	Displays the ARP filter configuration.

MIB Objects

```
alaIpClearArpFilter
```

icmp type

Enables or disables a specific type of ICMP message, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp type *type* **code** *code* **{{enable | disable} | min-pkt-gap** *gap***}**

Syntax Definitions

type	The ICMP packet type. This in conjunction with the ICMP code determines the type of ICMP message being specified.
code	The ICMP code type. This in conjunction with the ICMP type determines the type of ICMP message being specified.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
gap	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable | **disable**	disabled
gap	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command allows the user to enable or disable all types of ICMP messages and set the minimum packet gap between messages of the specified type. The ICMP message types are specified in RFC 792, and are listed below:

ICMP Message	Type	Code
echo reply	**0**	**0**
network unreachable	**0**	**3**
host unreachable	**3**	**1**
protocal unreachable	**3**	**2**
port unreachable	**3**	**3**
frag needed but DF bit set	**3**	**4**
source route failed	**3**	**5**
destination network unknown	**3**	**6**
destination host unknown	**3**	**7**
source host isolated	**3**	**8**
dest network admin prohibited	**3**	**9**
host admin prohibited by filter	**3**	**10**
network unreachable for TOS	**3**	**11**
host unreachable for TOS	**3**	**12**
source quench	**4**	**0**
redirect for network	**5**	**0**
redirect for host	**5**	**1**
redirect for TOS and network	**5**	**2**
redirect for TOS and host	**5**	**3**
echo request	**8**	**0**
router advertisement	**9**	**0**
router solicitation	**10**	**0**
time exceeded during transmit	**11**	**0**
time exceeded during reassembly	**11**	**1**
ip header bad	**12**	**0**
required option missing	**12**	**1**
timestamp request	**13**	**0**
timestamp reply	**14**	**0**
information request (obsolete)	**15**	**0**
information reply (obsolete)	**16**	**0**
address mask request	**17**	**0**
address mask reply	**18**	**0**

- While this command can be used to enable or disable all ICMP messages, some of the more common ICMP messages have their own CLI commands, as described in the pages below. The following ICMP messages have specific commands to enable and disable:

ICMP Message	Command
Network unreachable (type 0, code 3)	**icmp unreachable**
Host unreachable (type 3, code 1)	**icmp unreachable**
Protocol unreachable (type 3, code 2)	**icmp unreachable**
Port unreachable (type 3, code 3)	**icmp unreachable**
Echo reply (type 0, code 0)	**icmp echo**
Echo request (type 8, code 0)	**icmp echo**
Timestamp request (type 13, code 0)	**icmp timestamp**
Timestamp reply (type 14, code 0)	**icmp timestamp**
Address Mask request (type 17, code 0)	**icmp addr-mask**
Address Mask reply (type 18, code 0)	**icmp addr-mask**

- Enabling **Host unreachable** and **Network unreachable** messages is not recommended. Enabling these messages can cause switch instability due to high-CPU conditions, depending upon the volume of traffic required by these messages.

Examples

```
-> icmp type 4 code 0 enabled
-> icmp type 4 code 0 min-pkt-gap 40
-> icmp type 4 code 0 disable
```

Release History

Release 6.1; command introduced.

icmp unreachable

Enables or disables ICMP messages pertaining to unreachable destinations, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp unreachable [net-unreachable | host-unreachable | protocol-unreachable | port-unreachable] {{enable | disable} | min-pkt-gap *gap***}**

Syntax Definitions

net-unreachable	Sets the unreachable network ICMP message.
host-unreachable	Sets the unreachable host ICMP message.
protocol-unreachable	Sets the unreachable protocol ICMP message.
port-unreachable	Sets the unreachable port ICMP message.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
gap	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable | **disable**	disabled
gap	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command enables ICMP messages relating to unreachable destinations. Unreachable networks, hosts, protocols, and ports can all be specified.
- Enabling **host-unreachable** and **net-unreachable** messages are not recommended as it can cause the switch instability due to high-CPU conditions depending upon the volume of traffic required by these messages.
- The unreachable ICMP messages can also be enabled, disabled, and modified using the **icmp type** command. See the **icmp type** command information on the type and code for the unreachable ICMP messages.

Examples

```
-> icmp unreachable net-unreachable enable
-> icmp unreachable host-unreachable enable
```

```
-> icmp unreachable protocol-unreachable enable
-> icmp unreachable port-unreachable enable
-> icmp unreachable port-unreachable min-pkt-gap 50
```

Release History

Release 6.1; command introduced.

icmp echo

Enables or disables ICMP echo messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp echo [request | reply] {{enable | disable} | min-pkt-gap *gap***}**

Syntax Definitions

request	Specifies the echo request ICMP message.
reply	Specifies the echo reply ICMP message.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
gap	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable | disable	**enable**
gap	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command sets the ICMP echo messages. An echo request is sent to a destination, and must be responded to with an echo reply message that contains the original echo request.
- Using this command without specifying a request or reply will enable, disable, or set the minimum packet gap for both types.
- The echo ICMP messages can also be enabled, disabled, and modified using the **icmp type** command. See the **icmp type** command information on the type and code for the echo ICMP messages.

Examples

```
-> icmp echo reply enable
-> icmp echo enable
-> icmp echo request enable
-> icmp echo request min-pkt-gap 50
```

Release History

Release 6.1; command introduced.

```

icmp timestamp

Enables or disables ICMP timestamp messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp timestamp [request | reply] {{enable | disable} | min-pkt-gap *gap***}**

Syntax Definitions

request	Specifies timestamp request messages.
reply	Specifies timestamp reply messages.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
gap	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable | disable	**enable**
gap	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The data received (a timestamp) in the message is returned in the reply together with an additional timestamp. The timestamp is 32 bits of milliseconds since midnight UT. The Originate timestamp is the time the sender last touched the message before sending it, the Receive timestamp is the time the echoer first touched it on receipt, and the Transmit timestamp is the time the echoer last touched the message on sending it.
- Using this command without specifying a request or reply will enable, disable, or set the minimum packet gap for both types.
- The timestamp ICMP messages can also be enabled, disabled, and modified using the **icmp type** command. See the **icmp type** command information on the type and code for the timestamp ICMP messages.

Examples

```
-> icmp timestamp reply enable
-> icmp timestamp enable
-> icmp timestamp request enable
-> icmp timestamp request min-pkt-gap 50
```

Release History

Release 6.1; command introduced.

Related Commands

```

icmp addr-mask

Enables or disables ICMP address mask messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp addr-mask [request | reply] {{enable | disable} | min-pkt-gap *gap***}**

Syntax Definitions

request	Specifies request address mask messages.
reply	Specifies reply address mask messages.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
gap	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable | disable	**enable**
gap	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- A gateway receiving an address mask request return it with the address mask field set to the 32-bit mask of the bits identifying the subnet and network, for the subnet on which the request was received.
- Using this command without specifying a request or reply will enable, disable, or set the minimum packet gap for both types.
- The address mask ICMP messages can also be enabled, disabled, and modified using the **icmp type** command. See the **icmp type** command information on the type and code for the address mask ICMP messages.

Examples

```
-> icmp addr-mask reply enable
-> icmp addr-mask enable
-> icmp addr-mask request enable
-> icmp addr-mask request min-pkt-gap 50
```

Release History

Release 6.1; command introduced.

```

icmp messages

Enables or disables all Internet Control Message Protocol (ICMP) messages.

icmp messages {enable | disable}

Syntax Definitions

enable	Enables ICMP messages.
disable	Disables ICMP messages.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

```
-> icmp messages enable
-> icmp messages disable
```

Release History

Release 6.1; command introduced.

Related Commands

icmp type	Enables or disables a specific type of ICMP message, and sets the minimum packet gap.
show icmp control	Allows the viewing of the ICMP control settings.

MIB Objects

```
alaIcmpCtrl
   alaIcmpAllMsgStatus
```

ip dos scan close-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP or UDP packet is received on a closed port.

ip dos scan close-port-penalty *penalty_value*

Syntax Definitions

penalty_value	A penalty value added to the penalty scan value. This value can be any non-negative integer.

Defaults

parameter	default
penalty_value	10

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

This command creates a point value that is added to the total port scan penalty value when a TCP or UDP packet is received that is destined for a closed port.

Examples

```
-> ip dos scan close-port-penalty 25
```

Release History

Release 6.1; command introduced.

Related Commands

ip dos scan threshold	Sets the threshold for the port scan value, at which a DoS attack is recorded.
ip dos trap	Sets whether the switch generates SNMP DoS traps when an attack is detected.

MIB Objects

```
alaDoSConfig
   alaDoSPortScanClosePortPenalty
```

ip dos scan tcp open-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP packet is received on an open port.

ip dos scan tcp open-port-penalty *penalty_value*

Syntax Definitions

penalty_value	A penalty value added to the penalty scan value. This value can be any non-negative integer.

Defaults

parameter	default
penalty_value	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command creates a point value that is added to the total port scan penalty value when a TCP packet is received that is destined for an open port.
- The switch does not distinguished between a legal TCP packet and a port scan packet.

Examples

```
-> ip dos scan tcp open-port-penalty 10
```

Release History

Release 6.1; command introduced.

Related Commands

ip dos scan threshold	Sets the threshold for the port scan value, at which a DoS attack is recorded.
ip dos trap	Sets whether the switch generates SNMP DoS traps when an attack is detected.

MIB Objects

```
alaDoSConfig
   alaDoSPortScanTcpOpenPortPenalty
```

ip dos scan udp open-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a UDP packet is received on an open port.

ip dos scan udp open-port-penalty *penalty_value*

Syntax Definitions

penalty_value	A penalty value added to the penalty scan value. This value can be any non-negative integer.

Defaults

parameter	default
penalty_value	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command creates a point value that is added to the total port scan penalty value when a UDP packet is received that is destined for an open port.
- The switch does not distinguished between a legal UDP packet and a port scan packet.

Examples

```
-> ip dos scan udp open-port-penalty 15
```

Release History

Release 6.1; command introduced.

Related Commands

ip dos scan threshold	Sets the threshold for the port scan value, at which a DoS attack is recorded.
ip dos trap	Sets whether the switch generates SNMP DoS traps when an attack is detected.

MIB Objects

```
alaDoSConfig
   alaDoSPortScanUdpOpenPortPenalty
```

ip dos scan threshold

Sets the threshold for the port scan value, at which a DoS attack is recorded.

ip dos scan threshold *threshold_value*

Syntax Definitions

threshold_value	A numerical value representing the total acceptable penalty before a DoS attack is noted. This value can be any non-negative integer.

Defaults

parameter	default
threshold_value	1000

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If the total port scan penalty value exceeds this value, a port scan attack is recorded.
- The penalty value is incremented by recording TCP or UDP packets that are bound for open or closed ports. Such packets are given a penalty value, which are added together. The commands for setting the packet penalty value are the **ip dos scan close-port-penalty**, **ip dos scan tcp open-port-penalty**, and **ip dos scan udp open-port-penalty** commands.

Examples

```
-> ip dos scan threshold 1200
```

Release History

Release 6.1; command introduced.

Related Commands

ip dos scan close-port-penalty	Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP or UDP packet is received on a closed port.
ip dos scan tcp open-port-penalty	Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP packet is received on an open port.
ip dos scan udp open-port-penalty	Assigns a penalty value to be added to the Denial of Service penalty scan value when a UDP packet is received on an open port.
show ip dos config	Displays the configuration parameters of the DoS scan for the switch.

MIB Objects

```
alaDoSConfig
   alaDoSPortScanThreshold
```

ip dos trap

Sets whether the switch generates SNMP DoS traps when an attack is detected.

ip dos trap {enable | disable}

Syntax Definitions

enable	Enables the generation of DoS traps.
disable	Disables the generation of DoS traps.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

This command controls whether the switch generates an SNMP trap when a DoS attack is detected. It is assumed a DoS attack has occurred when the port scan penalty threshold is exceeded. This value is set using the **ip dos scan threshold** command.

Examples

```
-> ip dos trap enable
-> ip dos trap disable
```

Release History

Release 6.1; command introduced.

Related Commands

ip dos scan threshold	Sets the threshold for the port scan value, at which a DoS attack is recorded.
show ip dos config	Displays the configuration parameters of the DoS scan for the switch.

MIB Objects

```
alaDoSConfig
   alaDoSTrapCnt1
```

ip dos scan decay

Sets the decay speed of the port scan penalty value for the switch when calculating DoS attacks.

ip dos scan decay *decay_value*

Syntax Definitions

decay_value	The decay value amount for reducing the port scan penalty. This value can be any non-negative integer.

Defaults

parameter	default
decay_value	2

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

The port scan penalty value is reduced every minute by dividing by the amount set in using this command. For example, if the decay value is set to 10, every minute the total port scan penalty value is divided by 10.

Examples

```
-> ip dos scan decay 10
```

Release History

Release 6.1; command introduced.

Related Commands

ip dos scan threshold	Sets the threshold for the port scan value, at which a DoS attack is recorded.
show ip dos config	Displays the configuration parameters of the DoS scan for the switch.

MIB Objects

```
alaDoSConfig
   alaDoSPortScanDecay
```

show ip traffic

Displays IP datagram traffic and errors.

show ip traffic

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The statistics show the cumulative totals since the last time the switch was powered on or since the last reset of the switch was executed.
- Packets received on a port that is a member of the UserPorts group are dropped if they contain a source IP network address that does not match the IP subnet for the port. This is done to block spoofed IP traffic. If the UserPorts group function is active and spoofed traffic was detected and blocked, the output display of this command will include statistics regarding the spoofed traffic.
- The presence of spoofing event statistics in the output display of this command indicates that an attack was prevented, not that the switch is currently under attack.
- If statistics for spoofed traffic are not displayed, then a spoofing attempt has not occurred since the last time this command was issued.

Examples

```
-> show ip traffic

IP statistics
  Datagrams received
    Total                  =   621883,
    IP header error        =        0,
    Destination IP error   =    51752,
    Unknown protocol       =        0,
    Local discards         =        0,
    Delivered to users     =   567330,
    Reassemble needed      =        0,
    Reassembled            =        0,
    Reassemble failed      =        0

  Datagrams sent
    Fowarded               =     2801,
    Generated              =   578108,
    Local discards         =        0,
    No route discards      =        9,
```

```
Fragmented              =     2801,
Fragment failed         =        0,
Fragments generated     =        0
```

output definitions

Total	Total number of input datagrams received including those received in error.
IP header error	Number of IP datagrams discarded due to errors in the IP header (for example,, bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discarded in processing IP options).
Destination IP error	Number of IP datagrams discarded because the IP header destination field contained an invalid address. This count includes invalid addresses (for example,, 0.0.0.0) and addresses of unsupported classes (for example,, Class E).
Unknown protocol	Number of locally addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
Local discards	Number of IP datagrams received that were discarded, even though they had no errors to prevent transmission (for example,, lack of buffer space). This does not include any datagrams discarded while awaiting reassembly. This value be zero.
Delivered to users	Total number of datagrams received that were successfully delivered to IP user protocols (including ICMP).
Reassemble needed	Number of IP fragments received that needed to be reassembled.
Reassembled	Number of IP datagrams received that were successfully reassembled.
Reassemble failed	Number of IP failures detected by the IP reassembly algorithm for all reasons (for example,, timed out, error). This is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
Forwarded	Number of IP datagrams forwarded by the switch.
Generated	Total number of IP datagrams that local IP user protocols (including ICMP) generated in response to requests for transmission. This does not include any datagrams counted as “Forwarded.”
Local discards	Number of output IP datagrams that were discarded, even though they had no errors to prevent transmission (for example,, lack of buffer space). This number includes datagrams counted as “Forwarded” if the packets are discarded for these reasons.
No route discards	Number of IP datagrams received and discarded by IP because no route could be found to transmit them to their destination. This includes any packets counted as “Forwarded” if the packets are discarded for these reasons. It also includes any datagrams that a host cannot route because all of its default routers are down.
Fragmented	Number of successfully fragmented IP datagrams.
Fragment failed	Number of packets received and discarded by IP because they needed to be fragmented but could not be. This situation could happen if a large packet has the “Don’t Fragment” flag set.
Fragments generated	The of IP datagram fragments generated as a result of fragmentation.

Release History

Release 6.1; command introduced.

Related Commands

show icmp statistics	Displays ICMP statistics and errors.

show ip interface

Displays the configuration and status of IP interfaces.

show ip interface [*name* | **emp | vlan** *vlan id* | **dhcp-client]**

Syntax Definitions

name	The name associated with the IP interface.
emp	Displays the configuration and status of the Ethernet Management Port interface. This parameter is available on OmniSwitch 9000E Series switches only.
vlan_id	VLAN ID (displays a list of IP interfaces associated with a VLAN).
dhcp-client	Displays the configuration and status of the DHCP-Client interface.

Defaults

By default, all IP interfaces are displayed.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The basic **show ip interface** command displays information about all configured IP interfaces on the switch.
- Use the optional **vlan** parameter to display a list of interfaces configured for the specified VLAN.
- Specify an optional interface *name* to display detailed information about an individual interface.
- Use the optional **emp** parameter to display detailed information about the EMP interface. This parameter is available on OmniSwitch 9000E Series switches only.

Examples

```
-> show ip interface
Total 13 interfaces
        Name            IP Address     Subnet Mask   Status Forward  Device
-------------------+---------------+---------------+------+-------+--------

```

output definitions

Name	Interface name. Generally, this is the name configured for the interface (for example,, Accounting). **EMP** refers to the Ethernet Management Port. **Loopback** refers to a loopback interface configured for testing.
IP Address	IP address of the interface. Configured through the **ip interface** command.
Subnet Mask	IP subnet mask for the interface IP address. Configured through the **ip interface** command.
Status	Interface status: • **UP**—Interface is ready to pass packets. • **DOWN**—Interface is down.
Forward	Indicates whether the interface is actively forwarding packets (**YES** or **NO**).
Device	The type of device bound to the interface: • **unbound**—No device is bound to the interface. • **vlan**—The VLAN ID that is bound to the interface. • **EMP**—The Ethernet Management Port is bound to the interface. • **Loopback**—A loopback interface is configured for testing. • **GRE tunnel**—GRE tunnel is configured for the interface. • **IPIP tunnel**—IPIP tunnel is configured for the interface. Configured through the **ip interface** command.

```
-> show ip interface Marketing
Interface Name = Marketing

```

output definitions

SNMP Interface Index	Interface index.
IP Address	IP address associated with the interface. Configured through the **ip interface** command.
Subnet Mask	IP subnet mask for the interface. Configured through the **ip interface** command.
Broadcast Address	Broadcast address for the interface.
Device	The type of device bound to the interface: • **unbound**—No device is bound to the interface. • **vlan**—The VLAN ID that is bound to the interface. • **EMP**—The Ethernet Management Port is bound to the interface. • **Loopback**—A loopback interface is configured for testing. • **GRE tunnel**—GRE tunnel is configured for the interface. • **IPIP tunnel**—IPIP tunnel is configured for the interface. Configured through the **ip interface** command.
Forwarding	Indicates whether IP forwarding is active for the interface (**enabled** or **disabled**). Configured through the **ip interface** command.
Administrative State	Administrative state of the IP interface (**enabled** or **disabled**), which is independent of the state of the underlying device. Configured through the **ip interface** command.
Operational State	Indicates whether the interface is active (**up** or **down**).
Operation State Reason	Indicates why the operational state of the interface is down: • **unbound**—No device is bound to the interface. • **device-down—**Device bound to the interface is down. • **admin-down—**The admin state of the interface is down. • **no-such-device—**Device does not exist. • **no-router-mac—**No MAC address available for the interface. • **tunnel-src-invalid—**Tunnel's source IP address is invalid. • **tunnel-dst-unreachable—**Tunnel's destination IP address is not reachable. The **tunnel-src-invalid** and **tunnel-dst-unreachable** are only applicable for the **GRE tunnel** and **IPIP tunnel** device types. **Operational State Reason** field is only included in the display output when the operational state of the interface is **down**.
Router MAC	Switch MAC address assigned to the interface. Each interface assigned to the same VLAN will share the same switch MAC address.
Local Proxy ARP	Indicates whether Local Proxy ARP is active for the interface (**enabled** or **disabled**). Configured through the **ip interface** command.
Maximum Transfer Unit	The Maximum Transmission Unit size set for the interface. Configured through the **ip interface** command.
DHCP-CLIENT Parameter Details	(Parameters below are only applicable to the 'dhcp-client' interface)
Client Status	DHCP Client Status (**In-active**, **Inactive**)
Server IP	The IP address of the DHCP server.
Lease Time Remaining	The lease time remaining for the DHCP client IP address.

output definitions (continued)

Option-60	The option-60 string that shall be included in DHCP discover/request packets.
HostName	The system name of the OmniSwitch.

The following are examples of the output display on OmniSwitch stackable and chassis-based switches:

```
-> show ip interface ipip-1
Interface Name = ipip-1
  SNMP Interface Index           =   13600001,
  IP Address                     =   25.25.25.1,
  Subnet Mask                    =   255.255.255.0,
  Device                         =   IPIP Tunnel,
  Tunnel Source Address          =   23.23.23.1
  Tunnel Destination Address     =   23.23.23.2,
  Forwarding                     =   enabled,
  Administrative State           =   enabled,
  Operational State              =   up,
  Maximum Transfer Unit          =   1480,

-> show ip interface gre-1
Interface Name = gre-1
  SNMP Interface Index           =   13600002,
  IP Address                     =   24.24.24.1,
  Subnet Mask                    =   255.255.255.0,
  Device                         =   GRE Tunnel,
  Tunnel Source Address          =   23.23.23.1
  Tunnel Destination Address     =   23.23.23.2,
  Forwarding                     =   enabled,
  Administrative State           =   enabled,
  Operational State              =   down,
  Operational State Reason       =   unbound,
  Maximum Transfer Unit          =   1476,
```

output definitions

SNMP Interface Index	Interface index.
IP Address	IP address associated with the interface. Configured through the **ip interface** command.
Subnet Mask	IP subnet mask for the interface. Configured through the **ip interface** command.
Device	The type of device bound to the interface: • **unbound**—No device is bound to the interface. • **vlan**—The VLAN ID that is bound to the interface. • **EMP**—The Ethernet Management Port is bound to the interface. • **Loopback**—A loopback interface is configured for testing. • **GRE tunnel**—GRE tunnel is configured for the interface. • **IPIP tunnel**—IPIP tunnel is configured for the interface. Configured through the **ip interface** command.
Tunnel Source Address	The source IP address for the tunnel.
Tunnel Destination Address	The destination IP address for the tunnel.
Forwarding	Indicates whether the IP forwarding is active for the interface (**enabled** or **disabled**). Configured through the **ip interface** command.

output definitions (continued)

Administrative State	Administrative state of the IP interface (**enabled** or **disabled**), which is independent of the state of the underlying device. Configured through the **ip interface** command.
Operational State	Indicates whether the interface is active (**up** or **down**).
Operational State Reason	Indicates why the operational state of the interface is down: • **interface-up—**The admin state of the interface is up. • **unbound**—No device is bound to the interface. • **device-down—**Device bound to the interface is down. • **admin-down—**The admin state of the interface is down. • **no-such-device—**Device does not exist. • **no-router-mac—**No MAC address available for the interface. • **tunnel-src-invalid—**Tunnel's source IP address is invalid. • **tunnel-dst-unreachable—**Tunnel's destination IP address is not reachable. This field is only included in the display output when the operational state of the interface is **down**.
Maximum Transfer Unit	The Maximum Transmission Unit size set for the interface. Configured through the **ip interface** command.

Release History

Release 6.1; command introduced.
Release 6.3.1; **Tunnel Source Address** and **Tunnel Destination Address** fields added.
Release 6.4.3; **DHCP Client** options added.

Related Commands

ip interface	Configures an IP interface to enable IP routing on a VLAN. Without an IP interface, traffic is bridged within the VLAN or across connections to the same VLAN on other switches.
ip interface dhcp-client	Configures a DHCP client IP interface that is to be assigned an IP address from a DHCP server.
ip interface tunnel	Configures the end points for the GRE and IPIP tunnels.
show icmp statistics	Displays ICMP statistics and errors.

show ip managed-interface

Displays the application name and the corresponding interface name.

show ip managed-interface

Syntax Definitions

N/A.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use this command to view the interface name used by the application.

Examples

```
-> show ip managed-interface
 Application       Interface-Name
-----------------+----------------------
 tacacs            -
 sflow             -
 ntp               Loopback0
 syslog            -
 dns               -
 dhcp-server       -
 telnet            management
 ssh               -
 tftp              -

```

show ip route

Displays the IP Forwarding table.

[vrf *name***] show ip route [gateway** *ip_address* **| protocol** *type* **| summary | destination {***ip_address/prefixLen* | *ip_address***}]**

Syntax Definitions

name	The alphanumeric name (1–20 characters) assigned to the VRF instance.
type	Routing protocol type (local, static, OSPF, RIP, or BGP).
ip_address	Destination IP address.
ip_address/prefixLen	The destination IP address along with the prefix length of the routes processed for redistribution.
summary	Displays a summary of routing protocols that appear in the IP Forwarding table.

Defaults

By default, all routes are displayed.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The IP Forwarding table includes static routes as well as all routes learned through routing protocols (for example,, RIP, OSPF).
- Use the optional **summary** keyword to display a list of routing protocols and the number of routes for each protocol that appear in the IP Forwarding table.

Examples

```
-> show ip route
 + = Equal cost multipath routes
 * = BFD Enabled static route
 Total 6 routes

  Dest Address      Subnet Mask       Gateway Addr      Age       Protocol
------------------+-----------------+-----------------+---------+-----------
  127.0.0.1         255.255.255.255     127.0.0.1        2d 3h    LOCAL
  10.0.0.0          255.0.0.0           10.10.1.1        2d 3h    NETMGMT
  10.0.0.0          255.255.0.0         10.10.1.1        2d 3h    NETMGMT
  10.0.0.0          255.255.255.0       10.10.1.1        2d 3h    NETMGMT
  10.1.0.0          255.255.0.0         10.10.1.1        2d 3h    NETMGMT
  10.1.1.0          255.255.255.0       10.10.1.1        2d 3h    LOCAL
```

```
-> show ip route summary

 Protocol        Route Count
---------------+--------------
 All                       7
 Local                     3
 Netmgmt                   4
 RIP                       0
 ISIS                      0
 OSPF                      0
 BGP                       0
 Other                     0
```

output definitions

Dest Addr	Destination IP address.
Subnet Mask	Destination IP address IP subnet mask.
Gateway Addr	IP address of the gateway from which this address was learned.
Age	Age of the entry. If the entry is less than a day old, it is displayed in *hh/mm/ss* format. If it is more than a day old, it is displayed in *dd/hh* format (for example,, a route that is 2 days and 12 hours old is displayed as 2d12h).
Protocol	Protocol by which this IP address was learned (for example,, RIP). NETMGT indicates a static route. LOCAL indicates a local interface. IMPORT indicates routes imported from other VRF(s).
Route Count	The number of routes that appear in the IP Forwarding table for each protocol type listed.

Release History

Release 6.1; command introduced.
Release 6.3.4; **BFD Enabled** field added.
Release 6.4.5; **vrf** parameter added.

Related Commands

ping	Used to test whether an IP destination can be reached from the local switch.
traceroute	Used to find the path taken by an IP packet from the local switch to a specified destination.
show ip managed-interface	Displays a list of all routes (static and dynamic) that exist in the IP router database.

MIB Objects

show ip route-pref

Displays the IPv4 routing preferences of a router.

[vrf *name***] show ip route-pref**

Syntax Definitions

name	The alphanumeric name (1–20 characters) assigned to the VRF instance.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

The command also displays the import preference.

Examples

```
-> show ip route-pref
  Protocol    Route Preference Value
------------+-----------------------
  Local                 1
  Static                2
  OSPF                110
  ISISL1              115
  ISISL2              118
  RIP                 120
  EBGP                190
  IBGP                200
  Import              210
```

Release History

Release 6.1.1; command introduced.
Release 6.4.5; **vrf** parameter added.

Related Commands

ip route-pref	Configures the route preference of a router.

```

show ip redist

Displays the IPv4 route map redistribution configuration.

[vrf *name***] show ip redist [rip | ospf | isis | bgp]**

Syntax Definitions

name	The alphanumeric name (1–20 characters) assigned to the VRF instance.
rip	Displays route map redistribution configurations that use RIP as the destination (into) protocol.
ospf	Displays route map redistribution configurations that specify OSPF as the destination (into) protocol.
isis	Displays route map redistribution configurations that specify ISIS as the destination (into) protocol.
bgp	Displays the route map redistribution configurations that specify BGP as the destination (into) protocol at this time.

Defaults

By default, all route map redistribution configurations are shown.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Specify a destination protocol with this command to display only those configurations that redistribute routes into the specified protocol.

Release History

Release 6.1.3; command introduced.
Release 6.4.5; **vrf** parameter added.

Examples

```
-> show ip redist

Source       Destination
Protocol     Protocol     Status    Route Map
-------------+------------+---------+--------------------
RIP          OSPF         Enabled   ipv4rm
BGP          RIP          Enabled   ipv4rm
IMPORT       RIP          Enabled   ipv4rm
```

```
-> show ip redist rip

Source       Destination
Protocol     Protocol     Status    Route Map
-------------+------------+---------+--------------------
BGP          RIP          Enabled   ipv4rm
IMPORT       RIP          Enabled   ipv4rm
```

output definitions

Source Protocol	The protocol from which the routes are learned.
Destination Protocol	The protocol into which the source protocol routes are redistributed.
Status	The administrative status (**Enabled** or **Disabled**) of the route map redistribution configuration.
Route Map	The name of the route map that is applied with this redistribution configuration.

Related Commands

ip redist	Controls the conditions for redistributing different IPv6 routes between protocols.

MIB Objects

```
alaRouteMapRedistProtoTable
   alaRouteMapRedistSrcProtoId
   alaRouteMapRedistDestProtoId
   alaRouteMapRedistRouteMapIndex
   alaRouteMapRedistStatus
   alaRouteMapRedistAddressType
   alaRouteMapRedistRowStatus
```

show ip access-list

Displays the details of the access list.

show ip access-list [*access-list-name***]**

Syntax Definitions

access-list-name	Name of the access list.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

If the *access-list-name* is not specified in this command, all the access lists will be displayed.

Examples

```
-> show ip access-list
                    Address /                   Redistribution
Name                Prefix Length      Effect   Control
--------------------+------------------+-------+--------------
al_3                10.0.0.0/8          permit   all-subnets
al_3                11.0.0.0/8          permit   all-subnets
al_4                1.0.0.0/8           permit   no-subnets
al_4                10.0.0.0/8          permit   all-subnets

-> show ip access-list al_4

                    Address /                   Redistribution
Name                Prefix Length      Effect   Control
--------------------+------------------+-------+--------------
al_4                1.0.0.0/8           permit   no-subnets
al_4                10.0.0.0/8          permit   all-subnets
```

output definitions

Name	Name of the access list.
Address/Prefix Length	IP address that belongs to the access list.
Effect	Indicates whether the IP address is permitted or denied for redistribution.
Redistribution Control	Indicates the conditions specified for redistributing the matched routes.

Release History

Release 6.1.3; command introduced.

Related Commands

ip access-list	Creates an access list for adding multiple IPv4 addresses to route maps.
ip access-list address	Adds multiple IPv4 addresses to the access list.

MIB objects

```
alaRouteMapAccessListIndex
alaRouteMapAccessListAddressType
alaRouteMapAccessListAddress
alaRouteMapAccessListPrefixLength
alaRouteMapAccessListAction
alaRouteMapAccessListRedistControl
```

show ip route-map

Displays the IP route maps configured on the switch.

show ip route-map [*route-map-name***]**

Syntax Definitions

route-map-name	The name of the specific route map.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

If the *route-map-name* is not specified in this command, all the route maps are displayed.

Examples

```
-> show ip route-map
Route Maps: configured: 1 max: 200
Route Map: Route_map1 Sequence Number: 50 Action permit
  match ip address 10.0.0.0/8 redist-control all-subnets permit
  set metric 100 effect replace
```

Release History

Release 6.1.3; command introduced.

Related Commands

ip route-map action	Creates a route map and sets the status of the route map to permit or deny.
ip route-map match ip address	Matches the route with the specified IPv4 address or with addresses contained in an IPv4 access list specified by the access list name.
ip route-map match ipv6 address	Matches the route with the specified IPv6 address or with addresses contained in an IPv6 access list specified by the access list name
ip route-map match ip-nexthop	Matches the routes that have a next-hop router address permitted by the specified access list.
ip route-map match ipv6-nexthop	Matches the routes that have an IPv6 next-hop router address permitted by the specified access list
ip route-map match tag	Permits or denies a route based on the specified next-hop IP address.
ip route-map match tag	Matches the tag value specified in the route map with the one that the routing protocol learned the route on.
ip route-map match metric	Matches the metric value specified in the route map with the one that the routing protocol learned the route on.
ip route-map match route-type	Matches the specified route type with the one that the routing protocol learned the route on.

MIB Objects

```
alaRouteMapRedistProtoTable
   alaRouteMapRedistRouteMapIndex
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

show ip router database

Displays a list of all routes (static and dynamic) that exist in the IP router database. This database serves as a central repository where routes are first processed and where duplicate routes are compared to determine the best route for the Forwarding Routing Database. If a route does not appear in the IP router database list, then the switch does not know about it. In the case of dynamically learned routes, this could indicate that the route was never received by the switch.

[vrf *name***] show ip router database [protocol** *type* | **gateway** *ip_address* | **dest {***ip_address/prefixLen* | *ip_address***}]**

Syntax Definitions

name	The alphanumeric name (1–20 characters) assigned to the VRF instance.
type	Routing protocol type (local, static, OSPF, RIP, or BGP).
ip_address	Destination IP address.
ip_address/prefixLen	The destination IP address along with the prefix length of the routes processed for redistribution.

Defaults

By default, all routes are displayed.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Command options are not mutually exclusive. You can use them on the same command line to narrow and/or customize the output display of this command. For example, use the **protocol** and **dest** options to display only those routes that are of a specific protocol type and have the specified destination network.
- The IP forwarding table is derived from IP router database processing performed by the switch and contains only unique routes that the switch currently uses. Use the **show ip route** command to view the forwarding table.
- If an expected route does not appear in the IP forwarding table, use the **show ip router database** command to see if the switch knows about the route and/or if a duplicate route with a higher precedence was selected instead.
- The switch compares the protocol of duplicate routes to determine which one to use. Regardless of whether a route has a higher priority metric value, protocol determines precedence. Local routes are given the highest level of precedence followed by static, OSFP, RIP, then BGP routes. As a result, a route that is known to the switch may not appear in the IP forwarding table if a duplicate route with a higher protocol precedence exists.
- A list of inactive static routes is also included in the **show ip router database** output display. A route becomes inactive if the interface for its gateway goes down. Inactive routes are unable to get to their destination and further investigation is warranted to determine why their gateway is unavailable.

- Static routes that appear as inactive are not included in the main IP router database listing. If an inactive route becomes active, however, it is removed from the inactive list and added to the active route list.

Examples

```
-> show ip router database
Legend: + indicates routes in-use
        * indicates BFD-enabled static route
        r indicates recursive static route, with following address in brackets

Total IPRM IPv4 routes: 9

10.212.62.0/24      10.212.61.27     OSPF     2      43

Inactive Static Routes
Destination       Gateway        Metric
-----------------+--------------+------
1.0.0.0/8          8.4.5.3         1
```

output definitions

Destination	Destination IP address. Also includes the mask prefix length notation after the address to indicate the subnet mask value. For example, **/24** indicates the destination IP address has a 24-bit mask (255.255.255.0) + indicates routes in-use * indicates BFD-enabled static route 'r' indicates a recursive static route.
Gateway	IP address of the gateway from which this route was learned.
Protocol	Protocol by which this IP address was learned: LOCAL, STATIC, OSPF, RIP, BGP).
Metric	RIP metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.
Tag	The VLAN on which the route was *learned*, not forwarded. **N/A** appears in this field for static routes as they are not learned on a VLAN.
Misc-Info	Used for various output such as IP address of the recursive static route or IP address of backup routes.

Release History

Release 6.1; command introduced.
Release 6.1.5; mask parameter deleted; /prefixLen parameter added.
Release 6.4.3; '**r**' added to indicate recursive static route.
Release 6.4.5; **vrf** parameter added.

Related Commands

show ip route	Displays the IP Forwarding table.

MIB Objects

```
alaIprmRouteTable
   alaIprmRouteDest
   alaIprmRouteMask
   alaIprmRouteTos
   alaIprmRouteNextHop
   alaIprmRouteProto
   alaIprmRouteMetric
   alaIprmRoutePriority
```

show ip emp-route

Displays the IP routes associated with the Ethernet Management Port (EMP).

show ip emp-route

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command displays the routes that are connected to the Ethernet Management Port (EMP).
- The EMP cannot handle routing protocols such as RIP or OSPF.
- The default route for the switch cannot be set up on the EMP.

Examples

```
-> show ip emp-route
Dest Address      Subnet Mask       Gateway Addr      Age       Protocol
------------------+-----------------+-----------------+---------+-----------
  127.0.0.1         255.255.255.255   127.0.0.1            2d 4h  LOCAL
  172.17.1.10       255.255.255.255   10.255.11.225        1d 5h  LOCAL
```

output definitions

Dest Addr	Destination IP address.
Subnet Mask	Destination IP address IP subnet mask.
Gateway Addr	IP address of the gateway from which this address was learned.
Age	Age of the entry. If the entry is less than a day old, it is displayed in *hh/mm/ss* format. If it is more than a day old, it is displayed in *dd/hh* format (for example,, a route that is 2 days and 12 hours old is displayed as 2d12h).
Protocol	Protocol by which this IP address was learned (for example,, RIP). NETMGT indicates a static route. LOCAL indicates a local interface.

Release History

Release 6.1; command introduced.

Related Commands

ping	Tests whether an IP destination can be reached from the local switch.
traceroute	Finds the path taken by an IP packet from the local switch to a specified destination.

show ip config

Displays IP configuration parameters.

show ip config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

```
-> show ip config
IP directed-broadcast   =   OFF,
IP default TTL          =   64
Dual Hash Mode          =   enabled (reboot required)
```

output definitions

IP directed-broadcast	Indicates whether the IP directed-broadcast feature is on or off.
IP default TTL	IP default TTL interval.
Dual Hash Mode	The status of dual-hash mode and whether a reboot is required for it to take effect.

Release History

Release 6.1; command introduced.
Release 6.4.5; Dual Hash Mode field added.

Related Commands

ip directed-broadcast	Enables or disables IP directed broadcasts routed through the switch.
ip default-ttl	Sets TTL value for IP packets.

show ip protocols

Displays switch routing protocol information and status.

show ip protocols

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

This command also displays the switch's primary IP address and router ID, if configured, and debug information.

Examples

```
-> show ip protocols
Router ID                           = 10.255.11.243,
Primary addr                        = 10.255.11.243,

RIP status                          = Not Loaded,
OSPF status                         = Not Loaded,
BGP status                          = Not Loaded,
DVMRP status                        = Not Loaded,
PIMSM status                        = Not Loaded,

Debug level                         = 1,
Debug sections                      = error,
```

output definitions

Router ID	The set routing ID. The router ID is how the router is identified in IP.
Primary addr	The primary interface address the route uses.
RIP status	Whether RIP is loaded or not.
OSPF status	Whether OSPF is loaded or not.
BGP status	Whether BGP is loaded or not.
DVMRP status	Whether DVMRP is loaded or not.
PIMSM status	Whether PIMSM is loaded or not.
Debug level	What the current router debug level is.
Debug sections	What types of debugging information are being tracked.

Release History

Release 6.1; command introduced.

Related Commands

ip router primary-address	Configures the router primary IP address.
ip router router-id	Configures the router ID for the router.

MIB Objects

```
alaIpRouteSumTable
   alaIpRouteProtocol
```

show ip service

Displays the current status of TCP/UDP service ports.

show ip service

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

The display output from this command also includes the service port number.

Examples

```
-> show ip service
Name                     Port    Status
-----------------------+-------+---------
ftp                        21   enabled
ssh                        22   disabled
telnet                     23   disabled
udp-relay                  67   disabled
http                       80   disabled
network-time              123   disabled
snmp                      161   disabled
avlan-telnet              259   disabled
avlan-http                260   disabled
avlan-secure-http         261   disabled
secure_http               443   enabled
avlan-http-proxy          262   disabled
```

output definitions

Name	Name of the TCP/UDP service.
Port	The TCP/UDP well-known port number associated with the service.
Status	The status of the well-known service port: **enabled** (port is closed) or **disabled** (port is open).

Release History

Release 6.1; command introduced.

Related Commands

ip service	Enables (opens) or disables (closes) well-known TCP/UDP service ports.

MIB Objects

```
alaIpServiceTable
   alaIpServiceType
   alaIpServicePort
   alaIpServiceStatus
alaIpPortServiceTable
   alaIpPortServicePort
   alaIpPortServiceStatus
```

show ip dynamic-proxy-arp

Displays the dynamic proxy ARP table. The ARP table contains a listing of router IP addresses and their corresponding translations to physical MAC addresses.

show ip dynamic-proxy-arp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The OmniSwitch provides the proxy ARP functionality for the addresses contained in this table.
- Dynamic proxy arp is used in conjuntion with the DHCP Snooping and Port Mapping features.

Examples

```
-> show ip dynamic-proxy-arp
Router IP Addr        Hardware Addr           VLAN       Interfaces
----------------+-----------------------+----------+--------------------
 172.18.16.1            00:d0:95:3a:e8:08     10             1/1
 172.18.16.100          00:1a:92:42:ac:63     20             3/2
```

output definitions

Router IP Addr	Router IP address.
Hardware Addr	Router MAC address.
VLAN	The VLAN the entry is learned on.
Interface	The interface the entry is learned on.

Release History

Release 6.4.3; command introduced.

Related Commands

port mapping dynamic-proxy-arp	Enables or disables the dynamic proxy arp functionality on a port mapping session.
ip helper dhcp-snooping	Enables or disables dhcp snooping.

MIB Objects

```
alaIpNetToMediaDpGroup
   alaIpNetToMediaDpaPhysAddress
   alaIpNetToMediaDpaIpType
   alaIpNetToMediaDpaIp
   alaIpNetToMediaDpaSlot
   alaIpNetToMediaDpaPort
```

show vrf

Displays the Multiple VRF instance configuration for the switch.

show vrf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 9000E, 6855-U24X

Usage Guidelines

Information is displayed for all VRF instances configured on the switch.

Examples

```
-> show vrf
Virtual Routers   Protocols
-----------------------------
        default
          IpOne   RIP
          IpTwo   BGP
```

Release History

Release 6.4.1; command introduced.

Related Commands

vrf	Configures a Multiple VRF instance for the switch.

MIB Objects

```
alaVirutalRouterNameTable
   alaVirtualRouterNameIndex
   alaVirtualRouterName
```

show arp

Displays the ARP table. The ARP table contains a listing of IP addresses and their corresponding translations to physical MAC addresses.

show arp [*ip_address* **|** *hardware_address***]**

Syntax Definitions

ip_address	IP address of the entry you want to view.
hardware_address	MAC address of the entry you want to view.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the basic command (**show arp**) to view all of the entries in the table. Enter a specific IP address or MAC address to view a specific entry.

Examples

```
-> show arp
Total 8 arp entries
 Flags (P=Proxy, A=Authentication, V=VRRP)

 IP Addr           Hardware Addr       Type       Flags   Port     Interface  Name
-----------------+------------------+----------+-------+--------+----------+------
 10.255.11.59      00:50:04:b2:c9:ee   DYNAMIC               3/20  vlan 1
 10.255.11.48      00:50:04:b2:ca:11   DYNAMIC               3/20  vlan 1
 10.255.11.201     00:10:83:03:e7:e4   DYNAMIC               3/20  vlan 1
 10.255.11.14      00:10:5a:04:19:a7   DYNAMIC               3/20  vlan 1
 10.255.11.64      00:b0:d0:62:fa:f1   DYNAMIC               3/20  vlan 1
 10.255.13.25      00:b0:d0:42:80:24   DYNAMIC               0/20  vlan 13   agg20
 10.255.13.26      00:b0:d0:42:82:59   DYNAMIC               0/20  vlan 13   agg20
 10.255.11.254     11:50:04:11:11:11   STATIC                3/20  vlan 1   demoarp
```

output definitions

IP Address	Device IP address.
Hardware Addr	MAC address of the device that corresponds to the IP address.
Type	Indicates whether the ARP cache entries are dynamic or static.
Flags	Indicates the type of entry: • P = Proxy • A = Authentication (AVLAN) • V = VRRP
Port	The port or link aggregate on the switch attached to the device identified by the IP address.

output definitions (continued)

Interface	The interface to which the entry belongs (for example,, VLAN, EMP).
Name	User configured name of static arp entry.

Release History

Release 6.1; command introduced.

Related Commands

ip service	Adds a permanent entry to the ARP table.
clear arp-cache	Deletes all dynamic entries from the ARP table.

MIB Objects

```
ipNetToMediaTable
   ipNetToMediaIfIndex
   ipNetToMediaNetAddress
   ipNetToMediaPhyAddress
   ipNetToMediaType
ipNetToMediaAugTable
   ipNetToMediaSlot
   ipNetToMediaPort
alaIpNetToMediaTable
   alaIpNetToMediaPhyAddress
   alaIpNetToMediaProxy
   alaIpNetToMediaVRRP
   alaIpNetToMediaAuth
```

show arp summary

Displays the number of each ARP entry type.

show arp summary

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

```
-> show arp summary

   Type               Count
-----------------+-----------
 Total                105

 Static                 2
 Dynamic                100
 Authenticated          3
 Proxy                  0
 VRRP                   0
```

output definitions

Type	The type of ARP entry.
Count	The number of entries for that type.

Release History

Release 6.1; command introduced.

Related Commands

show arp	Displays the ARP table.

show arp filter

Displays a list of ARP filters configured for the switch.

show arp filter [*ip_address***]**

Syntax Definitions

ip_address	IP address of the filter entry you want to view.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If an IP address is not specified with this command, a list of all ARP filters is displayed.
- Enter a specific IP address to view the configuration for an individual filter.

Examples

```
-> show arp filter
 IP Addr           IP Mask             Vlan   Type       Mode
-----------------+------------------+------+----------+-------
171.11.1.1         255.255.255.255        0   target     block
172.0.0.0          255.0.0.0              0   target     block
198.0.0.0          255.0.0.0              0   sender     block
198.172.16.1       255.255.255.255      200   target     allow

-> show arp filter 198.172.16.1
 IP Addr           IP Mask             Vlan   Type       Mode
-----------------+------------------+------+----------+-------
198.0.0.0          255.0.0.0              0   sender     block
198.172.16.1       255.255.255.255      200   target     allow
```

output definitions

IP Addr	The ARP packet IP address to which the filter is applied.
IP Mask	The IP mask that specifies which part of the IP address to which the filter is applied.
Vlan	A VLAN ID. The filter is applied only to ARP packets received on ports associated with this VLAN.
Type	Indicates which IP address in the ARP packet (**sender** or **target**) is used to identify if a filter exists for that address.
Mode	Indicates whether to **block** or **allow** a switch response to an ARP packet that matches the filter.

Release History

Release 6.1; command introduced.

Related Commands

arp filter	Adds a permanent entry to the ARP table.
clear arp filter	Deletes all dynamic entries from the ARP table.

MIB Objects

```
alaIpArpFilterTable
   alaIpArpFilterIpAddr
   alaIpArpFilterIpMask
   alaIpArpFilterVlan
   alaIpArpFilterMode
   alaIpArpFilterType
```

show icmp control

Allows the viewing of the ICMP control settings.

show icmp control

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use this command to view the status of the various ICMP messages. It is also useful to determine the type and code of the less common ICMP messages.

Examples

```
-> show icmp control
  Name                                Type   Code   Status    min-pkt-gap(us)
--------------------------------------+------+------+---------+-----------------
  echo reply                            0      0   enabled             0
  network unreachable                   3      0   enabled             0
  host unreachable                      3      1   enabled             0
  protocal unreachable                  3      2   enabled             0
  port unreachable                      3      3   enabled             0
  frag needed but DF bit set            3      4   enabled             0
  source route failed                   3      5   enabled             0
  destination network unknown           3      6   enabled             0
  destination host unknown              3      7   enabled             0
  source host isolated                  3      8   enabled             0
  dest network admin prohibited         3      9   enabled             0
  host admin prohibited by filter       3     10   enabled             0
  network unreachable for TOS           3     11   enabled             0
  host unreachable for TOS              3     12   enabled             0
  source quench                         4      0   enabled             0
  redirect for network                  5      0   enabled             0
  redirect for host                     5      1   enabled             0
  redirect for TOS and network          5      2   enabled             0
  redirect for TOS and host             5      3   enabled             0
  echo request                          8      0   enabled             0
  router advertisement                  9      0   enabled             0
  router solicitation                  10      0   enabled             0
  time exceeded during transmit        11      0   enabled             0
  time exceeded during reassembly      11      1   enabled             0
  ip header bad                        12      0   enabled             0
  required option missing              12      1   enabled             0
  timestamp request                    13      0   enabled             0
```

```
timestamp reply                    14      0   enabled          0
information request(obsolete)      15      0   enabled          0
information reply(obsolete)        16      0   enabled          0
address mask request               17      0   enabled          0
address mask reply                 18      0   enabled          0
```

output definitions

Name	The name of the ICMP message.
Type	The ICMP message type. This along with the ICMP code specify the kind of ICMP message.
Code	The ICMP message code. This along with the ICMP type specify the kind of ICMP message.
Status	Whether this message is **Enabled** or **Disabled**.
min-pkt-gap	The minimum packet gap, in microseconds, for this ICMP message. The minimum packet gap is the amount of time that must pass between ICMP messages of like types.

Release History

Release 6.1; command introduced.

Related Commands

icmp type	Enables or disables a specific type of ICMP message, and sets the minimum packet gap.
icmp unreachable	Enables or disables ICMP messages pertaining to unreachable destinations, and sets the minimum packet gap.
icmp echo	Enables or disables ICMP echo messages, and sets the minimum packet gap.
icmp timestamp	Enables or disables ICMP timestamp messages, and sets the minimum packet gap.
icmp addr-mask	Enables or disables ICMP address mask messages, and sets the minimum packet gap.
icmp messages	Enables or disables all ICMP messages.

show icmp statistics

Displays Internet Control Message Protocol (ICMP) statistics and errors. ICMP is a network layer protocol within the IP protocol suite that provides message packets to report errors and other IP packet processing information back to the source. ICMP generates several kinds of useful messages, including Destination Unreachable, Echo Request and Reply, Redirect, Time Exceeded, and Router Advertisement and Solicitation. If an ICMP message cannot be delivered, no second one is generated. This is to avoid an endless flood of ICMP messages.

show icmp [statistics]

Syntax Definitions

statistics	Optional syntax.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the ICMP Table to monitor and troubleshoot the switch.

Examples

```
-> show icmp
Messages                 Received    Sent
-------------------------+-----------+------------
  Total                       2105        2105
  Error                          0           0
  Destination unreachable        0           0
  Time exceeded                  0           0
  Parameter problem              0           0
  Source quench                  0           0
  Redirect                       0           0
  Echo request                2105           0
  Echo reply                     0        2105
  Time stamp request             0           0
  Time stamp reply               0           0
  Address mask request           0           0
  Address mask reply             0           0
```

output definitions

Total	Total number of ICMP messages the switch received or attempted to send. This counter includes all those counted as errors.
Error	Number of ICMP messages the switch sent/received but was unable to process because of ICMP-specific errors (for example,, bad ICMP checksums, bad length).
Destination unreachable	Number of “destination unreachable” messages that were sent/received by the switch.

output definitions (continued)

Time exceeded	Number of “time exceeded” messages that were sent/received by the switch. These occur when a packet is dropped because the TTL counter reaches zero. When a large number of these occur, it is a symptom that packets are looping, that congestion is severe, or that the TTL counter value is set too low. These messages also occur when all the fragments trying to be reassembled do not arrive before the reassembly timer expires.
Parameter problem	Number of messages sent/received which indicate that an illegal value has been detected in a header field. These messages can indicate a problem in the sending host’s IP software or possibly the gateway’s software.
Source quench	Number of messages sent/received that tell a host that it is sending too many packets. A host attempt to reduce its transmissions upon receiving these messages.
Redirect	Number of ICMP redirect messages sent/received by the switch.
Echo request	Number of ICMP echo messages sent/received by the switch to see if a destination is active and unreachable.
Echo reply	Number of echo reply messages received by the switch.
Time stamp request	Number of time stamp request messages sent/received by the switch.
Time stamp reply	Number of time stamp reply messages sent/received by the switch.
Address mask request	Number of address mask request messages that were sent/received by the switch in an attempt to determine the subnet mask for the network.
Address mask reply	Number of address mask reply messages that were sent/received by the switch.

Release History

Release 6.1; command introduced.

Related Commands

show udp statistics	Displays UDP errors and statistics.

show tcp statistics

Displays TCP statistics.

show tcp statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

```
-> show tcp statistics
Total segments received =   235080,
Error segments received =        0,
Total segments sent     =   363218,
Segments retransmitted  =       38,
Reset segments sent     =       97,
Connections initiated   =    57185,
Connections accepted    =      412,
Connections established =        1,
Attempt fails           =    24393,
Established resets      =      221
```

output definitions

Total segments received	Total number of segments received, including those received in error. This count includes segments received on currently established connections.
Error segments received	Total number of segments received in error (for example,, bad TCP checksums).
Total segments sent	Total number of segments sent, including those on current connections but excluding those containing only retransmitted octets.
Segments retransmitted	Number of TCP segments transmitted containing one or more previously transmitted octets.
Reset segments sent	Number of TCP segments containing the reset flag.
Connections initiated	Number of connections attempted.
Connections accepted	Number of connections allowed.
Connections established	Number of successful connections.

output definitions (continued)

Attempt fails	Number of times attempted TCP connections have failed.
Established resets	Number of times TCP connections have been reset from the "Established" or "Close Wait" state to the “Closed” state.

Release History

Release 6.1; command introduced.

Related Commands

show icmp statistics	Displays ICMP statistics and errors.
show tcp ports	Displays the TCP connection table.

show tcp ports

Displays the TCP connection table.

show tcp ports

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use this table to check the current available TCP connections.

Examples

```
-> show tcp ports
Local Address     Local Port   Remote Address    Remote Port    State
------------------+------------+-----------------+--------------+-------------
  0.0.0.0                  21   0.0.0.0                     0    LISTEN
  0.0.0.0                  23   0.0.0.0                     0    LISTEN
  0.0.0.0                  80   0.0.0.0                     0    LISTEN
  0.0.0.0                 260   0.0.0.0                     0    LISTEN
  0.0.0.0                 261   0.0.0.0                     0    LISTEN
  0.0.0.0                 443   0.0.0.0                     0    LISTEN
  0.0.0.0                6778   0.0.0.0                     0    LISTEN
  10.255.11.223            23   128.251.16.224           1867    ESTABLISHED
  10.255.11.223          2509   10.255.11.33              389    TIME-WAIT
  10.255.11.223          2510   10.255.11.25              389    TIME-WAIT
  10.255.11.223          2513   10.255.11.33              389    TIME-WAIT
  10.255.11.223          2514   10.255.11.25              389    TIME-WAIT
  10.255.11.223          2517   10.255.11.33              389    TIME-WAIT
  10.255.11.223          2518   10.255.11.25              389    TIME-WAIT
  10.255.11.223          2521   10.255.11.33              389    TIME-WAIT
  10.255.11.223          2522   10.255.11.25              389    TIME-WAIT
  10.255.11.223          2525   10.255.11.33              389    TIME-WAIT
  10.255.11.223          2526   10.255.11.25              389    TIME-WAIT
  10.255.11.223          2529   10.255.11.33              389    TIME-WAIT
  10.255.11.223          2530   10.255.11.25              389    TIME-WAIT
```

output definitions

Local Address	Local IP address for this TCP connection. If a connection is in the LISTEN state and accepts connections for any IP interface associated with the node, IP address 0.0.0.0 is used.
Local Port	Local port number for this TCP connection. The range is 0–65535.
Remote Address	Remote IP address for this TCP connection.

output definitions (continued)

Remote Port	Remote port number for this TCP connection. The range is 0–65535.
State	State of the TCP connection, as defined in RFC 793. A connection progresses through a series of states during its lifetime: • Listen—Waiting for a connection request from any remote TCP and port. • Syn Sent—Waiting for a matching connection request after having sent a connection request. • Syn Received—Waiting for a confirming connection request acknowledgment after having both received and sent a connection request. • Established—Open connection. Data received can be delivered to the user. This is the normal state for the data transfer phase of the connection. • Fin Wait 1—Waiting for a connection termination request from the remote TCP, or an acknowledgment of the connection termination request previously sent. • Fin Wait 2—Waiting for a connection termination request from the remote TCP. • Close Wait—Waiting for a connection termination request from the local user. • Closing—Waiting for a connection termination request acknowledgment from the remote TCP. • Last Ack—Waiting for an acknowledgment of the connection termination request previously sent to the remote TCP (which includes an acknowledgment of its connection termination request). • Time Wait—Waiting for enough time to pass to be sure the remote TCP received the acknowledgment of its connection termination request. • Closed—No connection state.

Release History

Release 6.1; command introduced.

Related Commands

show ip interface	Displays the status and configuration of IP interfaces.
show tcp statistics	Displays TCP statistics.

show udp statistics

Displays UDP errors and statistics.

show udp statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

This command displays cumulative statistics since the last time the switch was powered on or since the last reset of the switch.

Examples

```
-> show udp statistics
Total datagrams received   =   214937,
Error datagrams received   =        0,
No port datagrams received =    32891,
Total datagrams sent       =   211884
```

output definitions

Total datagrams received	Total number of UDP datagrams delivered to UDP applications.
Error datagrams received	Number of UDP datagrams that could not be delivered for any reason.
No port datagrams received	Number of UDP datagrams that could not be delivered for reasons other than lack of application at the destination.
Total datagrams sent	Total number of UDP datagrams sent from this switch.

Release History

Release 6.1; command introduced.

Related Commands

show udp ports	Displays the UDP Listener table.

show udp ports

Displays the UDP Listener table. The table shows the local IP addresses and the local port number for each UDP listener.

show udp ports

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- An IP address of zero (0.0.0.0) indicates that it is listening on all interfaces.
- This table contains information about the UDP end-points on which a local application is currently accepting datagrams.

Examples

```
-> show udp port
Local Address     Local Port
------------------+--------------
  0.0.0.0                  67
  0.0.0.0                 161
  0.0.0.0                 520
```

output definitions

Local Address	Local IP address for this UDP connection.
Local Port	Local port number for this UDP connection.

Release History

Release 6.1; command introduced.

Related Commands

show udp statistics	Displays UDP errors and statistics.

show ip dos config

Displays the configuration parameters of the DoS scan for the switch.

show ip dos config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

This command allows the user to view the configuration parameters of the DoS scan. The scan keeps a record of the penalties incurred by certain types of packets on TCP and UDP ports. When the set penalty threshold is reached, it is assumed a DoS attack is in progress, and a trap is generated to inform the system administrator.

Examples

```
-> show ip dos config

   Dos type                                    Status
-------------------------------------------+-----------------
   port scan                                   ENABLED
   tcp sync flood                              ENABLED
   ping of death                               ENABLED
   smurf                                       ENABLED
   pepsi                                       ENABLED
   land                                        ENABLED
   teardrop/bonk/boink                         ENABLED
   loopback-src                                ENABLED
   invalid-ip                                  ENABLED
   invalid-multicast                           ENABLED
   unicast dest-ip/multicast-mac               ENABLED
   ping overload                               DISABLED
   arp flood                                   ENABLED
   arp poison                                  ENABLED
DoS trap generation                            =  ENABLED,
DoS port scan threshold                        =  1000,
DoS port scan decay                            =  2,
DoS port scan close port penalty               =  10,
DoS port scan TCP open port penalty            =  0,
DoS port scan UDP open port penalty            =  0,
Dos MAximum Ping Rate                          =  100
Dos Maximum ARP Request Rate                   =  500
```

output definitions

DoS trap generation	Displays the status of DoS trap generation. It is either **ENABLED** or **DISABLED**. This is set using the **ip dos trap** command.
DoS port scan threshold	The penalty threshold setting. When enough packets have increased the penalty number to this setting, a trap is generated to warn the administrator that a DoS attack is in progress. This is set using the **ip dos scan threshold** command.
DoS port scan decay	The decay value for the switch. The penalty value of the switch is decreased by this number every minute. This is set using the **ip dos scan decay** command.
DoS port scan close port penalty	The penalty value for packets received on closed UDP and TCP ports. The penalty number for the switch is increased by this amount every time a packet is received on a closed UDP or TCP port. This is set using the **ip dos scan close-port-penalty** command.
DoS port scan TCP open port penalty	The penalty value for packets received on open TCP ports. The penalty number for the switch is increased by this amount every time a packet is received on an open TCP port. This is set using the **ip dos scan tcp open-port-penalty** command.
DoS port scan UDP open port penalty	The penalty value for packets received on open UDP ports. The penalty number for the switch is increased by this amount every time a packet is received on an open UDP port. This is set using the **ip dos scan udp open-port-penalty** command.

Release History

Release 6.1; command introduced.

Related Commands

show ip dos statistics	Displays the statistics on detected DoS attacks for the switch.

MIB Objects

```
alaDosTable
   alaDoSType
```

show ip dos statistics

Displays the statistics on detected DoS attacks for the switch.

show ip dos statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command displays the number of attacks the switch has detected for several types of DoS attacks.
- If an attack is detected and reported, it does not necessarily mean that an attack occurred. The switch assumes a DoS attack is underway anytime the penalty threshold is exceeded. It is possible for this threshold to be exceeded when no attack is in progress.

Examples

```
-> show ip dos statistics
DoS type               Attacks detected
-----------------------+-------------------
port scan                     0
tcp sync flood                0
ping of death                 0
smurf                         0
pepsi                         0
land                          0
teardrop/bonk/boink           0
loopback-src                  0
invalid-ip                    0
invalid-multicast             0
unicast dest-ip/multicast-mac 0
ping overload                 0
arp flood                     0
arp poison                    0
```

output definitions

DoS type	The type of DoS attack. The most common seven are displayed.
Attacks detected	The number of attacks noted for each DoS type.

Release History

Release 6.1; command introduced.

Related Commands

show ip dos config	Displays the configuration parameters of the DoS scan for the switch.

MIB Objects

   alaDoSType
```

show ip dos arp-poison

Displays the number of attacks detected for configured ARP poison restricted-addresses.

show ip dos arp-poison

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

```
-> show ip dos arp-poison
  IP Address                          Attacks
-----------------------------------+------------
192.168.1.1                            0
192.168.1.2                            0
192.168.1.3                           0
```

output definitions

IP Address	The configured ARP Poison restricted-addresses.
Attacks detected	The number of ARP Poison attacks detected for each address.

Release History

Release 6.3.1; command introduced.

Related Commands

ip dos arp-poison restricted-address	Adds or deletes an ARP Poison restricted address.

MIB Objects

```
alaDoSArpPoisonTable
   alaDoSArpPoisonIpAddr
   alaDoSArpPoisonDetected
```

ip wccp admin-state

Enables or disables the Web Cache Communication Protocol (WCCP) globally on the switch.

ip wccp admin-state {enable | disable}

Syntax Definitions

enable	Enables the administrative status for the WCCP feature.
disable	Disables the administrative status for the WCCP feature.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

Use this command to enable or disable the WCCP globally on the switch.

Examples

```
-> ip wccp admin-state enable
-> ip wccp admin-state disable
```

Release History

Release 6.4.4; command introduced.

Related Commands

clear ip wccp	Clears the statistics for the given service group.
show ip wccp service-group	Displays the global statistics related to WCCP.
show ip wccp service-group	Displays the WCCP statistics related to the specified service group.

MIB Objects

```
wccpAdminEnabled
```

ip wccp service-group web-cache md5

Configures one or a range of service groups and sets the MD5 authentication.

ip wccp service-group {web-cache | *service-id***[-***service-id2***]} [md5 password** *string***]**

no ip wccp service-group {web-cache | *service-id***[-***service-id2***]}**

Syntax Definitions

web-cache	The well-known service (ID = 0).
service-id	A WCCP service ID number (1 to 255). Use a hyphen to specify a range of service IDs (5-10).
string	The MD5 password for the service group (0 to 8 characters).

Defaults

parameter	default
md5 authentication	**disabled**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

Use the **no** form of the command to remove the service group.

Examples

```
-> ip wccp service-group web-cache
-> ip wccp service-group web-cache md5 password san
-> ip wccp service-group 10
-> ip wccp service-group 10 md5 password san
-> no ip wccp service-group web-cache
-> no ip wccp service-group 10
-> no ip wccp service-group 2-8
```

Release History

Release 6.4.4; command introduced.

Related Commands

clear ip wccp	Clears the statistics for the given service group.
show ip wccp services	Displays the list of service groups created on the switch and their related information.

MIB Objects

```
wccpServiceTable
   wccpServiceId
   wccpServicePassword
```

ip wccp service-group web-cache restrict

Restricts a port, VLAN or IP in a service group from processing WCCP messages.

ip wccp service-group {web-cache | *service-id***} restrict { port** *slot/port* | **vlan** *vlan_id* | **ip** *ipv4* **[mask** *mask***]}**

no ip wccp service-group {web-cache | *service-id***} restrict { port** *slot/port* | **vlan** *vlan_id* | **ip** *ipv4* **[mask** *mask***]}**

Syntax Definitions

web-cache	The well-known service (ID = 0).
service-id	A WCCP service ID number (1 to 255).
slot/port	Restricts the specified port from processing the WCCP messages.
vlan_id	Restricts the specified VLAN from processing the WCCP messages.
ipv4	Restricts the specified cache server IP from processing the WCCP messages.
mask	Specifies an optional mask when an IPv4 address is used.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

Use the **no** form of the command to remove the restriction from the service group.

Examples

```
-> ip wccp service-group web-cache restrict port 1/20
-> no ip wccp service-group web-cache restrict port 1/20
-> ip wccp service-group 10 restrict vlan 20
-> no ip wccp service-group 10 restrict vlan 20
-> ip wccp service-group 10 restrict ip 30.0.0.20
-> no ip wccp service-group 10 restrict ip 30.0.0.20
```

Release History

Release 6.4.4; command introduced.

Related Commands

show ip wccp restricts	Displays the restricted ports, VLANs and server IPs for the service groups created on the switch.

MIB Objects

```
wccpRestrictPortTable
   wccpRestrictPortServiceId
   wccpRestrictPortIndex
wccpRestrictVlanTable
   wccpRestrictVlanServiceId
   wccpRestrictVlanVlanId

   wccpRestrictWebCacheServiceId
   wccpRestrictWebCacheIpAddress
   wccpRestrictWebCacheIpMask
```

clear ip wccp

Clears the statistics for the given service group.

clear ip wccp [service-group {web-cache | *service-id*}] statistics

Syntax Definitions

web-cache	The well-known service (ID = 0).
service-id	A WCCP service ID number (1 to 255).

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

If no service group is specified, then the statistics for all the service groups are cleared.

Examples

```
-> clear ip wccp service-group web-cache statistics
-> clear ip wccp statistics
```

Release History

Release 6.4.4; command introduced.

Related Commands

show ip wccp service-group	Displays the global statistics related to WCCP.

MIB Objects

```

   wccpAdminEnabled
```

show ip wccp services

Displays the list of service groups created on the switch and their related information.

show ip wccp services

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

```
-> show ip wccp services
Service  Status   RcvId   Chgs  Caches   Type     Version   Password  Redirects
-------+--------+--------+-----+-------+--------+----------+---------+-------------
  95     Enable    42       20     1     Dynamic    2          Yes        0
```

output definitions

Service	Indicates the WCCP service ID.
Status	Indicates the admin status of the WCCP service.
RcvId	Indicates the current Receive Id from the router for the WCCP service. This is incremented every time a WCCP message is sent.
Chgs	Indicates the current change number for the service. This gets updated each time there is a WCCP topology change.
Caches	Indicates the total number of cache servers currently active on the WCCP service.
Type	Indicates the WCCP service type.
Version	Indicates the WCCP service version.
Password	Indicates if password has been specified for the WCCP service.
Redirects	Indicates the number of packets WCCP has redirected for the service.

Release History

Release 6.4.4; command introduced.

Related Commands

ip wccp admin-state	Enable or disable the WCCP globally on the switch.
ip wccp service-group web-cache md5	Allows to configure or remove a service group.

MIB Objects

```
wccpServiceTable
   wccpServiceId
   wccpServiceAdminEnabled
   wccpServiceRecieveId
   wccpServiceChangeNumber
   wccpServiceWebCacheCount
   wccpServiceType
   wccpServiceVersion
   wccpServicePassword
   wccpStatsPacketsRedir
```

show ip wccp cache-engines

Displays the various cache servers learned for the service groups created and their related information.

show ip wccp cache-engines

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

```
-> show ip wccp cache-engines
Service     Status     RcvId   Chgs       IP        RcvId  Chgs   Routers   Caches
----------+----------+--------+-----+------------+-------+-----+---------+---------
      95    Enable     14781   161      40.1.1.2   14781    1      1          1
```

output definitions

Service	Indicates the WCCP service ID.
Status	Indicates the admin status of the WCCP service..
RcvId	Indicates the current Receive Id from the router for the WCCP service. This is incremented every time a WCCP message is sent.
Chgs	Indicates the current change number for the service. This gets updated each time there is a WCCP topology change.
IP	Indicates the IP address of the Cache-Engine.
Routers	Indicates how many WCCP routers the Cache-Engine is in contact with.
Caches	Indicates the total count of cache servers currently active on the WCCP service.

Release History

Release 6.4.4; command introduced.

Related Commands

ip wccp admin-state	Enable or disable the WCCP globally on the switch.

MIB Objects

```
wccpServiceTable
   wccpServiceId
   wccpServiceAdminEnabled
   wccpServiceRecieveId

   wccpWebCacheNumberOfRouters
   wccpServiceWebCacheCount
```

show ip wccp restricts

Displays the restricted ports, VLANs and cache server IPs for the created service group.

show ip wccp [service-group {web-cache | *service-id***}] restricts**

Syntax Definitions

web-cache	The well-known service (ID = 0).
service-id	A WCCP service ID number (1 to 255).

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

If no service group is specified, the restrictions for all the service groups created is displayed..

Examples

```
-> show ip wccp restricts
Service     Port
----------+---------
95           1/23

Service    VLAN
----------+--------
95          100

Service         IP              Mask
----------+----------------+--------------------
65         50.0.0.90         255.255.255.255
95         60.0.0.0          255.255.255.0
```

output definitions

Service	Indicates the WCCP service ID.
Port	Indicates the restricted port number for the respective service group.
VLAN	Indicates the restricted VLAN Id for the respective service group.
IP	Indicates the restricted IP address for the respective service group.
Mask	Indicates the IP mask of the restricted IP address.

Release History

Release 6.4.4; command introduced.

Related Commands

ip wccp service-group web-cache restrict	Allows to restrict a port, VLAN or IP in a service group from processing WCCP messages.

MIB Objects

```
wccpRestrictPortTable
   wccpRestrictPortServiceId
   wccpRestrictPortIndex
wccpRestrictVlanTable
   wccpRestrictVlanServiceId
   wccpRestrictVlanVlanId

   wccpRestrictWebCacheServiceId
   wccpRestrictWebCacheIpAddress
   wccpRestrictWebCacheIpMask
```

show ip wccp service-group

Displays the WCCP statistics related to the specified service group.

show ip wccp service-group {web-cache | *service-id***}**

Syntax Definitions

web-cache	The well-known service (ID = 0).
service-id	A WCCP service ID number (1 to 255).

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

If no service group is specified the information for all the service groups created is displayed.

Examples

```
-> show ip wccp service-group web-cache
Global WCCP Information:
       Service Name/ID              :  web-cache,
       Protocol                     :  TCP,
       Ports                        :  80, 0, 0, 0, 0, 0, 0, 0,
       Port Type                    :  Source,
       Precedence                   :  240,
       Number of Cache Engines      :  1,
       Number of Routers            :  1,
       Type of Message              :  Unicast,
       Total Packets Redirected     :  50,
       Total WCCP Messages Dropped  :  0,
       Total Authentication failures :  0
```

output definitions

Service Name/ID	Indicates the WCCP service ID.
Protocol	Indicates the protocol type for the WCCP service.
Ports	Indicates the list of TCP/UDP ports identified for the service group.
Port Type	Indicates the port type.
Precedence	Indicates the priority of the service group. The lowest priority is 0, the highest is 255.
Number of Cache Engines	Indicates the total number of cache servers currently active on the WCCP service.

output definitions (continued)

Number of Routers	Indicates the total number WCCP routers the Cache-Engine is connected.
Type of Message	Indicates the mode of WCCP message exchange used (unicast/multicast).
Total Packets Redirected	Indicates the count of how many packets the WCCP has redirected for the service.
Total WCCP Messages Dropped	Indicates the count of how many WCCP packets were dropped for the service.
Total Authentication failures	Indicates the count of how many WCCP packets resulted in authentication failure because of mismatch in the password used for the service on the Router and Cache-Engine.

Release History

Release 6.4.4; command introduced.

Related Commands

ip wccp service-group web-cache md5	Allows to configure or remove a service group.

```

show ip wccp service-group detail

Displays detailed statistics of the switch and the cache engine for specified service group.

show ip wccp [service-group {web-cache | *service-id***}] detail**

Syntax Definitions

web-cache	The well-known service (ID = 0).
service-id	A WCCP service ID number (1 to 255).

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

If the service group is not specified, then the statistics related to all the service groups are displayed.

Examples

```
-> show ip wccp service-group web-cache detail
WCCP Detail:
Service ID: web-cache
        Router information:
            IP Address         :  10.135.38.120,
            Protocol Version   :  2.0

        Cache-Engine Information
         IP Address           :  192.168.1.1
         Protocol Version     :  2.0,
         State                :  Usable,
         Connect Time         :  01:10:55

-> show ip wccp detail
WCCP Detail:
Service ID: web-cache
        Router information:
            IP Address         :  10.135.38.120,
            Protocol Version   :  2.0

        Cache-Engine Information
         IP Address           :  192.168.1.1,

Service ID: 95
        Router information:
            IP Address         :  10.135.38.120,
```

```
    Protocol Version   :  2.0

Cache-Engine Information
 IP Address           :  192.168.1.2,
 Protocol Version     :  2.0,
 State                :  Usable,
 Connect Time         :  00:10:17
```

output definitions

Service ID	Indicates the WCCP service ID.
Router information	Indicates the IP address of the router and the WCCP service version supported by the Router.
Cache-Engine Information	
IP Address	Indicates the IP address of the Cache-Engine.
Protocol Version	Indicates the WCCP service version supported by the Cache-Engine.
State	Indicates the state of the Cache-Engine.
Connect Time	Indicates the time at which the cache server became active for the service.

Release History

Release 6.4.4; command introduced.

Related Commands

ip wccp admin-state	Enable or disable the WCCP globally on the switch.

MIB Objects

```

show ip wccp service-group view

Displays the WCCP view for the specified service group.

show ip wccp [service-group {web-cache | *service-id*}] view

Syntax Definitions

web-cache	The well-known service (ID = 0).
service-id	A WCCP service ID number (1 to 255).

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

If the service group is not specified, then the information related to all the service groups are displayed.

Examples

```
-> show ip wccp service-group 95 view
WCCP View:
Service ID : 95
      Routers Participating:
        10.135.38.120,
        10.135.38.140
      Cache Engines Usable:
        192.168.1.1, Connect Since: 01:10:55,
        192.168.1.2, Connect Since: 01:10:30
      Cache Engines Un-Usable:
        -none-

-> show ip wccp view
WCCP View:
Service ID: web-cache
     Routers Participating:
       10.135.38.120,
       10.135.38.140
     Cache Engines Usable:
       192.168.1.1, Connected Since: 01:10:55,
       192.168.1.2, Connected Since: 01:10:30
     Cache Engines Un-Usable:
       -none-

Service ID : 95
     Routers Participating:
       10.135.38.120
     Cache Engines Usable:
       192.168.1.2, Connected Since: 02:50:06,
```

```
    192.168.1.4, Connected Since: 00:30:10
  Cache Engines Un-Usable:
    192.168.1.5, Disconnected Since: 00:35:10
```

output definitions

Service ID	Indicates the WCCP service ID.
Routers Participating	Indicates the IP addresses of the routers participating in the service group.
Cache Engines Usable	Indicates the IP addresses of the Usable Cache-Engines participating in the service group, and the time when the cache server became active.
Cache Engines Un-Usable	Indicates the IP addresses of the Un-Usable Cache-Engines participating in the service group, and the time when the cache server became inactive.

Release History

Release 6.4.4; command introduced.

Related Commands

ip wccp admin-state	Enable or disable the WCCP globally on the switch.
show ip wccp service-group	Displays the global statistics related to the WCCP.

MIB Objects

```
wccpServiceTable
   wccpServiceId
wccpWebCacheTable
   wccpWebCacheServiceId
   wccpWebCacheIpAddress
   wccpWebCacheConnectTime
wccpRouterTable
   wccpRouterServiceId
   wccpRouterIpAddressType
   wccpRouterIpAddress
```

show ip wccp service-group statistics

Displays the total number of WCCP messages transmitted, received, and dropped for the specified service group.

show ip wccp [service-group {web-cache | *service-id*}] statistics

Syntax Definitions

web-cache	The well-known service (ID = 0).
service-id	A WCCP service ID number (1 to 255).

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

If the service group is not specified, then the statistics related to all the service groups is displayed including the total of all such statistics, along with the total number of invalid WCCP messages received.

Examples

```
-> show ip wccp service-group 95 statistics
Service ID: 95
        Total WCCP messages Received         : 338,
        Total WCCP messages Transmitted      : 339,
        Total WCCP messages Dropped          : 0

-> show ip wccp statistics
Service ID: web-cache
        Total WCCP messages Received         : 0,
        Total WCCP messages Transmitted      : 0,
        Total WCCP messages Dropped          : 0

Service ID: 95
        Total WCCP messages Received         : 358,
        Total WCCP messages Transmitted      : 359,
        Total WCCP messages Dropped          : 0

Total:
        Total WCCP messages Received         : 358,
        Total WCCP messages Transmitted      : 359,
        Total WCCP messages Dropped          : 0,
        Total WCCP messages Invalid          : 12
```

output definitions

Service ID	Indicates the WCCP service ID.
Total WCCP messages Received	Indicates the total number of WCCP messages received by the router for the service group (if specified), else it displays the total for all the service groups created.
Total WCCP messages Transmitted	Indicates the total number of WCCP messages transmitted by the router for the service group (if specified), else it displays the total for all the service groups created.
Total WCCP messages Dropped	Indicates the total number of WCCP Messages dropped due to WCCP restrictions applied to Port/Vlan/Ip for a service group (if specified), else it displays the total for all the service groups created.

Release History

Release 6.4.4; command introduced.

Related Commands

ip wccp admin-state	Enable or disable the WCCP globally on the switch.
clear ip wccp	Clears the statistics for the given service group.

MIB Objects

```
wccpStatisticsTable
   wccpServiceId
   wccpStatsMessagesReceived
   wccpStatsMessagesTransmitted
   wccpStatsMessagesDropped
```

ip dos anti-spoofing

Enable or disable IP anti-spoofing globally on the switch.

ip dos anti-spoofing {enable | disable}

Syntax Definitions

enable	Enable IP anti-spoofing.
disable	Disable IP anti-spoofing.

Defaults

By default, IP anti-spoofing is enabled globally on the switch.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- By default, anti-spoofing is enabled on all the IP or VRRP interface. Anti-spoof is enabled for VRRP interface only if the interface is in active state and is a VRRP master.
- If IP anti-spoofing is enabled, any IP packet ingressing on the switch with VLAN and the IP-address of that VLAN as source information is dropped.

Examples

```
-> ip dos anti-spoofing enable
-> ip dos anti-spoofing disable
```

Release History

Release 6.4.5; command introduced.

Related Commands

ip dos anti-spoofing address	Enable or disable IP anti-spoofing on a specific interface (IP interface or VRRP interface).
show ip dos anti-spoofing	Displays attack information and the last attempted source (VLAN, MAC address, port) of all the IP and VRRP interfaces configured on the switch.
ip dos anti-spoofing clear stats	Clears the IP anti-spoofing attack information globally.

MIB Objects

```
alaDoSIpAntiSpoof
```

ip dos anti-spoofing arp-only

Enable or disable ARP-only anti-spoofing globally on the switch.

ip dos anti-spoofing arp-only {enable | disable}

Syntax Definitions

enable	Enable ARP anti-spoofing.
disable	Disable ARP anti-spoofing.

Defaults

By default, ARP-only anti-spoofing is disabled globally on the switch.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

IP spoofing must be enabled globally to enable ARP-only spoofing. ARP-only anti-spoofing is enabled for VRRP interface only if interface is in an active state and is a VRRP master.

Examples

```
-> ip dos anti-spoofing arp-only enable
-> ip dos anti-spoofing arp-only disable
```

Release History

Release 6.4.5; command introduced.

Related Commands

ip dos anti-spoofing	Enable or disable IP anti-spoofing globally on the switch.
ip dos anti-spoofing address arp-only	Enable or disable ARP-only anti-spoofing on an interface (IP interface or VRRP interface).
show ip dos anti-spoofing	Displays attack information and the last attempted source (VLAN, MAC address, port) of all the IP and VRRP interfaces configured on the switch.
ip dos anti-spoofing clear stats	Clears the IP anti-spoofing attack information globally.

MIB Objects

```
alaDoSIpAntiSpoof
```

ip dos anti-spoofing address

Enable or disable IP anti-spoofing on a specific interface (IP interface or VRRP interface).

ip dos anti-spoofing address *ip-address* **{enable | disable}**

Syntax Definitions

ip-address	IP address of the interface.
enable	Enable IP anti-spoofing.
disable	Disable IP anti-spoofing.

Defaults

By default, IP anti-spoof is enabled globally on the switch.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- IP spoofing must be enabled globally to enable IP spoofing at an interface level. IP anti-spoofing is enabled for VRRP interface only if the interface is in an active state and is a VRRP master.
- If you want to enable IP anti-spoofing on a specific interface, ARP-only anti spoofing must be disabled on that interface.

Examples

```
-> ip dos anti-spoofing address 192.168.10.1 enable
-> ip dos anti-spoofing address 192.168.10.1 disable
```

Release History

Release 6.4.5; command introduced.

Related Commands

ip dos anti-spoofing	Enable or disable IP anti-spoofing globally on the switch.
show ip dos anti-spoofing	Displays attack information and the last attempted source (VLAN, MAC address, port) of all the IP and VRRP interfaces configured on the switch.
ip dos anti-spoofing address clear stats	Clears the IP anti-spoofing attack information at an interface level.

MIB Objects

`alaDoSIpAntiSpoof`

ip dos anti-spoofing address arp-only

Enable or disable ARP-only anti-spoofing for a specific interface (IP interface or VRRP interface).

ip dos anti-spoofing address *ip-address* **arp-only {enable | disable}**

Syntax Definitions

ip-address	IP address of the interface.
enable	Enable ARP-only anti-spoofing.
disable	Disable ARP-only anti-spoofing.

Defaults

By default, IP anti-spoof is enabled globally on the switch.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- ARP-only anti-spoofing must be enabled globally to enable ARP-only anti-spoofing at an interface level.
- The ARP-only anti-spoofing is enabled for VRRP interface only if the interface is active and is a VRRP master.

Examples

```
-> ip dos anti-spoofing address 172.18.16.1 arp-only enable
-> ip dos anti-spoofing address 172.18.16.1 arp-only disable
```

Release History

Release 6.4.5; command introduced.

Related Commands

ip dos anti-spoofing address arp-only	Enable or disable ARP-only anti-spoofing on an interface (IP interface or VRRP interface).
show ip dos anti-spoofing	Displays attack information and the last attempted source (VLAN, MAC address, port) of all the IP and VRRP interfaces configured on the switch.
ip dos anti-spoofing clear stats	Clears the IP anti-spoofing attack information globally.

MIB Objects

`alaDoSIpAntiSpoof`

ip dos anti-spoofing clear stats

Clears the IP anti-spoofing attack information globally.

ip dos anti-spoofing clear stats

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use of this command clears all the attack information and resets the counters.

Examples

```
-> ip dos anti-spoofing clear stats
```

Release History

Release 6.4.5; command introduced.

Related Commands

show ip dos anti-spoofing	Displays attack information and the last attempted source (VLAN, MAC address, port) of all the IP and VRRP interfaces configured on the switch.
ip dos anti-spoofing address clear stats	Clears the IP anti-spoofing attack information at an interface level.

MIB Objects

```
alaDoSIpAntiSpoof
```

ip dos anti-spoofing address clear stats

Clears the IP anti-spoofing attack information at an interface level.

ip dos anti-spoofing address *ip-address* **clear stats**

Syntax Definitions

ip-address	IP address of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use of this command clears all the attack information and resets the counters for a specific interface or VRRP interface IP.

Examples

```
-> ip dos anti-spoofing address 172.18.16.95 clear stats
```

Release History

Release 6.4.5; command introduced.

Related Commands

show ip dos anti-spoofing	Displays attack information and the last attempted source (VLAN, MAC address, port) of all the IP and VRRP interfaces configured on the switch.
ip dos anti-spoofing clear stats	Clears the IP anti-spoofing attack information globally.

MIB Objects

```
alaDoSIpAntiSpoof
```

show ip dos anti-spoofing

Displays the attack information and the last attempted source (VLAN, MAC address, port) of all the IP and VRRP interfaces configured on the switch. Specify the IP address to view the attack information for a specific interface.

show ip dos anti-spoofing [*ip-address***]**

Syntax Definitions

ip-address	IP address of the interface or VRRP interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

```
-> show ip dos anti-spoofing

20 IPv6 Commands

This chapter details Internet Protocol Version 6 (IPv6) commands for the switch (including RIPng commands). IPv6 (documented in RFC 2460) is designed as a successor to IPv4. The changes from IPv4 to IPv6 fall primarily into the following categories:

Expanded Routing and Addressing Capabilities - IPv6 increases the IP address size from 32 bits to 128 bits, to support more levels of addressing hierarchy and a much greater number of addressable nodes, and simpler auto-configuration of addresses. The scalability of multicast routing is improved by adding a "scope" field to multicast addresses.

Header Format Simplification - Some IPv4 header fields were dropped or made optional, to reduce the common-case processing cost of packet handling and to keep the bandwidth cost of the IPv6 header as low as possible despite the increased size of the addresses. Even though the IPv6 addresses are four times longer than the IPv4 addresses, the IPv6 header is only twice the size of the IPv4 header.

Anycast Addressing - A new type of address called a "anycast address" is defined, to identify sets of nodes where a packet sent to an anycast address is delivered to one of the nodes. The use of anycast addresses in the IPv6 source route allows nodes to control the path on which their traffic flows.

Improved Support for Options - Changes in the way IP header options are encoded allows for more efficient forwarding, less stringent limits on the length of options, and greater flexibility for introducing new options in the future.

Authentication and Privacy Capabilities - IPv6 includes the definition of extensions which provide support for authentication, data integrity, and confidentiality. This is included as a basic element of IPv6 and will be included in all implementations.

MIB information for the IPv6 and RIPng commands is as follows:

Filename: Ipv6.mib
Module: Ipv6-MIB, Ipv6-TCP-MIB, Ipv6-UDP-MIB

Filename: AlcatelIND1Ipv6.mib
Module: alcatelIND1IPv6MIB

Filename: AlcatelIND1Iprmv6.mib
Module: alcatelIND1IprmV6MIB

Filename: AlcatelIND1Ripng.mib
Module: alcatelIND1RipngMIB

A summary of the IPv6 commands is listed here:

IPv6	**ipv6 interface** **ipv6 address** **ipv6 address global-id** **ipv6 address local-unicast** **ipv6 dad-check** **ipv6 hop-limit** **ipv6 pmtu-lifetime** **ipv6 host** **ipv6 neighbor stale-lifetime** **ipv6 neighbor** **ipv6 prefix** **ipv6 static-route** **ipv6 route-pref** **ping6** **traceroute6** **show ipv6 hosts** **show ipv6 interface** **show ipv6 pmtu table** **clear ipv6 pmtu table** **show ipv6 neighbors** **clear ipv6 neighbors** **show ipv6 prefixes** **show ipv6 routes** **show ipv6 route-pref** **show ipv6 router database** **show ipv6 tcp ports** **show ipv6 traffic** **clear ipv6 traffic** **show ipv6 tunnel** **show ipv6 udp ports** **show ipv6 information**
IPv6 RIP	**ipv6 load rip** **ipv6 rip status** **ipv6 rip invalid-timer** **ipv6 rip garbage-timer** **ipv6 rip holddown-timer** **ipv6 rip jitter** **ipv6 rip route-tag** **ipv6 rip update-interval** **ipv6 rip triggered-sends** **ipv6 rip interface** **ipv6 rip interface metric** **ipv6 rip interface recv-status** **ipv6 rip interface send-status** **ipv6 rip interface horizon** **show ipv6 rip** **show ipv6 rip interface** **show ipv6 rip peer** **show ipv6 rip routes**

ipv6 interface

Configures an IPv6 interface on a VLAN or IPv6 tunnel.

ipv6 interface *if_name* **[vlan** *vid* **| tunnel {***tid* **| 6to4}] [enable | disable]**
[base-reachable-time *time***]**
[ra-send {yes | no}]
[ra-max-interval *interval***]**
[ra-managed-config-flag {true | false}]
[ra-other-config-flag {true | false}]
[ra-reachable-time *time***]**
[ra-retrans-timer *time***]**
[ra-default-lifetime *time* **| no ra-default-lifetime]**
[ra-send-mtu] {yes | no}

no ipv6 interface *if_name*

Syntax Definitions

if_name	IPv6 interface name.
vlan	Creates a VLAN interface.
vid	VLAN ID number.
tunnel	Creates a tunnel interface.
tid	Tunnel ID number.
6to4	Enables 6to4 tunneling.
base-reachable-time *time*	Base value used to compute the reachable time for neighbors reached via this interface.
ra-send	Specifies whether the router advertisements are sent on this interface.
ra-max-interval *interval*	Maximum time, in seconds, allowed between the transmission of unsolicited multicast router advertisements in this interface. The range is 4 - 1,800.
ra-managed-config-flag	Value to be placed in the managed address configuration flag field in router advertisements sent on this interface.
ra-other-config-flag	Value to be placed in the other stateful configuration flag in router advertisements sent on this interface.
ra-reachable-time *time*	Value, in milliseconds, to be placed in the reachable time field in router advertisements sent on this interface. The range is 0 - 3,600,000. The special value of zero indicates that this time is unspecified by the router.
ra-retrans-timer *time*	Value, in milliseconds, to be placed in the retransmit timer field in router advertisements sent on this interface. The value zero indicates that the time is unspecified by the router.

ra-default-lifetime *time*	Value, in seconds, to be placed in the router lifetime field in router advertisements sent on this interface. The time must be zero or between the value of “ra-max-interval” and 9,000 seconds. A value of zero indicates that the router is not to be used as a default router. The “no ra-default-lifetime” option will calculate the value using the formula (3 * ra-max-interval).
enable | disable	Administratively enable or disable the interface.
ra-send-mtu	Specifies whether the MTU option is included in the router advertisements sent on the interface.

Defaults

parameter	default
ra-send	yes
ra-max-interval	600
ra-managed-config-flag	false
ra-reachable-time	0
ra-retrans-timer	0
ra-default-lifetime	no
ra-send-mtu	no

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to delete an interface.
- When you create an IPv6 interface, it is enabled by default.
- All IPv6 VLAN and tunnel interfaces must have a name.
- When creating an IPv6 interface you must specify a VLAN ID, Tunnel ID, or **6to4**. When modifying or deleting an interface, you do not need to specify one of these options unless the name assigned to the interface is being changed. If it is present with a different value from when the interface was created, the command will be in error.
- A 6to4 interface cannot send advertisements (**ra-send**).
- To enable IPv6 routing you must first create a VLAN, then create an IPv6 interface on the VLAN. See Chapter 4, “VLAN Management Commands,” for information on creating VLANs.
- To route IPv6 traffic over an IPv4 network, you must create an IPv6 tunnel using the **ipv6 address global-id** command.

Examples

```
-> ipv6 interface Test vlan 1
-> ipv6 interface Test_Tunnel tunnel 2
-> ipv6 interface Test_6to4 tunnel 6to4
```

Release History

Release 6.1; command introduced.
Release 6.1.1; **base-reachable-time** parameter added.

Related Commands

show ipv6 interface	Displays IPv6 Interface Table.
show ipv6 tunnel	Displays IPv6 Tunnel information and whether the 6to4 tunnel is enabled.

MIB Objects

```

```

ipv6 address

Configures an IPv6 address for an IPv6 interface on a VLAN, configured tunnel, or a 6to4 tunnel. There are different formats for this command depending on the address type.

ipv6 address *ipv6_address /prefix_length* **[anycast] {***if_name* | **loopback}**

no ipv6 address *ipv6_address* **[anycast] {***if_name* **| loopback}**

ipv6 address *ipv6_prefix* **eui-64 {***if_name* | **loopback}**

no ipv6 address *ipv6_prefix* **eui-64 {***if_name* | **loopback}**

Syntax Definitions

ipv6_address	IPv6 address.
/prefix_length	The number of bits that are significant in the IPv6 address (mask). (3..128).
anycast	Indicates the address is an anycast address.
eui-64	Append an EUI-64 identifier to the prefix.
if_name	Name assigned to the interface.
loopback	Configures the loopback interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to delete an address.
- You can assign multiple IPv6 addresses to an IPv6 interface.
- No default value for prefix length.
- The “eui” form of the command is used to add or remove an IPv6 address for a VLAN or configured tunnel using an EUI-64 interface ID in the low order 64 bits of the address.
- To enable IPv6 routing you must first create a VLAN, then create an IPv6 interface on the VLAN. See Chapter 4, “VLAN Management Commands,” for information on creating VLANs.
- To route IPv6 traffic over and IPv4 network, you must create an IPv6 tunnel using the **ipv6 address global-id** command.

Examples

```
-> ipv6 address 4132:86::19A/64 Test_Lab
-> ipv6 address 2002:d423:2323::35/64 Test_6to4
```

Release History

Release 6.1; command introduced.

Related Commands

show ipv6 interface	Displays IPv6 Interface Table.

MIB Objects

```
IPv6IfIndex
alaIPv6InterfaceAddressTable
   alaIPv6InterfaceAddress
   alaIPv6InterfaceAddressAnycastFlag
   alaIPv6InterfaceEUI64AddressPrefixLength
   alaIPv6InterfaceEUI64AddressrowStatus

For EUI-64 Addresses:
alaIPv6InterfaceEUI64AddresssTable
   alaIPv6InterfaceEUI64Address
   alaIPv6InterfaceEUI64AddressPrefixLength
   alaIPv6InterfaceEUI64AddressRowStatus
```

ipv6 address global-id

Automatically generates or allows a new global ID to be entered.

ipv6 address global-id {generate | *globalID*}

Syntax Definitions

generate	Automatically generates the global ID.
globalID	A 5-byte global ID value specified in the form hh:hhhh:hhhh

Defaults

By default, the IPv6 global ID is set to all zeros.

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- Global ID needs to be automatically generated or configured explicitly.
- A 40-bit global identifier is used to make the local IPv6 address prefixes globally unique.
- The global ID will be generated the first time a local unicast address is added via the **ipv6 address local-unicast** command or when the **ipv6 address global-id** command is executed.

Examples

```
-> ipv6 address global-id generate
-> ipv6 address global-id 32:57a3:8fed
```

Release History

Release 6.3.4; command introduced.

Related Commands

ipv6 address local-unicast	Creates a IPv6 local unicast address using the configured global ID.
ipv6 bgp unicast	Enables or disables unicast IPv6 updates for the BGP routing process.
show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaIPv6GlobalID
```

ipv6 address local-unicast

Creates a IPv6 local unicast address using the configured global ID.

ipv6 address local-unicast [global-id *globalID***] [subnet-id** *subnetID***] {interface-id** *interfaceID* **| eui-64} [prefix-length** *prefixLength***]** *{if-name* **| loopback}**

[no] ipv6 address local-unicast [global-id *globalID***] [subnet-id** *subnetID***] {interface-id** *interfaceID* **| eui-64} [prefix-length** *prefixLength***]** *{if-name* **| loopback}**

Syntax Definitions

globalID	A 5-byte global ID value specified in the form hh:hhhh:hhhh.
subnetID	A 2-byte Subnet ID specified in the form 0xhhhh. The valid range is 0x0000-0xffff or 0-65535.
interfaceID	An interface identifier specified in the form hhhh:hhhh:hhhh:hhhh.
eui-64	Automatically-generated EUI-64 value to be used for interface identfier.
prefixLength	The number of bits that are significant in the IPv6 address (mask). The valid range is 0-128; however, the default value should rarely be over-ridden.
if-name	The name assigned to the interface.
loopback	The loopback for the loopback interface.

Defaults

parameter	default
prefixLength	64

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the local unicast address. However, addresses are normally deleted using the **ipv6 address** command.
- If the global ID value is not explicitly specified, the default global ID set by the **ipv6 address global-id** command is used.
- If the global ID value is explicitly configured using the **ipv6 address local-unicast** command, the address' global ID will not be changed if the **ipv6 address global-id** command is executed.
- The use of a double-colon abbreviation for the interface identifier similar to that used for full IPv6 addresses is allowed.

Examples

```
-> ipv6 address local-unicast global-id 0073:110:255 subnet-id 23 interface-id
215:60ff:fe7a:adc0 prefix-length 64 loopback
```

Release History

Release 6.3.4; command introduced.

Related Commands

ipv6 address global-id	Automatically generates or allows a new global ID to be entered. .
show ipv6 information	Displays IPv6 information.

MIB Objects

```
alaIPv6LocalUnicastGlobalID
alaIPv6LocalUnicastSubnetID
alaIPv6LocalUnicastInterfaceID
alaIPv6LocalUnicastEUI64
alaIPv6LocalUnicastPrefixLength
```

ipv6 interface tunnel source destination

Configures the source and destination IPv4 addresses for a configured tunnel.

ipv6 interface *if_name* **tunnel {[source** *ipv4_source***] [destination** *ipv4_destination***]}**

Syntax Definitions

if_name	Name assigned to the tunnel interface.
ipv4_source	Source IPv4 address for the configured tunnel.
ipv4_destination	Destination IPv4 address for the configured tunnel.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Use the **ipv6 interface** command to create an IPv6 tunnel interface.

Examples

```
-> ipv6 interface Test tunnel 2 source 10.255.11.242 destination 10.255.11.12
```

Release History

Release 6.1; command introduced.

Related Commands

ipv6 interface	Creates an IPv6 tunnel interface.
show ipv6 tunnel	Displays IPv6 tunnel information.

MIB Objects

```
IPv6IfIndex
   alaIPv6ConfigTunnelv4Source
   alaIPv6ConfigTunnelv4Dest
   alaIPv6ConfigTunnelRowStatus
```

ipv6 dad-check

Runs a Duplicate Address Detection (DAD) check on an address that was marked as duplicated.

ipv6 dad-check *ipv6_address if_name*

Syntax Definitions

ipv6_address	IPv6 address.
ip_name	Name assigned to the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

The switch performs DAD check when an interface is attached to the stack and its VLAN first enters the active state. Use this command to rerun a DAD check on an address that was marked as duplicated.

Examples

```
-> ipv6 dad-check fe80::2d0:95ff:fe6a:f458/64 Test_Lab
```

Release History

Release 6.1; command introduced.

Related Commands

N/A

MIB Objects

```
alaIPv6InterfaceAddressTable
   alaIPv6InterfaceAddressDADStatus
```

ipv6 hop-limit

Configures the value placed in the hop limit field in the header of all IPv6 packets that are originated by the switch. It also configures the value placed in the hop limit field in router advertisements.

ipv6 hop-limit *value*

no ipv6 hop-limit

Syntax Definitions

value	Hop limit value. The range is 0 - 255.

Defaults

parameter	default
value	64

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to return the hop limit to its default value.
- Inputting the value 0 (zero) will result in the default (64) hop-limit.

Examples

```
-> ipv6 hop-limit 64
```

Release History

Release 6.1; command introduced.

Related Commands

show ipv6 information	Displays IPv6 information.

MIB Objects

```
ipv6MibObjects
   Ipv6DefaultHopLimit
```

ipv6 pmtu-lifetime

Configures the minimum lifetime for entries in the path MTU Table.

ipv6 pmtu-lifetime *time*

Syntax Definitions

time	Minimum path MTU entry lifetime, in minutes. Valid range is 10–1440.

Defaults

parameter	default
time	60

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> ipv6 pmtu-lifetime 30
```

Release History

Release 6.1; command introduced.

Related Commands

show ipv6 pmtu table	Displays the IPv6 path MTU Table.
show ipv6 information	Displays IPv6 information.
clear ipv6 pmtu table	Removes all the entries from the IPv6 path MTU Table.

MIB Objects

```
alaIPv6ConfigTable
   alaIPv6PMTUMinLifetime
```

ipv6 host

Configures a static host name to IPv6 address mapping to the local host table.

ipv6 host *name ipv6_address*

no ipv6 host *name ipv6_address*

Syntax Definitions

name	Host name associated with the IPv6 address (1 - 255 characters).
ipv6_address	IPv6 address.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Use the **no** form of this command to remove the mapping from the host table.

Examples

```
-> ipv6 host Lab 4235::1200:0010
```

Release History

Release 6.1; command introduced.

Related Commands

show ipv6 hosts	Displays IPv6 Local Hosts Table.

MIB Objects

```
alaIPv6HostTable
   alaIPv6HostName
   alaIPv6HostAddress
   alaIPv6HostRowStatus
```

ipv6 neighbor stale-lifetime

Configures the minimum lifetime for all neighbor entries.

ipv6 neighbor stale-lifetime *stale-lifetime*

Syntax Definitions

stale-lifetime	Minimum lifetime for neighbor entries in the stale state (5–2800).

Defaults

parameter	default
stale-lifetime	1440

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> ipv6 neighbor stale-lifetime 1400
```

Release History

Release 6.1.1; command introduced.

Related Commands

show ipv6 neighbors	Displays IPv6 Neighbor Table.
show ipv6 information	Displays IPv6 information.

MIB Objects

```
IPv6IfIndex
   alaIPv6NeighborTable
   alaIPv6NeighborStaleLifetime
```

ipv6 neighbor

Configures a static entry in IPv6 Neighbor Table.

ipv6 neighbor *ipv6_address hardware_address* **{***if_name***}** *slot/port*

no ipv6 neighbor *ipv6_address* **{***if_name***}**

Syntax Definitions

ipv6_address	IPv6 address that corresponds to the hardware address.
hardware_address	MAC address in hex format (for example, 00:00:39:59:F1:0C).
if_name	Name assigned to the interface on which the neighbor resides.
slot/port	Slot/port used to reach the neighbor.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Use the **no** form of this command to remove an entry from IPv6 Neighbor Table.

Examples

```
-> ipv6 neighbor 4132:86::203 00:d0:c0:86:12:07 Test 1/1
```

Release History

Release 6.1; command introduced.

Related Commands

show ipv6 neighbors	Displays IPv6 Neighbor Table.
show ipv6 information	Displays IPv6 information.

MIB Objects

```
IPv6IfIndex
alaIPv6NeighborTable
   alaIPv6NeighborNetAddress
   alaIPv6NeighborPhysAddress
   alaIPv6NeighborSlot
   alaIPv6NeighborPort
   alaIPv6NeighborRowStatus
   alaIPv6NeighborStaleLifetime
```

ipv6 prefix

Configures an IPv6 prefix on an interface. Used for configuring prefixes for router advertisements.

ipv6 prefix *ipv6_address /prefix_length if_name*
[valid-lifetime *time***]**
[preferred-lifetime *time***]**
[on-link-flag {true | false}
[autonomous-flag {true | false}] *if_name*

no ipv6 prefix *ipv6_address /prefix_length if_name*

Syntax Definitions

ipv6_address	IPv6 address of the interface.
/prefix_length	The number of bits that are significant in the IPv6 address (mask). (1...127).
valid-lifetime *time*	Length of time, in seconds, that this prefix will remain valid (time until deprecation). A value of 4,294,967,295 represents infinity.
preferred-lifetime *time*	Length of time, in seconds, that this prefix will remain preferred (time until deprecation). A value of 4,294,967,295 represents infinity.
on-link-flag	On-link configuration flag. When “true” this prefix can be used for on-link determination.
autonomous-flag	Autonomous address configuration flag. When “true”, indicates that this prefix can be used for autonomous address configuration (can be used to form a local interface address).
if_name	Name assigned to the interface.

Defaults

parameter	default
valid-lifetime *time*	2,592,000
preferred-lifetime *time*	604,800
on-link-flag	true
autonomous-flag	true

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Use the **no** form of this command to delete a prefix.

Examples

```
-> ipv6 prefix 4132:86::/64 Test
```

Release History

Release 6.1; command introduced.

Related Commands

show ipv6 prefixes	Displays IPv6 prefixes used in router advertisements.

MIB Objects

```
IPv6IfIndex
alaIPv6InterfacePrefixTable
   alaIP6vInterfacePrefix
   alaIP6vInterfacePrefixLength
   alaIP6vInterfacePrefixValidLifetime
   alaIP6vInterfacePrefixPreferredLifetime
   alaIP6vInterfacePrefixonLinkFlag
   alaIP6vInterfacePrefixAutonomousFlag
   alaIP6vInterfacePrefixRowStatus
```

ipv6 static-route

Creates/deletes an IPv6 static route. Static routes are user-defined; they carry a higher priority than routes created by dynamic routing protocols. That is, static routes always have priority over dynamic routes, regardless of the metric value.

ipv6 static-route *ipv6_prefix/prefix_length* **gateway** *ipv6_address* **[***if_name***][metric** *metric***][tag** *tag-num***][name** *tag-name***]**

no ipv6 static-route *ipv6_prefix/prefix_length* **gateway** *ipv6_address* **[***if_name***][metric** *metric***][tag** *tag-num***][name** *tag-name***]**

Syntax Definitions

ipv6_prefix	IPv6 network that is the destination of this static route.
/prefix_length	The number of bits (0...128) that are significant in the iPv6 address (mask).
gateway *ipv6_address*	IPv6 address of the next hop used to reach the destination IPv6 address.
if_name	If the next hop is a link-local address, the name of the interface used to reach it.
metric	Metric or cost (hop count) for the static route. You can set a priority for the static route by assigning a metric value. The lower the metric value, the higher the priority. Valid range is 1–15.
tag-num	The tag number.
tag-name	The name of the tag.

Defaults

parameter	default
metric	1

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a static route.
- A name can be assigned to the static route to identify it quickly at a later time.
- If you want to classify certain static routes and filter them, then a tag value may be allocated to those routes and route-map match statement to filter those routes. If the tag or name value is not specified, then the previously configured values for the tag and name will remain unchanged.
- In order to remove the previously configured tag value, configure the same route with tag value as 0. This will be equivalent to un-tagging the route.
- To remove the previously configured name value, configure the static route with the name field as “”. Un-configuring the static route will as intended delete both the tag and name values.

- To view the tag and name of the configured static routes, use the **show ipv6 router database** command.

Examples

```
-> ipv6 static-route 10.1.5.1/64 gateway fe80::2d0:95ff:fe6a:f458 v6if-137 metric 3
-> Ipv6 static-route 10.1.1.1/128 gateway 30.00.1.1 name HRDept
-> Ipv6 static-route 10.4.7.1/128 gateway 30.5.4.1 name Finance
-> ipv6 static-route 10.2.1/128 gateway 30.2.1.1 tag 234
```

Release History

Release 6.1.3; command was introduced.
Release 6.4.5; **tag** and **name** parameter was added.

Related Commands

show ipv6 routes	Displays IPv6 Forwarding Table.
show ipv6 router database	Displays a list of all routes (static and dynamic) that exist in the IPv6 router database.

MIB Objects

```
alaIprmv6StaticRouteTable
   alaIprmV6StaticRouteDest,
   alaIprmV6StaticRoutePfxLength,
   alaIprmV6StaticRouteNexthop,
   alaIprmV6StaticRouteMetric,
   alaIprmV6StaticRouteTag,
   alaIprmV6StaticRouteName,
```

ipv6 route-pref

Configures the route preference of a router.

ipv6 route-pref {static | ospf | rip | ebgp | ibgp} *value*

Syntax Definitions

static	Configures the route preference of static routes.
ospf	Configures the route preference of OSPF3 routes.
rip	Configures the route preference of RIPng routes.
ebgp	Configures the route preference of external BGP routes.
ibgp	Configures the route preference of internal BGP routes.
value	Route preference value.

Defaults

parameter	default
static *value*	2
ospf *value*	110
rip *value*	120
ebgp *value*	190
ibgp *value*	200

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Route preference of local routes cannot be changed.
- The valid route preference range is 1–255.
- The IPv6 version of BGP is not supported currently.

Examples

```
-> ipv6 route-pref ospf 20
-> ipv6 route-pref rip 60
```

Release History

Release 6.1.3; command introduced.

Related Commands

show ipv6 route-pref	Displays the configured route preference of a router.

MIB Objects

```
alaIprmRtPrefTable
   alaIprmRtPrefLocal
   alaIprmRtPrefStatic
   alaIprmRtPrefOspf
   alaIprmRtPrefRip
   alaIprmRtPrefEbgp
   alaIprmRtPrefIbgp
```

ping6

Tests whether an IPv6 destination can be reached from the local switch. This command sends an ICMPv6 echo request to a destination and then waits for a reply. To ping a destination, enter the **ping6** command and enter either the destination's IPv6 address or hostname. The switch will ping the destination using the default frame count, packet size, and interval (6 frames, 64 bytes, and 1 second respectively). You can also customize any or all of these parameters as described below.

ping6 {*ipv6_address* | *hostname***}** [*if_name*] **[count** *count***] [size** *data_size***] [interval** *seconds***]**

Syntax Definitions

ipv6_address	IP address of the system to ping.
hostname	DNS name of the system to ping.
if_name	If the target is a link-local address, the name of the interface used to reach it.
count	Number of packets to be transmitted.
size	Size of the data portion of the packet sent for this ping, in bytes.
seconds	Interval, in seconds, at which ping packets are transmitted.

Defaults

parameter	default
count	6
size	56
interval *seconds*	1

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- If you change the default values, they will only apply to the current ping. The next time you use the ping command, the default values will be used unless you again enter different values.
- When the next hop address is a local link address, the name of the interface used to reach the destination must be specified.

Examples

```
-> ping6 fe80::2d0:95ff:fe6a:f458/64
```

Release History

Release 6.1; command introduced.

Related Commands

traceroute6	Finds the path taken by an IPv6 packet from the local switch to a specified destination.

traceroute6

Finds the path taken by an IPv6 packet from the local switch to a specified destination. This command displays the individual hops to the destination as well as some timing information.

traceroute6 {*ipv6_address* | *hostname*} [*if_name*] **[max-hop** *hop_count***] [wait-time** *time***] [port** *port_number***] [probe-count** *probe***]**

Syntax Definitions

ipv6_address	Destination IPv6 address. IPv6 address of the host whose route you want to trace.
hostname	DNS name of the host whose route you want to trace.
if_name	If the target is a link-local address, the name of the interface used to reach it.
hop_count	Maximum hop count for the trace.
time	Delay time, in seconds between probes
port	Specific UDP port destination. By default, the destination port is chosen by traceroute6.
probe	Number of probes to be sent to a single hop.

Defaults

parameter	default
hop_count	30
time	5
probe	3

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- When using this command, you must enter the name of the destination as part of the command line (either the IPv6 address or hostname).
- Use the optional **max-hop** parameter to set a maximum hop count to the destination. If the trace reaches this maximum hop count without reaching the destination, the trace stops.

Examples

```
-> traceroute6 41EA:103::65C3
```

Release History

Release 6.1; command introduced.

Related Commands

ping6	Tests whether an IPv6 destination can be reached from the local switch.

show ipv6 hosts

Displays IPv6 Local Hosts Table.

show ipv6 hosts [*substring*]

Syntax Definitions

substring	Limits the display to host names starting with the specified substring.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

If you do not specify a substring, all IPv6 hosts are displayed.

Examples

```
-> show ipv6 hosts

Name                                      IPv6 Address
------------------------------------------+-------------------------------------
ipv6-test1.alcatel-lucent.com                    4235::1200:0010
ipv6-test2.alcatel-lucent.com                    4235::1200:0020
otheripv6hostname                       4143:1295:9490:9303:00d0:6a63:5430:9031
```

output definitions

Name	Name associated with the IPv6 address.
IPv6 Address	IPv6 address associated with the host name.

Release History

Release 6.1; command introduced.

Related Commands

ipv6 host	Configures a static host name to the IPv6 address mapping to the local host table.

MIB Objects

```
alaIPv6HostTable
   alaIPv6HostName
   alaIPv6HostAddress
```

show ipv6 icmp statistics

Displays IPv6 ICMP statistics.

show ipv6 icmp statistics [*if_name*]

Syntax Definitions

if_name	Display statistics only for this interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Use the ICMP table to monitor and troubleshoot the switch.

Examples

```
-> show ipv6 icmp statistics

Message                          Received   Sent
-------------------------------+----------+----------
 Total                                  0          0
 Errors                                 0          0
 Destination Unreachable                0          0
 Administratively Prohibited            0          0
 Time Exceeded                          0          0
 Parameter Problems                     0          0
 Packet Too Big                         0          0
 Echo Requests                          0          0
 Echo Replies                           0          0
 Router Solicitations                   0          0
 Router Advertisements                  0          0
 Neighbor Solicitations                 0          0
 Neighbor Advertisements                0          0
 Redirects                              0          0
 Group Membership Queries               0          0
 Group Membership Responses             0          0
 Group Membership Reductions            0          0
```

output definitions

Total	Total number of ICMPv6 messages the switch received or attempted to send.
Errors	Number of ICMPv6 messages the switch sent or received but was unable to process because of ICMPv6-specific errors (bad checksums, bad length, and so on).

output definitions (continued)

Destination Unreachable	Number of Destination Unreachable messages that were sent or received by the switch.
Administratively Prohibited	Number of Destination Unreachable/Communication Administratively Prohibited messages sent or received by the switch.
Time Exceeded	Number of Time Exceeded messages sent or received by the switch.
Parameter Problems	Number of Parameter Problem messages sent or received by the switch.
Packet Too Big	Number of Packet Too Big messages sent or received by the switch.
Echo Requests	Number of Echo Request messages sent or received by the switch.
Echo Replies	Number of Echo Reply messages sent or received by the switch.
Router Solicitations	Number of Router Solicitations sent or received by the switch.
Router Advertisements	Number of Router Advertisements sent or received by the switch.
Neighbor Solicitations	Number of Neighbor Solicitations sent or received by the switch.
Neighbor Advertisements	Number of Neighbor Advertisements sent or received by the switch.
Redirects	Number of Redirect messages sent or received by the switch.
Group Membership Queries	Number of Group Membership Queries sent or received by the switch.
Group Membership Responses	Number of Group Membership Responses sent or received by the switch.
Group Membership Reductions	Number of Group Membership Reductions sent or received by the switch.

Release History

Release 6.1; command introduced.

show ipv6 interface

Displays IPv6 Interface Table.

show ipv6 interface [*if_name* | **loopback**]

Syntax Definitions

if_name	Interface name. Limits the display to a specific interface.
loopback	Limits display to loopback interfaces.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- If you do not specify an interface name, all IPv6 interfaces are displayed.
- Specify an interface name (for example, VLAN 12) to obtain a more detailed information about a specific interface.

Examples

```
-> show ipv6 interface

Name                IPv6 Address/Prefix Length              Status    Device
--------------------+----------------------------------------+---------+--------
smbif-5             fe80::2d0:95ff:fe12:f470/64             Active    VLAN 955
                    212:95:5::35/64
                    212:95:5::/64
v6if-to-eagle       fe80::2d0:95ff:fe12:f470/64             Disabled  VLAN 1002
                    195:35::35/64
                    195:35::/64
V6if-6to4-137       2002:d423:2323::35/64                   Active    6to4 Tunnel
                    2002:d423:2323::/64
v6if-tunnel-137     fe80::2d0:95ff:fe12:f470/64             Disabled  Tunnel 2
                    137:35:35::35/64
                    137:35:35::/64                          Active    loopback
loopback            ::1/128
```

output definitions

Name	Interface name. This is usually the VLAN on which the interface is configured.
IPv6 Address/Prefix Length	IPv6 address and prefix length assigned to the interface. If an interface has more than one IPv6 address assigned to it, each address is shown on a separate line.

output definitions

Status	Interface status (for example, Active/Inactive).
Device	The device on which the interface is configured (for example, VLAN 955).

```

output definitions

IPv6 interface index	IPv6IfIndex value that should be used in SNMP requests pertaining to this interface.
Administrative status	Administrative status of this interface (Enabled/Disabled).
Operational status	Indicates whether the physical interface is connected to a device (Active/Inactive).
Hardware address	Interface's MAC address.
Link-local address	Link-local address assigned to the interface.
Global unicast address(es)	Global unicast address(es) assigned to the interface.
Joined group address(es)	Addresses of the multicast groups that this interface has joined.
Maximum Transfer Unit	Interface MTU value.
Send Router Advertisements	Indicates if the router sends periodic router advertisements and responds to router solicitations on the interface.
Maximum RA interval (sec)	Maximum time between the transmission of unsolicited router advertisements over the interface.
Minimum RA interval (sec)	Minimum time between the transmission of unsolicited router advertisements over the interface (0.33 * Maximum RA Interval).

output definitions (continued)

RA managed config flag	True/False value in the managed address configuration flag field in router advertisements.
RA other config flag	The True/False value in the other stateful configuration flag field in router advertisements sent over this interface.
RA reachable time (ms)	Value placed in the reachable time field in the router advertisements sent over this interface.
RA retransmit timer (ms)	Value placed in the retransmit timer field in router advertisements sent over this interface.
RA default lifetime (ms)	The value placed in the router lifetime field in the router advertisements sent over this interface.
Packets received	Number of IPv6 packets received since the last time the counters were reset.
Packets sent	Number of IPv6 packets sent since the last time the counters were reset.
Bytes received	Number of bytes of data received since the last time the counters were reset.
Bytes sent	Number of bytes of data sent since the last time the counters were reset.
Input errors	Number of input errors received since the last time the counters were reset.
Output errors	Number of output errors received since the last time the counters were reset.
Collisions	Number of collisions since the last time the counters were reset.
Dropped	Number of packets dropped since the last time the counters were reset.

Release History

Release 6.1; command introduced.

show ipv6 pmtu table

Displays the IPv6 Path MTU Table.

show ipv6 pmtu table

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> show ipv6 pmtu table

1-PMTU Entry
PMTU entry minimum lifetime = 10m
Destination Address                                      MTU      Expires
---------------------------------------------------------+--------+-------
fe80::02d0:c0ff:fe86:1207                                1280     1h 0m
```

output definitions

Destination Address	IPv6 address of the path's destination.
MTU	Path’s MTU.
Expires	Minimum remaining lifetime for the entry.

Release History

Release 6.1; command introduced.

Related Commands

ipv6 pmtu-lifetime	Configures the minimum lifetime for entries in the path MTU Table.
clear ipv6 pmtu table	Removes all the entries from the IPv6 path MTU Table.

MIB Objects

```
alaIPv6ConfigTable
   alaIPv6PMTUDest
   alaIPv6PMTUexpire
```

clear ipv6 pmtu table

Removes all the entries from the IPv6 path MTU Table.

clear ipv6 pmtu table

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> clear ipv6 pmtu table
```

Release History

Release 6.1; command introduced.

Related Commands

ipv6 pmtu-lifetime	Configures the configure the minimum lifetime for entries in the path MTU Table.

MIB Objects

```
alaIPv6ConfigTable
   alaIpv6ClearPMTUTable
```

show ipv6 neighbors

Displays IPv6 Neighbor Table.

show ipv6 neighbors [*ipv6_prefix/prefix_length* | *if_name* | **hw** *hardware_address* | **static]**

Syntax Definitions

ipv6_prefix/prefix_length	IPv6 prefix. Restricts the display to those neighbors starting with the specified prefix.
if_name	Interface name. Restricts the display to those neighbors reached via the specified interface.
hardware_address	MAC address. Restricts the display to the specified MAC address.
static	Restricts display to statically configured neighbors.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

If you do not specify an option (for example, if_name), all IPv6 neighbors are displayed.

Examples

```
-> show ipv6 neighbors

IPv6 Address                 Hardware Address    State     Type    Port  Interface
-----------------------------+------------------+----------+-------+-----+---------
fe80::02d0:c0ff:fe86:1207    00:d0:c0:86:12:07   Probe     Dynamic  1/15   vlan_4
fe80::020a:03ff:fe71:fe8d    00:0a:03:71:fe:8d   Reachable Dynamic  1/ 5   vlan_17
```

output definitions

IPv6 Address	The neighbor's IPv6 address.
Hardware Address	The MAC address corresponding to the IPv6 address.
State	The neighbor's state: - **Unknown** - **Incomplete** - **Reachable** - **Stale** - **Delay** - **Probe**.
Type	Indicates whether the neighbor entry is a **Static** or **Dynamic** entry.
Port	The port used to reach the neighbor.
Interface	The neighbor's interface name (for example, vlan_1)

Release History

Release 6.1; command introduced.

Related Commands

ipv6 neighbor	Configures a static entry in the IPv6 Neighbor Table.

MIB Objects

```
ipv6IfIndex
alaIPv6NeighborTable
   alaIPv6NeighborNetAddress
   alaIPv6NeighborPhysAddress
   alaIPv6NeighborSlot
   alaIPv6NeighborPort
   alaIPv6NeighborType
   alaIPv6NeighborState
```

clear ipv6 neighbors

Removes all entries, except static entries, from IPv6 Neighbor Table.

clear ipv6 neighbors

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

This commands only clears dynamic entries. If static entries have been added to the table, they must be removed using the **no** form of the **ipv6 neighbor** command.

Examples

```
-> clear ipv6 neighbors
```

Release History

Release 6.1; command introduced.

Related Commands

ipv6 neighbor	Configures a static entry in IPv6 Neighbor Table.
show ipv6 neighbors	Displays IPv6 Neighbor Table.

MIB Objects

```
alaIPv6NeighborTable
   alaIPv6ClearNeighbors
```

show ipv6 prefixes

Displays IPv6 prefixes used in router advertisements.

show ipv6 prefixes

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> show ipv6 prefixes

Legend: Flags: A = Autonomous Address Configuration, L = OnLink

                                          Valid     Preferred
Name           IPv6 Address/Prefix Length   Lifetime   Lifetime   Flags   Source
---------------+---------------------------+----------+----------+-------+---------
vlan 955       212:95:5::/64                2592000    604800     LA     dynamic
vlan 1002      195:35::/64                  2592000    604800     LA     dynamic

tunnel 2       137:35:35::/64               2592000    604800     LA     dynamic
```

output definitions

Name	The interface name. This is usually the VLAN on which the interface is configured.
IPv6 Address/Prefix Length	The IPv6 prefix and prefix length for a Router Advertisement Prefix Option.
Valid Lifetime	Length of time, in seconds, that this prefix will remain valid (time until deprecation). A value of 4,294,967,295 represents infinity.
Preferred Lifetime	Length of time, in seconds, that this prefix will remain preferred (time until deprecation). A value of 4,294,967,295 represents infinity.
Flags	**L** - Prefix can be used for onlink determination. **A** - Prefix can be used for autonomous address configuration (can be used to form a local interface address).
Source	**config** - Prefix has been configured by management. **dynamic** - Router Advertisements are using interface prefixes.

Release History

Release 6.1; command introduced.

Related Commands

ipv6 prefix	Configures an IPv6 prefix on an interface. Used for configuring prefixes for router advertisements.

   alaIPv6InterfacePrefixsource
```

show ipv6 routes

Displays IPv6 Forwarding Table.

show ipv6 routes [*ipv6_prefix/prefix_length* | **static]**

Syntax Definitions

ipv6_prefix/prefix_length	IPv6 prefix. Restricts the display to those routes starting with the specified prefix.
static	Restricts display to statically configured routes.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

If you do not specify an option (for example, “static”), all IPv6 interfaces are displayed.

Examples

```
-> show ipv6 routes

Legend:Flags:U = Up, G = Gateway, H = Host, S = Static, C = Cloneable, D = Dynamic,
             M = Modified, R = Unreachable, X = Externally resolved, B = Discard,
             L = Link-layer, 1 = Protocol specific, 2 = Protocol specific

Destination   Gateway Address           Interface         Age          Protocol  Flags
Prefix
-------------+-----------------------+---------------+------------+---------+-----
::/0           2002:d468:8a89::137       v6if-6to4-137   18h 47m 26s  Static    UGS
137:35:35::/64 fe80::2d0:95ff:fe12:f470  v6if-tunnel-137 18h 51m 55s  Local     UC
195:35::/64    fe80::2d0:95ff:fe12:f470  v6if-to-eagle   18h 51m 55s  Local     UC
212:95:5::/64  fe80::2d0:95ff:fe12:f470  smbif-5         18h 51m 55s  Local     UC
2002::/16      2002:d423:2323::35        v6if-6to4-137   18h 51m 55s  Other     U
```

output definitions

Destination Prefix	IPv6 destination address and prefix.
Gateway Address	IPv6 address of the gateway used to reach the destination network.
Interface	The device the interface is using (for example, VLAN 6to4tunnel); or loopback.
Age	Age of the entry. Entries less than 1 day old are displayed in hh:mm:ss format. Entries more than 1 day old are displayed in dd:hh format.
Protocol	Protocol by which the route was learned.

Release History

Release 6.1; command introduced.

Related Commands

ipv6 static-route	Configures a static entry in the IPv6 route.

MIB Objects

```
IPv6RouteTable
   IPv6Routes
   IPv6RoutesPrefix
   IPV6RoutesStatic
alaIPv6StaticRouteTable
   alaIPv6StaticRouteEntry
```

show ipv6 route-pref

Displays the IPv6 routing preference of the router.

show ipv6 route-pref

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

The IPv6 version of BGP is not supported currently.

Examples

```
-> show ipv6 route-pref
  Protocol    Route Preference Value
------------+-----------------------
  Local                   1
  Static                  2
  OSPF                  110
  RIP                   120
  EBGP                  190
  IBGP                  200
```

Release History

Release 6.1.1; command introduced.

Related Commands

ipv6 route-pref	Configures the IPv6 route preference of a router.

show ipv6 router database

Displays a list of all routes (static and dynamic) that exist in the IPv6 router database. This database serves as a central repository where routes are first processed for redistribution and where duplicate routes are compared to determine the best route to use. If a route does not appear in the IPv6 router database list, then the switch does not know about it. In the case of dynamically learned routes, this could indicate that the route was never received by the switch.

show iv6p router database [protocol *type* | **gateway** *ipv6_address* | **dest** *ipv6_prefix/prefix_length***]**

Syntax Definitions

type	Routing protocol type (local, static, OSPF, RIP, or BGP).
gateway *ipv6_address*	IPv6 address of the next hop used to reach the destination IPv6 address.
ipv6_prefix	IPv6 network that is the destination of this static route.
/prefix_length	The number of bits that are significant in the iPv6 address (mask). (0...128).

Defaults

By default, all routes are displayed.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- The IPv6 forwarding table is derived from IPv6 router database processing performed by the switch and contains only unique routes that the switch currently uses. Use the **show ipv6 routes** command to view the forwarding table.
- If an expected route does not appear in the IPv6 forwarding table, use the **show ipv6 router database** command to see if the switch knows about the route and/or if a duplicate route with a higher precedence was selected instead.
- The switch compares the protocol of duplicate routes to determine which one to use. Regardless of whether or not a route has a higher priority metric value, protocol determines precedence. Local routes are given the highest level of precedence followed by static, OSFP, RIP, then BGP routes. As a result, a route that is known to the switch may not appear in the IP forwarding table if a duplicate route with a higher protocol precedence exists.
- A list of inactive static routes is also included in the **show ipv6 router database** output display. A route becomes inactive if the interface for its gateway goes down. Inactive routes are unable to get to their destination and further investigation is warranted to determine why their gateway is unavailable.
- Routes that appear as inactive are not included in the main IP router database listing. If an inactive route becomes active, however, it is removed from the inactive list and added to the active route list.

Examples

```
-> show ipv6 router database
Legend: + indicates routes in use

Total IPRM IPv6 routes: 5

Destination/Prefix  Gateway Address           Interface         Protocol  Metric
------------------+------------------------+-----------------+---------+-------
::/0                2002:d468:8a89::137       v6if-6to4-137      Static    1
137:35:35::/64      fe80::2d0:95ff:fe12:f470  v6if-tunnel-137    OSPF      2
195:35::/64         fe80::2d0:95ff:fe12:f470  v6if-to-eagle      OSPF      2
212:95:5::/64       fe80::2d0:95ff:fe12:f470  smbif-5            Local     1
2002::/16           2002:d423:2323::35        v6if-6to4-137      Local     1

Inactive Static Routes:

VLAN  Destination/Prefix   Gateway Address          Metric
-----+------------------+------------------------+-------
1510  212:95:5::/64       fe80::2d0:95ff:fe6a:f458   1
```

output definitions

Destination/Prefix	IPv6 destination address and prefix.
Gateway Address	IPv6 address of the gateway used to reach the destination network.
Interface	The device the interface is using (for example, VLAN 6to4tunnel); or loopback.
Protocol	Protocol by which this IPv6 address was learned: LOCAL, STATIC, OSPF, RIP, BGP).
Metric	RIP metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.
VLAN	The VLAN on which the route was *learned*, not forwarded. Note that **N/A** appears in this field for static routes as they are not learned on a VLAN.

Release History

Release 6.1.3; command introduced.

Related Commands

show ipv6 routes	Displays the IPv6 Forwarding Table.

show ipv6 tcp ports

Displays TCP Over IPv6 Connection Table. This table contains information about existing TCP connections between IPv6 endpoints.

show ipv6 tcp ports

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Only connections between IPv6 addresses are contained in this table.

Examples

```
-> show ipv6 tcp ports

Local Address        Port Remote Address                   Port   Interface      State
--------------------+-------------------------------------+------+--------------+--------
::                   21 ::                                 0                     listen
::                   23 ::                                 0                     listen
2002:d423:2323::35   21 212:61:61:0:2b0:doff:fe43:d4f8     34144  v6if-6to4-137  established
2002:d423:2323::35   49153 212:61:61:0:2b0:d0ff:fe43:d4f8  34144  v6if-6to4-137  established
```

output definitions

Local Address	Local address for this TCP connection. For ports in the “Listen” state, which accepts connections on any IPv6 interface, the address is ::0.
Port	Local port number for the TCP connection.
Remote Address	Remote IPv6 address for the connection. If the connection is in the “Listen” state, the address is ::0.
Port	Remote port number for the TCP connection. If the connection is in the “Listen” state, the port number is 0.
Interface	Name of the interface (or “unknown”) over which the connection is established.
State	State of the TCP connection as defined in RFC 793.

Release History

Release 6.1; command introduced.

Related Commands

show ipv6 udp ports	Displays the UDP Over IPv6 Listener Table.

MIB Objects

```
IPv6TcpConnTable
   IPv6TcpConnEntry
   IPv6TcpConnLocalAddress
   IPv6TcpConnLocalPort
   IPv6TcpConnRemAddress
   IPv6TcpConnRemPort
   IPv6TcpConnIfIndex
   IPv6TcpConnState
```

show ipv6 traffic

Displays IPv6 traffic statistics.

show ipv6 traffic [*if_name*]

Syntax Definitions

if_name	Interface name. Restricts the display to the specified interface instead of global statistics.

Defaults

N/A.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

The statistics show the cumulative totals since the last time the switch was powered on, the last reset of the switch was executed or the traffic statistics were cleared using the command.

Examples

```
-> show ipv6 traffic

Global IPv6 Statistics
  Packets received
    Total               = 598174
    Header errors       = 0
    Too big             = 12718
    No route            = 4
    Address errors      = 0
    Unknown protocol    = 0
    Truncated packets   = 0
    Local discards      = 0
    Delivered to users  = 582306
    Reassembly needed   = 0
    Reassembled         = 0
    Reassembly failed   = 0
    Multicast Packets   = 118
  Packets sent
    Forwarded           = 3146
    Generated           = 432819
    Local discards      = 0
    Fragmented          = 0
    Fragmentation failed = 0
    Fragments generated  = 0
    Multicast packets   = 265
```

output definitions

Total	Total number of input packets received, including those received in error.
Header errors	Number of input packets discarded due to errors in their IPv6 headers (for example, version number mismatch, other format errors, hop count exceeded, and errors discovered in processing their IPv6 options).
Too big	Number of input packets that could not be forwarded because their size exceeded the link MTU of the outgoing interface.
No route	Number of input packets discarded because no route could be found to transmit them to their destination.
Address errors	Number of input packets discarded because the IPv6 address in their IPv6 header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (for example, ::0) and unsupported addresses (for example, addresses with unallocated prefixes).
Unknown protocol	Number of locally-addressed packets received successfully but discarded because of an unknown or unsupported protocol.
Truncated packets	Number of input packets discarded because the packet frame did not carry enough data.
Local discards	Number of input IPv6 packets for which no problems were encountered to prevent their continued processing, but which were discarded (for example, for lack of buffer space). Note that this counter does not include any packets discarded while awaiting re-assembly.
Delivered to users	Total number of packets successfully delivered to IPv6 user protocols (including ICMP).
Reassembly needed	Number of IPv6 fragments received that needed to be reassembled.
Reassembled	Number of IPv6 packets successfully reassembled.
Reassembly failed	Number of failures detected by the IPv6 reassembly algorithm (for whatever reason: timed out, errors, and so on).
Multicast packets	Number of multicast packets received.
Forwarded	Number of output packets that this entity received and forwarded to their final destinations.
Generated	Total number of IPv6 packets that local IPv6 user-protocols (including ICMP) supplied to IPv6 in requests for transmission. Note that this counter does not include any packets counted by the Forwarded statistic.
Local discards	Number of output IPv6 packets for which no problem was encountered to prevent their transmission to their destination, but were discarded (for example, for lack of buffer space). Note that this counter would include packets counted by the Forwarded statistic if any such packets met this (discretionary) discard criterion.
Fragmented	Number of IPv6 packets successfully fragmented.
Fragmentation failed	Number of IPv6 packets discarded because they needed to be fragmented but could not be.

output definitions

Fragments generated	Number of output packet fragments generated as a result of fragmentation.
Multicast packets	Number of multicast packets transmitted.

Release History

Release 6.1; command introduced.

Related Commands

clear ipv6 traffic

Resets all IPv6 traffic counters.

clear ipv6 traffic

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Use the **show ipv6 traffic** command to view current IPv6 traffic statistics.

Examples

```
-> clear ipv6 traffic
```

Release History

Release 6.1; command introduced.

Related Commands

show ipv6 traffic	Displays IPv6 traffic statistics.

MIB Objects

```
alaIPv6ConfigTable
   alaIPv6ClearTraffic
```

show ipv6 tunnel

Displays IPv6 tunnel information and whether the 6to4 tunnel is enabled.

show ipv6 tunnel

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> show ipv6 tunnel

IPv6 6to4 tunnel: Enabled
Configured Tunnels:
Tunnel              IPv6 Address/Prefix Length    Source IPv4     Destination IPv4
--------------------+-----------------------------+---------------+-----------------
1                   2001:0000:0200::101/48        192.16.10.101   192.28.5.254
23                  2001:0000:0200::102/48        192.15.10.102   10.27.105.25
v6if-tunnel-137     fe80::2d0:95ff:fe12:f470/64   212.35.35.35    212.104.138.137
```

output definitions

IPv6 6to4 tunnel	Indicates whether 6to4 tunneling is enabled or disabled on the switch.
Tunnel	Tunnel ID.
IPv6 Address/Prefix Length	IPv6 address associated with the tunnel.
Source IPv4	Source IPv4 address for the tunnel.
Destination IPv4	Destination IPv4 address for the tunnel.

Release History

Release 6.1; command introduced.

Related Commands

ipv6 address global-id	Configures the source and destination IPv4 addresses for a configured tunnel.

MIB Objects

```
alaIPv6ConfigTunnelTable
   alaIPv6Tunnel6to4
   alaIPv6ConfigTunnelv4Source
   alaIPv6ConfigTunnelv4Dest
```

show ipv6 udp ports

Displays UDP Over IPv6 Listener Table. This table contains information about UDP/IPv6 endpoints.

show ipv6 udp ports

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Only endpoints utilizing IPv6 addresses are displayed in this table.

Examples

```
-> show ipv6 udp ports

Local Address                                Port  Interface
---------------------------------------------+-----+--------------------
::                                            521
```

output definitions

Local Address	Local IPv6 address for this UDP listener. If a UDP listener accepts packets for any IPv6 address associated with the switch, the value is ::0.
Port	Local Port number for the UDP connection.
Interface	Name of the interface the listener is using or “unknown.”

Release History

Release 6.1; command introduced.

Related Commands

show ipv6 tcp ports	Displays TCP Over IPv6 Connection Table.

MIB Objects

```

   IPv6UdpEntry
   IPv6UdpLocalAddress
   IPv6UdpLocalPort
   IPv6UdpIfIndex
```

show ipv6 information

Displays the global IPv6 configuration values.

show ipv6 information

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> show ipv6 information

Default hop limit                     = 64
Path MTU entry minimum lifetime (min) = 60
Neighbor stale lifetime (min)         = 1440
Local Unicast Global ID               = 32:57a3:8fed
```

output definitions

Default hop limit	The value placed in the hop limit field in router advertisements
Path MTU entry minimum lifetime	Minimum lifetime for entries in the path MTU.
Neighbor stale lifetime	Minimum lifetime for neighbor entries in the stale state.
Local Unicast Global ID	40-bit global identifier which makes the local IPv6 address prefixes globally unique.

Release History

Release 6.1.1; command introduced.
Release 6.3.4; **Local Unicast Global ID** field added.

Related Commands

ipv6 neighbor	Configures a static entry in the IPv6 Neighbor Table.
ipv6 pmtu-lifetime	Configures the minimum lifetime for entries in the path MTU Table.
ipv6 hop-limit	Configures the value placed in the hop limit field in the header of all IPv6 packet.

MIB Objects

```
ipv6MibObjects
   Ipv6DefaultHopLimit
alaIPv6ConfigTable
   alaIPv6PMTUMinLifetime
alaIPv6NeighborTable
   alaIPv6NeighborStaleLifetime
   alaIPv6GlobalID
```

ipv6 redist

Controls the conditions for redistributing IPv6 routes between different protocols.

ipv6 redist {local | static | rip | ospf | isis | bgp} into {rip | ospf | isis | bgp} route-map *route-map-name* **[status {enable | disable}]**

no ipv6 redist {local | static | ospf | isis | bgp} into {rip | ospf | isis | bgp} [route-map *route-map-name***]**

Syntax Definitions

local	Redistributes local IPv6 routes.
static	Redistributes static IPv6 routes.
rip	Specifies RIP as the source or destination (into) protocol.
ospf	Specifies OSPF as the source or destination (into) protocol.
bgp	This parameter is currently not supported.
isis	This parameter is currently not supported.
route-map-name	Name of an existing route map that will control the redistribution of routes between the source and destination protocol.
enable	Enables the administrative status of the redistribution configuration.
disable	Disables the administrative status of the redistribution configuration.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a route map redistribution configuration. Note that if a route map name is not specified, all route maps associated with the redistribution configuration are removed.
- The source and destination protocols must be loaded and enabled before redistribution occurs.
- The IPv6 version of BGP is not supported currently.
- Use the **ip route-map** commands described in the “IP Commands” chapter of this guide to create a route map. Refer to the “Configuring IP” chapter in the *OmniSwitch AOS Release 6 Network Configuration Guide* for more information about how to create a route map.

Examples

```
-> ipv6 redist rip into ospf route-map rip-to-ospf1
-> ipv6 redist rip into ospf route-map rip-to-ospf2
-> no ipv6 redist rip into ospf route-map rip-to-ospf2
-> ipv6 redist local into rip route-map local-to-rip
-> ipv6 redist local into rip route-map local-to-rip disable
```

Release History

Release 6.1.3; command introduced.

Related Commands

show ipv6 redist	Displays the route map redistribution configuration.

MIB Objects

```
alaRouteMapRedistProtoTable
   alaRouteMapRedistSrcProtoId
   alaRouteMapRedistDestProtoId
   alaRouteMapRedistRouteMapIndex
   alaRouteMapRedistStatus
   alaRouteMapRedistAddressType
   alaRouteMapRedistRowStatus
```

ipv6 access-list

Creates an IPv6 access list that is used to specify multiple IPv6 addresses for a route map configuration.

ipv6 access-list *access-list-name*

no ipv6 access-list *access-list-name*

Syntax Definitions

access-list-name	Name of the IPv6 access list (up to 20 characters).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Use the **no** form of this command to delete the access list.

Examples

```
-> ipv6 access-list access1
-> no ipv6 access-list access1
```

Release History

Release 6.1.3; command introduced.

Related Commands

ipv6 access-list address	Adds IPv6 addresses to an existing IPv6 access list.
show ipv6 access-list	Displays the contents of an IPv6 access list.

MIB Objects

```
alaRouteMapAccessListNameTable
   alaRouteMapAccessListName
   alaRouteMapAccessListNameIndex
   alaRouteMapAccessListNameAddressType
   alaRouteMapAccessListNameRowStatus
```

ipv6 access-list address

Adds IPv6 addresses to the specified IPv6 access list.

ipv6 access-list *access-list-name* **address** *address/prefixLen* **[action {permit | deny}] [redist-control {all-subnets | no-subnets | aggregate}]**

no ipv6 access-list *access-list-name* **address** *address/prefixLen*

Syntax Definitions

access-list-name	Name of the IPv6 access list (up to 20 characters).
address/prefixLen	IPv6 address along with the prefix length to be added to the access list.
permit	Permits the IPv6 address for redistribution.
deny	Denies the IPv6 address for redistribution.
all-subnets	Redistributes or denies all the subnet routes that match the network portion of the IP address as specified by the mask length.
no-subnets	Redistributes or denies only those routes that exactly match the IP address and the mask length.
aggregate	Redistributes an aggregate route if there are one or more routes that match or are subnets of this address.

Defaults

parameter	default
permit | deny	**permit**
all-subnets | no-subnets | aggregate	**all-subnets**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the address from the access list.
- The *access-list-name* should exist before you add multiple IPv6 addresses to the IPv6 access list.
- The **action** parameters (**permit** and **deny**) determine if a route that matches the **redist-control** configuration for the IP address is allowed or denied redistribution.
- The **redist-control** parameters (**all-subnets, no-subnets**, and **aggregate**) defines the criteria used to determine if a route matches an address in the access list.
- Note that configuring the combination of **redist-control aggregate** with **action deny** is not allowed.

- Use this command multiple times with the same access list name to add multiple addresses to the existing IPv6 access list.

Examples

```
-> ipv6 access-list access1 address 2001::1/64 action permit
-> ipv6 access-list access1 address 2001::1/64 redist-control aggregate
-> no ipv6 access-list access1 address 2001::1/64
```

Release History

Release 6.1.3; command introduced.

Related Commands

ipv6 access-list	Creates an IPv6 access list that is used to specify multiple IPv6 addresses for a route map configuration.
show ipv6 access-list	Displays the contents of an IPv6 access list.

MIB Objects

```
alaRouteMapAccessListTable
   alaRouteMapAccessListIndex
   alaRouteMapAccessListAddress
   alaRouteMapAccessListAddressType
   alaRouteMapAccessListPrefixLength
   alaRouteMapAccessListAction
   alaRouteMapAccessListRedistControl
   alaRouteMapAccessListRowStatus
```

show ipv6 redist

Displays the IPv6 route map redistribution configuration.

show ipv6 redist [rip | ospf | bgp]

Syntax Definitions

rip	Displays the route map redistribution configurations that specify RIP as the destination (into) protocol.
ospf	Displays the route map redistribution configurations that specify OSPF as the destination (into) protocol.
bgp	This parameter is not supported.

Defaults

By default all route map redistribution configurations are shown.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Specify a destination protocol with this command to display only those configurations that redistribute routes into the specified protocol.
- The IPv6 version of BGP is not supported currently.

Release History

Release 6.1.3; command introduced.

Examples

```
-> show ipv6 redist

Source       Destination
Protocol     Protocol     Status    Route Map
------------+------------+---------+--------------------
localIPv6    RIPng        Enabled   ipv6rm
RIPng        OSPFv3       Enabled   ipv6rm

-> show ipv6 redist ospf

Source       Destination
Protocol     Protocol     Status    Route Map
------------+------------+---------+--------------------
RIPng        OSPFv3       Enabled   ipv6rm
```

output definitions

Source Protocol	The protocol from which the routes are learned.
Destination Protocol	The protocol into which the source protocol routes are redistributed..
Status	The administrative status (**Enabled** or **Disabled**) of the route map redistribution configuration.
Route Map	The name of the route map that is applied with this redistribution configuration.

Related Commands

ipv6 redist	Controls the conditions for redistributing IPv6 routes between different protocols.

MIB Objects

```
alaRouteMapRedistProtoTable
   alaRouteMapRedistSrcProtoId
   alaRouteMapRedistDestProtoId
   alaRouteMapRedistRouteMapIndex
   alaRouteMapRedistStatus
   alaRouteMapRedistAddressType
   alaRouteMapRedistRowStatus
```

show ipv6 access-list

Displays the contents of the specified IPv6 access list.

show ip access-list [*access-list-name***]**

Syntax Definitions

access-list-name	Name of the IPv6 access list.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

If the *access-list-name* is not specified in this command, all the access lists will be displayed.

Examples

```
-> show ipv6 access-list
                    Address /                   Redistribution
Name                Prefix Length      Effect   Control
--------------------+------------------+-------+--------------
al_3                128::/64           permit   all-subnets
al_4                124::/64           permit   no-subnets

-> show ipv6 access-list 4

                    Address /                   Redistribution
Name                Prefix Length      Effect   Control
--------------------+------------------+-------+--------------
al_4                124::/64           permit   no-subnets
```

output definitions

Name	Name of the IPv6 access list.
Address/Prefix Length	IPv6 address that belongs to the access list.
Effect	Indicates whether the IPv6 address is permitted or denied for redistribution.
Redistribution Control	Indicates the conditions specified for redistributing the matched routes.

Release History

Release 6.1.3; command introduced

Related Commands

ipv6 access-list	Creates an IPv6 access list for adding multiple IPv6 addresses to route maps.
ipv6 access-list address	Adds multiple IPv6 addresses to the IPv6 access list.

MIB objects

```
alaRouteMapAccessListIndex
   alaRouteMapAccessListAddressType
   alaRouteMapAccessListAddress
   alaRouteMapAccessListPrefixLength
   alaRouteMapAccessListAction
   alaRouteMapAccessListRedistControl
```

ipv6 load rip

Loads RIPng into memory. When the switch is initially configured, you must load RIPng into memory to enable RIPng routing.

ipv6 load rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- RIPng will support a maximum of 1,000 routes.
- RIPng will support a maximum of 20 interfaces.
- Use the **ipv6 rip status** command to enable RIPng on the switch.

Examples

```
-> ipv6 load rip
```

Release History

Release 6.1; command introduced.

Related Commands

ipv6 rip status	Enables/disables RIPng routing on the switch.
show ipv6 rip	Displays RIPng status and general configuration parameters.

MIB Objects

```
alaDrcTmConfig
   alaDrcTmIPRipngStatus
```

ipv6 rip status

Enables or disables RIPng on the switch.

ipv6 rip status {enable | disable}

Syntax Definitions

N/A

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

RIPng must be loaded on the switch (**ipv6 load rip**) to enable RIP on the switch.

Examples

```
-> ipv6 rip status enable
```

Release History

Release 6.1; command introduced.

Related Commands

ipv6 load rip	Loads RIPng into memory.
show ipv6 rip	Displays RIPng status and general configuration parameters.

MIB Objects

```
alaProtocolripng
   alaRipngProtoStatus
```

ipv6 rip invalid-timer

Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.

ipv6 rip invalid-timer *seconds*

Syntax Definitions

seconds	Time, in seconds, that a route will remain in an “Active” state. Valid range is 1 - 300.

Defaults

parameter	default
seconds	180

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

This timer is reset each time a routing update is received.

Examples

```
-> ipv6 rip invalid-timer 300
```

Release History

Release 6.1; command introduced.

Related Commands

ipv6 rip garbage-timer	Configures the RIPng garbage timer value.
ipv6 rip holddown-timer	Configures the amount of time a route is placed in a holddown state.

MIB Objects

```
alaProtocolripng
   alaRipngInvalidTimer
```

ipv6 rip garbage-timer

Configures the RIPng garbage timer value. When a route in the RIB exceeds the configured Invalid Timer Value, the route is moved to a “Garbage” state in the the RIB. The garbage timer is the length of time a route will stay in this state before it is flushed from the RIB.

ipv6 rip garbage-timer *seconds*

Syntax Definitions

seconds	Time, in seconds, that a route will remain in the RIPng Routing Table before it is flushed from the RIB. Valid range is 0 - 180.

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Use the **ipv6 rip invalid-timer** command to set the Invalid Timer Value.

Examples

```
-> ipv6 rip garbage-timer 180
```

Release History

Release 6.1; command introduced.

Related Commands

ipv6 rip invalid-timer	Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.
ipv6 rip holddown-timer	Configures the amount of time a route is placed in a holddown state.

MIB Objects

```
alaProtocolripng
   alaRipngGarbageTimer
```

ipv6 rip holddown-timer

Configures the amount of time a route is placed in a holddown state. Whenever a route is seen from the same gateway with a higher metric than the route in RIB, the route goes into holddown. This excludes route updates with an INFINITY metric.

ipv6 rip holddown-timer *seconds*

Syntax Definitions

seconds	Time, in seconds, that a route will remain in a holddown state. Valid range is 0 - 120.

Defaults

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

While in holddown, the route continues being announced as usual and used in RIB. This interval is used to control route flap dampening.

Examples

```
-> ipv6 rip holddown-timer 60
```

Release History

Release 6.1; command introduced.

Related Commands

ipv6 rip invalid-timer	Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.
ipv6 rip garbage-timer	Configures the RIPng garbage timer value.

MIB Objects

```
alaProtocolripng
   alaRipngHolddownTimer
```

ipv6 rip jitter

Configures an offset value for RIPng updates. This is the maximum (positive or negative) value that can be used to offset the update interval. For example, with an update interval of 30 seconds, and a jitter value of 5 seconds, the RIPng update packet would be sent somewhere (random) between 25 and 35 seconds from the previous update.

ipv6 rip jitter *value*

Syntax Definitions

value	Time, in seconds, that a routing update is offset. Valid range is 0 to one-half the updated interval value (for example, if the updated interval is 30, the range would be 0 - 300).

Defaults

parameter	default
value	5

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

As you increase the number of RIPng interfaces/peers, it is recommended that you increase the Jitter value to reduce the number of RIPng updates being sent over the network.

Examples

```
-> ipv6 rip jitter 10
```

Release History

Release 6.1; command introduced.

Related Commands

ipv6 rip update-interval	Configures the RIPng update interval.
show ipv6 rip	Displays RIPng status and general configuration information.

MIB Objects

```
alaProtocolripng
   alaRipngJitter
```

ipv6 rip route-tag

Configures the route tag value for RIP routes generated by the switch.

ipv6 rip route-tag *value*

Syntax Definitions

value	Route tag value. Valid range is 0 – 65535.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

This value does not apply to routes learned from other routers. For these routes, the route tag propagates with the route.

Examples

```
-> ipv6 rip route-tag 30
```

Release History

Release 6.1; command introduced.

Related Commands

show ipv6 rip	Displays RIPng status and general configuration information.

MIB Objects

```
alaProtocolripng
   alaRipngRouteTag
```

ipv6 rip update-interval

Configures the RIPng update interval. This is the interval, in seconds, that RIPng routing updates will be sent out.

ipv6 rip update-interval *seconds*

Syntax Definitions

seconds	Interval, in seconds, that RIPng routing updates are sent out. Valid range is 0–120.

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Use this command, along with the **ipv6 rip jitter** command to configure RIPng updates.

Examples

```
-> ipv6 rip update-interval 30
```

Release History

Release 6.1; command introduced.

Related Commands

ipv6 rip jitter	Configures an offset value for RIPng updates.
show ipv6 rip	Displays RIPng status and general configuration information.

MIB Objects

```
alaRipng
   alaRipngUpdateInterval
```

ipv6 rip triggered-sends

Configures the behavior of triggered updates.

ipv6 rip triggered-sends {all | updated-only | none}

Syntax Definitions

all	All RIPng routes are added to any triggered updates.
updated-only	Only route changes that are causing the triggered update are included in the update packets.
none	RIPng routes are not added to triggered updates.

Defaults

parameter	default
all | updated-only | none	**updated-only**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- If set to **all**, all routes are sent in the update, not just route changes, which increases RIPng traffic on the network.
- If set to **none**, no triggered updates are sent, which can cause delays in network convergence.

Examples

```
-> ipv6 rip triggered-sends none
```

Release History

Release 6.1; command introduced.

Related Commands

show ipv6 rip	Displays RIPng status and general configuration information.

MIB Objects

```
alaProtocolripng
   alaRipngTriggeredSends
```

ipv6 rip interface

Creates or deletes a RIPng interface.

ipv6 rip interface *if_name*

[no] ipv6 rip interface *if_name*

Syntax Definitions

if_name	IPv6 interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- By default, a RIPng interface is created in the enabled state.
- Routing is enabled on a VLAN when you create a router port. However, to enable RIPng routing, you must also configure and enable a RIPng routing interface on the VLAN's IP router port. For more information on VLANs and router ports, see Chapter 4, "VLAN Management Commands".
- RIPng will support a maximum of 20 interfaces.

Examples

```
-> ipv6 rip interface Test_Lab
```

Release History

Release 6.1; command introduced.

Related Commands

ipv6 redist	Loads RIPng into memory.
ipv6 rip status	Enables or disables RIPng on the switch.
ipv6 rip interface recv-status	Configures IPv6 RIPng interface “Receive” status. When this status is set to "enable", packets can be received on this interface.
ipv6 rip interface send-status	Configures IPv6 RIPng interface “Send” status. When this status is set to "enable", packets can be sent on this interface.
show ipv6 rip interface	Displays information for all or specified RIPng interfaces.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceStatus
```

ipv6 rip interface metric

Configures the RIPng metric or cost for a specified interface.

ipv6 rip interface *if_name* **metric** *value*

Syntax Definitions

if_name	IPv6 interface name.
value	Metric value. Valid range is 1 - 15.

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- When you configure a metric for a RIPng interface, this metric cost is added to the metric of the incoming route.
- You can set priorities for routes generated by a switch by assigning a metric value to routes generated by that switch's RIPng interface. For example, routes generated by a neighboring switch may have a hop count of 1. However, you can lower the priority of routes generated by that switch by increasing the metric value for routes generated by the RIPng interface.

Examples

```
-> ipv6 rip Test_Lab metric 1
```

Release History

Release 6.1; command introduced.

Related Commands

ipv6 rip interface	Creates or deletes a RIPng interface.
show ipv6 rip interface	Displays information for all or specified RIPng interfaces.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceMetric
```

ipv6 rip interface recv-status

Configures IPv6 RIPng interface “Receive” status. When this status is set to "enable", packets can be received on this interface. When it is set to "disable", packets will not be received on this interface.

ipv6 rip interface *if_name* **recv-status {enable | disable}**

Syntax Definitions

if_name	IPv6 interface name.
enable | disable	Interface “Receive” status.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

RIPng must be loaded (**ipv6 load rip**) and enabled (**ipv6 rip status**)on the switch to send or receive packets on the interface.

Examples

```
-> ipv6 rip interface Test_Lab recv-status disable
```

Release History

Release 6.1; command introduced.

Related Commands

ipv6 redist	Loads RIPng into memory.
ipv6 rip status	Enables/disables RIPng on the switch.
ipv6 rip interface send-status	Configures IPv6 RIPng interface “Send” status.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceRecvStatus
```

ipv6 rip interface send-status

Configures IPv6 RIPng interface “Send” status. When this status is set to "enable", packets can be sent from this interface. When it is set to "disable", packets will not be sent from this interface.

ipv6 rip interface *if_name* **send-status {enable | disable}**

Syntax Definitions

if name	IPv6 interface name.
enable | disable	Interface “Send” status.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

RIPng must be loaded (**ipv6 load rip**) and enabled (**ipv6 rip status**)on the switch to send or receive packets on the interface.

Examples

```
-> ipv6 rip interface Test_Lab send-status enable
```

Release History

Release 6.1; command introduced.

Related Commands

ipv6 redist	Loads RIPng into memory.
ipv6 rip status	Enables/disables RIPng on the switch.
ipv6 rip interface recv-status	Configures IPv6 RIPng interface “Receive” status.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceSendStatus
```

ipv6 rip interface horizon

Configures the routing loop prevention mechanisms.

ipv6 rip interface *if_name* **horizon {none | split-only | poison}**

Syntax Definitions

if_name	IPv6 interface name.
none | split-only | poison	**none** - Disables loop prevention mechanisms. **split-only** - Enables split-horizon, without poison-reverse. **poison** - Enables split-horizon with poison-reverse.

Defaults

parameter	default
none | split-only | poison	**poison**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- If set to **none** the route is not sent back to the peer.
- If set to **split-only**, the route received from the peer is sent back with an increased metric.
- If set to **poison** the route received from the peer is sent back with an “infinity” metric.

Examples

```
-> ipv6 rip interface Test_Lab none
```

Release History

Release 6.1; command introduced.

Related Commands

show ipv6 rip interface	Displays information for all or specified RIPng interfaces.
show ipv6 rip routes	Displays all or a specific set of routes in the RIPng Routing Table.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceHorizon
```

show ipv6 rip

Displays the RIPng status and general configuration parameters.

show ipv6 rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> show ipv6 rip

Status              = Enabled,
Number of routes    = 10,
Route tag           = 0,
Update interval     = 30,
Invalid interval    = 180,
Garbage interval    = 120,
Holddown interval   = 0,
Jitter interval     = 5,
Triggered Updates   = All Routes,
```

output definitions

Status	RIPng protocol status (enabled or disabled).
Number of routes	Number of RIPng routes in Forwarding Information Base (FIB).
Route tag	Route tag value for RIP routes generated by the switch. Valid range is 0-65535. Default is 0.
Invalid interval	Invalid Timer setting, in seconds.
Garbage interval	Garbage Timer setting, in seconds.
Holddown interval	Holddown Timer setting, in seconds.
Jitter interval	Jitter setting.
Triggered updates	Triggered Updates setting (All Routes, Updated Routes, and None).

Release History

Release 6.1; command introduced.

Related Commands

ipv6 rip status	Enables or disables RIPng routing on the switch.
ipv6 rip route-tag	Configures the route tag value for RIP routes generated by the switch.
ipv6 rip update-interval	Configures the Interval, in seconds, so that RIPng routing updates are sent out.
ipv6 rip invalid-timer	Configures the amount of time a route remains active in RIB before being moved to the "garbage" state.
ipv6 rip invalid-timer	Configures the RIPng garbage timer value. Routes move into the garbage collection state because the timer expired or a route update with an INFINITY metric was received.
ipv6 rip holddown-timer	Configures the amount of time a route is placed in a holddown state.
ipv6 rip jitter	Configures an offset value for RIPng updates. This is the maximum (positive or negative) value that can be used to offset the update interval.
ipv6 rip triggered-sends	Configures the behavior of triggered updates.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceStatus
   alaRipngRouteTag
   laRipngInvalidTimer
   alaRipngGarbageTimer
   alaRipngHolddownTimer
   alaRipngJitter
   alaRipngTriggeredSends
```

show ipv6 rip interface

Displays information for all or specified RIPng interfaces.

show ipv6 rip interface [*if_name*]

Syntax Definitions

if_name	IPv6 interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

If you do not specify an interface, all IPv6 RIP interfaces are displayed.

Examples

```
-> show ipv6 rip interface

    Interface                       Packets
       Name          Status     Recvd   Sent     Metric
--------------------+----------+---------+--------+---------
Test_Lab            Active     12986     12544    1
Test_Lab_2          Active     12556     12552    1

-> show ipv6 rip interface if3

Name                           = Test_Lab,
IPv6 interface index           = 3,
Interface status               = Active,
Next Update                    = 27 secs,
Horizon Mode                   = Split and Poison-reverse,
MTU size                       = 1500,
Metric                         = 1,
Send status                    = Enabled,
Receive status                 = Enabled,
Packets received               = 12986,
Packets sent                   = 12544,
```

output definitions

Interface name	Interface name.
IPv6 interface index	IPv6 index of this interface.
Status	Interface status (Active/Inactive).
Packets Recvd	Number of packets received by the interface.

output definitions (continued)

Packets Sent	Number of packets sent by the interface.
Metric	RIPng metric (cost) configured for the interface.
IPv6 interface index	IPv6 interface index number.
Interface status	Interface status (Active/Inactive).
Next update	Seconds remaining until the next update on this interface.
Horizon mode	Interface Horizon Mode (routing loop prevention mechanisms). Displayed modes are none/split-only/poison-reverse.
MTU size	Maximum transmission size for RIPng packets on the interface.
Send status	Interface “Send” status. When this status is set to "enable", packets can be sent from this interface. When it is set to "disable", packets will not be sent from this interface.
Receive status	Interface “Receive” status. When this status is set to "enable", packets can be received by this interface. When it is set to "disable", packets cannot be received by this interface.
Packets received	Number of packets received by the interface.
Packets sent	Number of packets sent by the interface.

Release History

Release 6.1; command introduced.

Related Commands

ipv6 rip interface	IPv6 interface name.
ipv6 rip status	Enables or disables RIPng routing on the switch.
ipv6 rip interface recv-status	Configures the interface “Receive” status. When this status is set to "enable", packets can be received by this interface. When it is set to "disable", packets cannot be received by this interface.
ipv6 rip interface send-status	Configures the interface “Send” status. When this status is set to "enable", packets can be sent from this interface. When it is set to "disable", packets will not be sent from this interface.
ipv6 rip interface metric	Configures the RIPng metric (cost) for the interface.
ipv6 rip interface horizon	Configures the interface Horizon Mode (routing loop prevention mechanisms).
show ipv6 rip	Displays RIPng status and general configuration parameters (for example, force holddown timer).

MIB Objects

```
alaRipngInterfaceTable

   alaRipngInterfaceStatus
   alaRipngInterfacePacketsRcvd
   alaRipngInterfacePacketsSent
   alaRipngInterfaceMetric
   alaRipngInterfaceIndex
   alaRipngInterfaceNextUpdate
   alaRipngInterfaceHorizon
   alaRipngInterfaceMTU
   alaRipngInterfaceSendStatus
   alaRipngInterfaceRecvStatus
```

show ipv6 rip peer

Displays a summary of the observed RIPng peers, or specific information about a peer when a peer address is provided.

show ipv6 rip peer [*ipv6_addresss*]

Syntax Definitions

ipv6_addresss	IPv6 address of the peer.

Defaults

N/A.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

If you do not specify a peer, all IPv6 RIP peers are displayed.

Examples

```
-> show ipv6 peer
                              Seen on       Packets   Last
Address                       Interface     Recv      Update
------------------------------+-------------+--------+----------
fe80::200:39ff:fe1f:710c      vlan172       23       20
fe80::2d0:95ff:fe12:da40      bkbone20      33       2
fe80::2d0:95ff:fe12:da40      vlan150       26       25
fe80::2d0:95ff:fe6a:5d41      nssa23        20       25

-> show ipv6 rip peer fe80::2d0:95ff:fe12:da40

Peer#1 address          = fe80::2d0:95ff:fe12:da40,
Seen on interface       = bkbone20,
Last Update             = 8 secs,
Received packets        = 33,
Received bad packets    = 0
Received routes         = 5,
Received bad routes     = 0

Peer#2 address          = fe80::2d0:95ff:fe12:da40,
Seen on interface       = vlan150,
Last Update             = 1 secs,
Received packets        = 27,
Received bad packets    = 0
Received routes         = 2,
Received bad routes     = 0
```

output definitions

Address	IPv6 address of the peer.
Seen on Interface	Interface used to reach the peer.
Packets Recvd	Number of packets received from the peer.
Last Update	Number of seconds since the last update was received from the peer.
Peer address	Peer IPv6 address.
Received packets	Number of packets received from the peer.
Received bad packets	Number of bad packets received from the peer.
Received routes	Number of RIPng routes received from the peer.
Received bad routes	Number of bad RIPng routes received from the peer.

Release History

Release 6.1; command introduced.

Related Commands

show ipv6 rip interface	Displays all or specified RIPng interface status.
show ipv6 rip routes	Displays all or a specific set of routes in RIPng Routing Table.

MIB Objects

```
alaRipngPeerTable
   alaRipngPeerEntry
   alaRipngPeerAddress

   alaRipngPeerLastUpdate
   alaRipngPeerNumUpdates
   alaRipngPeerBadPackets
   alaRipngPeerNumRoutes
   alaRipngPeerBadRoutes
```

show ipv6 rip routes

Displays all or a specific set of routes in RIPng Routing Table.

show ipv6 rip routes [dest <*ipv6_prefix/prefix_length*>**] | [gateway** <*ipv6_addr*>**] | [detail** <*ipv6 prefix/prefix_length*>**]**

Syntax Definitions

dest	Displays all routes whose destination matches the IPv6 prefix/prefix length.
gateway	Displays all routes whose gateway matches the specified IPv6 address.
detail	Displays detailed information about a single route matching the specified destination.
ipv6_addr	IPv6 address.
ipv6_prefix/prefix length	IPv6 address and prefix/prefix length.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

If you do not enter one of the optional parameters, all IPv6 RIP routes are displayed.

Examples

```
-> show ipv6 rip routes

Legends: State: A = Active, H = Holddown, G = Garbage
Destination     Gateway                     State    Metric Proto
---------------+---------------------------+-------+------+------
100::1/128      +fe80::200:39ff:fe1f:710c     A       2      Rip
100::100:1/128  +fe80::200:39ff:fe1f:710c     A       2      Rip
400::/100       +fe80::2d0:95ff:fe12:e050     A       1      Local
900::/100       +fe80::2d0:95ff:fe12:e050     A       1      Local
8900::/100      +fe80::2d0:95ff:fe12:da40     A       2      Rip
9800::/100      +fe80::2d0:95ff:fe12:da40     A       2      Rip
9900::/100      +fe80::2d0:95ff:fe12:e050     A       1      Local
```

```
-> show ipv6 rip routes detail 9900::/100

Destination     = 9900::,
Mask length     = 100,
Gateway(1)      = fe80::2d0:95ff:fe12:e050,
Protocol        = Local,
Out Interface   = nssa23,
Metric          = 1,
Status          = Installed,
State           = Active,
Age             = 10544s,
Tag             = 0,
Gateway(2)      = fe80::2d0:95ff:fe12:da40,
Protocol        = Rip,
Out Interface   = bkbone20,
Metric          = 2,
Status          = Not Installed,
State           = Active,
Age             = 15s,
Tag             = 0,
```

output definitions

Destination	IPv6 address/address length of the destination.
Gateway	IPv6 gateway used to reach the destination.
State	Route status (Active/Inactive).
Metric	Routing metric for this route.
Protocol	Protocol used to learn the route.
Mask Length	Prefix Length.
Out Interface	The interface used to reach the destination.
Status	Route status (Active/Inactive).
Age	The number of seconds since the route was last updated.
Tag	The route tag value for the route.

Release History

Release 6.1; command introduced.

Related Commands

21 IPsec Commands

IPsec is a suite of protocols for securing IPv6 communications by authenticating and/or encrypting each IPv6 packet in a data stream. IPsec provides security services such as encrypting traffic, integrity validation, authenticating the peers, and anti-replay.

IPsec protocols operate at network layer using appropriate security protocols, cryptographic algorithms, and cryptographic keys. The security services are provided through use of two security protocols, the Authentication Header (AH) and the Encapsulating Security Payload (ESP), and through the use of cryptographic key management procedures and protocols.

This implementation of IPsec supports the transport mode of operation. In this mode, only the data you transfer (payload) in the IPv6 packet is encrypted and/or authenticated and only the payloads that are originated and destined between two endpoints are processed with IPsec.

The pre-configured Security Policy determines the traffic that is to be rendered with IPsec protection. A Security Association (SA) specifies the actual IPsec actions to be performed (e.g encryption using 3DES, authentication with HMAC-SHA1). A security association is a bundle of algorithms and parameters (such as keys) that is being used to encrypt and authenticate a particular flow in one direction. Security Associations are manually configured.

A summary of the available commands is listed here:.

ipsec key
ipsec security-key
ipsec policy
ipsec policy rule
ipsec sa
show ipsec policy
show ipsec sa
show ipsec key
show ipsec ipv6 statistics

ipsec key

Configures the authentication and encryption keys for a manually configured IPsec SA.

ipsec key *key_name* **{sa-authentication | sa-encryption}** *key*

no ipsec key *key_name* **{sa-authentication | sa-encryption}**

Syntax Definitions

key_name	The name of this key (maximum 20 characters).
sa-authentication	Indicates that the key value is used by an authentication algorithm.
sa-encryption	Indicates that the key value is used by an encryption algorithm.
key	Specifies the key value. The key value can be either in the hexadecimal format or as a string.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove the authentication key or the encryption key from a manually configured IPsec SA.
- The *name* parameter should be the same as the name of the manually configured SA that will use this SA authentication or encryption key.
- The length of the key value must match the value that is required by the encryption or authentication algorithm that will use the key. The required key length for the supported algorithm are as follows:

algorithm	key length
des-cbc	64 bits
3des-cbc	192 bits
aes-cbc	128, 192, or 256 bits
aes-ctr	160, 224, or 288 bits
hmac-md5	128 bits
hmac-sha1	160 bits
aes-xcbc-mac	128 bits

- The combination of the key's name and type must be unique.
- The **encrypted** option will be used when the key commands are written to the **boot.cfg** or other snapshot file. This option should not be specified when entering this command through the switch CLI.

Examples

```
-> ipsec key sa1_ah sa-authentication 0x1122334455667788990011223344556 6
-> ipsec key sa1_esp sa-encryption "Quoth, Nevermore"
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ipsec sa	Configures an IPsec Security Association (SA).
show ipsec key	Displays the keys for the manually configured IPsec SA.

MIB Objects

```
AlaIPsecKeyTable
   alaIPsecKeyName
   alaIPsecKeyType
   alaIPsecKeyEncrypted
   alaIPsecKey
```

ipsec security-key

Sets the master security key for the switch. The master security key is used to encrypt and decrypt the configured SA keys that are saved to permanent storage (e.g., **boot.cfg** file).

ipsec security-key [*old_key***]** *new_key*

Syntax Definitions

old_key	The current master security key. The key can be specified either in the hexadecimal format (16 bytes in length) or as a string (16 characters in length).
new_key	The new key value. The key can be specified either in the hexadecimal format (16 bytes in length) or as a string (16 characters in length).

Defaults

By default, no master security key is set for the switch.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- The *old_key* parameter should always be specified when you modify an existing key. Setting the key for first time does not require the *old_key*.
- If the value of the *old_key* is incorrect, the attempt to set a new key will fail.
- When there is no master security key configured for the switch, the SA key values are written unencrypted to permanent storage (**boot.cfg** or other configuration file). A warning message is logged when this occurs.
- If the master security key is reset using **debug clear ipsec security-key** command, the currently configured SA keys will be deleted.
- When the master security key is set or changed, its value is immediately propagated to the secondary CMM. In a stacked configuration, the master security key is saved to all modules in case a stack split occurs or there is a simultaneous failure of both CMM modules. When the master security key is changed, save and synchronize the current configuration to ensure the proper operation of IPsec in the event of a switch reboot or takeover.

Examples

```
-> ipsec security-key alcatel_corp_001 alcatel_lucent01
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ipsec key	Adds, modifies or deletes the authentication and encryption keys for a manually configured IPsec SA.

MIB Objects

```
AlaIPsecSecurityKeyTable
   alaIPsecSecurityKeyCurrent
   alaIPsecSecurityKeyNew
```

ipsec policy

Configures a security policy.

ipsec policy *policy_name* **[priority** *priority***] [source {***ipv6_address* **[***/prefix_length***]} [port** *port***]] [destination {***ipv6_address* **[***/prefix_length***]}[port** *port]***] [protocol** *protocol***}] [in | out] [discard | ipsec | none] [description** *description***] [no shutdown | shutdown]**

no ipsec policy *policy_name*

Syntax Definitions

policy_name	The name for the policy
priority	The priority for the policy. Values range from 1 to 1000. The higher the value, the higher the priority.
ipv6_address	The IPv6 address to which the policy applies.
prefix_length	An IPv6 address prefix used to identify a range of addresses to which the policy applies.
port	The upper-layer protocol port number to which the policy applies.
protocol	Specifies the upper-layer protocol to which the policy applies (refer to the table in the “Usage Guidelines“section below for various protocol options).
in	Specifies that the policy is applied to the inbound IPv6 traffic.
out	Specifies that the policy is applied to the outbound IPv6 traffic.
discard	Specifies that traffic to which this policy applies is discarded.
ipsec	Specifies that IPsec processing is required on traffic to which this policy applies.
none	Specifies that no IPsec processing is done on traffic to which this policy applies**.**
description	The detailed description of the policy.
no shutdown	Administratively enables the policy.
shutdown	Administratively disables the policy.

Defaults

parameter	default
priority	100
port	any port
any | **icmp6** | **tcp** | **udp** | **ospf** | **vrrp** | **number**	**any**
discard | **ipsec** | **none**	**ipsec**
no shutdown | **shutdown**	**no shutdown**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove an IPsec policy rule from the switch configuration.
- If traffic matches more than one policy, the policy with the highest priority is applied. If two policies have the same priority, the one configured first has precedence.
- The following table lists the various **protocol** options for this command:

protocol
any
icmp6[type *type***]**
tcp
udp
ospf
vrrp
number *protocol*

  The **any** option should be used to apply the policy to all protocol traffic. Otherwise, an upper-layer protocol (or protocol number) may be specified to restrict the policy to the specified protocol traffic. The optional *type* parameter of **icmp6** can also be specified to restrict the policy for certain type of ICMPv6 packets.
- If the **ipsec** option is specified, then the IPv6 packets that matches the criteria will be processed by the the IPsec as defined with the **ipsec policy rule** command and this policy may not be enabled until at least one rule has been defined.

Examples

```
-> ipsec policy tcp_in source ::/0 destination 3ffe:200:200:4001::99 protocol tcp
in ipsec description "IPsec on all inbound TCP" no shutdown
-> no ipsec policy tcp_in
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ipsec policy rule	Adds, modifies, or removes an IPsec rule for a security policy.
show ipsec policy	Displays information about the security policies.

MIB Objects

```

   alaIPsecSecurityPolicyICMPv6Type
   alaIPsecSecurityPolicyDirection
   alaIPsecSecurityPolicyAction
   alaIPsecSecurityPolicyDescription
   alaIPsecSecurityPolicyAdminState
```

ipsec policy rule

Configures an IPsec rule for an IPsec security policy.

ipsec policy *policy_name* **rule** *index* **[ah | esp]**

no ipsec policy *policy_name* **rule** *index*

Syntax Definitions

policy_name	The name of an existing IPsec security policy.
index	The index of this rule. Values range from 1 to 10.
ah	Specifies that the rule requires the presence of an Authentication Header (AH).
esp	Specifies that the rule requires the presence of an Encrypted Security Payload (ESP).

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- The IPsec security policy name specified with this command must already exist in the switch configuration. Use the **ipsec policy** command to create a new security policy.
- The index value configured for the IPsec policy rule determines the order in which a rule is applied to the original payload. For example, to first enclose the original contents of an IPv6 packet in an ESP and then authenticate the encrypted payload with an AH, configure the ESP rule with and index of one and the AH rule with an index of two.

Examples

```
-> ipsec policy tcp_in rule 1 esp
-> ipsec policy tcp_in rule 2 ah
-> no ipsec policy tcp_in rule 2
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ipsec policy	Configures an IPsec security policy.
show ipsec policy	Displays the IPsec security policy configuration for the switch.

MIB Objects

```
AlaIPsecSecurityPolicyRuleTable
   alaIPsecSecurityPolicyName
   alaIPsecSecurityPolicyRuleIndex
   alaIPsecSecurityPolicyRuleProtocol
```

ipsec sa

Configures an IPsec Security Association (SA).

ipsec sa *sa_name* **{esp | ah} [source** *ipv6_address***] [destination** *ipv6_address***] [spi** *spi***] [encryption {null | des-cbc | 3des-cbc | aes-cbc [key-size** *key_length***] | aes-ctr [key-size** *key_length***]}] [authentication {none | hmac-md5 | hmac-sha1 | aes-xcbc-mac}] [description** *description***] [no shutdown | shutdown]**

no ipsec sa *name*

Syntax Definitions

sa_name	The name assigned to this IPsec SA.
esp	Specifies the type of security association as ESP.
ah	Specifies the type of security association as AH.
source *ipv6_address*	Specifies the source address of the IPv6 traffic that will be covered by the SA.
destination *ipv6_address*	Specifies the destination address of the IPv6 traffic that will be covered by the SA.
spi	The Security Parameters Index (SPI) for the SA.
encryption	Specifies the encryption algorithm to be used for traffic covered by the SA. This parameter is used only when the SA type is ESP.
key_length	Key length for the specified encryption algorithm.
authentication	Specifies the authentication algorithm to be used for traffic covered by the SA.
description	The detailed description of the SA.
no shutdown	Administratively enables the SA.
shutdown	Administratively disables the SA.

Defaults

parameter	Defaults
authentication {none | hmac-md5 | hmac-sha1 | aes-xcbc-mac}	**none (**ESP SAs only; no default value for AH SAs**)**
no shutdown | shutdown	**no shutdown**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- When using **ESP** to verify integrity only, use the **null** option with the **encryption** parameter.
- If the **null** option is used with the **encryption** parameter, specify an integrity algorithm using the **authentication** parameter.
- To override the default key length for the **aes-cbc** or **aes-ctr** encryption algorithm, specify the key length value after the protocol name. The following key length values are supported:

encryption algorithm	key length (in bits)
aes-cbc	128(default), 192, and 256
aes-ctr	160(default), 224, and 288

- There are two ways to configure an ESP confidentiality-only SA: use the **none** option with the **authentication** parameter, or simply omit the **authentication** parameter from the command.
- For an integrity-only SA or an encryption and integrity SA, specify one of the authentication algorithms (**aes-xcbc-mac**, **hmac-md5** or **hmac-sha1).**
- For AH SAs, specify one of the authentication algorithms (**aes-xcbc-mac**, **hmac-md5** or **hmac-sha1).**
- Note that enabling an SA is not allowed if the required encryption and/or authentication keys have not been configured.

Examples

```
-> ipsec sa ah_in ah source 3ffe:200:200:4001::99 destination 3ffe:200:200:4001::1
spi 9901 authentication hmac-sha1 description "HMAC SHA1 on traffic from 99 to 1"
-> ipsec sa esp_out esp source 3ffe:200:200:4001::1 destination
3ffe:200:200:4001::1ae7 spi 12901 encryption aes-cbc authentication aes-xcbc-mac
description "ESP confidentiality and integrity on traffic from 1 to 1ae7"
-> no ipsec sa ah_in
```

Release History

Release 6.3.4; command was introduced.

Related Commands

show ipsec policy

Displays the IPsec security policy configuration for the switch.

show ipsec policy [*policy_name***]**

Syntax Definitions

policy_name	The name of an existing IPsec policy.

Defaults

By default, information is displayed for all security policies configured for the switch.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

Use the *policy_name* parameter to display information about a specific security policy.

Examples

```
-> show ipsec policy
Name         Priority  Source-> Destination      Protocol Direction Action   State
-------------+--------+-------------------------+--------+---------+--------+------
ftp-in-drop  100     ::/0->fe80::1:1::1            TCP     in       discard  active
telnet-in-1  100     2000::/48->3ffe::200(23)      TCP     in       ipsec    active
telnet-out-1 100     3ffe::200(23)->2000::/48      TCP     out      ipsec    active
```

output definitions

Name	The name of the security policy.
Priority	The priority value assigned to the policy. If the same traffic is covered by multiple policies, the policy with the highest priority is applied.
Source -> Destination	Indicates the source and destination of traffic covered by this policy.
Protocol	Indicates the protocol traffic covered by this policy. The protocol name (TCP) or protocol number (80) will be displayed in this field.
Direction	Indicates whether the policy has been applied to the incoming or outgoing traffic.
Action	Indicates the action to be taken on the traffic covered by this policy.
State	Indicates the operational state of this policy.

```
-> show ipsec policy telnet-out-1
Name        = telnet-out-1
Priority    = 100
Source      = 3ffe::200(23)
Destination = 2000::/48
Protocol    = TCP
Direction   = out
Action      = ipsec
State       = active
Rules:
  1) esp
  2) ah
Description:
  Require AH and ESP headers on outgoing telnet traffic.
```

output definitions

Name	The name of the security policy.
Priority	The priority value assigned to the policy. If the same traffic is covered by multiple policies, the policy with the highest priority is applied.
Source	Indicates the source of the traffic covered by this policy.
Destination	Indicates the destination of the traffic covered by this policy.
Protocol	Indicates the protocol traffic covered by this policy. The protocol name (TCP) or protocol number (80) will be displayed in this field.
Direction	Indicates whether the policy has been applied to the incoming or outgoing traffic.
Action	Indicates the action to be taken on the traffic covered by this policy.
State	Indicates the operational state of this policy.
Rules	Indicates the rules specified for this policy.
Description	The description for this policy.

show ipsec sa

Displays information about manually configured IPsec Security Associations.

show ipsec sa [*sa_name* **| esp | ah]**

Syntax Definitions

sa_name	The name of the Security Association (SA).
esp	Restricts the display to ESP SAs.
ah	Restricts the display to AH SAs.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the *sa_name* parameter to display information about a specific SA.
- Use the **esp** or **ah** options to display information about a specific SA type.

Examples

```
-> show ipsec sa
Name           Type  Source-> Destination[SPI]      Encryption   Authentication State
---------------+----+--------------------------------+------------+------------+-----
telnet-in-esp  ESP  2000::/49->3ffe::200[8920]       aes-cbc(128) hmac-sha1 active
telnet-out-esp ESP  3ffe::200->2000::/48[100120]     aes-cbc(128) hmac-sha1 active
```

output definitions

Name	The SA name.
Type	The SA type (**AH** or **ESP**).
Source -> Destination [SPI]	The traffic source, destination, and SPI for this SA.
Encryption	The encryption algorithm used for this SA.
Authentication	The authentication algorithm used for this SA.
State	The operational state of this SA.

```
-> show ipsec sa telnet-in-esp

Name           = telnet-in-esp
Type           = ESP
Source         = 2000::/49
Destination    = 3ffe::200
SPI            = 8920
Encryption     = aes-cbc(128)
Authentication = hmac-sha1
State          = active
Description:
  Security association for traffic from 2000::/49 to
  3ffe::200.
```

output definitions

Name	The SA name.
Type	The SA type (**AH** or **ESP**).
Source	The traffic source for this SA.
Destination	The traffic destination for this SA.
SPI	The SPI for this SA.
Encryption	The encryption algorithm used for this SA.
Authentication	The authentication algorithm used for this SA.
State	The operational state of this SA.
Description	The description for this SA.

Release History

show ipsec key

Displays the encryption and authentication key values for the manually configured IPsec security association (SA).

show ipsec key {sa-encryption | sa-authentication}

Syntax Definitions

sa-encryption	Displays encryption SA key information.
sa-authentication	Displays authentication SA key information.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

The key values will not be displayed due to security reasons.

Examples

```
-> show ipsec key sa-encryption
Encryption Keys
Name                  Length (bits)
--------------------+-------------
sa_1                             192
sa_2                             160
sa_3                              64

-> show ipsec key sa-authentication

Authentication Keys
Name                  Length (bits)
--------------------+-------------

  Successful                = 5135
  Discarded                 = 0
  Policy violation          = 0
  No SA found               = 19
  Packet not valid          = 0
  No memory available       = 0
```

output definitions

Successful (inbound)	The number of incoming packets requiring IPsec processing that were successfully handled.
Discarded (inbound)	The number of incoming packets discarded because they matched a discard policy.
Policy violation (inbound)	The number of incoming packets dropped due to policy violations.

output definitions

No SA found (inbound)	The number of incoming packets dropped because no matching SA was found.
Unknown SPI (inbound)	The number of incoming packets dropped because the SPI was unknown.
AH replay check failed (inbound)	The number of incoming packets that failed the AH replay check.
ESP replay check failed (inbound)	The number of incoming packets that failed the ESP replay check.
AH authentication success (inbound)	The number of incoming packets that successfully passed AH authentication.
AH authentication failure (inbound)	The number of incoming packets that failed AH authentication.
ESP authentication success (inbound)	The number of incoming packets that successfully passed ESP authentication.
ESP authentication failure (inbound)	The number of incoming packets that failed ESP authentication.
Packet not valid (inbound)	The number of incoming packets requiring IPsec processing that were not valid.
No memory available (inbound)	The number of incoming packets requiring IPsec processing that were dropped because memory was not available.
Successful (outbound)	The number of outgoing packets requiring IPsec processing that were successfully handled.
Discarded (outbound)	The number of outbound packets discarded because they matched a discard policy.
Policy violation (outbound)	The number of outgoing packets dropped due to policy violation.
No SA found (outbound)	The number of outgoing packets dropped because no matching SA was found.
Packet not valid (outbound)	The number of outgoing packets requiring IPsec processing that were not valid.
No memory available (outbound)	The number of outgoing IPsec packets dropped because memory was not available.

Release History

Release 6.3.4; command was introduced.

Related Commands

show ipsec policy	Displays the IPsec security policy configuration for the switch.
show ipsec sa	Displays information about manually configured IPsec Security Associations.
show ipsec key	Displays the encryption and authentication key values for the manually configured IPsec security association (SA).

22 RIP Commands

Routing Information Protocol (RIP) is an Interior Gateway Protocol (IGP) that uses hop count as its routing metric. RIP-enabled switches update neighboring switches by transmitting a copy of their own routing table. The RIP routing table always uses the most efficient route to a destination, that is, the route with the fewest hops and longest matching prefix.

The switch supports RIP version 1 (RIPv1), RIP version 2 (RIPv2), and RIPv2 that is compatible with RIPv1. It also supports simple and MD5 authentication, on an interface basis, for RIPv2.

The RIP commands comply with the following RFCs: RFC1058, RFC2453, RFC1722, RFC1723, and RFC1724.

MIB information for the RIP commands is as follows:

Filename: RIPv2.mib
Module: rip2

Filename: AlcatelIND1Rip.mib
Module: alaRipMIB

A summary of the available commands is listed here:

ip load rip
ip rip status
ip rip interface
ip rip interface status
ip rip interface metric
ip rip interface send-version
ip rip interface recv-version
ip rip force-holddowntimer
ip rip host-route
ip rip route-tag
ip rip interface auth-type
ip rip interface auth-key
ip rip update-interval
ip rip invalid-timer
ip rip garbage-timer
ip rip holddown-timer
show ip rip
show ip rip routes
show ip rip interface
show ip rip peer

ip load rip

Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.

ip load rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- In simple networks where only IP forwarding is required, you may not want to use RIP. If you are not using RIP, it is best not to load it to save switch resources.
- To remove RIP from switch memory, you must manually edit the **boot.cfg** file. The **boot.cfg** file is an ASCII text-based file that controls many of the switch parameters. Open the file and delete all references to RIP. You must reboot the switch when this is complete.
- Use the **ip rip status** command to enable RIP on the switch.

Examples

```
-> ip load rip
```

Release History

Release 6.1; command was introduced.

Related Commands

ip rip status	Enables/disables RIP routing on the switch.
show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaDrcTmConfig
   alaDrcTmIPRipStatus
```

ip rip status

Enables/disables RIP on the switch. RIP performs well in small networks. By default, RIP packets are broadcast every 30 seconds, even if no change has occurred anywhere in a route or service. Depending on the size and speed of the network, these periodic broadcasts can consume a significant amount of bandwidth.

ip rip status {enable | disable}

Syntax Definitions

enable	Enables RIP routing on the switch.
disable	Disables RIP routing on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- RIP must be loaded on the switch (**ip load rip**) to enable RIP on the switch.
- A RIP network can be no more than 15 hops (end-to-end). If there is a 16th hop, that network is identified as infinity and the packet is discarded.

Examples

```
-> ip rip status enable
```

Release History

Release 6.1; command was introduced.

Related Commands

ip load rip	Loads RIP into the switch memory.
show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipProtoStatus
```

ip rip interface

Creates/deletes a RIP interface. Routing is enabled on a VLAN when you create a router interface. However, to enable RIP routing, you must also configure and enable a RIP routing interface on the VLAN's IP router interface.

ip rip interface *interface_name*

no ip rip interface *interface_name*

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- By default, a RIP interface is created in the disabled state. To enable RIP routing on the interface, you must enable the interface by using the **ip rip interface status** command.
- You can create a RIP interface even if an IP router interface has not been configured. However, RIP will not function unless an IP router interface is configured with the RIP interface.
- For more information on VLANs and router ports, see Chapter 4, "VLAN Management Commands".

Examples

```
-> ip rip interface rip-1
```

Release History

Release 6.1; command was introduced.

Related Commands

ip interface	Creates a VLAN router interface.
ip load rip	Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.
ip rip status	Enables/disables RIP routing on the switch.
ip rip interface status	Enables/disables a RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfStatus
```

ip rip interface status

Enables/disables a RIP interface. By default, a RIP interface is created in the disabled state. After creating a RIP interface, you must use this command to enable the interface.

ip rip interface *interface_name* **status {enable | disable}**

Syntax Definitions

interface_name	The name of the interface.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- You must first create a RIP interface by using the **ip rip interface** command before enabling the interface.
- You can create a RIP interface even if an IP router interface has not been configured. However, RIP will not function unless an IP router interface is configured with the RIP interface.
- For more information on VLANs and router ports, see Chapter 4, “VLAN Management Commands”.

Examples

```
-> ip rip interface rip-1 status enable
```

Release History

Release 6.1; command was introduced.

Related Commands

ip interface	Creates a VLAN router interface.
ip load rip	Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.
ip rip status	Enables/disables RIP routing on the switch.
ip rip interface	Creates/deletes a RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfStatus
```

ip rip interface metric

Configures the RIP metric or cost for a specified interface. You can set priorities for routes generated by a switch by assigning a metric value to routes generated by that switch's RIP interface. For example, routes generated by a neighboring switch may have a hop count of 1. However, you can lower the priority of routes generated by that switch by increasing the metric value for routes generated by the RIP interface.

ip rip interface *interface_name* **metric** *value*

Syntax Definitions

interface_name	The name of the interface.
value	Metric value. Valid range is 1–15.

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

When you configure a metric for a RIP interface, this metric cost is added to the metric of the incoming route.

Examples

```
-> ip rip interface rip-1 metric 2
```

Release History

Release 6.1; command was introduced.

Related Commands

ip rip interface	Enables/disables RIP on a specific interface.
show ip rip peer	Displays active RIP neighbors (peers). An active peer is a switch that has sent a RIP packet within the last 180 seconds.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfDefaultMetric
```

ip rip interface send-version

Configures the send option for a RIP interface. This defines the type(s) of RIP packets that the interface will send.

ip rip interface *interface_name* **send-version {none | v1 | v1compatible | v2}**

Syntax Definitions

interface_name	The name of the interface.
none	RIP packets will not be sent by the interface.
v1	Only RIPv1 packets will be sent by the interface.
v1compatible	Only RIPv2 broadcast packets (not multicast) will be sent by the interface.
v2	Only RIPv2 packets will be sent by the interface.

Defaults

parameter	default
none | v1 | v2 | v1compatible	**v2**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Using this command will override RIP default behavior.
- Other devices must be able to interpret the information provided by this command or there will not be proper routing information exchanged between the switch and other devices on the network.

Examples

```
-> ip rip interface rip-1 send-version v1
```

Release History

Release 6.1; command was introduced.

Related Commands

ip rip interface recv-version	Configures the receive option for a RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfSend
```

ip rip interface recv-version

Configures the receive option for a RIP interface. This defines the type(s) of RIP packets that the interface will accept.

ip rip interface *interface_name* **recv-version {v1 | v2 | both | none}**

Syntax Definitions

interface_name	The name of the interface.
v1	Only RIPv1 packets will be received by the interface.
v2	Only RIPv2 packets will be received by the interface.
both	Both RIPv1 and RIPv2 packets will be received by the interface.
none	Interface ignores any RIP packets received.

Defaults

parameter	default
v1 | v2 | both | none	**both**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Using this command will override RIP default behavior.
- Other devices must be able to interpret the information provided by this command or there will not be proper routing information exchanged between the switch and other devices on the network.

Examples

```
-> ip rip interface rip-1 recv-version both
```

Release History

Release 6.1; command was introduced.

Related Commands

ip rip interface send-version	Configures the send option for a RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfReceive
```

ip rip force-holddowntimer

Configures the forced hold-down timer value, in seconds, that defines an amount of time during which routing information regarding better paths is suppressed. A route enters into a forced hold-down state when an update packet is received that indicates the route is unreachable and when this timer is set to a non-zero value. After this timer has expired and if the value is less than 120 seconds, the route enters a hold-down state for the rest of the period until the remainder of the 120 seconds has also expired. During this time the switch will accept any advertisements for better paths that are received.

ip rip force-holddowntimer *seconds*

Syntax Definitions

seconds	The forced hold-down time interval, in seconds. The valid range is 0–120.

Defaults

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- The forced hold-down timer is not the same as the RIP hold-down timer. The forced hold-down timer defines a separate interval that overlaps the hold-down state. During the forced hold-down timer interval, the switch will not accept *better* routes from other gateways.
- The forced hold-down time interval can become a subset of the hold-down timer (120 seconds) by using this command to set a value less than 120.
- To allow the routing switch to use better routes advertised during the entire hold-down time period, leave the forced hold-down timer set to the default value of 0.

Examples

```
-> ip rip force-holddowntimer 10
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipForceHolddownTimer
```

ip rip host-route

Specifies whether or not RIP can add host routes (routes with a 32-bit mask) to the RIP table.

ip rip host-route

no ip rip host-route

Syntax Definitions

N/A

Defaults

The default is to enable a default host route.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to prevent RIP from adding host routes to the RIP table.
- When enabled, RIPv1 will interpret an incoming route announcement that contains any 1 bit in the host portion of the IP address as a host route, implying a mask of 255.255.255.255.

Examples

```
-> ip rip host-route
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip rip routes	Displays the RIP Routing Database.

MIB Objects

```
alaProtocolRip
   alaRipHostRouteSupport
```

ip rip route-tag

Configures the route tag value for RIP routes generated by the switch.

ip rip route-tag *value*

Syntax Definitions

value	Route tag value. Valid range is 0–2147483647.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Only RIPv2 supports route tags.

Examples

```
-> ip rip route-tag 0
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaRipRedistRouteTag
```

ip rip interface auth-type

Configures the type of authentication that will be used for the RIP interface. By default, there is no authentication used for RIP. However, you can configure a password for a RIP interface. To configure a password, you must first select the authentication type (simple or MD5), then configure a password.

ip rip interface *interface_name* **auth-type {none | simple | md5}**

Syntax Definitions

interface_name	The name of the interface.
none	No authentication will be used.
simple	Simple authentication will be used.
md5	MD5 authentication will be used.

Defaults

parameter	default
none | simple	**none**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Regardless of which authentication type is used (simple or MD5), both switches on either end of a link must share the same password.

Examples

```
-> ip rip interface rip-1 auth-type none
```

Release History

Release 6.1; command was introduced.

Related Commands

ip rip interface auth-key	Configures the text string that will be used as the password for the RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfAuthType
```

ip rip interface auth-key

Configures the text string that will be used as the password for the RIP interface. If you configure simple or MD5 authentication, you must configure a text string that will be used as the password for the RIP interface.

ip rip interface *interface_name* **auth-key** *string*

Syntax Definitions

interface_name	The name of the interface.
string	16-byte text string.

Defaults

The default authentication string is a null string.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Regardless of which authentication type is used (simple or MD5), both switches on either end of a link must share the same password.

Examples

```
-> ip rip interface rip-1 auth-key nms
```

Release History

Release 6.1; command was introduced.

Related Commands

ip rip interface auth-type	Configures the type of authentication that will be used for the RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfAuthKey
```

ip rip update-interval

Configures the time interval during which RIP routing updates are sent out.

ip rip update-interval *seconds*

Syntax Definitions

seconds	The RIP routing update interval, in seconds. The valid range is 1–120.

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

The update interval value must be less than or equal to one-third the invalid interval value.

Examples

```
-> ip rip update-interval 45
```

Release History

Release 6.1.5; command was introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipUpdateInterval
```

ip rip invalid-timer

Configures the RIP invalid timer value that defines the time interval during which a route will remain active in Routing Information Base (RIB) before moving to the invalid state.

ip rip invalid-timer *seconds*

Syntax Definition

seconds	The RIP invalid timer value, in seconds. The valid range is 3–360.

Defaults

parameter	default
seconds	180

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

The invalid time interval value must be three times the update interval value.

Examples

```
-> ip rip invalid-timer 270
```

Release History

Release 6.1.5; command was introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipInvalidTimer
```

ip rip garbage-timer

Configures the RIP garbage timer value that defines the time interval, which must elapse before an expired route is removed from the RIB.

ip rip garbage-timer *seconds*

Syntax Definition

seconds	The RIP garbage timer value, in seconds. The valid range is 0–180.

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

During the RIP garbage interval, the router advertises the route with a metric of INFINITY (i.e., 16 hops).

Examples

```
-> ip rip garbage-timer 180
```

Release History

Release 6.1.5; command was introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipGarbageTimer
```

ip rip holddown-timer

Configures the RIP hold-down timer value that defines the time interval during which a route remains in the hold-down state.

ip rip holddown-timer *seconds*

Syntax Definition

seconds	The hold-down time interval, in seconds. The valid range is 0–120.

Defaults

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

When RIP detects a route with higher metric than the route in the RIB, the route with the higher metric goes into the hold-down state. The route updates with a metric of INFINITY are rejected.

Examples

```
-> ip rip holddown-timer 10
```

Release History

Release 6.1.5; command was introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipHolddownTimer
```

show ip rip

Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

show ip rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> show ip rip

Status                    = Enabled
Number of routes          = 9
Host Route Support        = Enabled
Route Tag                 = 42
Update interval           = 30
Invalid interval          = 180
Garbage interval          = 120
Holddown interval         = 0
Forced Hold-Down Timer    = 0
```

output definitions

Status	RIP status (**Enabled** or **Disabled**).
Number of routes	Number of network routes in the RIP routing table.
Host Route Support	Host route status (**Enabled** or **Disabled**). Indicates whether or not RIP can add host routes (routes with a 32-bit mask) to the RIP table.
Route Tag	Route tag value for RIP routes generated by the switch. Valid values are 0–2147483647.
Update interval	The RIP routing update interval, in seconds. Valid range is 1–120. Default is 30.
Invalid interval	The RIP invalid timer value, in seconds. Valid range is 3–360. Default is 180.
Garbage interval	The RIP garbage timer value, in seconds. Valid range is 0–180. Default is 120.

output definitions

Holddown interval	The hold-down time interval, in seconds. Valid range is 0–120. Default is 0.
Forced Hold-Down Timer	The forced hold-down time interval, in seconds. The valid range is 0–120. Default is 0.

Release History

Release 6.1; command was introduced.
Release 6.1.5; new fields added.

Related Commands

ip rip status	Enables/disables RIP routing on the switch.
ip rip force-holddowntimer	Configures the interval during which a RIP route remains in the forced hold-down state.
ip rip update-interval	Configures the time interval during which RIP routing updates are sent out.
ip rip invalid-timer	Configures the RIP invalid timer value that defines the time interval during which a route will remain active in Routing Information Base (RIB) before moving to the invalid state.
ip rip garbage-timer	Configures the RIP garbage timer value that defines the time interval, which must elapse before an expired route is removed from the RIB.
ip rip holddown-timer	Configures the RIP hold-down timer value that defines the time interval during which a route remains in the hold down state.

MIB Objects

```
alaProtocolRip
   alaRipProtoStatus
   alaRipRouteNumber
   alaRipHostRouteSupport
   alaRipRedistRouteTag
   alaRipUpdateInterval
   alaRipInvalidTimer
   alaRipGarbageTimer
   alaRipHolddownTimer
   alaRipForceHolddownTimer
```

show ip rip routes

Displays the RIP routing database. The routing database contains all of the routes learned through RIP.

show ip rip routes [*ip_address ip_mask***]**

Syntax Definitions

ip_address	32-bit IP address.
ip_mask	The mask corresponding to the IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

To view all RIP routes, enter the basic command syntax (**show ip rip routes**). To view a specific route, enter the destination IP address and mask.

Examples

```
-> show ip rip routes

Legends: State: A = Active, H = Holddown, G = Garbage
Destination        Gateway          State Metric Proto

152.0.0.0/24       +4.0.0.7           A    2      Rip
                    5.0.0.14          A    3      Rip
```

output definitions

Destination	Destination network IP address.
Gateway	The Gateway IP address (switch from which the destination address was learned).
State	The associated state of the route, which can be **A** (**Active**), **H** (**Holddown**), or **G** (**Garbage**).
Metric	Metric associated with this network. Generally, this is the RIP hop count (the number of hops from this switch to the destination switch).
Proto	The type of route (**Local**, **Rip**, or **Redist**).

```
-> show ip rip routes 2.0.0.0 255.0.0.0

Destination             = 2.0.0.0,
Mask length             = 8,
Gateway(1)              = 5.0.0.14,
  Protocol              = Rip,
  Out Interface         = intf5,
  Metric                = 2,
  Status                = Installed,
  State                 = Active,
  Age                   = 19s,
  Tag                   = 0,
Gateway(2)              = 4.0.0.7,
  Protocol              = Rip,
  Out Interface         = intf4,
  Metric                = 3,
  Status                = Not Installed,
  State                 = Active,
  Age                   = 12s,
  Tag                   = 0,
```

output definitions

Destination	Destination network IP address.
Mask length	Length of the destination network IP subnet mask.
Gateway	The Gateway IP address (switch from which the destination address was learned).
Protocol	The type of the route (**Local**, **Rip**, or **Redist**).
Out Interface	The RIP interface through which the next hop is reached.
Metric	Metric associated with this network. Generally, this is the RIP hop count (the number of hops from this switch to the destination switch).
Status	The RIP interface status (Installed or Not Installed).
State	The associated state of the route (**Active**, **Holddown**, or **Garbage**).
Age	The age of the route in seconds (the number of seconds since this route was last updated or otherwise determined to be correct).
Tag	The associated route tag.

Release History

Release 6.1; command was introduced.
Release 6.1.5; new fields added.

Related Commands

ip rip host-route	Enables/disables a host route to an individual host on a network.

```

show ip rip interface

Displays RIP interface status and configuration.

show ip rip interface [*interface_name***]**

Syntax Definitions

interface_name	The interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

Enter an IP address to view a specific interface. Enter the basic **show ip rip interface** command to show status for all interfaces.

Examples

```
-> show ip rip interface rip-1

Interface IP Name                       = rip-1,
Interface IP Address                    = 11.11.11.1
IP Interface Number (VLANId)            = 4,
Interface Admin status                  = enabled,
IP Interface Status                     = enabled,
Interface Config AuthType               = None,
Interface Config AuthKey Length         = 0,
Interface Config Send-Version           = v2,
Interface Config Receive-Version        = both,
Interface Config Default Metric         = 1,
Received Packets                        = 154,
Received Bad Packets                    = 0,
Received Bad Routes                     = 0,
Sent Updates                            = 8
```

output definitions

Interface IP Name	The IP Interface name.
Interface IP Address	Interface IP address.
IP Interface Number	Interface VLAN ID number.
Interface Admin Status	The RIP administrative status (enabled/disabled).
IP Interface Status	Interface status (enabled /disabled).
Interface Config AuthType	The type of authentication that will be used for the RIP interface (None or Simple).

output definitions (continued)

Interface Config AuthKey Length	The authentication key length used for the RIP interface.
Interface Config Send-Version	Interface send option (none, v1, v2, and v1 compatible). Default is v2.
Interface Config Receive-Version	Interface receive option (none, v1, v2, and both). Default is both.
Interface Config Default Metric	Default redistribution metric. Default is 1.
Received Packets	Number of packets received on the interface.
Received Bad Packets	Number of bad packets received and discarded. Normally this value is zero (0).
Received Bad Routes	Number of bad routes received and discarded. Normally this value is zero (0).
Sent Updates	Number of RIP routing table updates sent.

Release History

Release 6.1; command was introduced.

show ip rip peer

Displays active RIP neighbors (peers). An active peer is a switch that has sent a RIP packet within the last 180 seconds. If a peer does not send a RIP packet (request or response) within 180 seconds, it is aged out and will not be displayed.

show ip rip peer [*ip_address*]

Syntax Definitions

ip_address	32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> show ip rip peer

                Total   Bad     Bad             Secs since
    IP Address   Recvd  Packets Routes Version  last update
----------------+------+-------+------+-------+-----------
  100.10.10.1      1      0       0      2       3
```

output definitions

IP Address	Peer IP address.
Total recvd	Total number of RIP packets received from the peer.
Bad Packets	Number of bad packets received from peer.
Bad Routes	Number of bad routes received from peer.
Version	Peer's RIP version as seen on the last packet received.
Secs since last update	Number of seconds since the last packet was received from the peer.

Release History

Release 6.1; command was introduced.

23 RDP Commands

This chapter details Router Discovery Protocol (RDP) commands for the switch. RDP is an extension of the Internet Control Message Protocol (ICMP) that provides a mechanism for end hosts to discover at least one router in the same network.

This implementation of RDP is based on the router requirements specified in RFC 1256. Switches that serve as a router can enable RDP to advertise themselves to clients on the same network at random intervals between a configurable range of time and in response to client solicitations.

MIB information for the RDP commands is as follows:

Filename: AlcatelIND1Rdp.mib
Module: alcatelIND1RDPMIB

A summary of the available commands is listed here:

ip router-discovery
ip router-discovery interface
ip router-discovery interface advertisement-address
ip router-discovery interface max-advertisement-interval
ip router-discovery interface min-advertisement-interval
ip router-discovery interface advertisement-lifetime
ip router-discovery interface preference-level
show ip router-discovery
show ip router-discovery interface

ip router-discovery

Enables or disables the Router Discovery Protocol (RDP) for the switch.

ip router-discovery {enable | disable}

Syntax Definitions

enable	Enables RDP on the switch.
disable	Disables RDP on the switch.

Defaults

By default, RDP is disabled on the switch.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- The **ip router-discovery** command only activates RDP for the switch. No advertisements occur until an IP interface is configured with RDP.
- Note that if VRRP is enabled but there is no VRRP master on the network, RDP will not transmit advertisements. If a VRRP master is identified or VRRP is disabled, however, RDP will transmit advertisements as described in this chapter.

Examples

```
-> ip router-discovery enable
-> ip router-discovery disable
```

Release History

Release 6.1; command was introduced.

Related Commands

ip router-discovery interface	Enables or disables an RDP interface.

MIB Objects

```
alaRDPConfig
   alaRDPStatus
```

ip router-discovery interface

Enables or disables RDP for the specified IP interface. An RDP interface is created for the specified IP interface name, which is then advertised by RDP as an active router on the local network.

ip router-discovery interface *name* **[enable | disable]**

no router-discovery interface *name*

Syntax Definitions

name	The IP interface name that was defined at the time the IP interface was configured.
enable	Enables an RDP interface for the specified IP interface.
disable	Disables an RDP interface for the specified IP interface.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to remove the RDP interface from the switch configuration.
- Do *not* use the **enable** option the first time this command is used to create an RDP interface, as it is not necessary and will return an error message. Once RDP is enabled and then is subsequently disabled, however, the **enable** option is then required the next time this command is used to enable the RDP interface.
- The RDP interface is not active unless RDP is also enabled for the switch.

Examples

```
-> ip router-discovery interface Marketing
-> ip router-discovery interface Marketing disable
-> ip router-discovery interface Marketing enable
-> no ip router-discovery interface Marketing
```

Release History

Release 6.1; command was introduced.

Related Commands

ip router-discovery	Enables or disables RDP for the switch.
ip interface	Configures an IP router interface.

MIB Objects

```
alaRDPIfTable
   alaRDPIfStatus
```

ip router-discovery interface advertisement-address

Configures the destination address to which RDP will send router advertisement packets from the specified interface. Advertisement packets are sent at configurable intervals by routers to announce their IP addresses on the network.

ip router-discovery interface *name* **advertisement-address {all-systems-multicast | broadcast}**

Syntax Definitions

name	The IP interface name that was defined at the time the IP interface was configured.
all-systems-multicast	Specifies 224.0.0.1 as the destination address for RDP advertisement packets.
Broadcast	Specifies 255.255.255.255 as the destination address for RDP advertisement packets. Use this address if IP multicast links are not available.

Defaults

parameter	default
all-systems-multicast | broadcast	**all-systems-multicast**

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- The RDP interface advertisement address is not active unless RDP is enabled on the switch and the specified interface is also enabled.
- RFC 1256 recommends the use of **all-system-multicast** on all links with “listening hosts” that support IP multicast.

Examples

```
-> ip router-discovery interface Marketing advertisement-address all-systems-multi-
cast
-> ip router-discovery interface Accounting advertisement-address broadcast
```

Release History

Release 6.1; command was introduced.

Related Commands

ip router-discovery	Enables or disables RDP on the switch.
ip router-discovery interface	Enables or disables an RDP interface.

MIB Objects

```
alaRDPIfTable
   alaRDPIfAdvtAddress
```

ip router-discovery interface max-advertisement-interval

Configures the maximum time, in seconds, RDP allows between each advertisement packet the router transmits on the specified interface.

ip router-discovery interface *name* **max-advertisement-interval** *seconds*

Syntax Definitions

name	The IP interface name that was defined at the time the IP interface was configured.
seconds	The maximum amount of time allowed before the next advertisement occurs. The range is 4 to1800 seconds.

Defaults

parameter	default
seconds	600

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- The RDP interface maximum advertisement time is not active unless RDP is enabled on the switch and the specified interface is also enabled.
- Do not specify a value for the maximum advertisement interval that is *less* than the value specified for the minimum advertisement interval. To set the minimum advertisement interval value, use the **ip router-discovery interface min-advertisement-interval** command.
- Note that the minimum and maximum advertisement values define an interval of time in which RDP transmits advertisement packets. RDP transmits packets at random times within this interval, waiting no longer than the maximum time specified and no sooner than the minimum time specified before the next transmission.

Examples

```
-> ip router-discovery interface Marketing max-advertisement-interval 350
-> ip router-discovery interface Accounting max-advertisement-interval 20
```

Release History

Release 6.1; command was introduced.

Related Commands

ip router-discovery	Enables or disables RDP on the switch.
ip router-discovery interface	Enables or disables an RDP interface.
ip router-discovery interface min-advertisement-interval	Configures the minimum time, in seconds, RDP allows between each advertisement packet the router transmits on the specified interface.
ip router-discovery interface advertisement-lifetime	Configures the maximum amount of time, in seconds, that router IP addresses received in advertisement packets are considered valid.

MIB Objects

```
alaRDPIfTable
   alaRDPIfMaxAdvtInterval
```

ip router-discovery interface min-advertisement-interval

Configures the minimum time, in seconds, RDP allows between each advertisement packet the router transmits on the specified interface.

ip router-discovery interface *name* **min-advertisement-interval** *seconds*

Syntax Definitions

name	The IP interface name that was defined at the time the IP interface was configured.
seconds	The minimum amount of time allowed before the next advertisement occurs. The range is 3 seconds to the value set for the maximum advertisement interval.

Defaults

parameter	default
seconds	0.75 * maximum advertisement interval

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- The RDP interface minimum advertisement time is not active unless RDP is enabled on the switch and the specified interface is also enabled.
- Do not specify a value for the minimum advertisement interval that is *greater* than the value specified for the maximum advertisement interval. To set the maximum advertisement interval value, use the **ip router-discovery interface max-advertisement-interval** command.
- Note that the minimum and maximum advertisement values define an interval of time in which RDP transmits advertisement packets. RDP transmits packets at random times within this interval, waiting no longer than the maximum time specified and no sooner than the minimum time specified before the next transmission.

Examples

```
-> ip router-discovery interface Marketing min-advertisement-interval 20
-> ip router-discovery interface Accounting min-advertisement-interval 3
```

Release History

Release 6.1; command was introduced.

Related Commands

ip router-discovery	Enables or disables RDP on the switch.
ip router-discovery interface	Enables or disables an RDP interface.
ip router-discovery interface max-advertisement-interval	Configures the maximum time, in seconds, RDP allows between each advertisement packet the router transmits on the specified interface.
ip router-discovery interface advertisement-lifetime	Configures the maximum amount of time, in seconds, that router IP addresses received in advertisement packets are considered valid.

MIB Objects

```
alaRDPIfTable
   alaRDPIfMinAdvtInterval
```

ip router-discovery interface advertisement-lifetime

Configures the maximum amount of time, in seconds, that router IP addresses advertised from the specified interface are considered valid. This value is set in the lifetime field of the advertisement packets transmitted on the specified RDP interface.

ip router-discovery interface *name* **advertisement-lifetime** *seconds*

Syntax Definitions

name	The IP interface name that was defined at the time the IP interface was configured.
seconds	The length of time, in seconds, that advertised IP addresses are considered valid by the receiving host.

Defaults

parameter	default
seconds	3 * maximum advertisement interval

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- The RDP interface advertisement lifetime value is not active unless RDP is enabled on the switch, and the specified interface is also enabled.
- Do not specify an advertisement lifetime value that is less than the value specified for the maximum advertisement interval. To set the maximum advertisement interval value, use the **ip router-discovery interface max-advertisement-interval** command.

Examples

```
-> ip router-discovery interface Marketing advertisement-lifetime 2000
-> ip router-discovery interface Accounting advertisement-lifetime 750
```

Release History

Release 6.1; command was introduced.

Related Commands

ip router-discovery	Enables or disables RDP on the switch.
ip router-discovery interface	Enables or disables an RDP interface.
ip router-discovery interface min-advertisement-interval	Configures the minimum time, in seconds, RDP allows between each advertisement packet the router transmits on the specified interface.
ip router-discovery interface max-advertisement-interval	Configures the maximum time, in seconds, RDP allows between each advertisement packet the router transmits on the specified interface.

MIB Objects

```
alaRDPIfTable
   alaRDPIfAdvLifeTime
```

ip router-discovery interface preference-level

Configures the preference level for each IP address advertised on the specified RDP interface. The end host selects the address with the highest preference level to use as its default router, if the host is not already redirected or configured to use another default router for a particular destination.

ip router-discovery interface *name* **preference-level** *level*

Syntax Definitions

name	The IP interface name that was defined at the time the IP interface was configured.
level	Any positive, integer value.The higher the value, the higher the precedence.

Defaults

parameter	default
level	0

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- The RDP interface preference level value is not active unless RDP is enabled on the switch and the specified interface is also enabled.
- Set the preference level higher to encourage the use of an advertised router IP address.
- Set the preference level lower to discourage the use of an advertised router IP address.
- The preference level of an advertised router IP address is compared only to the preference levels of other addresses on the same subnet.

Examples

```
-> ip router-discovery interface Marketing preference-level 10
-> ip router-discovery interface Accounting preference-level 50
```

Release History

Release 6.1; command was introduced.

Related Commands

ip router-discovery	Enables or disables RDP on the switch.
ip router-discovery interface	Enables or disables an RDP interface.

MIB Objects

```
alaRDPIfTable
   alaRDPIfPrefLevel
```

show ip router-discovery

Displays the current RDP status and related statistics for the entire switch.

show ip router-discovery

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Each time RDP is enabled on the switch, all statistic parameter values are reset to zero for the new session. For example, if the RDP uptime was 160000 seconds when RDP was last disabled, the uptime starts out at zero the next time RDP is enabled.
- Use the **show ip router-discovery interface** command to display information about a specific RDP interface.

Examples

```
-> show ip router-discovery
Status                    = Enabled,
RDP uptime                = 161636 secs
#Packets Tx               = 4,
#Packets Rx               = 0,
#Send Errors              = 0,
#Recv Errors              = 0,
```

output definitions

Status	The status of RDP. **Enabled** allows RDP interfaces to advertise router IP addresses; **Disabled** stops RDP traffic on all switch interfaces. Use the **ip router-discovery** command to enable or disable RDP on the switch.
RDP uptime	Indicates the amount of time, in seconds, that RDP has remained active on the switch.
#Packets Tx	The number of RDP packets transmitted from all active RDP interfaces on the switch.
#Packets Rx	The number of RDP packets received on all active RDP interfaces on the switch.
#Send Errors	The number of RDP packet transmission errors that have occurred.
#Recv Errors	The number of errors that occurred when receiving RDP packets.

Release History

Release 6.1; command was introduced.

Related Commands

show ip router-discovery interface	Displays the current RDP status and related statistics for one or more switch router port interfaces.

MIB Objects

```
alaRDPConfig
   alaRDPStatus
```

show ip router-discovery interface

Displays the current RDP status, related parameter values, and RDP traffic statistics for one or more switch router interfaces.

show ip router-discovery interface [*name***]**

Syntax Definitions

name	The IP interface name that was defined at the time the IP interface was configured.

Defaults

By default, the information for all RDP interfaces is displayed with this command.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- When an optional IP interface name is specified with this command, additional information about the RDP interface is displayed.
- Use the **show ip router-discovery** command to display global RDP status and statistics for the entire switch.

Examples

```
-> show ip router-discovery interface
                       IP i/f   RDP i/f  VRRP i/f      Next   #Pkts
         Name          status   status  status(#mast)  Advt sent/recvd
---------------------+--------+--------+--------------+----+----------
Marketing             Disabled  Enabled Disabled(0)    9    0   0
Accounting            Disabled  Enabled Disabled(0)    3    0   0
```

output definitions

Name	The user-defined IP interface name defined at the time the IP interface was configured.
IP i/f status	The IP status for this interface (**Enabled** or **Disabled)**.
RDP i/f status	The RDP status for this interface (**Enabled** or **Disabled**).
VRRP i/f status (#mast)	The VRRP status for this interface (**Enabled** or **Disabled**), and the number of VRRP masters on the network for this interface.
Next Advt	Time remaining until the next advertisement is sent.
#Pkts sent/recvd	Number of advertisement packets sent from this interface; the number of solicitation packets received on this interface.

```
-> show ip router-discovery interface Marketing
Name                                    = Marketing,
IP Address                              = 11.255.4.1,
IP Mask                                 = 255.0.0.0,
IP Interface status                     = Enabled,
RDP Interface status                    = Enabled,
VRRP Interface status                   = Disabled,
Advertisement address                   = 224.0.0.1,
Max Advertisement interval              = 600 secs,
Min Advertisement interval              = 450 secs,
Advertisement lifetime                  = 1800 secs,
Preference Level                        = 0x0,
#Packets sent                           = 3,
#Packets received                       = 0,
```

output definitions

Name	The user-defined IP interface name defined at the time the IP interface was configured.
IP Address	The IP address associated with the IP interface name.
IP Mask	The subnet mask associated with the interface IP address.
IP Interface status	The IP status for this interface (**Enabled** or **Disabled**).
RDP Interface status	The RDP status for this interface (**Enabled** or **Disabled**).
VRRP Interface status	The VRRP status for this interface (**Enabled** or **Disabled**). See Chapter 26, "VRRP Commands," for more information.
Advertisement address	The destination address for RDP advertisement packets: **224.0.0.1** (all-systems-multicast) or **255.255.255.255** (broadcast). Configured using the **ip router-discovery interface advertisement-address** command.
Max Advertisement interval	The maximum time, in seconds, RDP allows between each advertisement packet the router transmits from this interface. Configured using the **ip router-discovery interface max-advertisement-interval** command.
Min Advertisement interval	The minimum time, in seconds, RDP allows between each advertisement packet the router transmits from this interface. Configured using the **ip router-discovery interface min-advertisement-interval** command.
Advertisement lifetime	The maximum amount of time, in seconds, that router IP addresses advertised from this interface are considered valid. Configured using the **ip router-discovery interface advertisement-lifetime** command.
Preference Level	The preference level, displayed in hex, for each IP address advertised on this interface. Configured using the **ip router-discovery interface preference-level** command.
#Packets sent	The number of advertisement packets transmitted from this interface.
#Packets received	The number of solicitation packets received on this interface.

Release History

Release 6.1; command was introduced.

Related Commands

show ip router-discovery	Displays the current RDP status and related statistics for the entire switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a particular virtual router.

   alaRDPIfMaxAdvtInterval
   alaRDPIfMinAdvtInterval
   alaRDPIfAdvLifeTime
   alaRDPIfPrefLevel
```

24 BFD Commands

Bidirectional Forwarding Detection (BFD) is a hello protocol, which can be configured to interact with routing protocols for the detection of path failures and can reduce the convergence time in a network. BFD is supported with the BGP, OSPF, VRRP, and Static Routes.

When BFD is configured and enabled, BFD sessions are created and timers are negotiated between BFD neighbors. If a system does not receive a BFD control packet within the negotiated time interval, the neighbor system is considered down. Rapid failure detection notices are then sent to the routing protocol, which initiates a routing protocol recalculation. This process can reduce the time of convergence in a network.

BFD can be operated in three different modes: Asynchronous mode, Demand mode or Echo mode.

In Asynchronous mode, the systems continuously send BFD control packets between each other as part of a BFD session. If there are no packets received for a minimum time interval negotiated between the systems, then the neighbor system is considered down.

In Demand mode, a poll sequence is initiated for which there is an exchange of BFD control packets. If the demand mode is active and no control packets are received in response to the poll sequence, the session is declared down.

In Echo mode, a stream of BFD echo packets are transmitted in a forwarding path for which the neighboring system would loop the packets and send them back. If the number of packets transmitted is not echoed back, then the system is declared down. Echo mode can be operated along with Asynchronous mode and Demand mode.

MIB information for the BFD commands is as follows:

Filename: ALCATEL-IND1-BFD-MIB
Module: ALCATEL-IND-BFD-MIB

A summary of the available commands is listed here:

Global BFD commands	**ip bfd-std status** **ip bfd-std transmit** **ip bfd-std receive** **ip bfd-std mode** **ip bfd-std echo interval** **ip bfd-std l2-hold-timer** **show ip bfd-std** **show ip bfd-std sessions** **show ip bfd-std session**
BFD Interface commands	**ip bfd-std interface** **ip bfd-std interface status** **ip bfd-std interface transmit** **ip bfd-std interface receive** **ip bfd-std interface multiplier** **ip bfd-std interface mode** **ip bfd-std interface echo-interval** **ip bfd-std interface l2-hold-timer** **show ip bfd-std interfaces**
Commands to configure BFD supported protocols	**ip ospf bfd-std status** **ip ospf bfd-std all-interfaces** **ip ospf interface bfd-std** **ip ospf interface bfd-std drs-only** **ip ospf interface bfd-std all-nbrs** **ip bgp bfd-std status** **ip bgp bfd-std all-neighbors** **ip bgp neighbors bfd-std** **vrrp bfd-std** **vrrp track address bfd-std** **ip static-route all bfd-std** **ip static-routes bfd-std status**

ip bfd-std status

Enables or disables the global BFD protocol status for the switch.

ip bfd-std status {enable | disable}

Syntax Definitions

enable	Enables BFD.
disable	Disables BFD.

Defaults

By default, BFD is disabled for the switch.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Disabling BFD does not remove the existing BFD configuration from the switch.
- When BFD is disabled, all BFD functionality is disabled for the switch, but configuring BFD is still allowed.
- Configuring BFD global parameters is not allowed when BFD is enabled for the switch.

Examples

```
-> ip bfd-std status enable
-> ip bfd-std status disable
```

Release History

Release 6.3.4; command was introduced.

Related Commands

show ip bfd-std	Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalAdminStatus
```

ip bfd-std transmit

Configures the global transmit time interval for BFD control packets. This command specifies the minimum amount of time BFD waits between each transmission of control packets.

ip bfd-std transmit *transmit-interval*

Syntax Definitions

transmit-interval	The transmit time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
transmit-interval	100 milliseconds

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- The transmit time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd-std transmit** command does not override the value set for the interface using the **ip bfd-std interface transmit** command.
- The global transmit time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd-std transmit 500
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bfd-std interface transmit	Configures the transmit time interval for a specific BFD interface.
show ip bfd-std	Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalTxInterval
```

ip bfd-std receive

Configures the global receive time interval for BFD control packets. This command specifies the minimum amount of time BFD waits to receive control packets before determining there is a problem.

ip bfd-std receive *receive-interval*

Syntax Definitions

receive-interval	The receive time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
receive-interval	100 milliseconds

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- The minimum receive time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd-std receive** command does not override the value set for the interface using the **ip bfd-std interface receive** command.
- The global receive time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd-std receive 500
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bfd-std interface receive	Configures the receive time interval for a specific BFD interface.
show ip bfd-std	Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalRxInterval
```

ip bfd-std mode

Configures the global operational mode and echo status for the BFD protocol.

ip bfd-std mode {echo-only | demand echo {enable | disable} | asynchronous echo {enable|disable}}

Syntax Definitions

echo-only	Specifies echo only mode.
demand echo enable	Specifies demand mode with the echo function enabled.
demand echo disable	Specifies demand mode with the echo function disabled.
asynchronous echo enable	Specifies asynchronous mode with the echo function enabled.
asynchronous echo disable	Specifies asynchronous mode with the echo function disabled.

Defaults

By default, BFD is set to globally operate in demand mode with the echo function enabled.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- The global operational mode and echo status is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd-std mode** command does not override the value set for the interface using the **ip bfd-std interface mode** command.
- The global operational mode and echo status serves as the default mode and status for a BFD interface. The default mode and status is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd-std mode echo-only
-> ip bfd-std mode demand echo enable
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bfd-std interface mode	Configures the operational mode and echo status for a BFD interface.
show ip bfd-std	Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalOperMode
alaBfdGlobalEchoStatus
```

ip bfd-std echo interval

Configures the global BFD echo packet time interval. The echo function is available with the asynchronous or demand mode. Echo packets are transmitted to BFD peers to see if they loop back to the peer from which they originated.

ip bfd-std echo interval *echo-interval*

Syntax Definitions

echo-interval	The echo time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
echo-interval	100 milliseconds

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- The echo packet time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd-std echo interval** command does not override the value set for the interface using the **ip bfd-std interface echo interval** command.
- The global echo packet time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd-std echo interval 500
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bfd-std interface echo-interval	Configures the echo packet time interval for a BFD interface.
show ip bfd-std	Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalEchoRxInterval
```

ip bfd-std l2-hold-timer

Configures the global Layer 2 hold-down (convergence) timer value for the BFD protocol. This command specifies the amount of time BFD remains in a hold-down state after a Layer 2 topology change occurs.

ip bfd-std 12-hold-timer *l2-holdtimer-interval*

Syntax Definitions

l2-holdtimer-interval	The Layer 2 hold-down time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
l2-holdtimer-interval	100 milliseconds

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- The global Layer 2 hold-down timer is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd-std l2-hold-timer** command does not override the value set for the interface using the **ip bfd-std interface l2-hold-timer** command.
- The global Layer 2 hold-down timer serves as the default value for a BFD interface. The default timer value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd-std l2-holdtimer 500
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bfd-std interface l2-hold-timer	Configures the Layer 2 hold-down timer value for a BFD interface.
show ip bfd-std	Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalL2HoldTimer
```

ip bfd-std interface

Configures a BFD interface.

ip bfd-std interface *interface_name*

no ip bfd-std interface *interface_name*

Syntax Definitions

interface_name	The name of an existing IP interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete a BFD interface.
- The interface name must be an existing IP interface name that is configured with an IP address.

Examples

```
-> ip bfd-std interface bfd-vlan-101
-> no ip bfd-std interface bfd-vlan-101
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bfd-std interface status	Configures the administrative status of a BFD interface.
show ip bfd-std interfaces	Displays the status and statistics of a BFD interface.
show ip bfd-std sessions	Displays the status and statistics of the BFD sessions.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfAddrType
   alaBfdIntfAddr
   alaBfdIntfIndex
```

ip bfd-std interface status

Enables or disables the administrative status of a BFD interface.

ip bfd-std interface *interface_name* **status {enable | disable}**

Syntax Definitions

interface_name	The name of an existing BFD interface.
enable	Enables the BFD interface.
disable	Disables the BFD interface.

Defaults

By default, a BFD interface is disabled when it is created.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

The BFD interface must be enabled to participate in the BFD protocol.

Examples

```
-> ip bfd-std interface bfd-vlan-101 status enable
-> ip bfd-std interface bfd-vlan-101 status disable
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bfd-std interface	Creates a BFD interface.
show ip bfd-std interfaces	Displays the status and statistics of a BFD interface.
show ip bfd-std sessions	Displays the status and statistics of BFD sessions.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfAdminStatus
```

ip bfd-std interface transmit

Configures the transmit time interval for the BFD interface. This command specifies the minimum amount of time BFD waits between each transmission of control packets from the interface.

ip bfd-std interface *interface_name* **transmit** *transmit-interval*

Syntax Definitions

interface_name	The name of an existing BFD interface.
transmit-interval	The transmit time interval, in milliseconds. The valid range is 100–999.

Defaults

The global transmit time interval value is used by default.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- The global transmit time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface transmit time interval using the **ip bfd-std interface transmit** command does not change the global value configured with the **ip bfd-std transmit** command.

Examples

```
-> ip bfd-std interface bfd-vlan-101 transmit 500
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bfd-std interface	Creates a BFD interface.
ip bfd-std transmit	Configures a global BFD transmit time interval.
show ip bfd-std interfaces	Displays the status and statistics of a BFD interface.
show ip bfd-std sessions	Displays the status and statistics of the BFD sessions.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfDesiredMinTxInterval
```

ip bfd-std interface receive

Configures the receive time interval for the BFD interface. This command specifies the minimum amount of time BFD waits to receive control packets on the interface before determining there is a problem.

ip bfd-std interface *interface_name* **receive** *receive-interval*

Syntax Definitions

interface_name	The name of an existing BFD interface.
receive-interval	The receive time interval, in milliseconds. The valid range is 100–999.

Defaults

The global receive time interval value is used by default.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- The global receive time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface transmit time interval using the **ip bfd-std interface receive** command does not change the global value configured with the **ip bfd-std receive** command.

Examples

```
-> ip bfd-std interface bfd-vlan-101 receive 500
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bfd-std interface	Creates a BFD interface.
ip bfd-std receive	Configures a global BFD receive time interval.
show ip bfd-std interfaces	Displays the BFD interface configuration table.
show ip bfd-std sessions	Displays the BFD interface configuration table.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfMinRxInterval
```

ip bfd-std interface multiplier

Configures the BFD interface dead interval multiplier. This command specifies a number that is used to calculate the BFD detection time used in the asynchronous mode. When an interface stops receiving packets from a neighbor, the interface uses the detection time value to determine how long to wait before declaring that the BFD session is down.

ip bfd-std interface *interface_name* **multiplier** *multiplier_value*

Syntax Definitions

interface_name	The name of an existing BFD interface.
multiplier_value	The dead interval multiplier number. The valid range is 1–10.

Defaults

By default, the multiplier value is set to 3.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

The detection time between neighbors is calculated by multiplying the negotiated transmit time interval by the dead interval multiplier.

Examples

```
-> ip bfd-std interface bfd-vlan-101 multiplier 5
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bfd-std interface	Creates a BFD interface.
show ip bfd-std interfaces	Displays the BFD interface configuration table.
show ip bfd-std sessions	Displays the BFD interface configuration table.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfDetectMult
```

ip bfd-std interface echo-interval

Configures the echo time interval for the BFD interface. The echo function is available with the asynchronous or demand mode. Echo packets are transmitted to BFD peers to see if they loop back to the peer from which they originated.

ip bfd-std interface *interface_name* **echo-interval** *echo-interval*

Syntax Definitions

interface_name	The name of an existing IP interface.
echo-interval	The echo time interval, in milliseconds. The valid range is 100–999.

Defaults

The global echo interval value is used by default.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- The global echo time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface echo time interval using the **ip bfd-std interface echo-interval** command does not change the global value configured with the **ip bfd-std echo-interval** command.

Examples

```
-> ip bfd-std interface bfd-vlan-101 echo-interval 500
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bfd-std interface	Creates a BFD interface.
ip bfd-std echo interval	Configures a global BFD echo time interval.
show ip bfd-std interfaces	Displays the BFD interface configuration table.
show ip bfd-std sessions	Displays the BFD interface configuration table.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfReqMinEchoRxInterval
```

ip bfd-std interface mode

Configures the operational mode and echo status for the BFD interface.

ip bfd-std interface *interface_name* **mode {echo-only | demand [echo {enable | disable}] | asynchronous [echo {enable|disable}}**

Syntax Definitions

interface_name	The name of an existing IP interface.
echo-only	Specifies echo only mode.
demand echo enable	Specifies demand mode with the echo function enabled.
demand echo disable	Specifies demand mode with the echo function disabled.
asynchronous echo enable	Specifies asynchronous mode with the echo function enabled.
asynchronous echo disable	Specifies asynchronous mode with the echo function disabled.

Defaults

By default, the BFD interface is set to operate in demand mode with the echo function enabled.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- The global operational mode and echo status serves as the default mode and status for a BFD interface. The default mode and status is overridden when a specific value is configured for the interface.
- Note that configuring the interface mode and echo status using the **ip bfd-std interface mode** command does not change the global value configured with the **ip bfd-std mode** command.

Examples

```
-> ip bfd-std mode echo-only
-> ip bfd-std mode demand echo enable
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bfd-std interface	Creates a BFD interface.
ip bfd-std mode	Configures the global BFD operational mode and echo status.
show ip bfd-std interfaces	Displays the BFD interface configuration table.
show ip bfd-std sessions	Displays the BFD interface configuration table.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfOperMode
   alaBfdIntfEchoMode
```

ip bfd-std interface l2-hold-timer

Configures the Layer 2 hold-down (convergence) timer value for the BFD interface. This command specifies the amount of time the interface remains in a hold-down state after a Layer 2 topology change occurs.

ip bfd-std interface *interface_name* **12-hold-timer** *l2-holdtimer-interval*

Syntax Definitions

interface_name	The name of an existing BFD interface.
l2-holdtimer-interval	The Layer 2 hold-down time interval, in milliseconds. The valid range is 100–999.

Defaults

The global Layer 2 hold-down time interval is used by default.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- The global Layer 2 hold-down time interval serves as the default interval for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the Layer 2 hold-down time interval using the **ip bfd-std interface l2-hold-timer** command does not change the global value configured with the **ip bfd-std l2-hold-timer** command.

Examples

```
-> ip bfd-std interface bfd-vlan-101 l2-hold-timer 500
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bfd-std interface	Creates a BFD interface.
ip bfd-std l2-hold-timer	Configures the global BFD Layer 2 hold-down time interval.
show ip bfd-std interfaces	Displays the BFD interface configuration table.
show ip bfd-std sessions	Displays the BFD interface configuration table.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfL2HoldTimer
```

ip ospf bfd-std status

Enables or disables the BFD status for the OSPF protocol.

ip ospf bfd-std status {enable | disable}

Syntax Definitions

enable	Enables BFD Status.
disable	Disables BFD Status.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- All the status changes on the neighbors are received from the BFD level and the OSPF protocol acts based upon the BFD message.
- Whenever a neighbor goes down, OSPF informs BFD to remove that neighbor from the BFD active list.

Examples

```
-> ip ospf bfd-std status enable
-> ip ospf bfd-std status disable
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip ospf bfd-std all-interfaces	Enables or disables BFD for all OSPF interfaces configured.
ip ospf interface bfd-std	Enables or disables BFD for a specific OSPF interface.
ip ospf interface bfd-std drs-only	Establishes BFD sessions only on neighbors in full state.
ip ospf interface bfd-std all-nbrs	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

MIB Objects

```
alaProtocolospf
   alaOspfBfdStatus
```

ip ospf bfd-std all-interfaces

Enables or disables BFD for all OSPF interfaces in the switch configuration.

ip ospf bfd-std all-interfaces

no ip ospf bfd-std all-interfaces

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to disable the BFD status for all OSPF interfaces.
- The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf bfd-std all-interfaces
-> no ip ospf bfd-std all-interfaces
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip ospf bfd-std status	Enables or disables the BFD status for the OSPF protocol.
ip ospf interface bfd-std	Enables or disables BFD for a specific OSPF interface.
ip ospf interface bfd-std drs-only	Establishes BFD sessions only on neighbors in full state.
ip ospf interface bfd-std all-nbrs	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

MIB Objects

```
alaProtocolospf
   alaOspfBfdAllInterfaces
```

ip ospf interface bfd-std

Enables or disables BFD for a specific OSPF interface.

ip ospf interface *interface-name* **bfd-std {enable | disable}**

Syntax Definitions

interface-name	The name of an existing OSPF interface.
enable	Enables the OSPF interface.
disable	Disables the OSPF interface.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf interface int1 bfd-std enable
-> ip ospf interface int2 bfd-std disable
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip ospf bfd-std status	Enables or disables the BFD status for the OSPF protocol.
ip ospf bfd-std all-interfaces	Enables or disables BFD for all OSPF interfaces configured.
ip ospf interface bfd-std drs-only	Establishes BFD sessions only on neighbors in full state.
ip ospf interface bfd-std all-nbrs	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

MIB Objects

```
alaOspfIfAugEntry
   ospfIfIpAddress
   alaOspfIfBfdStatus
```

ip ospf interface bfd-std drs-only

Establishes BFD sessions only with neighbors that are in the full state.

ip ospf interface *interface-name* **bfd-std drs-only**

Syntax Definitions

interface-name	The name of an existing OSPF interface.

Defaults

By default, BFD is enabled for DR neighbors only.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- The specified OSPF interface must be enabled to interact with BFD.
- The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf interface int1 bfd-std drs-only
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bfd-std interface status	Enables or disables the BFD status for OSPF protocol.
ip ospf bfd-std all-interfaces	Enables or disables BFD for all OSPF interfaces configured.
ip ospf interface bfd-std	Enables or disables BFD for a specific OSPF interface.
ip ospf interface bfd-std all-nbrs	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

MIB Objects

```
alaOspfIfAugEntry
   ospfIfIpAddress
   alaOspfIfBfdDrsOnly
```

ip ospf interface bfd-std all-nbrs

Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

ip ospf interface *interface-name* **bfd-std all-nbrs**

Syntax Definitions

interface-name	The name of an existing OSPF interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- The specified OSPF interface must be enabled to interact with BFD.
- The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf interface int1 bfd-std all-nbrs
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bfd-std interface status	Enables or disables the BFD status for OSPF protocol.
ip ospf bfd-std all-interfaces	Enables or disables BFD for all OSPF interfaces configured.
ip ospf interface bfd-std	Enables or disables BFD for a specific OSPF interface.
ip ospf interface bfd-std drs-only	Establishes BFD sessions only on neighbors in full state.

MIB Objects

```
alaOspfIfAugEntry
   ospfIfIpAddress
   alaOspfIfBfdDrsOnly
```

ip bgp bfd-std status

Enables or disables BFD for the BGP protocol.

ip bgp bfd-std status {enable | disable}

Syntax Definitions

enable	Enables BGP.
disable	Disables BGP.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- All the status changes on the neighbors are received from the BFD level and the BGP protocol acts based upon the BFD message.
- Whenever a neighbor goes down, BGP informs BFD to remove that neighbor from the BFD active list.

Examples

```
-> ip bgp bfd-std status enable
-> ip bgp bfd-std status disable
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bgp bfd-std all-neighbors	Enables or disables BFD for all BGP neighbors.
ip bgp neighbors bfd-std	Enables or disables BFD for a specific neighbor.

MIB Objects

```
alaBgpGlobal
   alaBgpBfdStatus
```

ip bgp bfd-std all-neighbors

Enables or disables BFD for all BGP neighbors.

ip bgp bfd-std all-neighbors

no ip bgp bfd-std all-neighbors

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to disable BFD for all BGP neighbors.
- The BFD status for BGP must be enabled before BGP can interact with BFD.

Examples

```
-> ip bgp bfd-std all-neighbors
-> no ip bgp bfd-std all-neighbors
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bgp bfd-std status	Enables or disables BGP with BFD protocol.
ip bgp neighbors bfd-std	Enables or disables the BFD for a specific BGP neighbor.

MIB Objects

```
alaBgpGlobal
   alaBgpBfdAllNeighbors
```

ip bgp neighbors bfd-std

Enables or disables BFD for a specific BGP neighbor.

ip bgp neighbor *name* **bfd-std {enable | disable}**

Syntax Definitions

name	The peer name of the BGP neighbor.
enable	Enables BGP neighbor.
disable	Disables BGP neighbor.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

The BFD status for BGP must be enabled before BGP can interact with BFD.

Examples

```
-> ip bgp neighbor neigh1 bfd-std enable
-> ip bgp neighbor neigh2 bfd-std disable
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bgp bfd-std status	Enables or disables BGP with BFD protocol.
ip bgp bfd-std all-neighbors	Enables or disables BFD for all BGP neighbors.

MIB Objects

```
alaBgpPeerEntry
   alaBgpPeerName
   alaBgpPeerBfdStatus
alaBgpGlobal

vrrp bfd-std

Enables or disables VRRP with the BFD protocol.

vrrp bfd-std {enable | disable}

Syntax Definitions

enable	Enables BFD for VRRP.
disable	Disables BFD for VRRP.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- BFD support for VRRP is done only for tracking policy configuration for a remote address.
- The BFD status for VRRP must be enabled before VRRP can interact with BFD.

Examples

```
-> ip vrrp bfd-std enable
-> ip vrrp bfd-std disable
```

Release History

Release 6.3.4; command was introduced.

Related Commands

vrrp track address bfd-std	Enables or disable BFD for a specific tracking policy.

MIB Objects

```
alaVrrpConfig
   alaVrrpBfdStatus
```

vrrp track address bfd-std

Enables or disable BFD for a specific track policy.

vrrp track *num* **address** *address* **bfd-std {enable| disable}**

Syntax Definitions

num	The VRRP track number.
address	The remote IP address.
enable	Enables BFD.
disable	Disables BFD.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- BFD support for VRRP is done only for tracking policy configuration for a remote address.
- The BFD status for VRRP must be enabled before VRRP can interact with BFD.

Examples

```
-> vrrp track 2 address 10.1.1.1 bfd-std enable
-> vrrp track 3 address 10.1.1.2 bfd-std disable
```

Release History

Release 6.3.4; command was introduced.

Related Commands

vrrp bfd-std	Enables or disables VRRP with BFD protocol.

MIB Objects

```
alaVRRPConfig
   alaVrrpTrackBfdStatus
```

ip static-route all bfd-std

Enables BFD for all static routes.

ip static-route all bfd-std {enable| disable}

Syntax Definitions

enable	Enables BFD.
disable	Disables BFD.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- When there are static route configured in the switch, BFD is enabled to track the gateway.
- If the route is not reachable, it is moved to the inactive database.

Examples

```
-> ip static-route all bfd-std enabled
-> ip static-route all bfd-std disabled
```

Release History

Release 6.3.4; command was introduced.

Related Commands

ip static-routes bfd-std status	Enables or disables BFD for a specific static route.

MIB Objects

```
alaIprmConfig
   alaIprmStaticallbfd
```

ip static-routes bfd-std status

Enables or disables BFD for a specific static route.

ip static-routes *ip-address/prefixLen* **gateway** *ip-address* **bfd-std status {enable| disable}**

Syntax Definitions

ip_address	The destination IP address.
prefixLen	The prefix length for the destination IP address.
gateway *ip_address*	The gateway IP address.
enable	Enables BFD.
disable	Disables BFD.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

BFD is enabled to track the gateway of static routes.

Examples

```
-> ip static-route 10.1.1.1 255.0.0.0 gateway 10.1.1.25 bfd-std status enable
-> ip static-route 10.1.1.2 255.0.0.0 gateway 10.1.1.25 bfd-std status disabled
```

Release History

Release 6.3.4; command was introduced.

Related Commands

show ip bfd-std

Displays the global BFD configuration table.

show ip bfd-std

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 9000E

Usage Guidelines

N/A

Examples

```
-> show ip bfd-std
BFD Version Number              = 1,
Admin Status                    = Disabled,
Transit Interval                = 300,
Receive Interval                = 300,
Multiplier                      = 3,
Echo Status                     = Enabled,
Echo Interval                   = 300,
Mode                            = ASYNCHRONOUS,
L2 Hold Down Interval           = 500,
Protocols Registered            = PIM
```

output definitions

BFD Version Number	Refers to BFD Version.
Admin Status	Refers to BFD global admin status.
Transmit interval	Refers to BFD global Tx interval.
Receive interval	Refers to BFD global Rx interval.
Multiplier	Refers to BFD interface Multiplier.
Echo status	Refers to Echo functionality status.
Echo interval	Refers to BFD echo Rx interval.
Mode	Refers to BFD echo operational mode.
L2 Hold Down Interval	Refers to BFD Layer 2 hold down interval.
Protocols Registered	Refers to Protocols registered to BFD.

Release History

Release 6.3.4; command was introduced.
Release 6.4.5; **L2 Hold Down Interval** added in output.

show ip bfd-std interfaces

Displays the BFD interface configuration table.

show ip bfd-std interfaces [*interface-name***]**

Syntax Definitions

interface-name	The name of the BFD interface.

Defaults

By default, the configuration for all BFD interfaces is displayed.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

Enter an interface name to display information for a specific BFD interface.

Examples

```
->show ip bfd-std interfaces
Interface               Admin     Tx        Min Rx                Oper
Name        Mode        Status    Interval  Interval  Multiplier  Status
----------+------------+---------+---------+---------+-----------+----------
vlan-10     ASYNCHRONOUS enabled     100      100        3          UP
vlan-20     ASYNCHRONOUS disabled    0        0          5          DOWN

-> show ip bfd-std interfaces vlan-10
Interface IP Address:           = 215.20.10.1,
Admin Status:                   = Enabled,
Mode:                           = ASYNCHRONOUS,
Echo Status:                    = Disabled,
Transmit Interval:              = 100,
Receive Interval:               = 100,
Multiplier:                     = 3,
Echo Interval:                  = 100,
L2 Hold Down Interval           = 100
```

output definitions

Interface address	Refers to BFD Interface address.
Admin status	Refers to BFD interface admin status.
Mode	Refers to BFD interface operational mode.
Echo status	Refers to Interface Echo functionality status.
Transmit Interval	Refers to BFD interface Tx interval.
Receive Interval	Refers to BFD interface Rx interval.
Multiplier	Refers to BFD interface Multiplier.

output definitions (continued)

Echo interval	Refers to BFD interface echo Rx interval.
Layer2 Hold down Interval	Refers to BFD Layer 2 hold down interval.

Release History

Release 6.3.4; command was introduced.

Related Commands

ip bfd-std status	Configures BFD at global level.
ip bfd-std interface	Configures BFD at interface level.

25 DHCP and DHCPv6 Relay Commands

Bootstrap Protocol (BOOTP) and Dynamic Host Configuration Protocol (DHCP) packets contain configuration information for network hosts. DHCP Relay enables forwarding of BOOTP/DHCP packets between networks. This allows routing of DHCP traffic between clients and servers. It is not necessary to enable DHCP Relay if DHCP traffic is bridged through one network (clients and servers are on the same physical network).

This chapter includes a description of DHCP Relay commands that are used to define the IP address of DHCP servers, maximum number of hops, and forward delay time. Configure DHCP Relay on the switch where routing of BOOTP/DHCP packets occur.

MIB information for DHCP and DHCPv6 Relay commands is as follows:

Filename: AlcatelIND1UDPRelay.MIB
Module: ALCATEL-IND1-UDP-RELAY-MIB

A summary of the available DHCP Relay commands are listed here.

DCHP Relay Commands	ip helper address ip helper address vlan ip helper standard ip helper avlan only ip helper per-vlan only ip helper forward delay ip helper maximum hops ip helper agent-information ip helper agent-information policy ip helper pxe-support ip helper dhcp-snooping ip helper dhcp-snooping mac-address verification ip helper dhcp-snooping option-82 data-insertion ip helper dhcp-snooping option-82 format ip helper dhcp-snooping option-82 format ascii circuit-id ip helper dhcp-snooping option-82 format ascii remote-id ip helper dhcp-snooping bypass option-82-check ip helper dhcp-snooping vlan ip helper dhcp-snooping port ip helper dhcp-snooping linkagg ip helper dhcp-snooping port traffic-suppression ip helper dhcp-snooping port ip-source-filtering ip helper dhcp-snooping binding ip helper dhcp-snooping ip-source-filter ip helper dhcp-snooping binding timeout ip helper dhcp-snooping binding action ip helper dhcp-snooping binding persistency ip helper boot-up ip udp relay ip udp relay vlan show ip helper show ip helper stats show ip helper dhcp-snooping vlan show ip helper dhcp-snooping port show ip helper dhcp-snooping binding show ip udp relay service show ip udp relay statistics show ip udp relay destination dhcp-server clear dhcp-server statistics clear dhcp-server statistics show dhcp-server leases show dhcp-server statistics ip helper dhcp-snooping ip-source-filter show ip helper dhcp-snooping ip-source-filter

A summary of the available DHCPv6 Relay commands are listed here.:

DHCPv6 Relay commands	**ipv6 helper address** **ipv6 helper address vlan** **ipv6 helper standard** **ipv6 helper per-vlan only** **ipv6 helper maximum hops** **ipv6 helper dhcp-snooping** **ipv6 helper dhcp-snooping vlan** **ipv6 helper dhcp-snooping port** **ipv6 helper dhcp-snooping linkagg** **ipv6 helper dhcp-snooping binding** **ipv6 helper dhcp-snooping binding timeout** **ipv6 helper dhcp-snooping binding action** **ipv6 helper dhcp-snooping binding persistency** **ipv6 helper interface-id prefix** **ipv6 helper remote-id format** **show ipv6 helper** **show ipv6 helper stats** **show ipv6 helper dhcp-snooping vlan** **show ipv6 helper dhcp-snooping port** **show ipv6 helper dhcp-snooping binding**

ip helper address

Adds or deletes a DHCP server IP address. DHCP Relay forwards BOOTP/DHCP broadcasts to and from the specified address. If multiple DHCP servers are used, configure one IP address for each server.

ip helper address *ip_address*

ip helper no address [*ip_address***]**

Syntax Definitions

ip_address	DHCP server IP address (for example, 21.0.0.10).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Using this command enables a Global DHCP Relay service on the switch. When the DHCP Relay is specified by the DHCP server IP address, the service is called Global DHCP.
- When the DHCP Relay is specified by the VLAN number of the DHCP request, the service is referred to as Per-VLAN DHCP.
- Global DHCP and Per-VLAN DHCP are mutually exclusive. You can only configure one or the other.
- Use the **no** form of this command to delete an IP address from the DHCP Relay service. If an address is not specified, then all addresses are deleted.
- UDP Relay is automatically enabled on a switch when a DHCP server IP address is defined. There is no separate command for enabling or disabling the relay service.
- Configure DHCP Relay on switches where packets are routed between IP networks.
- You can configure up to 256 server IP addresses for one relay service.

Examples

```
-> ip helper address 75.0.0.10
-> ip helper no address 31.0.0.20
```

Release History

Release 6.1; command introduced.

Related Commands

ip helper address vlan	Specifies or deletes DHCP Relay based on the VLAN of the DHCP request.
ip helper forward delay	Sets the forward delay time value. DHCP Relay will not process a client packet unless the packet contains an elapsed boot time value that is equal to or greater than the configured value of the forward delay time.
ip helper maximum hops	Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper stats	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperTable
   iphelperService
   iphelperForwAddr
```

ip helper address vlan

Configures a DHCP Relay service for the specified VLAN. This command is used when a per-VLAN only relay service is active on the switch. It does not apply when using a standard relay service.

ip helper address *ip_address* **vlan** *vlan_id*

ip helper no address *ip_address* **vlan** *vlan_id*

Syntax Definitions

ip_address	IP address (for example, 21.0.0.10) of the DHCP server VLAN.
vlan_id	VLAN identification number (for example, 3) of the DHCP server VLAN.

Defaults

If no VLAN identification number is entered, VLAN ID 0 is used by default.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the DHCP server VLAN from the DHCP Relay.
- Specifying multiple VLAN IDs and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range and a space to separate multiple VLAN ID entries (for example, 10-15 500-510 850).
- The **ip helper address vlan** command does not work if the **per-vlan only** forwarding option is not active. Use the **ip helper per-vlan only** command to enable this option.
- Configure DHCP Relay on switches where packets are routed between IP networks.
- The per-VLAN only relay service supports a maximum of 256 VLANs.

Examples

```
-> ip helper address 75.0.0.10 3
-> ip helper no address 31.0.0.20 4
-> ip helper address 198.206.15.2 250-255
-> ip helper address 10.11.4.1 550-555 1500 1601-1620
-> ip helper no address 198.206.15.2 1601-1620
```

Release History

Release 6.1; command introduced.
Release 6.1.2; support added for entering a range and/or multiple entries of VLAN IDs.

Related Commands

ip helper per-vlan only	Sets the DHCP Relay forwarding option to process only DHCP packets received from a specific, identified VLAN.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper stats	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperTable
   iphelperService
   iphelperVlan
```

ip helper standard

Sets DHCP Relay forwarding option to standard. All DHCP packets are processed by a global relay service.

ip helper standard

Syntax Definitions

N/A

Defaults

By default, the DHCP Relay forwarding option is set to **standard**.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- To limit forwarding of DHCP packets to only packets that originate from authenticated ports, use the **ip helper avlan only** command.
- To process DHCP packets on a per VLAN basis, use the **ip helper per-vlan only** command.

Examples

```
-> ip helper standard
```

Release History

Release 6.1; command introduced.

Related Commands

show ip helper	Displays current DHCP Relay configuration information.
show ip helper stats	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperStatTable
   iphelperForwOption
```

ip helper avlan only

Sets DHCP Relay forwarding option to process only DHCP packets received on authenticated VLAN ports.

ip helper avlan only

Syntax Definitions

N/A

Defaults

By default, the UDP forwarding option is set to **standard**.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

When the forwarding option is set to **avlan only**, all other DHCP packets are not processed.

Examples

```
-> ip helper avlan only
```

Release History

Release 6.1; command introduced.

Related Commands

ip helper standard	Sets DHCP Relay forwarding option to standard. All DHCP packets are processed.
ip helper per-vlan only	Sets the DHCP Relay forwarding option to process only DHCP packets received on authenticated ports from a specific, identified VLAN.
ip helper forward delay	Sets the forward delay time value. DHCP Relay will not process a client packet unless the packet contains an elapsed boot time value that is equal to or greater than the configured value of the forward delay time.
ip helper maximum hops	Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper stats	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperStatTable
   iphelperForwOption
```

ip helper per-vlan only

Sets the DHCP Relay forwarding option to process only DHCP packets received from a specific, identified VLAN. This option allows each VLAN to have its own relay.

ip helper per-vlan only

Syntax Definitions

N/A

Defaults

By default, the UDP forwarding option is set to **standard**.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- When the forwarding option is set to **per-vlan only**, the **standard** (global) DHCP relay service is not available. These two types of services are mutually exclusive.
- Using the **per-vlan only** forwarding option requires you to specify a DHCP server IP address for each VLAN that will provide a relay service. The **ip helper address vlan** command performs this function and at the same time enables relay for the specified VLAN.

Examples

```
-> ip helper per-vlan only
```

Release History

Release 6.1; command introduced.

Related Commands

ip helper address vlan	Configures a DHCP Relay service for the specified VLAN.
ip helper standard	Sets DHCP Relay forwarding option to standard. All DHCP packets are processed.
ip helper avlan only	Sets DHCP Relay forwarding option to process only DHCP packets received on authenticated VLAN ports from clients that are not yet authenticated.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper stats	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperStatTable
   iphelperForwOption
```

ip helper forward delay

Sets the forward delay time value for the DHCP Relay configuration. The BOOTP/DHCP packet the client sends contains the elapsed boot time. This is the amount of time, in seconds, since the client last booted. DHCP Relay will not process the packet unless the client's elapsed boot time value is equal to or greater than the configured value of the forward delay time.

ip helper forward delay *seconds*

Syntax Definitions

seconds	Forward delay time value in seconds (1–65535). Do not use commas in the value.

Defaults

By default, the forward delay time is set to three seconds.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The time specified applies to all defined IP helper addresses.
- If a packet contains an elapsed boot time value that is less than the specified forward delay time value, DHCP Relay discards the packet.

Examples

```
-> ip helper forward delay 300
-> ip helper forward delay 120
```

Release History

Release 6.1; command introduced.

Related Commands

ip helper address	Adds or deletes one or more DHCP server IP addresses to the DHCP Relay configuration.
ip helper maximum hops	Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper stats	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperStatTable
   iphelperForwDelay
```

ip helper maximum hops

Sets the maximum number of hops value for the DHCP Relay configuration. This value specifies the maximum number of relays a BOOTP/DHCP packet is allowed to traverse until it reaches its server destination. Limiting the number of hops that can forward a packet prevents packets from looping through the network.

ip helper maximum hops *hops*

Syntax Definitions

hops	The maximum number of relays (1–16).

Defaults

By default, the maximum hops value is set to four hops.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If a packet contains a hop count equal to or greater than the *hops* value, DHCP Relay discards the packet.
- The maximum hops value only applies to DHCP Relay and is ignored by other services.

Examples

```
-> ip helper maximum hops 1
-> ip helper maximum hops 10
```

Release History

Release 6.1; command introduced.

Related Commands

ip helper address	Adds or deletes one or more DHCP server IP addresses to the DHCP Relay configuration.
ip helper forward delay	Sets the forward delay time value. DHCP Relay will not process a client packet unless the packet contains an elapsed boot time value that is equal to or greater than the configured value of the forward delay time.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper stats	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperStatTable
   iphelperMaxHops
```

ip helper agent-information

Enables or disables the DHCP relay agent information option (Option-82) feature. When this feature is enabled, local relay agent information is inserted into client DHCP packets when the agent forwards these packets to a DHCP server.

ip helper agent-information {enable | disable}

Syntax Definitions

enable	Enables the relay agent Option-82 feature for the switch.
disable	Disables the relay agent Option-82 feature for the switch.

Defaults

By default, this feature is disabled on the switch.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command enables the DHCP Option-82 feature for the entire switch; it is not configurable on a per-VLAN basis.
- When the DHCP Option-82 feature is enabled, DHCP Snooping is not available. These two features are mutually exclusive.
- When the relay agent receives a DHCP packet that already contains the Option-82 field, it will process the packet based on the agent information policy configured for the switch. This policy is configured using the **ip help agent-information policy** command.

Examples

```
-> ip helper agent-information enable
-> ip helper agent-information disable
```

Release History

Release 6.1.2; command introduced.

Related Commands

ip helper agent-information policy	Configures a policy to determine how the relay agent handles DHCP packets that already contain the Option-82 field.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper stats	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperAgentInformation
```

ip helper agent-information policy

Configures a policy that determines how the DHCP relay agent will handle DHCP packets that already contain an Option-82 field.

ip helper agent-information policy {drop | keep | replace}

Syntax Definitions

drop	Drop DHCP packets that already contain an Option-82 field.
keep	Keep the existing Option-82 field information and continue to relay the DHCP packet.
replace	Replace the existing Option-82 field information with local relay agent information and continue to relay the DHCP packet.

Defaults

By default, DHCP packets that already contain an Option-82 field are dropped.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The policy configured with this command is only applied if the DHCP Option-82 feature is enabled for the switch.
- The agent information policy is not applied if the DHCP relay agent receives a DHCP packet from a client that contains a non-zero value for the gateway IP address (giaddr). In this case, the agent will not insert the relay agent information option into the DHCP packet and will forward the packet to the DHCP server.
- Note that if a DHCP packet contains a gateway IP address (giaddr) value that matches a local subnet and also contains the Option-82 field, the packet is dropped by the relay agent.

Examples

```
-> ip helper agent-information policy drop
-> ip helper agent-information policy keep
-> ip helper agent-information policy replace
```

Release History

Release 6.1.2; command introduced.

Related Commands

ip helper agent-information	Enables the insertion of relay agent information Option-82 into DHCP packets.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper stats	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperAgentInformationPolicy
```

ip helper pxe-support

Enables or disables relay agent support for Preboot Execution Environment (PXE) devices.

ip helper pxe-support {enable | disable}

Syntax Definitions

enable	Enables PXE support.
disable	Disables PXE support.

Defaults

By default, PXE support is disabled for the switch.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- PXE support was enabled by default in previous releases. Note that PXE is currently disabled by default and is now a user-configurable option using the **ip helper pxe-support** command.
- Enable PXE support to insert 'relay agent IP address' (client IP address space) as the source IP address. With PXE support disabled, relayed DHCP packets toward the DHCP server take the outgoing interface IP as the source IP address.
- Configure PXE support only on switches where packets are routed between IP networks. Also, validate the reachability of relay agent IP address, in case configuration is deemed necessary.
- **ip helper pxe-support disable** is the no form of this command. This is the default configuration of PXE support.

Examples

```
-> ip helper pxe-support enable
-> ip helper pxe-support disable
```

Release History

Release 6.3.1; command introduced.

Related Commands

show ip helper	Displays current DHCP Relay configuration information.

MIB Objects

```
iphelperPXESupport
```

ip helper traffic-suppression

Globally enables or disables the suppression of DHCP broadcast traffic on the switch. When this feature is enabled, all DHCP broadcast packets are forwarded to the relay agent for processing even if the client and server reside in the same VLAN.

This command is currently not supported. Traffic suppression is automatically enabled when DHCP Snooping is enabled for the switch or for specific VLANs.

ip helper traffic-suppression {enable | disable}

Syntax Definitions

enable	Enables traffic suppression for the switch.
disable	Disables traffic suppression for the switch.

Defaults

By default, traffic suppression is disabled for the switch.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- When traffic suppression is enabled, any active relay agent features (for example, Option-82 data insertion, DHCP Snooping) are also effected on all DHCP broadcast traffic, regardless of the VLAN in which the traffic originated.
- Enabling traffic suppression requires the configuration of IP helper addresses for all DHCP servers, even if the server resides in the same VLAN as the DHCP clients.
- Note that enabling DHCP traffic suppression for the switch overrides any traffic suppression status configured for an individual DHCP Snooping port.
- If the per-VLAN UDP Relay mode is active for the switch, DHCP broadcast traffic originating in a VLAN that does not have an IP helper address configured is still broadcast whether or not traffic suppression is enabled for the switch.
- When traffic suppression is disabled, DHCP packets are flooded on the default VLAN for the port. Any DHCP server in the same VLAN domain as the client will receive and respond to such packets without the involvement of the relay agent.

Examples

```
-> ip helper traffic-suppression enable
-> ip helper traffic-suppression disable
```

Release History

Release 6.1.3; command introduced.
Release 6.1.5; command was deprecated.

Related Commands

ip helper dhcp-snooping	Enables or disables DHCP Snooping for the switch.
ip helper dhcp-snooping vlan	Enables or disables DHCP Snooping on a per VLAN basis.
show ip helper	Displays the current DHCP configuration for the switch.

MIB Objects

```
iphelperTrafficSuppressionStatus
```

ip helper dhcp-snooping

Globally enables or disables DHCP Snooping for the switch. When this feature is enabled, all DHCP packets received on all switch ports are filtered.

ip helper dhcp-snooping {enable | disable}

Syntax Definitions

enable	Enables DHCP Snooping for the switch.
disable	Disables DHCP Snooping for the switch.

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If the DHCP relay agent Option-82 feature is enabled, DHCP Snooping is not available. These two features are mutually exclusive.
- If the DHCP Snooping feature is globally enabled for the switch, then configuring snooping on a per-VLAN basis is not allowed. The opposite is also true; invoking VLAN based snooping prevents the use of switch level snooping.
- When DHCP Snooping is enabled at the switch level, MAC address verification and Option-82 data insertion are enabled by default. In addition, the trust mode for all ports is set to the DHCP client only mode.

Examples

```
-> ip helper dhcp-snooping enable
-> ip helper dhcp-snooping disable
```

Release History

Release 6.1.2; command introduced.

Related Commands

ip helper dhcp-snooping vlan	.Enables or disables DHCP Snooping on a per VLAN basis.
show ip helper	Displays the current DHCP configuration for the switch.

MIB Objects

```
iphelperDhcpSnooping
```

ip helper dhcp-snooping mac-address verification

Globally enables or disables MAC address verification for incoming DHCP traffic. When this feature is enabled, the source MAC address is compared to the client hardware MAC address in the DHCP packet. If these two addresses do not match, the DHCP packet is dropped.

ip helper dhcp-snooping mac-address verification {enable | disable}

Syntax Definitions

enable	Enables DHCP MAC address verification for the switch.
disable	Disables DHCP MAC address verification for the switch.

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- When DHCP Snooping is enabled at the switch level, MAC address verification and Option-82 data insertion are enabled by default. In addition, the trust mode for all ports is set to the DHCP client only mode.
- Changing the enabled or disabled status for MAC address verification is only allowed when DHCP Snooping is globally enabled for the switch.

Examples

```
-> ip helper dhcp-snooping mac-address verification enable
-> ip helper dhcp-snooping mac-address verification disable
```

Release History

Release 6.1.2; command introduced.

Related Commands

MIB Objects

```
iphelperDhcpSnoopingMacAddressVerificationStatus
```

ip helper dhcp-snooping option-82 data-insertion

Globally enables or disables DHCP Option-82 data insertion for DHCP packets. When this feature is enabled, the relay agent inserts the Option-82 field into DHCP packets before forwarding them to the DHCP server.

ip helper dhcp-snooping option-82 data-insertion {enable | disable}

Syntax Definitions

enable	Enables inserting the DHCP Option-82 field into DHCP packets.
disable	Disables inserting the DHCP Option-82 field into DHCP packets.

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

When DHCP Snooping is enabled at the switch level, Option-82 data insertion and MAC address verification are enabled by default. In addition, the trust mode for all ports is set to the DHCP client only mode.

Examples

```
-> ip helper dhcp-snooping option-82 data-insertion enable
-> ip helper dhcp-snooping option-82 data-insertion disable
```

Release History

Release 6.1.2; command introduced.

Related Commands

ip helper dhcp-snooping option-82 format	Configures the type of information that is inserted in both the Circuit ID and Remote ID suboption of the Option-82 field.
ip helper dhcp-snooping	.Globally enables or disables DHCP Snooping for the switch.
ip helper dhcp-snooping ip-source-filter	Enables or disables the DHCP Snooping binding table functionality
show ip helper	Displays the current DHCP configuration for the switch.

MIB Objects

iphelperDhcpSnoopingOpt82DataInsertionStatus

ip helper dhcp-snooping option-82 format

Configures the type of information that is inserted into both the Circuit ID and Remote ID suboption fields of the Option-82 field.

ip helper dhcp-snooping option-82 format {base-mac | system-name | user-string *string* | **interface-alias | auto-interface-alias}**

Syntax Definitions

base-mac	The base MAC address of the switch.
system-name	The system name of the switch.
string	A user-defined text string up to 64 characters.
interface-alias	The alias configured for the interface.
auto-interface-alias	The switch automatically generates the interface-alias in the following format: *SystemName_slot_port*.

Defaults

parameter	value
base-mac | system-name | user-string *string*	**base-mac**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The *string* parameter specifies user-defined information to insert into the Circuit ID and Remote ID fields.
- When entering a *string* for user-defined Option-82 information, quotes are required around ambiguous characters, such as hex characters, spaces, etc, so they are interpreted as text. For example, the *string* “Building B Server” requires quotes because of the spaces between the words.
- The interface-alias parameter will use the alias configured with the **interfaces alias** command. If no alias is configured a NULL string will be inserted.
- A maximum of 63 characters can be inserted when using the **interface-alias** and **auto-interface-alias** commands, remaining characters will be truncated.
- The Option-82 format option is a global setting, the format specified will be applied to all ports on the switch.
- The data specified with this command is added to the Circuit ID and Remote ID fields only when DHCP Option-82 data insertion is enabled for the switch.
- When DHCP Snooping is enabled at the switch level, Option-82 data insertion is enabled by default.

Examples

```
-> ip helper dhcp-snooping option-82 format user-string “Building B Server”
-> ip helper dhcp-snooping option-82 format system-name
-> ip helper dhcp-snooping option-82 format base-mac
-> ip helper dhcp-snooping option-82 format interface-alias
-> ip helper dhcp-snooping option-82 format auto-interface-alias
```

Release History

Release 6.3.1; command introduced.
Release 6.4.2; **interface-alias** and **auto-interface-alias** parameters introduced.

Related Commands

ip helper dhcp-snooping option-82 data-insertion	Globally enables or disables DHCP Option-82 data insertion for DHCP packets.
ip helper dhcp-snooping	Globally enables or disables DHCP Snooping for the switch.
show ip helper	Displays the current DHCP configuration for the switch.
interfaces alias	Configures an alias for a port.

MIB Objects

```
iphelperDhcpSnoopingOption82FormatType
iphelperDhcpOption82FormatInterfaceAliasAutoGen
iphelperDhcpSnoopingOption82StringValue
```

ip helper dhcp-snooping option-82 format ascii circuit-id

Configures the type of information that is inserted into the Option-82 Circuit ID suboption. The information is inserted into the Circuit ID field in ASCII text string format.

ip helper dhcp-snooping option-82 format ascii circuit-id {base-mac | system-name | vlan | user-string *string* | **interface-alias | cvlan} {delimiter** *character***}**

no ip helper dhcp-snooping option-82 format ascii circuit-id

Syntax Definitions

base-mac	The base MAC address of the switch.
system-name	The system name of the switch.
vlan	The VLAN ID of which the client is a member.
string	A user-defined text string up to 64 characters.
interface-alias	The alias configured for the interface.
cvlan	The Customer VLAN ID.
character	The delimiter character that separates fields within the Circuit ID ASCII string value. Valid characters are **|** (pipe), \ (backward slash), / (forward slash), **-** (dash), **_** (underscore), and " " (space).

Defaults

By default, the base MAC address of the switch is used in ASCII format.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guideline

- This command is used to specify the type of information that is configured in ASCII text string format and then inserted into the Option-82 Circuit ID suboption. Each parameter provided with this command represents a different type of information.
- Configuring the Circuit ID suboption in ASCII format allows up to five fields (types) of information within the ASCII string. However, if the contents of all the fields combined exceeds 127 characters, then the ASCII string is truncated.
- Specifying at least one parameter with this command is required. If multiple parameters are selected, then specifying one of the valid delimiter characters is also required.
- The *string* parameter specifies user-defined information to insert into the Circuit ID ASCII field.
- When entering a *string* for user-defined Option-82 information, quotes are required around ambiguous characters, such as hex characters, spaces, etc, so they are interpreted as text. For example, the *string* "Building B Server" requires quotes because of the spaces between the words.

- The **interface-alias** parameter will use the alias configured with the **interfaces alias** command. If no alias is configured, a NULL string will be inserted.
- A maximum of 63 characters can be inserted when using the **interface-alias** keyword, remaining characters will be truncated.
- The Option-82 format option is a global setting, the format specified will be applied to all ports on the switch.
- The data specified with this command is inserted into the Circuit ID suboption only when DHCP Option-82 data insertion is enabled for the switch.
- When DHCP Snooping is enabled at the switch level, Option-82 data insertion is enabled by default.

Examples

```
-> ip helper dhcp-snooping option-82 format ascii circuit-id user-string “Bldg A
Server”
-> ip helper dhcp-snooping option-82 format ascii circuit-id vlan system-name
delimiter /
-> ip helper dhcp-snooping option-82 format ascii circuit-id user-string “Bldg. B
Server” base-mac system name vlan interface-alias delimiter |
```

Release History

Release 6.4.4; command introduced.

Related Commands

ip helper dhcp-snooping option-82 format ascii remote-id

Configures the type of information that is inserted into the Option-82 Remote ID suboption. The information is inserted into the Remote ID field in ASCII text string format.

ip helper dhcp-snooping option-82 format ascii remote-id {base-mac | system-name | vlan | user-string *string* | **interface-alias | cvlan} {delimiter** *character***}**

no ip helper dhcp-snooping option-82 format ascii remote-id

Syntax Definitions

base-mac	The base MAC address of the switch.
system-name	The system name of the switch.
vlan	The VLAN ID of which the client is a member.
string	A user-defined text string up to 64 characters.
interface-alias	The alias configured for the interface.
cvlan	The Customer VLAN ID.
character	The delimiter character that separates fields within the Circuit ID ASCII string value. Valid characters are **|** (pipe), \ (backward slash), / (forward slash), **-** (dash), **_** (underscore), and " " (space).

Defaults

By default, the base MAC address of the switch is used in ASCII format.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guideline

- This command is used to specify the type of information that is configured in ASCII text string format and then inserted into the Option-82 Remote ID suboption. Each parameter provided with this command represents a different type of information.
- Configuring the Remote ID suboption in ASCII format allows up to five fields (types) of information within the ASCII string. However, if the contents of all the fields combined exceeds 127 characters, then the ASCII string is truncated.
- Specifying at least one parameter with this command is required. If multiple parameters are selected, then specifying one of the valid delimiter characters is also required.
- The *string* parameter specifies user-defined information to insert into the Remote ID ASCII field.
- When entering a *string* for user-defined Option-82 information, quotes are required around ambiguous characters, such as hex characters, spaces, etc, so they are interpreted as text. For example, the *string* "Building B Server" requires quotes because of the spaces between the words.

- The **interface-alias** parameter will use the alias configured with the **interfaces alias** command. If no alias is configured, a NULL string will be inserted.
- A maximum of 63 characters can be inserted when using the **interface-alias** commands, remaining characters will be truncated.
- The Option-82 format option is a global setting, the format specified will be applied to all ports on the switch.
- The data specified with this command is inserted into the Remote ID suboption only when DHCP Option-82 data insertion is enabled for the switch.
- When DHCP Snooping is enabled at the switch level, Option-82 data insertion is enabled by default.

Examples

```
-> ip helper dhcp-snooping option-82 format ascii remote-id user-string “Bldg A
Server”
-> ip helper dhcp-snooping option-82 format ascii remote-id vlan system-name delim-
iter /
-> ip helper dhcp-snooping option-82 format ascii remote-id user-string “Bldg. B
Server” base-mac system name vlan interface-alias delimiter |
```

```

ip helper dhcp-snooping bypass option-82-check

Enables or disables checking for an Option-82 field in DHCP packets ingressing on untrusted ports.

ip helper dhcp-snooping bypass option-82-check {enable | disable}

Syntax Definitions

enable	Bypasses the Option-82 field check.
disable	Checks DHCP packets for the Option-82 field.

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- When this feature is disabled (the default), DHCP packets ingressing on untrusted ports are checked to see if they contain the Option-82 field. If this field is present, the DHCP packet is discarded.
- When this feature is enabled, DHCP packets ingressing on untrusted ports are *not* checked to see if they contain the Option-82 field. In this case, the Option-82 field is ignored and all DHCP packets are processed.
- Using this command is only allowed when DHCP Snooping is enabled globally for the switch or at the VLAN level.

Examples

```
-> ip helper dhcp-snooping bypass option-82-check enable
-> ip helper dhcp-snooping bypass option-82-check disable
```

Release History

Release 6.1.5; command introduced.

Related Commands

ip helper dhcp-snooping	Globally enables or disables DHCP Snooping for the switch.
show ip helper	Displays the current DHCP configuration for the switch.

MIB Objects

```
iphelperDHCPSnoopingBypassOpt82CheckStatus
```

ip helper dhcp-snooping vlan

Enables or disables DHCP Snooping on a per VLAN basis. When this feature is enabled, all DHCP packets received on ports associated with the DHCP Snooping VLAN are filtered.

ip helper dhcp-snooping vlan *vlan_id* **[mac-address verification {enable | disable}] [option-82 data-insertion {enable | disable}]**

no ip helper dhcp-snooping vlan *vlan_id*

Syntax Definitions

vlan_id	The VLAN identification number (1–4094).
mac-address verification	Enables or disables verifying the source MAC address of DHCP packets with the client MAC address contained in the same packet.
option-82 data-insertion	Enables or disables inserting Option-82 information into DHCP packets.

Defaults

By default, DHCP Snooping is disabled. When this feature is enabled for the specified VLAN, the following default parameter values apply:

parameter	default
mac-address verification	Enabled
option-82 data-insertion	Enabled

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to disable DHCP Snooping for the specified VLAN.
- The MAC address verification and Option-82 data insertion are applied to packets received on ports associated with the DHCP Snooping VLAN.
- If the DHCP relay agent Option-82 feature is enabled, DHCP Snooping is not available. These two features are mutually exclusive.
- If the DHCP Snooping feature is globally enabled for the switch, then configuring snooping on a per-VLAN basis is not allowed. The opposite is also true; invoking VLAN based snooping prevents the use of switch level snooping.
- Note that disabling the Option-82 data insertion operation for a VLAN is not allowed when the binding table functionality is enabled.

Examples

```
-> ip helper dhcp-snooping vlan 100 enable
-> ip helper dhcp-snooping vlan 100 disable
```

Release History

Release 6.1.2; command introduced.

Related Commands

ip helper dhcp-snooping	Globally enables or disables DHCP Snooping for the switch.

```

ip helper dhcp-snooping port

Configures the DHCP Snooping trust mode for the port. The trust mode determines if the port will accept all DHCP traffic, block all DHCP traffic, or accept only client DHCP traffic.

ip helper dhcp-snooping port *slot1/port1***[**-*port1a***] {block | client-only | trust}**

Syntax Definitions

*slot1/port1***[**-*port1a***]**	Specifies the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3). Use a hyphen to specify a range of ports (for example, 3/1-16).
block	Blocks all DHCP traffic on the port.
client-only	Allows only DHCP client traffic on the port.
trust	Allows all DHCP traffic on the port. The port behaves as if DHCP Snooping was not enabled.

Defaults

By default, the trust mode for a port is set to **client-only** when the DHCP Snooping feature is enabled for the switch or for a VLAN.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The DHCP trust mode only applies when the DHCP Snooping feature is enabled for the switch or for a VLAN.
- If DHCP Snooping is enabled at the switch level, the trust mode applies to all switch ports.
- If DHCP Snooping is enabled for a specific VLAN, then the trust mode applies to only those ports that are associated with that VLAN.
- Use the **show ip helper dhcp-snooping port** command to display the current trust mode for a port and statistics regarding the number of packets dropped due to DHCP Snooping violations.

Examples

```
-> ip helper dhcp-snooping port 1/24 trust
-> ip helper dhcp-snooping port 2/1-10 block
-> ip helper dhcp-snooping port 4/8 client-only
```

Release History

Release 6.1.2; command introduced.

Related Commands

   iphelperDhcpSnoopingPortIfIndex
   iphelperDhcpSnoopingPortTrustMode
```

ip helper dhcp-snooping linkagg

Configures the DHCP Snooping trust mode for the link aggregate. The trust mode determines if the link-aggregate will accept all DHCP traffic, block all DHCP traffic, or accept only client DHCP traffic.

ip helper dhcp-snooping linkagg *num* **{block | client-only | trust| ip-source-filtering}**

Syntax Definitions

num	Specifies the link aggregate ID number.
block	Blocks all DHCP traffic on the port.
client-only	Allows only DHCP client traffic on the port.
trust	Allows all DHCP traffic on the link aggregate. The port behaves as if DHCP Snooping was not enabled.
ip-source-filter	Traffic on the port is restricted to packets received on the port that contain the client MAC address and IP address. All other packets are dropped.

Defaults

By default, the trust mode for a link aggregate is set to **client-only** when the DHCP Snooping feature is enabled for the switch or for a VLAN.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The DHCP trust mode only applies when the DHCP Snooping feature is enabled for the switch or for a VLAN.
- If DHCP Snooping is enabled at the switch level, the trust mode applies to all link aggregates.
- If DHCP Snooping is enabled for a specific VLAN, then the trust mode applies to only those link aggregates that are associated with that VLAN.
- Use the **show ip helper dhcp-snooping port** command to display the current trust mode for a link aggregate and statistics regarding the number of packets dropped due to DHCP Snooping violations.

Examples

```
-> ip helper dhcp-snooping linkagg 1 trust
-> ip helper dhcp-snooping linkagg 2 block
-> ip helper dhcp-snooping linkagg 3 client-only
```

Release History

Release 6.1.2; command introduced.

Release 6.4.4; ip-source-filtering parameter deprecated, use **ip helper dhcp-snooping ip-source-filter**.

Related Commands

ip helper dhcp-snooping	Globally enables or disables DHCP Snooping for the switch.
ip helper dhcp-snooping vlan	Enables or disables DHCP Snooping on a per-VLAN basis.

MIB Objects

```
iphelperDhcpSnoopingPortTable
   iphelperDhcpSnoopingPortIfIndex
   iphelperDhcpSnoopingPortTrustMode
```

ip helper dhcp-snooping port traffic-suppression

Configures the traffic suppression status for the port. When this function is enabled, DHCP packets are not flooded on the default VLAN for the specified port. This will prevent DHCP communications between a DHCP server and a client when both devices belong to the same VLAN domain.

This command is currently not supported. Traffic suppression is automatically enabled when DHCP Snooping is enabled for the switch or for specific VLANs.

ip helper dhcp-snooping port *slot1/port1***[-***port1a***] traffic-suppression {enable | disable}**

Syntax Definitions

*slot1/port1***[-***port1a***]**	Specifies the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3). Use a hyphen to specify a range of ports (for example, 3/1-16).
enable	Enables traffic suppression for the specified port.
disable	Disables traffic suppression for the specified port.

Defaults

By default, traffic suppression is disabled for the port.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Traffic suppression applies only to ports that are associated with a VLAN that has DHCP Snooping enabled or to all ports when DHCP Snooping is globally enabled for the switch.
- When traffic suppression is disabled, then DHCP packets are flooded on the default VLAN for the port. Any DHCP server in the same VLAN domain as the client will receive and respond to such packets; DHCP Snooping is not invoked in this scenario.

Examples

```
-> ip helper dhcp-snooping port 1/24 traffic-suppression enable
-> ip helper dhcp-snooping port 2/1-10 traffic-suppression enable
-> ip helper dhcp-snooping port 4/8 traffic-suppression disable
-> ip helper dhcp-snooping port 3/1-5 traffic-suppression disable
```

Release History

Release 6.1.2; command introduced.
Release 6.1.5; command was deprecated.

Related Commands

ip helper dhcp-snooping	Globally enables or disables DHCP Snooping for the switch.
ip helper dhcp-snooping vlan	Enables or disables DHCP Snooping on a per-VLAN basis.
ip helper dhcp-snooping port	Configures the DHCP Snooping trust mode for a port.
ip helper dhcp-snooping port ip-source-filtering	Configures the IP source filtering status for a DHCP Snooping port.

MIB Objects

```
iphelperDhcpSnoopingPortTable
   iphelperDhcpSnoopingPortIfIndex
   iphelperDhcpSnoopingPortIpTrafficSuppression
```

ip helper dhcp-snooping port ip-source-filtering

Configures the IP source filtering status for the port. When this function is enabled, traffic on the port is restricted to packets received on the port that contain the client MAC address and IP address. All other packets are dropped.

ip helper dhcp-snooping port *slot1/port1***[-***port1a***] ip-source-filtering {enable | disable}**

Syntax Definitions

*slot1/port1***[-***port1a***]**	Specifies the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3). Use a hyphen to specify a range of ports (for example, 3/1-16).
enable	Enables IP source filtering for the specified port.
disable	Disables IP source filtering for the specified port.

Defaults

By default, IP source filtering is disabled for the port.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- IP source filtering applies only to ports that are associated with a VLAN that has DHCP Snooping enabled or to all ports when DHCP Snooping is globally enabled for the switch.
- The DHCP Snooping binding table is used to verify client information.
- If a device connected to a DHCP Snooping port with IP source filtering enabled does not have a valid IP address lease from the trusted DHCP server, then all IP traffic for that device is blocked on the port.
- Disable IP source filtering for the DHCP Snooping port to allow a device to obtain a valid IP address lease.
- Once a device obtains a valid lease or if a device already has a valid lease, then only source bound traffic is allowed.

Examples

```
-> ip helper dhcp-snooping port 1/24 ip-source-filtering enable
-> ip helper dhcp-snooping port 2/1-10 ip-source-filtering enable
-> ip helper dhcp-snooping port 4/8 ip-source-filtering disable
-> ip helper dhcp-snooping port 3/1-5 ip-source-filtering disable
```

Release History

Release 6.1.2; command introduced.
Release 6.4.4; ip-source-filtering parameter deprecated, use **ip helper dhcp-snooping ip-source-filter**.

Related Commands

ip helper dhcp-snooping	Globally enables or disables DHCP Snooping for the switch.
ip helper dhcp-snooping vlan	Enables or disables DHCP Snooping on a per-VLAN basis.
ip helper dhcp-snooping port	Configures the DHCP Snooping trust mode for a port.
ip helper dhcp-snooping port traffic-suppression	Configures the traffic suppression status for a DHCP Snooping port.

MIB Objects

```
iphelperDhcpSnoopingPortTable
   iphelperDhcpSnoopingPortIfIndex
   iphelperDhcpSnoopingPortIpSourceFiltering
```

ip helper dhcp-snooping binding

Enables or disables the DHCP Snooping binding table functionality. The binding table contains the MAC address, IP address, lease time, binding type (dynamic or static), VLAN number, and the interface information that corresponds to a local untrusted port on the switch. In addition, this command is also used to configure a static entry in the binding table.

ip helper dhcp-snooping port binding {[enable | disable] | [*mac_address* **port** *slot/port* **address** *ip_address* **vlan** *vlan_id***]}**

no ip helper dhcp-snooping port binding *mac_address* **port** *slot/port* **address** *ip_address* **vlan** *vlan_id*

Syntax Definitions

enable	Enables the creation of binding table entries.
disable	Disables the creation of binding table entries.
mac_address	The client MAC address.
slot/port	The slot and port number that received the DHCP request.
ip_address	The IP address that the DHCP server offered to the client.
vlan_id	The VLAN identification number (1–4094) of the VLAN to which the client belongs.

Defaults

By default, the binding table functionality is enabled when the DHCP Snooping feature is enabled for the switch or for a VLAN.

Platforms Supported

OmniSwitch 6400, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a static entry from the DHCP Snooping binding table.
- The **enable** and **disable** parameters are independent of the other parameters, in that they are only used to turn the binding table functionality on and off. Enabling or disabling binding table functionality and creating a static binding table entry is not allowed on the same command line.
- Note that enabling the binding table functionality is not allowed if Option-82 data insertion is *not* enabled at either the switch or VLAN level.
- Static binding table entries are created using this command. If DHCP Snooping binding table functionality is not enabled, creating a static entry is not allowed.
- Dynamic binding table entries are created when the relay agent receives a DHCPACK packet.

Examples

```
-> ip helper dhcp-snooping binding disable
-> ip helper dhcp-snooping binding enable
```

```
-> ip helper dhcp-snooping binding 00:2a:95:51:6c:10 port 1/15 address 17.15.3.10
lease-time 3 vlan 200
-> no ip helper dhcp-snooping binding 00:2a:95:51:6c:10 port 1/15 address
17.15.3.10 lease-time 3 vlan 200
```

Release History

Release 6.1.2; command introduced.
Release 6.3.4; **lease-time** parameter was removed.

Related Commands

ip helper dhcp-snooping binding timeout	Configures the amount of time between each automatic save of the binding table contents to a file on the switch.
ip helper dhcp-snooping binding action	Synchronizes the contents of the DHCP Snooping binding table with the contents of the **dhcpBinding.db** file saved on the switch.

MIB Objects

```
iphelperDhcpSnoopingBindingStatus
iphelperDhcpSnoopingBindingTable
   iphelperDhcpSnoopingBindingMacAddress
   iphelperDhcpSnoopingBindingIfIndex
   iphelperDhcpSnoopingBindingIpAddress
   iphelperDhcpSnoopingBindingVlan
   iphelperDhcpSnoopingBindingType
```

ip helper dhcp-snooping ip-source-filter

Enables or disables the IP source filtering capability at a port, link aggregation, or VLAN level. When this function is enabled, the switch allows the traffic that matches the client IP address, MAC address, port, and VLAN combination obtained from the DHCP snooping binding table entry.

ip helper dhcp-snooping ip-source-filter {vlan *num* **| port** *slot/port***[-***port2***] | linkagg** *num***} {enable | disable}**

Syntax Definitions

vlan	The VLAN identification number (1–4094).
linkagg *num*	Specifies the link aggregate identification number.
*slot1/port1***[-***port1a***]**	Specifies the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3). Use a hyphen to specify a range of ports (for example, 3/1-16).
enable	Enables IP source filtering for the specified port, link aggregation, or VLAN.
disable	Disables IP source filtering for the specified port, link aggregation, or VLAN level.

Defaults

By default, IP source filtering is disabled for a port or link aggregate, or VLAN.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Source filtering can be enabled only on the VLANs on which the DHCP Snooping is enabled.
- Source filtering can be enabled
  - on the ports that are associated with a VLAN on which DHCP Snooping is enabled.
  - on all the ports when DHCP Snooping is globally enabled for the switch.

Examples

```
-> ip helper dhcp-snooping ip-source-filter port 1/1 enable
-> ip helper dhcp-snooping ip-source-filter linkagg 2 enable
-> ip helper dhcp-snooping ip-source-filter vlan 10 enable
-> ip helper dhcp-snooping ip-source-filter vlan 20 disable
```

Release History

Release 6.4.4; command introduced.

Related Commands

show ip helper dhcp-snooping ip-source-filter	Displays the ports or VLANs on which IP source filtering is enabled.

MIB Objects

```
iphelperDhcpSnoopingPortIpSourceFiltering
   iphelperDhcpSnoopingPortIfIndex
   iphelperDhcpSourceFilterVlanNumber
   iphelperDhcpSourceFilterVlanFilteringStatus
```

ip helper dhcp-snooping binding timeout

Configures the amount of time between each automatic save of the DHCP Snooping binding table contents maintained in memory to a file on the switch. This functionality preserves binding table contents across switch reboots.

ip helper dhcp-snooping port binding timeout *seconds*

Syntax Definitions

seconds	The number of seconds (180 to 600) to wait before the next save.

Defaults

By default, the timeout value is set to 300 seconds.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The timeout value is only valid if the DHCP Snooping binding table functionality is enabled.
- The contents of the binding table is saved to the **dhcpBinding.db** file in the **/flash/switch** directory.
- The **dhcpBinding.db** file is time stamped when a save of the binding table contents is successfully completed.

Examples

```
-> ip helper dhcp-snooping binding timeout 600
-> ip helper dhcp-snooping binding timeout 250
```

Release History

Release 6.1.2; command introduced.

Related Commands

ip helper dhcp-snooping ip-source-filter	.Enables or disables the DHCP Snooping binding table functionality.
ip helper dhcp-snooping binding action	Synchronizes the contents of the DHCP Snooping binding table with the contents of the **dhcpBinding.db** file saved on the switch.

MIB Objects

```
iphelperDhcpSnoopingBindingDatabaseSyncTimeout
iphelperDhcpSnoopingBindingDatabaseLastSyncTime
```

ip helper dhcp-snooping binding action

Triggers a purge or renew action against the DHCP Snooping binding table. A purge action clears the contents of the table. A renew action populates the table with entries saved in the **dhcpBinding.db** file.

ip helper dhcp-snooping port binding action {purge | renew}

Syntax Definitions

purge	Clears all binding table entries that are maintained in switch memory.
renew	Populates the binding table with entries saved in the **dhcpBinding.db file** located in the **/flash/switch** directory on the switch.

Defaults

By default, the timeout value is set to 300 seconds.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

The DHCP Snooping binding table is maintained in the switch memory. Binding table entries are saved on a periodic basis to the **dhcpBinding.db** file on the switch. Use the **purge** and **renew** options available with this command to sync the binding table contents with the contents of the **dhcpBinding.db** file.

Examples

```
-> ip helper dhcp-snooping binding action purge
-> ip helper dhcp-snooping binding action renew
```

Release History

Release 6.1.2; command introduced.

Related Commands

ip helper dhcp-snooping ip-source-filter	.Enables or disables the DHCP Snooping binding table functionality.
ip helper dhcp-snooping binding timeout	Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

MIB Objects

```
iphelperDhcpSnoopingBindingDatabaseAction
```

ip helper dhcp-snooping binding persistency

Retains the entries in the DHCP Snooping binding table for the duration of the lease regardless of the existence of the MAC address in the MAC address table.

ip helper dhcp-snooping binding persistency {enable | disable}

Syntax Definitions

enable	Enables DHCP Snooping binding persistency.
disable	Disables DHCP Snooping binding persistency.

Defaults

By default, DHCP Snooping binding persistency is disabled.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- When this option is disabled, the client MAC address entry in the MAC table is removed. If the MAC address is missing from the MAC address table then the binding entry is removed.
- Use the **show ipv6 helper** command to display the current status.

Examples

```
-> ip helper dhcp-snooping binding persistency enable
-> ip helper dhcp-snooping binding persistency disable
```

Release History

Release 6.3.3; command introduced.

Related Commands

ip helper dhcp-snooping ip-source-filter	Enables or disables the DHCP Snooping binding table functionality.
ip helper dhcp-snooping binding timeout	Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

ip helper boot-up

Enables or disables automatic IP address configuration for default VLAN 1 when an unconfigured switch boots up. If enabled, the switch broadcasts a BootP or a DHCP request packet at boot time. When the switch receives an IP address from a BootP/DHCP server, the address is assigned to default VLAN 1.

Note. Automatic IP address configuration only supports the assignment of a *permanent* IP address to the switch. Make sure that the DHCP server is configured with such an address before using this feature.

ip helper boot-up {enable | disable}

Syntax Definitions

enable	Enables automatic IP address configuration for default VLAN 1.
disable	Disables automatic IP address configuration for default VLAN 1.

Defaults

By default, this feature is disabled on the switch.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **ip helper boot-up enable** command to specify BootP or DHCP for the request packet type.
- If an IP router port already exists for VLAN 1, a request packet is not broadcast even if automatic IP address configuration is enabled for the switch.

Examples

```
-> ip helper boot-up enable
-> ip helper boot-up disable
```

Release History

Release 6.1; command introduced.
Release 6.4.3; command deprecated; use **ip interface dhcp-client**.

Related Commands

ip helper boot-up enable	Specifies BootP or DHCP as the type of request packet the switch will broadcast at boot time.

MIB Objects

```
iphelperStatTable
   iphelperBootupOption
```

ip helper boot-up enable

Specifies the type of packet to broadcast (BootP or DHCP) when automatic IP address configuration is enabled for the switch.

Note. Automatic IP address configuration only supports the assignment of a *permanent* IP address to the switch. Make sure that the DHCP server is configured with such an address before using this feature.

ip helper boot-up enable {BOOTP | DHCP}

Syntax Definitions

BOOTP	Broadcasts a BOOTP formatted request packet.
DHCP	Broadcasts a DHCP formatted request packet.

Defaults

parameter	default
BOOTP | DHCP	**BOOTP**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

This command is only valid if automatic IP address configuration is already enabled for the switch.

Examples

```
-> ip helper boot-up enable DHCP
-> ip helper boot-up enable BOOTP
```

Release History

Release 6.1; command introduced.
Release 6.4.3; command deprecated; use **ip interface dhcp-client**.

Related Commands

ip helper boot-up	Enables or disables automatic IP configuration for the switch.

MIB Objects

```
iphelperStatTable
   iphelperBootupPacketOption
```

ip udp relay

Enables or disables UDP port relay for BOOTP/DHCP and generic UDP service ports (NBNS/NBDD, other well-known UDP ports, and user-defined service ports that are not well-known).

ip udp relay {BOOTP | NBDD | NBNSNBDD | DNS | TACACS | TFTP | NTP | port [*port_num* | *name***]} {vlan** *vlan_id* **| address** *ip_address***}**

no ip udp relay {BOOTP | NBDD | NBNSNBDD | DNS | TACACS | TFTP | NTP | port [*port_num* | *name***]} {vlan** *vlan_id* **| address** *ip_address***}**

Syntax Definitions

BOOTP	BOOTP/DHCP well-known ports 67/68.
NBDD	NBDD well-known port 138.
NBNSNBDD	NBNS/NBDD well-known ports 137/138.
DNS	DNS well-known port 53.
TACACS	TACACS well-known port 65.
TFTP	TFTP well-known port 69.
NTP	NTP well-known port 123.
port_num	Any number that is not a well-known port number.
name	Text string description up to 30 characters.
ip_address	IPv4 address of the configured UDP relay server.

Defaults

By default, relay is enabled on the BOOTP/DHCP well-known ports.

parameter	default
name	User Service number Other #

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to disable UDP Relay for the specified service port.
- Only one IP address can be configured per UDP service port.
- Only use the *port* parameter to specify service port numbers that are not well known. For example, do not specify port 53 as it is the well-known port number for DNS. Instead, use the **DNS** parameter to enable relay for port 53.

- The *name* parameter is only used with the *port* parameter and provides a user-defined description to identify the not well-known port service.
- When entering a *name* for a user-defined service, quotes are required around ambiguous characters, such as hex characters, spaces, etc, so they are interpreted as text. For example, the *name* “A UDP Protocol” requires quotes because of the spaces between the words.
- When UDP Relay is disabled for BOOTP/DHCP, the **ip helper** configuration is *not* retained and all dependant functionality automatic IP configuration for VLAN 1, (Telnet and HTTP client authentication, and so on.) is disrupted.
- Up to three types of UDP Relay services are supported at any one time and in any combination.

Note. If the relay service for BOOTP/DHCP is disabled when the switch reboots, the service is automatically enabled when the switch comes back up. If there were three non-BOOTP/DHCP relay services already enabled before the reboot, the most recent service enabled is disabled and replaced with the BOOTP/DHCP relay service.

- If port relay is enabled for the NBDD well-known port, NBNS is not automatically enabled by default. Specify **NBNS/NBDD** to enable relay for both well-known ports.
- Note that when UDP port relay is enabled for NTP, relay cannot forward NTP packets that contain a destination IP address that matches a VLAN router IP address on the switch.

Examples

```
-> ip udp relay DNS address 125.254.34.1
-> ip udp 3047 “Generic Service”
-> no ip udp relay BOOTP
-> no ip udp relay 3047
```

Release History

Release 6.1; command introduced.
Release 6.4.5; **address** option added to command

Related Commands

ip udp relay vlan	Specifies the VLAN to which traffic from the specified UDP service port is forwarded.
show ip udp relay destination	Displays the VLAN assignments to which the traffic received on the specified UDP service port is forwarded.

MIB Objects

```
iphelperEntry
iphelperxServicePortAssociationTable
   iphelperxServicePortAssociationService
   iphelperxServicePortAssociationPort
   iphelperxServicePortAssociationName
iphelperxPortServiceAssociationTable
   iphelperxPortServiceAssociationService
   iphelperxPortServiceAssociationPort
```

```
iphelperxPortServiceAssociationName
```

ip udp relay vlan

Specifies a VLAN on which traffic destined for a UDP port is forwarded.

ip udp relay {BOOTP | NBDD | NBNSNBDD | DNS | TACACS | TFTP | NTP | port *port_num***} vlan** *vlan_id*

no ip udp relay {BOOTP | NBDD | NBNSNBDD | DNS | TACACS | TFTP | NTP | port *port_num***} vlan** *vlan_id*

Syntax Definitions

BOOTP	BOOTP/DHCP well-known ports 67/68.
NBDD	NBDD well-known port 138.
NBNSNBDD	NBNS/NBDD well-known ports 137/138.
DNS	DNS well-known port 53.
TACACS	TACACS well-known port 65.
TFTP	TFTP well-known port 69.
NTP	NTP well-known port 123.
port	A user-specified port that is not a well-known port.
vlan_id	A numeric value (1–4094) that uniquely identifies an individual VLAN. Use a hyphen to specify a range of VLANs (for example, 1-5).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove the VLAN association with the UDP service port.
- The maximum number of VLANs that can receive forwarded UDP service port traffic is 256.
- Only specify service port numbers that are *not* well known when using the *port* parameter with this command. For example, do not specify port 53 as it is the well-known port number for the DNS UDP service. Instead, use the **DNS** parameter to enable relay for port 53.
- Specifying a VLAN for the BOOTP/DHCP service is not supported.

Examples

```
-> ip udp relay DNS vlan 10
-> ip udp 3047 vlan 500
-> no ip udp relay DNS vlan 10
```

Release History

Release 6.1; command introduced.

Related Commands

ip udp relay	Enables or disables relay for UDP service ports.

MIB Objects

```
iphelperxPortServiceAssociationTable
   iphelperxPortServiceAssociationService
```

ipv6 helper address

Adds or deletes a DHCPv6 server address. DHCPv6 relay forwards DHCPv6 packets to and from the specified address. If multiple DHCPv6 servers are used, one IPv6 address must be configured for each server.

ipv6 helper address *ipv6_address*

ipv6 helper no address [*ipv6_address***]**

Syntax Definitions

ipv6_address	DHCPv6 server address (for example, 5001::6).

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to delete an IPv6 address from the DHCPv6 Relay service. If an address is not specified, then all addresses are deleted.
- Using this command enables a Global DHCPv6 Relay service on the switch. When the DHCPv6 Relay is specified by the DHCPv6 server IPv6 address, the service is called Global DHCPv6 Relay.
- When the DHCPv6 Relay is specified by the VLAN number of the DHCPv6 request, the service is referred to as Per-VLAN DHCPv6. You can either configure Global DHCPv6 or Per-VLAN DHCPv6 but not noth together.
- UDPv6 Relay is automatically enabled on a switch when a DHCPv6 server IPv6 address is defined. There is no separate command for enabling or disabling the relay service.
- Configure DHCPv6 Relay on switches where packets are routed between IPv6 networks. You can configure up to 256 server IPv6 addresses for one relay service.

Example

```
-> ipv6 helper address 2001::5
-> ipv6 helper no address 3001::3
```

Release History

Release 6.4.5; command introduced.

Related Commands

ipv6 helper address	Configures an IPv6 address for an IPv6 interface on a VLAN, configured tunnel, or a 6to4 tunnel.
ipv6 helper address vlan	Configures DHCPv6 relay for the specified VLAN.
ipv6 helper maximum hops	Sets the maximum number of hops value for the DHCPv6 Relay configuration.
show ipv6 helper	Displays the current DHCPv6 Relay, Relay Agent information and DHCPv6 snooping configurations.

MIB Objects

```
ipv6helperTable
   ipv6helperForwAddr
```

ipv6 helper standard

Sets DHCPv6 Relay forwarding option to standard. All DHCPv6 packets are processed by a global relay.

ipv6 helper standard

Syntax Definitions

N/A

Defaults

By default, the DHCPv6 relay forwarding option is set to standard

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

All DHCPv6 packets are processed by a global relay. When the DHCPv6 Relay is specified by the DHCPv6 server, the service is called Global DHCPv6 Relay.

Example

```
-> ipv6 helper standard
```

Release History

Release 6.4.5; command introduced.

Related Commands

ipv6 helper per-vlan only	Sets the DHCPv6 Relay forwarding option to process only DHCPv6 packets received from a specific identified VLAN. This option allows each VLAN to have its own relay.
show ipv6 helper	Displays the current DHCPv6 Relay, Relay Agent information and DHCPv6 snooping configurations.

MIB Objects

```
ipv6helperTable
   ipv6helperForwardOption
```

ipv6 helper per-vlan only

Sets the DHCPv6 Relay forwarding option to process only DHCPv6 packets received from a specific identified VLAN. This option allows each VLAN to have its own relay.

ipv6 helper per-vlan only

Syntax Definitions

N/A

Defaults

By default, forwarding option is set to standard.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- When the forwarding option is set to Per-VLAN only, the standard (global) DHCPv6 relay service must not be active.
- Using the **per-vlan only** forwarding option requires you to specify a DHCPv6 server IPv6 address for each VLAN that provides a relay service. The **ipv6 helper address vlan** command performs this function and at the same time enables relay for the specified VLAN.

Example

```
-> ipv6 helper per-vlan only
```

Release History

Release 6.4.5; command introduced.

Related Commands

ipv6 helper address vlan	Configures DHCPv6 relay for the specified VLAN. This command can be used when a Per-VLAN only relay service is active on the switch.
show ipv6 helper	Displays current DHCPv6 Relay configuration information.

MIB Objects

```
ipv6helperTable
   ipv6helperForwardOption
```

ipv6 helper address vlan

Configures DHCPv6 relay for the specified VLAN. This command can be used when a Per-VLAN only relay service is active on the switch.

ipv6 helper address *ipv6_address* **vlan** *vlan_id*

ipv6 helper no address *ipv6_address* **vlan** *vlan_id*

Syntax Definitions

ipv6_address	DHCPv6 server IPv6 address (for example, 5001::6).
vlan_id	VLAN Identification number of per-VLAN

Defaults

If no VLAN identification number is entered, VLAN ID 0 is used by default

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the DHCPv6 server VLAN from the DHCPv6 Relay.
- This command does not apply when using a standard relay service.
- Specifying multiple VLAN IDs or a range of VLAN IDs on the same command line is allowed.
- Use a hyphen to indicate a contiguous range and a space to separate multiple VLAN ID entries (for example, 10-15, 500-510, 850).
- The **ipv6 helper address vlan** command does not work if the **per-vlan only** forwarding option is not active. Use the **ipv6 helper per-vlan only** command to enable this option.
- The per-VLAN only relay service supports a maximum of 256 VLANs.

Example

```
-> ipv6 helper address 2001::5 vlan 100
-> ipv6 helper address 2001::5 vlan 100-105
-> ipv6 helper no address 2001::5 vlan 103
```

Release History

Release 6.4.5; command introduced.

Related Commands

ipv6 helper per-vlan only	Sets the DHCPv6 Relay forwarding option to process only DHCPv6 packets received from a specific identified VLAN. This option allows each VLAN to have its own relay.
show ipv6 helper	Displays the current DHCPv6 Relay, Relay Agent information and DHCPv6 snooping configurations.

MIB Objects

```
ipv6helperTable
   ipv6helperVlan
   ipv6helperStatus
```

ipv6 helper maximum hops

Sets the maximum number of hops value for the DHCPv6 Relay configuration.

ipv6 helper maximum hops *hops*

Syntax Definitions

hops	Maximum number of relays (1-32).

Defaults

By default, the maximum number of hops is set to 32.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- The **hops** value specifies the maximum number of relays a DHCPv6 packet is allowed to traverse until it reaches its server destination. Limiting the number of hops that can forward a packet prevents packets from looping through the network.
- If a packet contains a hop count equal to or greater than the **hops** value, DHCPv6 Relay discards the packet.

Example

```
-> ipv6 helper maximum hops 1
-> ipv6 helper maximum hops 12
```

Release History

Release 6.4.5; command introduced.

Related Commands

show ipv6 helper	Displays the current DHCPv6 Relay, Relay Agent information and DHCPv6 snooping configurations.

MIB Objects

```
ipv6helperTable
   ipv6helperMaxHops
```

ipv6 helper dhcp-snooping

Globally enables or disables DHCPv6 Snooping for the switch. When this feature is enabled, all DHCPv6 packets received on all switch ports are filtered.

ipv6 helper dhcp-snooping {enable | disable}

Syntax Definitions

enable	Enables DHCPv6 snooping for the switch.
disable	Disables DHCPv6 snooping for the switch.

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- If the DHCPv6 Snooping feature is globally enabled for the switch, then configuring snooping on a Per-VLAN basis is not allowed.
- If Per-VLAN based snooping is enabled, switch level snooping cannot be enabled.

Example

```
-> ipv6 helper dhcp-snooping enable
-> ipv6 helper dhcp-snooping disable
```

Related Commands

ipv6 helper address	Adds or deletes a DHCPv6 server address. DHCPv6 relay forwards DHCPv6 packets to and from the specified address.
show ipv6 helper	Displays the current DHCPv6 Relay, Relay Agent information and DHCPv6 snooping configurations.

Release History

Release 6.4.5; command introduced.

MIB Objects

```
ipv6helperTable
   ipv6helperDhcpSnooping
```

ipv6 helper dhcp-snooping vlan

Enables or disables DHCPv6 Snooping on a Per-VLAN basis. When this feature is enabled, all DHCPv6 packets received on ports associated with the VLAN are filtered.

ipv6 helper dhcp-snooping vlan *vlan_id*

no ipv6 helper dhcp-snooping vlan *vlan_id*

Syntax Definitions

vlan_id	VLAN Identification Number (1 to 4094).

Defaults

By default, DHCPv6 snooping is disabled.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to disable DHCPv6 Snooping for the specified VLAN.
- If the DHCPv6 Snooping feature is globally enabled for the switch, then configuring snooping on a Per-VLAN basis is not allowed.
- If per-VLAN based snooping is enabled for the switch, then DHCPv6 snooping cannot be enabled.

Example

```
-> ipv6 helper dhcp-snooping vlan 100
-> no ipv6 helper dhcp-snooping vlan 100
```

Release History

Release 6.4.5; command introduced.

Related Commands

show ipv6 helper dhcp-snooping vlan Displays a list of VLANs that have DHCPv6 Snooping enabled.

MIB Objects

```
ipv6helperDhcpSnoopingVlanTable
```

ipv6 helper dhcp-snooping port

Configures the DHCPv6 Snooping trust mode for the port. The trust mode determines if the port accepts all DHCPv6 traffic, blocks all DHCPv6 traffic, or accepts only client DHCPv6 traffic.

ipv6 helper dhcp-snooping port *slot / port1* [- *port 1a*] **{block | client-only-trusted | client-only-untrusted | trusted}**

Syntax Definitions

slot / port1 [- *port1a*]	Specifies the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3). Use a hyphen to specify a range of ports (for example, 3/1-16).
block	Blocks all DHCPv6 traffic on the port.
client-only-trusted	Allows only DHCPv6 client traffic on the port along with the Relay forward message
client-only-untrusted	Allows only DHCPv6 client traffic on the port with DHCPv6 snooping enabled.
trusted	Allows all DHCPv6 traffic on the port. The port behaves as if DHCPv6 Snooping is not enabled.

Defaults

By default, the trust mode for a port is set to **client-only-untrusted** when the DHCPv6 Snooping feature is enabled for the switch or for a VLAN.

Usage Guidelines

- The DHCPv6 trust mode only applies when the DHCPv6 Snooping feature is enabled for the switch or for a VLAN.
- If DHCPv6 Snooping is enabled at the switch level, the trust mode applies to all switch ports.
- If DHCPv6 Snooping is enabled for a specific VLAN, then the trust mode applies to only those ports that are associated with that VLAN.
- Use the **show ipv6 helper dhcp-snooping port** command to display the current trust mode for a port and statistics regarding the number of packets dropped due to DHCPv6 Snooping violations.

Example

```
-> ipv6 helper dhcp-snooping port 1/24 trusted
-> ipv6 helper dhcp-snooping port 2/1-5 block
-> ipv6 helper dhcp-snooping port 4/7 client-only-untrusted
```

Release History

Release 6.4.5; command introduced.

Related Commands

show ipv6 helper dhcp-snooping port	Displays the trust mode and DHCPv6 Snooping violation statistics for all switch ports that are filtered by DHCPv6 Snooping.

Related MIB Objects

```
Ipv6helperDhcpSnoopingPortTable
   ipv6helperDhcpSnoopingPortEntry
   ipv6helperDhcpSnoopingPortIfIndex
   ipv6helperDhcpSnoopingPortTrustMode
```

ipv6 helper dhcp-snooping linkagg

Configures the DHCPv6 Snooping trust mode for the link aggregate. The trust mode determines if the link aggregate will accept all DHCPv6 traffic, block all DHCPv6 traffic, or accept only client DHCPv6 traffic.

ipv6 helper dhcp-snooping linkagg *num* **{block | client-only-trusted | client-only-untrusted | trusted}**

Syntax Definitions

num	Specifies the link aggregate ID number
block	Blocks all DHCPv6 traffic on the ports of the specified link aggregate.
client-only-trusted	Allows only DHCPv6 client traffic on the link aggregate ports along with the Relay forward message.
client-only-untrusted	Allows only DHCPv6 client traffic on the link aggregate ports with DHCPv6 snooping enabled.
trusted	Allows all DHCPv6 traffic on the link aggregate ports. The port behaves as if DHCPv6 Snooping was not enabled.

Defaults

By default, the trust mode for link aggregate is set to **client-only-untrusted** when the DHCPv6 Snooping feature is enabled for the switch or for a VLAN.

Usage Guidelines

- The DHCPv6 trust mode only applies when the DHCPv6 Snooping feature is enabled for the switch or for a VLAN.
- If DHCPv6 Snooping is enabled at the switch level, the trust mode applies to all link aggregates.
- If DHCPv6 Snooping is enabled for a specific VLAN, then the trust mode applies to only those link aggregates that are associated with that VLAN.
- Use the **show ipv6 helper dhcp-snooping port** command to display the current trust mode for link aggregate and statistics regarding the number of packets dropped due to DHCPv6 Snooping violations.

Example

```
-> ipv6 helper dhcp-snooping linkagg 1 trust
-> ipv6 helper dhcp-snooping linkagg 2 block
-> ipv6 helper dhcp-snooping linkagg 3 client-only-trusted
```

Release History

Release 6.4.5; command introduced.

Related Commands

show ipv6 helper dhcp-snooping port	Displays the trust mode and DHCPv6 Snooping violation statistics for all switch ports that are filtered by DHCPv6 Snooping.

MIB Objects

```
Ipv6helperDhcpSnoopingPortTable
   ipv6helperDhcpSnoopingPortEntry
   ipv6helperDhcpSnoopingPortIfIndex
   ipv6helperDhcpSnoopingPortTrustMode
```

ipv6 helper dhcp-snooping binding

Enables or disables the DHCPv6 Snooping binding table functionality. The binding table contains the link local address, IPv6 address, lease time, VLAN number, and the interface information that corresponds to a local untrusted port on the switch.

ipv6 helper dhcp-snooping binding [enable | disable]

Syntax Definitions

enable	Enables the creation of binding table entries.
disable	Disables the creation of binding table entries.

Defaults

By default, the binding table functionality is enabled when the DHCPv6 Snooping feature is enabled for the switch or for a VLAN.

Usage Guidelines

- The enable and disable parameters are independent of the other parameters, in that they are only used to turn the binding table functionality on and off.
- Dynamic binding table entries are created when the relay agent receives a DHCPv6 Reply packet.

Example

```
-> ipv6 helper dhcp-snooping binding disable
-> ipv6 helper dhcp-snooping binding enable
```

Release History

Release 6.4.5; command introduced.

Related Commands

show ipv6 helper dhcp-snooping binding	Displays the trust mode and DHCPv6 Snooping violation statistics for all switch ports that are filtered by DHCPv6 Snooping.

MIB Objects

```
ipv6helperDhcpSnoopingBindingTable
   ipv6helperDhcpSnoopingBindingStatus
```

ipv6 helper dhcp-snooping binding timeout

Configures the amount of time between each automatic save of the DHCPv6 Snooping binding table contents maintained in memory to a file on the switch. This functionality preserves binding table contents across switch reboots.

ipv6 helper dhcp-snooping binding timeout seconds

Syntax Definitions

seconds	The number of seconds (180 to 600) to wait before the next save.

Defaults

By default, timeout value is set to 300 seconds.

Usage Guidelines

- The timeout value is only valid if the DHCPv6 Snooping binding table functionality is enabled.
- The contents of the binding table are saved to the **dhcpv6bind.db** file in the **/flash/switch** directory.
- The **dhcpv6bind.db** file is time stamped when a save of the binding table contents is successfully completed.

Example

```
-> ipv6 helper dhcp-snooping binding timeout 600
-> ipv6 helper dhcp-snooping binding timeout 240
```

Release History

Release 6.4.5; command introduced.

Related Commands

show ipv6 helper	Displays the current DHCPv6 Relay, Relay Agent information and DHCPv6 snooping configurations.

MIB Objects

```
ipv6helperDhcpSnoopingBindingTable.
   ipv6helperDhcpSnoopingBindingDatabaseSyncTimeout
   ipv6helperDhcpSnoopingBindingDatabaseLastSyncTime
```

ipv6 helper dhcp-snooping binding action

Triggers a purge or renew action against the DHCPv6 Snooping binding table. A purge action clears the contents of the table. A renew action populates the table with entries saved in the DHCPv6 binding table.

ipv6 helper dhcp-snooping binding action {purge | renew}

Syntax Definitions

purge	Clears all binding table entries that are maintained in switch memory.
renew	Populates the binding table with entries saved in the **dhcpv6bind.db** file located in **/flash/switch** directory on the switch.

Defaults

N/A

Usage Guidelines

The DHCPv6 Snooping binding table is maintained in the switch memory. Binding table entries are saved on a periodic basis to the **dhcpv6bind.db** file on the switch. Use the purge and renew options available with this command to sync the binding table contents with the contents of the **dhcpv6bind.db** file.

Example

```
-> ipv6 helper dhcp-snooping binding action purge
-> ipv6 helper dhcp-snooping binding action renew
```

Release History

Release 6.4.5; command introduced.

Related Commands

N/A

MIB Objects

```
ipv6helperDhcpSnoopingBindingTable
   ipv6helperDhcpSnoopingBindingDatabaseAction
```

ipv6 helper dhcp-snooping binding persistency

Retains the entries in the DHCPv6 Snooping binding table for the duration of the lease, regardless of the existence of the MAC address in the MAC address table.

ipv6 helper dhcp-snooping binding persistency {enable | disable}

Syntax Definitions

enable	Enables DHCPv6 snooping binding persistency.
disable	Disables DHCPv6 snooping binding persistency.

Defaults

By default, DHCPv6 snooping binding persistency is disabled.

Usage Guidelines

- When this option is disabled, the client MAC address entry in the MAC table is removed. If the MAC address is missing from the MAC address table then binding entry will be removed.
- Use the **show ipv6 helper** command to display the current status.

Example

```
-> ipv6 helper dhcp-snooping binding persistency enable
-> ipv6 helper dhcp-snooping binding persistency disable
```

Release History

Release 6.4.5; command introduced.

Related Commands

show ipv6 helper	Displays the current DHCPv6 Relay, Relay Agent information and DHCPv6 snooping configurations.

MIB Objects

```
ipv6helperDhcpSnoopingBindingTable
   ipv6helperDhcpSnoopingBindingPersistencyStatus
```

ipv6 helper interface-id prefix

This command can be used to configure Interface ID manually.

ipv6 helper interface-id prefix *string*

ipv6 helper no interface-id prefix

Syntax Definitions

string	A user-defined text string upto 255 characters.

Defaults

- By default, **interface-id** option is added with value containing VLAN ID and Ifindex.
- When MCLAG is enabled, by default, **interface-id** option is added with value containing Chassis group ID, chassis ID, and Ifindex.

Usage Guidelines

When the **interface-id** prefix is configured, the user defined Interface ID is inserted into the relay-forward message.

Example

```
-> ipv6 helper interface-id prefix pool-1
-> ipv6 helper no interface-id prefix
```

Release History

Release 6.4.5; command introduced.

Related Commands

show ipv6 helper	Displays the current DHCPv6 Relay, Relay Agent information and DHCPv6 snooping configurations.

MIB Objects

```
ipv6helperTable
   ipv6helperInterfaceIdPrefixValue
```

ipv6 helper remote-id format

Configures the type of information that is inserted into the Remote ID suboption. The information is inserted into the Remote ID field in ASCII text string format.

ipv6 helper remote-id format { base-mac | system-name | vlan | user-string *string* **| interface-alias | auto-interface-alias | disable}**

ipv6 helper remote-id enterprise-number *num*

Syntax Definitions

base-mac	The base MAC address of the switch.
system-name	The system name of the switch.
vlan	The VLAN ID of which the client is a member.
string	A user-defined text string upto 64 characters to insert into the Remote ID ASCII field.
interface-alias	The alias configured for the interface.
auto-interface-alias	The switch automatically generates the interface-alias in the following format: *systemName_slot_port.*
enterprise-number	The vendor's registered enterprise number.
disable	Disable the Remote ID format and remove the enterprise-number configuration.

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Configuring the Remote ID suboption in ASCII format allows up to five types of information within the ASCII string. However, if the contents of all the fields combined exceed 127 characters, then the ASCII string is truncated.
- Enterprise number must be set before the Remote ID format
- Specifying at least one parameter with this command is required. If multiple parameters are selected, then one of the valid delimiter characters must be specified.
- For user-defined *string*, include ambiguous characters such as hex characters and spaces in quotes so that they are interpreted as text. For example, the string "Building B Server" requires quotes because of the spaces between the words.
- The **interface-alias** parameter uses the alias configured with the **interfaces alias** command. If no alias is configured, a NULL string is inserted.

- The Remote ID format option is a global setting; the format specified is applied to all ports on the switch.
- Both Enterprise-number and format is disabled when the **disable** option is used in the Remote ID format.

Example

```
-> ipv6 helper remote-id enterprise-number 5
-> ipv6 helper remote-id format interface-alias
-> ipv6 helper remote-id format user-string "Network XYZ"
```

Release History

Release 6.4.5; command introduced.

Related Commands

interfaces alias	Configures a description (alias) for a single port.
show ipv6 helper	Displays the current DHCPv6 Relay, relay agent information and DHCPv6 snooping configurations

MIB Objects

```
ipv6helperTable
   ipv6helperRemoteIdEnterpriseNumber
   ipv6helperRemoteIdUserStringValue
   ipv6helperRemoteIdFormatType
```

show ip helper

Displays the current DHCP Relay, Relay Agent Information, and DHCPSnooping configuration.

show ip helper

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Displays information for all IP addresses configured.

Examples

The following example shows what the display output looks like when the DHCP Snooping feature is enabled and the DHCP relay agent information (Option 82) feature is disabled:

```
-> show ip helper
Ip helper :
  Forward Delay(seconds) = 3,
  Max number of hops     = 4,
  Relay Agent Information            =  Disabled,
  DHCP Snooping Status               =  Switch-Level Enabled,
      Option 82 Data Insertion Per Switch  =  Enabled,
      MAC Address Verification Per Switch  =  Enabled,
  DHCP Snooping Bypass Opt82-Check   =  Disabled,
  DHCP Snooping Opt82 Format  =  Base MAC,
  DHCP Snooping Opt82 String  =  00:d0:95:ae:3b:f6,
  DHCP Snooping Binding DB Status    =  Enabled,
      Database Sync Timeout          =  300,
      Database Last Sync Time        =  Mar 19 2007 14:32,
      Binding Persistency Status = Enabled
  PXE Support                        =  Disabled,
  Forward option     = standard
      Vlan Number NA
  Bootup Option Disable
      Forwarding Address :
        1.1.1.1
        21.2.2.10
        10.19.4.1
  UDP Relay on Default VRF = Enabled
```

The following example shows what the display output looks like when the DHCP Snooping feature is enabled and the Option-82 format is set to ASCII:

```
-> show ip helper
Ip helper :
  Forward Delay(seconds) = 3,
  Max number of hops     = 4,
  Relay Agent Information            =  Disabled,
  DHCP Snooping Status               =  Switch-Level Enabled,
      Option 82 Data Insertion Per Switch  =  Enabled,
      MAC Address Verification Per Switch  =  Enabled,
  DHCP Snooping Opt82 ASCII Circuit ID Field1  =  Base MAC,
  DHCP Snooping Opt82 ASCII Circuit ID Field1 String  =  00:e0:b1:91:45:d0,
  DHCP Snooping Opt82 ASCII Circuit ID Field2  =  Cvlan,
  DHCP Snooping Opt82 ASCII Circuit ID Field2 String  =   - ,
  DHCP Snooping Opt82 ASCII Circuit ID Delimiter  =  "/",
  DHCP Snooping Opt82 ASCII Remote ID Field1  =  Vlan,
  DHCP Snooping Opt82 ASCII Remote ID Field1 String  =   - ,
  DHCP Snooping Opt82 ASCII Remote ID Field2  =  Cvlan,
  DHCP Snooping Opt82 ASCII Remote ID Field2 String  =   - ,
  DHCP Snooping Opt82 ASCII Remote ID Delimiter  =  " ",

  DHCP Snooping Binding DB Status    =  Enabled,
      Database Sync Timeout          =  300,
      Database Last Sync Time        =  Mar 19 2007 14:32,
      Binding Persistency Status = Enabled
  PXE Support                        =  Disabled,
  Forward option     = standard
      Vlan Number NA
  Bootup Option Disable
      Forwarding Address :
        1.1.1.1
        21.2.2.10
        10.19.4.1
  UDP Relay on Default VRF = Enabled
```

output definitions

Forward Delay	The current forward delay time (default is three seconds). Use the **ip helper forward delay** command to change this value.
Max number of hops	The current maximum number of hops allowed (default is four hops). Use the **ip helper maximum hops** command to change this value.
Forward option	The current forwarding option setting: **standard** or **avlan only**. Use the **ip helper standard** and **ip helper avlan only** commands to change this value.
Relay Agent Information	Indicates the status (**Enabled** or **Disabled**) of the DHCP relay agent information option (Option 82) feature. Configured through the **ip helper agent-information** command. This feature is disabled if the DHCP snooping feature is enabled.

output definitions

Relay Agent Information Policy	The current policy action (**Drop**, **Keep**, **Replace**) applied to DHCP packets that contain an Option-82 field. Configured through the **ip helper agent-information policy** command. Note that this field only appears when the DHCP relay agent information Option-82 feature is enabled.
DHCP Snooping Status	Indicates the status (**Disabled**, **Switch-Level Enabled**, or **VLAN-Level Enabled**) of the DHCP snooping feature. Configured through the **ip helper dhcp-snooping** or **ip helper dhcp-snooping vlan** command. This feature is disabled if the DHCP relay agent information option is enabled.
Option 82 Data Insertion Per Switch	Indicates whether or not the DHCP Option 82 field is added to DHCP packets (**Enabled** or **Disabled**). Configured through the **ip helper dhcp-snooping option-82 data-insertion** command. Note that this field only appears when DHCP snooping is enabled at the switch level.
MAC Address Verification Per Switch	Indicates whether or not MAC address verification is performed on the DHCP packets (**Enabled** or **Disabled**). Configured through the **ip helper dhcp-snooping mac-address verification** command. Note that this field only appears when DHCP snooping is enabled at the switch level.
DHCP Snooping Bypass Opt82-Check	Indicates whether or not an Option-82 check is performed for DHCP packets ingressing on untrusted ports (**Enabled** or **Disabled**). Configured through the **ip helper dhcp-snooping option-82 format ascii circuit-id** command.
DHCP Snooping Opt82 Format	The type of information (base MAC address for the switch, system name for the switch, user-defined text, or interface alias) that the switch will insert into the Option-82 suboption when Option-82 data insertion is enabled for the switch. Configured through the **ip helper dhcp-snooping option-82 format** command.
DHCP Snooping Opt 82 String	The user-defined text inserted into the Option-82 field when data insertion is enabled and a string format for the data is specified. Configure through the **ip helper dhcp-snooping option-82 format** command.
DHCP Snooping Opt82 Format = ASCII	Indicates that the switch will insert Option-82 information into the Circuit ID suboption as an ASCII text string. Configured through the **ip helper dhcp-snooping option-82 format ascii circuit-id** command.
DHCP Snooping Opt82 ASCII Field1	If the Option-82 format is set to ASCII, this field contains the type of information that the switch will insert into the Option-82 Circuit ID suboption. This field only displays when the Option-82 format is set to ASCII. The Circuit ID suboption may contain up to five ASCII text strings; a separate field is displayed for each type of string that is configured. Configured through the **ip helper dhcp-snooping option-82 format ascii circuit-id** command.

output definitions

DHCP Snooping Opt82 ASCII Field1 String	The value of the ASCII text string that is inserted into the Option-82 Circuit ID suboption field. This field only displays when the Option-82 format is set to ASCII. The Circuit ID suboption may contain up to five ASCII text strings; a separate field is displayed for each string that is configured.Configured through the **ip helper dhcp-snooping option-82 format ascii circuit-id** command.
DHCP Snooping Opt82 ASCII Delimiter	The character that is used to separate multiple ASCII text strings inserted into the Option-82 Circuit ID suboption. This field only displays when more than one ASCII text string is configured for the Circuit ID suboption. Configured through the **ip helper dhcp-snooping option-82 format ascii circuit-id** command.
DHCP Binding DB Status	Indicates if the DHCP snooping binding table (database) functionality is **Enabled** or **Disabled**.
Database Sync Timeout	The amount of time, in seconds, that the switch waits between each synchronization of the DHCP snooping binding table with the **dhcpBinding.db** file (default is 300 seconds). Configured through the **ip helper dhcp-snooping binding timeout** command. Note that this field does not appear if the binding table functionality is disabled.
Database Last Sync Time	The last time and day the DHCP snooping binding table was synchronized with the **dhcpBinding.db** file. Note that this field does not appear if the binding table functionality is disabled.
Binding Persistency Status	Indicates whether or not the DHCP snooping binding table retains entries with MAC addresses that were cleared from the MAC address table (**Enabled** or **Disabled**). Configured through the **ip helper dhcp-snooping binding persistency** command.
Bootup Option	Indicates whether or not automatic IP address configuration for default VLAN 1 is done when the switch boots up (**Enabled** or **Disabled**). Configured through the **ip helper boot-up** command.
Bootup Packet Option	Indicates if the Bootup Option broadcasts a **DHCP** or **BOOTP** packet to obtain an IP address for default VLAN 1. Configured through the **ip helper boot-up enable** command. Note that this field does not appear if the Bootup Option is disabled.
Forwarding Addresses	IP addresses for DHCP servers that will receive BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the **ip helper address** command to add or remove DHCP server IP addresses from the DHCP Relay configuration.

Release History

Release 6.1; command introduced.
Release 6.1.2; new fields added for DHCP Option 82 and DHCP Snooping features.
Release 6.1.3; new field added for global DHCP traffic suppression feature.
Release 6.1.5; **Traffic Suppression** field deprecated; new **DHCP Snooping Bypass Opt82-Check** field added.
Release 6.3.1; **DHCP Snooping Opt82 Format** and **DHCP Snooping Opt82 String** fields added.
Release 6.3.3; **Binding Persistency Status** field added.
Release 6.4.3; **DHCP Snooping Opt82 Format ASCII** fields added.

Related Commands

show ip helper stats

Displays the number of packets DHCP Relay has received, the number of packets dropped due to forward delay and maximum hops violations, and the number of packets processed since the last time these statistics were displayed. Also includes statistics that apply to a specific DHCP server, such as the number of packets transmitted to the server and the difference between the number of packets received from a client and the number transmitted to the server.

show ip helper stats

ip helper no stats

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use the **no** form of this command to clear all DHCP Relay statistics.

Examples

```
-> show ip helper stats

 Global Statistics :
    Reception From Client :
      Total Count =         12, Delta =         12,
    Forw Delay Violation :
      Total Count =          3, Delta =          3,
    Max Hops Violation :
      Total Count =          0, Delta =          0,
    Agent Info Violation :
      Total Count =          0, Delta =          0,
    Invalid Gateway IP :
      Total Count =          0, Delta =          0,
    Invalid Agent Info From Server :
      Total Count =          0, Delta =          0,
 Server Specific Statistics :
    Server  5.5.5.5
        Tx Server :
          Total Count =          9, Delta =      9
```

output definitions

Reception From Client	Number of packets DHCP Relay has received from the DHCP client.
Forw Delay Violation	Number of packets dropped as a result of forward delay violations. A violation occurs if a client packet contains an elapsed boot time value that is less than the configured DHCP Relay forward delay time value.
Max Hops Violation	Number of packets dropped as a result of maximum hop violations. A violation occurs if a packet contains a hop count equal to or greater than the configured DHCP Relay maximum hops value.
Agent Info Violation	Number of packets dropped as a result of a relay agent information (Option-82) violation. A violation occurs if an Option-82 DHCP packet contains a zero gateway IP address (giaddr) and the relay agent information policy is set to **Drop** or a DHCP packet has no Option-82 field and contains a non-zero giaddr.
Invalid Gateway IP	Number of packets dropped as a result of a gateway IP violation. A violation occurs if an Option-82 DHCP packet contains a gateway IP address (giaddr) that matches a local subnet address.
Invalid Agent Info From Server	Number of invalid Option-82 DHCP server packets dropped by the relay agent.
Delta	Total number of packets processed since the last time the **ip helper** statistics were checked during any user session.
Server	DHCP server IP address that receives BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the **ip helper address** command to add or remove DHCP server IP addresses from DHCP Relay configuration.
Tx Server	Number of packets DHCP Relay has transmitted to the DHCP server.
Delta	The difference between the number of packets received from the client and the number of packets transmitted to the DHCP server since the last time DHCP Relay statistics were checked during any user session.

Release History

Release 6.1; command introduced.
Release 6.1.2; new fields added.

Related Commands

show ip helper	Displays current DHCP Relay configuration information.

MIB Objects

```
iphelperStatTable
   iphelperServerAddress
   iphelperRxFromClient
   iphelperTxToServer
   iphelperMaxHopsViolation
   iphelperForwDelayViolation
   iphelperResetAll
```

show ip helper dhcp-snooping vlan

Displays a list of VLANs that have DHCP Snooping enabled and whether or not MAC address verification and Option-82 data insertion is enabled for each VLAN.

show ip helper dhcp-snooping vlan

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command only applies if DHCP Snooping is enabled at the VLAN level.
- Use the **show ip helper** command to determine the status of DHCP Snooping at the switch level.

Examples

```
-> show ip helper dhcp-snooping vlan
VLAN    Opt82        MAC Addr
 ID    Insertion   Verification
------+----------+--------------
 50       Enabled      Enabled
 60       Enabled      Enabled
 100      Disabled     Enabled
 200      Enabled      Disabled
 1500     Disabled     Disabled
```

output definitions

VLAN ID	The VLAN identification number for the DHCP Snooping VLAN.
MAC Address Verification	Indicates whether or not MAC address verification is enabled for the VLAN (**Enabled** or **Disabled**). Configured through the **ip helper dhcp-snooping vlan** command.
Opt-82 Data Insertion	Indicates whether or not Option-82 data insertion is enabled for the VLAN (**Enabled** or **Disabled**). Configured through the **ip helper dhcp-snooping vlan** command.

Release History

Release 6.1.2; command introduced.

Related Commands

show ip helper	Displays current DHCP Relay configuration information.
show ip helper dhcp-snooping port	Displays the trust mode and DHCP violation statistics for all switch ports that are filtered by DHCP Snooping.

MIB Objects

```
iphelperDhcpSnoopingVlanTable
   iphelperDhcpSnoopingVlanNumber
   iphelperDhcpSnoopingVlanMacVerificationStatus
   iphelperDhcpSnoopingVlanOpt82DataInsertionStatus
```

show ip helper dhcp-snooping port

Displays the trust mode and DHCP Snooping violation statistics for all switch ports that are filtered by DHCP Snooping.

show ip helper dhcp-snooping port

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- If DHCP Snooping is operating at the switch level, then information for all switch ports is displayed.
- If DHCP Snooping is operating at the VLAN level, then information for only those ports that are associated with a DHCP Snooping VLAN is displayed.
- The violation statistics displayed only apply to ports that are in the client only trust mode. When the trust mode for a port is changed from **client-only** to **trusted** or **blocked**, the violation counters are set to zero (0).

Examples

```
-> show ip helper dhcp-snooping port
Slot      Trust        IP Src    Opt82       MAC      Server     Relay    Binding
Port      Mode       Filtering Violation  Violation  Violation  Violation Violation
-----+-------------+----------+----------+----------+----------+---------|---------
1/1        Blocked    Disabled      0          0          0          0        0
1/2    Client-Only    Enabled       0          0          0          0        0
1/3    Client-Only    Enabled       0          0          0          0        0
1/4    Client-Only    Enabled       0          0          0          0        0
1/5    Client-Only    Enabled       0          0          0          0        0
1/6        Blocked    Disabled      0          0          0          0        0
1/7    Client-Only    Enabled       0          0          0          0        0
1/8    Client-Only    Enabled       0          0          0          0        0
1/9    Client-Only    Enabled       0          0          0          0        0
1/10       Trusted    Disabled      0          0          0          0        0
1/11       Trusted    Disabled      0          0          0          0        0
1/12       Trusted    Disabled      0          0          0          0        0
```

output definitions

Slot/Port	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
Trust Mode	The DHCP Snooping trust mode for the port (**Blocked**, **Client-Only**, or **Trusted**). Configured through the **ip helper dhcp-snooping port** command.
IP Src Filtering	Indicates whether or not IP source filtering is enabled for the port (**Enabled** or **Disabled**). Configured through the **ip helper dhcp-snooping port ip-source-filtering** command.
Opt82 Violation	The number of DHCP packets dropped due to a DHCP Snooping Option-82 violation.
MAC Violation	The number of DHCP packets dropped due to a mismatch between the packet source MAC address and the client hardware address contained within the packet.
Server Violation	The number of DHCP server packets dropped because they originated from outside the network or firewall.
Relay Violation	The number of DHCP packets dropped because the packet included a relay agent IP address that was not 0.0.0.0.
Binding Violation	The number of DHCP packets dropped due to a mismatch between packets received and binding table information.

Release History

Release 6.1.2; command introduced.

Related Commands

show ip helper	Displays current DHCP Relay configuration information.
show ip helper dhcp-snooping vlan	Displays a list of DHCP Snooping VLANs.

MIB Objects

```

   iphelperDhcpSnoopingPortIfIndex
   iphelperDhcpSnoopingPortTrustMode
   iphelperDhcpSnoopingPortIpSourceFiltering
   iphelperDhcpSnoopingPortOption82Violation
   iphelperDhcpSnoopingPortMacAddrViolation
   iphelperDhcpSnoopingPortDhcpServerViolation
   iphelperDhcpSnoopingPortRelayAgentViolation
   iphelperDhcpSnoopingPortBindingViolation
```

show ip helper dhcp-snooping binding

Displays the contents of the DHCP Snooping binding table (database).

show ip helper dhcp-snooping binding

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **ip helper dhcp-snooping ip-source-filter** command to create a static entry in the binding table.
- Dynamic binding table entries are created when the relay agent receives a DHCPACK packet.

Examples

```
-> show ip helper dhcp-snooping binding
       MAC           Slot        IP          Lease    VLAN     Binding
     Address         Port      Address       Time      ID       Type
------------------+------+--------------+---------+-------+-----------
00:ae:22:e4:00:08    1/4    10.255.11.23     2000      5      Dynamic
10:fe:a2:e4:32:08    2/15   10.255.91.53     2000      2      Dynamic
```

output definitions

MAC Address	The MAC address of the client.
Slot/Port	The slot/port designation for the switch port that received the DHCP request
IP Address	The IP address offered by the DHCP server.
Lease Time	The IP address lease time assigned by the DHCP server. A value of 0 indicates a static entry.
VLAN ID	The VLAN ID of the VLAN to which the client belongs.
Binding Type	Indicates whether the binding table entry is **dynamic** or **static**. Static entries are created using the **ip helper dhcp-snooping ip-source-filter** command.

Release History

Release 6.1.2; command introduced.

Related Commands

```

show ip udp relay service

Displays current configuration for UDP services by service name or by service port number.

show ip udp relay service [BOOTP | NBDD | NBNSNBDD | DNS | TACACS | TFTP | NTP | *port***]**

Syntax Definitions

BOOTP	BOOTP/DHCP well-known ports 67/68.
NBDD	NBDD well-known port 138.
NBNSNBDD	NBNS/NBDD well-known ports 137/138.
DNS	DNS well-known port 53.
TACACS	TACACS well-known port 65.
TFTP	TFTP well-known port 69.
NTP	NTP well-known port 123.
port	A user-specified port that is not a well-known port.

Defaults

By default, the configuration for all UDP services is shown.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a service name or port number with this command to display information about an individual service.
- When specifying a port number, do not specify a well-known port number. Instead, use the service name for the well-known port (NBNS/NBDD, DNS, and so on.).

Examples

```
-> show ip udp relay service

Service    Port(s)  Description
---------+--------+-----------------
  1        67  68   BOOTP/DHCP
  4        53       DNS
  5        65       TACACS

-> show ip udp relay service dns

Service    Port(s)  Description
---------+--------+-----------------
   4       53       DNS
```

```
-> show ip udp relay service 1776

Service    Port(s)  Description
---------+--------+------------------
   9       1776     A UDP protocol
```

output definitions

Service	The UDP service number. (**1** through **7** for well-known service ports and **8** and above for user-defined service ports).
Port(s)	The UDP service port number.
Description	A description of the UDP service.

Release History

Release 6.1; command introduced.

Related Commands

show ip udp relay statistics	Displays the current statistics for each UDP port relay service.
show ip udp relay destination	Displays the VLAN assignments to which the traffic received on the specified UDP service port is forwarded.

MIB Objects

```
iphelperxPropertiesTable
   iphelperxPropertiesService
   iphelperxPropertiesPort
   iphelperxPropertiesName
```

show ip udp relay statistics

Displays the current statistics for each UDP port relay service. These statistics include the name of the service, the forwarding VLAN(s) configured for that service, and the number of packets the service has sent and received.

show ip udp relay [BOOTP | NBDD | NBNSNBDD | DNS | TACACS | TFTP | NTP | *port***]**

Syntax Definitions

BOOTP	BOOTP/DHCP well-known ports 67/68.
NBDD	NBDD well-known port 138.
NBNSNBDD	NBNS/NBDD well-known ports 137/138.
DNS	DNS well-known port 53.
TACACS	TACACS well-known port 65.
TFTP	TFTP well-known port 69.
NTP	NTP well-known port 123.
port	A user-specified port that is not a well-known port.

Defaults

By default, the statistics for all UDP services is shown.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Enter a service name or port number with this command to display information about an individual service.
- When specifying a port number, do not specify a well-known port number. Instead, use the service name for the well-known port (NBNS/NBDD, DNS, and so on.).

Examples

```
-> show ip udp relay statistics

Service          Vlan     Pkts Sent   Pkts Recvd
---------------+--------+------------+----------
BOOTP                       0           0
DNS              2         10          10
                 4         15          15
TACACS           3          0           0
```

```
-> show ip udp relay statistics tacacs

Service          Vlan     Pkts Sent   Pkts Recvd
---------------+--------+------------+-----------
TACACS            3        0            0

-> show ip udp relay statistics 1776

Service              Vlan     Pkts Sent   Pkts Recvd
-------------------+--------+-----------+-----------
A UDP Protocol       18       2           2
```

output definitions

Service	The active UDP service name.
VLAN	The VLAN assigned to the UDP service port that will forward traffic destined for that port. Use the **ip udp relay vlan** command to configure this value.
Pkts Sent	The number of packets sent from this service port to the server.
Pkts Recvd	The number of packets received by this service port from a client.

Release History

Release 6.1; command introduced.

Related Commands

show ip udp relay service	Displays current configuration for UDP services by service name or by service port number.

```

show ip udp relay destination

Displays the VLAN assignments to which the traffic received on the specified UDP service port is forwarded.

show ip udp relay destination [BOOTP | NBDD | NBNSNBDD | DNS | TACACS | TFTP | NTP | *port***]**

Syntax Definitions

BOOTP	BOOTP/DHCP well-known ports 67/68.
NBDD	NBDD well-known port 138.
NBNSNBDD	NBNS/NBDD well-known ports 137/138.
DNS	DNS well-known port 53.
TACACS	TACACS well-known port 65.
TFTP	TFTP well-known port 69.
NTP	NTP well-known port 123.
port	A user-specified port that is not a well-known port.

Defaults

By default, the forwarding VLAN assignments for all UDP services is shown.

Platforms Supported

OmniSwitch 6400, 6855, 6850E, 9000E

Usage Guidelines

- Enter a service name or port number with this command to display information about an individual service.
- When specifying a port number, do not specify a well-known port number. Instead, use the service name for the well-known port (NBNS/NBDD, DNS, and so on.).

Examples

```
-> show ip udp relay destination

Service          Port     VLANs           Server IP Address
---------------+--------+---------------+------------
BOOTP            67
DNS              53       2  4
TACACS           65       3

-> show ip udp relay destination dns

Service          Port     VLANs       Server IP Address
---------------+--------+------------+---------------
DNS              53       2  4
```

```
-> show ip udp relay destination
 Service              Port  Vlans          Server Address
--------------------+-----+--------------+---------------
 1:BOOTP              68
 8:OTHER1             5001                 10.168.58.21
```

output definitions

Service	The active UDP service name.
Port	The UDP service port number.
VLANs	The VLAN assigned to the UDP service port that will forward traffic destined for that port. Use the **ip udp relay vlan** command to configure this value.
Server Address	The Server IPv4 address assigned to the port

Release History

Release 6.1; command introduced.

Related Commands

show ip udp relay service	Displays current configuration for UDP services by service name or by service port number.
show ip udp relay statistics	Displays the current statistics for each UDP port relay service.

MIB Objects

```
iphelperTable
   iphelperService
   iphelperVlan
iphelperxPropertiesTable
   iphelperxPropertiesName
   iphelperxPropertiesPort
```

dhcp-server

Enables, disables, or restarts the DHCP server operation.

dhcp-server {enable | disable | restart}

Syntax Definitions

enable	Enables operation status of the DHCP server.
disable	Disables operation status of the DHCP server.
restart	Restarts the DHCP Server.

Defaults

The DHCP server is disabled by default.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Restart the DHCP server after making changes to the *dhcpd.conf* file.

Examples

```
-> dhcp-server enable
-> dhcp-server disable
-> dhcp-server restart
```

Release History

Release 6.4.3; command introduced.

Related Commands

show dhcp-server statistics	Displays the DHCP Server lease statistics.

MIB Objects

```
alaDhcpSrvGlobalConfigStatus
alaDhcpSrvGlobalRestart
```

clear dhcp-server statistics

Clears the packet counters of dhcp-server statistics.

clear dhcp-server statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

Use this command to clear the packet counters of dhcp-server statistics.

Examples

```
-> clear dhcp-server statistics
```

Release History

Release 6.4.3; command introduced.

Related Commands

show dhcp-server statistics	Displays the DHCP Server lease statistics.

MIB Objects

N/A

show dhcp-server leases

Displays the leases offered by the DHCP server.

show dhcp-server leases [*ip_address* **|** *mac_address***] [type {static | dynamic}]**

Syntax Definitions

ip_address	Specifies IP address of the interface configured with DHCP server.
mac_address	Specifies MAC address of the interface configured with DHCP server.
static	Displays only static leases.
dynamic	Displays only dynamic leases.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

DHCP server should be enabled first before using this command.

Examples

```
-> show dhcp-server leases

IP address     MAC address      Lease Granted           Lease Expiry     Type
-------------+-----------------+-------------------+-------------------+---------
10.255.91.53  10:fe:a2:e4:32:08  2010-01-16 11:38:47 2010-01-17 11:38:47 Dynamic
10.255.91.55  20:fe:a2:e4:32:08  2010-01-16 10:30:00 2010-01-18 10:30:00 Static
10.255.91.58  20:fe:a2:e4:34:08 2010-01-16 10:30:00 2010-01-18 10:30:00 Dynamic

-> show dhcp-server leases ipaddr 10.255.91.53

IP address   MAC address        Lease Granted        Lease Expiry     Type
------------+-----------------+-------------------+-------------------+---------
10.255.91.53 10:fe:a2:e4:32:08 2010-01-16 11:38:47  2010-01-17 11:38:47 Dynamic

-> show dhcp-server leases type static

IP address   MAC address        Lease Granted        Lease Expiry     Type
------------+-----------------+-------------------+-------------------+---------
10.255.91.55 20:fe:a2:e4:32:08 2010-01-16 10:30:00   2010-01-18 10:30:00   Static
```

output definitions

IP address	The IP address allocated to the client.
MAC address	The MAC address of the client for which the lease is allocated.

output definitions (continued)

Lease Granted	The date and time at which lease is granted.
Lease Expiry	The date and time at which lease expires.
Type	The type of lease offered.

Release History

Release 6.4.3; command introduced.

Related Commands

clear dhcp-server statistics	Clears the DHCP Server lease statistics.

MIB Objects

```

show dhcp-server statistics

Displays the statistics of the DHCP server.

show dhcp-server statistics [packets | hosts | subnets | all]

Syntax Definitions

packets	Displays general statistical information along with specific information about data packets received, dropped and transmitted.
hosts	Displays general statistical information along with specific information about hosts related to all the subnets.
subnets	Displays general statistical information along with specific information about all the subnets.
all	Displays all statistical information related to the DHCP server.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

DHCP server should be enabled first before using this command.

Examples

```
-> Show dhcp-server stats all

```

output definitions

General stats	Denotes General DHCP Server statistics.
Name	Specifies the name assigned to the DHCP Server.
Status	Specifies up or down status of the DHCP Server.
Total subnets used	Specifies the total number of subnets being used.
Total subnets managed	Specifies the total number of subnets being managed by the DHCP server.
Total subnets unused	Specifies the total number of subnets being unused
Total subnets full	Specifies the total number of subnets wherein all of the IP addresses are used.
DHCP Server System Up Time	Shows the DHCP Server System Up Time Performance Monitor counter.
Sync time	Specifies the time for DHCP server to contact and synchronize with the designated time server
Last sync time	Specifies the last time the synchronization occured.
Next sync time	Specifies the next time the synchronization should be scheduled.
Packet stats	Denotes statististical information about the data packet transmission
Total DHCP Discovers	Specifies the total number of DHCPDISCOVER packets sent by the clients to the DHCP server.
Total DHCP Offers	Specifies the total number of DHCPOFFER packets sent by the server to the clients.
Total DHCP Requests	Specifies the total number of DHCPREQUEST packets sent by the clients in response to the DHCPOFFER packets.
Total DHCP Request Grants	Specifies the total number of DHCP request grants provided by the server to the clients.

output definitions (continued)

Total DHCP Request Renews	Specifies the total number of DHCP lease renew requests sent by the clients to the DHCP server.
Total DHCP Declines	Specifies the total number of DHCP requests declined by the DHCP server.
Total DHCP Acks	Specifies the total number of DHCPACK acknowledgement packets sent by the DHCP server to the clients.
Total DHCP Nacks	Specifies the total number of DHCP Negative acknowledgements sent from the DHCP server to the clients. The DHCPNACK message is sent when all the IP addresses available to the server are exhausted and the client sends a DHCPREQUEST.
Total DHCP Releases	Specifies the total number of DHCPRELEASE packets sent by the DHCP server to release IP addresses from its clients.
Total DHCP Informs	Specifies the total number of DHCPINFORM packets sent by the clients to obtain DHCP options from the DHCP server.
Total Bootp requests	Specifies the total number of BOOTP requests sent by the clients to the DHCP server.
Total Bootp response	Specifies the total number of BOOTP response packets sent by the DHCP server to the clients.
Total Unknown packets	Specifies the total number of unknown or badly formatted DHCP packets received by the DHCP server.
Leases stats	Denotes statististical information about leases provided by the DHCP server.
Hosts Managed	Specifies the total number of clients managed by the DHCP server.
Hosts used	Specifies the total number of clients using the IP addresses provided by the DHCP server.
Hosts unused	Specifies the total number of clients managed by the DHCP server which are not being used.
Hosts Pending	Specifies the total number of DHCP IP address requests which are pending by the DHCP server.
Hosts unavailable	Specifies the total number of DHCP hosts which are unavailable i.e; whose lease period have expired.
Static DHCP	Denotes statististical information about the hosts configured with Static DHCP.
Automatic DHCP	Denotes statististical information about the hosts configured with Automatic DHCP.
Static BootP	Denotes statististical information about the hosts configured under Static BootP. **Note:** BootP Relay is disabled when DHCP server is enabled on the switch.
Automatic BootP	Denotes statististical information about the hosts configured with Automatic BootP.
Subnet statistics	Denotes all DHCP related statististical information for individual subnets.
Range	Specifies the range of IP addresses in the individual subnet

output definitions (continued)

Mask	Specifies the subnet mask
Type	Specifies whether the type of IP address allocation is dynamic or Static.

Release History

Release 6.4.3; command introduced.

Related Commands

clear dhcp-server statistics	Clears the DHCP Server lease statistics.

MIB Objects

N/A

show ip helper dhcp-snooping ip-source-filter

Displays the ports or VLANs on which IP source filtering is enabled.

show ip helper dhcp-snooping ip-source-filter {vlan | port}

Syntax Definitions

vlan	Displays the VLANs on which IP source filtering is enabled.
port	Displays the ports on which IP source filtering is enabled.

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- The show output displays only those ports or VLANs on which IP source filtering is enabled.
- This command also displays the status of the link aggregate ports when source filtering is enabled at VLAN or port level.

Examples

```
-> show ip helper dhcp-snooping ip-source-filter port
Slot   IP Src
Port  Filtering
------+-----------
1/7    Enabled
1/12   Enabled
```

output definitions

Slot/Port	Specifies the slot and port number.
IP Src Filtering	Specifies if IP source filtering status. **Enabled** or **Disabled**.

```
-> show ip helper dhcp-snooping ip-source-filter vlan
Vlan   IP Src Filtering
------+-----------
 10    Enabled
 11    Enabled
 12    Enabled
 13    Enabled
```

output definitions

Vlan	VLAN number.
IP Src Filtering	Specifies if IP source filtering status. **Enabled** or **Disabled**.

Release History

Release 6.4.4; command introduced.

Related Commands

ip helper dhcp-snooping ip-source-filter	Enables or disables the IP source filtering at a port, link aggregation, or VLAN level.

MIB Objects

```
iphelperDhcpSnoopingPortIpSourceFiltering
   iphelperDhcpSnoopingPortIfIndex
   iphelperDhcpSourceFilterVlanNumber
   iphelperDhcpSourceFilterVlanFilteringStatus
```

show ipv6 helper

Displays the current DHCPv6 Relay, Relay Agent information and DHCPv6 snooping configurations.

show ipv6 helper

Syntax Definitions

N/A

Defaults

N/A

Usage Guidelines

Displays information for all IPv6 server addresses configured

Example

```
-> show ipv6 helper
IPv6 helper :
  Max number of hops     = 32,
  DHCPV6 Snooping Status               =  Disabled,
  DHCPV6 Snooping Remote-id            =  Enabled,
  DHCPV6 Snooping Interface-id Prefix =  OS6,
  DHCPv6 Snooping Binding DB Status = Enabled,
  Database Sync Timeout = 300,
  Database Last Sync Time = Mar 19 2012 14:32,
  Binding Persistency Status = Enabled
  Forward option = standard
  Vlan Number:
  2001::5
```

output definitions

Ipv6 helper	Specifies the configured IPv6 helper address.
Max number of hops	Specifies the maximum number of hops configured.
DHCPv6 Snooping Status	Specifies DHCPv6 snooping status **Switch-Level Enabled** or **Switch-Level Disabled, VLAN-Level Enabled**
DHCPv6 Snooping Binding DB Status	Specifies DHCPv6 Snooping Binding DB Status **Enabled,** or **Disabled**
Database Sync Timeout	Specifies the assigned Database Sync Timeout
Database Last Sync Time	Specifies the last time, database synchronization was performed on the switch in date tiem and year format.
Binding Persistency Status	Specifies if Binding Persistency Status **Enabled** or **Disabled**
Forward option	Specifies the configured Forwarding option - **Standard** or **per-vlan only**

output definitions

Vlan Number	Specifies the assigned VLAN Numbers in **per-vlan only** mode.
Forwarding Address	Specifies the assigned Forwarding Address

Release History

Release 6.4.5; command introduced.

Related Commands

ipv6 helper address	Adds or deletes a DHCPv6 server address. DHCPv6 relay forwards DHCPv6 packets to and from the specified address.
ipv6 helper standard	Sets DHCPv6 Relay forwarding option to standard. All DHCPv6 packets are processed by a global relay.
ipv6 helper per-vlan only	Sets the DHCPv6 Relay forwarding option to process only DHCPv6 packets received from a specific identified VLAN.
ipv6 helper address vlan	Configures DHCPv6 relay for the specified VLAN.
ipv6 helper maximum hops	Sets the maximum number of hops value for the DHCPv6 Relay configuration.
ipv6 helper dhcp-snooping	Globally enables or disables DHCPv6 Snooping for the switch. When this feature is enabled, all DHCPv6 packets received on all switch ports are filtered.
ipv6 helper dhcp-snooping binding	Enables or disables the DHCPv6 Snooping binding table functionality.
ipv6 helper dhcp-snooping binding timeout	Configures the amount of time between each automatic save of the DHCP Snooping binding table contents maintained in memory to a file on the switch.
ipv6 helper dhcp-snooping binding persistency	Retains the entries in the DHCPv6 Snooping binding table for the duration of the lease, regardless of the existence of the MAC address in the MAC address table.

MIB Objects

```
ipv6helperTable
   ipv6helperForwAddr
   ipv6helperForwardOption
   ipv6helperMaxHops
   ipv6helperDhcpSnooping
ipv6helperDhcpSnoopingBindingTable
   ipv6helperDhcpSnoopingBindingStatus
   ipv6helperDhcpSnoopingBindingDatabaseSyncTimeout
   ipv6helperDhcpSnoopingBindingDatabaseLastSyncTime
   ipv6helperDhcpSnoopingBindingPersistencyStatus
```

show ipv6 helper stats

Displays the IPv6 helper statistics information.

show ipv6 helper stats

ipv6 helper no stats

Syntax Definitions

N/A

Defaults

N/A

Usage Guidelines

- Use the **no** form of this command to clear the DHCPv6 relay statistics
- The number of packets DHCPv6 Relay has received, the number of packets dropped due to maximum hops violations, and the number of packets processed since the last time these statistics were displayed.
- Also includes statistics that apply to a specific DHCPv6 server, such as the number of packets transmitted to the server and the difference between the number of packets received from a client and the number transmitted to the server.

Example

```
-> show ipv6 helper stats
Global Statistics :
    Reception From Client :
      Total Count =          0, Delta =          0,
    Max Hops Violation :
      Total Count =          0, Delta =          0,
 Server Specific Statistics :
    Server  2001::1
        Tx Server :
          Total Count =      0, Delta =          0
```

output definitions

Global Statistics	Specifies Global DHCPv6 statistics
Reception From Client	Specifies statistics of data reception from Client. **Total Count** and **Delta.**
Max Hops Violation	Specifies Max Hops Violation statistics **Total Count** and **Delta**
Server Specific Statistics	Server details and Server Specific Statistics 5001::5
Tx Server	Specifies Tx Server details **Total Count** and **Delta.**

Release History

Release 6.4.5; command introduced.

Related Commands

ipv6 helper address	Displays the DHCPv6 Relay statistics.
ipv6 helper address vlan	Configures DHCPv6 relay for the specified VLAN. This command is used when a per-VLAN only relay service is active on the switch.
ipv6 helper standard	Sets DHCPv6 Relay forwarding option to standard. All DHCPv6 packets are processed by a global relay.
ipv6 helper per-vlan only	Sets the DHCPv6 Relay forwarding option to process only DHCPv6 packets received from a specific identified VLAN. This option allows each VLAN to have its own relay.
ipv6 helper maximum hops	Sets the maximum number of hops value for the DHCPv6 Relay configuration.

MIB Objects

```
ipv6helperTable
   ipv6helperForwAddr
   ipv6helperForwardOption
   ipv6helperMaxHops
   ipv6helperVlan
   ipv6helperStatus
```

show ipv6 helper dhcp-snooping vlan

Displays a list of VLANs that have DHCPv6 Snooping enabled.

show ipv6 helper dhcp-snooping vlan

Syntax Definitions

N/A

Defaults

N/A

Usage Guidelines

- This command only applies if DHCPv6 snooping is enabled at VLAN level.
- Use **show ipv6 helper** command to determine the status of DHCPv6 snooping at the switch level

Example

```
-> show ipv6 helper dhcp-snooping vlan
VLAN ID  Status
----------------
1       Enabled
2       Enabled
100     Disabled
200     Disabled
```

output definitions

VLAN ID	Specifies all the configured VLAN IDs
Status	Specifies whether DHCPv6 snooping binding is **Enabled** or **Disabled** on the related VLAN.

Release History

Release 6.4.5; command introduced.

Related Commands

ipv6 helper dhcp-snooping vlan	Enables or disables DHCPv6 Snooping on a Per-VLAN basis.

MIB Objects

```
ipv6helperDhcpSnoopingVlanTable
   ipv6helperDhcpSnoopingVlanNumber
    ipv6helperDhcpSnoopingVlanStatus
```

show ipv6 helper dhcp-snooping port

Displays the trust mode and DHCPv6 Snooping violation statistics for all switch ports that are filtered by DHCPv6 Snooping.

show ipv6 helper dhcp-snooping port

Syntax Definitions

N/A

Defaults

N/A

Usage Guidelines

- If DHCPv6 Snooping is operating at the switch level, then information for all switch ports is displayed.
- If DHCPv6 Snooping is operating at the VLAN level, then information for only those ports that are associated with a DHCPv6 Snooping VLAN is displayed

Example

```
-> show ipv6 helper dhcp-snooping port
 Slot      Trust             Client     Server     Binding   Interface-id
 Port      Mode             Violation  Violation  Violation   Violation
------+--------------------+----------+----------+----------+-------------
 1/1  Client-Only-UnTrusted       0          0          0          0
 1/2  Client-Only-UnTrusted       0          0          0          0
 1/3  Client-Only-UnTrusted       0          0          0          0
 1/4  Client-Only-UnTrusted       0          0          0          0
 1/5  Client-Only-UnTrusted       0          0          0          0
```

output definitions

Slot/Port	Specifies Slot/Port of DHCPv6 snooping port
Trust Mode	Specifies Trust Mode configured on the DHCPv6 snooping port. The different types of modes are - **Client-Only-Trusted**, **Client-Only-Untrusted, Trusted, Blocked**
Client Violation	Specifies the number of Client Violations on the DHCPv6 snooping port.
Server Violation	Specifies the number of Server Violations on the DHCPv6 snooping port.
Binding Violation	Specifies the number of Binding Violations on the DHCPv6 snooping port.
Interface-id Violation	Specifies the number of Interface Id Violations on the DHCPv6 snooping port.

Release History

Release 6.4.5; command introduced.

Related Commands

ipv6 helper interface-id prefix	This command can be used to configure Interface ID manually.
ipv6 helper dhcp-snooping port	Configures the DHCPv6 Snooping trust mode for the port.
ipv6 helper dhcp-snooping linkagg	Configures the DHCPv6 Snooping trust mode for the link aggregate.
ipv6 helper dhcp-snooping binding	Enables or disables the DHCPv6 Snooping binding table functionality.

MIB Objects

```
ipv6helperTable
   ipv6helperInterfaceIdPrefixValue
ipv6helperDhcpSnoopingPortTable
   ipv6helperDhcpSnoopingPortEntry
   ipv6helperDhcpSnoopingPortIfIndex
   ipv6helperDhcpSnoopingPortTrustMode
```

show ipv6 helper dhcp-snooping binding

Displays the contents of DHCPv6 Snooping binding table (database)

show ipv6 helper dhcp-snooping binding

Syntax Definitions

N/A

Defaults

N/A

Usage Guidelines

Dynamic binding table entries are created when the relay agent receives a DHCPv6 REPLY packet.

Example

```
-> show ipv6 helper dhcp-snooping binding

   Link-local            Slot       IPv6           Valid      VLAN
     Address             Port       Address        LifeTime    ID
------------------------+------+----------------+----------+-----
fe80::200:ff:fe00:101     1/4        2300::5         2000      5
fe80::200:16ff:fe0e:a785  2/15       4001::2         2000      2
```

Example output with remote flag when Multi Chassis Mode is enabled

```
-> show ipv6 helper dhcp-snooping binding

Total Number of Binding Entries: 11

Link-local              Slot    IPv6              Valid       VLAN       Remote
Address                 Port    Address           LifeTime     ID        Entry
----------------------+------+----------------+----------+----------+-----------
fe80::200:ff:fe00:101    3/2   2001:1001:21::1c8   360        1109      Local
fe80::200:16ff:fe0e:a785 3/2   2001:1001:21::18a   360        1109      Local
fe80::200:16ff:fe0e:a786 3/2   2001:1001:21::1e8   360        1109      Local
fe80::200:16ff:fe0e:a787 3/2   2001:1001:21::13c   360        1109      Local
```

output definitions

Link-local address	Specifies the IPv6 Address configured for DHCPv6 Snooping Binding
Slot/Port	Specifies the Slot and Port on which DHCPv6 Snooping Binding is configured
IPv6 Address	Specifies the forwarding IPv6 address specified by the **ipv6 helper address** command
Valid LifeTime	Specifies the valid binding lease life time.

output definitions

VLAN ID	Specifies the VLAN IDs on which DHCPv6 snooping binding is active.
Remote Entry	This column is available only when Multi-Chassis mode is active. Specifies the chassis through which the Binding entries are learned. Options that can be displayed are - **Remote** (if entry learned from remote chassis), **Local** (if entry learned from local chassis).

Release History

Release 6.4.5; command introduced.

Related Commands

ipv6 helper dhcp-snooping binding	Enables or disables the DHCPv6 Snooping binding table functionality.
ipv6 helper dhcp-snooping binding action	Triggers a purge or renew action against the DHCPv6 Snooping binding table. A purge action clears the contents of the table. A renew action populates the table with entries saved in the DHCPv6 binding table.
ipv6 helper dhcp-snooping binding persistency	Retains the entries in the DHCPv6 Snooping binding table for the duration of the lease, regardless of the existence of the MAC address in the MAC address table.

MIB Objects

```
ipv6helperDhcpSnoopingBindingTable
   ipv6helperDhcpSnoopingBindingStatus
   ipv6helperDhcpSnoopingBindingDatabaseAction
   ipv6helperDhcpSnoopingBindingPersistencyStatus
```

26 VRRP Commands

The Virtual Router Redundancy Protocol (VRRP) eliminates the single point of failure in a default route environment. VRRP specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the VRRP/VRRP3 routers on the LAN. The VRRP/VRRP3 router, which controls the IP/IPv6 address associated with a virtual router is called the master router, and forwards packets to that IP/IPv6 address. If the master router becomes unavailable, the highest priority backup router will transition to the master state. The Alcatel-Lucent implementation of VRRP also supports the collective management of virtual routers on a switch.

Note. VRRP3 does not support the collective management functionality.

The VRRP and VRRP3 commands comply with RFC 2787 and RFC 3768, respectively.

MIB information is as follows:

Filename: IETF-VRRP.MIB
Module: VRRP-MIB

Filename: AlcatelIND1VRRP.MIB
Module: ALCATEL-IND1-VRRP-MIB

Filename: AlcatelIND1VRRP3.MIB
Module: ALCATEL-IND1-VRRP3-MIB

The VRRP CLI commands are listed here:

vrrp
vrrp address
vrrp track
vrrp track-association
vrrp trap
vrrp delay
vrrp interval
vrrp priority
vrrp preempt
vrrp all
vrrp set
vrrp group
vrrp group all
vrrp group set
vrrp group-association
vrrp3
vrrp3 address
vrrp3 trap
vrrp3 track-association
show vrrp
show vrrp statistics
show vrrp track
show vrrp track-association
show vrrp group
show vrrp group-association
show vrrp3
show vrrp3 statistics
show vrrp3 track-association

vrrp

Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.

vrrp *vrid vlan_id* **[enable | disable | on | off] [priority** *priority***] [preempt | no preempt] [[advertising] interval** *seconds***]**

no vrrp *vrid vlan_id*

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
vlan_id	The VLAN on which the virtual router is configured. The VLAN must already be created and available on the switch.
enable	Enables the virtual router. A virtual router may only be enabled if an IP address is configured for the virtual router.
disable	Disables the virtual router. Cannot be combined on the same line with other parameters.
on	Alternate syntax for enabling the virtual router.
off	Alternate syntax for disabling the virtual router.
priority	The priority for this virtual router to become the master router. The range is 1 (lowest priority) to 255 (highest priority). The priority should be set to 255 only if this router is the actual owner of the virtual router's IP address.
preempt	Specifies that a higher priority router may preempt a lower priority master router.
no preempt	Specifies that a higher priority router may not preempt a lower priority master router.
seconds	The interval in seconds after which the master router will send VRRP advertisements. The advertising interval must be same for all VRRP routers configured with the same VRID. The valid range is 1–255 seconds.

Defaults

parameter	default
enable | disable | on | off	**disable** (**off**)
priority	100
preempt | no preempt	**preempt**
seconds	1

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a virtual router from the configuration.
- Use the **vrrp address** command to configure an IP address for the virtual router. This must be done before the virtual router can be enabled.
- To disable the virtual router, rather than to remove it, use the **disable** or **off** option. Note that **disable** or **off** cannot be used with any other optional parameter.
- A virtual router must be disabled before it can be modified.

Important information about configuring priority:

- A value of 255 indicates that the VRRP router owns the IP address; that is, the router contains the real physical interface to which the IP address is assigned. The system automatically sets this value to 255 if it detects that this router is the IP address owner. If the priority is set to 255 and the virtual router is not the IP address owner, then the priority will be set to the default value of 100. The IP address owner will always be the master router if it is available.
- VRRP routers backing up a virtual router must use priority values from 1 to 254. The default priority value for VRRP routers backing up a virtual router is 100. If you configure more than one backup, their priority values should be different. The **preempt** or **no preempt** setting specifies whether or not a higher priority router may preempt a lower priority master router.

Examples

```
-> vrrp 23 1 priority 75
-> vrrp 23 1 enable
```

Release History

Release 6.1; command was introduced.

Related Commands

vrrp address	Configures an IP address for a virtual router.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVrrp3OperTable
   alaVrrp3OperAdminState
   alaVrrp3OperPriority
   alaVrrp3OperPreemptMode
   alaVrrp3OperAdvertisementinterval
   alaVrrp3OperRowStatus
```

vrrp address

Configures an IP address for a virtual router.

vrrp *vrid vlan_id* **address** *ip_address*

vrrp *vrid vlan_id* **no address** *ip_address*

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
vlan_id	The VLAN on which the virtual router is configured.
ip_address	The virtual IP address associated with the specified virtual router.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

A virtual router IP address must be configured before the virtual router can be enabled.

Examples

```
-> vrrp 1 3 address 10.10.3.2
-> vrrp 1 3 no address 10.10.3.2
```

Release History

Release 6.1; command was introduced.
Release 6.1.3; command modified; *ip* parameter is replaced by *address* parameter.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable to disable a virtual router.
show vrrp statistics	Displays statistics about VRRP packets for all virtual routers configured on the switch or for a specific virtual router.

MIB Objects

```
alaVrrp3AssoIpAddrTable
   alaVrrp3AssoIpAddrRowStatus
```

vrrp track

Creates a new tracking policy or modifies an existing tracking policy.

vrrp track *track_id* **[enable | disable] [priority** *value***] [ipv4-interface** *name* | **ipv6-interface** *name* **| port** *slot/port* **| address** *address***]**

no vrrp track *track_id*

Syntax Definitions

track_id	The ID of the tracking policy; the range is 1 to 255.
enable	Enables the tracking policy.
disable	Disables the tracking policy.
value	The value to be decremented from the priority value of the virtual router monitoring this tracking policy when the operational state of the tracking policy is down. The valid range is 0–255.
name	The name of the IPv4 or IPv6 interface that this policy will track.
slot/port	The slot/port number that this policy will track.
address	The remote IP or IPv6 address that this policy will track.

Defaults

parameter	default
enable | disable	**enable**
value	25

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a tracking policy.
- Use the **disable** option to disable the tracking policy, rather than removing it from the switch.

Examples

```
-> vrrp track 2 enable priority 50 ipv4-interface Marketing
-> vrrp track 3 enable priority 60 ipv6-interface Sales
-> vrrp track 3 disable
```

Release History

Release 6.1; command was introduced.
Release 6.1.3; *ip* parameter is replaced by *address* parameter.

Related Commands

vrrp track-association	Associates a VRRP tracking policy with a virtual router.
show vrrp track	Displays information about tracking policies on the switch.

   alaVrrpTrackEntityIpv6Interface
   alaVrrpTrackEntityInterface
   alaVrrpTrackRowStatus
```

vrrp track-association

Associates a VRRP tracking policy with a virtual router.

vrrp *vrid vlan_id* **track-association** *track_id*

vrrp *vrid vlan_id* **no track-association** *track_id*

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
vlan_id	The VLAN ID of the virtual router.
track_id	The ID of the tracking policy associated with the virtual router; the range is 1 to 255.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

Use the **no** form of this command to remove a tracking policy from a virtual router.

Examples

```
-> vrrp 2 4 track-association 1
-> vrrp 2 4 no track-association 1
```

Release History

Release 6.1; command was introduced.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.
show vrrp track-association	Displays the tracking policies associated with virtual routers.

MIB Objects

```
alaVrrpAssoTrackTable
   alaVrrpAssoTrackId
   alaVrrpTrackRowStatus
```

vrrp trap

Enables or disables SNMP traps for VRRP.

vrrp trap

no vrrp trap

Syntax Definitions

N/A

Defaults

By default, SNMP traps for VRRP are enabled.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

SNMP traps must be enabled globally on the switch for VRRP traps to actually be sent.

Examples

```
-> vrrp trap
-> no vrrp trap
```

Release History

Release 6.1; command was introduced.

Related Commands

snmp trap filter	Enables or disables SNMP trap filtering.

MIB Objects

```
vrrpOperGroup
   vrrpNotificationCntl
```

vrrp delay

Configures the amount of time allowed for routing tables to stabilize before virtual routers are started.

vrrp delay *seconds*

Syntax Definitions

seconds	The amount of time after a reboot that virtual routers will wait before they go active; the range is 0 to 180 seconds.

Defaults

parameter	default
seconds	45 seconds

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

Use this command to prevent loss of workstation connectivity before a virtual router becomes master.

Examples

```
-> vrrp delay 50
```

Release History

Release 6.1; command was introduced.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVRRPStartDelay
```

vrrp interval

Modifies the default advertising interval value assigned to the virtual routers on the switch.

vrrp interval *seconds*

Syntax Definitions

seconds	The default advertising interval for the virtual routers. The valid range is 1–255 seconds.

Defaults

parameter	default
seconds	1

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Modifying the default advertising interval value will affect the value assigned by default to any new virtual routers that are created.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

Examples

```
-> vrrp interval 50
```

Release History

Release 6.3.1; command was introduced.

Related Commands

vrrp all	Changes the administrative status of all the virtual routers on the switch.
vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVrrpv2Config
   alaVrrpDefaultInterval
```

vrrp priority

Modifies the default priority value assigned to the virtual routers on the switch.

vrrp priority *priority*

Syntax Definitions

priority	The default priority value for the virtual routers. The valid range is 1–254.

Defaults

parameter	default
priority	100

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Modifying the default priority value will affect the value assigned by default to any new virtual routers that are created.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using the **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

Examples

```
-> vrrp priority 50
```

Release History

Release 6.3.1; command was introduced.

Related Commands

vrrp all	Changes the administrative status of all the virtual routers on the switch.
vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVrrpv2Config
   alaVrrpDefaultPriority
```

vrrp preempt

Modifies the default preempt mode assigned to the virtual routers on the switch.

vrrp [preempt | no preempt]

Syntax Definitions

preempt	Specifies that a higher priority router may preempt a lower priority master router by default.
no preempt	Specifies that a higher priority router may not preempt a lower priority master router by default.

Defaults

parameter	default
preempt | no preempt	**preempt**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Modifying the default preempt mode will affect the mode assigned by default to any new virtual routers that are created.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using the **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

Examples

```
-> vrrp preempt
-> vrrp no preempt
```

Release History

Release 6.3.1; command was introduced.

Related Commands

vrrp all	Changes the administrative status of all the virtual routers on the switch.
vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVrrpv2Config
   alaVrrpDefaultPreemptMode
```

vrrp all

Changes the administrative status of all the virtual routers on the switch.

vrrp [disable | enable | enable all]

Syntax Definitions

disable	Disables all the virtual routers on the switch.
enable	Enables the virtual routers that have not previously been disabled individually or collectively via the **vrrp group all** command.
enable all	Enables all the virtual routers on the switch including those virtual routers that have been disabled individually or collectively via the **vrrp group all** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- This command changes the administrative status of all the virtual routers on the switch by executing a single command.
- This command will not affect the ability to change the administrative status of an individual virtual router.

Examples

```
-> vrrp disable
-> vrrp enable
-> vrrp enable all
```

Release History

Release 6.3.1; command was introduced.

Related Commands

vrrp interval	Modifies the default advertising interval value assigned to the virtual routers on the switch.
vrrp priority	Modifies the default priority value assigned to the virtual routers on the switch.
vrrp preempt	Modifies the default preempt mode assigned to the virtual routers on the switch.
vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVrrpv2Config
   alaVrrpAdminState
```

vrrp set

Sets the new default parameter values to existing virtual routers on the switch.

vrrp set [interval | priority | preempt | all] [override]

Syntax Definitions

interval	Sets the VRRP advertisement interval value to the new default value.
priority	Sets the priority value to the new default value.
preempt	Sets the preempt mode to the new default mode.
all	Sets all the parameters value to the new default value.
override	Overrides the specified parameters configured value with the new default value.

Defaults

parameter	default
interval | priority | preempt | all	**all**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- All the virtual routers must be disabled before using this command.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using the **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

Examples

```
-> vrrp set priority
-> vrrp set priority override
```

Release History

Release 6.3.1; command was introduced.

Related Commands

vrrp interval	Modifies the default advertising interval value assigned to the virtual routers on the switch.
vrrp priority	Modifies the default priority value assigned to the virtual routers on the switch.
vrrp preempt	Modifies the default preempt mode assigned to the virtual routers on the switch.
vrrp all	Changes the administrative status of all the virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVrrpv2Config
   alaVrrpSetParam
   alaVrrpOverride
```

vrrp group

Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.

vrrp group *vrgid* **[interval** *seconds***] [priority** *priority***] [preempt | no preempt]**

no vrrp group *vrgid*

Syntax Definitions

vrgid	The virtual router group ID, in the range from 1–255.
seconds	The default advertising interval for the virtual router group. The valid range is 1–255 seconds.
priority	The default priority value for the virtual router group. The valid range is 1–254.
preempt	Specifies that a higher priority router may preempt a lower priority master router by default.
no preempt	Specifies that a higher priority router may not preempt a lower priority master router by default.

Defaults

parameter	default
seconds	1
priority	100
preempt | no preempt	**preempt**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to delete the virtual router group.
- The configuration parameters can be modified at any time, but will not have any effect on the virtual routers in the group until the virtual routers are enabled again. To apply the group default value to the virtual routers in a group, you must first disable the virtual router group, then apply the group default value using the **vrrp group set** command and enable the virtual router group again.
- If any of the virtual routers in the group are running with their configured value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual router group, then override the configured value by using the **vrrp group set** command with the **override** option and enable the virtual router group again.
- When a virtual router group is deleted, the virtual routers assigned to the group become unassigned. However, this does not have any impact on the virtual routers.

Examples

```
-> vrrp group 25 interval 50 priority 50 no preempt
-> no vrrp group 25
```

Release History

Release 6.3.1; command was introduced.

Related Commands

vrrp group all	Changes the administrative status of all the virtual routers in a virtual router group using a single command.
vrrp group set	Sets the new modified default value to all the virtual routers in a virtual router group.
vrrp group-association	Adds a virtual router to a virtual router group.
show vrrp group	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

MIB Objects

```
alaVrrpGroupTable
   alaVrrpGroupInterval
   alaVrrpGroupPriority
   alaVrrpGroupPreemptMode
   alaVrrpGroupRowStatus
```

vrrp group all

Changes the administrative status of all the virtual routers in a virtual router group using a single command.

vrrp group *vrgid* **[disable | enable | enable all]**

Syntax Definitions

vrgid	The virtual router group ID, in the range from 1–255.
disable	Disables all the virtual routers in the group.
enable	Enables those virtual routers that have not previously been disabled individually in the group.
enable all	Enables all the virtual routers in the group including those virtual routers that have been disabled individually.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- If a virtual router in a group is disabled on an individual basis, it can only be reenabled by using the **enable all** option in this command.
- This command will not affect the ability to change the administrative status of an individual virtual router.

Examples

```
-> vrrp group 25 disable
-> vrrp group 25 enable
-> vrrp group 25 enable all
```

Release History

Release 6.3.1; command was introduced.

Related Commands

vrrp group	Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.
vrrp group set	Sets the new modified default value to all the virtual routers in a virtual router group.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.
show vrrp group	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

MIB Objects

```
alaVrrpGroupTable
   alaVrrpGroupAdminState
```

vrrp group set

Sets the new modified default value to all the virtual routers in a virtual router group.

vrrp group *vrgid* **set [interval | priority | preempt | all] [override]**

Syntax Definitions

vrgid	The virtual router group ID, in the range from 1–255.
interval	Sets the VRRP advertisement interval value to the new default value.
priority	Sets the priority value to the new default value.
preempt	Sets the preempt mode to the new default mode.
all	Sets all the parameters' value to the new default value.
override	Overrides the parameter's configured value with the group default value.

Defaults

parameter	default
interval | priority | preempt | all	**all**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- All the virtual routers must be disabled before using this command.
- To apply the group default value to the virtual routers in a group, you must disable the virtual router group, then apply the group default value using the **vrrp group set** command and enable the virtual router group again.
- If any of the virtual routers in the group are running with their own configured parameter value, then that value will take priority over the group default value. To override the configured value with the group default value, you must first disable the virtual router group, then override the configured value by using the **vrrp group set** command with the **override** option and enable the virtual router group again.

Examples

```
->vrrp group 10 set priority
->vrrp group 10 set priority override
```

Release History

Release 6.3.1; command was introduced.

Related Commands

vrrp group	Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.
vrrp group all	Changes the administrative status of all the virtual routers in a virtual router group using a single command.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.
show vrrp group	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

MIB Objects

```
alaVrrpGroupTable
   alaVrrpGroupSetParam
   alaVrrpGroupOverride
```

vrrp group-association

Adds a virtual router to a virtual router group.

vrrp *vrid vlan_id* **group-association** *vrgid*

vrrp *vrid vlan_id* **no group-association** *vrgid*

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
vlan_id	The VLAN on which the virtual router is configured. The VLAN must already be created and available on the switch.
vrgid	The virtual router group ID, in the range from 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove the virtual router from the virtual router group.
- A virtual router need not be disabled in order to be added to a virtual router group. However, the virtual router will not adopt the group's default parameter values until it is reenabled.
- A virtual router need not be disabled to be removed from a group.

Examples

```
-> vrrp 25 1 group-association 10
-> vrrp 25 1 no group-association 10
```

Release History

Release 6.3.1; command was introduced.

Related Commands

show vrrp group-association	Displays the virtual routers that are associated with a group.

MIB Objects

```
alaVrrpAssoGroupTable
   alaVrrpAssoGroupRowStatus
```

vrrp3

Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.

vrrp3 *vrid vlan_id* **[enable | disable | on | off] [priority** *priority***] [preempt | no preempt][accept | no accept] [[advertising] interval** *centiseconds***]**

no vrrp3 *vrid vlan_id*

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
vlan_id	The VLAN on which the virtual router is configured. The VLAN must already be created and available on the switch.
enable	Enables the virtual router.
disable	Disables the virtual router. Cannot be combined on the same line with other parameters.
on	Alternate syntax for enabling the virtual router.
off	Alternate syntax for disabling the virtual router.
priority	The priority for this virtual router to become the master router. The range is 1 (lowest priority) to 255 (highest priority). The priority should be set to 255 only if this router is the actual owner of the virtual router's IP address.
preempt	Specifies that a higher priority router may preempt a lower priority master router.
no preempt	Specifies that a higher priority router may not preempt a lower priority master router.
accept	Specifies that the master router, which is not the IPv6 address owner will accept the packets addressed to the IPv6 address owner as its own.
no accept	Specifies that the master router, which is not the IPv6 address owner will not accept the packets addressed to the IPv6 address owner as its own.
centiseconds	The interval in centiseconds after which the master router will send VRRP3 advertisements. The advertising interval must be the same for all VRRP3 routers configured with the same VRID. The valid range is 1–4096 centiseconds.

Defaults

parameter	default
enable | disable | on | off	**disable (off)**
priority	100
preempt | no preempt	**preempt**
accept | no accept	**accept**
centiseconds	100

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a virtual router from the configuration.
- Use the **vrrp3 address** command to configure an IPv6 address for the virtual router.
- To disable the virtual router, rather than to remove it, use the **disable** or **off** option. Note that the **disable** or **off** options cannot be used with any other optional parameter.
- A virtual router must be disabled before it can be modified.
- The maximum number of virtual routers supported is based on the 100 centisecond interval. A smaller interval will result in a relatively lesser number of virtual routers.
- The advertising interval cannot be less than 10 centiseconds.

Examples

```
-> vrrp3 23 1 priority 75
-> vrrp3 23 1 enable
```

Release History

Release 6.1.3; command was introduced.

Related Commands

vrrp3 address	Configures an IPv6 address for a virtual router.
show vrrp3	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

alaVrrp3OperTable

- alaVrrp3OperAdminState
- alaVrrp3OperPriority

- alaVrrp3OperAcceptMode
- alaVrrp3OperAdvinterval
- alaVrrp3OperRowStatus

vrrp3 address

Configures an IPv6 address for a virtual router.

vrrp3 *vrid vlan_id* **address** *ipv6_address*

vrrp3 *vrid vlan_id* **no address** *ipv6_address*

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
vlan_id	The VLAN on which the virtual router is configured.
address	The virtual IPv6 address associated with the specified virtual router.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

```
-> vrrp3 1 3 address 213:100:1::56
-> vrrp3 1 3 no address 213:100:1::56
```

Release History

Release 6.1.3; command was introduced.

Related Commands

vrrp3	Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.
show vrrp3 statistics	Displays statistics for all virtual routers configured on the switch or for a specific virtual router.

MIB Objects

```
alaVrrp3AssoIpAddrTable
   alaVrrp3AssoIpAddrRowStatus
```

vrrp3 trap

Enables or disables SNMP traps for VRRP3.

vrrp3 trap

no vrrp3 trap

Syntax Definitions

N/A

Defaults

By default, SNMP traps for VRRP3 are enabled.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

SNMP traps must be enabled globally on the switch for VRRP3 traps to actually be sent.

Examples

```
-> vrrp3 trap
-> no vrrp3 trap
```

Release History

Release 6.1.3; command was introduced.

Related Commands

snmp trap filter	SNMP traps must be enabled with this command.

MIB Objects

```
alaVrrp3OperGroup
   alaVrrp3NotificationCntl
```

vrrp3 track-association

Associates a VRRP3 tracking policy with a virtual router.

vrrp3 *vrid vlan_id* **track-association** *track_id*

vrrp3 *vrid vlan_id* **no track-association** *track_id*

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
vlan_id	The VLAN ID of the virtual router.
track_id	The ID of the tracking policy associated with the virtual router; the range is 1 to 255.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to remove a tracking policy from a virtual router.
- Use the **vrrp track** command to create a tracking policy for an IPv6 interface.

Examples

```
-> vrrp3 2 4 track-association 1
-> vrrp3 2 4 no track-association 1
```

Release History

Release 6.1.3; command was introduced.

Related Commands

vrrp3	Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.
show vrrp3 track-association	Displays the tracking policies associated with VRRP3 virtual routers.

MIB Objects

```
alaVrrp3AssoTrackTable
   alaVrrp3AssoTrackId
   alaVrrp3TrackRowStatus
```

show vrrp

Displays the virtual router configuration for all virtual routers or for a specific virtual router.

show vrrp [*vrid***]**

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

Use the **show vrrp** command to display information about configuration parameters, which may be set through the **vrrp** command. Use the **show vrrp statistics** command to get information about VRRP packets.

Examples

```
-> show vrrp
VRRP default advertisement interval: 5 seconds
VRRP default priority: 99
VRRP default preempt: No
VRRP trap generation: Enabled
VRRP startup delay: 45  (expired)

                IP         Admin                       Adv.
VRID VLAN   Address(es)    Status  Priority Preempt Interval

   2  102 192.60.246.240  Enabled        99      No        5

-> show vrrp 1
Virtual Router VRID = 1 on VLAN = 1
   Admin Status       = Enabled
   Priority           = 255
   Preempt            = Yes
   Adv. Interval      = 1
   Virtual MAC        = 00-00-5E-00-02-01
   IP Address(es)
      192.168.170.1
      192.168.170.2
```

output definitions

VRRP default advertisement interval	The default advertising interval for all virtual routers on the switch.
VRRP default priority	The default priority value for all virtual routers on the switch.
VRRP default preempt	The default preempt mode for all virtual routers on the switch.
VRRP trap generation	Indicates whether or not the VRRP trap generation is enabled or disabled; configured through the **vrrp track** command.
VRRP startup delay	The amount of time after a reboot that virtual routers will wait before they go active; allows time for routing tables to stabilize. Configured through the **vrrp delay** command.
VRID	Virtual router identifier. Configured through the **vrrp** command.
VLAN	The VLAN associated with the VRRP instance. Configured through the **vrrp** command.
IP Address(es)	The assigned IP addresses. Configured through the **vrrp address** command.
Admin Status	The administrative status of this virtual router instance; **enabled** allows the virtual router instance to operate; **disabled** disables the virtual router instance without deleting it.
Priority	Indicates the VRRP router's priority for the virtual router. For more information about priority, see the **vrrp** command description on page 26-3.
Preempt	Controls whether a higher priority virtual router will preempt a lower priority master router: preempt indicates that a higher priority virtual router will preempt a lower priority master; no preempt indicates that the first backup router to take over for the master will not be preempted by a virtual router with a higher priority. In either case, the IP address owner will always take over it if is available.
Virtual MAC	Displays the virtual MAC address for the virtual router. The first 5 bytes are always 00-00-5E-00-02. The last byte indicates the VRID. This field displays N/A when the virtual router is in the **backup** or **initialize** state.
Adv. Interval	Indicates the time interval, in seconds, between sending advertisement messages. Only the master router sends advertisements.

Release History

Release 6.1; command was introduced.
Release 6.3.1; **VRRP default advertisement interval**, **VRRP default priority**, and **VRRP default preempt** fields added.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.
vrrp address	Configures an IP address for a virtual router.
vrrp interval	Modifies the default advertising interval value assigned to the virtual routers on the switch.
vrrp priority	Modifies the default priority value assigned to the virtual routers on the switch.
vrrp preempt	Modifies the default preempt mode assigned to the virtual routers on the switch.
show vrrp statistics	Displays statistics for all virtual routers configured on the switch or for a specific virtual router.

   alaVRRPDefaultPriority
   alaVRRPDefaultPreemptMode
   alaVrrp3AssoIpAddr
   alaVrrp3OperAdminState
   alaVrrp3OperPriority
   alaVrrp3OperPreemptMode
   alaVrrp3OperAcceptMode
```

show vrrp statistics

Displays statistics about VRRP packets for all virtual routers configured on the switch or for a specific virtual router.

show vrrp [*vrid***] statistics**

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

Use the **show vrrp statistics** command to display information about VRRP packets. Use the **show vrrp** command to display information about the virtual router configuration.

Examples

```
-> show vrrp statistics
Checksum   Version      VRID
 Errors     Errors      Errors
----------+-----------+---------
         0          0         0

VRID  VLAN   State          UpTime   Become Master   Adv. Rcvd
----+ ----+ -------------+----------+--------------+------------
  1      1  master          378890            1              0
  2     15  backup            4483            0             44
  7      2  initialize           0            0              0
```

output definitions

Checksum Errors	The total number of VRRP packets received with an invalid checksum value.
Version Errors	The total number of VRRP packets received with an invalid version number.
VRID Errors	The total number of VRRP packets received with invalid VRIDs.
VRID	The virtual router identifier.
VLAN	The VLAN associated with the VRRP instance.

output definitions (continued)

State	The operational state of the VRRP router instance; **initialize** specifies that the interface or VLAN is either disabled or down, or if the startup delay timer has not expired; **backup** specifies that this instance is monitoring the availability of the master router; **master** specifies that this instance is functioning as the master router.
UpTime	Time interval (in hundredths of a second) since this virtual router was last initialized.
Become Master	The total number of times this virtual router's state has transitioned from backup to master.
Adv. Rcvd	The total number of VRRP advertisements received by this instance.

```
-> show vrrp 1 statistics
Virtual Router VRID = 1 on VLAN = 1
   State                                = master
   UpTime (1/100th second)              = 378890
   Become master                        = 1
   Advertisements received              = 0
   Type errors                          = 0
   Advertisement interval errors        = 0
   Authentication errors                = 0
   IP TTL errors                        = 0
   IP address list errors               = 0
   Packet length errors                 = 0
   Zero priority advertisements sent    = 0
   Zero priority advertisements received  = 0
```

output definitions

VRID	The virtual router identifier.
VLAN	The VLAN associated with the VRRP instance.
State	The operational state of this VRRP router instance; **initialize** specifies that the interface or VLAN is either disabled or down, or the startup delay timer has not expired; **backup** specifies that this instance is monitoring the availability of the master router; **master** specifies that this instance is functioning as the master router.
UpTime	Time interval (in hundredths of a second) since this virtual router was last initialized.
Become master	The total number of times this virtual router's state has transitioned from backup to master.
Advertisements received	The total number of VRRP advertisements received by this instance.
Type errors	The total number of VRRP packets received with an invalid value in the VRRP type field.
Advertisement interval errors	The total number of VRRP packets received in which the advertisement interval differs from the one configured for the virtual router.
Authentication errors	The total number of VRRP packets received with an unknown or invalid authentication type.
IP TTL errors	The total number of VRRP packets received with a TTL value other than 255.

output definitions (continued)

IP address list errors	The total number of VRRP packets in which the IP address list does not match the configured list for the virtual router.
Packet length errors	The total number of VRRP packets received with a length less than the length of the VRRP header.
Zero priority advertisements sent	The total number of VRRP advertisements with a priority of 0 sent by the virtual router.
Zero priority advertisements received	The total number of VRRP advertisements with a priority of 0 received by the virtual router.

Release History

Release 6.1; command was introduced.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable to disable a virtual router.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

show vrrp track

Displays information about tracking policies on the switch.

show vrrp track [*track_id***]**

Syntax Definitions

track_id	The ID of the tracking policy for which you want to display information.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

Enter the tracking ID to display information about a particular policy; if no tracking policy ID is entered, information for all tracking policies is displayed.

Examples

```
-> show vrrp track
Track                       Admin    Oper
 ID         Policy          State    State  Pri
-----+-----------------+----------+------+-----
   1    PORT 1/1         Enabled    Up      25
   2    192.10.150.42    Enabled    Down    25
```

output definitions

Track ID	The ID of the tracking policy.
Policy	The slot/port, IP address, or VLAN tracked by the policy.
Admin State	Whether the tracking policy is administratively enabled or disabled.
Oper State	Indicates whether the operating state of the tracking policy is Up or Down.
Pri	The value to be decremented from the priority value of the virtual router monitoring this tracking policy when the operational state of the tracking policy is down.

Release History

Release 6.1; command was introduced.

Related Commands

vrrp track	Creates a new tracking policy or modifies an existing tracking policy.

MIB Objects

```

   alaVrrpTrackState
   alaVrrpTrackAdminState
   alaVrrpTrackPriority
   alaVrrpTrackEntityType
   alaVrrpTrackEntityVlan
   alaVrrpTrackEntityPort
   alaVrrpTrackEntityIpAddress
   alaVrrpTrackEntityIpv6Interface
   alaVrrpTrackEntityInterface
```

show vrrp track-association

Displays the tracking policies associated with virtual routers.

show vrrp [*vrid***] track-association [***track_id***]**

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
track_id	The ID of the tracking policy for which you want to display information.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

If a track ID is specified, only information about that track ID is displayed. If the virtual router ID and track ID are not specified, information about all virtual routers and their associated tracking policies is displayed.

Examples

```
-> show vrrp 2 track-association
           Conf  Cur  Track                      Admin   Oper  Track
VRID VLAN  Pri   Pri   ID        Policy           State   State  Pri
----+----+-----+-----+-----+----------------+----------+-----+------
   2    1  100   100     1  VLAN    1           Enabled  Up       25
                         2    10.255.11.101     Enabled  Up       25
```

output definitions

VRID	The virtual router identifier.
VLAN	The VLAN ID associated with the virtual router.
Conf Pri	The priority configured for the virtual router through the **vrrp** command.
Cur Pri	The priority currently being used for the virtual router. If the tracking policy is in effect because the tracked entity is down, the current priority will be equal to the configured priority (Conf Pri) minus the tracking priority (Track Pri). Otherwise the current priority will be equal to the configured priority.
Track ID	The ID of the tracking policy.
Policy	The VLAN, IP address, or slot/port being tracked by this policy.
Admin State	The administrative state of the tracking policy configured through the **vrrp track** command.

output definitions (continued)

Oper State	Whether the tracking policy is operational (Up) or not (Down).
Track Pri	The amount to be decremented from the configured virtual router priority when the tracking policy is applied.

Release History

Release 6.1; command was introduced.

Related Commands

vrrp track-association	Associates a VRRP tracking policy with a virtual router.
vrrp track	Creates a new tracking policy or modifies an existing tracking policy.

MIB Objects

```
alaVrrpAssoTrackTable
   alaVrrpAssoTrackId
alaVRRPTrackTable
   alaVrrpTrackState
   alaVrrpTrackAdminState
   alaVrrpTrackPriority
   alaVrrpTrackEntityType
   alaVrrpTrackEntityVlan
   alaVrrpTrackEntityPort
   alaVrrpTrackEntityIpAddress
   alaVrrpTrackEntityInterface
```

show vrrp group

Displays the default parameter values for all the virtual router groups or for a specific virtual router group.

show vrrp group [*vrgid***]**

Syntax Definitions

vrgid	The virtual router group ID, in the range from 1–255.

Defaults

By default, the default parameter values are displayed for all the virtual router groups.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

Use the *vrgid* parameter with this command to display the default values for a specific virtual router group.

Examples

```
-> show vrrp group 2
Virtual Router Group GROUPID = 2
  Interval = 11
  Priority = 250
  Preempt Mode = Yes
  3 Associated Virtual Routers
```

output definitions

Group ID	The virtual router group identifier.
Adv Interval	Indicates the time interval, in seconds, between the sending of advertisement messages. Only the master router sends advertisements.
Priority	Indicates the VRRP router's priority for the virtual router group. For more information about priority, see the **vrrp** command description on page 26-3.
Preempt Mode	Controls whether a higher priority virtual router will preempt a lower priority master; preempt indicates that a higher priority virtual router will preempt a lower priority master; no preempt indicates that the first backup router to take over for the master will not be preempted by a virtual router with a higher priority. In either case, the IP address owner will always take over it if is available.

Release History

Release 6.3.1; command was introduced.

Related Commands

vrrp group	Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.
vrrp group all	Changes the administrative status of all the virtual routers in a virtual router group using a single command.

MIB Objects

```
alaVrrpGroupTable
   alaVrrpGroupInterval
   alaVrrpGroupPriority
   alaVrrpGroupPreemptMode
```

show vrrp group-association

Displays the virtual routers that are associated with a group.

show vrrp group-association [*vrgid***]**

Syntax Definitions

vrgid	The virtual router group ID, in the range from 1–255.

Defaults

By default, all virtual router group associations are displayed.

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

Use the *vrgid* parameter with this command to display the association details of a specific virtual router group.

Examples

```
-> show vrrp group-association 2
GROUPID VRID  VLAN
-------+----+-----+
    2     3      2
          4      2
          5      2
```

output definitions

GROUPID	The virtual router group identifier.
VRID	The virtual router identifier.
VLAN	The VLAN associated with the VRRP instance. Configured through the **vrrp** command.

Release History

Release 6.3.1; command was introduced.

Related Commands

vrrp group-association	Adds a virtual router to a virtual router group.

MIB Objects

```
alaVrrpAssoGroupTable
   alaVrrp3OperVrId
```

show vrrp3

Displays the virtual router configuration for all virtual routers or for a specific virtual router.

show vrrp3 [*vrid***]**

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

Use the **show vrrp3** command to display information about configuration parameters, which may be set through the **vrrp3** command. Use the **show vrrp3 statistics** command to get information about VRRP3 packets.

Examples

```
-> show vrrp3
VRRP trap generation: Enabled
VRRP startup delay: 45  (expired)

                                      Admin                              Adv.

            1100::30
```

output definitions

VRRP trap generation	Whether or not VRRP trap generation is enabled or disabled.
VRRP startup delay	The amount of time after a reboot that virtual routers will wait before they go active; allows time for routing tables to stabilize.
VRID	Virtual router identifier. Configured through the **vrrp3** command.
VLAN	The VLAN associated with the VRRP3 instance. Configured through the **vrrp3** command.
IPv6 Address(es)	The assigned IPv6 addresses. Configured through the **vrrp3 address** command.
Admin Status	The administrative status of this virtual router instance; **enabled** allows the virtual router instance to operate; **disabled** disables the virtual router instance without deleting it.
Priority	Indicates the VRRP3 router's priority for the virtual router. For more information about priority, see the **vrrp3** command description on page 26-30.
Preempt	Controls whether a higher priority virtual router will preempt a lower priority master: preempt indicates that a higher priority virtual router will preempt a lower priority master; no preempt indicates that the first backup router to take over for the master will not be preempted by a virtual router with a higher priority. In either case the IP address owner will always take over it if is available.
Accept	Displays whether the master router, which is not the IPv6 address owner will accept the packets addressed to the IPv6 address owner as its own.
Virtual MAC	Displays the virtual MAC address for the virtual router when the router is in the **master** state. The first 5 bytes are always 00-00-5E-00-02. The last byte indicates the VRID. This field displays N/A when the virtual router is in the **backup** or **initialize** state.
Adv. Interval	Indicates the time interval, in seconds, between sending advertisement messages. Only the master router sends advertisements.

Release History

Release 6.1.3; command was introduced.

Related Commands

vrrp3	Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.
vrrp3 address	Configures an IPv6 address for a virtual router.
show vrrp3 statistics	Displays statistics for all virtual routers configured on the switch or for a specific virtual router.

MIB Objects

```
alaVrrp3OperTable

```

show vrrp3 statistics

Displays statistics about VRRP3 packets for all virtual routers configured on the switch or for a specific virtual router.

show vrrp3 [*vrid***] statistics**

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

Use the **show vrrp3 statistics** command to display information about VRRP3 packets. Use the **show vrrp3** command to display information about the virtual router configuration.

Examples

```
-> show vrrp3 statistics
 Checksum    Version     VRID
  Errors     Errors     Errors
----------+----------+----------
         0          0          0

```

show vrrp3 track-association

Displays the tracking policies associated with VRRP3 virtual routers.

show vrrp3 [*vrid***] track-association [***track_id***]**

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
track_id	The ID of the tracking policy for which you want to display information.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

If a track ID is specified, only information about that track ID is displayed. If the virtual router ID and track ID are not specified, information about all virtual routers and their associated tracking policies is displayed.

Examples

```
-> show vrrp3 track-association
           Conf  Cur  Track                        Admin   Oper  Track
VRID VLAN  Pri   Pri   ID             Policy       State   State  Pri

   1  101  200   200     1  PORT 1/37             Enabled  Up      25
```

output definitions

VRID	The virtual router identifier.
VLAN	The VLAN ID associated with the virtual router.
Conf Pri	The priority configured for the virtual router through the **vrrp3** command.
Cur Pri	The priority currently being used for the virtual router. If the tracking policy is in effect because the tracked entity is down, the current priority will be equal to the configured priority (Conf Pri) minus the tracking priority (Track Pri). Otherwise the current priority will be equal to the configured priority.
Track ID	The ID of the tracking policy.
Policy	The VLAN, IPv6 address, or slot/port being tracked by this policy.
Admin State	The administrative state of the tracking policy.

output definitions (continued)

Oper State	Indicates whether the tracking policy is operational (Up) or not (Down).
Track Pri	The amount to be decremented from the configured virtual router priority when the tracking policy is applied.

Release History

Release 6.1.3; command was introduced.

Related Commands

vrrp3 track-association	Associates a VRRP3 tracking policy with a virtual router.

27 OSPF Commands

Open Shortest Path First routing (OSPF) is a shortest path first (SPF) or link-state protocol. OSPF is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPF chooses the least-cost path as the best path.

Each participating router distributes its local state (that is, the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPF allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an *area*. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

Alcatel-Lucent's version of OSPF complies with RFCs 1370, 1850, 2328, 2370, 3101, and 3623.

MIB information for OSPF is as follows:

Filename: AlcatelIND1DrcTm.mib
Module: ALCATEL-IND1-DRCTM-MIB

Filename: AlcatelIND1Ospf.mib
Module: ALCATEL-IND1-OSPF-MIB

Filename: IETF_OSPF.MIB
Module: OSPF-MIB

The following is a list of the commands for configuring OSPF:

Global OSPF Commands	**ip ospf status** **ip load ospf** **ip ospf exit-overflow-interval** **ip ospf extlsdb-limit** **ip ospf host** **ip ospf mtu-checking** **ip ospf default-originate** **ip ospf route-tag** **ip ospf spf-timer** **ip ospf virtual-link** **ip ospf neighbor** **show ip ospf** **show ip ospf border-routers** **show ip ospf ext-lsdb** **show ip ospf host** **show ip ospf lsdb** **show ip ospf neighbor** **show ip ospf routes** **show ip ospf virtual-link** **show ip ospf virtual-neighbor**
OSPF Area Commands	**ip ospf area** **ip ospf area default-metric** **ip ospf area range** **show ip ospf area** **show ip ospf area range** **show ip ospf area stub**
OSPF Interface Commands	**ip ospf interface** **ip ospf interface area** **ip ospf interface auth-key** **ip ospf interface auth-type** **ip ospf interface dead-interval** **ip ospf interface hello-interval** **ip ospf interface md5** **ip ospf interface md5 key** **ip ospf interface type** **ip ospf interface cost** **ip ospf interface poll-interval** **ip ospf interface priority** **ip ospf interface retrans-interval** **ip ospf interface transit-delay** **show ip ospf interface**
OSPF Graceful Restart Commands	**ip ospf restart-support** **ip ospf restart-interval** **ip ospf restart-helper status** **ip ospf restart-helper strict-lsa-checking status** **ip ospf restart initiate** **show ip ospf restart**

ip ospf status

Enables or disables the administration status of OSPF on the router.

ip ospf status {enable | disable}

Syntax Definitions

enable	Enables OSPF.
disable	Disables OSPF.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

The OSPF protocol must be enabled for it to route traffic.

Examples

```
-> ip ospf status enable
-> ip ospf status disable
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf	Displays OSPF status and general configuration parameters.

MIB Objects

```
ospfGeneralGroup
   ospfAdminStat
```

ip load ospf

Loads the OSPF software on the router.

ip load ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

N/A

Example

```
-> ip load ospf
```

Release History

Release 6.1; command was introduced.

Related Commands

N/A

MIB Objects

```
alaDrcTmConfig
   alaDrcTmIPOspfStatus
```

ip ospf exit-overflow-interval

This command sets the overflow interval value.

ip ospf exit-overflow-interval *seconds*

Syntax Definitions

seconds	The number of seconds the router waits before attempting to leave the overflow state.

Defaults

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- The overflow interval is the time the router will wait before attempting to leave the database overflow state; the interval begins upon the router's arrival into this state.
- When the router leaves the overflow state, it can once again create non-default and external link state advertisements (LSAs) for autonomous systems (AS).
- The router will not leave the overflow state (until it is restarted) when the overflow interval value is set to 0.

Example

```
-> ip ospf exit-overflow-interval 10
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

MIB Objects

```
ospfGeneralGroup
   ospfExitOverflowInterval
```

ip ospf extlsdb-limit

Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.

ip ospf extlsdb-limit *limit*

Syntax Definitions

limit	The maximum number of LSDB entries allowed on the router. The accepted value is any number greater than or equal to 1. If 0 is entered, there is no limit.

Defaults

parameter	default
limit	-1

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- This command allows you to set a limit to the number of external LSDBs learned by the router. An external LSDB is created when the router learns a link address that exists outside of its Autonomous System (AS).
- When the limit is set, and it is exceeded, older addresses that were previously learned are removed from the routing table to make room for the new external LSDB.

Example

```
-> ip ospf extlsdb-limit 25
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf	Displays OSPF status and general configuration parameters.

MIB Objects

```
ospfGeneralGroup
   ospfExtLsdbLimit
```

ip ospf host

Creates and deletes an OSPF entry for directly attached hosts. Allows for the modification of the host parameters of Type of Service (ToS) and metric.

ip ospf host *ip_address* **tos** *tos* **[metric** *metric***]**

no ip ospf host *ip_address* **tos** *tos*

Syntax Definitions

ip_address	The 32-bit IP address in dotted decimal format of the OSPF host. See the example below for more information.
tos	The type of service (ToS) of the specified OSPF host. The valid range is 0- 15. Only ToS value 0 is supported at this time.
metric	The cost metric value assigned to the specified host. The valid range is 0 and up.

Defaults

parameter	default
metric	0

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- The **no** variant of this command removes the record of the OSPF host.
- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. ToS routing is the ability to make a forwarding decision based on a destination address and a desired Quality of Service (QoS). ToS routing allows link selection based on QoS when more than one path exists between a source and a destination.A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path

Examples

```
-> ip ospf host 172.22.2.115 tos 1 metric 10
-> no ip ospf host 172.22.2.115 tos 1
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf host	Displays information on configured OSPF hosts.

MIB Objects

```
ospfHostTable
   ospfHostStatus
   ospfHostIpAddress
   ospfHostTOS
   ospfHostMetric
```

ip ospf mtu-checking

Enables or disables the use of Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

ip ospf mtu-checking

no ip ospf mtu-checking

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch OS6855-U24X, 6850E, 9000E

Usage Guidelines

- The **no** form of this command disables MTU checking.
- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

Examples

```
-> ip ospf mtu-checking
-> no ip ospf mtu-checking
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf
   alaOspfMTUCheck
```

ip ospf default-originate

Configures a default external route into the OSPF routing domain.

ip ospf default-originate {only | always} [metric-type {type1 | type2}] [metric *value***]**

no ip ospf default-originate

Syntax Definitions

only	Advertises only when there is a default route in the routing table**.**
always	Advertises the default route regardless of whether the routing table has a default route.
type1	Sets the external route as type1.
type2	Sets the external route as type2.
value	The metric value.The valid range is 1-65535.

Defaults

parameter	default
type1 | type2	**type2**
value	1

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

Use the **no** form of the command to delete redistributed default routes.

Examples

```
-> ip ospf default-originate always
-> ip ospf default-originate only metric 10
-> ip ospf default-originate always metric-type type1 metric 5
-> no ip ospf default-originate
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show ip ospf	Displays OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf
   alaOspfDefaultOriginate
   alaOspfDefaultOriginateMetricType
   alaOspfDefaultOriginateMetric
```

ip ospf route-tag

Configures a tag value for the Autonomous System External (ASE) routes created.

ip ospf route-tag *tag*

Syntax Definitions

tag	The set tag value. The valid range is 0–2,147,483,647.

Defaults

parameter	default
tag	0

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- This command allows you to set a tag value for ASE routes that are learned by this OSPF router. The tag value allows for quick identification.
- OSPF ASE route advertisements contain a tag value field. This field allows the exchange of information between autonomous system border routers (ASBRs).

Example

```
-> ip ospf route-tag 2
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf	Displays OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf
   alaOspfRedistRouteTag
```

ip ospf spf-timer

Configures timers for Shortest Path First (SPF) calculation.

ip ospf spf-timer [delay *delay_seconds***] [hold** *hold_seconds***]**

Syntax Definitions

delay_seconds	Specifies time (from 0 to 65535 seconds) between the reception of an OSPF topology change and the start of an SPF calculation.
hold_seconds	Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations.

Defaults

parameter	default
delay_seconds	5
hold_seconds	10

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- This command allows you to configure the time between SPF calculations. Using the delay timer, you can determine how much time to postpone an SPF calculation after the router receives a topology change. Using the hold timer, you can configure the amount of time that must elapse between consecutive SPF calculations.
- Note that if either of these values is set to 0, there will be no delay in the SPF calculation. This means that SPF calculations will occur immediately upon the reception of a topology change and/or that back-to back SPF calculations can take place with no break in-between the two.

Example

```
-> ip ospf spf-timer delay 20 hold 35
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf
   alaOspfTimerSpfDelay
   alaOspfTimerSpfHold
```

ip ospf virtual-link

Creates or deletes a virtual link. A virtual link is used to restore backbone connectivity if the backbone is not physically contiguous.

ip ospf virtual-link *area_id router_id* **[auth-type {none | simple | md5}] [auth-key** *key_string***] [dead-interval** *seconds***] [hello-interval** *seconds***] [retrans-interval** *seconds***] [transit-delay** *seconds***]**

no ip ospf virtual-link *area_id router_id*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
router_id	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
none	Sets the virtual link authorization type to no authentication.
simple	Sets the virtual link authorization type to simple authentication. If **simple** is selected, a key must be specified as well.
md5	Sets the virtual link authorization type to MD5 authentication.
key_string	Sets the virtual link authorization key. The key can be up to 8 ASCII characters. See the example for more details.
dead-interval *seconds*	Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647.
hello-interval *seconds*	Sets the virtual link hello interval, which is the time interval between OSPF hellos sent on this virtual link. The valid range is 1–65535.
retrans-interval *seconds*	Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPF packets. The valid range is 0–3600.
transit-delay *seconds*	Sets the virtual link transit delay, which is the number of seconds to transmit OSPF packets over this link. The valid range is 0–3600.

Defaults

parameter	default
none | simple | md5	**none**
key_string	null string
dead-interval *seconds*	40
hello-interval *seconds*	10
retrans-interval *seconds*	5
transit-delay *seconds*	1

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- The **no** form of the command deletes the virtual link.
- It is possible to define areas in such a way that the backbone is no longer contiguous. In this case the system administrator can ensure backbone connectivity physically.
- Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.
- If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.
- The **dead-interval** value should be the same for all routers on the same network. This value should be some multiple of the value given for the hello interval.

Examples

```
-> ip ospf virtual-link 0.0.0.1 172.22.2.115
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 auth-key "techpubs"
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 auth-type simple
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 dead-interval 50
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 hello-interval 20
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 retrans-interval 20
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 transit-delay 50
-> no ip ospf virtual-link 0.0.0.1 172.22.2.115
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf virtual-link	Displays the virtual link information.

MIB Objects

```
ospfVirtIfTable
   ospfVirtIfAreaId
   ospfVirtIfNeighbor
   ospfVirtIfAuthKey
   ospfVirtIfStatus
   ospfVirtIfAuthType
   ospfVirtIfRtrDeadInterval
   ospfVirtIfHelloInterval
   ospfVirtIfRetransInterval
   ospfVirtIfTransitDelay
```

ip ospf neighbor

Creates a static neighbor on a non-broadcast interface.

ip ospf neighbor *neighbor_id* **{eligible | non-eligible}**

no ip ospf neighbor *neighbor_id*

Syntax Definitions

neighbor_id	A unique 32-bit IP address identical to the neighbor's interface address.
eligible	Sets this router as eligible to be the DR.
non-eligible	Sets this router as not eligible to be the DR.

Defaults

parameter	default
eligible | non-eligible	**eligible**

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- NBMA (Non Broadcast Multi Access), PMP (Point-to-Multipoint), and P2P (Point-to-Point) OSPF non-broadcast modes are supported over Ethernet interfaces (broadcast media).
- Neighboring routers on non-broadcast OSPF networks must be statically configured, because lack of OSPF multicast capabilities prevents using normal OSPF Hello protocol discovery.
- In the case of NBMA interface the static neighbor eligibility for becoming a DR can be configured while it is not necessary for point-to-multipoint and point-to-point interfaces.
- An interface connected to this neighbor must also be configured as a non-broadcast interface, which can be either point-to-multipoint or point-to-point, by using the **ip ospf interface type** command.
- For the correct working of an OSPF NBMA network, a fully meshed network is mandatory. Also, the neighbor eligibility configuration for a router on every other router should match the routers interface priority configuration.

Examples

```
-> ip ospf neighbor 1.1.1.1 non-eligible
-> no ip ospf neighbor 1.1.1.1
```

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf interface type	Configures the OSPF interface type.
show ip ospf neighbor	Displays information on OSPF non-virtual neighbor routers.

MIB Objects

```
ospfNbrTable
   ospfNbrPriority
   ospfNbmaNbrStatus
```

ip ospf area

Assigns an OSPF interface to a specified area.

ip ospf area *area_id* **[summary {enable | disable}] | [type {normal | stub | nssa}]**

no ip ospf area *area_id*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
enable	Enables summarization.
disable	Disables summarization.
normal	Sets the area as a regular OSPF area.
stub	Configures an OSPF area as a stub area.
nssa	Configures an OSPF area as a Not So Stubby Area (NSSA)

Defaults

parameter	default
enable | disable	**enable**
normal | stub | nssa	**normal**

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- The **no** form deletes the area.
- The **summary** options are used to enable or disable route summarization for stub and NSSA areas. Stub and NSSA areas will not receive LSA type 3 unless summary is enabled.
- The **type** command allows you to chose what type of area this is going to be.

Examples

```
-> ip ospf area 0.0.0.1
-> ip ospf area 0.0.0.1 type stub
-> ip ospf area 0.0.0.1 type normal
-> no ip ospf area 0.0.0.1
```

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf area default-metric	Creates or deletes an OSPF default metric.
ip ospf area range	Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
show ip ospf area	Displays either all OSPF areas, or a specified OSPF area.

MIB Objects

```
ospfAreaTable
   ospfImportAsExtern
   ospfAreaSummary
   ospfAreaId
```

ip ospf area default-metric

Creates or deletes a default metric for stub or Not So Stubby Area (NSSA) areas. The default metric configures the type of cost metric that a default area border router (ABR) will advertise in the default summary Link State Advertisement (LSA).

ip ospf area *area_id* **default-metric** *tos* **[[cost** *cost***] | [type {ospf | type 1 | type 2}]**

no ip ospf area *area_id* **default-metric** *tos*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
tos	Type of service. The valid range is 0–15. Only ToS value 0 is supported at this time.
cost	The numerical cost of this area and ToS. Only 0 is supported in the current release.
ospf	Advertises external routes as OSPF autonomous system external (ASE) routes.
type1	Advertises external routes as a Type 1 (non-OSPF) metric.
type2	Advertises external routes as a Type 2 (calculated weight value from non-OSPF protocol) metric.

Defaults

parameter	default
tos	0
ospf | type 1 | type 2	**ospf**

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- The **no** form deletes the default metric from the specified area.
- The **type** command configures the type of cost metric for the specified ToS.To ensure that internal routers receiving external route advertisements choose the correct route, all border routers advertising a particular external network should be configured to advertise the route using the same metric type. That is, they must all advertise the route using an OSPF, Type 1, or Type 2 metric.

Examples

```
-> ip ospf area 1.1.1.1 default-metric 0
-> no ip ospf area 1.1.1.1 default-metric 0
```

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf area	Creates or deletes an OSPF area.
ip ospf area range	Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
show ip ospf area	Displays either all OSPF areas, or a specified OSPF area.

MIB Objects

```
ospfStubAreaTable
   ospfStubAreaId
   ospfStubTOS
   ospfStubStatus
   ospfStubMetric
   ospfStubMetricType
```

ip ospf area range

Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

ip ospf area *area_id* **range {summary | nssa}** *ip_address subnet_mask*
[effect {admatching | noMatching}]

no ip ospf area *area_id* **range {summary | nssa}** *ip_address subnet_mask*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
summary	Advertises the address range as a summary link state advertisement (LSA).
nssa	Advertises the address range of Not So Stubby Area (NSSA) routes as a Type 5 advertisement.
ip_address	A 32-bit IP address for the range's area.
subnet_mask	A 32-bit subnet mask that determines how many bits of the IP address denote the network number.
admatching	Determines that routes specified falling within the specified range will be advertised.
noMatching	Determines that any route falling within the specified range will not be advertised.

Defaults

parameter	default
summary | nssa	**summary**
admatching | noMatching	**admatching**

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- Route summarization is the consolidation of addresses within an area which are advertised as a single route. When network numbers in an area are assigned consecutively, the area border router can be configured, using this command, to advertise a route that aggregates all the individual networks within the range.
- Using this command causes a single route to be advertised, for an address range in the specified area, to other areas.

- An NSSA (Not So Stubby Area) is similar to a stub area. However, where autonomous system (AS) external routes cannot be imported into a stub area, an NSSA will allow the importing of some AS external routes.
- Area ranges, once created, are enabled by default. Classless Inter-Domain Routing (CIDR) can work with OSPF to make route summarization more efficient. This is especially true for the summarization of routes in the global database. OSPF area address ranges can be configured on area border routers

Examples

```
-> ip ospf area 1.1.1.1 range summary 172.22.2.0 255.255.255.0
-> no ip ospf area 1.1.1.1 range summary 172.22.2.0 255.255.255.0
```

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf area	Creates or deletes an OSPF area.
ip ospf area default-metric	Creates or deletes an OSPF default metric.
show ip ospf area range	Displays all or specified route summaries in a given area.

MIB Objects

```
ospfAreaAggregateTable
   ospfAreaAggregateAreaId
   ospfAreaAggregateLsdbType
   ospfAreaAggregateNet
   ospfAreaAggregateMask
   ospfAreaAggregateEffect
   ospfAreaAggregateStatus
```

ip ospf interface

Creates and deletes an OSPF interface.

ip ospf interface *interface_name*

no ip ospf interface *interface_name*

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of the command to delete an OSPF interface.
- The interface name cannot contain spaces.

Examples

```
-> ip ospf interface vlan-101
-> no ip ospf interface vlan-101
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfIpAddress
alaOspfIfAugTable
   alaOspfIfIntfName
```

ip ospf interface status

Enables or disables the administrative status on an OSPF interface.

ip ospf interface *interface_name* **status {enable | disable}**

no ip ospf interface *interface_name* **status {enable | disable}**

Syntax Definitions

interface_name	The name of the interface.
enable	Enables the OSPF interface.
disable	Disables the OSPF interface.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of the command to delete an OSPF interface.
- The OSPF interface must be enabled for it to participate in the OSPF protocol.

Examples

```
-> ip ospf interface vlan-101 status enable
-> ip ospf interface vlan-101 status disable
-> no ip ospf interface vlan-101 status enable
-> no ip ospf interface vlan-101 status disable
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfAdminStat
```

ip ospf interface area

Configures an OSPF area identifier for this interface.

ip ospf interface *interface_name* **area** *area_id*

Syntax Definitions

interface_name	The name of the interface.
area_id	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

An interface must be assigned to an area to become operational.

Examples

```
-> ip ospf interface vlan-101 area 0.0.0.1
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf area	Displays either all the OSPF areas, or a specified OSPF area.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfAreaId
```

ip ospf interface auth-key

Configures an OSPF authentication key for simple authentication on an interface.

ip ospf interface *interface_name* **auth-key** *key_string*

Syntax Definitions

interface_name	The name of the interface.
key_string	An authentication key (8 characters maximum).

Defaults

The default for the authentication key string is a null string.

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- Sets a password as a simple text string of 8 ASCII characters.
- Must be used in conjunction with the **auth-type** command, described on page 27-30, set to **simple**.

Examples

```
-> ip ospf interface vlan-101 auth-key pass
```

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf interface auth-type	Sets the authentication type.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfAuthKey
```

ip ospf interface auth-type

Sets the OSPF interface authentication type. Authentication allows the router to only respond to other routers that have the correct authentication information.

ip ospf interface *interface_name* **auth-type [none | simple | md5]**

Syntax Definitions

interface_name	The name of the interface.
none	No authentication.
simple	Simple, clear text authentication.
md5	MD5 encrypted authentication.

Defaults

parameter	default
none | simple | md5	**none**

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- Use this command to set the type of authentication that the OSPF interface uses to validate requests for route information from other OSPF neighbors on this interface.
- Simple authentication is authentication that uses only a text string as the password. The authentication type **simple** is used in conjunction with the **auth-key** keyword described, on page 27-29.
- MD5 authentication is encrypted authentication that uses an encryption key string and a key identification number. Both of these are necessary as the password. The authentication type **md5** is used in conduction with the commands described on page 27-34 and page 27-36. One command enables MD5 and the other sets the key identification number.

Examples

```
-> ip ospf interface vlan-101 auth-type simple
```

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf interface auth-key	Sets the password for simple authentication.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfAuthType
```

ip ospf interface dead-interval

Configures the OSPF interface dead interval.

ip ospf interface *interface_name* **dead-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The dead interval, in seconds. The valid range is 1–65535.

Defaults

parameter	default
seconds (broadcast and point-to-point)	40
seconds (NBMA and point-to-multi-point)	120

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- This is the interval, in seconds, after which a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or the multiple of the hello interval.

Examples

```
-> ip ospf interface vlan-101 dead-interval 50
```

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf interface hello-interval	Configures the OSPF interface hello interval.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfRtrDeadInterval
```

ip ospf interface hello-interval

Configures the OSPF interface hello interval.

ip ospf interface *interface_name* **hello-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The hello interval, in seconds. The valid range is 0–65535. A value of 0 creates a passive OSPF interface.

Defaults

parameter	default
seconds (broadcast and point-to-point)	10
seconds (NBMA and point-to-multi-point)	30

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

This is the interval between two consecutive hello packets sent out on this interface.

Examples

```
-> ip ospf interface vlan-101 hello-interval 50
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfHelloInterval
```

ip ospf interface md5

Creates and deletes the OSPF interface MD5 key identification number.

ip ospf interface *interface_name* **md5** *key_id* **[enable | disable]**

Syntax Definitions

interface_name	The name of the interface.
key_id	A key identification number. The key identification number specifies a number that allows MD5 encrypted routers to communicate. Both routers must use the same key ID. The valid range is 1–255.
enable	Enables the interface key.
disable	Disables the interface key.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- MD5 authentication can be used to encrypt information sent over the network. MD5 authentication works by using shared secret keys. Keys are used to sign the packets with an MD5 checksum, and they cannot be forged or tampered with. Since the keys are not included in the packet, snooping the key is not possible.
- This command is used in conjunction with the commands described on page 27-30 and page 27-36.
- The **no** variant deletes the key ID number.

Examples

```
-> ip ospf interface vlan-101 md5 100
-> ip ospf interface vlan-101 md5 10 disable
-> ip ospf interface vlan-101 md5 10 enable
```

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf interface auth-type	Sets the OSPF interface authentication type.
ip ospf interface md5 key	Configures the OSPF key ID and key.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
alaOspfIfMd5Table
   alaOspfIfMd5IpAddress
   alaOspfIfMd5KeyId
```

ip ospf interface md5 key

Configures the OSPF key string. This interface MD5 string, along with the key identification number, enables the interface to encode MD5 encryption.

ip ospf interface *interface_name* **md5** *key_id* **key** *key_string*

Syntax Definitions

interface_name	The name of the interface.
key_id	The key ID. The valid range is 1–255.
key_string	A key string.

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- This command is used in conjunction with the commands described above on page 27-30 and page 27-34.
- For MD5 authentication to function properly the same key string must be configured on the neighboring router for that interface.

Examples

```
-> ip ospf interface vlan-101 md5 100 key 1
```

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf interface auth-type	Sets the OSPF interface authentication type.
ip ospf interface md5	Creates and deletes the OSPF interface MD5 key identification number.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
alaOspfIfMd5Table
   alaOspfIfMd5IpAddress
   alaOspfIfMd5KeyId
   alaOspfIfMd5Key
```

ip ospf interface type

Configures the OSPF interface type.

ip ospf interface *interface_name* **type {point-to-point | point-to-multipoint | broadcast | non-broadcast}**

Syntax Definitions

interface_name	The name of the interface.
point-to-point	Sets the interface to be a point-to-point OSPF interface.
point-to-multipoint	Sets the interface to be a point-to-multipoint OSPF interface.
broadcast	Sets the interface to be a broadcast OSPF interface.
non-broadcast	Sets the interface to be NBMA (Non Broadcast Multi Access) OSPF interface.

Defaults

parameter	default
broadcast | non-broadcast | point-to-point| point-to-multipoint	**broadcast**

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- This command sets an interface to be broadcast, non-broadcast, point-to-point, or point-to-multipoint.
- If the type is non-broadcast or point-to-multipoint, static neighbors should be configured.

Examples

```
-> ip ospf interface vlan-101 type non-broadcast
```

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf neighbor	Creates a static neighbor on a Non Broadcast Multi Access (NBMA) interface.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfType
```

ip ospf interface cost

Configures the OSPF interface cost.

ip ospf interface *interface_name* **cost** *cost*

Syntax Definitions

interface_name	The name of the interface.
cost	The interface cost. The valid range is 0 to 65535.

Defaults

parameter	default
cost	1

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

The configured interface cost, if any, is used during OSPF route calculations.

Examples

```
-> ip ospf interface vlan-101 cost 10
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfMetricTable
   ospfIfMetricIpAddress
   ospfIfMetricValue
```

ip ospf interface poll-interval

Configures the OSPF poll interval for a Non Broadcast Multi Access (NBMA) interface.

ip ospf interface *interface_name* **poll-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The poll interval, in seconds. The valid range is 1–2147483647.

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

This parameter configures the larger time interval, in seconds, between hello packets sent to an inactive neighbor.

Examples

```
-> ip ospf interface vlan-101 poll-interval 500
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfPollInterval
```

ip ospf interface priority

Configures the OSPF interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

ip ospf interface *interface_name* **priority** *priority*

Syntax Definitions

interface_name	The name of the interface.
priority	The interface priority. The valid range is 0–255.

Defaults

parameter	default
priority	1

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

Examples

```
-> ip ospf interface vlan-101 priority 100
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfRtrPriority
```

ip ospf interface retrans-interval

Configures the OSPF interface retransmit interval.

ip ospf interface *interface_name* **retrans-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The retransmit interval, in seconds. The valid range 0–3600.

Defaults

parameter	default
seconds	5

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

The number of seconds between link retransmission of OSPF packets on this interface.

Examples

```
-> ip ospf interface vlan-101 retrans-interval 500
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfRetransInterval
```

ip ospf interface transit-delay

Configures the OSPF interface transit delay.

ip ospf interface *interface_name* **transit-delay** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The transit delay, in seconds. The valid range is 0–3600.

Defaults

parameter	default
seconds	1

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

Examples

```
-> ip ospf interface vlan-101 transit-delay 100
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
  ospfIfTransitDelay
```

ip ospf restart-support

Configures support for the graceful restart feature on an OSPF router.

ip ospf restart-support {planned-unplanned | planned-only}

no ip ospf restart-support

Syntax Definitions

planned-unplanned	Specifies support for planned and unplanned restarts.
planned-only	This parameter is currently not supported.

Defaults

Graceful restart is disabled by default.

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- Use the **no** form of the command to disable support for the graceful restart feature on an OSPF router.
- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch chassis-based switches with a single CMM or OmniSwitch stackable switches in a standalone configuration.
- On OmniSwitch switches, a graceful restart is supported only on active ports (that is, interfaces) that are on the secondary or idle modules in a stack during a takeover. It is not supported on ports on a primary switch in a stack.

Examples

```
-> ip ospf restart-support planned-unplanned
-> no ip ospf restart-support
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf restart	Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
   alaOspfRestartSupport
```

ip ospf restart-interval

Configures the grace period for achieving a graceful OSPF restart.

ip ospf restart-interval [*seconds***]**

Syntax Definitions

seconds	The hitless restart timeout interval, in seconds. The valid range is 0–1800.

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch chassis-based switches with a single CMM or OmniSwitch stackable switches in a standalone configuration.
- On OmniSwitch stackable switches, a graceful restart is supported only on active ports (that is, interfaces) that are on the secondary or idle modules in a stack during a takeover. It is not supported on ports on a primary switch in a stack.

Example

```
-> ip ospf restart-interval 600
```

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf restart-support	Administratively enables and disables support for the graceful restart feature on an OSPF router.
show ip ospf restart	Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
   alaOspfRestartInterval
```

ip ospf restart-helper status

Administratively enables and disables the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart.

ip ospf restart-helper [status {enable | disable}]

Syntax Definitions

enable	Enables the capability of an OSPF router to operate in helper mode.
disable	Disables the capability of an OSPF router to operate in helper mode.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch chassis-based switches with a single CMM or OmniSwitch stackable switches in a standalone configuration.
- On OmniSwitch stackable switches, a graceful restart is supported only on active ports (that is, interfaces) that are on the secondary or idle modules in a stack during a takeover. It is not supported on ports on a primary switch in a stack.

Examples

```
-> ip ospf restart-helper status disable
-> ip ospf restart-helper status enable
```

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf restart-support	Administratively enables and disables support for the graceful restart feature on an OSPF router.
ip ospf restart-helper strict-lsa-checking status	Administratively enables and disables whether a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.
show ip ospf restart	Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
   alaOspfRestartHelperSupport
```

ip ospf restart-helper strict-lsa-checking status

Administratively enables and disables whether a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

ip ospf restart-helper strict-lsa-checking status {enable | disable}

Syntax Definitions

enable	Enables whether a changed LSA will result in termination of graceful restart by a helping router.
disable	Disables a changed LSA will result in termination of graceful restart by a helping router.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch chassis-based switches with a single CMM or OmniSwitch stackable switches in a standalone configuration.
- On OmniSwitch stackable switches, a graceful restart is supported only on active ports (that is, interfaces) that are on the secondary or idle modules in a stack during a takeover. It is not supported on ports on a primary switch in a stack.

Examples

```
-> ip ospf restart-helper strict-lsa-checking status disable
-> ip ospf restart-helper strict-lsa-checking status enable
```

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf restart-support	Administratively enables and disables support for the graceful restart feature on an OSPF router.
ip ospf restart-helper status	Administratively enables and disables the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart.
show ip ospf restart	Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
   alaOspfRestartHelperSupport
```

ip ospf restart initiate

Initiates a planned graceful restart.

ip ospf restart initiate

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- You must execute this command on the primary CMM before executing a **takeover** command.
- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch chassis-based switches with a single CMM or OmniSwitch stackable switches in a standalone configuration.
- On OmniSwitch stackable switches, a graceful restart is supported only on active ports (that is, interfaces) that are on the secondary or idle modules in a stack during a takeover. It is not supported on ports on a primary switch in a stack.

Example

```
-> ip ospf restart initiate
```

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf restart	Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
   alaOspfRestartInitiate
```

show ip ospf

Displays the OSPF status and general configuration parameters.

show ip ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- This command is used to display the general configuration parameters of the OSPF router.
- See the Related Commands section below to modify the displayed parameters.

Examples

```
-> show ip ospf

Router Id                        = 10.255.11.242,
OSPF Version Number              = 2,
Admin Status                     = Enabled,
Area Border Router?              = No,
AS Border Router Status          = Disabled,
Route Tag                        = 0,
SPF Hold Time (in seconds)       = 10,
SPF Delay Time (in seconds)      = 5,
MTU Checking                     = Disabled,
# of Routes                      = 0,
# of AS-External LSAs            = 0,
# of self-originated LSAs        = 0,
# of LSAs received               = 0,
External LSDB Limit              = -1,
Exit Overflow Interval           = 0,
# of SPF calculations done       = 0,
# of Incr SPF calculations done  = 0,
# of Init State Nbrs             = 0,
# of 2-Way State Nbrs            = 0,
# of Exchange State Nbrs         = 0,
# of Full State Nbrs             = 0,
# of attached areas              = 1,
# of Active areas                = 0,
# of Transit areas               = 0,
# of attached NSSAs              = 0
```

output definitions

Router Id	The unique identification for the router.
OSPF Version Number	The version of OSPF the router is running.
Admin Status	Whether OSPF is currently enabled or disabled on the router.
Area Border Router?	Whether the router status is an area router or not.
AS Border Router Status	Whether the area Autonomous System Border Router status of this router is enabled or disabled.
Route Tag	Shows the route tag for this router.
SPF Hold Time	Shows the time in seconds between the reception of an OSPF topology change and the start of a SPF calculation.
SPF Delay Time	Shows the time in seconds between consecutive SPF calculations.
MTU Checking	Shows whether Maximum Transfer Unit checking is enabled or disabled. This is set using the **ip ospf mtu-checking** command.
# of routes	The total number of OSPF routes known to this router.
# of AS-External LSAs	The number of external routes learned from outside the router's Autonomous System (AS).
# of self-originated LSAs	The number of times a new Link State Advertisement has been sent from this router.
# of LSAs received	The number of times a new Link State Advertisement has been received by this router.
External LSDB Limit	The maximum number of entries allowed in the external Link State Database.
Exit Overflow Interval	The number of seconds the router remains in the overflow state before attempting to leave it. This is set using the **ip ospf exit-overflow-interval** command.
# of SPF calculations done	The number of SPF calculations that have occurred.
# of Incr SPF calculations done	The number of incremental SPF calculations done.
# of Init State Nbrs	The number of neighbors in the initialization state.
# of 2-Way State Nbrs	The number of OSPF 2-way state neighbors on this router.
# of Exchange State Nbrs	The number of neighbors in the exchange state.
# of Full State Nbrs	The number of neighbors in the full state.
# of attached areas	The number of areas that are configured on the router.
# of Active areas	The number of areas that are active.
# of Transit areas	The number of transit areas that are configured on the router.
# of attached NSSAs	The number of Not So Stubby Areas that are configured on the router.

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf status	Enables or disables the administration of OSPF on the router.
ip ospf mtu-checking	Enables or disables the use of Maximum Transfer Unit (MTU) checking.
ip ospf spf-timer	Configures timers for SPF calculation.
ip ospf extlsdb-limit	Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.
ip ospf exit-overflow-interval	This command sets the overflow interval value.
ip ospf route-tag	Configures a tag value for Autonomous System External (ASE) routes created.
ip router router-id	Configures the router ID for the router.

show ip ospf border-routers

Displays information regarding all or specified border routers.

show ip ospf border-routers [*area_id***] [***router_id***] [***tos***] [***gateway***]**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
router_id	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
tos	The Type of Service. The valid range is 0–15. Only ToS value 0 is supported at this time.
gateway	The 32-bit IP address of the gateway for the border router being displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- This command is used to display a list of border routers known by this OSPF router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.

Examples

```
-> show ip ospf border-routers 10.0.0.0

Router Id              Area Id            Gateway         TOS    Metric
-----------------+-----------------+--------------------+------+--------
10.0.0.0           1.0.0.1            143.209.92.71       1       1
```

output definitions

Router ID	The unique identification for the router.
Area ID	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
Gateway	The next hop interface on which the border router has been learned.
ToS	The Type of Service. Only ToS value 0 is supported at this time.
Metric	The cost to the border router.

Release History

Release 6.1; command was introduced.

Related Commands

N/A

MIB Objects

```
alaOspfBdrRouterAreaId
alaOspfBdrRouterId
alaOspfBdrRouterTos
alaOspfBdrRouterMetric
```

show ip ospf ext-lsdb

Displays external Link State Advertisements known by this router.

show ip ospf ext-lsdb [linkstate-id *ls_id***] [router-id** *router_id***]**

Syntax Definitions

ls_id	The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database.
router_id	The Router ID. The ID is a unique 32-bit value such as an IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- This command is used to display the external link state database (LSDB) for the OSPF router.
- This command can be used for OSPF debugging purposes, specifically to narrow down sections of attached areas to determine which sections are receiving the specified external LSAs. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf ext-lsdb

      LS Id         Orig Router-Id     SeqNo      Age     Protocol
-----------------+-----------------+----------+--------+----------
  198.168.100.100    198.168.100.100      10      100     STATIC
```

output definitions

LS Id	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
Orig Router-Id	The router ID of the router that originated the external LSDB.
SeqNo	The advertisement sequence number (that is, a value used to identify old and duplicate link state advertisements).
Age	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.
Protocol	The type of protocol, if any.

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf extlsdb-limit	Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.

MIB Objects

```
ospfExtLsdbTable
   ospfExtLsdbLsid
   ospfExtLsdbRouterId
   ospfExtLsdbSequence
   ospfExtLsdbAge
   ospfExtLsdbType
```

show ip ospf host

Displays information on the configured OSPF hosts.

show ip ospf host [*ip_address***]**

Syntax Definitions

ip_address	A 32-bit IP address for a directly attached host.

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- This command is used to display general information for OSPF hosts directly attached to this router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf host 172.22.2.115

   Host Address     TOS     Metric     Status       AreaId
-----------------+-------+-----------+--------+-----------------
 143.209.92.12       1            0      Up     0.0.0.0
```

output definitions

Host Address	A 32-bit IP address for a directly attached host. This can be set using the **ip ospf host** command.
ToS	The Type of Service traffic from the host is labeled as. ToS is set using the **ip ospf host** command.
Metric	The metric assigned to the host. Metric is set using the **ip ospf host** command.
Status	Whether the host is enabled or disabled.
AreaId	The area identification for the host's area.

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf host	Creates and deletes an OSPF entry for directly attached hosts.

MIB Objects

```
ospfHostTable
   ospfHostIpAddress
   ospfHostTOS
   ospfHostMetric
   ospfHostStatus
   ospfHostAreaID
```

show ip ospf lsdb

Displays LSAs in the Link State Database associated with each area.

show ip ospf lsdb [*area_id*] **[rtr | net | netsum | asbrsum] [linkstate-id** *ls_id***] [router-id** *router_id***]**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
rtr	Specifies router LSAs.
net	Specifies network LSAs.
netsum	Specifies network summary LSAs.
asbrsum	Specifies Autonomous System Border Router summary LSAs.
ls_id	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
router_id	The Router ID. The ID is a unique 32-bit value such as an IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- This command is used to display the Link State Database (LSDB) of the OSPF router. This command can be used for OSPF debugging purposes, specifically to narrow down sections of an area to determine which sections are receiving the specified link state advertisements. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.
- You can view link state advertisements by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you must also supply a valid link state ID.

Examples

```
-> show ip ospf lsdb
    Area Id       Type        LS Id        Orig Router-Id     SeqNo      Age
----------------+-------+---------------+---------------+------------+-----
0.0.0.1          OSPF   198.168.100.100  198.168.100.100     1         100
```

output definitions

Area Id	The area identification for the area to which the record belongs.
Type	The protocol type from where the route was learned.
LS Id	The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database.

output definitions (continued)

Orig Router-Id	The router ID of the router that originated the external LSDB.
SeqNo	The advertisement sequence number (that is, a value used to identify old and duplicate link state advertisements).
Age	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

MIB Objects

```
ospfLsdbTable
   ospfLsdbAreaId
   ospfLsdbType
   ospfLsdbLsid
   ospfLsdbRouterId
   ospfLsdbSequence
   ospfLsdbAge
```

show ip ospf neighbor

Displays information on OSPF non-virtual neighbor routers.

show ip ospf neighbor [*ip_address*]

Syntax Definitions

ip_address	A 32-bit IP address of the neighboring router.

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- This command is used to display all non-virtual neighbors of the OSPF router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf neighbor

IP Address        Area Id          Router Id      Vlan  State  Mode
----------------+----------------+----------------+----+-------+--------
1.1.1.1          255.255.255.255  0.0.0.0        0     Down   Static
```

output definitions

IP Address	The IP address of the neighbor.
Area Id	A unique 32-bit value, such as an IP address, that identifies the neighboring router in the Autonomous System.
Router Id	The unique identification for the neighboring router.
VlanId	The VLAN corresponding to this interface on which the neighbor is reachable.
State	The state of the OSPF neighbor adjacency.
Mode	What type of neighbor, either **Dynamic** (learned) or **Static**.

```
-> show ip ospf neighbor 1.1.1.1
Neighbor's IP Address                = 1.1.1.1,
Neighbor's Router Id                 = 0.0.0.0,
Neighbor's Area Id                   = 255.255.255.255,
Neighbor's DR Address                = 0.0.0.0,
Neighbor's BDR Address               = 0.0.0.0,
Neighbor's Priority                  = 1,
Neighbor's State                     = Down,
Hello Suppressed ?                   = No,
Neighbor's type                      = Static,
DR Eligible                          = Yes,
# of State Events                    = 0,
Mode                                 = Slave,
MD5 Sequence Number                  = 0,
Time since Last Hello                = 0 sec,
# of Outstanding LS Requests         = 0,
# of Outstanding LS Acknowledgements = 0,
# of Outstanding LS Retransmissions  = 0,
Restart Helper Status               = Not Restarting,
Restart Age (in seconds)            = 0 sec,
Last Restart Helper Exit Reason     = None
```

output definitions

Neighbor's IP Address	The IP address of the neighbor.
Neighbor's Router Id	The identification number for the selected host's record. It is most often the router's IP address.
Neighbor's Area Id	Identifier of the OSPF Area to which the neighbor is attached. 255.255.255.255 shows that this neighbor is not attached to any area.
Neighbor's DR Address	The address of the neighbors Designated Router.
Neighbor's BDR Address	The address of the neighbors Backup Designated Router.
Neighbor's Priority	The priority value for this neighbor becoming the DR.
Neighbor's State	The condition of the OSPF neighbor's state machine.
Hello Suppressed	Whether sending hello messages to this neighbor is suppressed.
Neighbor's type	What type of neighbor this is, either dynamic or static.
DR Eligible	Shows the eligibility status of the static neighbor. If it is configured as "ineligible" during creation of the neighbor, it shows up as **No**. Otherwise, if configured as Eligible (the default), it shows up as **Yes**.
# of State Events	The number of state events restricted for this neighbor and the local router.
Mode	The role the neighbor has with the local router during DD Exchange, which can be Master or Slave.
MD5 Sequence Number	The sequence number of the MD5 authorization key.
Time since Last Hello	The amount of time (in seconds) since the last HELLO messages was received from this neighbor.
# of Outstanding LS Requests	The number of Link State requests to this neighbor that have not received a response from this neighbor.
# of Outstanding LS Acknowledgements	Number of Link state Acknowledgements queued up by the local router to be sent to the neighbor.

output definitions (continued)

# of Outstanding LS Retransmissions	The number of Link State updates to the neighbor that need to be retransmitted by the OSPF router.
Restart Helper Status	Indicates whether the router is acting as a hitless restart helper for the neighbor.
Restart Age	The remaining time, in seconds, for the current OSPF hitless restart interval if the router is acting as a restart helper for the neighbor.
Last Restart Helper Exit Reason	The outcome of the last attempt at acting as a hitless restart helper for the neighbor.

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf neighbor	Creates a static neighbor on a Non Broadcast Multi Access (NBMA) interface.

MIB Objects

   alaOspfNbrRestartHelperStatus
   alaOspfNbrRestartHelperAge
   alaOspfNbrRestartHelperExitReason
```

show ip ospf routes

Displays the OSPF routes known to the router.

show ip ospf routes [*ip_addr mask tos gateway***]**

Syntax Definitions

ip_addr	The 32-bit IP address of the route destination in dotted decimal format.
mask	The IP subnet mask of the route destination.
tos	The Type of Service of the route.
gateway	The next hop IP address for this router.

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

If no variables are entered, all routes are displayed. If the variables are entered, then only routes matching the specified criteria are shown. All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

Examples

```
-> show ip ospf routes

Destination/Mask          Gateway       Metric   Vlan     Type
--------------------+-----------------+--------+------+----------
198.168.100.100       195.5.2.8          0        5       AS-Ext
```

output definitions

Destination/Mask	The destination address of the route. This can also display the destination IP address mask if it is known.
Gateway	The gateway address of the route.
Metric	The cost of the route.
Vlan	The VLAN number on which the gateway can be routed.
Type	The type of OSPF route.

Release History

Release 6.1; command was introduced.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

MIB Objects

show ip ospf virtual-link

Displays virtual link information. A virtual link is used to connect OSPF backbone routers that are not physically contiguous.

show ip ospf virtual-link [*router_id***]**

Syntax Definitions

router_id	The router ID of the remote end of the virtual link that is to be viewed.

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf virtual-link
                                      State
 Transit AreaId      Router-id    Link / Adjacency  AuthType   OperStatus
----------------+----------------+----------------+----------+------------
1.1.1.1           172.17.1.1     P2P  / Full       none        up
```

output definitions

Transit AreaId	The area identification for the area assigned to the virtual link.
Router-Id	The destination router identification for the virtual link.
State Link	The state of the virtual link with regards to the local router.
State Adjacency	The state of the virtual link adjacency.
AuthType	The type of authorization employed by the virtual link.
OperStatus	Displays whether the virtual link is enabled or disabled.

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf virtual-link	Creates or deletes a virtual link.
show ip ospf virtual-neighbor	Displays OSPF virtual neighbors.

MIB Objects

```
ospfVirtIfTable
   ospfVirtIfAreaId
   ospfVirtIfNeighbor
   ospfVirtIfState
   ospfVirtIfAuthType
```

show ip ospf virtual-neighbor

Displays OSPF virtual neighbors. A virtual neighbor is connected to the router via a virtual link rather than a physical one.

show ip ospf virtual-neighbor *area_id router_id*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
router_id	A unique 32-bit value, such as an IP address, that identifies the configured OSPF area in the AS.

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- This command is used to display all virtual neighbors for the OSPF router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf virtual-neighbor 0.0.0.0 10.0.0.1

     AreaId           RouterId     Priority Events RxmtQLen LastHello  State
----------------+----------------+--------+------+--------+---------+-------
 0.0.0.0           10.0.0.1          1        10     100      323     INIT
```

output definitions

AreaId	The area identification for the area of which the virtual neighbor is a part.
RouterId	The router identification of the virtual neighbor.
Priority	The number used to determine whether the virtual neighbor will become the designated router for its area.
Events	The number of OSPF control message sent by the neighbor to the router.
RxmtQlen	The length (in number of packets) of the retransmit queue.
LastHello	The last Hello message sent by the neighbor
State	The current state the virtual neighbor is in relative to the router; this will be INIT, Exchange, or Full.

```
-> show ip ospf virtual-neighbor 0.0.0.1 2.0.0.254
Neighbor's IP Address               = 2.0.0.254,
Neighbor's Router Id                = 2.0.0.254,
Neighbor's Area Id                  = 0.0.0.1,
Neighbor's DR Address               = 2.0.0.1,
Neighbor's BDR Address              = 2.0.0.254,
Neighbor's Priority                 = 1,
Neighbor's State                    = Full,
Hello Suppressed ?                  = No,
Neighbor's type                     = Dynamic,
# of State Events                   = 6,
Mode = Master,
MD5 Sequence Number                 = 0,
Time since Last Hello               = 5 sec,
Last DD I_M_MS                      =
# of Outstanding LS Requests        = 0,
# of Outstanding LS Acknowledgements= 0,
# of Outstanding LS Retransmissions = 0,
Restart Helper Status               = Not Restarting,
Restart Age (in seconds)            = 0 sec,
Last Restart Helper Exit Reason     = None
```

output definitions

Neighbor's IP Address	The IP address of the virtual neighbor.
Neighbor's Router Id	The identification number for the selected host's record. It is most often the router's IP address.
Neighbor's Area Id	Identifier of the OSPF Area to which the virtual neighbor is attached. 255.255.255.255 shows that this virtual neighbor is not attached to any area.
Neighbor's DR Address	The address of the virtual neighbor's Designated Router.
Neighbor's BDR Address	The address of the virtual neighbor's Backup Designated Router.
Neighbor's Priority	The priority value for this virtual neighbor becoming the DR.
Neighbor's State	The condition of the OSPF virtual neighbor's state machine.
Hello Suppressed	Whether sending hello messages to this virtual neighbor is suppressed.
Neighbor's type	What type of virtual neighbor this is, either dynamic or static.
DR Eligible	Shows the eligibility status of the virtual neighbor. If it is configured as "ineligible" during creation of the neighbor, it shows up as **No**. Otherwise, if configured as Eligible (the default), it shows up as **Yes**.
# of State Events	The number of state events restricted for this virtual neighbor and the local router.
Mode	The role the virtual neighbor has with the local router during DD Exchange, which can be Master or Slave.
MD5 Sequence Number	The sequence number of the MD5 authorization key.
Time since Last Hello	The amount of time (in seconds) since the last HELLO messages was received from this virtual neighbor.
Last DD I_M_MS	The initialize (I), more (M) and master (MS) bits, and Options field Data Description (DD) packet received from the virtual neighbor. This parameter is used to determine whether the next DD packet has been received or not.

output definitions (continued)

# of Outstanding LS Requests	The number of Link State requests to this virtual neighbor that have not received a response from this virtual neighbor.
# of Outstanding LS Acknowledgements	Number of Link state Acknowledgements queued up by the local router to be sent to the virtual neighbor.
# of Outstanding LS Retransmissions	The number of Link State updates to the virtual neighbor that need to be retransmitted by the OSPF router.
Restart Helper Status	Indicates whether the router is acting as a hitless restart helper for the virtual neighbor.
Restart Age	The remaining time, in seconds, for the current OSPF hitless restart interval if the router is acting as a restart helper for the virtual neighbor.
Last Restart Helper Exit Reason	The outcome of the last attempt at acting as a hitless restart helper for the virtual neighbor.

Release History

Release 6.1; command was introduced.

```

show ip ospf area

Displays either all OSPF areas, or a specified OSPF area.

show ip ospf area [*area_id*]

Syntax Definitions

area_id	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- Allows you to view the details of a specified OSPF area.
- Not specifying an OSPF area will display all known areas for the OSPF router.
- See the Related Commands section below for information on modifying an area.

Examples

```
-> show ip ospf area

    Area Id      AdminStatus      Type       OperStatus
---------------+-------------+-------------+------------
1.1.1.1           disabled     normal       down
0.0.0.1           disabled     normal       down

-> show ip ospf area 0.0.0.0

Area Identifier                          = 1.1.1.1,
Admin Status                             = Disabled,
Operational Status                       = Down,
Area Type                                = normal,
Area Summary                             = Enabled,
Time since last SPF Run                  = 00h:00m:27s,
# of Area Border Routers known           = 0,
# of AS Border Routers known             = 0,
# of LSAs in area                        = 0,
# of SPF Calculations done               = 0,
# of Incremental SPF Calculations done   = 0,
# of Neighbors in Init State             = 0,
# of Neighbors in 2-Way State            = 0,
# of Neighbors in Exchange State         = 0,
# of Neighbors in Full State             = 0,
# of Interfaces attached                 = 0
Attached Interfaces                      = vlan-213
```

output definitions

Area Identifier	The unique 32-bit value, such as IP address, that identifies the OSPF area in the AS.
Admin Status	Whether the area is enabled or disabled.
Operational Status	Whether the area is active.
Area Type	The area type. This field will be **normal**, **stub**, or **NSSA**.
Area Summary	Whether Area Summary is enabled or disabled.
Time since last SPF Run	The last time the Shortest Path First calculation was performed.
# of Area Border Routers known	The number of Area Border Routers in the area.
# of AS Border Routers known	The number of Autonomous System Border Routers in the area.
# of LSAs	The total number of Link State Advertisements for the Area.
# of SPF Calculations	The number of times the area has calculated the Shortest Path.
# of Incremental SPF Calculations	The number of incremental Shortest Path First calculations that have been performed in the area.
# of Neighbors in Init State	The number of OSPF neighbors that are in initialization.
# of Neighbors in 2-Way State	The number of OSPF 2-way state neighbors in this area.
# of Neighbors in Exchange State	The number of OSPF neighbors that are currently establishing their status.
# of Neighbors in Full State	The number of OSPF neighbors.
# of Interfaces attached	The number of OSPF interfaces.
Attached Interfaces	The names of the OSPF interfaces attached to this area.

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf area	Creates or deletes an OSPF area, assigning default metric, cost, and type.
ip ospf area range	Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
show ip ospf interface	Displays OSPF interface information.

MIB Objects

```
ospfAreaTable
   ospfAreaId
   ospfImportAsExtern
   ospfSpfRuns
   ospfAreaBdrRtrCount
   ospfAsBdrRtrCount
   ospfAreaLsaCount
   ospfAreaSummary
   ospfAreaStatus
alaOspfIfAugTable
   alaOspfIfIntfName
```

show ip ospf area range

Displays all or specified route summaries in a given area.

show ip ospf area *area_id* **range [{summary | nssa}** *ip_address ip_mask***]**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
summary	Specifies that routes are summarized.
nssa	Specifies the Not So Stubby Area (NSSA) routers are summarized.
ip_address	A 32-bit IP address.
ip_mask	A 32-bit subnet mask.

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- Allows you to view the details of a specified OSPF area range.
- See the Related Commands section below for information on modifying an area.

Examples

```
-> show ip ospf area 0.0.0.0 range

     AreaId        Type     Destination        Advertise
---------------+---------+-----------------+-----------
0.0.0.0          Summary   192.168.12.1/24   Matching
0.0.0.0          NSSA      143.209.92.71/24  noMatching
```

output definitions

AreaId	The area identification for the area range.
Type	The type of area the range is associated with.
Destination	The destination address of the range.
Advertise	Shows the filter effect of the range. LSAs in the range are either advertised (Matching) or not advertised (noMatching).

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf area range	Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

MIB Objects

```
ospfAreaRangeTable
   ospfAreaRangeAreaId
   ospfAreaRangeNet
   ospfAreaRangeMask
   ospfAreaRangeStatus
   ospfAreaRangeEffect
```

show ip ospf area stub

Displays stub default area metrics, if configured.

show ip ospf area *area_id* **stub**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

N/A

Examples

```
-> show ip ospf area 0.0.0.1 stub

    Area Id       TOS     Metric    MetricType
---------------+-------+----------+------------
0.0.0.1           1          1        ospf
```

output definitions

Area Id	The identification number of the stub area.
TOS	The Type of Service assignment.
Metric	The metric assignment of the default router in the stub area.
MetricType	The metric type of the stub area. It will be either **ospf**, **type1**, or **type2**.

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf area	Creates or deletes an OSPF area.

MIB Objects

```
ospfStubAreaTable
   ospfStubAreaId
   ospfStubTOS
   ospfStubMetric
   ospfStubStatus
   ospfStubMetricType
```

show ip ospf interface

Displays OSPF interface information.

show ip ospf interface [*interface_name***]**

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

Not specifying an interface name displays all known interfaces for the OSPF router.

Examples

No interface name is specified:

```
-> show ip ospf interface
    Interface                DR           Backup DR      Admin    Oper
      Name                 Address         Address       Status  Status  State
--------------------+---------------+---------------+--------+------+-------
vlan-213              213.10.10.1     213.10.10.254    enabled   up    DR
vlan-215              215.10.10.254   215.10.10.1      enabled   up    BDR
```

output definitions

Interface Name	The name of the interface.
DR Address	The designated router IP address on this network segment. Make sure you configure a VLAN for the router IP. (See Chapter 4, "VLAN Management Commands," for more information.)
Backup DR Address	The IP address of the backup designated router.
Vlan	The VLAN to which the interface is assigned.
Admin Status	The current administration status of the interface, either **enabled** or **disabled**.
Oper Status	Whether the interface is an active OSPF interface.
State	The current state of the OSPF interface. It will be **down**, **up**, **dp**, **dr**, or **other**.

The following is an example of MD5 authentication (an interface name is used in this example).

```
-> show ip ospf interface vlan-3
Interface IP Name                     = vlan-3
VLAN Id                               = 3,
Interface IP Address                  = 100.10.10.2,
Interface IP Mask                     = 255.255.255.0,

#   Id   Key   Status   StartAccept  StopAccept  StartGen  StopGen
--+----+-----+----------+-----------+-----------+---------+--------
1  1     Set  Enabled       0           0         0        0
# of Events                           = 2,
# of Init State Neighbors             = 0,
# of 2-Way State Neighbors            = 0,
# of Exchange State Neighbors         = 0,
# of Full State Neighbors             = 1
BFD Status                            = Disabled,
DR-Only Option for BFD                = Disabled
```

Note. See the table of the following page for output definitions.

The following is an example of simple authentication (an interface name is used in this example):

```
-> show ip ospf interface vlan-3
Interface IP Name                     = vlan-3
VLAN Id                               = 3,
Interface IP Address                  = 100.10.10.2,
Interface IP Mask                     = 255.255.255.0,
Admin Status                          = Enabled,
Operational Status                    = Up,
OSPF Interface State                  = DR,
Interface Type                        = Broadcast,
Area Id                               = 0.0.0.2,
Designated Router IP Address          = 100.10.10.2,
Designated Router RouterId            = 192.169.1.2,
Backup Designated Router IP Address   = 0.0.0.0,
Backup Designated Router RouterId     = 0.0.0.0,
MTU  (bytes)                          = 1500,
Metric Cost                           = 1,
Priority                              = 1,
Hello Interval (seconds)              = 10,
Transit Delay (seconds)               = 1,
Retrans Interval (seconds)            = 5,
Dead Interval (seconds)               = 40,
Poll Interval (seconds)               = 120,
Link Type                             = Broadcast,
Authentication Type                   = simple,
Authentication Key                    = Set,
# of Events                           = 3,
# of Init State Neighbors             = 0,
# of Exchange State Neighbors         = 0,
# of 2-Way State Neighbors            = 0,
# of Full State Neighbors             = 0
BFD Status                            = Disabled,
DR-Only Option for BFD                = Disabled
```

Output fields when an interface name is specified are described below:

output definitions

Interface IP Name	The name of the IP interface to which the OSPF interface is assigned.
VLAN Id	The VLAN to which the interface is assigned.
Interface IP Address	The IP address assigned to the interface.
Interface IP Mask	The IP mask associated with the IP address assigned to the interface.
Admin Status	The current administration status of the interface, either **enabled** or **disabled**.
Operational Status	Whether the interface is an active OSPF interface.
OSPF Interface State	The current state of the OSPF interface. It will be **down**, **up**, **dp**, **dr**, or **other**.
Interface Type	The OSPF interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint.
Area Id	The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area.
Designated Router IP Address	The designated router IP address.

output definitions (continued)

Designated Router RouterId	The identification number of the designated router.
Backup Designated Router IP Address	The IP address of the backup designated router.
Backup Designated Router RouterId	The identification number of the backup designated router.
MTU	The Maximum Transfer Unit (in bytes) for the interface.
Metric Cost	The cost added to routes learned on this interface.
Priority	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
Hello Interval	The number of seconds between hello messages sent out on the interface.
Transit Delay	The estimated number of seconds required to transmit a link state update over this interface.
Retrans Interval	The number of seconds the interface waits before resending hello messages.
Dead Interval	The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead.
Poll Interval	The larger time interval, in seconds, between hello messages sent to inactive neighbors.
Link Type	The IP interface type, either **broadcast** or **non broadcast**.
Authentication Type	The type of authentication used by this interface, either **none**, **simple**, or **md5**.
#	The indexing of the MD5 key. (This field is only displayed for MD5 authentication.)
Id	A key identifier that identifies the algorithm and MD5 secret key associated with this interface. (This field is only displayed for MD5 authentication.)
Key	Indicates whether the MD5 key has been set or not. (This field is only displayed for MD5 authentication.)
Status	The status of the configured MD5 authentication key. (This field is only displayed for MD5 authentication.)
StartAccept	The time that the OSPF router will start accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.)
StopAccept	The time that the OSPF router will stop accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.)
StartGen	The time that the OSPF router will start using this key for packet generation. (This field is only displayed for MD5 authentication.)
StopGen	The time that the OSPF router will stop using this key for packet generation. (This field is only displayed for MD5 authentication.)
Authentication Key	This field displays whether the authentication key has been configured or not. (This field is only displayed for simple and no authentication.)
# of Events	The number of interface state machine events.

output definitions (continued)

# of Init State Neighbors	The number of OSPF neighbors in the initialization state.
# of 2-Way State Neighbors	The number of OSPF 2-way state neighbors on this interface.
# of Exchange State Neighbors	The number of OSPF neighbors in the exchange state.
# of Full State Neighbors	The number of OSPF neighbors in the full state. The full state is a neighbor that is recognized and passing data between itself and the interface.
BFD Status	The status of BFD on this interface.
DR-Only Option for BFD	The BFD setting for this interface. If DR-Only only is disabled then the setting is All Neighbors.

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf interface	Creates and deletes an OSPF interface.
ip ospf interface auth-key	Configures an OSPF authentication key for simple authentication on an interface.
ip ospf interface dead-interval	Configures the OSPF interface dead interval.
ip ospf interface hello-interval	Configures the OSPF interface hello interval.
ip ospf interface md5	Creates and deletes the OSPF interface MD5 key identification number.
ip ospf interface md5 key	Configures the OSPF key string.
ip ospf interface cost	Configures the OSPF interface cost.
ip ospf interface poll-interval	Configures the OSPF poll interval for a Non Broadcast Multi Access (NBMA) interface.
ip ospf interface priority	Configures the OSPF interface priority.
ip ospf interface retrans-interval	Configures the OSPF interface retransmit interval.
ip ospf interface transit-delay	Configures the OSPF interface transit delay.
ip ospf interface auth-type	Sets the OSPF interface authentication type.
ip ospf interface area	Configures an OSPF interface area.
ip ospf interface type	Configures the OSPF interface type.
ip ospf interface status	Enables or disables the administration status on an OSPF interface.

show ip ospf restart

Displays the OSPF graceful restart related configuration and status.

show ip ospf restart

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6855, 6850E, 9000E

Usage Guidelines

- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch chassis-based switches with a single CMM or OmniSwitch stackable switches in a standalone configuration.
- On OmniSwitch stackable switches, a graceful restart is supported only on active ports (that is, interfaces) that are on the secondary or idle modules in a stack during a takeover. It is not supported on ports on a primary switch in a stack.

Examples

```
-> show ip ospf restart
Restart Support                     = Enabled,
Restart Interval (in seconds)       = 120,
Restart Status                      = Not Restarting,
Restart Age (in seconds)            = 0,
Last Restart Exit Reason            = None,
Restart Helper Support              = Enabled,
Restart Helper Strict Checking      = Enabled,
Restart Helper Mode                 = NotHelping
```

output definitions

Restart Support	The administrative status of OSPF graceful restart, which can be **Enabled** or **Disabled**.
Restart Interval	The configured OSPF hitless restart timeout interval, in seconds. Use the **ip ospf restart-interval** command to modify this parameter.
Restart Status	The current status of OSPF graceful restart, which can be **Not Restarting**, **Unplanned Restart** (after a CMM takeover), or **Planned Restart** (before CMM takeover).
Restart Age	The remaining time, in seconds, for the current OSPF graceful restart interval.

output definitions (continued)

Last Restart Exit Reason	The outcome of the last attempt at a graceful restart. If the value is **None**, then no restart has yet been attempted. If the value is **In Progress**, then a restart attempt is currently underway. Other possible values include **Completed** (successfully completed), **Timed Out** (timed out), and **Topology Changed** (aborted due to topology change).
Restart Helper Support	The administrative status of the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart, which can be **Enabled** or **Disabled**. Use the **ip ospf restart-helper status** command to modify this parameter.
Restart Helper Strict Checking	The administrative status of whether a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router, which can be **Enabled** or **Disabled**. Use the **ip ospf restart-helper strict-lsa-checking status** command to modify this parameter.
Restart Helper Mode	Whether this OSPF router is operating as a helper to a restarting router.

Release History

Release 6.1; command was introduced.

Related Commands

ip ospf interface	Creates and deletes an OSPF interface.
ip ospf restart-interval	Configures the grace period for achieving a graceful OSPF restart.
ip ospf restart-helper status	Administratively enables and disables the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart.
ip ospf restart-helper strict-lsa-checking status	Administratively enables and disables whether a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

MIB Objects

28 OSPFv3 Commands

Open Shortest Path First version 3 (OSPFv3) routing is a shortest path first (SPF) or link-state protocol. This protocol is compatible with 128-bit IPv6 address space, while OSPF is compatible with 32-bit IPv4 address space. OSPFv3 is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPFv3 chooses the least-cost path as the best path.

Each participating router distributes its local state (that is, the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPFv3 allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an *are*a. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

Note. OSPFv3 is supported only on OmniSwitch 6855, OmniSwitch 6850E Series, and 9000E switches.

Alcatel-Lucent's version of OSPFv3 complies with RFCs 2740, 1826, 1827, 2553, 2373, 2374, and 2460.

MIB information for OSPFv3 is as follows:

Filename: AlcatelIND1DrcTm.mib
Module: ALCATEL-IND1-DRCTM-MIB

Filename: AlcatelIND1Ospf3.mib
Module: ALCATEL-IND1-OSPF3-MIB

Filename: IETF-OSPF-OSPFv3.MIB
Module: OSPF-OSPFv3-MIB

The following is a list of the commands for configuring OSPFv3:

Global OSPFv3 Commands	**ipv6 ospf status** **ipv6 load ospf** **ipv6 ospf host** **ipv6 ospf mtu-checking** **ipv6 ospf route-tag** **ipv6 ospf spf-timer** **ipv6 ospf virtual-link** **show ipv6 ospf** **show ipv6 ospf border-routers** **show ipv6 ospf host** **show ipv6 ospf lsdb** **show ipv6 ospf neighbor** **show ipv6 ospf routes** **show ipv6 ospf virtual-link**
OSPFv3 Area Commands	**ipv6 ospf area** **show ipv6 ospf area**
OSPFv3 Interface Commands	**ipv6 ospf interface** **ipv6 ospf interface status** **ipv6 ospf interface area** **ipv6 ospf interface dead-interval** **ipv6 ospf interface hello-interval** **ipv6 ospf interface cost** **ipv6 ospf interface priority** **ipv6 ospf interface retrans-interval** **ipv6 ospf interface transit-delay** **show ipv6 ospf interface**

ipv6 ospf status

Enables or disables the OSPFv3 administrative status for the router.

ipv6 ospf status {enable | disable}

Syntax Definitions

enable	Enables OSPFv3.
disable	Disables OSPFv3.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

The OSPFv3 protocol should be enabled to route traffic.

Examples

```
-> ipv6 ospf status enable
-> ipv6 ospf status disable
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show ipv6 ospf	Displays OSPFv3 status and general configuration parameters.

MIB Objects

```
ospfv3GeneralGroup
   ospfv3AdminStat
```

ipv6 load ospf

Loads the OSPFv3 software on the router.

ipv6 load ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

N/A

Example

```
-> ipv6 load ospf
```

Release History

Release 6.1.3; command was introduced.

Related Commands

N/A

MIB Objects

```
ALADRCTMCONFIG
   alaDrcTmIPOspf3Status
```

ipv6 ospf host

Creates or deletes an OSPFv3 entry for directly attached hosts.

ipv6 ospf host *ipv6_address* **[area** *area_id***] [metric** *metric***]**

no ipv6 ospf host *ipv6_address* **area** *area_id*

Syntax Definitions

ipv6_address	The 128-bit IP address of the OSPF host.
area_id	Area to which the host route belongs.
metric	The cost metric value assigned to the specified host. The valid range is 0–65535.

Defaults

parameter	default
metric	0

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of the command to remove the record of the OSPFv3 host.
- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path.
- This command allows you to modify the host parameter **metric**.

Examples

```
-> ipv6 ospf host 2001::1/64 metric 10
-> no ipv6 ospf host 2001::1/64 metric 10
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show ipv6 ospf host	Displays information on the configured OSPFv3 hosts.

MIB Objects

```
ospfv3HostTable
   ospfv3HostStatus
   ospfv3HostAreaID
   ospfv3HostAddress
   ospfv3HostMetric
```

ipv6 ospf mtu-checking

Enables or disables Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

ipv6 ospf mtu-checking

no ipv6 ospf mtu-checking

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of the command to disable MTU checking.
- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

Examples

```
-> ipv6 ospf mtu-checking
-> no ipv6 ospf mtu-checking
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show ipv6 ospf	Displays the OSPFv3 status and general configuration parameters.

MIB Objects

```
alaProtocolOspf3
   alaOspf3MTUCheck
```

ipv6 ospf route-tag

Configures a tag value for the Autonomous System External (ASE) routes created.

ipv6 ospf route-tag *tag*

Syntax Definitions

tag	The set tag value. The valid range is 0–2, 147, 483, 647.

Defaults

parameter	default
tag	0

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- This command allows you to set a tag value for ASE routes that are learned by this OSPF router. The tag value allows for quick identification.
- OSPF ASE route advertisements contain a tag value field. This field allows the exchange of information between autonomous system border routers (ASBRs).

Examples

```
-> ipv6 ospf route-tag 2
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show ipv6 ospf	Displays OSPFv3 status and general configuration parameters.

MIB Objects

```
alaProtocolOspf3
   alaOspf3RedistRouteTag
```

ipv6 ospf spf-timer

Configures timers for Shortest Path First (SPF) calculation.

ipv6 ospf spf-timer [delay *delay_seconds***] [hold** *hold_seconds***]**

Syntax Definitions

delay_seconds	Specifies time (from 0 to 65535 seconds) between the reception of an OSPF topology change and the start of an SPF calculation.
hold_seconds	Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations.

Defaults

parameter	default
delay_seconds	5
hold_seconds	10

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- This command allows you to configure the time interval between SPF calculations.
- Use the delay timer to determine how much time to postpone an SPF calculation after the router receives a topology change.
- Use the hold timer to configure the amount of time that must elapse between consecutive SPF calculations.
- There will be no delay in the SPF calculation if either the delay timer or hold timer is set to 0. The SPF calculations will occur immediately upon the reception of a topology change and/or that back-to back SPF calculations can take place with no break in-between the two.

Examples

```
-> ipv6 ospf spf-timer delay 20 hold 35
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show ipv6 ospf	Displays the OSPFv3 status and general configuration parameters.

MIB Objects

```
alaProtocolOspf3
   alaOspf3TimerSpfDelay
   alaOspf3TimerSpfHold
```

ipv6 ospf virtual-link

Creates or deletes a virtual link. A virtual link restores the backbone connectivity if the backbone is not physically contiguous.

ipv6 ospf virtual-link area *area_id* **router** *router_id*
[dead-interval *seconds***] [hello-interval** *seconds***] [retrans-interval** *seconds***] [transit-delay** *seconds***]**

no ipv6 ospf virtual-link area *area_id* **router** *router_id*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
router_id	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
dead-interval *seconds*	Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647.
hello-interval *seconds*	Sets the virtual link hello interval, which is the time interval between OSPF hellos sent on this virtual link. The valid range is 1–65535.
retrans-interval *seconds*	Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPF packets. The valid range is 0–3600.
transit-delay *seconds*	Sets the virtual link transit delay, which is the number of seconds to transmit OSPF packets over this link. The valid range is 0–3600.

Defaults

parameter	default
dead-interval *seconds*	40
hello-interval *seconds*	10
retrans-interval *seconds*	5
transit-delay *seconds*	1

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of the command to delete the virtual link.
- You can define areas in such a way that the backbone is no longer contiguous. In this case, the system administrator can ensure backbone connectivity physically.
- Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.
- If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.
- The **dead-interval** value should be the same for all the routers on the same network. This value should be a multiple of the value provided for the **hello-interval**.

Examples

```
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 dead-interval 50
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 hello-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 retrans-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 transit-delay 50
-> no ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show ipv6 ospf virtual-link	Displays the virtual link information.

MIB Objects

```
ospfv3VirtIfTable
   ospfv3VirtIfAreaId
   ospfv3VirtIfNeighbor

   ospfv3VirtIfHelloInterval
   ospfv3VirtIfRetransInterval
   ospfv3VirtIfTransitDelay
```

ipv6 ospf area

Assigns an OSPFv3 interface to a specified area.

ipv6 ospf area *area_id* **[type {normal | stub [default-metric** *metric***]}]**

no ipv6 ospf area *area_id*

Syntax Definitions

area_id	A unique 32-bit value in IPv4 address format.
normal	Sets the area as a regular OSPFv3 area.
stub	Configures an OSPFv3 area as a stub area.
metric	Defines the metric to be used for default routes injected into the stub.

Defaults

parameter	default
normal | stub	**normal**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of the command to delete the OSPFv3 area.
- The **default-metric** parameter defines the metric to be used for default routes injected into the stub area.

Examples

```
-> ipv6 ospf area 0.0.0.1
-> ipv6 ospf area 0.0.0.1 stub
-> ipv6 ospf area 0.0.0.1 type normal
-> no ipv6 ospf area 0.0.0.1
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show ipv6 ospf area	Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

MIB Objects

```
ospfv3AreaTable
   ospfv3ImportAsExtern
   ospfv3AreaSummary
   ospfv3StubMetric
   ospfv3AreaId
```

ipv6 ospf interface

Creates or deletes an OSPFv3 interface.

ipv6 ospf interface *interface_name*

no ipv6 ospf interface *interface_name*

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of the command to delete an OSPFv3 interface.
- The interface name cannot contain spaces.

Examples

```
-> ipv6 ospf interface vlan-101
-> no ipv6 ospf interface vlan-101
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
```

ipv6 ospf interface status

Enables or disables the administration status on an OSPFv3 interface.

ipv6 ospf interface *interface_name* **status {enable | disable}**

no ipv6 ospf interface *interface_name*

Syntax Definitions

interface_name	The name of the interface.
enable	Enables the OSPFv3 interface.
disable	Disables the OSPFv3 interface.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of the command to delete an OSPFv3 interface.
- The OSPFv3 interface must be enabled to participate in the OSPFv3 protocol.

Examples

```
-> ipv6 ospf interface vlan-101 status enable
-> ipv6 ospf interface vlan-101 status disable
-> no ipv6 ospf interface vlan-101
-> no ipv6 ospf interface vlan-101
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfAdminStat
```

ipv6 ospf interface area

Configures an OSPFv3 area identifier for this interface.

ipv6 ospf interface *interface_name* **area** *area_id*

Syntax Definitions

interface_name	The name of the interface.
area_id	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

An interface must be assigned to an area to become operational.

Examples

```
-> ipv6 ospf interface vlan-101 area 0.0.0.1
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show ipv6 ospf area	Displays either all the OSPFv3 areas, or a specified OSPFv3 area.
show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfAreaId
```

ipv6 ospf interface dead-interval

Configures the OSPFv3 interface dead interval.

ipv6 ospf interface *interface_name* **dead-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The dead interval, in seconds. The valid range is 1–65535.

Defaults

parameter	default
seconds (broadcast and point-to-point)	40
seconds (NBMA and point-to-multi-point)	120

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- After the dead interval, a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or multiples of the hello interval.

Examples

```
-> ipv6 ospf interface vlan-101 dead-interval 50
```

Release History

Release 6.1.3; command was introduced.

Related Commands

ipv6 ospf interface hello-interval	Configures the OSPFv3 interface hello interval.
show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfRtrDeadInterval
```

ipv6 ospf interface hello-interval

Configures the OSPFv3 interface hello interval.

ipv6 ospf interface *interface_name* **hello-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The hello interval, in seconds. The valid range is 0–65535. A value of 0 create a passive OSPF interface.

Defaults

parameter	default
seconds (broadcast and point-to-point)	10
seconds (NBMA and point-to-multi-point)	30

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

This is the interval between two consecutive hello packets sent out on this interface.

Examples

```
-> ipv6 ospf interface vlan-101 hello-interval 50
```

Release History

Release 6.1.3; command was introduced.

Related Commands

ipv6 ospf interface dead-interval	Configures the OSPFv3 interface dead interval.
show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfHelloInterval
```

ipv6 ospf interface cost

Configures the OSPFv3 interface cost.

ipv6 ospf interface *interface_name* **cost** *cost*

Syntax Definitions

interface_name	The name of the interface.
cost	The interface cost. The valid range is 0–65535.

Defaults

parameter	default
cost	1

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

The configured interface cost (if any) is used during OSPFv3 route calculations.

Examples

```
-> ipv6 ospf interface vlan-101 cost 10
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfMetricValue
```

ipv6 ospf interface priority

Configures the OSPFv3 interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

ip ospf interface *interface_name* **priority** *priority*

Syntax Definitions

interface_name	The name of the interface.
priority	The interface priority. The valid range is 0–255.

Defaults

parameter	default
priority	1

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

Examples

```
-> ipv6 ospf interface vlan-101 priority 100
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfRtrPriority
```

ipv6 ospf interface retrans-interval

Configures the OSPFv3 interface retransmit time interval.

ipv6 ospf interface *interface_name* **retrans-interval** *interval*

Syntax Definitions

interface_name	The name of the interface.
interval	The retransmit interval, in seconds. The valid range 0–3600.

Defaults

parameter	default
interval	5

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

The number of seconds between link retransmission of OSPFv3 packets on this interface.

Examples

```
-> ipv6 ospf interface vlan-101 retrans-interval 500
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfRetransInterval
```

ipv6 ospf interface transit-delay

Configures the OSPFv3 interface transit time delay.

ipv6 ospf interface *interface_name* **transit-delay** *delay*

Syntax Definitions

interface_name	The name of the interface.
delay	The transit delay, in seconds. The valid range is 0–3600.

Defaults

parameter	default
seconds	1

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

Examples

```
-> ipv6 ospf interface vlan-101 transit-delay 100
```

Release History

Release 6.1.3; command was introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfTransitDelay
```

show ipv6 ospf

Displays the OSPFv3 status and general configuration parameters.

show ipv6 ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- This command is used to display the general configuration parameters of the OSPFv3 router.
- See the Related Commands section below to modify the displayed parameters.

Examples

```
-> show ipv6 ospf

Status                          = Enabled,
Router ID                       = 5.5.5.5,
# Areas                         = 2,
# Interfaces                    = 4,
Area Border Router              = Yes,
AS Border Router                = No,
External Route Tag              = 0,
SPF Hold (seconds)              = 10,
SPF Delay (seconds)             = 5,
MTU checking                    = Enabled,
# SPF calculations performed    = 3,
Last SPF run (seconds ago)      = N/A,
# of neighbors that are in:
  Full state                    = 3,
  Loading state                 = 0,
  Exchange state                = 0,
  Exstart state                 = 0,
  2way state                    = 0,
  Init state                    = 0,
  Attempt state                 = 0,
  Down state                    = 0,
```

output definitions

Status	Displays whether OSPFv3 is currently enabled or disabled on the router.
Router Id	The unique identification for the router.
# Areas	Number of areas to which the router belongs.
# Interface	Number of interfaces participating in OSPF
Area Border Router	Displays whether the router status is an area router or not.
AS Border Router	Displays whether the area Autonomous System Border Router status of this router is enabled or disabled.
External Route Tag	Displays the route tag for this router.
SPF Hold (seconds)	Displays the time in seconds between the reception of an OSPFv3 topology change and the start of a SPF calculation.
SPF Delay (seconds)	Displays the time in seconds between consecutive SPF calculations.
MTU Checking	Displays whether Maximum Transfer Unit checking is enabled or disabled. This is set using the **ipv6 ospf mtu-checking** command.
# SPF calculations performed	Displays the number of SPF calculation performed.
Last SPF run (seconds ago)	N/A
Full state	Displays the number of neighbor routers that are in Full state.
Loading state	Displays the number of neighbor routers that are in Loading state.
Exchange state	Displays the number of neighbor routers that are in Exchange state.
Exstart state	Displays the number of neighbor routers that are in Exstart state.
2way state	Displays the number of neighbor routers that are in 2way state.
Init state	Displays the number of neighbor routers that are in Init state.
Attempt state	Displays the number of neighbor routers that are in Attempt state.
Down state	Displays the number of neighbor routers that are in Down state.

Release History

Release 6.1.3; command was introduced.

Related Commands

ipv6 ospf status	Enables or disables the administration of OSPFv3 on the router.
ipv6 ospf mtu-checking	Enables or disables the use of Maximum Transfer Unit (MTU) checking.
ipv6 ospf spf-timer	Configures timers for SPF calculation.
ipv6 ospf route-tag	Configures a tag value for Autonomous System External (ASE) routes created.
ip router router-id	Configures the router ID for the router.

MIB Objects

```
ospfv3GeneralGroup
   ospfv3RouterId
   ospfv3AdminStat

   alaOspf3MTUCheck
```

show ipv6 ospf border-routers

Displays information regarding all or specified border routers.

show ipv6 ospf border-routers [area *area_id***] [router** *router_id***]**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
router_id	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- This command is used to display a list of border routers known by this OSPFv3 router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.

Examples

```
-> show ipv6 ospf border-routers

Router ID          Area           Metric   Type
---------------+---------------+--------+---------
6.6.6.6            0.0.0.0          2      INTRA
6.6.6.6            0.0.0.1          2      INTRA
        fe80::2d0:95ff:fee2:6bda -> pseudo1
        fe80::2d0:95ff:fee2:6bda -> pseudo2
```

output definitions

Router ID	The unique identification for the router.
Area	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
Metric	The metric used by the routes.
Type	The type of routes specified (intra or inter).

Release History

Release 6.1.3; command was introduced.

Related Commands

N/A

MIB Objects

N/A

show ipv6 ospf host

Displays information on the configured OSPFv3 hosts.

show ipv6 ospf host [*ipv6_address***]**

Syntax Definitions

ipv6_address	A 128-bit IP address for a directly attached host.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- This command is used to display general information for OSPFv3 hosts directly attached to this router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ipv6 ospf host

Area             Metric   Address
---------------+-------+-----------
0.0.0.1            1      2001::1/64
```

output definitions

Area	A 32-bit IP address for a directly attached host. This can be set using the **ipv6 ospf host** command.
Metric	The metric assigned to the host. Metric is set using the **ipv6 ospf host** command.
Address	IPV6 address of the host.

Release History

Release 6.1.3; command was introduced.

Related Commands

ipv6 ospf host	Creates or deletes an OSPFv3 entry for directly attached hosts.

MIB Objects

```
ospfv3HostTable
   ospfv3HostIpAddress
   ospfv3HostMetric
   ospfHostStatus
   ospfv3HostAreaID
```

show ipv6 ospf lsdb

Displays Link State Advertisements (LSAs) in the Link State Database (LSDB) associated with each area.

show ipv6 ospf lsdb [area *area_id***] [rtr | net | netsum | asbrsum] [linkstate-id** *ls_id***] [router-id** *router_id***]**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
rtr	Specifies router LSAs.
net	Specifies network LSAs.
netsum	Specifies network summary LSAs.
asbrsum	Specifies Autonomous System Border Router summary LSAs.
ls_id	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
router_id	The Router ID. The ID is a unique 32-bit value such as an IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- This command is used to display the LSDB of the OSPF router. It can be used for OSPF debugging, specifically to narrow down sections of an area to determine which sections are receiving the specified LSAs. You can specify the parameters of only the area LSDB using the optional command parameters.
- You can view LSAs by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you also need to supply a valid link state ID.

Examples

```
-> show ipv6 ospf lsdb

Area             Type       Link ID      Advertising Rtr  Sequence #   Age

-----------------+----------+------------+-----------------+----------+----------
0.0.0.0          Router     0            1.1.1.1           8000020f     1117
0.0.0.0          Router     0            3.3.3.3           80000208     1121
0.0.0.0          Router     0            5.5.5.5           800001f1     1117
0.0.0.0          Router     0            30.30.30.30       800000da     1115
```

output definitions

Area	The identification of the area to which the router belongs.
Type	The protocol type from where the route was learned.
Link Id	The Link state ID. The ID is a unique 32-bit value expressed as an IPv6 address. This number is used as a record in the link state database.
Advertising Rtr	The ID of the router that advertises the routes.
Sequence #	The advertisement sequence number (that is, a value used to identify old and duplicate link state advertisements).
Age	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.

Release History

Release 6.1.3; command was introduced.

Related Commands

ipv6 ospf status	Displays the OSPFv3 status and general configuration parameters.

MIB Objects

```
ospfv3AsLsdbTable
   ospfv3AsLsdbAreaId
   ospfv3AsLsdbType
   ospfv3AsLsdbLsid
   ospfv3AsLsdbRouterId

   ospfv3AsLsdbSequence
   ospfv3AsLsdbAge
```

show ipv6 ospf neighbor

Displays information on OSPFv3 non-virtual neighbors.

show ipv6 ospf neighbor [router *ipv4_address***][interface** *interface_name***]**

Syntax Definitions

ipv4_address	A 32-bit router ID of the neighboring router.
interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- This command is used to display all non-virtual neighbors of the OSPF router.

Examples

```
-> show ipv6 ospf neighbor
Router ID        Area/Transit Area   State  Interface
----------------+-------------------+-----+---------------------------------
1.1.1.1          0.0.0.0              FULL  vlan-2071
3.3.3.3          0.0.0.0              FULL  vlan-2071
5.5.5.5          0.0.0.0              FULL  vlan-2071
23.23.23.23      0.0.0.1              FULL  vlan-2055
23.23.23.23      0.0.0.1              FULL  vlan-2056
24.24.24.24      0.0.0.1              FULL  vlan-2065
24.24.24.24      0.0.0.1              FULL  vlan-2066
```

output definitions

Router ID	The unique identification for the router.
Area/Transit Area	The area identifier.
State	The state of the OSPF neighbor adjacency.
Interface	The name of the interface.

```
-> show ipv6 ospf neighbor router 24.24.24.24
Router ID        Area/Transit Area   State  Interface
----------------+-------------------+-----+--------------
24.24.24.24      0.0.0.1              FULL  vlan-2070
24.24.24.24      0.0.0.1              FULL  vlan-2073
```

output definitions

Router ID	The unique identification for the router.
Area/Transit Area	The area identifier.
State	The state of the OSPF neighbor adjacency.
Interface	The name of the interface.

Release History

Release 6.1.3; command was introduced.

Related Commands

N/A

MIB Objects

```

```

show ipv6 ospf routes

Displays the OSPFv3 routes known to the router.

show ipv6 ospf routes [prefix *ipv6_address_prefix***][gateway** *gateway***]**

Syntax Definitions

ipv6_address_prefix	The 128-bit IPv6 address of the route destination in hexadecimal format.
gateway	The next hop IPv6 address for this router.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- If no variables are entered, all routes are displayed.
- If the variables are entered, then only routes matching the specified criteria are shown.
- All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

Examples

```
-> show ipv6 ospf routes
                                                          Path  Metric
                                                             Metric
 Prefix                                       Path Type         1 : 2
        Gateway Address -> Interface
----------------------------------------+----------+--------------------------
 ::30.30.31.0/120                            INTRA            1 : -
        :: -> v6-intf1001
 ::30.30.32.0/120                            INTRA            1 : -
        :: -> v6-intf1002
 ::30.30.33.0/120                            INTRA            1 : -
        :: -> v6-intf1003
```

output definitions

Prefix	The destination address of the IPv6 route in the hexadecimal format.
Gateway Address	The address of the gateway.
Interface	The outgoing interface on the switch.
Path Type	The type of routes specified (intra or inter).
Path Metric	The cost of the route.

Release History

Release 6.1.3; command was introduced.

Related Commands

ipv6 ospf status	Displays the OSPFv3 status and general configuration parameters.

MIB Objects

N/A

show ipv6 ospf virtual-link

Displays virtual link information. A virtual link is used to connect OSPFv3 backbone routers that are not physically contiguous.

show ipv6 ospf virtual-link [*router_id***]**

Syntax Definitions

router_id	The router ID of the remote end of the virtual link.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

N/A

Examples

```
-> show ipv6 ospf virtual-link
                                    Intf   Nbr
Transit Area     Peer Router ID    State  State   Cost
----------------+----------------+------+-------+------+
0.0.0.1          6.6.6.6           P2P     FULL    2
```

output definitions

Transit Area	The area identification for the area assigned to the virtual link.
Peer Router ID	The destination router identification for the virtual link.
Intf State	The state of the virtual link with regards to the local router.
Nbr State	The state of the virtual link adjacency.
Cost	The cost metric of the route.

Release History

Release 6.1.3; command was introduced.

Related Commands

ipv6 ospf virtual-link	Creates or deletes a virtual link.

MIB Objects

```
ospfv3VirtIfTable
   ospfv3VirtIfAreaId
   ospfv3VirtIfNeighbor
   ospfv3VirtIfState
```

show ipv6 ospf area

Displays either all OSPFv3 areas, or a specified OSPFv3 area.

show ipv6 ospf area [*area_id*]

Syntax Definitions

area_id	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

- Allows you to view the details of a specified OSPFv3 area.
- If an OSPF area is not specified, all known areas for the OSPFv3 router will be displayed.
- See the Related Commands section below for information on modifying an area.

Examples

```
-> show ipv6 ospf area

                           Stub   Number of
Area ID           Type    Metric  Interfaces
----------------+-------+-------+-------------
0.0.0.0           Normal   NA      2
0.0.0.1           Normal   NA      2

-> show ipv6 ospf area 0.0.0.0
Area Type                              = Normal,
Area Stub Metric                       = 0,
# of SPF calculations                  = 52,
# Interfaces                           = 3,
# Router LSAs                          = 2,
# Network LSAs                         = 3,
# Intra-area-prefix LSAs               = 4,
# Inter-area-prefix LSAs               = 15,
# Inter-area-router LSAs               = 0,
# hosts                                = 0,
```

output definitions

Area Type	The area type. This field will be **normal** or **stub**.
Area Stub Metric	Indicates whether the area is enabled or disabled.
# Router LSAs	The total number of Link State Advertisements for the Area.

output definitions (continued)

# Network LSAs	The total number of inter-area Link State Advertisements.
# of SPF calculations	The number of times the area has calculated the Shortest Path.
# Interfaces	The number of OSPF interfaces.
# Intra-area-prefix LSAs	The number of intra-area-prefix LSAs, which associates a list of IPv6 address prefixes with a router by referencing a router-LSA.
# Inter-area-prefix LSAs	The number of inter-area-prefix LSAs.Corresponds to Type 3 summary-LSA of OSPF.
# Inter-area-router LSAs	The number of inter-area-router LSAs. Corresponds to Type 4 summary-LSA of OSPF.
# hosts	The number of directly attached hosts.

Release History

Release 6.1.3; command was introduced.

Related Commands

ipv6 ospf area	Creates or deletes an OSPFv3 area, assigning default metric, cost, and type.
show ipv6 ospf interface	Displays OSPFv3 interface information.

MIB Objects

```
ospfv3AreaTable
   ospfv3AreaId
   ospfv3ImportAsExtern
   ospfv3SpfRuns
   ospfv3AreaBdrRtrCount
   ospfv3AreaSummary
   ospfv3AreaStatus
```

show ipv6 ospf interface

Displays OSPFv3 interface information.

show ipv6 ospf interface [*interface_name***]**

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 6855, 9000E

Usage Guidelines

Not specifying the interface name displays all known interfaces for the OSPFv3 router.

Examples

```
-> show ipv6 ospf interface
                                                Admin     Oper
Name        DR Router ID     BDR Router ID     Status    Status     State
----------+----------------+---------------+----------+---------+---------
vlan-2071    5.5.5.5          0.0.0.0        Enabled      Up        DR

vlan-2055    7.7.7.7          5.5.5.5        Enabled      Up        BDR

vlan-2056    7.7.7.7          5.5.5.5        Enabled      Up        BDR
```

output definitions

Name	The name of the interface.
DR Router ID	The designated router address on this network segment. Make sure you configure a VLAN for the router IP. (See Chapter 4, "VLAN Management Commands," for more information.)
BDR Router ID	The IP address of the backup designated router.
Vlan	The VLAN to which the interface is assigned.
Admin Status	The current administration status of the interface, either **enabled** or **disabled**.
Oper Status	Indicates whether the interface is an active OSPF interface.
State	The current state of the OSPF interface. It will be **DR, BDR, other.**

```
-> show ipv6 ospf interface vlan-2071
Type                              = BROADCAST,
Admin Status                      = Enabled,
IPv6 Interface Status             = Up,
Oper Status                       = Up,
State                             = DR,
Area                              = 0.0.0.0,
Priority                          = 100,
Cost                              = 1,
Designated Router                 = 3.3.3.3,
Backup Designated Router          = 0.0.0.0,
Hello Interval                    = 1,
Router Dead Interval              = 4,
Retransmit Interval               = 5,
Transit Delay                     = 1,
Ifindex                           = 17,
IPv6 'ifindex'                    = 2071,
MTU                               = 1500,
# of attached neighbors           = 0,
Globally reachable prefix #0      = 2071::2/64
```

Output fields when an IP address or interface name is specified are described below:

output definitions

Type	The OSPF interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint.
Admin Status	The current administrative status of the interface, either **enabled** or **disabled**.
IPv6 Interface Status	The current administrative status of the IPv6 interface, either **up** or **down**.
Oper Status	Indicates whether the interface is an active OSPF interface.
State	The current state of the OSPF interface. It will be **down**, **up**, **dp**, **dr**, or **other**.
Area	The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area.
Priority	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
Cost	The cost added to routes learned on this interface.
Designated Router	The identification number of the designated router.
Backup Designated Router	The identification number of the backup designated router.
Hello Interval	The number of seconds between hello messages sent out on the interface.
Router Dead Interval	The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead.
Retransmit Interval	The number of seconds the interface waits before resending hello messages.
Transit Delay	The estimated number of seconds required to transmit a link state update over this interface.

output definitions (continued)

Ifindex	The unique value assigned to an interface.
IPv6 'ifindex'	The unique value assigned to an IPv6 interface.
MTU	The Maximum Transfer Unit (in bytes) for the interface.
# of attached neighbors	The number of OSPFv3 neighbors in the initialization state.
Globally reachable prefix #0	A globally unique IPv6 address.

Release History

Release 6.1.3; command was introduced.

Related Commands

ipv6 ospf interface	Creates and deletes an OSPFv3 interface.
ipv6 ospf interface dead-interval	Configures the OSPFv3 interface dead interval.
ipv6 ospf interface hello-interval	Configures the OSPFv3 interface hello interval.
ipv6 ospf interface cost	Configures the OSPFv3 interface cost.
ipv6 ospf interface priority	Configures the OSPFv3 interface priority.
ipv6 ospf interface retrans-interval	Configures the OSPFv3 interface retransmit interval.
ipv6 ospf interface transit-delay	Configures the OSPFv3 interface transit delay.
ipv6 ospf interface area	Configures an OSPFv3 interface area.
ipv6 ospf interface status	Enables or disables the administration status on an OSPFv3 interface.

MIB Objects

   ospfv3IfStatus
```

29 IS-IS Commands

Intermediate System-Intermediate System (IS-IS) is a shortest path first (SPF) or link-state protocol. IS-IS is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS) for IP as well as OSI environments. This feature allows a single routing protocol to support pure IP and OSI environments, and dual environments. Integrated IS-IS is also deployed extensively in an IP-only environment.

Each participating router distributes its local state (i.e., the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. IS-IS routers have adjacencies with other routers on point-to-point links. In a multi-access network, routers report their adjacencies to a Designated Intermediate System (DIS), which generates an additional Link State PDU (LSP), commonly known as the pseudo-node LSP. The DIS is responsible for flooding the LAN with LSP and also for synchronizing the entire AS topology. This database is built from the collected link state advertisements of all routers.

IS-IS is a hierarchical protocol where the autonomous system is divided into multiple areas to reduce the size of the Routing table. Routing within an area is referred to as Level-1 routing and that between two or more areas is referred to as Level 2 routing. Each area runs a separate copy of the basic link-state routing algorithm.

Note. IS-IS is currently supported only on the OmniSwitch 6850E Series

---

Alcatel-Lucent's version of IS-IS complies with RFC 1142.

MIB information for the IP commands is as follows:

Filename: AlcatelIND1Isis.mib
Module: ALCATEL-IND1-ISIS-MIB

Filename: IETF_ISIS.MIB
Module: ISIS-MIB

A summary of the available commands is listed here:

Global IS-IS Commands	**ip load isis** **ip isis status** **ip isis area-id** **ip isis level-capability** **ip isis auth-check** **ip isis auth-type** **ip isis csnp-auth** **ip isis hello-auth** **ip isis psnp-auth** **ip isis lsp-lifetime** **ip isis lsp-wait** **ip isis spf-wait** **ip isis summary-address** **ip isis overload** **ip isis overload-on-boot** **ip isis graceful-restart** **ip isis graceful-restart helper** **ip isis strict-adjacency-check** **ip isis level auth-type** **ip isis level hello-auth** **ip isis level csnp-auth** **ip isis level psnp-auth** **ip isis level wide-metrics-only** **show ip isis adjacency** **show ip isis database** **show ip isis hostname** **show ip isis routes** **show ip isis spf** **show ip isis spf-log** **show ip isis statistics** **show ip isis status** **show ip isis summary-address**

Interface Commands	**ip isis interface** **ip isis interface status** **ip isis interface interface-type** **ip isis interface csnp-interval** **ip isis interface hello-auth-type** **ip isis interface level-capability** **ip isis interface lsp-pacing-interval** **ip isis interface passive** **ip isis interface retransmit-interval** **ip isis interface default-type** **ip isis interface level hello-auth-type** **ip isis interface level hello-interval** **ip isis interface level hello-multiplier** **ip isis interface level metric** **ip isis interface level passive** **ip isis interface level priority** **show ip isis interface**
Clear Commands	**clear ip isis adjacency** **clear ip isis lsp-database** **clear ip isis spf-log** **clear ip isis statistics**

ip load isis

Loads the IS-IS software on the router.

ip load isis

Syntax Definitions

N/A

Defaults

By default, IS-IS is not loaded on the switch.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- You need to load IS-IS on the switch before executing any IS-IS configuration command.
- To unload IS-IS, remove all the IS-IS configuration from “boot.cfg”.

Examples

```
-> ip load isis
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show ip protocols	Displays switch routing protocol information and status.

MIB Objects

```
alaDrcTmIPIsisStatus
```

ip isis status

Enables or disables the administrative status of IS-IS on the switch.

ip isis status {enable | disable}

Syntax Definitions

enable	Enables IS-IS.
disable	Disables IS-IS.

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

When IS-IS status is disabled, the configuration settings and related statistics of the protocol remain unaffected.

Examples

```
-> ip isis status enable
-> ip isis status disable
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```
isisSysTable
   isisSysAdminState
```

ip isis area-id

Configures the area ID for the switch.

ip isis area-id *area address*

no ip isis area-id *area address*

Syntax Definitions

area address	1–13 byte variable length integer, which specifies the area address.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to remove the area ID.
- The area ID is part of the Network Service Access Point (NSAP) address.
- Other parts of NSAP address (system ID and selector ID) are not configurable. System ID is derived from router ID and selector ID remains always as 00.
- You can configure a maximum of three area addresses.

Examples

```
-> ip isis area-id 49.0001
-> no ip isis area-id 49.0001
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```
isisManAreaAddrTable
   isisManAreaAddrExistState
```

ip isis level-capability

Configures the router level of the IS-IS protocol globally.

ip isis level-capability {level-1 | level-2 | level-1/2}

Syntax Definitions

level-1	Specifies that the router can operate at Level-1 only.
level-2	Specifies that the router can operate at Level-2 only.
level-1/2	Specifies that the router can operate at both Level-1 and Level-2.

Defaults

parameter	default
level-1 | **level-2** | **level-1/2**	**level-1/2**

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Changing the level capability restarts the IS-IS protocol.
- You can also configure the level capability at per interface level.

Examples

```
-> ip isis level-capability level-1
-> ip isis level-capability level-2
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis interface level-capability	Configures the IS-IS level on the specified interface.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
isisSysTable
   isisSysType
```

ip isis auth-check

Enables or disables authentication check for IS-IS PDUs.

ip isis auth-check {enable | disable}

Syntax Definitions

enable	Enables authentication check for IS-IS PDUs.
disable	Disables authentication check for IS-IS PDUs.

Defaults

By default, authentication check is enabled.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- If enabled, IS-IS PDUs that fail to match either of the authentication type and key requirements are rejected.
- If disabled, the authentication PDUs are generated and the IS-IS PDUs are authenticated on receipt. An error message will be generated in case of a mismatch; but PDUs will not be rejected.

Examples

```
-> ip isis auth-check enable
-> ip isis auth-check disable
```

Release History

Release 6.3.1; command was introduced;

Related Commands

ip isis auth-type	Enables authentication and configures the authentication type of IS-IS protocol globally.
ip isis level auth-type	Enables authentication and configures the authentication types for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisAuthCheck
```

ip isis auth-type

Enables authentication and configures the authentication type of IS-IS protocol globally.

ip isis auth-type {simple {key *key* **| encrypt-key** *encrypt-key***} | md5 {key** *key* | **encrypt-key** *encrypt-key***} | none}**

Syntax Definitions

simple	Simple authentication will be used.
md5	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
key	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
encrypt-key	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
none	No authentication will be used.

Defaults

parameter	default
simple | **md5** | **none**	**none**

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt-key* parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.
- If the *encrypt-key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.
- This command configures the authentication type of ISIS protocol globally. These settings can be overridden at each level.

- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis auth-type simple key rachel
-> ip isis auth-type md5 encrypt-key 7a1e441a014b4030
```

Release History

Release 6.2.1; command was introduced.
Release 6.3.1; **key** and **encrypt-key** parameters were added.

Related Commands

ip isis level auth-type	Enables authentication and configures the authentication types for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisAuthType
   vRtrIsisAuthKey
```

ip isis csnp-auth

Enables or disables the authentication of Complete Sequence Number PDUs (CSNPs).

ip isis csnp-auth

no ip isis csnp-auth

Syntax Definitions

N/A

Defaults

CSNP authentication check is enabled by default.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

Use the **no** form of this command to prevent the CSNP authentication.

Examples

```
-> ip isis csnp-auth
-> no ip isis csnp-auth
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis level csnp-auth	Configures CSNP authentication for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisCsnpAuthentication
```

ip isis hello-auth

Enables or disables the authentication of Hello PDUs globally.

ip isis hello-auth

no ip isis hello-auth

Syntax Definitions

N/A

Defaults

Authentication check of Hello PDUs is enabled by default.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

Use the **no** form of this command to prevent the authentication of Hello packets.

Examples

```
-> ip isis hello-auth
-> no ip isis hello-auth
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis level hello-auth	Enables or disables the authentication of Hello PDUs for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisHelloAuthentication
```

ip isis psnp-auth

Enables or disables the authentication of Partial Sequence Number PDUs (PSNPs).

ip isis psnp-auth

no ip isis psnp-auth

Syntax Definitions

N/A

Defaults

PSNP authentication check is enabled by default.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

Use the **no** form of this command to prevent the authentication of PSNP packets.

Examples

```
-> ip isis psnp-auth
-> no ip isis psnp-auth
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis level psnp-auth	Configures the PSNP authentication for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisPsnpAuthentication
```

ip isis lsp-lifetime

Configures the time interval for which Link State PDUs generated by a router are considered valid by other routers in the same domain.

ip isis lsp-lifetime *seconds*

no ip isis lsp-lifetime

Syntax Definitions

seconds	Validity interval in seconds.The valid range is 350–65535.

Defaults

parameter	default
seconds	1200

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

Use the **no** form of this command to restore the default value.

Examples

```
-> ip isis lsp-lifetime 760
-> no ip isis lsp-lifetime
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis interface lsp-pacing-interval	Configures the time interval between IS-IS LSP PDUs sent from the specified interface.
show ip isis status	Displays the IS-IS status.
show ip isis database	Displays IS-IS LSP database information of the adjacent routers.

MIB Objects

```
vRtrIsisTable
  vRtrIsisLspLifetime
```

ip isis lsp-wait

Configures the intervals between the first, second and subsequently generated LSPs.

ip isis lsp-wait {max-wait | initial-wait | second-wait} *seconds*

no ip isis lsp-wait {max-wait | initial-wait | second-wait}

Syntax Definitions

max-wait	Specifies the maximum interval between two successive LSPs, in seconds. The valid range is 1–120.
initial-wait	Specifies the initial LSP generation delay, in seconds. The valid range is 0–100.
second-wait	Specifies the time interval between the first and second generated LSPs, in seconds. The valid range is 1–100.
seconds	Specifies the time interval.

Defaults

parameter	default
seconds **(max-wait)**	5
seconds **(initial-wait)**	0
seconds **(second-wait)**	1

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Successive LSPs are generated at increasing **second-wait** interval until a maximum value is reached.

Examples

```
-> ip isis lsp-wait max-wait 25
-> no ip isis lsp-wait initial-wait
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis interface lsp-pacing-interval	Configures the time interval between IS-IS LSP PDUs sent from the specified interface.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisLspInitialWait
   vRtrIsisLspSecondWait
   vRtrIsisLspMaxWait
```

ip isis spf-wait

Configures the intervals between the first, second, and subsequent SPF calculations.

ip isis spf-wait {max-wait *seconds* **| initial-wait** *milliseconds***| second-wait** *milliseconds***}**

no ip isis spf-wait {max-wait | initial-wait | second-wait}

Syntax Definitions

max-wait *seconds*	Specifies the maximum interval between two successive SPF calculations, in seconds. The valid range is 1–120 seconds.
initial-wait *milliseconds*	Specifies the initial SPF calculation delay, in milliseconds. The valid range is 10–100000 milliseconds.
second-wait *milliseconds*	Specifies the interval between first and second generated SPFs, in milliseconds. The valid range is 1–100000 milliseconds.

Defaults

parameter	default
max-wait *seconds*	10
initial-wait *milliseconds*	1000
second-wait *milliseconds*	1000

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Successive SPF calculations are generated at exponentially increasing **second-wait** interval until a maximum value is reached.

Examples

```
-> ip isis spf-wait max-wait 25
-> no ip isis spf-wait initial-wait
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

vRtrIsisTable

- vRtrIsisSpfWait
- vRtrIsisSpfInitialWait
- vRtrIsisSpfSecondWait

ip isis summary-address

Adds or deletes the summary address.

ip isis summary-address {*ip-prefix/mask* **|** *ip-prefix* **[**/*netmask***]} {level-1 | level-2 | level-1/2}**

no ip isis summary-address {*ip-prefix/mask* **|** *ip-prefix* **[**/*netmask***]}**

Syntax Definitions

ip-prefix/mask	Specifies the IP prefix in dotted decimal notation and the mask length.
ip-prefix	Specifies the IP prefix in dotted decimal notation.
/netmask	Specifies the subnet mask in dotted decimal notation.
level-1	Specifies the IS-IS level as Level-1.
level-2	Specifies the IS-IS level as Level-2.
level-1/2	Specifies the IS-IS level as Level-1/2.

Defaults

parameter	default
level-1 | level-2 | level-1/2	**level-1/2**

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to remove an already configured summary address.
- Native IS-IS routes can only be summarized into Level-2 from the Level-1 database.
- It is not possible to summarize IS-IS internal routes at Level-1, although it is possible to summarize external (redistributed) routes at Level-1.
- IS-IS routes are not summarised by default.

Examples

```
-> ip isis summary-address 10.0.0.0/8 level-2
-> no ip isis summary-address 10.0.0.0/8
```

Release History

Release 6.2.1; command was introduced.
Release 6.3.1; **level-1/2** parameter was added, *netmask* parameter is optional.

Related Commands

show ip isis summary-address Displays the IS-IS summary address database.

MIB Objects

```
vRtrIsisSummaryTable
   vRtrIsisSummRowStatus
```

ip isis overload

Enables and configures the IS-IS router to operate in the overload state for a specified time period.

ip isis overload [timeout *seconds***]**

no ip isis overload [timeout]

Syntax Definitions

timeout *seconds*	Specifies the timeout interval, in seconds. The valid range is 60–1800.

Defaults

By default, the IS-IS overload state is disabled.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to make the router exit the overload state.
- If the time period is not specified, the router remains in the overload state for an infinite period.
- During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is used only if the destination route is directly reachable by the router i.e., it will not be used for other transit traffic.
- This command can be used when the router is overloaded or before executing a shutdown command to divert traffic around the router.

Examples

```
-> ip isis overload timeout 70
-> no ip isis overload timeout
```

Release History

Release 6.2.1; command was introduced..

Related Commands

ip isis overload-on-boot	Configures the IS-IS router to be in the overload state during bootup for a specified time period.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
isisSysTable
   isisSysSetOverload
vRtrIsisTable
   vRtrIsisOverloadTimeout
```

ip isis overload-on-boot

Configures the IS-IS router to be in the overload state after bootup for a specified time period.

ip isis overload-on-boot [timeout *seconds***]**

no ip isis overload-on-boot [timeout *seconds***]**

Syntax Definitions

timeout *seconds*	Specifies the timeout interval, in seconds. The valid range is 60–1800.

Defaults

By default, the IS-IS router will not be in the overload state.

parameter	default
timeout *seconds*	60

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to prevent the router from entering the overload state after bootup.
- The router in the overload state is used only if there is no alternate path to reach the destination.
- This command configures the router after bootup in the overload state until the timeout timer expires or a timeout value is specified in the **no** form of this command.
- The **no overload** command does not influence the overload-on-boot function.

Examples

```
-> ip isis overload-on-boot timeout 80
-> no ip isis overload-on-boot timeout
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis overload	Sets the IS-IS router to operate in the overload state.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisOverloadOnBoot
   vRtrIsisOverloadOnBootTimeout
```

ip isis graceful-restart

Configures graceful restart of the router. It allows routing protocols to reconverge faster, minimizing service interruption.

ip isis graceful-restart

no ip isis graceful-restart

Syntax Definitions

N/A

Defaults

Graceful restart is disabled on the router by default.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to disable graceful restart and remove the graceful restart configuration from the IS-IS router.
- When graceful restart is enabled, the router can either be a helper (which helps a neighbor router to restart) or a restarting router, or both. In the current release, only the helper mode of a router is supported.

Examples

```
-> ip isis graceful-restart
-> no ip isis graceful-restart
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis graceful-restart helper	Configures the helper mode of routers for graceful restart.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisGracefulRestart
```

ip isis graceful-restart helper

Administratively enables and disables the IS-IS router to operate in the helper mode in response to a router performing a graceful restart.

ip isis graceful-restart helper {enable | disable}

Syntax Definitions

enable	Enables the helper mode on the router.
disable	Disables the helper mode on the router.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- When graceful restart is enabled, the helper mode is enabled by default.
- When graceful restart helper is enabled on a router, it can help other restarting routers.

Examples

```
-> ip isis graceful-restart helper disable
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis graceful-restart	Configures graceful restart on the router.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisGRHelperMode
```

ip isis strict-adjacency-check

Enables or disables the adjacency check configuration on the router.

ip isis strict-adjacency-check {enable | disable}

Syntax Definitions

enable	Enables the adjacency check configuration on the router.
disable	Disables the adjacency check configuration on the router.

Defaults

By default, the adjacency check configuration is disabled.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- When the adjacency check configuration is enabled, both routers have to run the same IP version only in the IS-IS protocol to form an adjacency.
- When the adjacency check configuration is disabled, one common IP version running between two routers is enough to form an adjacency in the IS-IS protocol.

Examples

```
-> ip isis strict-adjacency-check enable
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisStrictAdjacencyCheck
```

ip isis level auth-type

Enables authentication and configures the authentication types for specific IS-IS levels.

ip isis level {1 | 2} auth-type {simple {key *key* | **encrypt-key** *encrypt-key***} | md5 {key** *key* **| encrypt-key** *encrypt-key***} | none}**

Syntax Definitions

1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
simple	Simple authentication will be used.
md5	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
key	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
encrypt-key	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
none	No authentication will be used.

Defaults

parameter	default
simple | **md5** | **none**	**none**

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt-key* parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.

- If the *encrypt-key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.
- This command overrides the global configuration of IS-IS authentication type.
- This command also sets the password or hash-key according to the type of authentication.
- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis level 2 auth-type simple key rachel
-> ip isis level 2 auth-type md5 encrypt-key 7a1e441a014b4030
```

Release History

Release 6.2.1; command was introduced.
Release 6.3.1; **key** and **encrypt-key** parameters were added.

Related Commands

ip isis auth-type	Enables authentication and configures the authentication type of IS-IS protocol globally.
show ip isis status	Displays the IS-IS status.

ip isis level hello-auth

Enables or disables the authentication of Hello PDUs for specific IS-IS levels.

ip isis level {1 | 2} hello-auth

no ip isis level {1 | 2} hello-auth

Syntax Definitions

1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.

Defaults

Authentication check of Level Hello PDUs is enabled by default.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to prevent the authentication of Hello packets at the specified IS-IS level.
- This command overrides the global configuration of IS-IS Hello authentication.

Examples

```
-> ip isis level 1 hello-auth
-> no ip isis level 1 hello-auth
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis hello-auth	Enables or disables the authentication of Hello PDUs globally.
show ip isis status	Displays the IS-IS status.

MIB Objects

```

```

ip isis level csnp-auth

Enables or disables the CSNP authentication for specific IS-IS levels.

ip isis level {1 | 2} csnp-auth

no ip isis level {1 | 2} csnp-auth

Syntax Definitions

1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.

Defaults

CSNP authentication check for specific IS-IS levels is enabled by default.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to prevent the authentication of CSNPs at the specified IS-IS level.
- This command overrides the global configuration of IS-IS CSNP authentication.

Examples

```
-> ip isis level 1 csnp-auth
-> no ip isis level 1 csnp-auth
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis csnp-auth	Enables or disables the authentication of CSNPs.
show ip isis status	Displays the IS-IS status.

MIB Objects

```

ip isis level psnp-auth

Enables or disables PSNP authentication for specific IS-IS levels.

ip isis level {1 | 2} psnp-auth

no ip isis level {1 | 2} psnp-auth

Syntax Definitions

1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.

Defaults

PSNP authentication check for specific IS-IS levels is enabled by default.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to prevent the authentication of PSNPs at the specified IS-IS level.
- This command overrides the global configuration of IS-IS PSNP authentication.

Examples

```
-> ip isis level 1 psnp-auth
-> no ip isis level 1 psnp-auth
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis psnp-auth	Enables or disables the authentication of PSNPs.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisLevelTable
   vRtrIsisLevelPsnpAuthentication
```

ip isis level wide-metrics-only

Enables the wide metrics in LSPs for specific IS-IS levels.

ip isis level {1 | 2} wide-metrics-only

no ip isis level {1 | 2} wide-metrics-only

Syntax Definitions

1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.

Defaults

By default, wide metrics is disabled.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to restore the narrow metric (1–63).
- Wide metrics are used for improved granularity of metrics.
- Numeric values above 63 indicate wide metrics.

Examples

```
-> ip isis level 1 wide-metrics-only
-> no ip isis level 1 wide-metrics-only
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```

show ip isis adjacency

Displays information about IS-IS adjacent routers.

show ip isis adjacency [{system-id *nbr_sys_id* | **interface** *interface_name***}] [detail]**

Syntax Definitions

nbr_sys_id	The system ID of the neighbor router.
interface_name	The name of the IS-IS interface.
detail	Indicates that the output is displayed in a detailed manner.

Defaults

By default adjacency information for all the neighbor routers are displayed.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

Use *the nbr_sys_id* or *interface_name* parameter with this command to view the adjacency information for a specific neighbor.

Examples

```
-> show ip isis adjacency
================================================================================
ISIS Adjacency
================================================================================
System ID          Type     State     Hold      Interface   Host-name
--------------------------------------------------------------------------------
1720.2116.0051      L2        UP        8         vlan2      HostA
1720.2116.0051      L1        UP        8         vlan2      HostA
1720.2116.0051      L1        UP        8         vlan3      HostA
1720.2116.0051      L2        UP        8         vlan3      HostA
--------------------------------------------------------------------------------
Adjacency : 4
================================================================================
```

output definitions

System ID	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
Type	The level (**LI, L2,** or **L1/L2**) of the adjacent router.
State	The state of the adjacent router (**Up** or **Down**).
Hold	The Hold time of the adjacent router.
Interface	The interface name of the adjacent router.

output definitions

Host-name	The hostname of the adjacent router.
Adjacencies	The total number of adjacent routers.

output definitions

SystemID	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
Interface	The interface name of the adjacent router.
State	The state of the adjacent router (**Up** or **Down**).
Adj Level	The adjacency level (**L1** or **L2**) of the router.
Nbr Sys Type	The type of the neighboring router(**L1, L2** or **L1L2**)
Hold Time	The Hold time of the adjacent router.
IPv4 Neighbor	The 32-bit IP address of the neighbor.
Restart Support	Indicates if graceful restart is **enabled** or **disabled**.
Restart Status	Indicates whether the router is currently helping an adjacent router to restart.
Restart Suppressed	Indicates whether the advertisement of LSPs are suppressed (**enabled**) or not (**disabled**) as per the request of adjacent router.
SNPA	The SNPA address of the adjacent router.
Up Time	Indicates the time period in seconds, during which the router was in the adjacency.

output definitions

Priority	The priority of the adjacent router.
Host-name	The hostname of the adjacent router.
L. CircType	Indicates the level circuit type (**L1, L2** or **L1L2**) of the adjacent router.
Max Hold	Indicates the maximum Hold time of the adjacent router.

Release History

Release 6.2.1; command was introduced.
Release 6.3.1; System ID/HostName field removed; System ID, Host-name, and IPv4 neighbor fields added.

Related Commands

clear ip isis adjacency	Clears and resets the IS-IS adjacency database.

show ip isis database

Displays IS-IS LSP database information of the adjacent routers.

show ip isis database [{system_id *system_id* **| lsp_id** *lsp_id***}] [detail] [level {1** | **2}]**

Syntax Definitions

system_id	The system ID of the router.
lsp_id	The LSP ID.
detail	Indicates that the output is displayed in a detailed manner.
level	Indicates the IS-IS level, either **1** or **2**.

Defaults

By default the entire LSP database is displayed.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use *system-id* or *lsp-id* parameter with this command to view specific LSP database information.
- Use the **level** parameter with this command to view the LSP database information of a particular level.

Examples

```
-> show ip isis database

output definitions

LSP ID	The LSP ID. Indicates the system ID and the pseudo-node ID of the originating router.
Sequence	The sequence number of the LSP. The Sequence number is a value used to identify old and duplicate LSPs.
Checksum	The checksum value of the LSP.
Lifetime	The number of seconds the LSP remains valid. The LSP lifetime value of zero indicates that this LSP is being removed from the Link State Database of all the routers.
Version	The version of the IS-IS protocol that has generated the LSP.
Pkt Type	The IS-IS PDU type number derived from the PDU header, which can be **18** or **20**. The number 18 represents L1 LSP PDU type and 20 represents L2 LSP PDU type.
Pkt Ver	The version of the IS-IS protocol that has generated the packet.
Attributes	The level capability of the router.
Max Area	The Maximum number of areas supported by the originating router of the LSP.
SysID Len	The length of the system-id as used by the originating router.
Used Len	The length used by the LSP.
Alloc Len	The length allocated for the LSP to be stored.
Area Address	The area ID of the router.
Supp protocols	The network layer protocols that are supported.
IS-Host Name	The host name of the router.
System ID	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
IS Neighbors	The list of reachable IS-IS neighbors.
IPv4 Internal Reach	The list of IS-IS internal routes.
IP Prefix	The IP address and subnet mask of the destination.
Metrics	The metric value to reach the destination.
IPv4 External Reach	The list of external IS-IS routes.
level-1 LSP Count	The number of Level-1 LSPs.
level-2 LSP Count	The number of Level-2 LSPs.

Release History

Release 6.2.1; command was introduced..

Related Commands

show ip isis hostname	Displays the database of IS-IS host name and its corresponding system ID.
clear ip isis lsp-database	Clears and resets the IS-IS LSP database information.

Unknown   0           0         0       0          0
```

output definitions

ISIS Instance	The number of IS-IS instances.
SPF Runs	The number of SPF calculations that have been performed.
Purge Intiated	The number of purges that the system initiated. A purge is initiated if the router decides that a link-state PDU must be removed from the database.
LSP Regens	The number of LSPs that have been regenerated. An LSP is regenerated when it nears the end of its lifetime and has not changed.
Requests	The number of CSNP requests received.

output definitions (continued)

Request Drops	The number of CSNP requests that are dropped.
Paths Found	The number of paths found.
Paths Not Found	The number of paths not found.
PDU Type	The type of PDU.
Received	The number of PDUs received since IS-IS started or since the statistics were set to zero.
Processed	The number of PDUs that are processed (number of PDUs received less the number dropped).
Dropped	The number of PDUs that are dropped.
Sent	The number of PDUs transmitted since IS-IS started or since the statistics were set to zero.
Retransmitted	The number of PDUs that are retransmitted.

Release History

Release 6.2.1; command was introduced.

Related Commands

clear ip isis statistics	Clears and resets the IS-IS statistics information.

```

output definitions

System Id	The system ID of the router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
Admin State	The state of the router (**Up** or **Down**).
Last Enabled	The date and time when the router is enabled.
Level Capability	The level capability of the router **(L1, L2,** or **L1L2**).
Authentication Check	Indicates the status of the authentication (**true** or **false**).
Authentication Type	The type of authentication (**password** or **md5**).
Graceful Restart	Indicates if graceful restart is **Enabled** or **Disabled**.
GR helper-mode	Indicates if the helper mode of graceful restart is **Enabled** or **Disabled**.
LSP Lifetime	The Lifetime of the LSP (in seconds).
LSP Wait	The Wait time of the LSP (in seconds).
Adjacency Check	The adjacency check configuration on the router
L1 Auth Type	The authentication type (**password** or **md5**) for Level-1 adjacency.
L2 Auth Type	The authentication type (**password** or **md5**) for Level-2 adjacency.
L1 Wide Metrics-only	Indicates whether wide metrics is **Enabled** or **Disabled** for Level-1 adjacency.
L2 Wide Metrics-only	Indicates whether wide metrics is **Enabled** or **Disabled** for Level-2 adjacency.
L1 LSDB Overload	Indicates whether LSDB Overload is **Enabled** or **Disabled** for Level-1 adjacency.
L2 LSDB Overload	Indicates whether LSDB Overload is **Enabled** or **Disabled** for Level-2 adjacency.
L1 LSPs	The number of LSPs for Level-1 adjacency.
L2 LSPs	The number of LSPs for Level-2 adjacency.
Last SPF	The date and duration of the last SPF calculation.
SPF Wait	The Wait time for the SPF calculation.
Hello-Auth Check	Indicates the status of global Hello authentication check (**Enabled** or **Disabled**).
Csnp-Auth Check	Indicates the status of global CSNP authentication check (**Enabled** or **Disabled**).
Psnp-Auth Check	Indicates the status of global PSNP authentication check (**Enabled** or **Disabled**).
L1 Hello-Auth Check	Indicates the status of L1 Hello authentication check (**Enabled** or **Disabled**).
L1 Csnp-Auth Check	Indicates the status of L1 CSNP authentication check (**Enabled** or **Disabled**).

output definitions (continued)

L1 Psnp-Auth Check	Indicates the status of L1 PSNP authentication check (**Enabled** or **Disabled**).
L2 Hello-Auth Check	Indicates the status of L2 Hello authentication check (**Enabled** or **Disabled**).
L2 Csnp-Auth Check	Indicates the status of L2 CSNP authentication check (**Enabled** or **Disabled**).
L2 Psnp-Auth Check	Indicates the status of L2 PSNP authentication check (**Enabled** or **Disabled**).
Area Address	The area address of the router.

Release History

Release 6.2.1; command was introduced.
Release 6.3.1; Adjacency Check field was added.

Related Commands

ip isis status	Enables or disables the administration status of IS-IS on the router.
ip isis level-capability	Configures the router level of the IS-IS protocol globally.
ip isis auth-type	Configures authentication type of IS-IS protocol globally.
ip isis csnp-auth	Enables or disables the authentication of CSNPs.
ip isis hello-auth	Enables or disables the authentication of Hello PDUs globally.
ip isis psnp-auth	Enables or disables the authentication of PSNPs.
ip isis graceful-restart	Configures graceful restart on the router.
ip isis overload	Sets the IS-IS router to operate in the overload state for a specified time period.
ip isis overload-on-boot	Configures the IS-IS router to be in the overload state after bootup for a specified time period.
ip isis lsp-wait	Configures the time interval between successively generated LSPs.
ip isis spf-wait	Configures the time interval between successive Shortest Path First (SPF) calculations.
ip isis level auth-type	Enables the authentication and configures the authentication types for specific IS-IS levels.
ip isis level hello-auth	Enables or disables the authentication of Hello PDUs for specific IS-IS levels.
ip isis level csnp-auth	Enables or disables the authentication of CSNPs for specific IS-IS levels.
ip isis level psnp-auth	Enables or disables the authentication of PSNP PDUs for specific IS-IS levels.
ip isis level wide-metrics-only	Configures wide metrics in LSPs for specific IS-IS levels.
ip isis area-id	Configures the area ID for the switch.
ip isis auth-check	Enables or disables authentication check for IS-IS PDUs.

ip isis graceful-restart helper	Administratively enables and disables the IS-IS router to operate in the helper mode in response to a router performing a graceful restart.
ip isis lsp-lifetime	Configures the time interval for which Link State PDUs generated by a router are considered valid by other routers in the same domain.
ip isis strict-adjacency-check	Enables or disables the adjacency check configuration on the router.

show ip isis summary-address

Displays the IS-IS summary address database.

show ip isis summary-address [*ip-addr* **[***/mask***]]**

Syntax Definitions

ip-addr	The 32-bit IP address.
/mask	The netmask value. The valid range is 1–32.

Defaults

By default summary address information for all the IP addresses is displayed.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

Use the *ip-addr* parameter with this command to view the summary address information for a specific IP address.

Examples

```
-> show ip isis summary-address
================================================================================
ISIS Summary Address
=====================================================
Address                     Level
--------------------------------------------------------------------------------
1.0.0.0/8                   L1
2.1.0.0/24                  L1L2
3.1.2.3/32                  L2
--------------------------------------------------------------------------------

Summary Address : 3
```

output definitions

Address	The summary address for a range of IPv4 addresses.
Level	The capability level of the router.
Summary Address	The number of summarized addresses.

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis summary-address	Adds or deletes the summary address.

MIB Objects

```
vRtrIsissummaryTable
   vRtrIsisSummPefix
   vRtrIsisSummMask
   vRtrIsisSummLevel
```

ip isis interface

Creates an IS-IS interface.

ip isis interface *interface_name*

no ip isis interface *interface_name*

Syntax Definitions

interface_name	The name of the IS-IS interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to remove the IS-IS interface.
- The interface name cannot contain spaces.

Examples

```
-> ip isis interface vlan-101
-> no ip isis interface vlan-101
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show ip isis interface	Displays the IS-IS interface information.

MIB Objects

```
vRtrIsisIfTable
   vRtrIsisIfRowStatus
```

ip isis interface status

Enables or disables IS-IS on an interface.

ip isis interface *interface_name* **status {enable | disable}**

Syntax Definitions

interface_name	Name of the interface.
enable	Administratively enables IS-IS on the interface.
disable	Administratively disables IS-IS on the interface.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

When the status is manually disabled, the configuration settings and related statistics of the protocol remain unaffected.

Examples

```
-> ip isis interface vlan-101 status enable
-> ip isis interface vlan-101 status disable
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show ip isis interface	Displays the IS-IS interface information.

MIB Objects

```
isisCircTable
   isisCircAdminState
```

ip isis interface interface-type

Configures the IS-IS interface as broadcast or point-to-point.

ip isis interface *interface_name* **interface-type {broadcast | point-to-point}**

Syntax Definitions

interface_name	The name of the interface.
broadcast	Sets the interface as a broadcast IS-IS interface.
point-to-point	Sets the interface as a point-to-point IS-IS interface.

Defaults

parameter	default
broadcast | point-to-point	**broadcast**

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

N/A.

Examples

```
-> ip isis interface vlan-101 interface-type broadcast
-> ip isis interface vlan-101 interface-type point-to-point
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis interface default-type	Sets the interface type to default
show ip isis interface	Displays the IS-IS interface information.

MIB Objects

```
isisCircTable
   isisCircType
```

ip isis interface csnp-interval

Configures the time interval to send CSNPs from the specified interface.

ip isis interface *interface_name* **csnp-interval** *seconds*

no ip isis interface *interface_name* **csnp-interval**

Syntax Definitions

interface_name	The name of the interface.
seconds	The time interval (1–65535) in seconds between successive CSNP PDUs sent on this interface.

Defaults

parameter	default
seconds (broadcast)	10
seconds (point-to-point)	5

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

Use the **no** form of this command to restore the settings to the default value.

Examples

```
-> ip isis interface vlan-101 csnp-interval 50
-> no ip isis interface vlan-101 csnp-interval
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show ip isis interface	Displays the IS-IS interface information.

MIB Objects

```
vRtrisisIftable
   vRtrIsisIfCsnpInterval
```

ip isis interface hello-auth-type

Configures the authentication of Hello PDUs on a specific interface.

ip isis interface *interface_name* **hello-auth-type {simple {key** *key* **| encrypt-key** *encrypt-key***} | md5 {key** *key* **| encrypt-key** *encrypt-key***} | none}**

Syntax Definitions

interface_name	The name of the interface.
simple	Simple authentication will be used.
md5	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
key	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
encrypt-key	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
none	No authentication will be used.

Defaults

parameter	default
simple | **md5** | **none**	**none**

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt-key* parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.
- If the *encrypt-key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.

- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis interface vlan-101 hello-auth-type md5 encrypt-key 7a1e441a014b4030
-> ip isis interface vlan-101 hello-auth-type none
```

Release History

Release 6.2.1; command was introduced.
Release 6.3.1; **key** and **encrypt-key** parameters were added.

Related Commands

ip isis interface level hello-auth-type	Configures the authentication of Hello PDUs for the specified IS-IS level of an interface.
show ip isis interface	Displays the IS-IS interface information.

MIB Objects

```
vRtrIsisIfTable
   vRtrIsisIfHelloAuthType
   vRtrIsisIfHelloAuthKey
```

ip isis interface level-capability

Configures the IS-IS level on the specified interface.

ip isis interface *interface_name* **level-capability [level-1 | level-2 | level-1/2]**

Syntax Definitions

interface_name	The name of the interface.
level-1	Specifies that the interface can operate at Level-1 only.
level-2	Specifies that the interface can operate at Level-2 only.
level-1/2	Specifies that the interface can operate at both Level-1 and Level-2.

Defaults

parameter	default
level-1 | **level-2** | **level-1/2**	**level-1/2**

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Changing the level capability restarts the IS-IS protocol on the interface.
- If the level capability is configured globally and on a specific interface, the combination of the two settings will decide the potential adjacency.

Examples

```
-> ip isis interface vlan-101 level-capability level-1
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis level-capability	Configures the router level of the IS-IS protocol globally.
show ip isis interface	Displays the IS-IS interface information.

MIB Objects

```
isisCircTable
   isisCircLevel
```

ip isis interface lsp-pacing-interval

Configures the time interval between IS-IS LSP PDUs sent from the specified interface.

ip isis interface *interface_name* **lsp-pacing-interval** *milliseconds*

no ip isis interface *interface_name* **lsp-pacing-interval**

Syntax Definitions

interface_name	The name of the interface.
milliseconds	The time interval in milliseconds (from 0 to 65535) between IS-IS LSPs.

Defaults

parameter	default
milliseconds	*100*

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to restore the default settings.
- No LSPs are sent from the specified interface if the time interval is set to 0.

Examples

```
-> ip isis interface vlan-101 lsp-pacing-interval 120
-> no ip isis interface vlan-101 lsp-pacing-interval
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis lsp-lifetime	Configures the time interval for which LSPs generated by a router is considered valid by other routers in the same domain.
ip isis lsp-wait	Configures the time interval between successively generated LSPs.
show ip isis interface	Displays the IS-IS interface information.

MIB Objects

```
vRtrIsisIfTable
   vRtrIsisIfLspPacingInterval
```

ip isis interface passive

Configures the interface as passive.

ip isis interface *interface_name* **passive**

no ip isis interface *interface_name* **passive**

Syntax Definitions

interface_name	The name of the interface.

Defaults

By default, the interface passive configuration is disabled.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to remove the passive attribute.
- The passive interface will not permit ingressing and egressing IS-IS PDUs.

Examples

```
-> ip isis interface lan-1 passive
-> no ip isis interface lan-1 passive
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis interface level passive	Configures the interface as passive at the specified IS-IS level.
show ip isis interface	Displays the IS-IS interface information.

MIB Objects

```
isisCircTable
   isisCircPassiveCircuit
```

ip isis interface retransmit-interval

Configures the minimum time interval between LSP retransmissions on a point-to-point interface.

ip isis interface *interface_name* **retransmit-interval** *seconds*

no ip isis interface *interface_name* **retransmit-interval**

Syntax Definitions

interface_name	The name of the interface.
seconds	The minimum time interval (1–65535) in seconds between LSP transmissions on a point-to-point interface.

Defaults

parameter	default
seconds	5

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

Use the **no** form of this command to restore the default settings.

Examples

```
-> ip isis interface lan-3 retransmit-interval 130
-> no ip isis interface lan-4 retransmit-interval
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show ip isis interface	Displays the IS-IS interface information.

MIB Objects

```
vRtrIsisIfTbale
   vRtrIsisIfRetransmitInterval
```

ip isis interface default-type

Sets the interface type to default.

ip isis interface *interface_name* **default-type**

Syntax Definitions

interface_name	The IP interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

This command is used to indicate whether the circuit type is default or has been modified.

Examples

```
-> ip isis interface lan-3 default-type
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis interface interface-type	Configures the IS-IS interface as broadcast or point-to-point.

MIB Objects

```
vRtrIsisIfTable
   vRtrIsisIfTypeDefault
```

ip isis interface level hello-auth-type

Configures the authentication of Hello PDUs for the specified IS-IS level of an interface.

ip isis interface *interface_name* **level [1 | 2] hello-auth-type {simple {key** *key* | **encrypt-key** *encrypt-key***} | md5 {key** *key* **| encrypt-key** *encrypt-key***} | none}**

Syntax Definitions

interface_name	The name of the interface.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
simple	Simple authentication will be used.
md5	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
key	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
encrypt-key	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
none	No authentication will be used.

Defaults

parameter	default
simple | **md5** | **none**	**none**

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt-key* parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.

- If the *encrypt-key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.
- This command also configures the authentication type and the corresponding key. These settings override the configuration done on the specific interface.
- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis interface wan-50 level 1 hello-auth-type md5 key xyz123
-> ip isis interface man-80 level 2 hello-auth-type none
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis interface hello-auth-type	Configures the authentication of Hello PDUs on a specific interface.
show ip isis interface	Displays the IS-IS interface information.

MIB Objects

```
vRtrIsisIfLevelTable
   vRtrIsisIfLevelHelloAuthType
   vRtrIsisIfLevelHelloAuthKey
```

ip isis interface level hello-interval

Configures the time interval between the successive Hello PDUs for the specified IS-IS level of an interface.

ip isis interface *interface_name* **level [1 | 2] hello-interval** *seconds*

no ip isis interface *interface_name* **level [1 | 2] hello-interval**

Syntax Definitions

interface_name	The name of the interface.
seconds	The Hello interval, in seconds. The valid range is 1–20000.

Defaults

parameter	default
seconds (designated routers)	3
seconds (non-designated routers)	9

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

Use the **no** form of this command to restore the default settings.

Examples

```
-> ip isis interface man-1 level 1 hello-interval 50
-> no isis interface wan-876 level 2 hello-interval
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show ip isis interface	Displays the IS-IS interface information.

MIB Objects

```
vRtrIsisIfLevelTable
   vRtrIsisIfLevelHelloTimer
```

ip isis interface level hello-multiplier

Configures the number of missing Hello PDUs from a neighbor, after which the adjacency is declared as down.

ip isis interface *interface_name* **level [1 | 2] hello-multiplier** *number*

no ip isis interface *interface_name* **level [1 | 2] hello-multiplier**

Syntax Definitions

interface_name	The name of the interface.
number	The multiplier (2–100) of the Hello interval.

Defaults

parameter	default
number	3

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

Use the **no** form of this command to restore the default settings.

Examples

```
-> ip isis interface lan-1 level 1 hello-multiplier 10
-> no ip isis interface lan-1 level 2 hello-multiplier
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show ip isis interface	Displays the IS-IS interface information.

MIB Objects

```
isisCircLevelTable
   isisCircLevelHelloMultiplier
```

ip isis interface level metric

Configures the metric value of the specified IS-IS level of the interface.

ip isis interface *interface_name* **level [1 | 2] metric** *number*

no ip isis interface *interface_name* **level [1 | 2] metric**

Syntax Definitions

interface_name	The name of the interface.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
number	The metric value (1–16777215) assigned for the specified level of the interface.

Defaults

parameter	default
number	10

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- To calculate the lowest cost to reach a destination, each configured level on each interface must have a cost.

Examples

```
-> ip isis interface interface-1 level 1 metric 25
-> no ip isis interface interface-2 level 2 metric
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show ip isis interface	Displays the IS-IS interface information.

MIB Objects

```
vRtrIsisIfLevelTable
   vRtrisisIfLevelAdminMetric
```

ip isis interface level passive

Configures the interface as passive at the specified IS-IS level.

ip isis interface *interface_name* **level [1 | 2] passive**

no ip isis interface *interface_name* **level [1 | 2] passive**

Syntax Definitions

interface_name	The name of the interface.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.

Defaults

By default, the interface level passive configuration is disabled.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to remove the passive attribute.
- The passive interface will not permit ingressing and egressing IS-IS PDUs.

Examples

```
-> ip isis interface lan-5 level 1 passive
-> no ip isis interface wan-10 level 1 passive
```

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis interface passive	Configures the interface as passive.
show ip isis interface	Displays the IS-IS interface information.

MIB Objects

```
vRtrIsisIfLevelTable
   vRtrIsisIfLevelPassive
```

ip isis interface level priority

Configures the IS-IS router interface priority for the designated router election on a multi-access network.

ip isis interface *interface_name* **level [1 | 2] priority** *number*

no ip isis interface *interface_name* **level [1 | 2] priority**

Syntax Definitions

interface_name	The name of the given IP interface.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
number	The priority value of this interface at this level. The valid range is 0–127.

Defaults

parameter	default
number	64

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- The router with the highest priority is the preferred designated router.
- The designated router sends LSPs to this network and also to the routers that are attached to it.

Examples

```
-> ip isis interface vlan-isis level 1 priority 4
-> ip isis interface vlan-isis level 2 priority 4
-> no ip isis interface vlan-isis level 1 priority
```

Release History

Release 6.2.1; command was introduced.

Related Commands

show ip isis interface	Displays the IS-IS interface information.

MIB Objects

```
vRtrIsisIfLevelTable
   vRtrIsisIfLevelISPriority
```

show ip isis interface

Displays the IS-IS interface information.

show ip isis interface [*interface_name***] [detail]**

Syntax Definitions

interface_name	The name of the interface.
detail	Indicates that the output is displayed in a detailed manner.

Defaults

By default the interface information for all the interfaces is displayed.

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

Use the *interface_name* parameter with this command to view information for a specific interface.

Examples

```
-> show ip isis interface

Priority           : 64              Passive          : No
```

output definitions

Interface	The name of the IS-IS interface.
Level Capability	The level capability of the interface.
Oper State	The operational state of the interface (**up** or **down**).
Admin State	The administrative state of the interface (**up** or **down**).
Auth Type	Indicates the authentication type (**simple**, **MD5**, or **none**) of the interface.
Circuit Id	The circuit ID of the interface.
RetransmitInt	Specifies the minimal interval of time, in seconds between retransmission of an LSP on the point-to-point interface.
Type	The type of interface: **Broadcast** or **Pt-to-Pt** (point to point).
LSP Pacing Int	The LSP Pacing interval.
Mesh Group	The status of the mesh group (**Active** or **Inactive**).
CSNP Int	The CSNP interval.
Level	Indicates the IS-IS level of the neighbor (**L1,L2**, or **L1L2**).
Adjacencies	The number of adjacencies formed.

output definitions (continued)

Desg IS	The ID of the LAN Designated Intermediate System on this circuit at this level.
Auth Type	Indicates the authentication type (**simple**, **MD5**, or **none**) for the specified level.
Metric	The metric value of this circuit for a specific level.
Hello Timer	Indicates the Hello timer value.
Hello Mult	Indicates the Hello multiplier value.
Priority	The priority value of the interface.
Passive	Indicates whether the interface is configured as a passive interface (**Yes** or **No**).

Release History

Release 6.2.1; command was introduced.

Related Commands

ip isis interface	Creates an IS-IS interface.

clear ip isis adjacency

Clears and resets the IS-IS adjacency database information.

clear ip isis adjacency [system-id *nbr-sys-id***]**

Syntax Definitions

nbr-sys-id	The system ID of the neighbor router.

Defaults

N/A

Platforms Supported

OmniSwitch 6850E, 9000E

Usage Guidelines

If the *nbr-sys-id* parameter is specified, only the entries specific to that system ID are removed from the database.

Examples

```
-> clear ip isis adjacency system-id 1122.3344.5566
```

Release History

Release 6.2.1; command was introduced.

Related Commands

30 BGP Commands

This chapter describes the CLI commands used to configure the BGP (Border Gateway Protocol) and Multiprotocol extensions to BGP. BGP is a protocol for exchanging routing information between gateway hosts in a network of ASs (autonomous systems). BGP is the most common protocol used between gateway hosts on the Internet. The routing table exchanged contains a list of known routers, the addresses they can reach, and a preference metrics associated with the path to each router so that the best available route is chosen.

Multiprotocol Extensions to BGP-4 supports the exchange of IPv6 unicast prefixes, as well as the establishment of BGP peering sessions with BGP speakers identified by their IPv6 addresses.

The Alcatel-Lucent implementation of BGP-4 and Multiprotocol Extensions to BGP-4 complies with the following RFCs: 4271, 2439, 3392, 2385, 1997, 4456, 3065, 4273, 4760, 2545

Note. In the following document, the BGP terms “peer” and “neighbor” are used interchangeably to mean any BGP speaker known to the local router.

MIB information for BGP is as follows:

Filename: AlcatelIND1Bgp.MIB
Module: ALCATEL-IND1-BGP-MIB

Filename: IETF_BGP4.MIB
Module: BGP4-MIB

The following table summarizes the available commands:

Global BGP Commands	**ip load bgp** **ip bgp status** **ip bgp unicast** **ip bgp autonomous-system** **ip bgp bestpath as-path ignore** **ip bgp cluster-id** **ip bgp default local-preference** **ip bgp fast-external-failover** **ip bgp always-compare-med** **ip bgp bestpath med missing-as-worst** **ip bgp client-to-client reflection** **ip bgp as-origin-interval** **ip bgp synchronization** **ip bgp confederation identifier** **ip bgp maximum-paths** **ip bgp log-neighbor-changes** **ip bgp dampening** **ip bgp dampening clear** **show ip bgp** **show ip bgp statistics** **show ip bgp dampening** **show ip bgp dampening-stats** **show ip bgp path** **show ip bgp routes**
Aggregate Configuration	**ip bgp aggregate-address** **ip bgp aggregate-address status** **ip bgp aggregate-address as-set** **ip bgp aggregate-address community** **ip bgp aggregate-address local-preference** **ip bgp aggregate-address metric** **ip bgp aggregate-address summary-only** **show ip bgp aggregate-address**
Network (local route) Configurations	**ip bgp network** **ip bgp network status** **ip bgp network community** **ip bgp network local-preference** **ip bgp network metric** **show ip bgp network**

Neighbor (Peer) Configuration	**ip bgp neighbor** **ip bgp neighbor status** **ip bgp neighbor advertisement-interval** **ip bgp neighbor clear** **ip bgp neighbor route-reflector-client** **ip bgp neighbor default-originate** **ip bgp neighbor timers** **ip bgp neighbor conn-retry-interval** **ip bgp neighbor auto-restart** **ip bgp neighbor maximum-prefix** **ip bgp neighbor md5 key** **ip bgp neighbor ebgp-multihop** **ip bgp neighbor description** **ip bgp neighbor next-hop-self** **ip bgp neighbor passive** **ip bgp neighbor remote-as** **ip bgp neighbor remove-private-as** **ip bgp neighbor soft-reconfiguration** **ip bgp neighbor stats-clear** **ip bgp confederation neighbor** **ip bgp neighbor update-source** **ip bgp neighbor in-aspathlist** **ip bgp neighbor in-communitylist** **ip bgp neighbor in-prefixlist** **ip bgp neighbor in-prefix6list** **ip bgp neighbor out-prefix6list** **ip bgp neighbor out-aspathlist** **ip bgp neighbor out-communitylist** **ip bgp neighbor out-prefixlist** **ip bgp neighbor route-map** **ip bgp neighbor clear soft** **show ip bgp neighbors** **show ip bgp neighbors policy** **show ip bgp neighbors timer** **show ip bgp neighbors statistics**

Policy Commands	**ip bgp policy aspath-list** **ip bgp policy aspath-list action** **ip bgp policy aspath-list priority** **ip bgp policy community-list** **ip bgp policy community-list action** **ip bgp policy community-list match-type** **ip bgp policy community-list priority** **ip bgp policy prefix-list** **ip bgp policy prefix-list action** **ip bgp policy prefix-list ge** **ip bgp policy prefix-list le** **ip bgp policy prefix6-list** **ip bgp policy route-map** **ip bgp policy route-map action** **ip bgp policy route-map aspath-list** **ip bgp policy route-map asprepend** **ip bgp policy route-map community** **ip bgp policy route-map community-list** **ip bgp policy route-map community-mode** **ip bgp policy route-map lpref** **ip bgp policy route-map lpref-mode** **ip bgp policy route-map match-community** **ip bgp policy route-map match-mask** **ip bgp policy route-map match-prefix** **ip bgp policy route-map match-regexp** **ip bgp policy route-map med** **ip bgp policy route-map med-mode** **ip bgp policy route-map origin** **ip bgp policy route-map prefix-list** **ip bgp policy route-map weight** **ip bgp policy route-map community-strip** **show ip bgp policy aspath-list** **show ip bgp policy community-list** **show ip bgp policy prefix-list** **show ip bgp policy prefix6-list** **show ip bgp policy route-map**
BGP Graceful Restart Commands	**ip bgp graceful-restart** **ip bgp graceful-restart restart-interval**
IPv6 Global BGP Commands	**ipv6 bgp unicast** **ip bgp neighbor activate-ipv6** **ip bgp neighbor ipv6-nexthop** **show ipv6 bgp path** **show ipv6 bgp routes**
IPv6 BGP Network Configuration Commands	**ipv6 bgp network** **ipv6 bgp network community** **ipv6 bgp network local-preference** **ipv6 bgp network metric** **ipv6 bgp network status** **show ipv6 bgp network**

IPv6 BGP Neighbor (Peer) Configuration Commands	**ipv6 bgp neighbor** **ipv6 bgp neighbor clear soft** **ipv6 bgp neighbor soft-reconfiguration** **ipv6 bgp neighbor in-prefix6list** **ipv6 bgp neighbor out-prefix6list** **ipv6 bgp neighbor activate-ipv6** **ipv6 bgp neighbor ipv6-nexthop** **ipv6 bgp neighbor status** **ipv6 bgp neighbor remote-as** **ipv6 bgp neighbor timers** **ipv6 bgp neighbor maximum-prefix** **ipv6 bgp neighbor next-hop-self** **ipv6 bgp neighbor conn-retry-interval** **ipv6 bgp neighbor default-originate** **ipv6 bgp neighbor update-source** **ipv6 bgp neighbor ipv4-nexthop** **show ipv6 bgp neighbors** **show ipv6 bgp neighbors statistics** **show ipv6 bgp neighbors timers** **show ipv6 bgp neighbors policy**

ip load bgp

Loads the BGP protocol software into running memory on the router. The image file containing BGP should already be resident in flash memory before issuing this command.

ip load bgp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- This command requires that the BGP software be resident in flash memory in the active directory.
- Enter this command in the router's configuration file (boot.cfg) to ensure BGP software is running after a reboot.
- The command does not administratively enable BGP on the router; BGP will be disabled after issuing this command. You must issue the **ip bgp status** to start the BGP protocol.

Examples

```
-> ip load bgp
```

Release History

Release 6.1; command was introduced.

Related Commands

ip bgp autonomous-system	Configures the Autonomous system number for this BGP router.
ip bgp status	Administratively enables or disables BGP.

MIB Objects

```
alaDrcTmIPBgpStatus
```

ip bgp status

Administratively enables or disables BGP. The BGP protocol will not be active until you enable it using this command.

ip bgp status {enable | disable}

Syntax Definitions

enable	Enables BGP.
disable	Disables BGP.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- You must first load the BGP software into running memory using the **ip load bgp** command before initiating this command.
- Many BGP commands require that the protocol be disabled (**ip bgp status**) before issuing them.

Examples

```
-> ip bgp status enable
-> ip bgp status disable
```

Release History

Release 6.1; command was introduced.

Related Commands

ip load bgp	Loads the BGP software.

MIB Objects

```
alaBgpGlobal
   alaBgpProtoStatus
```

ip bgp unicast

Enables or disables unicast IPv4 advertisements for the BGP routing process.

ip bgp unicast

no ip bgp unicast

Syntax Definitions

N/A

Defaults

By default, BGP IPv4 advertisements are enabled.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to turn off IPv4 unicast advertisements.
- BGP should be disabled before enabling or disabling IPv4 unicast advertisements.
- IPv4 unicast advertisements may be turned off on homogenous IPv6 networks that are not aware of IPv4 routing. In such cases, the command, **ip router router-id**, must be used to explicitly configure the 32-bit unique router identifier.

Examples

```
-> ip bgp unicast
-> no ip bgp unicast
```

Release History

Release 6.1.5; command was introduced.

Related Commands

ipv6 bgp unicast	Enables or disables unicast IPv6 updates for the BGP routing process.
show ip bgp	Displays the current global settings for the local BGP speaker.
ip router router-id	Configures the router ID for the router.

MIB Objects

```
alaBgpGlobal
   alaBgpMultiProtocolIpv4
```

ip bgp autonomous-system

Configures the Autonomous System (AS) number for this router. This number identifies this BGP speaker (this router) instance to other BGP routers. The AS number for a BGP speaker determines whether it is an internal or an external peer in relation to other BGP speakers. BGP routers in the same AS are internal peers while BGP routers in different ASs are external peers. BGP routers in the same AS exchange different routing information with each other than they exchange with BGP routers in external ASs. BGP speakers append their AS number to routes passing through them; this sequence of AS numbers is known as a route's AS path.

ip bgp autonomous-system *value*

Syntax Definitions

value	The AS number. The valid range is 1–65535.

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- A router can belong to only one AS. Do not specify more than one AS value for each router.
- The BGP protocol must be disabled (using the **ip bgp status** command) before using this command.

Examples

```
-> ip bgp autonomous-system 64724
```

Release History

Release 6.1; command was introduced.

Related Commands

ip bgp status	Enables and disables the BGP protocol.

MIB Objects

```
alaBgpGlobal
   alaBgpAutonomousSystemNumber
```

ip bgp bestpath as-path ignore

Indicates whether AS path comparison will be used in route selection. The AS path is the sequence of ASs through which a route has traveled. A shorter AS path is preferred over a longer AS path. The AS path is always advertised in BGP route updates. This command informs BGP to use the length of the AS path as a criteria for determining the best route.

ip bgp bestpath as-path ignore

no ip bgp bestpath as-path ignore

Syntax Definitions

N/A

Defaults

This command is enabled by default.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to disable this feature after it has been enabled.
- AS path comparison does not consider the type of links connecting the ASs along the path. In some cases a longer path over very fast connections may be a better route than a shorter path over slower connections. For this reason the AS path should not be the only criteria used for route selection. BGP considers local preference before AS path when making path selections.
- The BGP protocol must be disabled (using the **ip bgp status** command) before using this command.

Examples

```
-> ip bgp bestpath as-path ignore
-> no ip bgp bestpath as-path ignore
```

Release History

Release 6.1; command was introduced.

Related Commands

ip bgp aggregate-address as-set	Specifies whether AS path aggregation is to be performed or not.
ip bgp policy aspath-list	Creates or removes an AS path list.
ip bgp default local-preference	Configures the default local preference (lpref) value to be used when advertising routes.

MIB Objects

```
alaBgpGlobal
   alaBgpAsPathCompare
```

ip bgp cluster-id

Configures a BGP cluster ID when there are multiple, redundant, route reflectors in a cluster. This command is not necessary for configurations containing only one route reflector.

ip bgp cluster-id *ip_address*

Syntax Definitions

ip_address	32-bit IP address that is the Cluster ID of the router acting as a route reflector.

Defaults

parameter	default
ip_address	0.0.0.0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- In a route-reflection configuration where there are multiple route-reflectors in a cluster, use this command to configure this cluster ID. Configuring multiple route-reflectors enhances redundancy and avoids a single point of failure. When there is only one reflector in a cluster, the router ID of the reflector is used as the cluster-ID.
- The BGP protocol must be disabled (using the **ip bgp status** command) before using this command.
- Using many redundant reflectors in a single cluster places demands on the memory required to store routes for all redundant reflectors' peers.

Examples

```
-> ip bgp cluster-id 1.2.3.4
```

Release History

Release 6.1; command was introduced.

Related Commands

ip bgp status	Enables and disables BGP.
ip bgp client-to-client reflection	Enables route reflection and sets this speaker as the route reflector.

MIB Objects

```
alaBgpGlobal
   alaBgpClusterId
```

ip bgp default local-preference

Configures the default local preference (lpref) value to be used when advertising routes. A higher local preference value is preferred over a lower value. The local preference value is sent to all BGP peers in the local autonomous system; it is not advertised to external peers.

ip bgp default local-preference *value*

Syntax Definitions

value	The default local preference value for this router. The valid range is 0–4294967295.

Defaults

parameter	default
value	100

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Unless a route is specifically configured for a different local preference value it will default to value you specify in this command. This value is used for routes learned from external autonomous systems (the local preference value is not advertised in routes received from external peers) and for aggregates and networks that do not already contain local preference values.
- This value is specific to the router so it can compare its own local preference to those received in advertised paths. If other routers belong to the same AS, then they should use the same default local preference value.
- The BGP protocol must be disabled (using the **ip bgp status** command) before using this command.

Examples

```
-> ip bgp default local-preference 200
```

Release History

Release 6.1; command was introduced.

Related Commands

ip bgp aggregate-address local-preference	Sets the local preference for a BGP aggregate.
ip bgp network local-preference	Sets the local preference for a BGP network.

MIB Objects

```
alaBgpGlobal
   alaBgpDefaultLocalPref
```

ip bgp fast-external-failover

Enables fast external failover (FEFO). When enabled, FEFO resets a session when a link to a directly connected external peer is operationally down. The BGP speaker will fall back to Idle and then wait for a connection retry by the external peer that went down.

ip bgp fast-external-failover

no ip bgp fast-external-failover

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to disable Fast External Failover.
- When enabled, this command allows BGP to take immediate action when a directly connected interface, on which an external BGP session is established, goes down. Normally BGP relies on TCP to manage peer connections. Fast External failover improves upon TCP by resetting connections as soon as they go down.
- The BGP protocol must be disabled (using the **ip bgp status** command) before using this command.

Examples

```
-> ip bgp fast-external-failover
-> no ip bgp fast-external-failover
```

Release History

Release 6.1; command was introduced.

Related Commands

ip bgp neighbor clear	Restarts a BGP peer.
ip bgp neighbor auto-restart	Enables or disables BGP peer automatic restart.
ip bgp neighbor timers	Configures the time interval between KEEPALIVE messages sent by this peer and the tolerated hold time interval, in seconds, for messages to this peer from other peers.

MIB Objects

```
alaBgpFastExternalFailOver
```

ip bgp always-compare-med

Enables or disables Multi-Exit Discriminator (MED) comparison between peers in different autonomous systems. The MED value is considered when selecting the best path among alternatives; it indicates the weight for a particular exit point from the AS. A path with a lower MED value is preferred over a path with a higher MED value.

ip bgp always-compare-med

no ip bgp always-compare-med

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to disable MED comparison for external peers.
- By default, BGP only compares MEDs from the same autonomous system when selecting routes. Enabling this command forces BGP to also compare MEDs values received from external peers, or other autonomous systems.
- The BGP protocol must be disabled (using the **ip bgp status** command) before using this command.

Examples

```
-> ip bgp always-compare-med
-> no ip bgp always-compare-med
```

Release History

Release 6.1; command was introduced.

Related Commands

ip bgp bestpath med missing-as-worst	Configures the MED parameter when it is missing in a BGP path.

MIB Objects

```
alaBgpGlobal
   alaBgpMedAlways
```

ip bgp bestpath med missing-as-worst

Configures the MED parameter when it is missing in a BGP path.

ip bgp bestpath med missing-as-worst

no ip bgp bestpath med missing-as-worst

Syntax Definitions

N/A

Defaults

By default this command is disabled.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to disable missing MEDs as worst.
- This command is used to specify how a missing MED in an external BGP path is to be treated for route selection purposes. The default behavior is to treat missing MEDs as zero (best). This command allows you to treat missing MEDs as worst (2^{32}-1) for compatibility reasons.
- The BGP protocol must be disabled (using the **ip bgp status** command) before using this command.

Examples

```
-> ip bgp bestpath med missing-as-worst
-> no ip bgp bestpath med missing-as-worst
```

Release History

Release 6.1; command was introduced.

Related Commands

ip bgp always-compare-med	Forces BGP to consider MED values from external routes.

MIB Objects

```
alaBgpGlobal
   alaBgpMissingMed
```

ip bgp client-to-client reflection

Enables or disables this BGP speaker (router) to be a route reflector. Route reflectors advertise routing information to internal BGP peers, referred to as *clients*. BGP requires all internal routers to know all routes in an AS. This requirement demands a fully meshed (each router has a direct connection to all other routers in the AS) topology. Route reflection loosens the fully meshed restriction by assigning certain BGP routers as route reflectors, which take on the responsibility of advertising routing information to local BGP peers.

ip bgp client-to-client reflection

no ip bgp client-to-client reflection

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to disable the speaker as a route reflector.
- In addition to defining this router as the route reflector, this command also enable route reflection for this cluster. After setting this command this reflector will begin using route reflection behavior when communicating to client and non-client peers.
- Once route reflectors are configured, you need to indicate the clients (those routers receiving routing updates from the reflectors) for each route reflector. Use the **ip bgp neighbor route-reflector-client** command to configure clients.
- The BGP protocol must be disabled (using the **ip bgp status** command) before using this command.

Examples

```
-> ip bgp client-to-client reflection
-> no ip bgp client-to-client reflection
```

Release History

Release 6.1; command was introduced.

Related Commands

ip bgp status	Administratively disables BGP in this router.
ip bgp neighbor route-reflector-client	Configures a BGP peer to be a client to the this route reflector.

MIB Objects

```
alaBgpGlobal

ip bgp as-origin-interval

Specifies the frequency at which routes local to the autonomous system are advertised. These advertisements are also referred to as UPDATE messages. This interval applies to advertisements to internal peers.

ip bgp as-origin-interval *seconds*

no ip bgp as-origin-interval

Syntax Definitions

seconds	The update interval in seconds. The valid range is 1–65535.

Defaults

parameter	default
seconds	15

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to reset the feature to the default value.
- A lower value may increase the likelihood of route flapping as route status is updated more frequently.

Examples

```
-> ip bgp as-origin-interval 15
-> no ip bgp as-origin-interval
```

Release History

Release 6.1; command was introduced.

Related Commands

ip bgp neighbor advertisement-interval	Set the route advertisement interval for external peers.

ip bgp synchronization

Enables or disables synchronization of BGP prefixes with AS-internal routing information. Enabling this command will force the BGP speaker to advertise prefixes only if the prefixes are reachable through AS-internal routing protocols (IGPs like RIP and OSPF).

ip bgp synchronization

no ip bgp synchronization

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to disable IGP synchronization.
- A BGP router is not supposed to advertise routes learned through internal BGP updates unless those routes are also known by the primary internal routing protocol (e.g, RIP or OSPF). However, requiring all routers in an AS to know all external routes places a heavy burden on routers focusing mainly on Intra-AS routing. Therefore, disabling synchronization avoids this extra burden on internal routers. As long as all BGP routers in an AS are fully meshed (each has a direct connection to all other BGP routers in the AS) then the problem of unknown external router should not be a problem and synchronization can be disabled.
- By default, synchronization is disabled and the BGP speaker can advertise a route without waiting for the IGP to learn it. When the autonomous system is providing transit service, BGP should not propagate IGP paths until the IGP prefixes themselves are known to be reachable through IGP. If BGP advertises such routes before the IGP routers have learned the path, they will drop the packets causing a blackhole.
- The BGP protocol must be disabled (using the **ip bgp status** command) before using this command.

Examples

```
-> ip bgp synchronization
-> no ip bgp synchronization
```

Release History

Release 6.1; command was introduced.

Related Commands

```

ip bgp confederation identifier

Sets a confederation identification value for the local BGP speaker (this router). A confederation is a grouping of sub-ASs into a single AS. To peers outside a confederation, the confederation appears to be a single AS. Within the confederation multiple ASs may exist and even exchange information with each other as using external BGP (EBGP).

ip bgp confederation identifier *value*

Syntax Definitions

value	The confederation identification value. The valid range is 0–65535.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- A value of 0 means this local speaker is not a member of any confederation.
- The BGP protocol must be disabled (using the **ip bgp status** command) before using this command.
- Use this command in conjunction with the **ip bgp confederation neighbor** command to specify those peers that are a members of the same confederation as the local BGP speaker.

Examples

```
-> ip bgp confederation identifier 3
```

Release History

Release 6.1; command was introduced.

Related Commands

ip bgp autonomous-system	Sets the AS number for this router.
ip bgp confederation neighbor	Specifies peers that are members of a confederation.

MIB Objects

```
alaBgpGlobal
   alaBgpConfedId
```

ip bgp maximum-paths

Enables or disables support for multiple equal paths. When multipath support is enabled and the path selection process determines that multiple paths are equal when the router-id is disregarded, then all equal paths are installed in the hardware forwarding table. When multipath support is disabled, only the best route entry is installed in the hardware forwarding table.

ip bgp maximum-paths

no ip bgp maximum-paths

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to disable support for multiple equal cost paths.
- The BGP protocol must be disabled (using the **ip bgp status** command) before using this command.

Examples

```
-> ip bgp maximum-paths
-> no ip bgp maximum-paths
```

Release History

Release 6.1; command was introduced.

Related Commands

alaBgpGlobal
   alaBgpMultiPath
```

ip bgp log-neighbor-changes

Enables or disables the logging of peer state changes. If enabled, this logging tracks changes in the state of BGP peers from ESTABLISHED to IDLE and from IDLE to ESTABLISHED. Viewing peer state logging requires that certain debug parameters be set.

ip bgp log-neighbor-changes

no ip bgp log-neighbor-changes

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

The BGP protocol must be disabled (using the **ip bgp status** command) before using this command.

Examples

```
-> ip bgp log-neighbor-changes
-> no ip bgp log-neighbor-changes
```

Release History

Release 6.1; command was introduced.

Related Commands

ip bgp status	Disables BGP within the router.

```

ip bgp dampening

Enables or disables BGP route dampening or the suppression of unstable routes. Route dampening helps to control the advertisement of routes that are going up and then down at an abnormally high rate. Routes that are changing states (available then unavailable) are said to be *flapping*.

ip bgp dampening [half-life *half_life* **reuse** *reuse* **suppress** *suppress* **max-suppress-time** *max_suppress_time***]**

no ip bgp dampening

Syntax Definitions

half_life	The half-life duration, in seconds. The valid range is 0–65535.
reuse	The number of route withdrawals set for the re-use value. The valid range is 1–9999.
suppress	The dampening cutoff value. The valid range is 1–9999.
max_suppress_time	The maximum number of seconds a route can be suppressed. The valid range is 0–65535.

Defaults

parameter	value
half_life	300
reuse	200
suppress	300
max_suppress_time	1800

This command is disabled by default.

Platforms Supported

OmniSwitch 6400, 6850E, 6855, 9000E

Usage Guidelines

- Use the **no** form of this command to disable dampening.
- BGP dampening is disabled by default. When enabled, route dampening suppresses routes that are unstable, or “flapping,” and disrupting the network.
- BGP dampening of IPv6 route flaps is currently not supported.
- This command enables dampening and can also be used to change the default times for the dampening variables.
- Use the dampening variables to set penalties, suppression limits, and reuse values for flapping routes.

- The half-life value configures the half-life duration for a reachable route. After the time interval specified in this command, the penalty value for the route will be reduced by half. This command sets the duration in seconds during which the accumulated stability value is reduced by half if the route is considered reachable, whether suppressed or not. A larger value may be desirable for routes that are known for their instability. A larger value will also result in a longer suppression time if the route exceeds the flapping rate.
- The reuse value configures the number of route withdrawals necessary to begin readvertising a previously suppressed route. If the penalty value for a suppressed route fall below this value, then it will be advertised again. This command sets the reuse value, expressed as a number of route withdrawals. When the stability value for a route reaches or falls below this value, a previously suppressed route will be advertised again. The instability metric for a route is decreased by becoming more stable and by passing half-life time intervals
- The suppress value configures the cutoff value, or number of route withdrawals, at which a flapping route is suppressed and no longer advertised to BGP peers. This value is expressed as a number of route withdrawals. When the stability value for a route exceeds this cutoff value, the route advertisement is suppressed.
