Part No. 060394-10, Rev. B
November 2015

OmniSwitch AOS Release 8 CLI Reference Guide

Alcatel·Lucent Enterprise

enterprise.alcatel-lucent.com

This user guide documents AOS Release 8 for the OmniSwitch 6860 and OmniSwitch 6860E.
The functionality described in this guide is subject to change without notice.

Chapter 1 **Ethernet Port Commands** 1-1

interfaces 1-3
interfaces speed 1-5
interfaces duplex 1-7
interfaces alias 1-9
clear interfaces 1-10
interfaces max-frame-size 1-11
interfaces flood-limit 1-12
interfaces flood-limit action 1-14
interfaces ingress-bandwidth 1-16
interfaces pause 1-17
interfaces link-trap 1-19
interfaces ddm 1-20
interfaces ddm-trap 1-21
interfaces wait-to-restore 1-22
interfaces wait-to-shutdown 1-24
interfaces eee 1-26
clear violation 1-27
violation recovery-maximum 1-29
violation recovery-time 1-31
violation recovery-trap 1-33
show interfaces 1-34
show interfaces alias 1-38
show interfaces status 1-40
show interfaces capability 1-42
show interfaces accounting 1-44
show interfaces counters 1-46
show interfaces counters errors 1-48

show interfaces flood-rate 1-50
show interfaces traffic 1-52
show interfaces ingress-rate-limit 1-54
show interfaces ddm 1-56
show transceivers 1-59
show violation 1-61
show violation-recovery-configuration 1-63
interfaces link-monitoring admin-status 1-65
interfaces link-monitoring time-window 1-67
interfaces link-monitoring link-flap-threshold 1-69
interfaces link-monitoring link-error-threshold 1-71
interfaces clear-link-monitoring-stats 1-73
show interfaces link-monitoring config 1-75
show interfaces link-monitoring statistics 1-78
link-fault-propagation group 1-80
link-fault-propagation group source 1-82
link-fault-propagation group destination 1-84
link-fault-propagation group wait-to-shutdown 1-86
show link-fault-propagation group 1-87
interfaces tdr 1-89
show interfaces tdr-statistics 1-90

Chapter 2 Power over Ethernet (PoE) Commands 2-1
lanpower slot service 2-3
lanpower port admin-state 2-4
lanpower type 2-5
lanpower power 2-6
lanpower power 2-6
lanpower slot maxpower 2-8
lanpower priority 2-10
lanpower slot priority-disconnect 2-12
lanpower power-rule 2-14
lanpower power-policy 2-17
lanpower slot class-detection 2-19
lanpower capacitor-detection 2-20
lanpower slot usage-threshold 2-21
lanpower slot update-from 2-22
show lanpower slot 2-23
show lanpower power-rule 2-26
show lanpower power-policy 2-28
show lanpower slot class-detection 2-30
show lanpower slot capacitor-detection 2-31
show lanpower slot priority-disconnect 2-32
show lanpower slot usage-threshold 2-33
show lanpower slot update-from 2-34

Chapter 3 UDLD Commands 3-1
udld 3-2
udld port 3-3
udld mode 3-5
udld probe-timer 3-7
udld echo-wait-timer 3-9

clear udld statistics port 3-11
show udld configuration 3-12
show udld configuration port 3-14
show udld statistics port 3-16
show udld neighbor port 3-18
show udld status port 3-20

Chapter 4 Source Learning Commands 4-1
mac-learning 4-2
mac-learning flush 4-4
mac-learning flush domain 4-5
mac-learning static mac-address 4-7
mac-learning multicast mac-address 4-9
mac-learning aging-time 4-11
mac-learning mode 4-13
show mac-learning 4-14
show mac-learning domain 4-18
show mac-learning remote 4-22
show mac-learning aging-time 4-25
show mac-learning learning-state 4-26
show mac-learning mode 4-28
mac-ping 4-29

Chapter 5 VLAN Management Commands 5-1
vlan 5-2
vlan members untagged 5-4
vlan members tagged 5-6
vlan mtu-ip 5-8
show vlan 5-10
show vlan members 5-13

Chapter 6 High Availability VLAN Commands 6-1
server-cluster 6-2
server-cluster vlan 6-4
server-cluster mac-address 6-6
server-cluster ip 6-8
server-cluster igmp mode 6-10
server-cluster ip-multicast 6-12
server-cluster port 6-14
server-cluster linkagg 6-16
show server-cluster 6-18

Chapter 7 Distributed Spanning Tree Commands 7-1
spantree mode 7-3
spantree protocol 7-5
spantree vlan admin-state 7-7
spantree mst region name 7-8
spantree mst region revision-level 7-10
spantree mst region max-hops 7-11
spantree msti 7-13
spantree msti vlan 7-15
spantree priority 7-17

spantree hello-time 7-20
spantree max-age 7-22
spantree forward-delay 7-24
spantree bpdu-switching 7-26
spantree path-cost-mode 7-28
spantree pvst+compatibility 7-30
spantree auto-vlan-containment 7-32
spantree cist 7-34
spantree vlan 7-36
spantree cist path-cost 7-38
spantree msti path-cost 7-41
spantree vlan path-cost 7-44
spantree cist mode 7-47
spantree loop-guard 7-49
spantree vlan mode 7-51
spantree cist connection 7-53
spantree vlan connection 7-55
spantree cist admin-edge 7-57
spantree vlan admin-edge 7-59
spantree cist auto-edge 7-61
spantree vlan auto-edge 7-63
spantree cist restricted-role 7-65
spantree vlan restricted-role 7-67
spantree cist restricted-tcn 7-69
spantree vlan restricted-tcn 7-71
spantree cist txholdcount 7-73
spantree vlan txholdcount 7-74
show spantree 7-75
show spantree cist 7-78
show spantree msti 7-82
show spantree vlan 7-87
show spantree ports 7-91
show spantree cist ports 7-95
show spantree msti ports 7-99
show spantree vlan ports 7-104
show spantree mode 7-110
show spantree mst 7-112
show spantree msti vlan-map 7-115
show spantree cist vlan-map 7-117
show spantree map-msti 7-119

Chapter 8 Shortest Path Bridging Commands 8-1
spb bvlan 8-3
spb isis bvlan ect-id 8-5
spb isis control-bvlan 8-6
spb isis bvlan tandem-multicast-mode 8-7
spb isis bridge-priority 8-8
spb isis interface 8-9
spb ipvpn bind 8-11
spb ipvpn redist 8-13
show spb ipvpn bind 8-15
show spb ipvpn redist 8-17

show spb ipvpn route-table 8-19
spb isis admin-state 8-21
spb isis area-address 8-22
spb isis source-id 8-23
spb isis control-address 8-24
spb isis spf-wait 8-25
spb isis lsp-wait 8-27
spb isis overload 8-29
spb isis overload-on-boot 8-31
spb isis graceful-restart 8-33
spb isis graceful-restart helper 8-34
show spb isis info 8-35
show spb isis bvlans 8-38
show spb isis interface 8-40
show spb isis adjacency 8-42
show spb isis database 8-45
show spb isis nodes 8-48
show spb isis unicast-table 8-50
show spb isis services 8-52
show spb isis spf 8-54
show spb isis multicast-table 8-56
show spb isis multicast-sources 8-58
show spb isis multicast-sources-spf 8-60
show spb isis ingress-mac-filter 8-62

Chapter 9 Loopback Detection Commands 9-1
loopback-detection 9-2
loopback-detection port 9-4
loopback-detection service-access 9-6
loopback-detection transmission-timer 9-8
loopback-detection autorecovery-timer 9-9
show loopback-detection 9-10
show loopback-detection port 9-12
show loopback-detection statistics port 9-15

Chapter 10 Link Aggregation Commands 10-1
linkagg static agg size 10-3
linkagg static agg name 10-6
linkagg static agg admin-state 10-8
linkagg static port agg 10-9
linkagg lacp agg size 10-11
linkagg lacp agg name 10-14
linkagg lacp agg admin-state 10-16
linkagg lacp agg actor admin-key 10-18
linkagg lacp agg actor system-priority 10-19
linkagg lacp agg actor system-id 10-21
linkagg lacp agg partner system-id 10-23
linkagg lacp agg partner system-priority 10-25
linkagg lacp agg partner admin-key 10-27
linkagg lacp port actor admin-key 10-29
linkagg lacp port actor admin-state 10-32
linkagg lacp port actor system-id 10-34

linkagg lacp port actor system-priority 10-36
linkagg lacp agg partner admin-state 10-38
linkagg lacp port partner admin system-id 10-40
linkagg lacp port partner admin-key 10-42
linkagg lacp port partner admin system-priority 10-44
linkagg lacp port actor port priority 10-46
linkagg lacp port partner admin-port 10-48
linkagg lacp port partner admin port-priority 10-50
dhl name 10-52
dhl num linka linkb 10-54
dhl num admin-state 10-56
dhl num vlan-map linkb 10-57
dhl num pre-emption-time 10-59
dhl num mac-flushing 10-61
show dhl 10-63
show dhl num 10-65
show dhl num link 10-68
linkagg range 10-70
show linkagg 10-72
show linkagg port 10-77
show linkagg range 10-83

Chapter 11 Virtual Chassis Commands 11-1
virtual-chassis configured-chassis-id 11-2
virtual-chassis chassis-group 11-4
virtual-chassis configured-chassis-priority 11-6
virtual-chassis configured-control-vlan 11-8
virtual-chassis hello-interval 11-9
virtual-chassis vf-link-mode 11-11
virtual-chassis auto-vf-link-port 11-12
virtual-chassis shutdown 11-13
vc-takeover 11-14
show virtual-chassis topology 11-15
show virtual-chassis consistency 11-20
show virtual-chassis vf-link 11-23
show virtual-chassis auto-vf-link-port 11-25
show virtual-chassis chassis-reset-list 11-27
show virtual-chassis slot-reset-list 11-29
show virtual-chassis neighbors 11-31
show configuration vcm-snapshot chassis-id 11-33
virtual-chassis split-protection admin-state 11-34
virtual-chassis split-protection linkagg 11-35
virtual-chassis split-protection guard-timer 11-36
virtual-chassis split-protection helper admin-state 11-37
virtual-chassis split-protection helper linkagg 11-38
show virtual-chassis split-protection status 11-39
show virtual-chassis split-protection vc-units 11-40
show virtual-chassis split-protection helper status 11-41

Chapter 12 Ethernet Ring Protection Commands 12-1
erp-ring 12-2
erp-ring rpl-node 12-5

erp-ring wait-to-restore 12-7
erp-ring enable 12-8
erp-ring guard-timer 12-9
erp-ring sub-ring 12-10
erp-ring virtual-channel 12-12
erp-ring revertive 12-14
erp-ring clear 12-16
erp-ring ethoam-event 12-17
clear erp statistics 12-19
show erp 12-21
show erp statistics 12-24

Chapter 13 MVRP Commands 13-1
mvrp 13-2
mvrp port 13-3
mvrp linkagg 13-5
mvrp maximum-vlan 13-7
mvrp registration 13-8
mvrp applicant 13-10
mvrp timer join 13-12
mvrp timer leave 13-14
mvrp timer leaveall 13-16
mvrp timer periodic-timer 13-18
mvrp periodic-transmission 13-20
mvrp restrict-vlan-registration 13-21
mvrp restrict-vlan-advertisement 13-23
mvrp static-vlan-restrict 13-25
show mvrp configuration 13-27
show mvrp port 13-28
show mvrp linkagg 13-31
show mvrp timer 13-33
show mvrp statistics 13-36
show mvrp last-pdu-origin 13-39
show mvrp vlan-restrictions 13-41
mvrp clear-statistics 13-43

Chapter 14 802.1AB Commands 14-1
lldp nearest-edge mode 14-3
lldp transmit 14-4
lldp transmit hold-multiplier 14-6
lldp reinit delay 14-7
lldp notification interval 14-8
lldp lldpdu 14-9
lldp notification 14-11
lldp network-policy 14-13
lldp med network-policy 14-15
lldp tlv management 14-17
lldp tlv dot1 14-19
lldp tlv dot3 14-21
lldp tlv med 14-23
show lldp system-statistics 14-25
show lldp statistics 14-27

show lldp local-system 14-29
show lldp local-port 14-31
show lldp local-management-address 14-33
show lldp config 14-34
show lldp network-policy 14-36
show lldp med network-policy 14-38
show lldp agent-destination-address 14-40
show lldp remote-system 14-41
show lldp remote-system med 14-46
show lldp remote-system application-tlv 14-49

Chapter 15 SIP Commands 15-1
sip-snooping admin-state 15-2
sip-snooping port admin-state 15-3
sip-snooping mode 15-5
sip-snooping trusted server 15-7
sip-snooping sip-control 15-9
sip-snooping sos-call number 15-10
sip-snooping sos-call dscp 15-11
sip-snooping udp port 15-12
sip-snooping tcp port 15-13
sip-snooping threshold 15-15
sip-snooping logging-threshold num-of-calls 15-17
show sip-snooping call-records 15-18
clear sip-snooping statistics 15-21
show sip-snooping config 15-22
show sip-snooping ports 15-24
show sip-snooping statistics 15-25
show sip-snooping registered-clients 15-28

Chapter 16 IP Commands 16-1
ip interface 16-4
ip interface tunnel 16-7
ip router primary-address 16-9
ip router router-id 16-10
ip static-route 16-11
ip route-pref 16-13
ip default-ttl 16-15
ping 16-16
traceroute 16-18
ip directed-broadcast 16-20
ip service 16-21
ip service port 16-23
ip service source-ip 16-25
ip redist 16-27
ip access-list 16-29
ip access-list address 16-30
ip route-map action 16-32
ip route-map match ip address 16-34
ip route-map match ipv6 address 16-36
ip route-map match ip-nexthop 16-38
ip route-map match ipv6-nexthop 16-40

ip route-map match tag 16-42
ip route-map match ipv4-interface 16-44
ip route-map match ipv6-interface 16-46
ip route-map match metric 16-48
ip route-map match route-type 16-50
ip route-map match protocol 16-52
ip route-map set metric 16-54
ip route-map set metric-type 16-56
ip route-map set tag 16-58
ip route-map set community 16-60
ip route-map set local-preference 16-62
ip route-map set level 16-64
ip route-map set ip-nexthop 16-66
ip route-map set ipv6-nexthop 16-68

show icmp statistics 16-145
show tcp statistics 16-147
show tcp ports 16-149
show udp statistics 16-151
show udp ports 16-152
show ip dos config 16-153
show ip dos statistics 16-155
show vrf 16-157
show vrf-profiles 16-160

Chapter 17 IPv6 Commands 17-1
ipv6 interface 17-3
ipv6 interface tunnel source destination 17-7
ipv6 address 17-8
ipv6 address global-id 17-10
ipv6 address local-unicast 17-11
ipv6 dad-check 17-13
ipv6 hop-limit 17-14
ipv6 pmtu-lifetime 17-15
ipv6 neighbor stale-lifetime 17-16
ipv6 neighbor 17-17
ipv6 neighbor limit 17-18
ipv6 neighbor vrf-limit 17-19
ipv6 ra-filter 17-20
ipv6 prefix 17-22
ipv6 static-route 17-24
ipv6 route-pref 17-26
ipv6 virtual-source-mac 17-28
ping6 17-29
traceroute6 17-31
show ipv6 icmp statistics 17-33
show ipv6 interface 17-36
show ipv6 ra-filter 17-40
show ipv6 pmtu table 17-42
show ipv6 neighbors 17-44
clear ipv6 neighbors 17-46
show ipv6 prefixes 17-47
show ipv6 routes 17-49
show ipv6 route-pref 17-51
show ipv6 router database 17-52
show ipv6 tcp connections 17-54
show ipv6 tcp listeners 17-56
show ipv6 traffic 17-58
show ipv6 tunnel configured 17-61
show ipv6 tunnel 6to4 17-63
show ipv6 udp ports 17-65
show ipv6 information 17-66
ipv6 redist 17-68

ipv6 access-list 17-70
ipv6 access-list address 17-71
show ipv6 redist 17-73
show ipv6 access-list 17-75
ipv6 load rip 17-77
ipv6 rip admin-state 17-78
ipv6 rip invalid-timer 17-79
ipv6 rip garbage-timer 17-80
ipv6 rip holddown-timer 17-81
ipv6 rip jitter 17-82
ipv6 rip route-tag 17-83
ipv6 rip update-interval 17-84
ipv6 rip triggered-sends 17-85
ipv6 rip interface 17-86
ipv6 rip interface metric 17-88
ipv6 rip interface recv-status 17-89
ipv6 rip interface send-status 17-90
ipv6 rip interface horizon 17-91
show ipv6 rip 17-92
show ipv6 rip interface 17-94
show ipv6 rip peer 17-97
show ipv6 rip routes 17-99
ipv6 dhcp relay admin-state 17-102
ipv6 dhcp relay interface admin-state 17-103
ipv6 dhcp relay destination 17-104
show ipv6 dhcp relay 17-106

Chapter 18 IPsec commands 18-1
ipsec key 18-2
ipsec security-key 18-4
ipsec policy 18-6
ipsec policy rule 18-9
ipsec sa 18-10
show ipsec policy 18-12
show ipsec sa 18-14
show ipsec key 18-16
show ipsec ipv6 statistics 18-18

Chapter 19 RIP Commands 19-1
ip load rip 19-2
ip rip admin-state 19-3
ip rip interface 19-4
ip rip interface admin-state 19-6
ip rip interface metric 19-8
ip rip interface send-version 19-9
ip rip interface recv-version 19-11
ip rip interface ingress-filter 19-12
ip rip interface ingress-filter 19-13
ip rip interface egress-filter 19-14
ip rip force-holddowntimer 19-15
ip rip host-route 19-17
ip rip route-tag 19-18

ip rip interface auth-type 19-19
ip rip interface auth-key 19-20
ip rip update-interval 19-21
ip rip invalid-timer 19-22
ip rip garbage-timer 19-23
ip rip holddown-timer 19-24
show ip rip 19-25
show ip rip routes 19-27
show ip rip interface 19-30
show ip rip peer 19-32

Chapter 20 BFD Commands 20-1
ip bfd admin-state 20-3
ip bfd transmit 20-4
ip bfd receive 20-5
ip bfd multiplier 20-6
ip bfd echo-interval 20-7
ip bfd interface 20-8
ip bfd interface admin-state 20-9
ip bfd interface transmit 20-10
ip bfd interface receive 20-11
ip bfd interface multiplier 20-12
ip bfd interface echo-interval 20-13
ip ospf bfd-state 20-15
ip ospf bfd-state all-interfaces 20-17
ip ospf interface bfd-state 20-18
ip ospf interface bfd-state drs-only 20-19
ip ospf interface bfd-state all-neighbors 20-20
ip bgp bfd-state 20-21
ip bgp bfd-state all-neighbors 20-22
ip bgp neighbor bfd-state 20-23
vrrp bfd-state 20-24
vrrp track address bfd-state 20-25
show ip bfd 20-26
show ip bfd interfaces 20-28
show ip bfd sessions 20-30
show ip bfd sessions statistics 20-32
ip static-route all bfd-state 20-34
ip static-route bfd-state 20-35

Chapter 21 DHCP Relay Commands 21-1
ip helper address 21-3
ip helper vlan address 21-5
ip helper standard 21-7
ip helper per-vlan-only 21-8
ip helper forward-delay 21-10
ip helper maximum-hops 21-12
ip helper agent-information 21-14
ip helper agent-information policy 21-16
ip helper pxe-support 21-18
ip helper boot-up 21-19
ip helper boot-up enable 21-20

ip udp relay port 21-21
ip udp relay service 21-23
ip udp relay service vlan 21-25
show ip helper 21-27
show ip helper statistics 21-29
show ip udp relay 21-31

tftp 52-28
sftp 52-30
ftp 52-32
show ftp 52-34

Chapter 53 Web Management Commands 53-1
webview server 53-2
webview access 53-3
webview force-ssl 53-4
webview http-port 53-5
webview https-port 53-6
show webview 53-7

Chapter 54 Configuration File Manager Commands 54-1
configuration apply 54-2
configuration error-file-limit 54-4
show configuration status 54-6
configuration cancel 54-8
configuration syntax-check 54-9
configuration snapshot 54-11
show configuration snapshot 54-13
write terminal 54-15

Chapter 55 SNMP Commands 55-1
snmp station 55-3
show snmp station 55-5
snmp community-map 55-7
snmp community-map mode 55-9
show snmp community-map 55-10
snmp security 55-12
show snmp security 55-14
show snmp statistics 55-16

show snmp mib-family 55-18
snmp-trap absorption 55-20
snmp-trap to-webview 55-21
snmp-trap replay-ip 55-22
snmp-trap filter-ip 55-24
snmp authentication-trap 55-26
show snmp-trap replay-ip 55-27
show snmp-trap filter-ip 55-29
show snmp authentication-trap 55-31
show snmp-trap config 55-32

Chapter 56 OpenFlow Commands 56-1
openflow back-off-max 56-2
openflow idle-probe-timeout 56-3
openflow logical-switch 56-4
openflow logical-switch controller 56-6
openflow logical-switch interfaces 56-8
show openflow 56-9
show openflow logical-switch 56-10

Chapter 57 DNS Commands 57-1
ip domain-lookup 57-2
ip name-server 57-3
ipv6 name-server 57-5
ip domain-name 57-7
show dns 57-8

CLI Quick Reference

Index Index-1

About This Guide

This *OmniSwitch AOS Release 8 CLI Reference Guide* is a comprehensive resource to all Command Line Interface (CLI) commands available on the OmniSwitch 6860, 6860E Series switches.

Supported Platforms

The information in this guide applies only to OmniSwitch 6860, 6860E switches.

Who Should Read this Manual?

The audience for this user guide is network administrators and IT support personnel who need to configure, maintain, and monitor switches and routers in a live network. Anyone wishing to gain knowledge on the details of all CLI commands available on the OmniSwitch will benefit from the material in this reference guide. However, advanced users who have already familiarized themselves with the OmniSwitch CLI commands will benefit most from the detailed content in this guide.

When Should I Read this Manual?

Read this guide whenever you want detailed information on individual CLI commands. Although this guide provides helpful information during any stage of the configuration process, it is a good idea to first familiarize yourself with the software features available on the switch before investigating the detailed command information in this guide.

Overview information, procedures, and live network examples on switch software features can be found in the *OmniSwitch AOS Release 8 Switch Management Guide*, *OmniSwitch AOS Release 8 Network Configuration Guide*, and the *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide*. Once you are familiar with the procedures and base CLI commands in these configuration guides you can obtain more detailed information on the individual commands in this guide.

What is in this Manual?

This reference guide includes information on every CLI command available in the switch. Command reference information is included for base software commands as well as commands associated with optional software packages, such as Advanced Routing (multicast routing protocols and OSPF). The information provided for each CLI command includes:

- Command description.
- Syntax.
- Description of all keywords and variables included in the syntax.
- Default values.
- Usage guidelines, which include tips on when and how to use the command.
- Examples of command lines using the command.
- Related commands with descriptions.
- Release history, which indicates the release when the command was introduced.
- SNMP information, such as the MIB files related to a set of CLI commands. In addition each CLI command includes the corresponding MIB variables that map to all parameters included in a command.

What is Not in this Manual?

Primarily a reference, this guide does not provide step-by-step instructions on how to set up particular features on the switch. It also does not provide overview or application examples on software features. For comprehensive information on how to configure particular software features in the switch, consult the appropriate configuration guide.

This guide also does not provide any information on the network management applications, WebView and OmniVista. Further information on WebView and OmniVista can be found in the context-sensitive on-line help available with those applications.

How is the Information Organized?

Each chapter in this guide includes reference material for all commands related to a single software feature, such as server load balancing or link aggregation. Typically commands in a single chapter will share a common prefix.

Text Conventions

The following table contains text conventions and usage guidelines for CLI commands as they are documented in this guide.

bold text	Indicates basic command and keyword syntax. Example: **show snmp station**
italicized text	Indicates user-specific information such as IP addresses, slot numbers, passwords, names, etc. Example: **no snmp station** *ip_address* Italicized text that is not enclosed with straight brackets (**[ ]**) indicates required information.
[ ] (Straight Brackets)	Indicates optional parameters for a given command. Example: **show aaa server [***server_name***]** Here, you can enter either of the following options: **show aaa server** **show aaa server** *server_name* (where *server_name* is the user-specified server name, e.g., **show aaa server myserver1**) Note that this example includes *italicized text*. The optional parameter in this case is a user-specified server name.
{ } (Curly Braces)	Indicates that the user must choose between one or more parameters. Example: **port mirroring {enable | disable}** Here, you must choose one of the following: **port mirroring enable** or **port mirroring disable**
| (Vertical Pipes)	Used to separate parameter choices within a command string. For example, the command string **show health threshold [rx | txrx | memory | cpu]** separates the choices **rx**, **txrx**, **memory,** and **cpu**. Examples: **show health threshold rx** **show health threshold txrx** **show health threshold memory** **show health threshold cpu**
‘ ‘(Quotation Marks)	Used to enclose text strings that contain spaces. The quotation marks are required input on the command line. Example: **vlan 2 ‘new test vlan’**

Documentation Roadmap

The OmniSwitch user documentation suite was designed to supply you with information at several critical junctures of the configuration process.The following section outlines a roadmap of the manuals that will help you at each stage of the configuration process. Under each stage, we point you to the manual or manuals that will be most helpful to you.

Stage 1: Using the Switch for the First Time

Pertinent Documentation: *Release Notes*
OmniSwitch Hardware Users Guide

A hard-copy *OmniSwitch AOS Release 8 Getting Started Guide* is included with your switch; this guide provides all the information you need to get your switch up and running the first time. It provides information on unpacking the switch, rack mounting the switch, installing NI modules, unlocking access control, setting the switch's IP address, and setting up a password. It also includes succinct overview information on fundamental aspects of the switch, such as hardware LEDs, the software directory structure, CLI conventions, and web-based management.

At this time you should also familiarize yourself with the Release Notes that accompanied your switch. This document includes important information on feature limitations that are not included in other user guides.

Stage 2: Gaining Familiarity with Basic Switch Functions

Pertinent Documentation: *OmniSwitch Hardware Users Guide*
OmniSwitch AOS Release 8 Switch Management Guide

Once you have your switch up and running, you will want to begin investigating basic aspects of its hardware and software. Information about switch hardware is provided in the *OmniSwitch AOS Release 8 Hardware Guide*. This guide provide specifications, illustrations, and descriptions of all hardware components, such as chassis, power supplies, Chassis Management Modules (CMMs), Network Interface (NI) modules, and cooling fans. It also includes steps for common procedures, such as removing and installing switch components.

This guide is the primary users guide for the basic software features on a single switch. This guide contains information on the switch directory structure, basic file and directory utilities, switch access security, SNMP, and web-based management. It is recommended that you read this guide before connecting your switch to the network.

Stage 3: Integrating the Switch Into a Network

Pertinent Documentation: *OmniSwitch AOS Release 8 Network Configuration Guide*
OmniSwitch AOS Release 8 Advanced Routing Configuration Guide

When you are ready to connect your switch to the network, you will need to learn how the OmniSwitch implements fundamental software features, such as 802.1Q, VLANs, Spanning Tree, and network routing protocols. The *OmniSwitch AOS Release 8 Network Configuration Guide* contains overview information, procedures, and examples on how standard networking technologies are configured on the OmniSwitch.

The *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* includes configuration information for networks using advanced routing technologies (OSPF and BGP) and multicast routing protocols (DVMRP and PIM-SM).

Anytime

The *OmniSwitch AOS Release 8 CLI Reference Guide* contains comprehensive information on all CLI commands supported by the switch. This guide includes syntax, default, usage, example, related CLI command, and CLI-to-MIB variable mapping information for all CLI commands supported by the switch. This guide can be consulted anytime during the configuration process to find detailed and specific information on each CLI command.

Related Documentation

The following are the titles and descriptions of all the related OmniSwitch user manuals:

- *OmniSwitch Hardware Users Guides*

  Describes the hardware and software procedures for getting an OmniSwitch up and running. Also provides information on fundamental aspects of OmniSwitch software architecture.

- *OmniSwitch AOS Release 8 CLI Reference Guide*

  Complete reference to all CLI commands supported on the OmniSwitch. Includes syntax definitions, default values, examples, usage guidelines and CLI-to-MIB variable mappings.

- *OmniSwitch AOS Release 8 Switch Management Guide*

  Includes procedures for readying an individual switch for integration into a network. Topics include the software directory architecture, image rollback protections, authenticated switch access, managing switch files, system configuration, using SNMP, and using web management software (WebView).

- *OmniSwitch AOS Release 8 Network Configuration Guide*

  Includes network configuration procedures and descriptive information on all the major software features and protocols included in the base software package. Chapters cover Layer 2 information (Ethernet and VLAN configuration), Layer 3 information (routing protocols, such as RIP and IPX), security options (authenticated VLANs), Quality of Service (QoS), link aggregation, and server load balancing.

- *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide*

  Includes network configuration procedures and descriptive information on all the software features and protocols included in the advanced routing software package. Chapters cover multicast routing (DVMRP and PIM-SM), Open Shortest Path First (OSPF), and Border Gateway Protocol (BGP).

- *OmniSwitch Transceivers Guide*

  Includes SFP and XFP transceiver specifications and product compatibility information.

- Technical Tips, Field Notices

  Includes information published by Alcatel-Lucent's Customer Support group.

- *Release Notes*

  Includes critical Open Problem Reports, feature exceptions, and other important information on the features supported in the current release and any limitations to their support.

Technical Support

An Alcatel-Lucent service agreement brings your company the assurance of 7x24 no-excuses technical support. You'll also receive regular software updates to maintain and maximize your Alcatel-Lucent product's features and functionality and on-site hardware replacement through our global network of highly qualified service delivery partners.

With 24-hour access to Alcatel-Lucent's Service and Support web page, you'll be able to view and update any case (open or closed) that you have reported to Alcatel-Lucent's technical support, open a new case or access helpful release notes, technical bulletins, and manuals.

Access additional information on Alcatel-Lucent's Service Programs:

1 Ethernet Port Commands

The Ethernet port software is responsible for configuring and monitoring Ethernet ports. This includes:

- Performing hardware diagnostics, loading software, and initializing hardware.
- Notifying other software modules in the system when Ethernet links become active or inactive.
- Configuring basic line parameters for Ethernet ports.
- Gathering basic line statistics for Ethernet ports and passing this information to the user interface and configuration manager.

MIB information for the Ethernet Port commands is as follows:

Filename: AlcatelIND1Port.mib
Module: alcatelIND1PortMIB

Filename: IETF_ETHERLIKE.mib
Module: EtherLike-MIB

A summary of the available commands is listed here.

Interfaces commands	**interfaces** **interfaces speed** **interfaces duplex** **interfaces alias** **clear interfaces** **interfaces max-frame-size** **interfaces flood-limit** **interfaces flood-limit action** **interfaces ingress-bandwidth** **interfaces pause** **interfaces link-trap** **interfaces ddm** **interfaces ddm-trap** **interfaces wait-to-restore** **interfaces wait-to-shutdown** **interfaces eee** **violation recovery-maximum** **show interfaces alias** **show interfaces status** **show interfaces capability** **show interfaces accounting** **show interfaces counters** **show interfaces counters errors** **show interfaces flood-rate** **show interfaces traffic** **show interfaces ingress-rate-limit** **show interfaces ddm** **show transceivers**
Interface violation commands	**violation recovery-maximum** **violation recovery-time** **violation recovery-trap** **show violation** **show violation-recovery-configuration** **clear violation**
Link monitoring commands	**show violation-recovery-configuration** **interfaces link-monitoring time-window** **interfaces link-monitoring link-flap-threshold** **interfaces link-monitoring link-error-threshold** **interfaces clear-link-monitoring-stats** **show interfaces link-monitoring config** **show interfaces link-monitoring statistics**
Time Domain Reflectometry (TDR) commands	**interfaces tdr** **show interfaces tdr-statistics**
Link fault propagation commands	**link-fault-propagation group** **link-fault-propagation group source** **link-fault-propagation group destination** **link-fault-propagation group wait-to-shutdown** **show link-fault-propagation group**

interfaces

Enables or disables auto negotiation or administrative status on a single port, a range of ports, or an entire Network Interface (NI).

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[**-*port2***]} {admin-state | autoneg | epp} {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to configure.
port	Port number of the interface you want to configure.
port2	Last port number in a range of ports you want to configure.
admin-state enable	Enables administrative state.
admin-state disable	Disables administrative state.
autoneg enable	Enables auto negotiation.
autoneg disable	Disables auto negotiation.
epp enable	Enables Enhanced Port Performance.
epp disable	Disables Enhanced Port Performance.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If auto negotiation is disabled, auto MDIX, flow control, auto speed, and auto duplex are not accepted. See the **interfaces duplex** command on page 1-7 for more information.
- When EPP is enabled the fiber port receiver performance is enhanced by increasing its sampling rate. This enhancement can help with port link connection reliability or CRC problems that may occur with direct copper cable interfaces.
- Autonegotiation cannot be disabled on 10GBase-T ports.

Examples

```
-> interfaces slot 3/1 autoneg disable
-> interfaces 3/1/1 autoneg disable
-> interfaces 3/1/1-4 autoneg disable
-> interfaces 2/1/1-5 admin-state enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

interfaces	Configures interface speed.
interfaces duplex	Enables or disables flow (pause).
show interfaces alias	Displays interface line settings.
violation recovery-maximum	Displays auto negotiation, speed, duplex, and other general interface information.

MIB Objects

```
esmConfTable
   esmPortCfgAutoNegotiation
```

interfaces speed

Configures interface line speed.

interfaces {slot *chassis/slot* | **port** *chassis/slot/port* **[-***port2***]} speed {10 | 100 | 1000 | 10000 | auto | max {10 | 100 | 1000}}**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to configure.
port	Port number of the interface you want to configure.
port2	Last port number in a range of ports you want to configure.
auto	The switch automatically sets the line speed to match the attached device (auto-sensing).
10	Sets the interface to 10 Mbps.
100	Sets the interface to 100 Mbps.
1000	Sets the interface to 1000 Mbps (1 Gigabit).
10000	Sets the interface to 10000 Mbps (10 Gigabit).
2000	Sets the interface to 2000 Mbps for FibreChannel.
4000	Sets the interface to 4000 Mbps for FibreChannel.
8000	Sets the interface to 8000 Mbps for FibreChannel.
max 10	Sets the maximum speed to 10 Mbps.
max 100	Sets the maximum speed to 100 Mbps.
max 1000	Sets the maximum speed to 1000 Mbps (1 Gigabit).
max 4000	Sets the maximum speed to 4000 Mbps for FibreChannel.
max 8000	Sets the maximum speed to 8000 Mbps for FibreChannel.

Defaults

parameter	default
auto	enable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> interfaces slot 3/1 speed auto
-> interfaces 3/1/1 speed 100
```

```
-> interfaces 3/1/1-8 speed auto
```

Release History

Release 8.1.1; command introduced.

Related Commands

violation recovery-maximum	Displays auto negotiation, speed, and duplex settings.

MIB Objects

```
esmConfTable
   esmPortCfgSpeed
```

interfaces duplex

Configures duplex mode. In full duplex mode, the interface transmits and receives data simultaneously. In half duplex mode, the interface can transmit *or* receive data at a given time. Auto duplex setting causes the switch to advertise all available duplex modes (half/full/both) for the port during autonegotiation.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[-***port2***]} duplex {full | half | auto}**

Syntax Definitions

chassis	The chassis identifier..
slot	Slot number you want to configure.
port	Port number of the interface you want to configure.
port2	Last port number in a range of ports you want to configure.
full	Sets interface to full duplex mode.
half	Sets interface to half duplex mode.
auto	Switch automatically sets both the duplex mode settings to auto-negotiation.

Defaults

parameter	default
full | half | auto	**full**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You can only configure one slot at a time. Repeat the command to configure additional slots.
- Half duplex mode is not supported on Gigabit modules if a port is detected as Gigabit (1000 Mbps).
- Gigabit and 10 Gigabit fiber ports only support full duplex.

Examples

```
-> interfaces slot 3/1 duplex auto
-> interfaces 3/1/1 duplex half
-> interfaces 3/1/1-4 auto
```

Release History

Release 8.1.1; command introduced.

Related Commands

interfaces	Configures interface line speed. Set to **auto** to set speed and duplex mode to auto-sensing.
violation recovery-maximum	Displays auto negotiation, speed, duplex, and other general interface information.

MIB Objects

```
esmConfTable
   esmPortAutoDuplexMode
```

interfaces alias

Configures a description (alias) for a single port.

interfaces port *chassis/slot/port* **alias** *description*

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to configure.
port	Port number of the interface you want to configure.
description	A description for the port, which can be up to 40 characters long. Description tags with spaces must be enclosed within quotes (e.g., “IP Phone”).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You can only configure one port at time. You cannot configure an alias for multiple ports.
- To remove an alias use a description consisting of two quotes without any spaces (e.g., "").

Examples

```
-> interfaces 3/1/1 alias "switch port"
-> interfaces 2/1/2 alias "IP Phone"
-> interfaces 3/1/1 alias ""
```

Release History

Release 8.1.1; command introduced.

Related Commands

show interfaces alias	Displays port status (up or down) and any aliases for a port.

MIB Objects

```
ifXTable
   ifAlias
```

clear interfaces

Resets all statistics counters.

clear interfaces {slot *chassis/slot* | **port** *chassis/slot/port*[**-***port2*]**} {l2-statistics [cli] | tdr-statistics}**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to configure.
port	Port number of the interface you want to configure.
port2	Last port number in a range of ports you want to configure.
cli	Clears the CLI statistics only.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

There is no global clear statistics command for TDR. The highest level granularity supported for clearing statistics is per *chassis/slot*.

Examples

```
-> clear interfaces 3/1/1 l2-statistics
-> clear interfaces 3/1/2 l2-statistics cli
-> clear interfaces 3/1/3 tdr-statistics
```

Release History

Release 8.1.1; command introduced.

Related Commands

show interfaces counters	Displays general interface information, including when statistics were last cleared.

MIB Objects

```
alcetherStatsTable
   alcetherClearStats
esmTdrPortTable
   esmTdrPortClearResults
```

interfaces max-frame-size

Configures the maximum frame size for Gigabit Ethernet interfaces.

interfaces {slot *chassis/slot* | **port** *chassis/slot/port***[-***port2***} max-frame-size** *bytes*

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to configure.
port	Port number of the interface you want to configure.
port2	Last port number in a range of ports you want to configure.
max frame	Maximum frame size, in bytes. Valid range is 1518–9216.

Defaults

parameter	default
bytes (Gigabit Ethernet Packets)	9216
bytes (Ethernet Packets)	1553

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> interfaces 3/1/1 max-frame-size 1518
-> interfaces slot 3/1 max-frame-size 1518
```

Release History

Release 8.1.1; command introduced.

Related Commands

violation recovery-maximum	Displays auto negotiation, speed, duplex, and other general interface information.

MIB Objects

```
esmConfTable
   esmPortCfgMaxFrameSize
```

interfaces flood-limit

Configures the flood rate settings on a single port, a range of ports, or an entire Network Interface (NI).

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[-***port2***]} flood-limit {bcast|mcast|uucast|all} rate {pps** *pps_num*| **mbps** *mbps_num* **| cap%** *cap_num* **| enable | disable | default} low-threshold** *num*

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to configure.
port	Port number of the interface you want to configure.
port2	Last port number in a range of ports you want to configure.
bcast	Specifies broadcast flood limit.
mcast	Specifies multicast flood limit.
uucast	Specifies unicast flood limit.
all	Specifies flood limit for all types of traffic.
pps_num	Packets per second.
mbps_num	Megabits per second.
cap_num	Percentage of port's capacity.
enable	Enables flood rate limits.
disable	Disables flood rate limits.
default	Sets default flood rate limits

Defaults

parameter	default
enable | disable	enable
low-threshold	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The auto recovery has to be enabled by configuring low threshold.
- The high and low threshold when configured, will have same type [mbps, pps, and percentage].

Examples

```
-> interfaces slot 3/1 flood-limit all rate cap% 50
-> interfaces 2/1/1 flood-limit bcast rate mbps 100
-> interfaces 1/1/1 flood-limit bcast rate mbps 60 low-threshold 40
-> interfaces 1/1/4 flood-limit uucast rate mbps 100 low-threshold 40
-> interfaces 1/1/5 flood-limit mcast rate pps 2000 low-threshold 1000
```

Release History

Release 8.1.1; command introduced.
Release 8.2.1; Parameter "**low-threshold**" added.

Related Commands

show interfaces flood-rate	Displays interface flood rate settings.

MIB Objects

```
esmConfigTable
   esmPortCfgFlow
   esmPortBcastRateLimit
   esmPortMcastRateLimit
   esmPortUucastRateLimit
dot3PauseTable
   dot3PauseAdminMode
```

interfaces flood-limit action

Configures the action on a single port, a range of ports, when the port reaches the storm violated state.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[-***port2***]} flood-limit {bcast|mcast|uucast|all} action {shutdown|trap|default}**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to configure.
port	Port number of the interface you want to configure.
port2	Last port number in a range of ports you want to configure.
bcast	Specifies broadcast flood limit.
mcast	Specifies multicast flood limit.
uucast	Specifies unicast flood limit.
all	Specifies flood limit for all types of traffic.
shutdown	Specifies when high threshold is violated, port need to be put in blocked state.
trap	Specifies when high threshold is crossed, trap will be sent with the violation reason.
default	Specifies when traffic reaches high threshold, packets above that rate will be dropped.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When high threshold is violated, and the port needs to be put in blocked state, set the action as "**shutdown**".
- When high threshold is crossed, and a trap has to be sent with violation reason, set the action as "**trap**".
- When traffic reaches high threshold, and the packets above that rate needs to be dropped, set the action as "**default**".

Examples

```
-> interfaces 1/1/1 flood-limit bcast action shutdown
-> interfaces 1/1/4 flood uucast action trap
-> interfaces 1/1/11 flood-limit all action shutdown
-> interfaces 1/1/14 flood mcast action default
```

Release History

Release 8.2.1; command introduced.

Related Commands

show interfaces flood-rate	Displays interface flood rate settings.

MIB Objects

```
esmConfigTable
   esmPortBcastThresholdAction
   esmPortMcastThresholdAction
   esmPortUucastThresholdAction
```

interfaces ingress-bandwidth

Configures the ingress bandwidth settings on a single port, a range of ports, or an entire Network Interface (NI).

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[**-*port2***]} ingress-bandwidth {mbps| enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to configure.
port	Port number of the interface you want to configure.
port2	Last port number in a range of ports you want to configure.
mbps	Specifies the ingress bandwidth in Mbps.
enable	Enables ingress bandwidth limiting.
disable	Disables ingress bandwidth limiting.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> interfaces slot 3/1 ingress-bandwidth enable
-> interfaces slot 3/2 ingress-bandwidth mbps 30
```

Release History

Release 8.1.1; command introduced.

Related Commands

show interfaces ingress-rate-limit	Displays the ingress-rate-limit set for each interface por.

MIB Objects

```
esmConfTable
   esmPortIngressRateLimitEnable
```

interfaces pause

Configures whether or not the switch will transmit and/or honor flow control PAUSE frames on the specified interface. PAUSE frames are used to temporarily pause the flow of traffic between two connected devices to help prevent packet loss when traffic congestion occurs between switches.

interfaces *chassis/slot***[/***port***[-***port2***]] pause {tx | rx | tx-and-rx | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to configure.
port	Port number of the interface you want to configure.
port2	Last port number in a range of ports you want to configure.
tx	Allows interface to transmit PAUSE frames to peer switches.
rx	Allows interface to honor PAUSE frames from peer switches and temporarily stop sending traffic to the peer.
tx-and-rx	Allows the interface to transmit and honor PAUSE frames to/from peer switches.
disable	Disables flow control on the interface.

Platforms Supported

OmniSwitch 6860, 6860E

Defaults

By default, flow control is disabled on all switch interfaces.

Usage Guidelines

- Flow control is only supported on interfaces configured to run in full-duplex mode; half-duplex mode is not supported. In addition, flow control is not supported across a virtual fabric link (VFL).
- If both autonegotiation and flow control are enabled on the same local interface, autonegotiation calculates operational flow control settings for that interface. Note that the operational settings override the configured settings as long as autonegotiation and flow control are both enabled for the interface.
- If autonegotiation is disabled, the configured flow control settings are applied to the local interface.

Examples

```
-> interfaces 4/1/2 pause rx
-> interfaces 1/1/11 pause tx
-> interfaces 2/1/1 pause tx-and-rx
-> interfaces 3/1/1-6 disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show interfaces status	Displays interface line settings.

MIB Objects

```
esmConfTable
   esmPortCfgPause
```

interfaces link-trap

Enables trap link messages. If enabled, a trap is generated whenever the port changes state.

interfaces [slot *chassis/slot* | **port** *chassis/slot/port* **[-***port2***]] link-trap {enable|disable}**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to configure.
port	Port number of the interface you want to configure.
port2	Last port number in a range of ports you want to configure.
enable	Port link up/down traps are displayed on the NMS.
disable	Port link up/down traps are not displayed on the NMS.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> interfaces 3/1/1 link-trap enable
-> interfaces slot 3/1 link-trap enable
-> interfaces 3/1/1-6 link-trap enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show interfaces status	Displays interface line settings.

MIB Objects

```
esmConfigTable
   esmPortSlot
   esmPortIF
```

interfaces ddm

Configures the DDM administrative status.

interfaces ddm {enable | disable}

Syntax Definitions

enable	Enables DDM functionality.
disable	Disables DDM functionality.

Defaults

parameter	default
ddm	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- DDM capability will vary based on the transceiver manufacturer.
- DDM status must be enabled in order to enable traps; traps are enabled separately.

Examples

```
-> interfaces ddm enable
-> interfaces ddm disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show interfaces ddm	Displays the interface DDM status.

MIB Objects

```
ddmConfiguration
   ddmConfig
```

interfaces ddm-trap

Configures the DDM administrative status or trap capability.

interfaces ddm-trap {enable | disable}

Syntax Definitions

enable	Enables DDM trap functionality.
disable	Disables DDM trap functionality.

Defaults

parameter	default
ddm-trap	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

DDM status must be enabled in order to enable traps; traps are enabled separately.

Examples

```
-> interfaces ddm-trap enable
-> interfaces ddm-trap disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show interfaces ddm	Displays the interface DDM status.

MIB Objects

```
ddmConfiguration
   ddmTrapConfig
   ddmNotificationType
```

interfaces wait-to-restore

Configures the wait to restore timer on a specific slot, port, or a range of specified ports. The timer is enabled when a link up event is detected. Other applications are notified of the link up event only after the wait to restore timer has elapsed.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[-***port2***]} wait-to-restore** *num*

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number. Use a hyphen to specify a range of ports.
num	The number of seconds the switch waits before notifying other applications. The valid range is 0-300 in multiples of 5 seconds.

Defaults

By default, the timer is set to zero (disabled).

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Set the wait-to-restore timer to zero to disable the timer.
- Enter a slot number to configure the timer value for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the timer value for a specific interface or a range of interfaces.

Example

```
-> interfaces slot 1/1 wait-to-restore 30
-> interfaces 1/1/1 wait-to-restore 10
-> interfaces 1/1/1-7 wait-to-restore 250
```

Release History

Release 8.1.1; command introduced.

Related Commands

violation recovery-maximum	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonWaitToRestoreTimer
```

interfaces wait-to-shutdown

Configures the wait to shutdown timer on a specific slot, port, or a range of specified ports. The timer is enabled when a link down event is detected. Other applications are notified of the link down event only after the wait to shutdown timer has elapsed.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[**-*port2***]} wait-to-shutdown** *num*

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
slot/*port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
num	The number of milliseconds the switch waits before notifying other applications. The valid range is 0-300 in multiples of 10msec.

Defaults

By default, the timer is set to zero (disabled).

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command can be used to reduce port flapping. If the port comes back up before the timer expires then the timer will be canceled and other applications will not be notified of the link down event.
- Set the wait-to-shutdown timer to zero to disable the timer.
- The WTS timer is not started when the switch is first booted. But administratively disabling the port will start the timer if enabled.
- The link-status of the remote port will be down when the WTS timer is running. This is due to the port being physically down and only the link-down event not being communicated to other applications.

Example

```
-> interfaces slot 1/1 wait-to-shutdown 30
-> interfaces 1/1/1 wait-to-shutdown 10
-> interfaces 1/1/1-7 wait-to-shutdown 250
```

Release History

Release 8.1.1; command introduced.

Related Commands

violation recovery-maximum	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonWaittoShutdownTimer
```

interfaces eee

Enables or disabled Energy Efficient Ethernet.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[-***port2***]} eee {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
enable	Enables EEE functionality.
disable	Disables EEE functionality.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- EEE is only supported on 10GBase-T ports.
- Enabling EEE will start advertising EEE capability to peer ports. Disabling EEE will stop advertising EEE capability to peer ports.

Examples

```
-> interfaces 1/1/1 eee enable
-> interfaces slot 2/1 eee disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

violation recovery-maximum	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.

MIB Objects

N/A

clear violation

Clears all the MAC address violation logs for a particular port and session. After the violations are cleared, the specific port resumes normal operation. This includes applying an existing application configuration.

clear violation {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	Enter a link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When a violation is set on a physical port that is part of a link aggregate, the violation is set for the whole link aggregate. All ports on that link aggregate are brought down. When this command is applied to a link aggregate ID, all member ports of the link aggregate are activated.
- When this command is applied, all MAC addresses known to the port are cleared from the MAC address table for the switch.

Examples

```
-> clear violation port 1/1/10
-> clear violation port 2/1/1-5
-> clear violation linkagg 5
-> clear violation linkagg 10-20
```

Release History

Release 8.1.1; command introduced.

Related Commands

show violation	Displays the address violations that occur on ports with LPS restrictions.

MIB Objects

```
portViolationTable
   portViolationClearPort
```

violation recovery-maximum

Configures the maximum number of recovery attempts allowed before the port is permanently shut down. This value is configurable on a global basis (applies to all ports on all modules) and on a per-slot or per-port basis.

violation [*chassis/slot/port***[-***port2***]] recovery-maximum {infinite | default |** *max_attempts***}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
infinite	Sets the recovery attempt to infinite auto recovery.
default	Sets the number of recovery attempts to the global value for the specified ports. This parameter is only available when a slot, port, or range of ports is specified with this command.
max_attempts	The maximum number of recovery attempts. Valid range is 0-50.

Defaults

By default, this command configures the global maximum number of recovery attempts. The global value applies to all ports on all modules in the switch.

parameter	default
max_attempts	10

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Set the maximum number of recovery attempts value to 0 to disable this recovery mechanism.
- Enter a slot number to configure the number of recovery attempts for all interfaces on a specific slot.
- Enter a slot and port number or a range of ports to configure the number of recovery attempts for a specific interface or a range of interfaces.
- When this command is used to configure the number of recovery attempts for all ports on a slot or for a specific port or range of ports, the value specified overrides the global maximum number of attempts configured for the switch.
- When configuring the number of recovery attempts for a specific slot, port, or range of ports, use the **default** parameter to reset this value to the global maximum number of attempts.
- The number of recovery attempts increments whenever a port recovers using automatic recovery timer mechanism. When the number of recovery attempts exceeds the configured threshold, the port is permanently shut down.

- Once an interface is permanently shut down, only the **clear violation** command can be used to recover the interface.
- The recovery mechanism tracks the number of recoveries within a fixed time window (FTW). The FTW = 2 * maximum recovery number * recovery timer. For example, if the maximum number of recovery attempts is set to 4 and the recovery timer is set to 5, the FTW is 40 seconds (2 * 4 * 5=40).

Examples

```
-> violation recovery-maximum 25
-> violation 1/2 recovery-maximum 10
-> violation 1/2/3 recovery-maximum 20
-> violation 1/2/4-9 recovery-maximum 50
-> violation 1/2/4-9 recovery-maximum default
-> violation 1/2/3 recovery-maximum 0
-> violation recovery-maximum infinite
-> violation recovery-maximum 0
```

Release History

Release 8.2.1; command was introduced.

Related Commands

violation recovery-time	Configures the time interval after which the port is automatically re-activated if the port was shut down for any violation.
show interfaces	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show violation-recovery-configuration	Displays the globally configured recovery time, SNMP recovery trap status, and maximum recovery attempts.

MIB Objects

```
alaPortViolationRecoveryTable
   alaPortViolationRecoveryMaximum
```

violation recovery-time

Configures the time interval after which the port is automatically re-activated if the port was shutdown for any violation. This value is configurable on a global basis (applies to all ports on all modules) and on a per-slot or per-port basis.

violation recovery-time *seconds*

violation {*chassis/slot/port***[-***port2***]} recovery-time {***seconds* | **default}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
seconds	The number of seconds after which a port is reactivated. The valid range is 30-600 seconds. Specify 0 to disable the recovery timer.
default	Sets the recovery time to the global value for the specified ports. This parameter is only available when a slot, port, or range of ports is specified with this command.

Defaults

- By default, this command configures the global recovery time. The global value applies to all ports on all modules in the switch.
- By default, the violation recovery time is set to 300 seconds.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the recovery timer expires, the interface is operationally re-enabled and the violation on the interface is cleared.
- The violation recovery time value does not apply to interfaces that are in a permanent shutdown state. A port in this state is only recoverable using the **clear violation** command.
- The interface violation recovery mechanism is not supported on link aggregates, but is supported on the link aggregate member ports.
- Set the recovery time to 0 to disable the violation recovery mechanism.
- Enter a slot number to configure the recovery time for all interfaces on a specific slot.
- Enter a slot and port number or a range of ports to configure the recovery time for a specific interface or a range of interfaces.

- When this command is used to configure the recovery time for all ports on a slot or for a specific port or range of ports, the value specified overrides the global maximum recovery time configured for the switch.
- When configuring the time for a specific slot, port, or range of ports, use the **default** parameter to reset this value to the global maximum number of attempts.

Examples

```
-> violation recovery-time 600
-> violation 1/2 recovery-time 100
-> violation 1/2/3 recovery-time 200
-> violation 1/2/4-9 recovery-time 500
-> violation 1/2/4-9 recovery-maximum default
-> violation 1/2/3 recovery-time 0
-> violation recovery-time 0
```

Release History

Release 8.2.1; command introduced.

Related Commands

violation recovery-maximum	Configures the maximum number of recovery attempts before a port is permanently shut down.
show interfaces	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show violation-recovery-configuration	Displays the globally configured recovery time, SNMP recovery trap enable/disable status and maximum recovery attempts.

MIB Objects

```
alaPortViolationRecoveryTable
   alaPortViolationRecoveryTime
```

violation recovery-trap

Enables or disables the sending of a violation recovery trap when any port is re-enabled after the violation recovery time has expired.

violation recovery-trap {enable | disable}

Syntax Definitions

enable	Enables the ports to send violation recovery traps.
disable	Disables the ports from sending violation recovery traps.

Defaults

By default, sending of a violation recovery trap is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This is a global command that is applied to all ports on all modules.

Examples

```
-> violation recovery-trap enable
-> violation recovery-trap disable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

violation recovery-time	Configures the time interval to automatically re-enable the ports that were shutdown due to a violation.
show violation-recovery-configuration	Displays the globally configured recovery time, SNMP recovery trap status, and maximum recovery attempts.

MIB Objects

```
esmViolationRecovery
   esmViolationRecoveryTrap
```

show interfaces

Displays general interface information (for example, hardware, MAC address, input errors, and output errors).

show interfaces [slot *chassis/slot* | **port** *chassis/*slot/*port***[-***port2***]]**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to display.
port	Port number of the interface you want to display.
port2	Last port number in a range of ports you want to display.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

EEE will be appended to the Autonegotiation output when EEE is enabled.

Examples

```
-> show interfaces 1/1/2
Chassis/Slot/Port  1/1/2  :
  Operational Status     : up,

  Lost Frames     :                   0, Collided Frames:                   0,
```

output definitions

Slot/Port	Interface slot and port.
Operational Status	Interface status: up - port is operationally up. down - port is operationally down dormant - SFP/SFP+ transceiver is inserted into a port configured for FibreChannel or vice versa.
Last Time Link Changed	The last time the configuration for this interface was changed.
Number of Status Change	The total number of times that the configuration of this interface has changed.
Type	Interface type (Ethernet/Fast Ethernet/Gigabit Ethernet).
SFP/XFP	The type of transceiver detected.
EPP	Enhanced Port Performance setting.
Link-Quality	The link quality of the connection: **GOOD** - The port will connect with no problems and transfer data with no errors. **FAIR** - The port may have intermittent problems connecting and maintaining its connection to a remote port and/or intermittent CRC's could occur. **POOR** - The port will have problems connecting and maintaining a connection with remote port. If the ports connect, it's likely CRC errors will occur. **N/A** - The port link quality is either very poor or the port type does not support the Link Quality capability.
MAC address	Interface MAC address.
WWPN	OmniSwitch 64-bit World Wide Port Name (WWPN) for each Fibre Channel port.
Bandwidth	Bandwidth (in megabits).
Duplex	Duplex mode (Half/Full/Auto).
Autonegotiation	The auto negotiation settings for this interface.
Long Accept	Long Frames status (enable/disable).
Runt Accept	Runt Frames status (enable/disable).
Long Frame Size	Long Frame Size (in Bytes).
Runt Size	Runt Frame Size (in Bytes).
Bytes Received	Number of Bytes received.
Rx Unicast Frames	Number of unicast frames received.
Rx Broadcast Frames	Number of broadcast frames received.
Rx M-cast Frames	Number of multicast frames received.
Rx Undersize Frames	Number of undersized frames received.
Rx Oversize Frames	Number of oversized frames received.
Rx Lost Frames	Number of Lost Frames received.
Rx Error Frames	Number of error frames received.

output definitions (continued)

Rx CRC Error Frames	Number of CRC error frames received. Only applies to frames that are less than or equal to Max/Long Frame Size. Frames larger than Long Frame Size are counted as OverSizeFrames.
Rx Alignments Err	Number of Alignments Error frames received.
Bytes Xmitted	Number of Bytes transmitted.
Tx Unicast Frames	Number of unicast frames transmitted.
Tx Broadcast Frames	Number of broadcast frames transmitted.
Tx M-cast Frames	Number of multicast frames r transmitted.
Tx Undersize Frames	Number of undersized frames transmitted.
Tx Oversize Frames	Number of oversized frames transmitted.
Tx Lost Frames	Number of Lost Frames transmitted.
Tx Collided Frames	Number of collision frames received or transmitted.
Tx Error Frames	Number of error frames transmitted.

Release History

Release 8.1.1; command introduced.

Related Commands

show interfaces accounting	Displays interface accounting information (e.g., packets received/ transmitted).

show interfaces alias

Displays interface line settings (e.g., speed and mode).

show interfaces [slot *chassis/slot* **| port** *chassis/slot/port***[-***port2***]] alias**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to display.
port	Port number of the interface you want to display.
port2	Last port number in a range of ports you want to display.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If no slot/port numbers are entered, line settings for all slots/ports on the switch are displayed.

Examples

```
-> show interfaces 1/1/2 alias
Legends:WTS - Wait to shutdown
# - WTS Timer is Running & port is in wait-to-shutdown state
Slot/    Admin     Link    WTR   WTS   Alias
Port     Status   Status   (sec) (msec)
-----+---------+--------+-----+----+---------------------------------
 1/1/2    disable     down     5    #10      ""
```

output definitions

Slot/Port	Interface slot/port number.
Admin Status	The administrative status of the port.
Link Status	The link status of the port.Autonegotiation status (Enable/Disable).
WTS (msec)	The wait-to-shutdown configuration time.
WTR (sec)	The wait-to-restore configuration time.
Alias	The configured alias for the port..

Release History

Release 8.1.1; command introduced.

Related Commands

interfaces alias	Configures the port alias.

MIB Objects

 1/1/11     en   dis     -      -       -     10000    Full  Rx-N-Tx  dis
```

output definitions

Slot/Port	Interface slot/port number.
Admin Status	The administrative status of the port. Configured through the **interfaces** command.
AutoNego	Autonegotiation status (Enable/Disable). Configured through the **interfaces** command.
Detected Speed	Detected line speed in Mbps.
Detected Duplex	Detected line duplex (Half duplex/Full duplex/Auto).
Detected Pause	Detected pause control configuration.
Configured Speed	Configured line speed (10/100/Auto/1000/10000 Mbps). Configured through the **interfaces speed** command.
Configured Duplex	Configured line duplex (Half duplex/Full duplex/Auto). Configured through the **interfaces duplex** command.
Configured Pause	Detected pause control configuration. Configured through the **interfaces pause** command.
Link Trap	Link Trap status. Configured through the **interfaces link-trap** command.

Release History

Release 8.1.1; command introduced.

Related Commands

interfaces	Configures interface line speed, sets speed, and duplex mode to auto-sensing.
interfaces duplex	Configures interface duplex mode.

MIB Objects

```
esmConfTable
   esmPortSlot
   esmPortIF
   esmPortAutoSpeed
   esmPortAutoDuplexMode
   esmPortCfgAutoNegotiation
   esmPortCfgSpeed
   esmPortCfgDuplexMode
   esmPortCfgPause
   esmPortLinkUpDownTrapEnable
```

show interfaces capability

Displays default auto negotiation, speed, duplex, flow, and cross-over settings for a single port, a range of ports, or all ports on a Network Interface (NI) module.

show interfaces [*slot* | *slot*//*port***[-***port2***]] capability**

Syntax Definitions

slot	Slot number you want to display.
port	Port number of the interface you want to display.
port2	Last port number in a range of ports you want to display.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Displays defaults settings in two rows of data for each port. The first row of data, identified by the label **CAP**, displays the valid user-defined configuration settings available for the port. The second row, identified by the label **DEF**, displays the default settings for the port.

Examples

```
-> show interfaces 5/1/1 capability
Ch/Slot/Port   AutoNeg     Pause   Crossover      Speed    Duplex
-----------+---------+--------+-----------+----------+----------
  5/1/1  CAP     EN/DIS   EN/DIS  MDI/X/Auto  10/100/1G Full/Half
  5/1/1  DEF         EN       EN        Auto       Auto     Auto
```

output definitions

Slot	The slot number.
Port	The port number
AutoNeg	In the row labeled **CAP,** the field displays the valid auto negotiation configurations for the port. In the row label **DEF,** the field displays the default auto negotiation settings for the port. The possible values are **EN** (enabled) or **DIS** (disabled).
Pause	In the row labeled **CAP,** the field displays the valid pause configurations for the port. In the row label **DEF,** the field displays the default pause settings for the port.

output definitions (continued)

Crossover	In the row labeled **CAP,** the field displays the valid cross over configurations for the port. In the row labeled **DEF,** the field displays the default cross over settings for the port. The possible values are **Auto**, **MDI/X/Auto** (MDI/MDIX/Auto), or **--** (*not configurable and/or not applicable*).
Speed	In the row labeled **CAP,** the field displays the valid line speed configurations for the port. In the row label **DEF,** the field displays the default line speed settings for the port. The possible values are **10/100**, **100**, **1G**, **10/100/1G**, **10G**, or **Auto**.
Duplex	In the row labeled **CAP,** the field displays the valid duplex configurations for the port. In the row label **DEF,** the field displays the default duplex settings for the port. The possible values are **Full**, **Full/Half**, or **Auto**.

Release History

Release 8.1.1; command introduced.

Related Commands

interfaces	Enables and disables auto negotiation.
interfaces speed	Configures interface speed.
interfaces duplex	Configures duplex settings.
show interfaces alias	Displays interface line settings.

MIB Objects

   esmPortCfgCrossover
   esmPortCfgSpeed
   esmPortAutoDuplexMode
```

show interfaces accounting

Displays interface accounting information (e.g., packets received/transmitted and deferred frames received).

show interfaces [slot *chassis/slot* **| port** *chassis/slot/port***[-***port2***]] accounting**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to display.
port	Port number of the interface you want to display.
port2	Last port number in a range of ports you want to display.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If no slot/port numbers are entered, accounting information for all slots/ports on the switch is displayed.

Examples

```
-> show interfaces 1/1/2 accounting
1/1/2 ,
     Rx undersize packets         =                    0,
     Tx undersize packets         =                    0,
     Rx oversize packets          =                    0,
     Tx oversize packets          =                    0,
     Rx packets 64 Octets         =              3073753,
     Rx packets 65To127 Octets    =               678698,
     Rx packets 128To255 Octets   =                21616,
     Rx packets 256To511 Octets   =                21062,
     Rx packets 512To1023 Octets  =                    2,
     Rx packets 1024To1518 Octets =                   84,
     Rx packets 1519to4095 Octets =                    0,
     Rx packets 4096ToMax Octets  =                    0,
     Rx Jabber frames             =                    0
```

output definitions

Rx undersize packets	Number of undersized packets received.
Tx undersize packets	Number of undersized packets transmitted.
Rx oversize packets	Number of oversized packets received.
Tx oversize packets	Number of oversized packets transmitted.

output definitions (continued)

Rx packets Octets	Number of packets received in each listed octet range.
Rx Jabber frames	Number of jabber packets received (longer than 1518 octets).
Tx deferred frames	Number of packets for which transmission was delayed (Ethernet only).

Release History

Release 8.1.1; command introduced.

Related Commands

violation recovery-maximum	Displays general interface information (e.g., hardware, MAC address, and input/output errors).
show interfaces counters	Displays interface counter information (e.g., unicast packets received/transmitted).

```

show interfaces counters

Displays interface counters information (e.g., unicast, broadcast, and multi-cast packets received/ transmitted).

show interfaces [slot *chassis/slot* | **port** *chassis/slot/port***[-***port2***]] counters**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to display.
port	Port number of the interface you want to display.
port2	Last port number in a range of ports you want to display.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If no slot/port numbers are entered, counter information for all slots/ports on the switch is displayed.

Examples

```
-> show interfaces 3/1/1 counters

InOctets      = 54367578586897979,  OutOctets     = 5.78E19,
InUcastPkts   = 55654265276,        OutUcastPkts  = 5.78E20,
InMcastPkts   = 58767867868768777,  OutMcastPkts  = 5465758756856,

InPauseFrames = 567798768768767,    OutPauseFrames= 786876,
```

output definitions

InOctets	Number of octets received.
OutOctets	Number of octets transmitted.
InUcastPkts	Number of unicast packets received.
OutUcastPkts	Number of unicast packets transmitted.
InMcastPkts	Number of multicast packets received.
OutMcastPkts	Number of unicast packets transmitted.
InBcastPkts	Number of broadcast packets received.
OutBcastPkts	Number of unicast packets transmitted.
InPauseFrames	Number of MAC control frames received.
OutPauseFrames	Number of MAC control frames transmitted.

Release History

Release 8.1.1; command introduced.

Related Commands

show interfaces counters errors	Displays interface error frame information (e.g., CRC errors, transit errors, and receive errors).

show interfaces counters errors

Displays interface error frame information (e.g., CRC errors, transit errors, and receive errors).

show interfaces [slot *chassis/slot* **| port** *chassis/slot/port***[-***port2***]] counters errors**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to display.
port	Port number of the interface you want to display.
port2	Last port number in a range of ports you want to display.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If no slot/port numbers are entered, counter error information for all slots/ports on the switch is displayed.

Examples

```
-> show interfaces 2/1/1 counters errors

02/01,
  Alignments Errors = 6.45E13,  FCS Errors = 7.65E12
  IfInErrors        = 6435346,  IfOutErrors= 5543,
  Undersize pkts    = 867568, Oversize pkts= 5.98E8
```

output definitions

Slot/Port	Interface slot and port number.
Alignments Errors	Number of Alignments errors.
FCS Errors	Number of Frame Check Sequence errors.
IfInErrors	Number of received error frames.
IfOutErrors	Number of transmitted error frames.
Undersize pkts	Number of undersized packets.
Oversize pkts	Number of oversized packets (more than 1518 octets).

Release History

Release 8.1.1; command introduced.

show interfaces flood-rate

Displays interface peak flood rate settings.

show interfaces [slot *chassis/slot* | **port** *chassis/slot/port***[-***port2***]] flood-rate [bcast | mcast | uucast]**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to display.
port	Port number of the interface you want to display.
port2	Last port number in a range of ports you want to display.
bcast	Specifies broadcast flood limit.
mcast	Specifies multicast flood limit.
uucast	Specifies unicast flood limit.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show interfaces flood-rate
Chas/
 Slot/  Bcast    Bcast   Bcast   Ucast    Ucast   Ucast    Mcast   Mcast   Mcast

 1/1/2       50       20     mbps    enable  Storm    Shutdown
 1/1/3      496        0     mbps    enable  Normal   Default
```

output definitions

Slot/Port	Interface slot and port numbers.
Value	The value set based on the type of flood limiting.
Type	The type of flood limiting: mbps, pps, or %
Status	Status of the type of flood-limiting: enabled or disabled.

Release History

Release 8.1.1; command introduced.
Release 8.2.1; Parameters **"bcast, mcast, uucast"** were added.

Related Commands

interfaces flood-limit	Configures the peak flood rate for an interface.

MIB Objects

```
esmConfTable
   esmPortSlot
   esmPortIF
   esmPortMaxFloodRate
   esmPortFloodMcastEnable
   esmPortBcastRateLimit
   esmPortMcastRateLimit
   esmPortUucastRateLimit
```

show interfaces traffic

Displays interface traffic statistics.

show interfaces [slot *chassis/slot* | **port** *chassis/slot/port***[-***port2***]] traffic**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to display.
port	Port number of the interface you want to display.
port2	Last port number in a range of ports you want to display.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If no port numbers are entered, traffic settings for all ports on the switch are displayed.

Examples

```
-> show interfaces traffic
 Ch/Slot/Port   Input packets     Input bytes      Output packets    Output bytes
---------+----------------+----------------+----------------+--------------
 1/1/2               322             20624              5125            347216
 3/1/2               322             20620              5133            347764
```

output definitions

Slot/Port	Interface slot and port numbers.
Input packets	Input packets detected.
Input bytes	Input bytes detected.
Output packets	Output packets detected.
Output bytes	Output bytes detected.

Release History

Release 8.1.1; command introduced.

Related Commands

violation recovery-maximum	Displays general interface information (e.g., hardware, MAC address, and input/output errors).
show interfaces counters	Displays interface counter information (e.g., unicast packets received/transmitted).

MIB Objects

```
esmConfTable
   esmPortSlot
   esmPortIF
ifXTable
   ifHCInOctets
   ifHCInUcastPkts
   ifHCInMulticastPkts
   ifHCInBroadcastPkts
   ifHCOutOctets
   ifHCOutUcastPkts
   ifHCOutMulticastPkts
   ifHCOutBroadcastPkts
```

show interfaces ingress-rate-limit

Displays the ingress-rate-limit set for each interface port.

show interfaces [slot *chassis/slot*| **port** *chassis/slot/port***[**-*port1***]] ingress-rate-limit**

Syntax Definitions

chassis	The chassis identifier.
slot	Slot number you want to display.
port	Port number of the interface you want to display.
port1	Last port number in a range of ports you want to display.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If the slot number is not specified, then the switch back pressure feature must be enabled or disabled on an entire chassis.

Examples

```
-> show interfaces 1/1/1-4 ingress-rate-limit
 Ch/Slot/ Rate Limit Burst Size Status
 Port    (Mbps)     (MB)
------+----------+----------+-------
 1/1/1         496         19  disable
 1/1/2         496         19  disable
 1/1/3         496         19  disable
 1/1/4         496         19  disable
```

output definitions

Slot/Port	Interface slot and port numbers.
Rate Limit (Mbps)	Rate limit in Megabits.
Burst Size (MB)	Burst size in Megabytes.
Status	Status of rate limiting.

Release History

Release 8.1.1; command introduced.

Related Commands

interfaces flood-limit	Configures the ingress-rate-limit.

MIB Objects

```
esmConfTable
   esmPortSlot
   esmPortIF
```

show interfaces ddm

Displays the information for the specified transceivers.

show interfaces [slot *chassis/slot*| **port** *chassis/slot/port***[**-*port1***]] ddm [w-low w-high status a-low a-high actual]**

Syntax Definitions

chassis	The chassis identifier.
slot	Display all the transceivers on the specified slot.
num	Display information for the specified transceiver.
port2	Last port number in a range of ports to display.
w-low	Display the transceivers Warning Low value.
w-high	Display the transceivers Warning High value.
status	Display the administrative status of DDM.
a-low	Display the transceivers Alarm Low value.
a-high	Display the transceivers Alarm High value.
actual	The real-time values indicated by the transceiver. Values displayed in parentheses indicate the Warning or Alarm value that has been reached.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If the threshold values of the transceiver are ‘0’ then NS (Not Supported) will be displayed in the DDM output display.

Examples

```
-> show interfaces transceiver W-Low

Ch/Slot/Port Temp C Voltage(V) Current(mA) Output(dBm) Input(dBm)
---------+------+----------+-----------+----------+---------+
1/1/1         48      5.15         50        2.50      2.50

-> show interfaces transceiver ddm
DDM Status      : enable
DDM Trap Status : disable
```

output definitions

Slot/Port	Interface slot and port numbers.
Temp C	The transceiver temperature, in degrees centigrade.
Voltage (V)	The transceiver supply voltage, in volts.
Current (mA)	The transceiver transmit bias current, in milliamps.
Output (dBm)	The transceiver output power, in decibels.
Input (dBm)	The transceiver received optical power, in decibels.
DDM Status	The administrative status of DDM.
DDM Trap Status	The administrative status of DDM traps.
Actual	The real-time values indicated by the transceiver. Values displayed in parentheses indicate the Warning or Alarm value that has been reached.
Alarm High (AH)	Indicates the value at which the transceiver's functionality may be affected.
Warning High (WH)	Indicates the transceiver is approaching the High Alarm value.
Warning Low (WL)	Indicates the transceiver is approaching the Low Alarm value.
Alarm Low (AL)	Indicates the value at which the transceiver's functionality may be affected.
N/A	Indicates the transceiver does support DDM.
N/S	Indicates the transceiver does not support the DDM attribute.

Release History

Release 8.1.1; command introduced.

Related Commands

show interfaces ddm	Configures the DDM administrative status or trap capability.

  Admin Status:                  POWER ON,
  Operational Status:            UP
```

output definitions

Manufacturer Name	The name of the transceiver's manufacturer.
Part Number	The part number of the transceiver.
Hardware Revision	The hardware revision of the transceiver.
Serial Number	The serial number of the transceiver.
Manufacturer Date	The manufacture date of the transceiver.
Laser Wave Length	The laser wavelength of the transceiver.
Admin Status	The administrative status of the transceiver.
Operational Status	The operational status of the transceiver.

Release History

Release 8.1.1; command introduced.

Related Commands

show interfaces ddm	Displays the DDM administrative status or trap capability.

MIB Objects

N/A

show violation

Displays the address violations that occur on ports with LPS restrictions. This command displays a port violation for sticky port security when the maximum number of MAC address of the connected workstation that the switch learns.

show violation {port *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]}**

Syntax Definitions

chassis	The chassis identifier.
***slot/port*[-*port2*]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
agg_id[-*agg_id2*]	Enter a link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

NA

Examples

```
-> show violation

LAG ID/                                              Recovery     Recovery
Port    Source        Action       Reason     WTR  Time         Max/Remain
-------+------+--------------+-------------+----+-------------+----------------
1/1/2    QOS   simulated down  lps shutdown   0      300         5/2
1/1/3    LPS                                 10      100         8/0
1/1/4    QOS                                  0      300         infinite
1/1/5    QOS                                  0      300         disabled
```

output definitions

LAG ID/Port	The chassis, slot and port numbers or link aggregate IDs on which address violations occurred.
Source	Specifies the source application that detected the violation.
Action	Specifies the action that is taken when the violation is detected on the port. There are two types of actions: **admin down** - deactivates the physical port. **simulated down** - the port is put in blocking state.
Reason	Specifies the reason for the violation.

output definitions\

WTR	Wait to restore time.
Recovery Time	Specifies the duration taken for recovery.
Recovery Max/Remain	Specifies the maximum number of retry configured and the number of retry remaining.

Release History

Release 8.1.1; command introduced.

Related Commands

clear violation	Clears all the MAC address violation logs for a particular port and session. After the violations are cleared, the specific port resumes normal operation.

MIB Objects

```
portViolationTable
   portViolationSource
   portViolationEntry
   portViolationTrap
   portViolationSource

   portViolationTimer
   portViolationCfgRecoveryMax
   portViolationRetryRemain
   portViolationTimerAction
```

show violation-recovery-configuration

Displays the global violation recovery configuration details (recovery trap, recovery maximum, and recovery time.

show violation-recovery-configuration {port *chassis/slot/port***[-***port2***] | slot** *chassis/slot***]}**

Syntax Definitions

chassis	The chassis identifier.
***slot/port*[-*port2*]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
chassis/slot	The chassis and slot number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

NA

Examples

```
-> show violation-recovery-configuration

Global Recovery Trap          : enable
Global Recovery Maximum       : 20
Global Recovery Time          : 200

Port    Recovery Max    Recovery Time
------+---------------+----------------
1/1/1   10                    300
1/1/2   10                    300

-> show violation-recovery-configuration 3/1/1-2

Global Recovery Trap          : enable
Global Recovery Maximum       : 20
Global Recovery Time          : 200

Port   Recovery Max      Recovery Time
------+----------------+---------------
3/1/1   10                    300
3/1/2   10                    300
```

output definitions\

Global Recovery Trap	Displays the global status of the violation trap recovery.
Global Recovery Maximum	Displays the global value set for the maximum violation recovery.
Global Recovery Time	Displays the global value set for the recovery time.
Port	Displays the chassis, slot and port numbers or link aggregate IDs on which address violations occurred.
Recovery Max	Displays the maximum number of retry configured.
Recovery Time	Displays the duration taken for recovery.

Release History

Release 8.2.1; command introduced.

Related Commands

clear violation	Clears all the MAC address violation logs for a particular port and session. After the violations are cleared, the specific port resumes normal operation.

MIB Objects

```

   alaPvrRecoveryMax
```

interfaces link-monitoring admin-status

Enables or disables link monitoring on a specific slot, port, or a range of specified ports.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[-***port2***]} link-monitoring admin-status {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
enable	Enables link monitoring for the specified port.
disable	Disables link monitoring for the specified port.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Configuring link monitoring parameters are allowed even if the link monitoring status is disabled for the specified ports.
- The Automatic Recovery Timer and link monitoring must not be enabled on Remote Fault Propagation (RFP) enabled ports.
- Enter a slot number to configure link monitoring for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure link monitoring for a specific interface or range of interfaces.
- Link Monitoring can be enabled on individual ports that make up a virtual port such as a link aggregate or VFL, but not on the entire link aggregate or VFL virtual port.

Example

```
-> interfaces slot 1/1 link-monitoring admin-status enable
-> interfaces 1/1/1 link-monitoring admin-status enable
-> interfaces 1/1/1-7 link-monitoring admin-status enable
-> interfaces 2/1/5 link-monitoring admin-status disable
-> interfaces 2/1/5-20 link-monitoring admin-status disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

violation recovery-maximum	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces link-monitoring config	Displays the link monitoring configuration for the specified ports.
show interfaces link-monitoring statistics	Displays the link monitoring statistics for the specified ports.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonStatus
```

interfaces link-monitoring time-window

Configures the monitoring time window on a specific slot, port, or a range of specified ports. This is the length of time during which the link is monitored.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[**-*port2***]} link-monitoring time-window** *seconds*

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
slot/*port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
seconds	The length of time during which the link is monitored. The valid range is 0–3600 seconds.

Defaults

By default, the time window value is set to 300 seconds.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter a slot number to configure the monitoring time window for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the monitoring time window for a specific interface or a range of interfaces.

Example

```
-> interfaces slot 1/1 link-monitoring time-window 20
-> interfaces 1/1/1 link-monitoring time-window 40
-> interfaces 1/1/1-7 link-monitoring time-window 2500
```

Release History

Release 8.1.1; command introduced.

Related Commands

violation recovery-maximum	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces link-monitoring config	Displays the link monitoring configuration for the specified ports.
show interfaces link-monitoring statistics	Displays the link monitoring statistics for the specified ports.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonTimeWindow
```

interfaces link-monitoring link-flap-threshold

Configures the number of link flaps allowed on a specific slot, port, or a range of specified ports in the time interval, before the port is shutdown.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[**-*port2***]} link-monitoring link-flap-threshold** *link_flaps*

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
slot/*port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
link_flaps	The number of link flaps. The valid range is 2-10.

Defaults

By default, the number of link flaps allowed is set to 5.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter a slot number to configure the number of link flaps allowed for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the number of link flaps allowed for a specific interface or a range of interfaces.

Example

```
-> interfaces slot 1/1 link-monitoring link-flap-threshold 6
-> interfaces 1/1/1 link-monitoring link-flap-threshold 3
-> interfaces 1/1/1-7 link-monitoring link-flap-threshold 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

violation recovery-maximum	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces link-monitoring config	Displays the link monitoring configuration for the specified ports.
show interfaces link-monitoring statistics	Displays the link monitoring statistics for the specified ports.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonLinkFlapThreshold
```

interfaces link-monitoring link-error-threshold

Configures the number of MAC errors allowed on a specific slot, port, or a range of specified ports in the time interval, before the port is shutdown. MAC errors refer to lost frames, error frames, alignment frames and cyclic redundancy check (CRC).

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[-***port2***]} link-monitoring link-error-threshold** *mac_errors*

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).
mac_errors	The number of MAC errors. The valid range is 1-100.

Defaults

By default, the number of MAC errors allowed is set to 5.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter a slot number to configure the number of MAC errors allowed on all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to configure the number of MAC errors allowed on a specific interface or on a range of interfaces.

Example

```
-> interfaces slot 1/1 link-monitoring link-error-threshold 30
-> interfaces 1/1/1 link-monitoring link-error-threshold 10
-> interfaces 1/1/1-7 link-monitoring link-error-threshold 35
```

Release History

Release 8.1.1; command introduced.

Related Commands

violation recovery-maximum	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces link-monitoring config	Displays the link monitoring configuration for the specified ports.
show interfaces link-monitoring statistics	Displays the link monitoring statistics for the specified ports.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonLinkErrorThreshold
```

interfaces clear-link-monitoring-stats

Clears the link monitoring statistics on a specific slot, port, or a range of specified ports.

interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[-***port2***]} clear-link-monitoring-stats**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter a slot number to clear monitoring statistics for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to clear monitoring statistics for a specific interface or a range of interfaces.

Example

```
-> interfaces slot 1/1 clear-link-monitoring-stats
-> interfaces 1/1/1 clear-link-monitoring-stats
-> interfaces 1/1/1-7 clear-link-monitoring-stats
```

Release History

Release 8.1.1; command introduced.

Related Commands

violation recovery-maximum	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces link-monitoring config	Displays the link monitoring configuration for the specified ports.
show interfaces link-monitoring statistics	Displays the link monitoring statistics for the specified ports.

MIB Objects

```
alaLinkMonStatsTable
   alaLinkMonStatsClearStats
```

show interfaces link-monitoring config

Displays configuration information for the Link Monitoring feature. This includes the link monitoring status on a specific slot, port or a range of specified ports, time window, link flap threshold, and link error threshold.

show interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[-***port2***]} link-monitoring config**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
slot/*port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific port.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Example

```
-> show interfaces 1 link-monitoring config

Ch/Slot/   Status   Time     Link-flap    Link-error
Port             Window   Threshold    Threshold
                 (sec)
------+--------+--------+------------+-----------
1/1/1    enabled     10        5           10
1/1/2    disabled    10        5           10
1/1/3    disabled   200        8           20
.
.
1/1/24   disabled   150        2           99

-> show interfaces 1/1/1-3 link-monitoring config

Slot/   Status   Time      Link-flap    Link-error
Port             Window    Threshold    Threshold
                 (sec)
------+--------+--------+------------+-------------
1/1/1    enabled     10         5            10
1/1/2    disabled    10         5            10
```

```
1/1/3    disabled   200         7            99

-> show interfaces 1/1/1 link-monitoring config

Ch/Slot/   Status    Time     Link-flap    Link-error
Port              Window   Threshold    Threshold
                  (sec)
------+--------+--------+------------+-------------
1/1/1    enabled     10          5           10

-> show interfaces 1/1/2 link-monitoring config

Ch/Slot/   Status    Time     Link-flap    Link-error
Port              Window   Threshold    Threshold
                  (sec)
------+--------+--------+------------+------------
1/1/2    disabled    10         5            10
```

output definitions

Slot/Port	Interface slot and port number.
Status	Link monitoring status (enable/disable).
Time Window	Time interval, in seconds, for which the link is monitored.
Link-flap threshold	Number of link flaps allowed on a specific slot, port, or a range of specified ports in the time interval before the port is shutdown.
Link-error threshold	Number of MAC errors allowed on a specific slot, port, or a range of specified ports in the time interval before the port is shutdown.

Release History

Release 8.1.1; command introduced.

Related Commands

violation recovery-maximum	Displays information of the interface port status.
show interfaces link-monitoring statistics	Displays the Link Monitoring statistics.
show violation-recovery-configuration	Enables or disables link monitoring.
interfaces link-monitoring time-window	Configures the monitoring of the time-window of the link.
interfaces link-monitoring link-flap-threshold	Configures the number of link flaps that are allowed before the port is shutdown.
interfaces link-monitoring link-error-threshold	Configures the number of MAC errors that are allowed before the port is shutdown.

MIB Objects

```
alaLinkMonConfigTable
   alaLinkMonStatus
   alaLinkMonTimeWindow
   alaLinkMonLinkFlapThreshold
   alaLinkMonLinkErrorThreshold
```

show interfaces link-monitoring statistics

Displays the Link Monitoring statistics for a specific slot, port, or a range of specified ports.

show interfaces {slot *chassis/slot*| **port** *chassis/slot/port***[**-*port2***]} link-monitoring statistics**

Syntax Definitions

chassis	The chassis identifier.
slot	The slot number for a specific module.
slot/*port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-3/10).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific port.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or a range of interfaces.

Example

```
-> show interfaces slot 1/1 link-monitoring statistics
Ch/Slot/   State     Current  Current  Current   Current  Current  Total  Total
Port              Flap     Error    CRC       Lost     Align    Flap   Error
------+---------+--------+--------+--------+--------+--------+-------+-------+
1/1/1     shutdown    6       3         2         0         0       15      6

```

Release History

Release 8.1.1; command introduced.

Related Commands

violation recovery-maximum	Displays the administrative, operational, violation, and recovery status and configuration for the specified port.
show interfaces link-monitoring config	Displays configuration information of the Link Monitoring.
show violation-recovery-configuration	Enables or disables link monitoring.
interfaces clear-link-monitoring-stats	Clears the Link Monitoring statistics.
interfaces link-monitoring link-error-threshold	Configures the number of MAC errors that are allowed before the port is shutdown.

MIB Objects

```
alaLinkMonStatsTable
   alaLinkMonStatsPortStatus
   alaLinkMonStatsCurrentLinkFlaps
   alaLinkMonStatsCurrentErrorFrames
   alaLinkMonStatsCurrentCRCErrors
   alaLinkMonStatsCurrentLostFrames
   alaLinkMonStatsCurrentAlignErrors
   alaLinkMonStatsCurrentLinkErrors
   alaLinkMonStatsTotalLinkFlaps
   alaLinkMonStatsTotalLinkErrors
```

link-fault-propagation group

Configures a Link Fault Propagation (LFP) group to associate with source and destination ports.

link-fault-propagation group *group_id* **[admin-status {enable | disable}]**

no link-fault-propagation group {*group_id***[-***group_id2***]}**

Syntax Definitions

group_id	A group ID number. The valid range is 1–8.
group_id[-group_id2]	A group ID number to remove. Use a hyphen to specify a range of existing group ID numbers (5-8). Specifying a range is only used to remove group IDs, not to create them.
enable	Enables LFP for the specified group.
disable	Disables LFP for the specified group.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a LFP group or a range of groups.
- Up to eight LFP groups per switch are allowed.
- Once a LFP group is created, assign source and destination ports to that group.

Example

```
-> link-fault-propagation group 1
-> no link-fault-propagation group 4
-> no link-fault-propagation group 4-7
```

Release History

Release 8.1.1; command introduced.

Related Commands

link-fault-propagation group source	Configures the source port assignments for the LFP group.
link-fault-propagation group destination	Configures the destination port assignments for the LFP group.
link-fault-propagation group wait-to-shutdown	Configures the amount of time LFP waits before shutting down the destination ports.
show link-fault-propagation group	Displays the LFP group configuration for the switch.

MIB Objects

```
alaLFPGroupTable
   alaLFPGroupId
   alaLFPGroupRowStatus
```

link-fault-propagation group source

Configures the source port assignments for a Link Fault Propagation (LFP) group.

link-fault-propagation group *group_id* **source {port** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id[-agg_id2]}*

no link-fault-propagation group *group_id* **source {port** *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]}**

Syntax Definitions

group_id	An existing LFP group ID number. The valid range is 1–8.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports and/or a space to specify multiple port entries (3/1-10 4/1 4/5 5/10).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs and/or a space to specify multiple ID entries (1-5 10 12).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a source port association with the specified LFP group.
- Make sure the LFP group specified with this command already exists in the switch configuration.
- Configuring the source ports and destinations ports for the specified LFP group is allowed within the same command (see the examples on this command page).
- A port/linkagg added as a source/destination port for a particular group cannot be added as a destination/source port for this group or for any other group.
- If a port is recovered due to the Interface Recovery Timer, then the port will revert to the shutdown state if the error persists.

Example

```
-> link-fault-propagation group 1 source port 1/1/2
-> link-fault-propagation group 1 source port 1/1/2-5 2/1/3
-> link-fault-propagation group 1 source linkagg 1
-> link-fault-propagation group 1 source linkagg 1-3
-> link-fault-propagation group 1 source port 2/1/3 destination port 1/1/6
-> link-fault-propagation group 1 source port 3/1/1-5 destination linkagg 6
-> no link-fault-propagation group 1 destination port 1/1/10
```

Release History

Release 8.1.1; command introduced.

Related Commands

link-fault-propagation group	Configures an LFP group, including the administrative status.
link-fault-propagation group destination	Configures the destination port assignments for the LFP group.
link-fault-propagation group wait-to-shutdown	Configures the amount of time LFP waits before shutting down the destination ports.
show link-fault-propagation group	Displays the LFP group configuration for the switch.

MIB Objects

```
alaLFPGroupTable
   alaLFPGroupId
alaLFPConfigTable
   alaLFPConfigPort
   alaLFPConfigPortType
   alaLFPConfigRowStatus
```

link-fault-propagation group destination

Configures the destination port assignments for a Link Fault Propagation (LFP) group.

link-fault-propagation group *group_id* **destination {port** *chassis/slot/port[-port2]* **| linkagg** *agg_id*[**-***agg_id2*]**}**

no link-fault-propagation group *group_id* **destination {port** *chassis/slot/port[-port2]* **| linkagg** *agg_id*[**-***agg_id2*]**}**

Syntax Definitions

group_id	An existing LFP group ID number. The valid range is 1–8.
chassis	The chassis identifier.
slot/port[-port2]	The slot and port number (3/1). Use a hyphen to specify a range of ports and/or a space to specify multiple port entries (3/1-10 4/1 4/5 5/10).
agg_i*d[-agg_id2]*	The link aggregate ID number. Use a hyphen to specify a range of IDs and/or a space to specify multiple ID entries (1-5 10 12).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a destination port association with the specified LFP group.
- Make sure the LFP group specified with this command already exists in the switch configuration.
- Configuring the source ports and destinations ports for the specified LFP group is allowed within the same command (see the examples on this command page).
- A port or link aggregate that is configured as a source port cannot be configured as a destination port for any group. However, a source port can be associated with multiple LFP groups.
- A port or link aggregate that is configured as a destination port cannot be configured as a source port for any group. However, a destination port can be associated with multiple LFP groups.
- If port is recovered due to the Interface Recovery Timer, then the port will revert to the shutdown state if the error persists.

Example

```
-> link-fault-propagation group 1 destination port 1/1/4
-> link-fault-propagation group 1 destination port 1/1/5-8 2/1/3
-> link-fault-propagation group 1 destination linkagg 6
-> link-fault-propagation group 1 destination linkagg 6-10
-> link-fault-propagation group 1 source port 1/1/2 2/1/3 destination port 1/1/6
-> link-fault-propagation group 1 source port 1/1/2 2/1/3 destination linkagg 6
-> link-fault-propagation group 1 source linkagg 3 destination port 1/1/6 1/1/9
-> link-fault-propagation group 1 source linkagg 3 destination linkagg 1

-> no link-fault-propagation group 1 source port 1/1/9
-> no link-fault-propagation group 1 destination port 1/1/10
```

Release History

Release 8.1.1; command introduced.

Related Commands

link-fault-propagation group	Configures an LFP group, including the administrative status.
link-fault-propagation group source	Configures the source port assignments for the LFP group.
link-fault-propagation group wait-to-shutdown	Configures the amount of time LFP waits before shutting down the destination ports.
show link-fault-propagation group	Displays the LFP group configuration for the switch.

MIB Objects

```
alaLFPGroupTable
   alaLFPGroupId
alaLFPConfigTable
   alaLFPConfigPort
   alaLFPConfigPortType
   alaLFPConfigRowStatus
```

link-fault-propagation group wait-to-shutdown

Configures the wait-to-shutdown timer value for the Link Fault Propagation (LFP) group. This is the amount of time after all the source ports go down that LFP waits before shutting down the destination ports.

link-fault-propagation group *group_id* **wait-to-shutdown** *seconds*

Syntax Definitions

group_id	An existing LFP group ID number. The valid range is 1–8.
seconds	The number of seconds LFP waits before shutting down the destination ports. The valid range is 0-300 in multiples of 5.

Defaults

By default, the timer is set to zero (disabled).

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Set the wait-to-shutdown timer value to 0 to disable the timer.
- Make sure the LFP group specified with this command already exists in the switch configuration.

Example

```
-> link-fault-propagation group 1 wait-to-shutdown 40
-> link-fault-propagation group 3 wait-to-shutdown 70
-> link-fault-propagation group 5 wait-to-shutdown 0
```

Release History

Release 8.1.1; command introduced.

Related Commands

link-fault-propagation group	Configures an LFP group, including the administrative status.
show link-fault-propagation group	Displays the LFP group configuration for the switch.

MIB Objects

```
alaLFPGroupTable
   alaLFPGroupId
   alaLFPGroupWaitToShutdown
   alaLFPGroupRowStatus
```

show link-fault-propagation group

Displays information for the specified Link Fault Propagation (LFP) group.

show link-fault-propagation group [*group_id***]**

Syntax Definitions

group_id	An existing LFP group ID number. The valid range is 1–8.

Defaults

By default, information is displayed for all existing LFP groups.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter a LFP group ID number with this command to display information for a specific group.
- If a virtual port such as a link aggregate is configured as a source or destination port it will be displayed instead of the physical ports.

Example

```
-> show link-fault-propagation group
Group Id : 2
  Source Port(s)          : 0/1-2 1/1/1-5 1/1/7,
  Destination Port(s)     : 0/3 1/1/10-13,
  Group-Src-Ports Status  : up,
  Admin Status            : enable,
  Wait To Shutdown        : 10

Group Id : 7
  Source Port(s)          : 1/1/1 1/1/3,
  Destination Port(s)     : 0/3 1/1/5 1/1/7 1/1/11,
  Group-Src-Ports Status  : up,
  Admin Status            : enable,
  Wait To Shutdown        : 100

-> show link-fault-propagation group 2
Group Id : 2
  Source Port(s)          : 0/1-2 1/1/1-5 1/1/7,
  Destination Port(s)     : 0/3 1/1/10-13,
  Group-Src-Ports Status  : up,
  Admin Status            : enable,
  Wait To Shutdown        : 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

link-fault-propagation group	Configures a LFP group, including the administrative status.
link-fault-propagation group wait-to-shutdown	Configures the amount of time LFP waits before shutting down the destination ports.

   alaLFPGroupOperStatus
   alaLFPGroupWaitToShutdown
```

interfaces tdr

Initiates a Time Domain Reflectometry (TDR) cable diagnostics test on the specified port. The TDR feature sends a signal down a cable to determine the distance to a break or other discontinuity in the cable path. The length of time it takes for the signal to reach the break and return is used to estimate the distance to the discontinuity.

interfaces *chassis/slot/port* **tdr enable**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- TDR is an on-demand, out-of-service test. The test is not automatically triggered; data and protocol traffic is interrupted.
- Only one TDR test can be run at any given time.
- TDR is not supported on link aggregate ports, fiber ports, or stacking ports.
- TDR results are automatically cleared when a new test is started on the port or when the module for the port is reset.

Examples

```
-> interfaces 1/1/1 tdr enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

clear interfaces	Clears the statistics of the last test performed on the port
show interfaces tdr-statistics	Displays the results of the last TDR test performed on a port.

MIB Objects

```
esmTdrPortTable
   esmTdrPortTest
```

show interfaces tdr-statistics

Displays the results of the last TDR test performed on a port.

show interfaces [slot *chassis/slot* | *chassis/slot/port***[-***port2***]] tdr-statistics**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot and port number.
*slot/port***[-***port2***]**	The slot and port number. Use a hyphen to specify a range of ports.

Defaults

By default, TDR statistics are shown for all ports on all modules

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter a slot number to display information for all interfaces on a specific slot.
- Enter a slot and port number or a range of port numbers to display information for a specific interface or range of interfaces.

Examples

```
-> show interfaces 1/1/3 tdr-statistics
Legend: Pair 1 - orange and white
        Pair 2 - green and white
        Pair 3 - blue and white
        Pair 4 - brown and white

Ch/Slot/ No of Cable Fuzzy  Pair1 Pair1  Pair2 Pair2  Pair3 Pair3  Pair4 Pair4 Test
port  pairs State Length State Length State Length State Length State Length Result
-----+-----+------+-----+-----+-----+------+------+-----+------+-----+------+------
1/1/3   4     ok     0     ok     3     ok      3    ok      3     ok    3  success
```

output definitions

Legend	Eight-conductor data cable contains 4 pairs of twisted Pair Copper Cable wires. Each pair consists of a solid (or predominantly) colored wire and a white wire with a strip of the same color. The pairs are twisted together.
Slot/Port	The interface slot and port number.
No of pairs	The number of pairs in the cable for which the test results are valid.

output definitions (continued)

Cable State	State of a cable as returned by the TDR test. The state of the cable wire. (a) **OK** - Wire is working properly (b) **Open** - Wire is broken (c) **Short** - Pairs of wire are in contact with each other (d) **Crosstalk** - Signal transmitted on one pair of wire creates an undesired effect in another wire. (e) **Unknown** - Cable diagnostic test unable to find the state of a cable.
Fuzzy Length	The error in the estimated length of the cable.
Pair1 State	The state of the Pair 1 cable wire (**OK**, **Open**, **Short**, **Crosstalk**, or **Unknown**)
Pair1 Length	The length of the Pair 1 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
Pair2 State	The state of the Pair 2 cable wire (**OK**, **Open**, **Short**, **Crosstalk**, or **Unknown**)
Pair2 Length	The length of the Pair 2 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
Pair3 State	The state of the Pair 3 cable wire (**OK**, **Open**, **Short**, **Crosstalk**, or **Unknown**)
Pair3 Length	The length of the Pair 3 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
Pair4 State	The state of the Pair 4 cable wire (**OK**, **Open**, **Short**, **Crosstalk**, or **Unknown**)
Pair4 Length	The length of the Pair 4 cable at which the fault is detected, if the pair is faulty. Else, specifies the complete length of the cable.
Test Result	The status of the TDR test performed, success or fail.

Release History

Release 8.1.1 command was introduced.

Related Commands

interfaces tdr	Initiates the cable diagnostics on a port.
clear interfaces	Clears the statistics of the last test performed on the port.

2 Power over Ethernet (PoE) Commands

The Power over Ethernet (PoE) feature is supported on OmniSwitch PoE-capable switches. Refer to the *OmniSwitch Hardware Users Guide* for further details.

Note. Note on Terminology. There are several general terms used to describe this feature. The terms *Power over Ethernet (PoE)*, *Power over LAN (PoL)*, *Power on LAN (PoL)*, and *Inline Power* are synonymous terms used to describe the powering of attached devices via Ethernet ports. For consistency, this chapter and the *OmniSwitch AOS Release 8 CLI Reference Guide* refer to the feature as *Power over Ethernet (PoE)*.

Note. Additional terms, such as *Powered Device (PD)* and *Power Source Equipment (PSE)* are terms that are not synonymous, but are directly related to PoE.

- *PD* refers to any attached device that uses a PoE data cable as its only source of power. Examples include access points such as IP telephones, Ethernet hubs, wireless LAN stations, etc.
- *PSE* refers to the actual hardware source of the electrical current for PoE (e.g., OmniSwitch PoE-capable switches.

PoE commands documented in this section comply with IEEE 802.3, 802.af, and 802.3at.

MIB information for the PoE commands is as follows:

Filename: AlcatelIND1InLinePowerEthernet_mib
Module: ALCATEL-IND1-INLINE-POWER-MIB

Filename: AaIETF_HUBMIB_POWER_ETHERNET_DRAFT_mib
Module: POWER-ETHERNET-MIB

A summary of the available commands is listed here:

lanpower slot service

show lanpower power-policy
show lanpower slot class-detection
show lanpower slot capacitor-detection
show lanpower slot priority-disconnect
show lanpower slot usage-threshold
show lanpower slot update-from

lanpower slot service

Activates or stops PoE service on all ports in a specified slot.

lanpower slot *chassis/slot* **service {start | stop}**

Syntax Definitions

chassis/slot	The slot on which the PoE power is being turned on or off.
start	Activates PoE on all ports in the specified slot.
stop	Turns off PoE on all ports in the specified slot.

Defaults

Power over Ethernet is globally disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> lanpower slot 2/1 service start
-> lanpower slot 1/1 service stop
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower port admin-state	Activates or stops PoE service on an individual port.
lanpower slot update-from	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
alaPethMainPseTable
   alaPethMainPseAdminStatus
```

lanpower port admin-state

Activates or stops PoE service on an individual port.

lanpower port *chassis/slot/port* **admin-state {enable | disable}**

Syntax Definitions

chassis/slot/port	The individual port on which the PoE power is being turned on or off.
enable	Activates PoE on the specified port.
stop	Turns off PoE on the specified port.

Defaults

Power over Ethernet is globally disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> lanpower port 2/1/1 admin-state enable
-> lanpower port 1/1/12 admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower slot service	Activates or stops PoE service on all ports in a specified slot.
lanpower slot update-from	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
pethPsePortTable
   pethPsePortAdminEnable
```

lanpower type

Assigns a user-defined port type to a specific port (when *chassis/slot/port* values are entered) or across all ports in a slot (if only *slot/port* values are entered).

lanpower {slot *chassis/slot* | **port** *chassis/slot/port***} type** *string*

Syntax Definitions

chassis/slot	The slot on which the port type is being defined.
chassis/slot/port	The specific port on which the port type is being defined.
string	A user-defined text string of up to nine (9) characters. This text string will be listed in the "Type" column in the **lanpower slot update-from** command output.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Be sure to use the syntax, **"slot"** or **"port",** before the *chassis/slot* or *chassis/slot/port* values in the command line. Refer to the examples below for more information.

Examples

```
-> lanpower slot 1/1 type test
-> lanpower port 1/1/23 type PDs
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower slot update-from	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
pethPsePortTable
   pethPsePortType
```

lanpower power

Specifies the amount of power, in milliwatts, provided for a specific port (when *chassis/slot/port* values are entered) or across all ports in a slot (if only *slot/port* values are entered).

lanpower {slot *chassis/slot* | **port** *chassis/slot/port***} power** *milliwatts*

Syntax Definitions

chassis/slot	The slot on which the port type is being defined.
chassis/slot/port	The specific port on which the port type is being defined.
milliwatts	The maximum amount of power for a specified port or slot. Refer to default and range information below.

Defaults

model	ports	default	range
OS6860	all	30000	3000-30000
OS6860E (Enhanced)	1 through 4	60000	3000-60000
OS6860E (Enhanced)	5 and higher	30000	3000-30000

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Using this command does not immediately allocate the power to the slot or port. Any unused power is still available and remains a part of the overall PoE budget.
- To globally specify the amount of inline power available to all ports in a slot, refer to the **lanpower slot maxpower** command on page 2-8.
- Be sure to use the syntax, **"slot"** or **"port",** before the *chassis/slot* or *chassis/slot/port* values in the command line. Refer to the examples below for more information.
- Be sure that the value specified complies with specific power requirements for all attached PDs.
- Note that the power value for the **lanpower power** command is specified in milliwatts (mW); the related command, **lanpower slot maxpower**, is specified in watts (W).

Examples

```
-> lanpower slot 3/1 power 3200
-> lanpower port 1/1/24 power 25000
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower slot maxpower	Specifies the maximum amount of inline power, in watts, available to all PoE ports in a specified slot.
lanpower slot update-from	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
alaPethPsePortTable
   alaPethPsePortPowerMaximum
```

lanpower slot maxpower

Specifies the maximum amount of power, in watts, assigned to a specified slot.

lanpower slot *chassis/slot* **maxpower** *watts*

Syntax Definitions

chassis/slot	The slot containing PoE ports on which the maximum amount of inline power allowed is being configured.
watts	The maximum amount of inline power, in watts, available to all PoE ports in the corresponding slot. Refer to the *OmniSwitch Hardware Users Guide* for additional PoE specifications.

Defaults

installed power supply	default	range
920W Power Supply	780W	37-780
600W Power Supply	450W	37-450

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- To specify the maximum amount of inline power available to a single port, refer to the **lanpower power** command on page 2-6.
- Note that the power value for the **lanpower slot maxpower** command is specified in watts (W); the related command, **lanpower power**, is specified in milliwatts (mW).

Examples

```
-> lanpower slot 3/1 maxpower 400
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower power	Specifies the amount of power, in milliwatts, provided for a specific port (when *chassis/slot/port* values are entered) or across all ports in a slot (if only *slot/port* values are entered).
lanpower slot update-from	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
alaPethMainPseTable
   alaPethMainPseMaxPower
```

lanpower priority

Specifies PoE power priority level to a port (when *chassis/slot/port* values are entered) or across all ports in a slot (if only *slot/port* values are entered). Levels include critical, high, and low.

lanpower {slot *chassis/slot* | **port** *chassis/slot/port***} priority {critical | high | low}**

Syntax Definitions

chassis/slot	The slot on which the PoE power priority is being set.
chassis/slot/port	The specific port on which the PoE power priority is being set.
critical	Intended for ports that have mission-critical devices attached, and therefore require top (i.e., critical) priority. In the event of a power management issue, power to critical ports is maintained as long as possible.
high	Intended for ports that have important, but not mission-critical, devices attached. If other ports in the chassis have been configured as critical, power to high-priority ports is given second priority to critical devices.
low	Intended for ports that have low-priority devices attached. In the event of a power management issue, power to low-priority ports is interrupted first (i.e., before critical- and high-priority ports).

Defaults

parameter	default
low | high | critical	low

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Be sure to use the syntax, **"slot"** or **"port",** before the *chassis/slot* or *chassis/slot/port* values in the command line. Refer to the examples below for more information.
- For OS6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power. For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power.

Examples

```
-> lanpower slot 2/1 priority low
-> lanpower port 1/1/6 priority critical
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower slot priority-disconnect	Enables or disables the priority disconnect function on all ports in a specified slot.
lanpower slot update-from	Displays the PoE status and related statistics for all ports in a specified slot.

MIB Objects

```
pethPsePortTable
   pethPsePortPowerPriority
```

lanpower slot priority-disconnect

Enables or disables the priority disconnect function on all ports in a specified slot. Priority disconnect is used by the system software in determining whether an incoming PD will be granted or denied power when there are too few watts remaining in the PoE power budget for an additional device.

lanpower slot *chassis/slot* **priority-disconnect {enable | disable}**

Syntax Definitions

chassis/slot	The particular slot on which the priority disconnect function is being enabled or disabled.
enable	Enables priority disconnect on a specified port. When this function is enabled *and* a power budget deficit occurs in which there is inadequate power for an incoming device, the system software uses priority disconnect rules to determine whether an incoming device will be granted or denied power.
disable	Disables priority disconnect on a specified port. When priority disconnect is disabled and there is inadequate power in the budget for an additional device, power will be denied to *any* incoming PD, regardless of its priority status.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

For OS6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power (per power supply installed). For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power (per power supply installed).

Examples

```
-> lanpower slot 2/1 priority-disconnect enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower priority	Specifies PoE power priority level to a port (when *chassis/slot/port* values are entered) or across all ports in a slot (if only *slot/port* values are entered).
lanpower slot update-from	Displays the PoE status and related statistics for all ports in a specified slot.
show lanpower slot priority-disconnect	Displays current priority disconnect status for a specified slot.

MIB Objects

```
alaPethMainPseTable
   alaPethMainPsePriorityDisconnect
```

lanpower power-rule

Specifies user-defined power rules that can be assigned to PoE ports.

lanpower power-rule *rule-name* **[admin-state {enable | disable}] [power {on | off}] [at {minutes** *mm* **| time** *hh:mm***}] [days {all |** *day [day...]* **| date** *[date...]***} [months {all |** *month***}] [timezone {local-server | utc | originator-server}]**

no lanpower power-rule *rule-name* **[admin-state {enable | disable}] [power {on | off}] [at {minutes** *mm* **| time** *hh:mm***}] [days {all |** *day [day...]* **| date** *[date...]***} [months {all |** *month***}] [timezone {local-server | utc | originator-server}]**

Syntax Definitions

rule-name	A user-defined name (up to 128 characters) for the power rule being configured.
admin-state	Specifies the admin-state for the power rule.
enable	Enables the power rule.
disable	Disables the power rule.
power	Specifies the power status (**on** or **off**) for devices connected to ports within the power rule.
on	Powers on devices on ports for which the rule is assigned.
off	Powers off devices on ports for which the rule is assigned.
at	Activates a a power rule timer. Power rules are triggered on a specified date or day of the week or at a particular time, or after a specified amount of time has elapsed.
minutes	Sets a timer. Power rules will take effect when a specified number of minutes have elapsed.
mm	The number of minutes that will elapse before the power rules take effect.
time	Sets a timer. Power rules will take effect at a specified time of day.
hh:mm	The time of day that the power rule will take effect.
days	Specifies that the power rule will take effect on a particular day of the week.
all	Specifies that the power rule will take effect on all days of the week (Monday through Sunday).
day	Specifies a particular day of the month or week the power rule will take effect. When entering a day of the month, enter one or more numbers from **1** to **31**. When entering a day of the week, use three-digit abbreviations (e.g., **mon**, **tue**, **wed**, **thu**, **fri**, **sat** and **sun**). Any combination of days may be entered in any order. Refer to command line examples for more information.
month	Specifies that the power rule will take effect during a particular month.
all	Specifies that the power rule will take effect during all months of the year (January through December).

month	Specifies a particular month of the year the power rule will take effect. When entering a month, use three-digit abbreviations (e.g., **jan**, **feb**, **mar**, **apr**, **may**, **jun**, **jul**, **aug**, **sep**, **oct**, **nov** and **dec**). Any combination of months may be entered in any order. Refer to command line examples for more information.
timezone	Sets a timezone in which timer-based power rules will take effect.
local-server	Time as specified by a local server.
utc	Specifies that timer-based rules fall under Universal Time Coordinated (UTC) time.
originator-server	Time as specified via the network.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Before a power rule can take effect, the rule must first be assigned to particular slots or ports via the **lanpower power-policy** command.

Examples

```
->lanpower power-rule RuleTest2 admin-state enable power on at minutes 10 days fri
thu tue months all timezone utc
-> lanpower power-rule new power on at time 18:30 days all months all timezone utc
->lanpower power-rule OutgoingPDs power off at time 6:00 days 1 2 3 6 9 12 31
months all timezone utc
-> lanpower power-rule NewRule admin-state enable power off at minutes 4 days all
months all timezone utc
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower power-policy	Allows users to bind existing power rules to particular slots or ports.
show lanpower power-rule	Displays current PoE power rule settings.
show lanpower power-policy	Displays existing power policies assigned to a slot, port or rule.

MIB Objects

```
alaPethPowerRuleTable
   alaPethPowerRuleAdminStatus
   alaPethPowerRulePowerStatus
   alaPethPowerRuleAtMinute
   alaPethPowerRuleAtTime
   alaPethPowerRuleDaysOfMonth
   alaPethPowerRuleDaysOfWeek
   alaPethPowerRuleMonths
   alaPethPowerRuleTimezone
   alaPethPowerRuleRowStatus
```

lanpower power-policy

Allows users to bind existing power rules to particular slots or ports.

lanpower [slot *chassis/slot* | **port** *chassis/slot/port-port***] power-policy** *policy-name* **[power-rule** *rule-name***]**

no lanpower power-policy *name*

Syntax Definitions

chassis/slot	The slot on which the power policy (with its associated power rule) is being assigned. This syntax is used the first time the **lanpower power-policy** command is entered, where a policy is being assigned to a particular slot. See Usage Guidelines below for more information.
chassis/slot/port-port	The specific slot on which the power policy (with its associated power rule) is being assigned. Port values may be entered as a single port or range of ports. This syntax is used the first time the **lanpower power-policy** command is entered, where a policy is being assigned to a particular slot. See Usage Guidelines below for more information
policy-name	A user-defined name (up to 128 characters) for the power policy being configured (or assigned to an existing power rule).
rule-name	This syntax is used the second time the **lanpower power-policy** command is entered, where a policy is being assigned to an existing power rule. See Usage Guidelines below for more information.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- One or more power rules must be created before using the **lanpower power-policy** command. For information on creating power rules, see the **lanpower power-rule** command on page 2-14.
- Using the **lanpower power-policy** command is a two-step process. First, use the command to assign the policy to specific slots or ports. For example:

```
-> lanpower slot 1/1 power-policy NewPolicy
-> lanpower port 1/1/23 power-policy NewPolicy
-> lanpower port 1/1/1-12 power-policy NewPolicy
```

  Next, run the command again to assign the policy (with its associated slots or ports) to an existing power rule. For example:

```
-> lanpower power-policy NewPolicy power-rule NewRule
```

- When assigning a policy to a slot or port, be sure to use the syntax, **"slot"** or **"port",** before the *chassis/slot* or *chassis/slot/port* values in the command line. Refer to the examples below for more information.

Examples

```
-> lanpower slot 1/1 power-policy NewPolicy
-> lanpower port 1/1/23 power-policy NewPolicy
-> lanpower power-policy NewPolicy power-rule NewRule
-> no lanpower power-policy NewPolicy
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower power-rule	Specifies user-defined power rules that can be assigned to PoE ports.
show lanpower power-rule	Displays current PoE power rule settings.
show lanpower power-policy	Displays existing power policies assigned to a slot, port or rule.

MIB Objects

```
alaPethPowerPolicyTable
   alaPethPowerPolicyRowStatus
alaPethPowerPortTable
   alaPethPowerPortPolicyName
   alaPethPowerPortRowStatus
```

lanpower slot class-detection

Enables or disables class detection of attached devices. When class detection is enabled, attached devices will automatically be limited to their class power, regardless of port power configuration.

lanpower slot *chassis/slot* **class-detection {enable | disable}**

Syntax Definitions

chassis/slot	The particular slot on which class detection is being enabled or disabled.
enable	Enables class detection on the specified slot.
disable	Disables class detection on the specified slot.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Although class-detection is disabled by default, the OS6860 still provides power to incoming PDs (if available in the power budget). However, to strictly enforce class detection as specified in the 802.3at standard, class detection must be enabled using the **lanpower slot class-detection** command.
- Enabling class detection will reset all PoE ports on the chassis.

Examples

```
-> lanpower slot 1/1 class-detection enable
-> lanpower slot 4/1 class-detection disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show lanpower slot class-detection	Displays class detection status on a specified slot.

MIB Objects

```
alaPethMainPseTable
   alaPethMainPseClassDetection
```

lanpower capacitor-detection

Enables or disables the capacitor detection method.

lanpower slot *chassis/slot* **capacitor-detection {enable | disable}**

Syntax Definitions

chassis/slot	The particular slot on which class detection is being enabled or disabled.
enable	Enables the capacitor detection method on the specified slot.
disable	Disables the capacitor detection method on the specified slot.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The capacitor detection method should only be enabled if there are legacy IP phones attached to the corresponding slot—this feature is *not* compatible with IEEE specifications. Please contact your Alcatel-Lucent sales engineer or Customer Support representative to find out which Alcatel-Lucent IP phones models need capacitive detection enabled.

Examples

```
-> lanpower slot 3/1 capacitor-detection enable
-> lanpower slot 1/1 capacitor-detection disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show lanpower slot capacitor-detection	Displays capacitor detection status on a specified slot.

MIB Objects

```
alaPethMainPseTable
   alaPethMainPseCapacitorDetect
```

lanpower slot usage-threshold

Tells the switch to watch for a user-defined, slot-wide threshold for PoE power usage, in percent. When the usage threshold is reached or exceeded, a notification is sent to the user.

lanpower slot *chassis/slot* **usage-threshold** *num*

Syntax Definitions

chassis/slot	The slot for which usage threshold monitoring is being set.
num	The percentage of allowed usage from attached PoE devices before a notification is sent to the user.

Defaults

parameter	default
num	99

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The **lanpower slot usage-threshold** does not affect the amount of PoE power allocated to a particular slot. The command is a monitoring method that tells the switch to send a “specified usage exceeded” notification (i.e., trap) only when a specified percentage has been reached.

Examples

```
-> lanpower slot 1/1 usage-threshold 50
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show lanpower slot usage-threshold	Displays current usage threshold, in percent.

MIB Objects

```
pethMainPseTable
   pethMainPseUsageThreshold
```

lanpower slot update-from

This command is used to update the PoE microcontroller firmware.

lanpower slot {*chassis/slot* | **all}** **update-from** *filename*

Syntax Definitions

chassis/slot	The slot to be updated.
all	Update all the chassis in a virtual chassis.
filename	The file name of the PoE firmware.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The binary file must be placed in the ***/flash*** directory of the Master.
- Once started, console messages will be displayed during the update procedure which may take up to 10 minutes.
- The lanpower service must be disabled during the update and minimal load should be placed on the switch. The update process must be allowed to finish prior to unplugging or configuring the units.

Examples

```
-> lanpower slot 1/1 update-from poe_binary_version.bin
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show lanpower slot update-from	Displays current PoE firmware update status.

MIB Objects

N/A

show lanpower slot

Displays the PoE status and related statistics for all ports in a specified slot.

show lanpower slot *chassis/slot*

Syntax Definitions

chassis	The virtual chassis ID for which current inline power status and related statistics are to be displayed.
slot	The slot for which current inline power status and related statistics are to be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show lanpower slot 1/1
Port Maximum(mW) Actual Used(mW)   Status    Priority   On/Off   Class   Type
----+-----------+---------------+-----------+---------+--------+-------+----------
  1     60000            0       Powered Off    Low      OFF       .
  2     60000            0       Powered Off    Low      OFF       .
  3     60000            0       Powered Off    Low      OFF       .
  4     60000            0       Powered Off    Low      OFF       .
  5     30000            0       Powered Off    Low      OFF       .
  6     30000            0       Powered Off    Low      OFF       .
  7     30000            0       Powered Off    Low      OFF       .
  8     30000            0       Powered Off    Low      OFF       .
  9     30000            0       Powered Off    Low      OFF       .
 10     30000            0       Powered Off    Low      OFF       .
...
 45     30000            0       Powered Off    Low      OFF       .
 46     30000            0       Powered Off    Low      OFF       .
 47     30000            0       Powered Off    Low      OFF       .
 48     30000            0       Powered Off    Low      OFF       .

ChassisId 1 Slot 1 Max Watts 780
0 Watts Total Power Budget Used
750 Watts Total Power Budget Available
1 Power Supplies Available
BPS power: Not Available
```

output definitions

Port	A PoE port for which current status and related statistics are being displayed.
Maximum (mW)	The current maximum amount of power available to the corresponding PoE port, in milliwatts. For more information on this parameter, including default values and changing the settings, refer to the **lanpower power** command on page 2-6.
Actual Used (mW)	The actual amount of power being used by an attached device (if applicable), in milliwatts. If no device is attached to the corresponding port, this row displays a value of 0.
Status	Displays the port's current operational status. Options include **Powered On**, **Powered Off**, **Searching**, **Fault**, **Deny** and **Test**. **Powered On** indicates that PoE power activation is complete and the attached device is receiving power. **Powered Off** indicates that no PoE device is attached and/or the port is not receiving PoE power. **Searching** indicates that PoE activation has started and a powered device PD has been detected, but activation or class detection is incomplete. **Fault** indicates that PoE activation or class detection has failed. **Deny** indicates that PoE power management has denied power to the port due to priority disconnect or over subscription. **Test** indicates that the port has been forced on and will remain on until it is forced off by RTP functions.
Priority	The current priority level for the corresponding PoE port. Options include **Critical**, **High**, and **Low**. **Critical** should be reserved for ports that have mission-critical devices attached, and therefore require top (i.e., critical) priority. In the event of a power management issue, inline power to critical ports is maintained as long as possible. **High** indicates ports that have important, but not mission-critical, devices attached. If other ports in the chassis have been configured as critical, inline power to high-priority ports is given second priority. **Low** priority is for ports that have low-priority devices attached. In the event of a power management issue, inline power to low-priority ports is interrupted first (i.e., before critical and high-priority ports). The default value is Low. Priority levels can be changed using the **lanpower priority** command.
On/Off	Displays whether a port has been manually turned on or off by the user. **ON** indicates that the port has been turned on by the user via the **lanpower slot service** command. **OFF** is the default value and can also indicate that the port has been turned off by the user via the **lanpower slot service** command.
Class	PoE class detected on the attached Powered Device. See the **lanpower slot class-detection** command on page 2-19 for more information.
Type	A user-defined name port type (i.e., text string) for the port. See the **lanpower type** command on page 2-5 for more information.
Max Watts	The maximum watts available to the corresponding slot. The maximum watts value for a slot can be changed using the **lanpower slot maxpower** command.
Total Power Budget Used	The amount of power being used by attached PoE devices.

output definitions (continued)

Total Power Budget Available	The amount of power budget remaining for PoE . If the total power budget remaining is exceeded, a power error will occur and the switch's chassis management software will begin shutting down power to PoE ports according to their priority levels.
Power Supplies Available	The number of power supplies currently installed and operating in the switch.
BPS power	The amount of power available from an OSBPS backup power supply. If no OSBPS is installed, the default value is **Not Available**.

Release History

Release 8.1.1; command was introduced.

show lanpower power-rule

Displays current PoE power rule settings.

show lanpower power-rule [*name***]**

Syntax Definitions

name	The name of an existing power rule.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Entering the **show lanpower power-rule** command without the *name* string provides top-level information for all existing power rules. To view detailed information for a particular rule (e.g., timer and timezone settings, etc.), specify the *name* string in the command line.

Examples

```
-> show lanpower power-rule
Power-Rule                        Admin-state   Power
----------------------------------+-----------+--------------------
test                               Disabled      Off

-> show lanpower power-rule test
                Power-Rule                :     test
                Admin-state               :     Disabled
                Power                     :     Off
                At HH:MM                  :     00:00
                Day-of-Week               :     All
                Month-of-Year             :     All
                Timezone                  :     Local
```

output definitions

Power-Rule	The name(s) of existing PoE power rule(s).
Admin-state	The port PoE status assigned to the rule. Refer to page 2-14 for more information.
Power	The PoE power status assigned to the rule. Refer to page 2-14 for more information.
At HH:MM	The time of day the power rule takes effect. Refer to page 2-14 for more information.

output definitions (continued)

Day-of-Week	The day of the week the power rule takes effect. Refer to page 2-15 for more information.
Month-of-Year	The month of year the power rule takes effect.Refer to page 2-15 for more information.
Timezone	The timezone under which the power rule takes effect. Options include **local-server**, **originator-server** and **utc**. Refer to page 2-15 for more information.

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower power-rule	Specifies user-defined power rules that can be assigned to PoE ports.

MIB Objects

N/A

show lanpower power-policy

Displays existing power policies assigned to a slot, port or rule.

show lanpower power-policy [*policy-name* **slot** | *policy-name* **power-rule** | *policy-name* **port**]

Syntax Definitions

policy-name	The text string for an existing power policy.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Entering the **show lanpower power-policy** command without the *policy-name* string provides top-level information for all existing policies, including associated power rules (if any). To view detailed information for a particular policy, specify the *policy-name* string in the command line, along with the policy's associated slot, port or rule. See Examples below for additional information.

Examples

```
-> show lanpower power-policy
Power-Policy name                   Power-rules
---------------------------------+---------------------------------
Mar25                                RuleTest2

-> show lanpower power-policy Mar25 power-rule
             Power-Policy name             : Mar25
                   Power-rules             : RuleTest2
```

output definitions

Power-Policy name	The names of existing PoE power policies.
Power-rules	The power rules associated with the existing power policies.

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower power-policy	Allows users to bind existing power rules to particular slots or ports.

MIB Objects

N/A

show lanpower slot class-detection

Displays class detection status on a specified slot.

show lanpower slot *chassis/slot* **class-detection**

Syntax Definitions

chassis/slot	The slot for which class detection is being displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Although class-detection is disabled by default, the OS6860 still provides power to incoming PDs (if available in the power budget). However, to strictly enforce class detection as specified in the 802.3at standard, class detection must be enabled using the **lanpower slot class-detection** command.
- Enabling class detection will reset all PoE ports on the chassis.

Examples

```
-> show lanpower slot 1/1 class-detection
Class Detection disabled on ChassisId 1 Slot 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower slot class-detection	Enables or disables class detection of attached devices.

MIB Objects

N/A

show lanpower slot capacitor-detection

Displays capacitor detection status on a specified slot.

show lanpower slot *chassis/slot* **capacitor-detection**

Syntax Definitions

chassis/slot	The slot for which capacitor detection is being displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show lanpower slot 1/1 capacitor-detection
Capacitor Detection disabled on ChassisId 1 Slot 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower capacitor-detection	Enables or disables the capacitor detection method.

MIB Objects

N/A

show lanpower slot priority-disconnect

Displays current priority disconnect status for a specified slot.

show lanpower slot *chassis/slot* **priority-disconnect**

Syntax Definitions

chassis/slot	The particular slot on which priority disconnect status is being displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

For OS6860 switches using 920W power supplies, priority disconnect supports up to a maximum of 780W of PoE power (per power supply installed). For switches using 600W power supplies, priority disconnect supports up to a maximum of 450W of PoE power (per power supply installed).

Examples

```
-> show lanpower slot 1/1 priority-disconnect
Priority Disconnect enabled on ChassisId 1 Slot 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower slot priority-disconnect	Enables or disables the priority disconnect function on all ports in a specified slot.

MIB Objects

N/A

show lanpower slot usage-threshold

Displays current usage threshold, in percent.

show lanpower slot *chassis/slot* **usage-threshold**]

Syntax Definitions

chassis/slot	The particular slot on which priority disconnect status is being displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show lanpower slot 1/1 usage-threshold
Usage Threshold 99% on ChassisId 1 Slot 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower slot usage-threshold	Sets a slot-wide threshold for PoE power usage, in percent.

MIB Objects

N/A

show lanpower slot update-from

Displays the PoE firmware update status.

show lanpower slot {*chassis/slot* **| all} update-from**

Syntax Definitions

chassis/slot	Display the update status for a slot.
all	Display the update status for all chassis.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command can be used to display the update progress from a remote session such as Telnet or SSH.

Examples

```
-> show lanpower slot all update-from
Tue Apr  8 16:48:16 : lpCmm LanCmm info message:
+++ Reprogramming Sequence Started  0 chassisId 1 slot 1
+++ Reprogramming Sequence Started  0 chassisId 2 slot 1

Tue Apr  8 16:48:19 : lpCmm LanCmm info message:
+++ Controller Memory Sequence Begining 0 chassisId 1 slot 1
+++ Controller Memory Sequence Begining 0 chassisId 2 slot 1

Tue Apr  8 16:48:33 : lpCmm LanCmm info message:
+++ Controller Memory Please Wait... 0 chassisId 1 slot 1
+++ Controller Memory Please Wait... 0 chassisId 2 slot 1

Tue Apr  8 16:52:22 : lpCmm LanCmm info message:
+++ Reprogram Pass 0 chassisId 1 slot 1
+++ Reprogram Pass 0 chassisId 2 slot 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

lanpower slot update-from	This command is used to update the PoE microcontroller firmware.

MIB Objects

3 UDLD Commands

This chapter describes the CLI commands used to configure the UDLD (UniDirectional Link Detection) protocol. UDLD operates at Layer 2 in conjunction with IEEE 802.3 Layer 1 fault detection mechanism. It is a protocol used for detecting and disabling unidirectional Ethernet fiber or copper connections to avoid interface malfunctions, Spanning Tree loops, media faults, and so on. It operates in two main modes normal and aggressive.

The two basic mechanisms that UDLD follows are:cha

- Advertises port identity and learns about its neighbors. This information is maintained in a cache table.
- It sends continuous echo messages when fast notifications are required.

MIB information for the UDLD commands is as follows:

Filename: AlcatelIND1UDLD.mib
Module: ALCATEL-IND1-UDLD-MIB

A summary of available commands is listed here:

udld
udld port
udld mode
udld probe-timer
udld echo-wait-timer
clear udld statistics port
show udld configuration
show udld configuration port
show udld statistics port
show udld neighbor port
show udld status port

Configuration procedures for UDLD are explained in “Configuring UDLD,” *OmniSwitch AOS Release 8 Network Configuration Guide*.

udld

Globally enables or disables UDLD protocol on the switch.

udld {enable | disable}

Syntax Definitions

enable	Globally enables UDLD on the switch.
disable	Globally disables UDLD on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The port shutdown by this command can be reset by using the **interfaces admin** command.

Examples

```
-> udld enable
-> udld disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

udld port	Enables or disables UDLD status on a specific port or a range of ports.
show udld configuration	Displays the global status of UDLD configuration.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldGlobalStatus
   alaUdldGlobalConfigUdldStatus
```

udld port

Enables or disables UDLD status on a specific port or a range of ports.

udld port *chassis/slot/port***[**-*port2***] {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
port2	The last port number in a range of ports that you want to configure on the same slot.
enable	Enables UDLD status on a port.
disable	Disables UDLD status on a port.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The UDLD protocol must be enabled before using this command.

Examples

```
-> udld port 1/1/3 enable
-> udld port 1/1/6-10 enable
-> udld port 2/1/4 disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldPortConfigTable
   alaUdldPortConfigUdldStatus
```

udld mode

Configures the UDLD operational mode on a specific port, a range of ports, or all ports.

udld [port [*chassis/slot/port***[-***port2***]] mode {normal | aggressive}**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
port2	The last port number in a range of ports that you want to configure on the same slot.
normal	Specifies UDLD operation in the normal mode.
aggressive	Specifies UDLD operation in the aggressive mode.

Defaults

parameter	default
normal | aggressive	**normal**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The UDLD protocol must be enabled before using this command.
- The UDLD protocol is not supported on aggregate ports.
- In case of faulty cable connection, the port which is configured in normal mode of operation is considered to be in the shutdown state.

Examples

```
-> udld mode aggressive
-> udld mode normal
-> udld port 1/1/3 mode aggressive
-> udld port 2/1/4 mode normal
-> udld port 2/1/9-18 mode aggressive
```

Release History

Release 8.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldPortConfigTable
   alaUdldPortConfigUdldMode
```

udld probe-timer

Configures the probe-message advertisement timer on a specific port, a range of ports, or all ports. Probe messages are transmitted periodically after this timer expires.

udld [port [*chassis/slot/port***[-***port2***]] probe-timer** *seconds*

no udld [port [*chassis/slot/port***[-***port2***]] probe-timer**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
port2	The last port number in a range of ports that you want to configure on the same slot.
seconds	The probe-message transmission interval, in seconds.

Defaults

parameter	default
seconds	15

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to reset the probe-message timer to the default value. Note that it is not necessary to specify the probe-message interval to reset it.
- The UDLD protocol must be enabled before using this command.
- Configure probe-advertisement timer with values varying in a range of 12-18 seconds for better convergence time and to avoid burst of probe advertisements.

Examples

```
-> udld probe-timer 20
-> udld port 1/1/3 probe-timer 16
-> udld port 1/1/8-21 probe-timer 18
-> no udld probe-timer
-> no udld port 1/1/3 probe-timer
```

Release History

Release 8.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldPortConfigTable
   alaUdldPortConfigUdldProbeIntervalTimer
```

udld echo-wait-timer

Configures the echo based detection timer on a specific port, a range of ports, or all the ports. This is known as link detection period.

udld [port [*chassis/slot/port***[-***port2***]] echo-wait-timer** *seconds*

no udld [port [*chassis/slot/port***[-***port2***]] echo-wait-timer**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
port2	The last port number in a range of ports that you want to configure on the same slot.
seconds	The echo based detection period, in seconds.

Defaults

parameter	default
seconds	8

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to reset the echo based detection timer to the default value. Note that it is not necessary to specify the echo based timer to reset it.
- The UDLD protocol must be enabled before using this command.
- An echo message is expected in reply from the neighbor within this time duration, otherwise, the port is considered as faulty.

Examples

```
-> udld echo-wait-timer 9
-> udld port 1/1/5 echo-wait-timer 12
-> udld port 1/1/7-16 echo-wait-timer 12
-> no udld echo-wait-timer
-> no udld port 1/1/3 echo-wait-timer
```

Release History

Release 8.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldPortConfigTable
   alaUdldPortConfigUdldDetectionPeriodTimer
```

clear udld statistics port

Clears the UDLD statistics for a specific port or for all the ports.

clear udld statistics [port *chassis/slot/port***]**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If the slot/port option is not specified, UDLD statistics for the switch is cleared.

Examples

```
-> clear udld statistics port 1/1/4
-> clear udld statistics
```

Release History

Release 8.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld statistics port	Displays the UDLD statistics for a specific port.

MIB Objects

```
alaUdldGlobalClearStats
```

show udld configuration

Displays the global status of UDLD configuration.

show udld configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show udld configuration

Global UDLD Status                : disabled,
Global UDLD Mode                  : normal,
Global UDLD Probe Timer (Sec)     : 15,
Global UDLD Echo-Wait Timer (Sec) : 8
Global UDLD Status : Disabled
```

output definitions

Global UDLD Status	Indicates the UDLD status on the switch. Options include **enabled** or **disabled**.
Global UDLD Mode	Indicates the UDLD mode on the switch. Options include **normal** or **aggressive**.
Global UDLD Probe Timer (Sec)	A probe-message is expected after this time period.
Global UDLD Echo-Wait Timer (Sec)	The detection of neighbor is expected with in this time period.
Global UDLD Status	Indicates the UDLD status on the switch. Options include **enabled** or **disabled**.

Release History

Release 8.1.1; command introduced.

Related Commands

udld	Globally enables or disables UDLD protocol on the switch.
show udld configuration port	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

MIB Objects

```
alaUdldGlobalStatus
   alaUdldGlobalConfigUdldStatus
```

show udld configuration port

Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

show udld configuration port [*chassis/slot/port***]**

Syntax Definitions

chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.

Defaults

By default, a list of all UDLD ports is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show udld configuration port

Slot/Port    Admin State    Oper Mode    Probe-Timer    Echo-Wait-Timer
-----------+--------------+------------+-------------+----------------

4 Source Learning Commands

The Source Learning capability of OmniSwitch is responsible for creating, updating, and deleting source and destination MAC Address entries in the MAC Address Table. This chaptebr includes descriptions of Source Learning commands used to create or delete static MAC addresses, define the aging time value for static and dynamically learned MAC addresses, and display MAC Address Table entries and statistics.

MIB information for Source Learning commands is as follows:

Filename: AlcatelInd1MacAddress.mib
Module: ALCATEL-IND1-MAC-ADDRESS-MIB

A summary of the available commands is listed here:

mac-learning
mac-learning flush
mac-learning flush domain
mac-learning static mac-address
mac-learning multicast mac-address
mac-learning aging-time
mac-learning mode
mac-ping
show mac-learning
show mac-learning domain
show mac-learning remote
show mac-learning aging-time
show mac-learning learning-state
show mac-learning mode

mac-learning

Configures the status of source MAC address learning on a single port, a range of ports, or on a link aggregate of ports.

mac-learning {vlan *vlan***[-***vlan2***] | port** *chassis/slot/port* **| linkagg** *linkagg***} {enable | disable}**

Syntax Definitions

vlan	The VLAN ID number.
-vlan2	The last VLAN ID in a range of VLAN IDs.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
linkagg	Specifies the link aggregate ID number.
enable	Enables source learning.
disable	Disables source learning.

Defaults

By default, source learning is enabled on all ports.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Configuring source learning is not supported on Learned Port Security (LPS) and Universal Network Profile (UNP) ports, as well as individual ports that are members of a link aggregate.
- When port-based source learning is configured for a link aggregate ID, it affects all the ports that are members of the link aggregate.
- When source learning is disabled on a port or link aggregate, dynamic learning of MAC addresses is stopped.
- Static MAC addresses associated with a port or link aggregate are *not* cleared when source learning is disabled. Also, new static MAC address configurations are allowed on ports or link aggregates on which source learning is disabled.
- Disabling source learning on a port or link aggregate is useful on a ring configuration, where switch A does not have to learn MAC addresses from switch B, or for a Transparent LAN Service, where service provider does not require the MAC addresses of the customer network.
- When mac-learning is disabled there may be an increase in flooded/broadcast traffic. In the case of an Eservice VLAN throughput may be decreased slightly due to the removal of the 4-byte outer VLAN in the case of traffic going from NNI to UNI. However there is no loss of data.

Examples

```
-> mac-learning port 1/1/2 enable
-> mac-learning linkagg 10 disable
```

Release History

Release 8.1.1; command added.

Related Commands

show mac-learning learning-state	Displays the source learning status of a port or link aggregate on the switch.

MIB Objects

```
slMacLearningControlTable
   slMacLearningControlStatus
```

mac-learning flush

Clears the specified MAC addresses from the Source Learning MAC Address Table on the local switch.

mac-learning flush {dynamic | static | multicast | vlan *vlan_id* **| } [mac-address** *mac_address***]**

Syntax Definitions

dynamic	Clears dynamically learned MAC addresses.
static	Removes static MAC addresseses.
multicast	Removes static multicast MAC addresses.
mac_address	Enter the MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c).

Defaults

parameter	default
mac-address	all MAC addresses

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command flushes dynamically learned addresses from the MAC Address Table.
- Static unicast and static multicast addresses are removed. This command replaces the **no** form of the **mac-learning** command that was used in previous releases.

Examples

```
-> mac-learning flush vlan 20 port 1/12 dynamic
-> mac-learning flush vlan 20 linkagg 10 static
```

Release History

Release 8.1.1; command added.

Related Commands

show mac-learning	Displays Source Learning MAC Address Table information for the local switch.

MIB Objects

```
slMacLearningControlTable
   slMacLearningControlStatus
```

mac-learning flush domain

Clears the specified MAC addresses from the Source Learning MAC Address Table for the specified learning domain on the local switch.

mac-learning flush domain {all | vlan {vlan *vlan_id* **[port** *chassis/slot/port* **| linkagg** *agg_id* **]} | spb {serviceid** *service_id* **| sap** *chassis/slot/port:encap* **| mesh-sdp** *mesh_id* **| isid** *instance_id***} | evb {serviceid** *service_id***}} {dynamc | static | static-multicast} [mac-address** *mac_address***]**

Syntax Definitions

all	Selects all learning domains.
vlan	Selects the VLAN domain.
vlan_id	VLAN ID number.
chassis	The chassis identifier.
slot/port	The slot and port number that is assigned to the static MAC address.
agg_id	Enter a link aggregate ID number.
spb	Selectes the Shortest Path Bridging (SPB) service domain.
service_id	An existing SPB service ID.
slot/port:encap	The SPB access port and encapsulation (**0**, **all**, *qtag*, or *outer_qtag.inner_qtag*) for a SPB service access point (SAP).
mesh_id	A SPB service distribution point (SDP) ID.
isid instance_id	A SPB backbone service instance identifier (I-SID).
evb	Selectes the Shortest Path Bridging (SPB) service domain.
service_id	An existing Edge Virtual Bridging (EVB) service ID.
dynamic	Clears dynamically learned MAC addresses from the specified domain.
static	Removes static MAC addresseses from the specified domain.
static-multicast	Removes static multicast MAC addresses from the specified domain. This parameter is not available for use with the **all**, **spb**, or **evb** parameters.
mac_address	Enter a specific MAC Address to clear from the MAC Address Table (for example, 00:00:39:59:f1:0c) for the specified domain.

Defaults

parameter	default
mac-address	all MAC addresses

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command flushes dynamically learned addresses from the MAC Address Table that were learned or statically configured for the specifie domain.
- Static unicast and static multicast addresses are removed.
- The **mac-learning flush** command replaces the **no** form of the **mac-learning** command that was used in previous releases.

Examples

```
-> mac-learning flush domain vlan vlan 20 port 1/1/2 dynamic
-> mac-learning flush domain vlan linkagg 10 static
-> mac-learning flush domain spb sap 1/12:0 dynamic
-> mac-learning flush domain all
```

Release History

Release 8.1.1; command added.

Related Commands

mac-learning flush	Clears the MAC Address Table for the local switch.
show mac-learning	Displays Source Learning MAC Address Table information for the local switch.

MIB Objects

```
slMacLearningControlTable
   slMacLearningControlStatus
```

mac-learning static mac-address

Configures a static destination unicast MAC address. The configured MAC address is assigned to a fixed switch port or link aggregate ID and VLAN. If the destination of the data packets received on the VLAN ports is the configured MAC address, then they are forwarded to the specific MAC address port.

mac-learning {vlan *vlan_id* **{port** *chassis/slot/port* | **linkagg** *linkagg_id***}} static mac-address** *mac_address* **[bridging | filtering]**

mac-learning flush [vlan *vlan_id* **[port** *chassis/slot/port* | **linkagg** *linkagg_id***]] static [mac-address** *mac_address***]**

Syntax Definitions

vlan_id	VLAN ID number.
chassis	The chassis identifier.
slot/port	The slot and port number that is assigned to the static MAC address.
linkagg_id	Enter a link aggregate ID number. See Chapter 10, "Link Aggregation Commands."
static	Specifies a permanent static MAC address that is retained even after the switch reboots.
dynamic	Specifies a dynamic MAC address that is removed when the switch reboots.
mac_address	Enter a destination MAC Address (for example, 00:00:39:59:f1:0c).
bridging	Specifies that all packets to or from this MAC address are bridged.
filtering	Specifies that all packets to or from this MAC address are filtered or dropped.

Defaults

parameter	default
bridging | filtering	bridging

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **mac-learning flush** command to remove a static MAC address from the Source Learning MAC Address Table. Note that If no parameters are specified with this command, then all static addresses are removed.
- Enter a port number or link aggregate ID that is already associated with the specified VLAN ID. Only traffic from other ports associated with the same VLAN is directed to the static MAC address port.
- Select the **filtering** parameter to set up a denial of service to block potential hostile attacks. Traffic sent to or from a filtered MAC address is dropped. Select the **bridging** parameter for regular traffic flow to or from the MAC address.

- The destination MAC addresses are maintained in the Source Learning MAC address table.
- If a packet received on a port associated with the same VLAN contains a source address that matches a static MAC address, then the packet is discarded.

Examples

```
-> mac-learning vlan 10 port 1/1/10 static mac-address 00:00:39:59:f1:0c bridging
-> mac-learning vlan 20 linkagg 5 static mac-address 00:00:9a:55:e0:01 filtering
-> mac-learning flush vlan 500 static
-> mac-learning flush vlan 10 port 1/1/10 static mac-address 00:00:39:59:f1:0c
-> mac-learning flush vlan 20 linkagg 5 static
-> mac-learning flush static
```

Release History

Release 8.1.1; command introduced.

Related Commands

vlan members untagged	Assigns ports and link aggregates to a VLAN.
mac-learning multicast mac-address	Configures a static multicast MAC address and assigns the address to one or more egress ports or link aggregates.
show mac-learning	Displays Source Learning MAC Address Table information.

MIB Objects

```
alaSlMacAddressGlobalTable
   slOriginId
   slServiceId
   slMacAddressGbl
   slMacAddressGblManagement
   slMacAddressGblDisposition
```

mac-learning multicast mac-address

Configures a static multicast MAC address and assigns the address to one or more egress ports. Packets received on ports associated with the specified VLAN that contain a destination MAC address that matches the static multicast address are forwarded to the specified egress ports. Static multicast MAC addresses are maintained in the Source Learning MAC address table.

mac-learning {vlan *vlan_id* **{ port** *chassis/slot/port* **| linkagg** *linkagg_id* **}} multicast mac-address** *multicast_address* **[group** *group_id***]**

mac-learning flush [vlan *vlan_id* **[port** *chassis/slot/port* **| linkagg** *linkagg_id* **]] multicast [mac-address** *multicast_address***]**

Syntax Definitions

vlan_id	VLAN ID number.
chassis	The chassis identifier.
slot/port	The egress slot and port number that is assigned to the static multicast MAC address.
linkagg_id	Enter a link aggregate ID number. See Chapter 10, "Link Aggregation Commands."
multicast_address	Enter the destination multicast MAC Address to add to the MAC Address Table (for example, 01:00:39:59:f1:0c).
group_id	This keyword cannot be user defined.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **mac-learning flush** command to remove a static multicast MAC address from the Source Learning MAC Address Table. Note that If no parameters are specified with this command, then all static multicast addresses are removed.
- Note that a MAC address is considered a multicast MAC address if the least significant bit of the most significant octet of the address is enabled. For example, MAC addresses with a prefix of 01, 03, 05, 13, and so on, are multicast MAC addresses.
- If a multicast prefix value is not present, then the address is treated as a regular MAC address and not allowed when using the **mac-learning vlan multicast mac-address** command. Also note that multicast addresses within the following ranges are not supported:

  01:00:5E:00:00:00 to 01:00:5E:7F:FF:FF
  01:80:C2:XX.XX.XX
  33:33:XX:XX:XX:XX

- The configured (static) multicast MAC address is assigned to a fixed switch port or link aggregate ID and VLAN.
- In addition to configuring the same static multicast address for multiple ports within a given VLAN, it is also possible to use the same multicast address across multiple VLANs.
- Enter a port number or link aggregate ID that is already associated with the specified VLAN ID. Only traffic from other ports associated with the same VLAN is directed to the static MAC address port.
- If the **configuration snapshot** or **write memory** command is entered after a static multicast MAC address is configured, the resulting ASCII file or **vcboot.cfg** file includes the "**group** *group_id*" as the additional syntax for the **mac-learning static-multicast** command. The "**group** *group_id*" indicates the number of the multicast group that the switch has assigned to the multicast MAC address for the given VLAN association. Each multicast address – VLAN association is treated as a unique instance and assigned a group number specific to that instance.
- Note that if the port assigned to a multicast MAC address is down or administratively disabled when the **configuration snapshot** or **write memory** command is used, the multicast MAC address is not saved to the resulting ASCII file or **vcboot.cfg** file.

Examples

```
-> mac-learning vlan 1500 port 1/1/10 multicast mac-address 03:00:00:3a:44:12

   slServiceId
   slMacAddressGbl
   slMacAddressGblManagement
   slMacAddressGblDisposition
```

mac-learning aging-time

Configures aging time, in seconds, for static and dynamically learned MAC addresses. When a MAC address has aged beyond the aging-time value, the MAC address is discarded.

mac-learning aging-time {*seconds* **| default}**

no mac-learning aging-time

Syntax Definitions

seconds	Aging time value (in seconds). Do not use commas in value.
default	The aging time is set to the default value of 300 seconds.

Defaults

By default, the aging time is set to 300 seconds.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **default** parameter to set the aging-time back to the default value of 300 seconds.
- The aging time value is a global value that applies to all VLANs. Configuring this value on a per VLAN basis is not supported.
- Note that an inactive MAC address can take up to twice as long as the aging time value specified to be removed from the MAC address table. For example, if an aging time of 60 seconds is specified, the MAC address ages out any time between 60 and 120 seconds of inactivity.
- The MAC address table aging time is also used as the timeout value for the Address Resolution Protocol (ARP) table. This timeout value determines how long the switch retains dynamically learned ARP table entries.

Examples

```
-> mac-learning aging-time 1200
-> mac-learning aging-time default
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mac-learning	Displays Source Learning MAC Address Table information.
show mac-learning aging-time	Displays the current aging time value for the Source Learning MAC Address Table.

MIB Objects

```
slMacAddressAgingTable
   slMacAgingValue
```

mac-learning mode

Specifies the source learning mode for the chassis.

mac-learning mode [centralized | distributed]

Syntax Definitions

centralized	Enables centralized MAC source learning mode.
distributed	Enables distributed MAC source learning mode.

Defaults

By default, centralized MAC source learning mode is enabled for the chassis.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

After the distributed MAC mode is either enabled or disabled using this command, immediately save the switch configuration using the **write memory** command and then reboot the switch.

Examples

```
-> mac-learning mode centralized
-> mac-learning mode distributed
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mac-learning mode	Displays the current status of the MAC source learning mode.

MIB Objects

```
slDistributedMacMode
```

show mac-learning

Displays Source Learning MAC Address Table information for the switch.

show mac-learning [summary | dynamic | static | multicast | bmac] [port *chassis/slot/port***] [linkagg** *agg_id***] [mac-address** *mac_address***] [remote [mac-address** *mac_address***]]**

Syntax Definitions

summary	Displays a summary of all the MAC address information.
dynamic	Displays only dynamically learned MAC addresses.
static	Displays only static MAC addresses with a permanent status.
multicast	Displays only multicast MAC addresses.
bmac	Displays only backbone MAC addresses (BMACs). A BMAC is the bridge MAC address of a Shortest Path Bridging (SPB) switch.
chassis	The chassis identifier.
slot/port	The slot and port number.
agg_id	The link aggregate ID number.
mac_address	A MAC Address (for example, 00:00:39:59:f1:0c).

Defaults

By default, information is displayed for all MAC addresses contained in the table.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the **show mac-learning** command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.
- If there is a duplicate static MAC address occurence, a “&” will appear to the right of the address in the **show mac-learning** command display.

Examples

```
-> show mac-learning summary
Mac Address Table Summary:

   Domain       Static     Static-Multicast       Bmac        Dynamic
------------+------------+------------------+------------+------------
    VLAN              0                  0           12           12
    VPLS              0                  0            0            0

output definitions

Domain	The domain in which the MAC address was learned or statically configured (**VLAN**, **SPB, EVB, VPLS**). Note that VPLS is currently not supported.
Vlan/ServcId/ISId	The VLAN ID number associated with the MAC address in the VLAN domain or the SPB service and ISID number associated with the MAC address in the SPB domain.
Mac Address	MAC address that is currently learned or statically assigned.
Type	MAC address management status (**dynamic, static, bmac).**
Operation	The disposition of the MAC address (**bridging**, **filtering**, **servicing**).
Interface	The port number that is associated with the static or dynamically learned MAC address. If the interface is a link aggregate ID, zero is displayed as the slot number (for example, 0/29). In the SPB domain, this field displays the service access point (SAP) associated with the MAC address.

Release History

Release 8.1.1; command introduced.

Related Commands

show mac-learning domain	Displays MAC Address Table information for a specific source learning domain.
show mac-learning aging-time	Displays the current aging time value for the Source Learning MAC Address Table.

show mac-learning domain

Displays MAC Address Table information for a specific source learning domain.

show mac-learning domain {all | vlan | spb | evb | vpls} [summary]

show mac-learning domain vlan [vlan *vlan_id***] [port** *chassis/slot/port* **| linkagg** *agg_id***] [dynamic | static | static-multicast | bmac] [mac-address** *mac_address***]**

show mac-learning domain spb [isid *instance_id* | **serviceid** *service_id* **[isid** *instance_id***]] [sap** *chassis/slot/port:encap* **| mesh-sdp** *mesh_id***] [dynamic | static] [mac-address** *mac_address***]**

show mac-learning evb [serviceid *service_id***] [sap** *chassis/slot/port:encap***] [dynamic | static] [mac-address** *mac_address***]**

Syntax Definitions

all	Selects all learning domains.
vlan	Selects the VLAN domain.
spb	Selectes the Shortest Path Bridging (SPB) service domain.
evb	Selectes the Edge Virtual Bridging (EVB) service domain. *EVB does not support services at this time.*
vpls	Virtual LAN Service (VPLS) domain. *The VPLS feature is not supported at this time*.
summary	Displays a summary count of the MAC addresses known to the MAC address table for the specified domain.
vlan_id	VLAN ID number.
chassis	The chassis identifier.
slot/port	The slot and port number that is assigned to the static MAC address.
agg_id	A link aggregate ID number.
instance_id	A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network. The valid range is 256–16777214.
service_id	An existing SPB service ID (EVB services not supported).
slot/port:encap	The SPB access port and encapsulation (**0**, **all**, *qtag*, or *outer_qtag.inner_qtag*) for a SPB service access point (SAP).
mesh_id	A SPB service distribution point (SDP) ID.
dynamic	Displays dynamically learned MAC addresses.
static	Displays static MAC addresses with a permanent status.
static-multicast	Displays static multicast MAC addresses. This parameter applies only to the VLAN domain.
bmac	Displays backbone MAC addresses (BMACs). A BMAC is the bridge MAC address of a SPB switch. This parameter applies only to the VLAN domain.
mac_address	A MAC Address (for example, 00:00:39:59:f1:0c).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the **show mac-learning** command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.
- If there is a duplicate static MAC address occurence, a "&" will appear to the right of the address in the **show mac-learning** command display.

show mac-learning remote

Note: *This command is not supported in this release.*

Displays Source Learning MAC Address Table information for devices learned on a fixed port connected to the remote (peer) switch in a Multi-Chassis Link Aggregation (MCLAG) network configuration.

show mac-learning [summary | dynamic | multicast | static | bmac] remote [mac-address *mac_address***]**

show mac-learning domain vlan [vlan *vlan_id* **[-***vlan_id2***]] remote [summary | dynamic | static-multicast | static | bmac] [mac-address** *mac_address***]**

Syntax Definitions

summary	Displays a summary of remote permanent (static), dynamic, and static multicast MAC address information.
multicast	Display all the static multicast MAC addresses information contained in the MAC address table.
static	Display static MAC addresses with a permanent status.
dynamic	Display dynamically learned MAC addresses.
vlan_id **[-***vlan_id2***]**	VLAN ID number. Use a hyphen to specify a range of VLAN ID numbers (1-20).
mac_address	MAC Address (for example, 00:00:39:59:f1:0c).

Defaults

By default, information is displayed for all remote MAC addresses contained in the table.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the **show mac-learning** command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.
- If there is a duplicate static MAC address occurence, a “&” will appear to the right of the address in the show mac-learning command display.

Examples

```
-> show mac-learning summary remote
Mac Address Table Summary:

   Domain       Static     Static-Multicast       Bmac        Dynamic
------------+------------+------------------+------------+------------
    VLAN               0                  0           12            3
```

```
    VPLS              0                   0           0           0
     SPB              0                   0           0           0
     EVB              0                   0           0           0

Total number of Valid MAC addresses above = 4
```

output definitions

Domain	The domain in which the MAC address was learned or statically configured (**VLAN**, **SPB, EVB, VPLS**). Note that this command only displays VLAN domain MAC addresses known to the peer MCLAG switch. SPB and EVB information is not included. In addition, VPLS is not supported at this time.
Vlan/ServcId/ISId	The VLAN ID number associated with the MAC address in the VLAN domain.
Mac Address	The remote peer MAC address that is currently learned or statically assigned.

output definitions

Type	The management status of the remote peer MAC address (**dynamic, static, bmac).**
Operation	The disposition of the MAC address (**bridging** or **filtering**).
Interface	In an MCLAG configuration, this field displays **remote** if the address was learned on a fixed port of the MCLAG peer switch.

Release History

Release 8.1.1; command introduced.

Related Commands

show mac-learning	Displays source learning MAC address table information.
show mac-learning aging-time	Displays the current aging time value for the Source Learning MAC Address Table.

MIB Objects

```
alaSlMacAddressGlobalTable
   slOriginId
   slServiceId
   slMacAddressGbl
   slMacAddressGblManagement
   slMacAddressGblDisposition
   slMacAddressGblProtocol
```

show mac-learning aging-time

Displays the current aging time value for the Source Learning MAC Address Table.

show mac-learning aging-time

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Note that the aging time is the same for all VLANs because it is not configurable on a per-VLAN basis. The aging time value on this platform is a global parameter that applies to all VLANs.

Examples

```
-> show mac-learning aging-time
Mac Address Aging Time (seconds) = 300
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mac-learning	Displays Source Learning MAC Address Table information.

MIB Objects

```
slMacAddressAgingTable
   slMacAgingValue
```

show mac-learning learning-state

Displays the source learning status of a VLAN, port, or link aggregate.

show mac-learning learning-state [vlan *vlan***[**-*vlan2***]** | **port** *chassis/slot/port* **| linkagg** *linkagg***]**

Syntax Definitions

vlan	The VLAN ID number.
-vlan2	The last VLAN ID in a range of VLAN IDs.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
linkagg	Specifies the link aggregate identifier.

Defaults

By default, the source learning status for all switch ports and link aggregates is displayed.

Platforms Supported

OmniSwitch

Usage Guidelines

- Use the **port** or **linkagg** keywords along with the port ID and link aggregate ID to display the source learning status for a specific port or link aggregate ID.
- Use the **vlan** keyword along with the VLAN ID or a range of VLAN IDs to display the source learning status for the specified VLAN or range of VLANs.
- Output display for a range of port IDs is supported with this command. However, output display for a range of link aggregate IDs is not supported.
- When the source learning status is configured for a link aggregate ID, it affects all the ports that are members of the link aggregate. However, the source learning status cannot be configured on individual ports which are members of the link aggregate.

Example

```
-> show mac-learning learning-state

port  source-learning
-----+----------------
1/1/1    disabled
1/1/2    enabled
1/1/3    disabled
```

```
-> show mac-learning learning-state port 1/2

port  source-learning
-----+---------------
1/1/2    enabled

-> show mac-learning learning-state linkagg 10

port  source-learning
-----+---------------
0/10     disabled
```

output definitions

port	The port number for a switch port or a link aggregate ID number. If the interface is a link aggregate ID, zero is displayed as the slot number (for example, 0/29).
source-learning	The source learning status of the port or link aggregate (**enabled** or **disabled**). Configured through the **mac-learning** command.

```
-> show mac-learning learning-state vlan 1-5

    Vlan        Learning State
------------+--------------------
       1         Enabled
       5         Enabled
```

output definitions

Vlan	The VLAN ID numbers of the VLANs that are active.
Learning State	The MAC learning state of the VLANs.

Release History

Release 8.1.1; command introduced

Related Commands

mac-learning	Configures the status of source MAC address learning on a single port, a range of ports or on a link aggregate of ports.

MIB Objects

```
slMacAddressTable
   slMacLearningControlTable
   slMacLearningControlEntry
   slMacLearningControlStatus
```

show mac-learning mode

Displays the current source learning mode (centralized or distributed) for the switch.

show mac-learning mode

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show mac-learning mode
MAC Learning Mode Configuration = CENTRALIZED
New Configured MAC Learning Mode After Reboot = DISTRIBUTED

-> show mac-learning mode
MAC Learning Mode Configuration = DISTRIBUTED
```

Release History

Release 8.1.1; command introduced.

Related Commands

mac-learning mode	Enables or disables the distributed MAC source learning mode.

MIB Objects

```
slMacAddressTable
   slDistributedMacMode
```

mac-ping

Configure a MAC address ping for testing Layer 2 connectivity.

mac-ping dst-mac *mac* **vlan** *vlan-id* **[priority** *vlan-priority***] [drop-eligible** {**true** | **false**}**] [count** *count***] [interval** *delay***] [size** *size***] [isid-check** *isid***]**

Syntax Definitions

mac	The destination MAC address to ping.
vlan-id	The VLAN on which the packets will be sent out.Valid range is 1-4094.
vlan-priority	Specifies both the internal priority of the Mac ping and the 802.1p value on the vlan tag header. Valid range is 0-7.
true | **false**	Specifies both the internal drop precedence of the MAC ping and the CFI bit on the vlan tag header. Default is false.
count	The number of packets to send in one ping iteration.Valid range is 1–5.
delay	The delay between packets sent during a ping iteration, in milliseconds. Valid range is from 100 ms to 1000 ms in multiples of 100 ms.
size	The size of the ICMP payload to be used for the ping iteration. Valid range is 32–1500 bytes.
isid	A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network.

Defaults

parameter	default
vlan-priority	0
drop-eligible	false
count	5
delay	1000 ms
size	36 bytes

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The timeout for each ping request packet is 1 sec. This value is not configurable.
- Destination MAC cannot be a broadcast, multicast, or NULL address.

Examples

```
-> mac-ping dst-mac 00:11:11:11:11:11 vlan 10
-> mac-ping dst-mac 00:11:11:11:11:11 vlan 10 count 5 size 100
-> mac-ping dst-mac 00:11:11:11:11:11 vlan 1001 isid-check 1002
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show mac-learning	Displays Source Learning MAC Address Table information.

MIB Objects

5 VLAN Management Commands

VLAN management software handles VLAN configuration and the reporting of VLAN configuration changes to other switch tasks. A VLAN defines a broadcast domain that contains physical ports and can span across multiple switches. All switches contain a default VLAN 1. Physical switch ports are initially assigned to VLAN 1 until they are statically or dynamically assigned to other VLANs.

This chapter includes descriptions of VLAN management commands used to create, modify or remove VLANs. These commands allow you to enable or disable Spanning Tree Protocol (STP), add or remove virtual router interfaces, statically assign physical switch ports to a default VLAN, and display VLAN configuration information.

MIB information is as follows:

Filename: AlcatelIND1VlanManager.mib
Module: ALCATEL-IND1-VLAN-MGR-MIB

A summary of the available commands is listed here:

vlan
vlan members untagged
vlan members tagged
vlan mtu-ip
show vlan
show vlan members

vlan

Creates a new VLAN with the specified VLAN ID (VID) and an optional description.

vlan *vlan_id* **[admin-state {enable | disable}] [name** *description***]**

no vlan *vlan_id*

Syntax Definitions

vlan_id	A numeric value that uniquely identifies an individual VLAN. This value becomes the VLAN ID for the new VLAN.
enable	Enable VLAN administrative status.
disable	Disable VLAN administrative status.
description	An alphanumeric string. Optional name description for the VLAN ID.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a VLAN from the configuration.
- All VLAN ports and routers are detached before the VLAN is removed. If the VLAN deleted is a default VLAN on the port, the port returns to default VLAN 1.
- If the VLAN deleted is not a default VLAN, then the ports are directly detached from the VLAN.
- A VLAN is not operationally active until at least one of the member ports of the VLAN is active and can forward traffic.
- Note that specifying multiple VLAN IDs and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range of VLAN ID entries (for example, vlan 10-15).
- When a VLAN is administratively disabled, static port assignments are retained but traffic is not forwarded from these ports.
- The description can be any alphanumeric string. Enclose the description in double quotes if it contains more than one word with space in between.

Examples

```
-> vlan 200 name “Corporate VLAN”
-> vlan 720 admin-state disable
-> no vlan 1020
```

Release History

Release 8.1.1; command introduced.

Related Commands

vlan members untagged	Statically assigns ports to a VLAN.
show vlan	Displays a list of existing VLANs.
show vlan members	Displays VLAN port assignments.

MIB Objects

```
vlanTable
   vlanNumber
   vlanDescription
   vlanAdmStatus
   vlanOperStatus
   vlanStatus
```

vlan members untagged

Configures a new default VLAN for a single port or an aggregate of ports. The VLAN specified with this command is referred to as the *configured default VLAN* for the port.

vlan *vlan_id* **[**-*vlan_id2***] members {port** *chassis/slot/port***[**-*port1***] | linkagg** *linkagg_id***[**-*linkagg_id2***]} untagged**

no vlan *vlan_id* **[**-*vlan_id2***] members {port** *chassis/slot/port***[**-*port1***]| linkagg** *linkagg_id***[**-*linkagg_id2***]}**

Syntax Definitions

chassis	The chassis identifier.
vlan_id	An existing VLAN ID number of the VLAN to assign as the default VLAN configured for the port.
*slot/port***[**-*port1***]**	The slot and port number for the module and the physical port number
*linkagg_id***[**-*linkagg_id2***]**	The link aggregate ID number or range of IDs to be assigned to the specified VLAN.

Defaults

VLAN 1 is the default VLAN for all ports.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a port or link aggregate from its configured default VLAN and restore VLAN 1 as the default VLAN.
- The VLAN ID and link aggregate ID specified with this command must already exist in the switch configuration.
- This command configures the port or link aggregate to send and receive untagged packets for the specified VLAN ID, which becomes the default VLAN of the port.
- Every switch port or link aggregate has only one configured default VLAN. The 802.1Q tagged ports, however, can have additional VLAN assignments, which are often referred to as *secondary* VLANs.

Examples

```
-> vlan 20 members port 4/1/1-24 tagged
-> vlan 20 members linkagg 2-4 untagged
-> no vlan 1-4 members port 4/1/1-24
-> no vlan 20 members linkagg 2-4
```

Release History

Release 8.1.1; command introduced.

Related Commands

vlan	Creates a VLAN.
vlan members tagged	Configures a port to accept 802.1q-tagged packets for a specific VLAN.
show vlan	Displays list of existing VLANs.
show vlan members	Displays VLAN port assignments.

MIB Objects

```
vpaTable
   vpaVlanNumber
   vpaIfIndex
   vpaType
   vpaState
   vpaStatus
```

vlan members tagged

Configures a port or link aggregate ID to send and receive 802.1q-tagged packets with the specified VLAN ID.

vlan *vlan_id***[-***vlan_id2***] members {port** *chassis/slot/port***[-***port2***] | linkagg** *linkagg_id***[-***linkagg_id2***]} tagged**

no vlan *vlan_id***[-***vlan_id2***] members {port** *chassis/slot/port***[-***port2***] | linkagg** *linkagg_id***[-***linkagg_id2***]}**

Syntax Definitions

vlan_id	The VLAN ID number for a preconfigured VLAN that will handle the 802.1Q-tagged traffic for this port. The valid range is 1–4094.
chassis	The chassis identifier.
slot	The slot number for the 802.1Q tagging.
port	The port number for the 802.1Q tagging.
-port2	The last port number in a range of ports.
linkagg_id	The link aggregation ID, which allows you to configure 802.1Q tagging on an aggregate of ports. The valid range is 1 to 31.
-linkagg_id2	The last link aggregate ID in a range.

Defaults

By default, all ports are untagged (they only carry untagged traffic for the default VLAN to which the port belongs).

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete 802.1Q tagging on a port or an aggregate of ports.
- The VLAN ID and link aggregate ID specified with this command must already exist in the switch configuration.
- A port or link aggregate cannot be tagged with its own default VLAN ID.

Examples

```
-> vlan 2 members port 3/1/1 tagged
-> vlan 100 members port 4/1/1-10
-> vlan 100 members linkagg 10
-> vlan 100 members linkagg 1-4
-> no vlan 2 members port 3/1/1
```

Release History

Release 8.1.1; command introduced.

Related Commands

vlan	Creates a VLAN.
vlan members untagged	Configures the default VLAN for the specified port or link aggregate.
show vlan members	Displays VLAN port assignments.

MIB Objects

   qPortVlanDescription
   qAggregateVlanTagValue
   qAggregateVlanAggregateId
   qAggregateVlanStatus
   qAggregateVlanDescription
```

vlan mtu-ip

Configures the maximum transmission unit (MTU) packet size allowed for all ports associated with a VLAN. This value is configured on a per VLAN basis, so all IP interfaces assigned to the VLAN apply the same MTU value to packets sent on VLAN ports.

vlan *vlan_id* **mtu-ip** *size*

Syntax Definitions

vlan_id	An existing VLAN ID number of the VLAN to assign as the default VLAN configured for the port.
size	Packet size value specified in bytes.

Defaults

By default, the MTU size is set to 1500 bytes (the standard Ethernet MTU size).

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The MTU size applies to traffic sent on all switch ports that are associated with the specified VLAN regardless of the port speed (for example, 10/100 Ethernet, gigabit Ethernet). Therefore, assign only ports that are capable of handling the MTU size restriction to the VLAN. If the VLAN MTU size is greater than 1500, do not assign 10/100 Ethernet ports to the VLAN.
- By default, packets that exceed the MTU size are dropped. To enable MTU discovery and fragmentation, use the **icmp type** command to enable the “frag needed but DF bit set” control (for example, **icmp type 3 code 4 enable**).
- The maximum MTU size value for a VLAN is 9198.

Examples

```
-> vlan 200 mtu-ip 1280
-> vlan 1503 mtu-ip 9198
```

Release History

Release 8.1.1; command introduced.

Related Commands

vlan	Creates a VLAN.
vlan members tagged	Configures a port to accept 802.1q-tagged packets for a specific VLAN.
show vlan	Displays list of existing VLANs.

MIB objects

```
vlanTable
   vlanMtu
```

show vlan

Displays a list of VLANs configured on the switch.

show vlan [*vlan_id***]**

Syntax Definitions

vlan_id	VLAN ID number.

Defaults

By default, a list of all VLANs is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Specify a VLAN ID with this command to display information about a specific VLAN.
- Note that specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (for example, show vlan 10-15). Note that only one VLAN entry - a single VLAN ID or a range of VLAN IDs is allowed with this command. Multiple entries are not accepted.

Examples

```
-> show vlan

 vlan  type  admin  oper  ip   mtu   name
-----+------+-----+-----+-----+-----+------------
   1   std    Ena   Dis   Dis  1500   Finance IP
  10  unpd    Ena   Dis   Dis  1500   UNP-DYN-VLAN
  11   std    Ena   Dis   Dis  1500   VLAN 11
 500  fcoe    Ena   Dis   Dis  1500   VLAN 500
```

output definitions

vlan	The numerical VLAN ID. Use the **vlan** command to create or remove VLANs.
type	The type of VLAN (**mtp, ipc, std, vip, unpd, spb, fcoe**).
admin	VLAN administrative status: **Ena** specifies that VLAN functions are enabled; **Dis** specifies that VLAN functions are disabled. Use the **vlan** command to change the VLAN administrative status.
oper	VLAN operational status: **Ena** (enabled) or **Dis** (disabled). The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (for example router interfaces, Spanning Tree) are applied to ports and traffic flow. A VLAN must have an enabled administrative status before it can become operationally enabled.

output definitions (continued)

ip	IP router interface status: **Ena** (IP interface exists for the VLAN) or **Dis** (no IP router interface exists for the VLAN). Use the **ip interface** command to define an IP router interface for a VLAN.
mtu	Maximum Transmission Unit: Size of largest data packet that the VLAN port can transmit. Configured through the **vlan mtu-ip** command.
name	The user-defined text description for the VLAN. By default, the VLAN ID is displayed if the VLAN description is not specified. Configured through the **vlan** command.

```
-> show vlan 10
Name                    : UNP-DYN-VLAN,
Type                    : UNP Dynamic Vlan,
Administrative State    : enabled,
Operational State       : disabled,
IP Router Port          : disabled,
IP MTU                  : 1500
```

output definitions

Name	The user-defined text description for the VLAN. By default, the VLAN ID is displayed if the VLAN description is not specified.
Type	The type of VLAN (**Static VLAN, MTP VLAN, MCM IPC, VIP VLAN, UNP Dynamic VLAN, Backbone VLAN, Fibre Channel over Ethernet VLAN**)
Administrative State	VLAN administrative status: **enabled** VLAN functions are enabled; **disabled** specifies that VLAN functions are disabled. Use the **vlan** command to change the VLAN administrative status.
Operational State	VLAN operational status: **Ena** (enabled) or **Dis** (disabled). The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (for example router interfaces, Spanning Tree) are applied to ports and traffic flow.
IP Router Port	IP router port status: **Ena** (IP interface exists for the VLAN) or **Dis** (no IP router interface exists for the VLAN). Use the **ip interface** command to define an IP router interface for a VLAN.
IP MTU	Maximum Transmission Unit: Size of largest data packet that the VLAN port can transmit.

Release History

Release 8.1.1; command introduced.

Related Commands

show vlan members	Displays VLAN port assignments.

MIB Objects

```
vlanMgrVlan
vlanTable
   vlanNumber
   vlanDescription
   vlanAdmStatus
   vlanOperStatus
   vlanStatus
```

show vlan members

Displays VLAN port associations (VPAs) for all VLANs, a specific VLAN, or for a specific port.

show vlan [*vlan_id* **[-***vlan_id2***]] members [port [***chassis/slot/port***[-***port2***]]| linkagg** *linkagg_id* **[-***linkagg_id2***]]**

Syntax Definitions

vlan_id	VLAN ID number.
-vlan_id2	The last VLAN ID in a range of VLAN IDs.
chassis	The chassis identifier.
slot/port	Enter the slot number for the module and the physical port number on that module.
linkagg_id	Enter the link aggregate ID number to assign to the specified VLAN.
linkagg_id2	The last link aggregate ID in a range of IDs to be assigned to a specified VLAN.

Defaults

If no parameters are specified with this command, a list of all VLANs and their assigned ports is displayed by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the *vlan_id* is specified without a *slot/port* or *linkagg_id*, then all port assignments for that VLAN are displayed.
- If the *slot/port* or *linkagg_id* is specified without a *vlan_id*, then all VLAN assignments for that port are displayed.
- If both the *vlan_id* and *slot/port* or *linkagg_id* are specified, then information only for that VLAN and slot/port or link aggregate ID is displayed.
- Note that specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (for example, show vlan 10-15 port). Note that only one VLAN entry - a single VLAN ID or a range of VLAN IDs is allowed with this command. Multiple entries are not accepted.
- The following types of VPAs may appear in the “type” field based on the switch configuration:

VPA Type	Description
default	Statically configured default VLAN assignment for the port.
qtagged	Statically configured 802.1Q tagged secondary VLAN assignment for the port.
dynamic	VPA created dynamically as learned by MVRP.

VPA Type	Description
mirror	Port is mirroring the VLAN assignment of another port created according to rules/policies.
mirrored	VPA created dynamically for remote port mirroring.
spb	Port is associated with a Shortest Path Bridging (SPB) Backbone VLAN (BVLAN). When a port is configured as an SPB interface, the port is dynamically assigned to all BVLANs in the switch configuration.
UNP Untagged	Untagged VPA created dynamically for UNP.
UNP QTagged	802.1Q tagged VPA created dynamically for UNP.

Examples

```
-> show vlan members
 vlan   port     type      status
+-----+-------+---------+------------+
  1      1/1/1    default   inactive
  2      1/1/2    default   blocking
  3      1/1/2    qtagged   blocking
  4      2/1/5    dynamic   forwarding

-> show vlan 10 members
  port   type      status
+------+--------+------------+
  1/1/1   default   forwarding
  1/1/2   qtagged   forwarding

-> show vlan members port 3/1/2
 vlan     type      status
+------+---------+------------+
   1     default   forwarding
   2     qtagged   forwarding
   5     dynamic   blocking
   3     qtagged   blocking

-> show vlan 1-11 members port 1/1/3
type       : default,
status     : inactive,
vlan admin : enabled,
vlan oper  : disabled,
```

output definitions

vlan	Numerical VLAN ID. Identifies the VLAN assignment of the port.
port	The slot number for the module and the physical port number on that module.
type	The type of VPA: **default** (configured default VLAN assignment for the port), **qtagged** (802.1Q-tagged secondary VLAN assignment for the port), **mirror** (port is mirroring the VLAN assignment of another port), **dynamic (**dynamically configured VLAN assignment for the port).

output definitions

status	The VPA status: **inactive** (port is not active), **forwarding** (traffic is forwarding on this VPA), **blocking** (traffic is not forwarding on this VPA)
vlan admin	VLAN administrative status: **enabled** enables VLAN functions to operate; **disabled** disables VLAN functions without deleting the VLAN. Use the **vlan** command to change the VLAN administrative status.
vlan oper	VLAN operational status: **enabled** or **disabled**. The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (for example router interfaces, Spanning Tree) are applied to ports and traffic flow. A VLAN must have an enabled administrative status before it can become operationally enabled.

Release History

Release 8.1.1; command introduced.

Related Commands

show vlan	Displays list of VLANs configured on the switch.
show ip interface	Displays IP router information.

6 High Availability VLAN Commands

High availability (HA) VLANs send traffic intended for a single destination MAC address to multiple switch ports. The OmniSwitch HA VLAN feature provides an elegant and flexible way to connect server cluster nodes directly to the ingress network. This involves multicasting the service requests on the configured ports. The multicast criteria is configurable based on destination MAC and destination IP address. Egress ports can be statically configured on a server cluster or they can be registered by IGMP reports. The HA VLAN server cluster feature multicasts the incoming packets based on the server cluster configuration on the ports associated with the server cluster.

An HAVLAN is configured by specifying the match criteria, a VLAN and a port list. Match criteria is used to identify the incoming traffic that has to be processed by the HA VLAN server-clusters. The specified VLAN is an ingress and egress VLAN in the case of a L2 server-cluster. In the case of a L3 server-cluster, the VLAN is not configured explicitly, but the IP address specified in the match criteria determines the VLAN. The port list specifies the egress switch ports within the VLAN. The cluster is connected to these switch ports.

There are typically two modes of implementation of server clusters in HA VLAN.

Layer 2 - The server cluster is attached to a L2 switch on which the frames destined to the cluster MAC address are to be flooded on all interfaces.

Layer 3 - The server cluster is attached to a L3 switch on which the frames destined to the server cluster IP address are to be routed to the server cluster IP and then flooded on all interfaces.

For more information, see the application examples in Chapter 28, “Configuring High Availability VLANs” in the *OmniSwitch AOS Release 8 Network Configuration Guide.*

MIB information is as follows:

Filename: AlcatelIND1VlanManager.mib
Module: ALCATEL-IND1-VLAN-MGR-MIB

Filename: AlcatelIND1MacAddress.mib
Module: ALCATEL-IND1-MAC-ADDRESS-MIB

A summary of the available commands is listed here:

server-cluster
server-cluster vlan
server-cluster mac-address
server-cluster ip
server-cluster igmp mode
server-cluster ip-multicast
server-cluster port
show server-cluster

server-cluster

Configures a cluster with an ID, name, mode and the administrative state.

server-cluster *cluster-id* **[name** *cluster-name***] [mode {L2 | L3}] [admin-state {enable|disable}]**

no server-cluster *cluster-id*

Syntax Definitions

cluster-id	A numerical identifier of the cluster. The valid range is 1–32.
cluster-name	Specifies a name (up to 32 characters) to represent the cluster.
L2	Specifies L2 for the cluster mode.
L3	Specifies L3 for the cluster mode.
enable	Enables the administrative state of the cluster.
disable	Disables the administrative state of the cluster.

Defaults

parameter	default
mode	**L2**
admin-state	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use **no** form of this command to remove the cluster ID from the switch configuration.
- Once the cluster mode is set, the mode cannot be changed.
- Use the **admin-state disable** parameter option to disable an existing cluster before attempting to modify any of the cluster parameters.

Examples

```
-> server-cluster 1
-> server-cluster 1 mode l2
-> server-cluster 1 name l2_cluster mode l2
-> server-cluster 2 name l3_cluster mode l3
-> no server-cluster 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vlan	Creates and deletes VLANs.
server-cluster mac-address	Configures a MAC address, VLAN of the specified cluster.
server-cluster port	Configures the specified IP, ARP entry to a given cluster and/or a multi-cast IP.
show server-cluster	Displays the clusters configured in the system.

MIB Objects

```
alaHAVlanClusterTable
   alaHAVlanClusterId
   alaHAVlanClusterName
   alaHAVlanClusterAdminStatus
   alaHAVlanClusterMode
   alaHAVlanClusterRowStatus
```

server-cluster vlan

Configures a VLAN assignment for the specified cluster. This command is used to assign VLANs to an L2 cluster.

server-cluster *cluster-id* **vlan** *vlan_id*

Syntax Definitions

cluster-id	The numerical identifier of an existing server cluster.
vlan_id	The VLAN identifier to assign to the cluster. The valid range is 1–4094.

Defaults

NA

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- If the specified VLAN ID does not exist in the switch configuration, the cluster will remain operationally disabled.
- Modifying the existing VLAN assignment for a cluster is only allowed when the cluster is administratively disabled.

Examples

```
-> server-cluster 1 vlan 10
-> server-cluster 5 vlan 10
-> server-cluster 6 mac-address 00 :11 :22 :33 :44 :55
```

Release History

Release 8.1.1; command was introduced.

Related Commands

server-cluster ip	Configures the specified IP, ARP entry to a given cluster.
server-cluster port	Configures the specified IP, ARP entry to a given cluster and/or a multi-cast IP.
show server-cluster	Displays the clusters configured in the system.
show mac-learning	Displays Source Learning MAC Address Table information.

MIB Objects

```
alaHAVlanClusterTable
   alaHAVlanClusterId
   alaHAVlanClusterVlan
   alaHAVlanClusterMacAddress
   alaHAVlanClusterRowStatus
```

server-cluster mac-address

Configures a MAC address assignment for the specified cluster. This command is used to assign a MAC address to an L2 cluster.

server-cluster *cluster-id* **mac-address** *mac-address*

Syntax Definitions

cluster-id	The numerical identifier of an existing server cluster.
mac-address	The MAC address of the cluster.

Defaults

NA

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- Modifying the existing MAC address assignment for a cluster is only allowed when the cluster is administratively disabled.
- The MAC address that is assigned to a cluster can be a unicast, L2 multicast, or IP multicast address. However reserved multicast MAC addresses cannot be assigned to the cluster.

Examples

```
-> server-cluster 1 vlan 10 mac-address 00 :11 :22 :33 :44
-> server-cluster 5 vlan 10
-> server-cluster 5 mac-address 01:
-> server-cluster 6 mac-address 00 :11 :22 :33 :44 :55
```

Release History

Release 8.1.1; command was introduced.

Related Commands

server-cluster ip	Configures the specified IP, ARP entry to a given cluster.
server-cluster port	Configures the port or linkagg to be assigned to a specific cluster.
show server-cluster	Displays the clusters configured in the system.
show mac-learning	Displays Source Learning MAC Address Table information.

MIB Objects

```
alaHAVlanClusterTable
   alaHAVlanClusterId
   alaHAVlanClusterVlan
   alaHAVlanClusterMacAddress
   alaHAVlanClusterRowStatus
```

server-cluster ip

Configures an IP address and ARP entry for the specified cluster. This command is used to assign an IP address to an L3 cluster.

server-cluster *cluster-id* **ip** *ip-address* **[mac-address {static** *mac-address* **| dynamic}]**

Syntax Definitions

cluster-id	The numerical identifier of an existing server cluster.
ip-address	The unicast IP address to assign to the cluster.
mac-address	The MAC address for the static ARP entry.
dynamic	Dynamically resolve the ARP entry for the cluster.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- A cluster can be assigned an IP address an ARP entry MAC address. Each cluster should have a unique IP address.
- Reserved MAC address cannot be configured as an ARP.
- Modifying the existing IP address parameters for a cluster is only allowed when the cluster is administratively disabled.

Examples

```
-> server-cluster 1 ip 10.135.33.203 mac-address static 00 :11 :22 :33 :44
-> server-cluster 3 ip 10.135.33.205 mac-address dynamic
-> server-cluster 5 ip 10.135.33.207
-> server-cluster 6 mac-address dynamic
-> server-cluster 7 mac-address static 00 :11 :22 :33 :44
```

Release History

Release 8.1.1; command was introduced.

Related Commands

server-cluster mac-address	Configures a MAC address of the specified cluster.
server-cluster port	Configures the port or linkagg to be assigned to a specific cluster.
show server-cluster	Displays the clusters configured in the system.

MIB Objects

```
alaHAVlanClusterTable
   alaHAVlanClusterId
   alaHAVlanClusterIfIndex
   alaHAVlanClusterInetAddressType
   alaHAVlanClusterInetAddress
   alaHAVlanClusterMacAddressType
   alaHAVlanClusterMacAddress
   alaHAVlanClusterMulticastStatus
   alaHAVlanClusterMulticastInetAddressType
   alaHAVlanClusterMulticastInetAddress
   alaHAVlanClusterRowStatus
```

server-cluster igmp mode

Configures the IGMP mode status for specified cluster.

server-cluster *cluster-id* **igmp-mode {enable | disable}**

Syntax Definitions

cluster-id	The numerical identifier of an existing server cluster.
enable	Enables IGMP mode for cluster ports.
disable	Disables IGMP mode for cluster ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- When the IGMP mode is enabled for the cluster, the port list is dynamically learned using the IGMP protocol for the configured IP multicast address.
- For HA VLAN IGMP to work, IGMP must be enabled globally on the switch using the command **ip multicast admin-state enable** command.

Examples

```
-> server-cluster 4 igmp-mode enable
-> server-cluster 4 igmp-mode disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

server-cluster ip	Configures the specified IP, ARP entry to a given cluster.
show server-cluster	Displays the clusters configured in the system.

MIB Objects

```
alaHAVlanClusterTable
   alaHAVlanClusterId
   alaHAVlanClusterIfIndex
   alaHAVlanClusterInetAddressType
   alaHAVlanClusterInetAddress
   alaHAVlanClusterMacAddressType
   alaHAVlanClusterMacAddress
   alaHAVlanClusterMulticastStatus
   alaHAVlanClusterMulticastInetAddressType
   alaHAVlanClusterMulticastInetAddress
   alaHAVlanClusterRowStatus
```

server-cluster ip-multicast

Configures a multicast IP address for the specified cluster. This command configures an IP multicast address for an L3 cluster.

server-cluster *cluster-id* **ip-multicast** *ipm-address*

Syntax Definitions

cluster-id	The numerical identifier of an existing server cluster.
ipm-address	The multicast IP address to assign to the cluster.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- A cluster can be assigned an IP address an ARP entry MAC address. Each cluster should have a uniqueIP-address. IP address is configurable only for L3 clusters
- Cluster parameters like IP, multicast IP and MAC address can be modified only when the cluster admin status is disabled.

Examples

```
-> server-cluster 2 ip-multicast 226.0.0.12
-> server-cluster 4 ip-multicast 226.0.0.14
```

Release History

Release 8.1.1; command was introduced.

Related Commands

server-cluster	Configures cluster parameters to create or modify a cluster ID.
show server-cluster	Displays the clusters configured in the system.

MIB Objects

```
alaHAVlanClusterTable
   alaHAVlanClusterId
   alaHAVlanClusterIfIndex
   alaHAVlanClusterInetAddressType
   alaHAVlanClusterInetAddress
   alaHAVlanClusterMacAddressType
   alaHAVlanClusterMacAddress
   alaHAVlanClusterMulticastStatus
   alaHAVlanClusterMulticastInetAddressType
   alaHAVlanClusterMulticastInetAddress
   alaHAVlanClusterRowStatus
```

server-cluster port

Configures a port port assignment for the port list of the specified cluster.

server-cluster *cluster-id* **port {***chassis//slot/port***[-***port2***] | all}**

no server-cluster *cluster-id* **port {***chassis//slot/port***[-***port2***] | all}**

Syntax Definitions

chassis	The chassis identifier.
cluster-id	The numerical identifier of an existing server cluster.
slot/port	The slot and port number to assign to the cluster port list. Use a hypen to specify a range of ports..
all	Assigns all of the ports that belong to the associated VLAN and NOT all ports on the NI. This parameter applies only to L3 clusters.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a port from the specified cluster port list.
- The cluster ID specified with this command must already exist in the switch configuration.
- Using a port list is not valid for a cluster operating with IGMP mode enabled.
- The **all** parameter does not apply to L2 clusters.

Examples

```
-> server-cluster 1 port 1/1/21
-> server-cluster 2 port 1/1/21-23
-> server-cluster 5 port all
-> no server-cluster 1 port 1/1/21
-> no server-cluster 2 port 1/1/21-23
-> no server-cluster 3 port all
```

Release History

Release 8.1.1; command was introduced.

Related Commands

server-cluster	Configures cluster parameters to create or modify a cluster ID.
show server-cluster	Displays the clusters configured in the system.
show mac-learning	Displays Source Learning MAC Address table information.
show vlan	Displays a list of existing VLANs.
show vlan members	Displays VLAN port assignments.

MIB Objects

```
alaHAVlanClusterPortTable
   alaHAVlanClusterId
   alaHAVlanClusterPortIfIndex
   alaHAVlanClusterPortRowStatus
```

server-cluster linkagg

Configures a link aggregate assignment for the port list of the specified cluster.

server-cluster *cluster-id* **linkagg** *agg_id***[-***agg_id2***]**

no server-cluster *cluster-id* **linkagg** *agg_id***[-***agg_id2***]}**

Syntax Definitions

cluster-id	The numerical identifier of an existing server cluster.
*agg_id***[-***agg_id2***]**	The link aggregate ID number to assign to the cluster port list. Use a hyphen to specify a range of IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a link aggregate ID from the specified cluster port list.
- The cluster ID and link aggregate ID specified with this command must already exist in the switch configuration.
- Using a port list is not valid for a cluster operating with IGMP mode enabled.

Examples

```
-> server-cluster 3 linkagg 1
-> server-cluster 4 linkagg 1-3
-> no server-cluster 3 linkagg 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

server-cluster	Configures cluster parameters to create or modify a cluster ID.
show server-cluster	Displays the clusters configured in the system.
show mac-learning	Displays Source Learning MAC Address table information.
show vlan	Displays a list of existing VLANs.
show vlan members	Displays VLAN port assignments.

MIB Objects

```
alaHAVlanClusterPortTable
   alaHAVlanClusterId
   alaHAVlanClusterPortIfIndex
   alaHAVlanClusterPortRowStatus
```

show server-cluster

Displays the cluster configuration information for the switch.

show server-cluster [*cluster-id* **[port]]**

Syntax Definitions

cluster-id	The numerical identifier of an existing server cluster.
port	Displays the ports and/or link aggregates assigned to a specific cluster.

Defaults

Displays a list of all server clusters configured for the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Specify a cluster ID with this command to display information for a single cluster.
- Use the **port** parameter with the *cluster-id* parameter to display information about the ports assigned to the specified cluster.
- An asterisk (*) is displayed to indicate invalid cases, as shown in the command example.

Examples

```
-> show server-cluster
Legend: * = not valid

Cluster   Mode   Vlan   Mac Address         Ip Address    IGMP Address        Name
---------+-----+-----+------------------+--------------+------------+-----------
* 10      L2     100    01:10:11:22:33:44       -               -          cluster1
  11      L2     100    01:10:11:22:33:44       -               -          cluster2
  12      L2     100    01:10:11:22:33:44       -               -             -
  13      L3     -      01:12:11:22:33:44 10.135.33.203         -             -
* 14      L3     -      01:12:11:22:33:45 10.135.33.203         -             -
  15      L3     -      01:00:5e:00:00:44 10.135.33.203    225.0.1.2    cluster-igmp

-> show server-cluster 10 port
Legend: * = not valid
Cluster   Port         Port Type
----------+-------+--------------
* 10      1/1/3        Static
  10      1/1/21       Static
* 10      0/2          Static
```

```
-> show server-cluster 11 port

7 Distributed Spanning Tree Commands

The Spanning Tree Algorithm and Protocol (STP) is a self-configuring algorithm that maintains a loop-free topology while providing data path redundancy and network scalability. Based on the IEEE 802.1D standard, the Alcatel-Lucent STP implementation distributes the Spanning Tree load between the primary management module and the network interface modules. This functionality improves network robustness by providing a Spanning Tree that continues to respond to BPDUs and port link up and down states in the event of a fail over to a backup management module or switch.

In addition to a distributed architecture, this implementation also provides the following Spanning Tree features:

- Automatic configuration of a physical topology into a single Spanning Tree to ensure that there is only one data path between any two switches.
- Fault tolerance within the network topology. The Spanning Tree is reconfigured in the event of a data path or bridge failure or when a new switch is added to the topology.
- Support for four Spanning Tree protocols: 802.1D (STP), 802.1W (RSTP), and 802.1Q 2005 (MSTP).
- A *flat* Spanning Tree operating mode. If STP or RSTP is used, this mode applies a single STP instance across all VLANs. If MSTP is used, this mode applies a single STP instance to each Multiple Spanning Tree Instance (MSTI), which identifies a set of VLANs.
- A *per-VLAN* Spanning Tree operating mode that applies a single STP instance for each defined VLAN on the switch.
- An STP topology that includes 802.1Q tagged ports and link aggregate logical ports in the calculation of the physical topology.

MIB information for Distributed Spanning Tree commands is as follows:

Filename: AlcatelIND1VlanSTP.MIB
Module: STP-MGMT-MIB

A summary of the available commands is listed here:

Bridge commands	**spantree mode** **spantree protocol** **spantree priority** **spantree hello-time** **spantree max-age** **spantree forward-delay** **spantree bpdu-switching** **spantree path-cost-mode** **spantree vlan admin-state** **spantree auto-vlan-containment** **show spantree** **show spantree cist** **show spantree msti** **show spantree vlan** **show spantree mode**
Port commands	**spantree cist** **spantree vlan** **spantree priority** **spantree cist path-cost** **spantree msti path-cost** **spantree vlan path-cost** **spantree cist mode** **spantree loop-guard** **spantree cist connection** **spantree vlan connection** **spantree cist admin-edge** **spantree vlan admin-edge** **spantree cist auto-edge** **spantree vlan auto-edge** **spantree cist restricted-role** **spantree vlan restricted-role** **spantree cist restricted-tcn** **spantree vlan restricted-tcn** **spantree cist txholdcount** **spantree vlan txholdcount** **show spantree ports** **show spantree cist ports** **show spantree msti ports** **show spantree vlan ports**

MST instance commands	**spantree msti** **spantree msti vlan** **show spantree msti vlan-map** **show spantree cist vlan-map** **show spantree map-msti**
PVST+ commands	**spantree pvst+compatibility**

spantree mode

Selects the flat Spanning Tree or per-VLAN Spanning Tree operating mode for the switch. These modes are exclusive; however, it is not necessary to reboot the switch when the STP modes are changed.

spantree mode {**flat | per-vlan}**

Syntax Definitions

flat	One Spanning Tree instance per switch.
per-vlan	One Spanning Tree instance for each VLAN configured on a switch.

Defaults

By default, the Spanning Tree mode for the switch is set to per-VLAN.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The Multiple Spanning Tree Protocol (MSTP), as defined in the IEEE 802.1Q 2005 standard, is only supported on switches operating in the flat Spanning Tree mode.
- If standard STP or RSTP is used when the switch is running in the flat mode, a single STP instance is applied across all VLANs. For example, if a port belonging to VLAN 10 and a port belonging to VLAN 20 connect to the same switch together, then STP blocks one of these ports.
- If MSTP is used when the switch is running in the flat mode, a single STP instance is applied to each Multiple Spanning Tree Instance (MSTI). Each MSTI represents a set of VLANs.
- Flat Spanning Tree mode supports fixed (untagged) and 802.1Q tagged ports in each VLAN. However, Bridge Protocol Data Units (BPDUs) are always untagged.
- If the per-VLAN mode is selected, a single Spanning Tree instance is enabled for each VLAN configured on the switch. For example, if there are five VLANs configured on the switch, then there are five separate Spanning Tree instances. In essence, a VLAN is a virtual bridge that has its own bridge ID and configurable STP parameters, such as protocol, priority, hello time, max-age, and forward delay.
- When operating in per-VLAN mode, 802.1Q tagged ports participate in an 802.1Q Spanning Tree instance that allows the Spanning Tree to extend across tagged VLANs. As a result, a tagged port can participate in more than one Spanning Tree instance; one for each VLAN that the port carries.
- If a VLAN contains both fixed and tagged ports and the switch is operating in per-VLAN Spanning Tree mode, then a hybrid of the two Spanning Tree instances (single and 802.1Q) is applied. If a VLAN appears as a tag on a port, then the BPDU for that VLAN are also tagged. However, if a VLAN appears as the configured default VLAN for the port, then BPDU are not tagged and the single Spanning Tree instance applies.

- Regardless of which mode the switch is running in, it is possible to administratively disable the Spanning Tree status for an individual VLAN (see Chapter 5, “VLAN Management Commands”).

Note. Active ports associated with such a VLAN are excluded from any Spanning Tree calculations and remain in a forwarding state.

Examples

```
-> spantree mode flat
-> spantree mode per-vlan
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree protocol	Selects the Spanning Tree protocol for the specified instance.
spantree bpdu-switching	Enables the switching of Spanning Tree BPDU on a VLAN that has Spanning Tree disabled.
show spantree	Displays VLAN Spanning Tree parameter values.

MIB Objects

```
vStpTable
   vStpNumber
   vStpMode
```

spantree protocol

Configures the Spanning Tree protocol for the flat mode Common and Internal Spanning Tree (CIST) instance or for an individual VLAN instance.

spantree [cist | vlan *vlan_id***] protocol {stp | rstp | mstp}**

Syntax Definitions

cist	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
vlan_id	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
stp	IEEE 802.1D standard Spanning Tree Algorithm and Protocol.
rstp	IEEE 802.1W Rapid Spanning Tree Protocol.
mstp	IEEE 802.1Q 2005 Multiple Spanning Tree Protocol. This protocol is not supported on a per-VLAN basis.

Defaults

By default, the Spanning Tree protocol is set to RSTP.

parameter	default
cist | vlan *vlan_id*	**cist**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the optional **cist** or **vlan** parameter is not specified with this command, the protocol is set for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active.

Note. Selecting MSTP is only an option for the flat mode CIST instance and is required to configure Multiple Spanning Tree Instances (MSTI).

- MSTP is only active when the switch is operating in the flat Spanning Tree mode. STP and RSTP are active when the switch is operating in either the flat or per-VLAN Spanning Tree mode.
- Deleting all existing MSTIs is required before changing the protocol from MSTP to STP or RSTP.

Note. When the protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values. However, if the path cost mode was set to 32-bit prior to the protocol change, the path cost is *not* reset to the default value. See the **spantree path-cost-mode** command page for more information.

Examples

```
-> spantree protocol mstp
```

```
-> spantree cist protocol mstp
-> spantree vlan 5 protocol rstp
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
show spantree	Displays the Spanning Tree instance configuration.

MIB Objects

```
vStpInsTable
   vStpInsNumber
   vStpInsMode
   vStpInsProtocolSpecification
```

spantree vlan admin-state

Enables or disables the Spanning Tree status for a VLAN.

spantree vlan *vlan_id* **[**-*vlan_id2***] admin-state {enable | disable}**

Syntax Definitions

*vlan_id***[**-*vlan_id2***]**	An existing VLAN ID number. Use a hyphen to specify a range of VLANs (10-15).
enable	Enables Spanning Tree for the specified VLAN.
disable	Disables Spanning Tree for the specified VLAN.

Defaults

By default, the Spanning tree status is enabled for a VLAN instance.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

VLAN Spanning Tree instances are only active when the switch is running in the per-VLAN mode. However, configuring the VLAN Spanning Tree status is allowed in both modes (per-VLAN and flat).

Examples

```
-> spantree vlan 850-900 admin-state enable
-> spantree vlan 720-750 admin-state disable
-> spantree vlan 500 admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

vlan	Creates a VLAN.
show vlan	Displays a list of existing VLANs.
show vlan members	Displays VLAN port assignments.

MIB Objects

```
vlanTable
   vlanNumber
   vlanAdmStatus
   vlanOperStatus
   vlanStatus
```

spantree mst region name

Defines the name for a Multiple Spanning Tree (MST) region. One of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

spantree mst region name *name*

no spantree mst region name

Syntax Definitions

name	An alphanumeric string. Use quotes around string if the name contains multiple words with spaces between them (for example “Alcatel-Lucent Marketing”).

Defaults

By default, the MST region name is left blank.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to remove the MST region name.

Note. It is not necessary to specify the region name to remove it.

- To change the existing region, use this command with a string value that is different than the existing region name.
- Specifying an MST region name is allowed regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values, such as region name, only apply when the switch is operating in the flat Spanning Tree mode and using MSTP.

Examples

```
-> spantree mst region name SalesRegion
-> spantree mst region name “Alcatel-Lucent Marketing”
-> no spantree mst region name
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mst region revision-level	Defines the revision level for an MST region.
spantree mst region max-hops	Defines the maximum number of hops for the MST region.
spantree msti	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
spantree msti vlan	Defines an association between a range of VLANs and a single MSTI.

MIB Objects

```
vStpMstRegionTable
   vStpMstRegionNumber
   vStpMstRegionConfigName
```

spantree mst region revision-level

Defines the revision level for a Multiple Spanning Tree (MST) region. One of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

spantree mst region revision-level *rev_level*

Syntax Definitions

rev_level	A numeric value that identifies the MST region revision level for the switch.

Defaults

By default, the MST revision level is set to zero.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

An MST region revision level can be assigned to the MST region regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values, such as revision level, only apply when the switch is operating in the flat Spanning Tree mode, using the MSTP.

Examples

```
-> spantree mst region revision-level 1000
-> spantree mst region revision-level 2000
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mst region name	Defines the name for an MST region.
spantree mst region max-hops	Defines the maximum number of hops for the MST region.
spantree msti	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
spantree msti vlan	Defines an association between a range of VLANs and a single MSTI.

MIB Objects

```
vStpMstRegionTable
   vStpMstRegionNumber
   vStpMstRegionConfigRevisionLevel
```

spantree mst region max-hops

Configures the maximum number of hops that are authorized to receive Multiple Spanning Tree (MST) regional information. Use this command to assign the maximum number of hops a BPDU is allowed to traverse, before it is discarded and related information is aged out.

spantree mst region max-hops *max_hops*

Syntax Definitions

max_hops	A numeric value that designates the maximum number of hops.

Defaults

By default, the maximum number of hops is set to 20.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The value configured with this command is a regional value that applies to all instances and is used to determine the size of the region.
- The maximum hop count value is the initial value of the “remaining hops” parameter in the MST BPDU that originates from the bridge that is serving as the root bridge for the region. Each bridge that in turn receives the MST BPDU decrements the “remaining hops” count value by one and passes the new value along to the next bridge. When the count reaches 0, the BPDU is discarded.
- Specifying an MST maximum hop count is allowed regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values only apply when the switch is operating in the flat Spanning Tree mode and using the MSTP.

Examples

```
-> spantree mst region max-hops 40
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mst region name	Defines the name for an MST region.
spantree mst region revision-level	Defines the revision level for an MST region.
spantree msti	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
spantree msti vlan	Defines an association between a range of VLANs and a single MSTI.

MIB Objects

```
vStpMstRegionTable
   vStpMstRegionNumber
   vStpMstRegionMaxHops
```

spantree msti

Defines a Multiple Spanning Tree Instance (MSTI) number. This number identifies an association between a range of VLANs and a single Spanning Tree instance. In addition, it is possible to assign an optional name to the MSTI for further identification.

spantree msti *msti_id* **[name** *name***]**

no spantree msti *msti_id* **[name]**

Syntax Definitions

msti_id	A numeric MSTI ID number. A range of VLANs is associated to an MSTI ID number.
name	An alphanumeric string. Use quotes around string if the name contains multiple words with spaces between them (for example “Alcatel-Lucent Marketing”).

Defaults

By default, a flat mode Common and Internal Spanning Tree (CIST) instance always exists. The MSTI ID number for this instance is 0.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the MSTI from the switch configuration.
- Use the **no** form of this command along with the **name** parameter to remove the optional MSTI name from the specified instance. The instance itself is not removed; only the name.
- There is always one CIST per switch. Initially all VLANs are associated with the CIST instance.
- Creating an MSTI is allowed when the switch is operating in either the per-VLAN or flat Spanning Tree mode, as long as MSTP is the selected flat mode protocol. The MSTI configuration, however, is not active unless the switch is running in the flat mode.

Examples

```
-> spantree msti 10
-> spantree msti 20 name BldgOneST10
-> no spantree msti 20 name
-> no spantree msti 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mst region name	Defines the name for an MST region.
spantree mst region revision-level	Defines the revision level for an MST region.
spantree mst region max-hops	Defines the maximum number of hops for the MST region.
spantree msti vlan	Defines an association between a range of VLANs and a single MSTI.

MIB Objects

```
vStpMstInstanceTable
   vStpMstInstanceNumber
   vStpMstInstanceName
   vStpMstInstanceVlanBitmapAddition
   vStpMstInstanceVlanBitmapDeletion
   vStpMstInstanceVlanBitmapState
```

spantree msti vlan

Defines an association between a range of VLANs and a single Multiple Spanning Tree Instance (MSTI). The MSTI-to-VLAN mapping created with this command is one of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

spantree msti *msti_id* **vlan** *vlan_id***[**-*vlan_id2***]**

no spantree msti *msti_id* **vlan** *vlan_id***[**-*vlan_id2***]**

Syntax Definitions

msti_id	A numeric MSTI identification number. A range of VLANs are associated to an MSTI ID number.
vlan_id	A VLAN ID number.
[*vlan_id2***]**	The last VLAN ID in a range of VLAN IDs.

Defaults

By default, all VLANs are associated with the flat mode Common and Internal Spanning Tree (CIST) instance, which is also known as MSTI 0.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a VLAN or a range of VLANs from the specified MSTI association.
- Note that the VLAN ID specified with this command does not have to already exist in the switch configuration. This command maps VLAN IDs to MSTIs, but does not create VLANs.
- A VLAN is associated with only one MSTI at a time, but it is possible to move a VLAN from one MSTI to another. In addition, it is also possible to assign only one VLAN to an MSTI; a range of VLANs is not required.
- To associate multiple VLANS in a single command, use a hyphen to specify a range of VLAN IDs and a space to separate multiple VLAN IDs and/or ranges (for example 100-115 122 135 200-210).
- Configuring an MSTI-to-VLAN mapping is allowed when the switch is operating in either the per-VLAN or flat Spanning Tree mode, as long as MSTP is the selected flat mode protocol. The MSTI configuration, however, is not active unless the switch is running in the flat mode.

Examples

```
-> spantree msti 10 vlan 100-115
-> spantree msti 20 vlan 122
-> no spantree msti 10 vlan 100-115
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mst region name	Defines the name for an MST region.
spantree mst region revision-level	Defines the revision level for an MST region.
spantree mst region max-hops	Defines the maximum number of hops for the MST region.
spantree msti	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.

MIB Objects

```
vStpMstVlanAssignmentTable
   vStpMstVlanAssignmentVlanNumber
   vStpMstVlanAssignmentEntry
   vStpMstVlanAssignmentMstiNumber
```

spantree priority

Configures the bridge priority value for the Common and Internal Spanning Tree (CIST) instance, a Multiple Spanning Tree Instance (MSTI), or a VLAN instance. This command is also used to configure the priority value for a port or link aggregate associated with the CIST, an MSTI, or a VLAN.

spantree [cist | msti *msti_id* **| vlan** *vlan_id***] [port** *chassis/slot/port***[-***port2***]** | **linkagg** *linkagg_id* **[-***linkagg_id2***]] priority** *priority*

Syntax Definitions

cist	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
msti_id	An existing MSTI ID number. If MSTI 0 is specified, the priority applies to the CIST instance. This parameter is configurable in both modes (flat or per-VLAN) but only if the flat mode protocol is set to MSTP.
vlan_id	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
*linkagg_id***[-***linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
priority	A bridge or port priority value. The valid range for the bridge priority is 0–65535. The valid range for the port priority is 0–15. If MSTP is the active flat mode protocol, enter a value that is a multiple of 4096 (for example, 4096, 8192, 12288).

Defaults

- By default, the bridge priority value is set to 32768 for the CIST, an MSTI, and a VLAN instance.
- By default, the port or link aggregate priority value is set to 7.

parameter	default
cist | **msti** *msti_id* | **vlan** *vlan_id*	**cist**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The bridge priority is used to determine which bridge the Spanning Tree algorithm designates as the root bridge. The port priority value is used to determine the most favorable port when a bridge has multiple ports with the same path cost to the root bridge.

- The lower the bridge or port priority number assigned, the higher the priority that is associated with the bridge or port.
- If none of the optional instance parameters (**cist**, **msti**, or **vlan**) or **port** and **linkagg** parameters are specified with this command, the bridge priority is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the **cist**, **msti**, and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified priority values are not applied unless the supporting mode (flat for CIST/MSTI or per-VLAN for a VLAN instance) is active.
- To configure the bridge priority with this command, specify the instance (**cist**, **msti**, or **vlan**) and the priority value; do not specify a port number or link aggregate ID.
- The bridge priority value for an MSTI is calculated by adding the configured priority value to the Spanning Tree instance number. For example, if the priority value of MSTI 10 equals 32768 (the default), then the Spanning Tree priority value advertised for this instance is 32770 (32768 + 10).
- When the protocol is changed to/from MSTP, the bridge priority for the flat mode CIST instance is reset to the default value.
- The bridge priority specifies the priority value for the first two octets of the Bridge ID (eight octets long). The remaining six octets of the Bridge ID contain a dedicated bridge MAC address. In regards to the priority for an MSTI, only the four most significant bits are used.
- To configure the port priority with this command, specify the instance (**cist**, **msti**, or **vlan**), a port number or link aggregate ID that is associated with that instance, and the priority value.
- The port priority value configured with this command is only applied to the specified instance. As a result, a single port can have different priority values for each instance. For example, in flat mode, port 1/24 can have a priority value of 7 for MSTI 2 and a priority value of 5 for MSTI 3.
- The port priority specifies the value of the priority field contained in the first byte of the port ID. The second byte contains the physical switch port number.

Examples

The following command examples set the bridge priority for the specified instance:

```
-> spantree priority 8192
-> spantree cist priority 8192
-> spantree vlan 2 priority 32679
-> spantree msti 1 priority 2500
ERROR: Valid bridge priority values are multiples of 4096: 0, 4096,
         8192, 12288, 16384 ... 61440
-> spantree msti 1 priority 8192
```

The following command examples set the port priority for the specified instance:

```
-> spantree port 1/1/10 priority 10
-> spantree cist port 1/1/10 priority 10
-> spantree cist linkagg 10 priority 1
-> spantree vlan 200 port 2/1/1 priority 15
-> spantree vlan 2 linkagg 5 priority 2
-> spantree msti 2 port 1/1/24 priority 5
-> spantree msti 3 linkagg 6-8 priority 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
show spantree	Displays the Spanning Tree instance configuration.
show spantree ports	Displays the Spanning Tree port configuration.

MIB Objects

```
vStpInsTable
   vStpInsNumber
   vStpInsMode
   vStpInsPriority
   vStpInsBridgeAddress
```

spantree hello-time

Configures the Spanning Tree hello time value for the flat mode Common and Internal Spanning Tree (CIST) instance or for a per-VLAN mode VLAN instance. This value specifies the amount of time, in seconds, between each transmission of a BPDU on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root.

spantree [cist | vlan *vlan_id***] hello-time** *seconds*

Syntax Definitions

cist	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
vlan_id	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
seconds	Specifies the Hello time value in seconds. The valid range is 1–10.

Defaults

By default, the bridge hello time value is set to 2 seconds.

parameter	default
cist | vlan *vlan_id*	**cist**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Lowering the Hello Time interval improves the robustness of the Spanning Tree Algorithm. Increasing the Hello Time interval lowers the overhead of the Spanning Tree Algorithm.
- If the optional **cist** or **vlan** parameter is not specified with this command, the hello time is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the **cist** and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified hello time value is not applied unless the supporting mode (flat for CIST or per-VLAN for a VLAN instance) is active.
- Note that for Multiple Spanning Tree Instances (MSTI), the hello time value is inherited from the CIST instance and is not a configurable parameter.

Examples

```
-> spantree hello-time 5
-> spantree cist hello-time 5
-> spantree vlan 10 hello-time 3
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
show spantree	Displays the Spanning Tree instance configuration.

MIB Objects

```
vStpInsTable
   vStpInsNumber
   vStpInsMode
   vStpInsBridgeHelloTime
```

spantree max-age

Configures the bridge maximum age time value for the flat mode Common and Internal Spanning Tree (CIST) instance or for a per-VLAN mode VLAN instance. This value is the amount of time, in seconds, that the Spanning Tree Protocol information learned from the network on any port is retained. This information is discarded when it ages beyond the maximum age value.

spantree [cist | vlan *vlan_id***] max-age** *seconds*

Syntax Definitions

cist	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
vlan_id	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
seconds	Max-age time in seconds. The valid range is 6–40.

Defaults

By default, the bridge maximum age time value is set to 20 seconds.

parameter	default
cist | vlan *vlan_id*	**cist**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A low maximum age time causes the Spanning Tree Algorithm to reconfigure more often.
- If the optional **cist** or **vlan** parameter is not specified with this command, the maximum age time is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the **cist** and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified maximum age time value is not applied unless the supporting mode (flat for CIST or per-VLAN for a VLAN instance) is active.
- Note that for Multiple Spanning Tree Instances (MSTI), the maximum age time value is inherited from the CIST instance and is not a configurable parameter.

Examples

```
-> spantree max-age 10
-> spantree cist max-age 10
-> spantree vlan 10 max-age 30
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
show spantree	Displays the Spanning Tree instance configuration.

MIB Objects

```
vStpInsTable
   vStpInsNumber
   vStpInsBridgeMaxAge
```

spantree forward-delay

Configures the bridge forward delay time for the flat mode Common and Internal Spanning Tree (CIST) instance or for a per-VLAN mode VLAN instance. This value is the amount of time, in seconds, that determines how fast a port changes its Spanning Tree state until it reaches a forwarding state. The forward delay time specifies how long a port stays in the listening and learning states, which precede the forwarding state.

spantree [cist | vlan *vlan_id***] forward-delay** *seconds*

Syntax Definitions

cist	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
vlan_id	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
seconds	Forward delay time, in seconds.The valid range is 4–30.

Defaults

By default, the bridge forward delay time value is set to 15 seconds.

parameter	default
cist | vlan *vlan_id*	**cist**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A low forward delay time can cause temporary loops in the network, because data may get forwarded before the reconfiguration message has reached all nodes on the network.
- The forward delay time is also used to age out all dynamic MAC address entries in the forwarding table (MAC address table) when a topology change occurs.
- If the optional **cist** or **vlan** parameter is not specified with this command, the forward delay time is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the **cist** and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified forward delay time value is not applied unless the supporting mode (flat for CIST or per-VLAN for a VLAN instance) is active.
- Note that for Multiple Spanning Tree Instances (MSTI), the forward delay time is inherited from the CIST instance and is not a configurable parameter.

Examples

```
-> spantree forward-delay 30
-> spantree cist forward-delay 30
-> spantree vlan 5 forward-delay 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

```

spantree bpdu-switching

Enables or disables the switching of Spanning Tree BPDU for VLAN and CIST instances if the switch is running in the per-VLAN mode.

spantree {vlan *vlan_id* **| cist} bpdu-switching {enable | disable}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
enable	Enables BPDU switching for the specified instance.
disable	Disables BPDU switching for the specified instance.

Defaults

By default, BPDU switching is disabled for VLAN or CIST instance.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Specifying the BPDU switching status for a VLAN does not depend on the current VLAN Spanning Tree status. For example, setting the BPDU switching status to enabled is allowed on a VLAN that also has Spanning Tree enabled.
- Use the **vlan** parameter along with the *vlan_id* to enable or disable BPDU switching for a particular VLAN.
- Use the **cist** parameter to enable or disable BPDU switching for the CIST instance.

Examples

```
-> spantree mode flat
-> spantree bpdu-switching enable
-> spantree bpdu-switching disable
-> spantree cist bpdu-switching enable
-> spantree cist bpdu-switching disable

-> spantree mode per-vlan
-> spantree vlan 10 bpdu-switching enable
-> spantree vlan 10 bpdu-switching disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

```

spantree path-cost-mode

Configures the automatic selection of a 16-bit path cost for STP/RSTP ports and a 32-bit path cost for MSTP ports or sets all path costs to use a 32-bit value.

spantree path-cost-mode {auto | 32bit}

Syntax Definitions

auto	The port path cost value is automatically set depending on which protocol is active on the switch (32-bit for MSTP, 16-bit for STP/RSTP).
32bit	Specifies that a 32-bit value is used for the port path cost value regardless of which protocol is active on the switch.

Defaults

By default, the path cost mode is set to **auto**.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- All path cost values, except those for MSTIs, are reset to the default path cost value when this mode is changed.
- When connecting a switch running in the 32-bit path cost mode to a switch running in the 16-bit mode, the 32-bit switch has a higher path cost value and thus an inferior path cost to the 16-bit switch. To avoid this, use the **spantree path-cost-mode** command to change the 32-bit switch to a 16-bit switch.
- Note that when the protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values. The exception to this is if the path cost mode is set to 32-bit prior to the protocol change, the path cost is not reset to its default value

Examples

```
-> spantree path-cost-mode 32bit
-> spantree path-cost-mode auto
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree protocol	Configures the protocol for the flat mode CIST instance or a per-VLAN mode VLAN instance.

MIB Objects

vStpBridge
   vStpPathCostMode
```

spantree pvst+compatibility

Enables or disables PVST+ mode on the switch, port or link aggregate enabling them to operate with Cisco switches.

spantree pvst+compatibility {port *chassis/slot/port***] | linkagg** *linkagg_id***} {enable | disable | auto}**

Syntax Definitions

enable	Enables the PVST+ mode.
disable	Disables the PVST+ mode.
auto	IEEE BPDUs are used until a PVST+ BPDU is detected.
chassis	The chassis identifier.
slot/port	Specifies the slot number for the module and the physical port number or a range of ports on that module.
linkagg_id	Link aggregate ID number.

Defaults

PVST+ is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- In order to handle PVST+ mode, the ports must be configured in per-VLAN mode.
- Specify **pvst+compatibility enable** to enable all the ports on the switch to handle PVST+ BPDUs.
- Initially, a port sends or receive IEEE BPDUs. Once a PVST+ BPDU is received, the port sends and receives only PVST+ BPDUs for tagged VLANs and IEEE BPDUs for default VLANs.

Examples

```
-> spantree pvst+compatibility enable
-> spantree pvst+compatibility disable
-> spantree port 1/1/3 pvst+compatibility enable
-> spantree port 2/1/2 pvst+compatibility auto
-> spantree linkagg 2 pvst+compatibility enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show spantree ports	Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance or a per-VLAN mode VLAN instance.
show spantree cist ports	Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance.
show spantree msti ports	Displays Spanning Tree port information for a flat mode Multiple Spanning Tree Instance (MSTI).

MIB Objects

```
vStpPortConfigPVST
vStpPortConfigStatePVST
vStpBridgeModePVST
```

spantree auto-vlan-containment

Enables or disables Auto VLAN Containment (AVC). When enabled, AVC prevents a port that has no VLANs mapped to an Multiple Spanning Tree Instance (MSTI) from becoming the root port for that instance. Such ports are automatically assigned an infinite path cost value to make them an inferior choice for root port.

spantree [msti *msti_id***] auto-vlan-containment {enable | disable}**

Syntax Definitions

msti_id	An existing MSTI ID number. A range of VLANs are associated to an MSTI ID number.
enable	Enables automatic VLAN containment.
disable	Disables automatic VLAN containment.

Defaults

By default, automatic VLAN containment is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The AVC feature is not active for any MSTI until it is globally enabled. To globally enable this feature, use the **spantree auto-vlan-containment** command but do not specify an *msti_ id*.
- When AVC is globally enabled, it is active for all MSTIs. To disable AVC for a single instance, specify the *msti_id* for the instance and use the **disable** form of this command.
- Use the **enable** form of this command and specify an *msti_id* to enable AVC for an instance that was previously disabled.
- An administratively set port path cost takes precedence and prevents AVC configuration of the path cost. However, if the port path cost is administratively set to zero, then the path cost is reset to the default value.
- Note that when AVC is disabled, a port assigned to a VLAN that is not mapped to a specific instance, can become the root port for that instance and cause a loss of connectivity between other VLANs.
- AVC does not have any effect on root bridges.

Examples

```
-> spantree auto-vlan-containment enable
-> spantree auto-vlan-containment disable
-> spantree msti 1 auto-vlan-containment disable
-> spantree msti 1 auto-vlan-containment enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show spantree msti ports	Displays Spanning Tree port information for a flat mode Multiple Spanning Tree Instance (MSTI).

MIB Objects

```
vStpInsTable
   vStpInsAutoVlanContainment
vStpBridge
   vStpBridgeAutoVlanContainment
```

spantree cist

Enables or disables the Spanning Tree status on a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance.

spantree cist {port *chassis/slot/port***[**-*port2***] | linkagg** *linkagg_id***[**-*linkagg_id2***]} {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
*linkagg_id***[**-*linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables Spanning Tree on the specified port for the CIST instance.
disable	Disables Spanning Tree on the specified port for the CIST instance.

Defaults

By default, the Spanning Tree status is enabled on eligible ports.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only applies to the CIST instance regardless of which Spanning Tree operating mode (flat or per-VLAN) or protocol is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the Spanning Tree status configured for the port is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- When the Spanning Tree status is disabled on a port, the port is set to a forwarding state for the specified instance.
- Physical ports that are reserved for link aggregation do not participate in the Spanning Tree Algorithm. Instead, the algorithm is applied to the aggregate logical link (virtual port) that represents a collection of physical ports.

Examples

```
-> spantree cist port 4/1/1 enable
-> spantree cist port 4/1/2-5 disable
-> spantree cist linkagg 16 disable
-> spantree cist linkagg 22-26 enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree vlan	Configures the Spanning Tree status on a port or a link aggregate of ports for a VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortEnable
```

spantree vlan

Enables or disables the Spanning Tree status on a port or a link aggregate of ports for the specified VLAN instance.

spantree vlan *vlan_id* **[**-*vlan2***] {port** *chassis/slot/port***[**-*port2***] | linkagg** *linkagg_id***[**-*linkagg_id2***]} {enable | disable}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
*linkagg_id***[**-*linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables Spanning Tree on the specified port for the specified instance.
disable	Disables Spanning Tree on the specified port for the specified instance.

Defaults

By default, the Spanning Tree status is enabled on eligible ports.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which Spanning Tree operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the Spanning Tree status configured for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- When the Spanning Tree status is disabled on a port, the port is set to a forwarding state for the specified instance.
- If STP is disabled on a VLAN in the per-VLAN mode, the port Spanning Tree status is ignored and all active ports associated with the VLAN are put in a forwarding state and not included in the Spanning Tree Algorithm. Note that when this occurs, ports will *not* bridge BPDU unless the BPDU switching status for the VLAN is enabled.
- Physical ports that are reserved for link aggregation do not participate in the Spanning Tree Algorithm. Instead, the algorithm is applied to the aggregate logical link (virtual port) that represents a collection of physical ports.

Examples

```
-> spantree vlan 2 port 4/1/1 enable
-> spantree vlan 2 port 4/1/2-5 disable
```

```
-> spantree vlan 3 linkagg 16 disable
-> spantree vlan 3 linkagg 22-25 disable
```

Release History

Release 8.1.1; command introduced.

spantree cist	Configures the Spanning Tree status on a port or an aggregate of ports for the CIST instance when the switch is operating in either the per-VLAN or flat mode.
spantree vlan admin-state	Enables or disables Spanning Tree instance for the specified VLAN.
spantree bpdu-switching	Enables or disables the switching of Spanning Tree BPDU for all VLAN instances if the switch is running in the per-VLAN mode.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortEnable
```

spantree cist path-cost

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance. This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

spantree cist {port *chassis/slot/port***[-***port2***]** | **linkagg** *linkagg_id***[-***linkagg_id2***]} path-cost** *path_cost*

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports**.**
*linkagg_id***[-***linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
path_cost	Path cost value. The valid range is 0 - 65535 for 16-bit, 0–200000000 for 32-bit.

Defaults

By default, the path cost is set to zero.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only applies to the port path cost value for the CIST instance regardless of which operating mode (flat or per-VLAN) or protocol is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the specified path cost value is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- Use the **spantree path-cost-mode** command to automatically select the path cost value based on the active Spanning Tree protocol (16-bit for STP and RSTP, 32-bit for MSTP) or to use a 32-bit path cost value regardless of which protocol is active.
- If a 32-bit path cost value is in use and the *path_cost* is set to zero, the following recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
10 MB	2,000,000
100 MB	200,000
1 GB	20,000

Link Speed	IEEE 802.1D Recommended Value
10 Gbps	2,000

- Is a 16-bit path cost value is in use and the *path_cost* is set to zero, the following IEEE 802.1D recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
4 Mbps	250
10 Mbps	100
16 Mbps	62
100 Mbps	19
1 Gbps	4
10 Gbps	2

- If a 32-bit path cost value is in use and the *path_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

- If a 16-bit path cost value is in use and the *path_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used. Note that for Gigabit ports the aggregate size is not applicable in this case:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 Mbps	2	60
	4	40

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
	8	30
100 Mbps	2	12
	4	9
	8	7
1 Gbps	N/A	3
10 Gbps	N/A	1

Examples

```
-> spantree cist port 4/1/1 path-cost 19
-> spantree cist port 4/1/2-5 path-cost 19
-> spantree cist linkagg 16 path-cost 12000
-> spantree cist linkagg 17-20 path-cost 12000
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree path-cost-mode	Selects a 32-bit or automatic path cost mode for the switch.
spantree msti path-cost	Configures the Spanning Tree path cost value for a port or a link aggregate of ports for an MSTI.
spantree vlan path-cost	Configures the Spanning Tree path cost value for a port or a link aggregate of ports for a VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortPathCost
```

spantree msti path-cost

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the specified flat mode Multiple Spanning Tree Instance (MSTI). This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

spantree msti *msti_id* **{port** *chassis/slot/port***[**-*port2***]** | **linkagg** *linkagg_id***[**-*linkagg_id2***]} path-cost** *path_cost*

Syntax Definitions

msti_id	An existing MSTI ID number. If MSTI 0 is specified, the priority applies to the CIST instance.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports**.**
*linkagg_id***[**-*linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
path_cost	Path cost value. The valid range is 0 - 65535 for 16-bit, 0–200000000 for 32-bit.

Defaults

By default, the path cost is set to zero.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only applies to the specified MSTI regardless of which operating mode (flat or per-VLAN) is active for the switch. However, if MSTP is not the selected flat mode protocol, the path cost value for any MSTI is not configurable.
- Note that if zero is entered for the *msti_id* value, the specified path cost value is applied to the CIST instance.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- The path cost value configured with this command is only applied to the specified instance. As a result, a single port can have a different path cost for each instance. For example, in flat mode, port 1/24 can have a path cost of 20000 for MSTI 2 and a path cost of 35000 for MSTI 3.
- If the switch is running in per-VLAN mode when this command is used, the specified path cost value is not active for the specified MSTI until the operating mode for the switch is changed to the flat mode.
- When MSTP is the active protocol on the switch, only a 32-bit path cost value is used. Using a 16-bit path cost value is not an option.

- If zero is entered for the *path_cost* value, then the following recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
10 MB	2,000,000
100 MB	200,000
1 GB	20,000
10 Gbps	2,000

- If the *path_cost* value for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

Examples

```
-> spantree msti 0 port 4/1/1 path-cost 35000
-> spantree msti 0 port 1/1/20-24 path-cost 12000
-> spantree msti 2 linkagg 10 path-cost 20000
-> spantree msti 2 linkagg 10-12 path-cost 65000
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree cist path-cost	Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the CIST instance.
spantree vlan path-cost	Configures the Spanning Tree path cost value for a port or a link aggregate of ports for a VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortPathCost
```

spantree vlan path-cost

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the specified VLAN instance. This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

spantree vlan *vlan_id* **{port** *chassis/slot/port***[**-*port2***]** | **linkagg** *linkagg_id* **[**-*linkagg_id2***]} path-cost** *path_cost*

Syntax Definitions

vlan_id	An existing VLAN ID number.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
*linkagg_id***[**-*linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
path_cost	Path cost value. The valid range is 0 - 65535 for 16-bit, 0–200000000 for 32-bit.

Defaults

By default, the path cost is set to zero.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified path cost for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- Use the **spantree path-cost-mode** command to automatically select the path cost value based on the active Spanning Tree protocol (16-bit for STP and RSTP, 32-bit for MSTP) or to use a 32-bit path cost value regardless of which protocol is active.
- If a 32-bit path cost value is in use and the *path_cost* is set to zero, the following IEEE 892.1S recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
10 MB	2,000,000
100 MB	200,000
1 GB	20,000
10 Gbps	2,000

- Is a 16-bit path cost value is in use and the *path_cost* is set to zero, the following IEEE 802.1D recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
4 Mbps	250
10 Mbps	100
16 Mbps	62
100 Mbps	19
1 Gbps	4
10 Gbps	2

- If a 32-bit path cost value is in use and the *path_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

- If a 16-bit path cost value is in use and the *path_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used. Note that for Gigabit ports the aggregate size is not applicable in this case:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 Mbps	2	60
	4	40
	8	30
100 Mbps	2	12
	4	9
	8	7
1 Gbps	N/A	3
10 Gbps	N/A	1

Examples

```
-> spantree vlan 200 port 4/1/1 path-cost 4
-> spantree vlan 200 port 4/1/2-5 path-cost 4
-> spantree vlan 300 linkagg 16 path-cost 200000
-> spantree vlan 500 linkagg 24-28 path-cost 20000
```

Release History

Release 8.1.1; command introduced.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortPathCost
```

spantree cist mode

Configures manual mode (forwarding or blocking) or dynamic mode to manage the state of a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance. Dynamic mode defers the management of the port state to the Spanning Tree algorithm.

spantree cist {port *chassis/slot/port***[-***port2***]** | **linkagg** *linkagg_id***[-***linkagg_id2***]} mode {forwarding | dynamic | blocking}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
*linkagg_id***[-***linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
forwarding	Sets the port state to forwarding.
dynamic	Port state is determined by the Spanning Tree algorithm.
blocking	Sets the port state to blocking.

Defaults

By default, the port Spanning Tree mode is set to dynamic.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only applies to the port Spanning Tree mode for the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the specified port mode is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Ports manually configured to operate in a forwarding or blocking state do not participate in the Spanning Tree algorithm.
- When port state is manually set to forwarding or blocking, the port remains in that state until it is changed using this command.

Examples

```
-> spantree cist port 4/1/1 mode forwarding
-> spantree cist port 4/1/2-5 mode forwarding
-> spantree cist linkagg 10 mode blocking
-> spantree cist linkagg 15-20 mode forwarding
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree loop-guard	Configures the Spanning Tree mode for a port or a link aggregate of ports for the specified VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortManualMode
```

spantree loop-guard

Enables or disables the STP loop-guard on a port or link aggregate.

spantree {port *chassis/slot/port***[-***port2***]** | **linkagg** *linkagg_id* **[-***linkagg_id2***]} loop-guard {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
*linkagg_id***[-***linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (example 10-20).
enable	Enables STP loop-guard.
disable	Disables STP loop-guard.

Defaults

STP loop-guard is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When you enable loop-guard on a port, it is automatically applied to all the active instances or VLANs associated to the port.
- Loop-guard cannot be enabled on a port if root-guard is already enabled on the port or link aggregate related to the port. Root-guard must be disabled before configuring loop-guard. Similarly, when loop-guard configuration is enabled on a port or chassis, root-guard cannot be configured on the port/s.
- Loop-guard can be enabled on all types of ports including designated (forwarding), non-designated (alternate, secondary, or root) ports. However, STP loop-guard configuration does not affect designated ports. Hence, loop-guard is not effective when applied on designated ports.
- When loop-guard is enabled on root ports, they change to blocking mode when a loop-guard error occurs. In such an instance, the alternate or secondary ports takeover until the root port recovers from the error state.
- If a set of ports that are already blocked by loop-guard are grouped together to form a link aggregate, the new link aggregate gets a new designated role. The link aggregate can also obtain a forwarding state depending on the STP state.
- If a spanning tree channel is blocked by loop-guard and the channel breaks, spanning tree loses all the state information. The individual physical ports obtain the designated role, even if one or more of the links that formed the channel are unidirectional. New link aggregate might obtain a forwarding state but new port state is defined.

- The ports that are configured as fast-forwarding or edge-ports do not receive BPDUs. Loop-guard is not effective on such ports.
- Loop-guard error state is recovered when the administrative state of the port is enabled or disabled.
- When a VLAN is disabled, all the VLAN port associations recover from the error state.
- The loop-guard feature can be enabled on the ports that have STP (RSTP, MRSTP or MSTP) enabled.
- STP loop-guard on link aggregate protects all ports that are members of the link aggregation group.

Examples

```
-> spantree port 1/1/2 loop-guard enable
-> spantree linkagg 1 loop-guard enable
-> spantree port 1/1/2 loop-guard disable
-> spantree linkagg 1 loop-guard disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show spantree ports	Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance or a 1x1 mode VLAN instance.

MIB Objects

```

   vStpPortConfigIfIndex
   vStpPortConfigLoopGuard
```

spantree vlan mode

Configures Manual mode (forwarding or blocking) or Dynamic mode to manage the state of a port or a link aggregate of ports for the specified VLAN instance. Dynamic mode defers the management of the port state to the Spanning Tree algorithm.

spantree vlan *vlan_id* **{port** *chassis/slot/port***[**-*port2***]** | **linkagg** *linkagg_id* **[**-*linkagg_id2***]} mode {dynamic | blocking | forwarding}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
*linkagg_id***[**-*linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
dynamic	Port state is determined by Spanning Tree algorithm.
blocking	Sets port state to blocking.
forwarding	Sets port state to forwarding.

Defaults

By default, the port Spanning Tree mode is set to dynamic.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified mode for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- Ports manually configured to operate in a forwarding or blocking state do not participate in the Spanning Tree algorithm.
- When port state is manually set to forwarding or blocking, the port remains in that state until it is changed using this command.

Examples

```
-> spantree vlan 255 port 4/1/1-4 mode forwarding
-> spantree vlan 355 port 1/1/24 mode dynamic
-> spantree vlan 450 linkagg 1 mode dynamic
-> spantree vlan 450 linkagg 1-5 mode dynamic
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree cist mode	Configures the Spanning Tree mode for a port or a link aggregate of ports for the CIST instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortManualMode
```

spantree cist connection

Configures the connection type for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

spantree cist {port *chassis/slot/port* **[**-*port2***] | linkagg** *linkagg_id* **[**-*linkagg_id2***]} connection {noptp | ptp | autoptp}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
*linkagg_id***[**-*linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
noptp	Defines port connection type as no point to point link.
ptp	Defines port connection type as point to point link.
autoptp	Specifies that switch software automatically defines connection type as point-to-point or no point-to-point.

Defaults

By default, the link connection type is set to auto point-to-point.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only applies to the port connection type for the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the specified port connection type is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- A port is considered connected to a point-to-point LAN segment if the port belongs to a link aggregate of ports or if autonegotiation determines the port must run in full duplex mode or if full duplex mode was administratively set. Otherwise, the port is considered connected to a no point-to-point LAN segment.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point-to-point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

Examples

```
-> spantree cist port 7/1/24 connection noptp
-> spantree cist port 7/1/25-28 connection ptp
```

```
-> spantree cist linkagg 5-10 connection autoptp
-> spantree cist linkagg 5-10 connection autoptp
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree cist admin-edge	Configures the administrative edge port status for a port or aggregate of ports for the CIST instance.
spantree cist auto-edge	Configures whether or not Spanning Tree automatically determines the operational edge status of a port or an aggregate of ports for the flat mode CIST instance.

MIB Objects

   vStpInsPortNumber
   vStpInsPortAdminConnectionType
   vStpInsPortOperConnectionType
```

spantree vlan connection

Configures the connection type for a port or a link aggregate of ports for a VLAN instance.

spantree vlan *vlan_id* **{port** *chassis/slot/port* **[**-*port2***]** | **linkagg** *linkagg_id* **[**-*linkagg_id2***]} connection {noptp | ptp | autoptp}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
*linkagg_id***[**-*linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
noptp	Defines port connection type as no point-to-point link.
ptp	Defines port connection type as point-to-point link.
autoptp	Specifies that switch software automatically defines connection type as point-to-point or no point-to-point *and* whether or not the port is an edge port.

Defaults

By default, the link connection type is set to auto point-to-point.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified connection type for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- A port is considered connected to a point-to-point LAN segment if the port belongs to a link aggregate of ports or if autonegotiation determines the port must run in full duplex mode or if full duplex mode was administratively set. Otherwise, the port is considered connected to a no point-to-point LAN segment.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

Examples

```
-> spantree vlan 255 port 7/1/24 connection noptp
-> spantree vlan 255 port 7/1/25-27 connection ptp
-> spantree vlan 255 linkagg 3 connection autoptp
-> spantree vlan 255 linkagg 3-7 connection autoptp
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch
spantree cist admin-edge	Configures the administrative edge port status for a port or aggregate of ports for the CIST instance.
spantree cist auto-edge	Configures whether or not Spanning Tree automatically determines the operational edge status of a port or an aggregate of ports for the flat mode CIST instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortAdminConnectionType
   vStpInsPortOperConnectionType
```

spantree cist admin-edge

Configures the administrative edge port status for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

spantree cist {port *chassis/slot/port***[-***port2***]** | **linkagg** *linkagg_id***[-***linkagg_id2***]} admin-edge {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
*linkagg_id***[-***linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs
enable	Enables the administrative edge port status for the specified port-CIST instance.
disable	Disables the administrative edge port status for the specified port-CIST instance.

Defaults

By default, the administrative edge port status is disabled (off).

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only applies to the port connection type for the CIST instance regardless of which operating mode (flat or per-VLAN) is active on the switch.
- If the switch is running in the per-VLAN mode when this command is used, the specified edge port status is not active for the CIST instance until the switch is configured to run in the flat Spanning Tree mode.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point-to-point connection type.

Examples

```
-> spantree cist linkagg 15 admin-edge enable
-> spantree cist linkagg 4-10 admin-edge enable
-> spantree cist port 8/1/25 admin-edge disable
-> spantree cist port 2/1/2-5 admin-edge enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree vlan admin-edge	Configures the administrative edge port status for a port or a link aggregate of ports for a specific VLAN instance.
spantree cist auto-edge	Configures whether or not Spanning Tree automatically determines the operational edge status of a port or a link aggregate of ports for the flat mode CIST instance.
spantree vlan auto-edge	Configures whether or not Spanning Tree determines the operational edge port status for a port or a link aggregate of ports for the specified per-VLAN mode VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortAdminEdge
```

spantree vlan admin-edge

Configures the administrative edge port status for a port or a link aggregate of ports for a VLAN instance.

spantree vlan *vlan_id* **{port** *chassis/slot/port***[**-*port2***] | linkagg** *linkagg_id***[**-*linkagg_id2***]} admin-edge {enable | disable}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
*linkagg_id***[**-*linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs
enable	Enables the administrative edge port status for the specified port-VLAN instance.
disable	Disables the administrative edge port status for the specified port-VLAN instance.

Defaults

By default, the administrative edge port status is disabled (off).

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified edge port status for the port is not active for the VLAN instance until the switch is configured to run in the per-VLAN Spanning Tree mode.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on.) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point to point connection type.

Examples

```
-> spantree vlan 4 linkagg 15 admin-edge enable
-> spantree vlan 5 linkagg 12-14 admin-edge enable
-> spantree vlan 255 port 8/1/23 admin-edge disable
-> spantree vlan 3 port 2/1/2-5 admin-edge enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortAdminEdge
```

spantree cist auto-edge

Configures whether or not Spanning Tree automatically determines the operational edge port status of a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

spantree cist {port *chassis/slot/port***[-***port2***]** | **linkagg** *linkagg_id* **[-***linkagg_id2***]} auto-edge {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
*linkagg_id***[-***linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs.
enable	Spanning Tree automatically determines edge port status.
disable	Spanning Tree does not automatically determine edge port status.

Defaults

By default, automatic edge port status configuration is enabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only applies to the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the per-VLAN mode when this command is used, the specified edge port status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the connection type of the port is defined as point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on.) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point to point connection type.

Examples

```
-> spantree cist linkagg 15 auto-edge enable
-> spantree cist linkagg 10-12 auto-edge disable
```

```
-> spantree cist port 8/1/23 auto-edge disable
-> spantree cist port 2/1/2-5 auto-edge enable
```

   vStpInsPortNumber
   vStpInsPortAutoEdge
```

spantree vlan auto-edge

Configures whether or not Spanning Tree determines the operational edge port status for a port or a link aggregate of ports for the specified per-VLAN mode VLAN instance.

spantree vlan *vlan_id* **{port** *chassis/slot/port***[**-*port2***]** | **linkagg** *linkagg_id* **[**-*linkagg_id2***]} auto-edge {enable | disable}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
*linkagg_id***[**-*linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs.
enable	Spanning Tree automatically determines edge port status.
disable	Spanning Tree does not automatically determine edge port status.

Defaults

By default, automatic edge port status configuration is enabled (on).

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified edge port status for the port is not active for the VLAN instance until the switch is running in the per-VLAN Spanning Tree mode.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the connection type of the port is defined as point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on.) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevent the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point to point connection type.

Examples

```
-> spantree vlan 255 port 8/1/23 auto-edge disable
-> spantree vlan 4 port 2/1/2-10 auto-edge enable
-> spantree vlan 100 linkagg 10 auto-edge disable
-> spantree vlan 200 linkagg 1-5 auto-edge enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree cist auto-edge	Configures whether or not Spanning Tree automatically determines the operational edge status of a port or aggregate of ports for the flat mode CIST instance.
spantree cist admin-edge	Configures the administrative edge port status for a port or aggregate of ports for the CIST instance.
spantree vlan admin-edge	Configures the administrative edge port status for a port or aggregate of ports for a specific VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortAutoEdge
```

spantree cist restricted-role

Configures the restricted role status for a port or a link aggregate of ports. Enabling this parameter blocks the port from becoming the Root Port, even if it is the most likely candidate for root. Once a root port is selected, the restricted port is selected as an Alternate Port.

spantree cist {port *chassis/slot/port***[-***port2***] | linkagg** *linkagg_id***[-***linkagg_id2***]} restricted-role {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports,
*linkagg_id***[-***linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs
enable	Enables the restricted role status for the specified port.
disable	Disables the restricted role status for the specified port.

Defaults

By default, the restricted role status for the port is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When running in flat mode, this is a per-port setting and is applicable to any CIST or MSTI instances configured on that port.
- Enabling the restricted role status is used by network administrators to prevent bridges external to the core region of the network from influencing the Spanning Tree topology.
- Note that enabling the restricted role status for a port may impact connectivity within the network.

Examples

```
-> spantree cist linkagg 15-20 restricted-role enable
-> spantree cist port 8/1/23 restricted-role disable
-> spantree cist port 8/1/24-27 restricted-role disable
-> spantree cist linkagg 10 restricted-role disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree vlan restricted-role	Configures the restricted role status for a port or aggregate of ports for the per-VLAN mode VLAN instance.

MIB Objects

```
vStpInsPortTable
   vStpInsPortNumber
   vStpInsPortRestrictedRole
```

spantree vlan restricted-role

Configures the restricted role status for a port or a link aggregate of ports for the specified VLAN instance. Enabling this parameter blocks the port from becoming the Root Port, even if it is the most likely candidate for root. Once a Root Port is selected, the restricted port is selected as an Alternate Port.

spantree vlan *vlan_id* **{port** *chassis/slot/port***[**-*port2***]** | **linkagg** *linkagg_id***[**-*linkagg_id2***]} restricted-role {enable | disable}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
chassischassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports,
*linkagg_id***[**-*linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs
enable	Enables the restricted role status for the specified port-VLAN instance.
disable	Disables the restricted role status for the specified port-VLAN instance.

Defaults

By default, the restricted role status for the port is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enabling the restricted role status is used by network administrators to prevent bridges external to the core region of the network from influencing the Spanning Tree topology.
- Note that enabling the restricted role status for a port may impact connectivity within the network.
- This command only applies to the VLAN instance specified by the VLAN ID regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified restricted role status for the port is not active for the VLAN instance until the switch is running in the per-VLAN Spanning Tree mode.

Examples

```
-> spantree vlan 3 linkagg 15 restricted-role enable
-> spantree vlan 255 port 8/1/23 restricted-role enable
-> spantree vlan 255 port 8/1/24-27 restricted-role enable
-> spantree vlan 255 linkagg 11-15 restricted-role enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

```

spantree cist restricted-tcn

Configures the restricted TCN status for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST). When this parameter is enabled, the port does not propagate topology changes and notifications to/from other ports.

spantree cist {port *chassis/slot/port***[-***port2***] | linkagg** *linkagg_id***[-***linkagg_id2***]} restricted-tcn {enable | disable}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
*linkagg_id***[-***linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs.
enable	Enables the restricted TCN status for the specified port-CIST instance.
disable	Disables the restricted TCN status for the specified port-CIST instance.

Defaults

By default, the restricted TCN status for the port is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enabling the restricted TCN status is used by network administrators to prevent bridges external to the core region of the network from causing unnecessary MAC address flushing in that region.
- Note that enabling the restricted TCN status for a port may impact Spanning Tree connectivity.
- This command only applies to the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the per-VLAN mode when this command is used, the specified restricted TCN status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.

Examples

```
-> spantree cist linkagg 15 restricted-tcn enable
-> spantree cist port 8/1/23 restricted-tcn disable
-> spantree cist port 2/1/2-4 restricted-tcn enable
-> spantree cist linkagg 10-14 restricted-tcn disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree vlan restricted-tcn	Configures the restricted TCN status for a port or aggregate of ports for the specified per-VLAN mode VLAN instance.

```

spantree vlan restricted-tcn

Configures the restricted TCN status for a port or a link aggregate of ports for the specified VLAN instance. When this parameter is enabled, the port does not propagate topology changes and notifications to/from other ports.

spantree vlan *vlan_id* **{port** *chassis/slot/port* **[**-*port2***]** | **linkagg** *linkagg_id* **[**-*linkagg_id2***]} restricted-tcn {enable | disable}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot number and port number of the physical port. Use a hyphen to specify a range of ports.
*linkagg_id***[**-*linkagg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs.
enable	Enables the restricted TCN status for the specified port-VLAN instance.
disable	Disables the restricted TCN status for the specified port-VLAN instance.

Defaults

By default, the restricted TCN is set to disable.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enabling the restricted TCN status is used by network administrators to prevent bridges external to the core region of the network from causing unnecessary MAC address flushing in that region.
- Note that enabling the restricted TCN status for a port may impact Spanning Tree connectivity.
- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified restricted TCN status for the port is not active for the VLAN instance until the switch is running in the per-VLAN Spanning Tree mode.

Examples

```
-> spantree vlan 2 linkagg 15 restricted-tcn enable
-> spantree vlan 2 linkagg 16-20 restricted-tcn enable
-> spantree vlan 255 port 8/1/23 restricted-tcn disable
-> spantree vlan 255 port 8/1/24-27 restricted-tcn disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

spantree cist txholdcount

This command is used to rate limit the transmission of BPDU through a given port for the flat mode Common and Internal Spanning Tree (CIST) instance.

spantree cist txholdcount *value*

Syntax Definitions

value	A numeric value that controls the transmission of BPDU through the port. The valid range is 1–10.

Defaults

By default, the **txholdcount** value is set to 3.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only applies to the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the per-VLAN mode when this command is used, the specified **txholdcount** status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.

Examples

```
-> spantree cist txholdcount 5
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree vlan txholdcount	Configures the BPDU transmission rate limit for the specified VLAN instance.

MIB Objects

```

```

spantree vlan txholdcount

This command is used to rate limit the transmission of BPDU through a given port for the VLAN instance.

spantree vlan *vlan_id* **txholdcount {***value***}**

Syntax Definitions

vlan_id	An existing VLAN ID number.
value	A numeric value that controls the transmission of BPDU through the port. The valid range is 1–10.

Defaults

By default, the **txholdcount** value is set to 3.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified **txholdcount** status for the port is not active for the VLAN instance until the switch is running in the per-VLAN Spanning Tree mode.

Examples

```
-> spantree vlan 3 txholdcount 6
```

Release History

Release 8.1.1; command introduced.

Related Commands

spantree mode	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
spantree cist txholdcount	Configures the BPDU transmission rate limit for the CIST instance.

MIB Objects

```

```

show spantree

Displays Spanning Tree bridge information for the flat mode Common and Internal Spanning Tree (CIST) instance or the per-VLAN mode VLAN instances.

show spantree

Syntax Definitions

NA

Defaults

NA

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the switch is operating in the per-VLAN mode, this command displays a list of VLAN instances.
- If the switch is operating in the flat mode and the protocol is STP or RSTP, this command displays the single flat mode instance.
- If the switch is operating in the flat mode and the protocol is set to MSTP, this command displays a list of MSTIs, including MSTI 0 (also known as the CIST).

Examples

```
-> spantree mode flat
-> spantree protocol rstp
-> show spantree

Spanning Tree Path Cost Mode :  32 BIT
Bridge STP Status Protocol Priority(Prio:SysID)
------+----------+--------+--------------------
    1      ON      RSTP   32768 (0x8000:0x0000)
```

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (**32 BIT** or **AUTO**) Configured through the **spantree path-cost-mode** command.
Bridge	The CIST instance, referred to as bridge 1 when either STP (802.1D) or RSTP (802.1W) is the active protocol.
STP Status	The Spanning Tree state for the CIST instance (**ON** or **OFF**).
Protocol	The Spanning Tree protocol applied to the instance (**STP** or **RSTP**). Configured through the **spantree protocol** command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the **spantree priority** command.

```
-> spantree mode flat
-> spantree protocol mstp

-> show spantree
  Spanning Tree Path Cost Mode : AUTO
 Msti STP Status Protocol Priority (Prio:SysID)
-----+----------+--------+--------------------
    0      ON      MSTP   32768 (0x8000:0x0000)
    2      ON      MSTP   32770 (0x8000:0x0002)
    3      ON      MSTP   32771 (0x8000:0x0003)
```

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (**32 BIT** or **AUTO**) Configured through the **spantree path-cost-mode** command.
Msti	The Multiple Spanning Tree Instance (MSTI) instance number. Configured through the **spantree msti** command. Note that MSTI 0 also represents the CIST instance that is always present on the switch.
STP Status	The Spanning Tree state for the MSTI (**ON** or **OFF**).
Protocol	The Spanning Tree protocol applied to this instance. Configured through the **spantree protocol** command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the **spantree priority** command.

```
-> spantree mode per-vlan
-> show spantree

  Spanning Tree Path Cost Mode : AUTO
  Spanning Tree PVST+ Mode     :  Enable
 Vlan STP Status Protocol Priority
-----+----------+--------+--------------
    1      ON        STP   32768 (0x8000)
    2      ON        STP   32768 (0x8000)
    3      ON        STP   32768 (0x8000)
    4      ON        STP   32768 (0x8000)
    5      ON        STP   32768 (0x8000)
    6      ON        STP   32768 (0x8000)
    7      ON        STP   32768 (0x8000)
```

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (**32 BIT** or **AUTO**) Configured through the **spantree path-cost-mode** command.
Spanning Tree PVST+ Mode	Indicates whether the PVST + status is enabled or disabled. Configured through the **spantree pvst+compatibility** command.
Vlan	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the **vlan** commands
STP Status	The Spanning Tree state for the instance (**ON** or **OFF**). Configured through the **spantree vlan admin-state** command.

output definitions (continued)

Protocol	The Spanning Tree protocol applied to this instance (**STP** or **RSTP**). Configured through the **spantree protocol** command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the **spantree priority** command.

Release History

Release 8.1.1; command introduced.

Related Commands

show spantree cist	Displays the Spanning Tree bridge configuration for the CIST instance regardless of which mode (per-VLAN or flat) is active on the switch.
show spantree msti	Displays the Spanning Tree bridge configuration for an MSTI regardless of which mode (per-VLAN or flat) is active on the switch.
show spantree vlan	Displays the Spanning Tree bridge configuration for a VLAN instance regardless of which mode (per-VLAN or flat) is active on the switch.

show spantree cist

Displays the Spanning Tree bridge configuration for the flat mode Common and Internal Spanning Tree (CIST) instance.

show spantree cist

Syntax Definitions

NA

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guideline

This command displays Spanning Tree bridge information for the flat mode CIST instance regardless of which mode (per-VLAN or flat) is active on the switch. Note that minimal information is displayed when this command is used in the per-VLAN mode, as the CIST is not active in this mode. See second example below.

Examples

```
-> spantree mode flat
-> show spantree cist
Spanning Tree Parameters for Cist

  System Max Age (seconds)       =     10,
  System Forward Delay (seconds) =     10,
  System Hello Time (seconds)    =      5
```

output definitions

Spanning Tree Status	The Spanning Tree state for the instance (**ON** or **OFF**).
Protocol	The Spanning Tree protocol applied to the CIST (**STP, RSTP,** or **MSTP**). Configured through the **spantree protocol** command.
Mode	The Spanning Tree operating mode for the switch (**per-vlan** or **flat**). Configured through the **spantree mode** command.
Auto-Vlan-Containment	The auto VLAN containment status for the instance (**Enabled** or **Disabled**). AVC prevents a port that has no VLANs mapped to a Multiple Spanning Tree Instance (MSTI) from becoming the root port for that instance. Configured through the **spantree auto-vlan-containment** command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the **spantree priority** command.
Bridge ID	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
CST Designated Root	The bridge identifier for the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Cost to CST Root	The cost of the path to the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Next CST Best Cost	The cost of the next best root port for the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Designated Root	The bridge identifier for the root of the Spanning Tree for this instance.
Cost to Root Bridge	The cost of the path to the root for this Spanning Tree instance.
Root Port	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
Next Best Root Cost	The cost of the next best root port for this Spanning Tree instance.
Next Best Root Port	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.
Tx Hold Count	The count to limit the transmission of BPDU through the port.

output definitions (continued)

Topology Changes	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
Topology age	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance (**hh:mm:ss** or **dd days and hh:mm:ss**).
Max Age	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. Configured through the **spantree max-age** command.
Forward Delay	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. Configured through the **spantree forward-delay** command.
Hello Time	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. Configured through the **spantree hello-time** command.
System Max Age	The Max Age value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.

Release History

Release 8.1.1; command introduced.

Related Commands

show spantree	Displays the Spanning Tree bridge configuration for the flat mode CIST instance or a per-VLAN mode VLAN instance, depending on which mode is active for the switch.
show spantree msti	Displays the Spanning Tree bridge configuration for an MSTI regardless of which mode (per-VLAN or flat) is active on the switch.
show spantree vlan	Displays the Spanning Tree bridge configuration for a VLAN instance regardless of which mode (per-VLAN or flat) is active on the switch.

show spantree msti

Displays Spanning Tree bridge information for a Multiple Spanning Tree Instance (MSTI).

show spantree msti [*msti_id***]**

Syntax Definitions

msti_id	An existing MSTI ID number.

Defaults

By default, displays information for all MSTIs.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If an *msti_id* number is *not* specified, this command displays the Spanning Tree status, protocol, and priority values for all MSTIs.
- This command displays Spanning Tree bridge information for an MSTI regardless of which mode (per-VLAN or flat) is active for the switch.
- Note that minimal information is displayed when this command is used in the per-VLAN mode, as MSTIs are not active in this mode. In addition, this command fails if MSTP is not the selected flat mode protocol.
- Note that MSTI 0 also represents the CIST instance that is always present on the switch. To view the CIST instance using this command, specify zero (0) for the *msti_id* number.

Examples

```
-> spantree mode flat
-> spantree protocol mstp
-> show spantree msti

  Spanning Tree Path Cost Mode : AUTO

  Priority             :    32770 (0x8002),
  TxHoldCount          :                  5,
  System Max Age (seconds)       =      20,
  System Forward Delay (seconds) =      15,
  System Hello Time (seconds)    =       2
```

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (**32 BIT** or **AUTO**) Configured through the **spantree path-cost-mode** command.
Msti	The Multiple Spanning Tree Instance (MSTI) number. MSTI 0 represents the CIST. Configured through the **spantree msti** command.
STP Status	The Spanning Tree state for the instance (**ON** or **OFF**).
Protocol	The Spanning Tree protocol applied to the instance (**STP, RSTP,** or **MSTP**). This value is not configurable for an MSTI. Configured through the **spantree protocol** command.
Mode	The Spanning Tree operating mode for the switch (**per-vlan** or **flat**). Configured through the **spantree mode** command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the **spantree priority** command.
Bridge ID	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
CST Designated Root	The bridge identifier for the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Cost to CST Root	The cost of the path to the root for the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Next CST Best Cost	The cost of the next best root port for the flat mode CIST instance. This field only appears when MSTP is active on the switch.
Designated Root	The bridge identifier for the root of the Spanning Tree for this instance.
Cost to Root Bridge	The cost of the path to the root for this Spanning Tree instance.
Root Port	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.

output definitions (continued)

Next Best Root Cost	The cost of the next best root port for this Spanning Tree instance.
Next Best Root Port	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.
TxHoldCount	The count to limit the transmission of BPDU through the port.
Topology Changes	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
Topology age	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance (**hh:mm:ss** or **dd days and hh:mm:ss**).
Max Age	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. MSTIs inherit this value from the CIST instance.
Forward Delay	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. MSTIs inherit this value from the CIST instance.
Hello Time	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. MSTIs inherit this value from the CIST instance.
System Max Age	The Max Age value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.

Release History

Release 8.1.1; command introduced.

Related Commands

show spantree	Displays the Spanning Tree bridge configuration for the flat mode CIST instance or a per-VLAN mode VLAN instance, depending on which mode is active for the switch.
show spantree cist	Displays the Spanning Tree bridge configuration for the CIST instance regardless of which mode (per-VLAN or flat) is active on the switch.
show spantree vlan	Displays the Spanning Tree bridge configuration for a VLAN instance regardless of which mode (per-VLAN or flat) is active on the switch.

show spantree vlan

Displays Spanning Tree bridge information for a per-VLAN mode VLAN instance.

show spantree vlan [*vlan_id***]**

Syntax Definitions

vlan_id	An existing VLAN ID number.

Defaults

By default, displays information for all VLAN instances.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If a *vlan_id* number is *not* specified, this command displays the Spanning Tree status, protocol, and priority values for all VLAN instances.
- Specify a *vlan_id* number with this command to display Spanning Tree bridge information for a specific VLAN instance.
- This command displays Spanning Tree bridge information for a VLAN instance regardless of which mode (per-VLAN or flat) is active on the switch. Note that minimal information is displayed when this command is used in the flat mode, as VLAN instances are not active in this mode.

Examples

```
-> spantree mode per-vlan
-> show spantree vlan
  Spanning Tree Path Cost Mode : AUTO
 Vlan STP Status Protocol Priority
-----+----------+--------+--------------
    1      ON        STP   32768 (0x8000)
    2      ON        STP   32768 (0x8000)
    3      ON        STP   32768 (0x8000)
    4      ON        STP   32768 (0x8000)
    5      ON        STP   32768 (0x8000)

```

output definitions

Spanning Tree Path Cost Mode	The Spanning Tree path cost mode for the switch (**32 BIT** or **AUTO**) Configured through the **spantree path-cost-mode** command.
Vlan	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the **vlan** commands
STP Status	The Spanning Tree state for the instance (**ON** or **OFF**).
Protocol	The Spanning Tree protocol applied to the VLAN instance (**STP** or **RSTP**). Note that MSTP is not supported for a VLAN instance. Configured through the **spantree protocol** command.
Mode	The Spanning Tree operating mode for the switch (**per-vlan** or **flat**). Configured through the **spantree mode** command.
Priority	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the **spantree priority** command.
Bridge ID	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
Designated Root	The bridge identifier for the root of the Spanning Tree for this instance.
Cost to Root Bridge	The cost of the path to the root for this Spanning Tree instance.
Root Port	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
Next Best Root Cost	The cost of the next best root port for this Spanning Tree instance.
Next Best Root Port	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.

output definitions (continued)

Tx Hold Count	The count to limit the transmission of BPDU through the port.
Topology Changes	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
Topology age	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance (**hh:mm:ss** or **dd days and hh:mm:ss**).
Max Age	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. Configured through the **spantree max-age** command.
Forward Delay	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. Configured through the **spantree forward-delay** command.
Hello Time	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. Configured through the **spantree hello-time** command.
System Max Age	The Max Age value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.
System Forward Delay	The Forward Delay value for the root bridge.

Release History

Release 8.1.1; command introduced.

show spantree ports

Displays Spanning Tree port information.

show spantree ports [forwarding | blocking | active | configured]

Syntax Definitions

forwarding	Displays Spanning Tree operational port parameters for ports that are forwarding for the specified instance.
blocking	Displays Spanning Tree operational port parameters for ports that are blocked for the specified instance.
active	Displays a list of active ports associated with the specified instance.
configured	Displays Spanning Tree administrative port parameters for all ports associated with the specified instance.

Defaults

parameter	default
forwarding | blocking | active | configured	all ports

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the switch is operating in the per-VLAN mode, this command displays port information for the VLAN instances.
- If the switch is operating in the flat mode and the protocol is STP or RSTP, this command displays port information for the single flat mode instance.
- If the switch is operating in the flat mode and the protocol is set to MSTP, this command displays port information for the MSTIs, including MSTI 0 (also known as the CIST).

Examples

```
-> spantree mode flat
-> spantree protocol rstp
-> show spantree ports

```

output definitions

Bridge, Msti, or Vlan	The CIST instance, referred to as bridge 1 when either STP (802.1D) or RSTP (802.1W) is the active protocol in the flat mode. The MSTI number when MSTP is the active protocol in the flat mode. The VLAN ID number when STP or RSTP is the active protocol in the per-VLAN mode.
Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Oper Status	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, learning, and forwarding.

output definitions (continued)

Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the **spantree msti path-cost** or **spantree vlan path-cost**command.
Role	The role of the port for this Spanning Tree instance. Possible port roles are: **root, designated, alternate**, and **backup**.
loop-guard	Displays if the loop-guard is enabled (ENA) or disabled (DIS) on the port.
Note	Displays a note if the port has entered the error violation state (ERR). Then the port role of the port instance in that row becomes insignificant.

Release History

Release 8.1.1; command introduced.
Release 8.2.1; **loop-guard** and **Note** output fields added.

Related Commands

show spantree cist ports	Displays Spanning Tree port information for the flat mode CIST instance when the switch is operating in the per-VLAN or flat Spanning Tree mode.

show spantree cist ports

Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance.

show spantree cist ports [forwarding | blocking | active | configured]

Syntax Definitions

forwarding	Displays Spanning Tree operational port parameters for ports that are forwarding for the CIST instance.
blocking	Displays Spanning Tree operational port parameters for ports that are blocked for the CIST instance.
active	Displays a list of active ports associated with the specified instance.
configured	Displays Spanning Tree administrative port parameters for the CIST instance.

Defaults

parameter	default
forwarding | blocking | active | configured	all ports

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command displays Spanning Tree port information for the flat mode CIST instance regardless of which mode (per-VLAN or flat) is active for the switch.
- Note that minimal information is displayed when this command is used in the per-VLAN mode, as the CIST is not active in this mode.

Examples

```
-> show spantree cist ports

output definitions

Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Oper St	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, listening, learning, and forwarding.
Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the **spantree vlan path-cost** command.
Desig Cost	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
Role	The role of the port for this Spanning Tree instance. Possible port roles are: **root, designated, alternate**, and **backup**.
Prim. Port	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
Op Cnx	Operational connection type: **PTP, NPT**, or **NS** (nonsignificant). Shows the current operational state of the port connection type. See the **spantree vlan connection** command for more information.
Op Edg	Operational connection type: **EDG.** Shows the current operational state of the port connection type. See the **spantree vlan connection** command for more information.
Loop Guard	Displays if the loop-guard is enabled (ENA) or disabled (DIS) on the port.
Desig Bridge ID	The bridge identifier for the designated bridge for this port segment.
Note	Displays the error violation state in case of violation.

output definitions

Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Port Pri	The Spanning Tree priority for the port. The lower the number, the higher the priority.
Adm St	The Spanning Tree administrative status of the port: **enabled** or **disabled**.
Man. Mode	The manual mode setting for the port: **yes** indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; **no** indicates that the Spanning Tree Algorithm is managing the port state. Configured through the **spantree vlan path-cost** command.
Config Cost	The configured path cost value for this port. Configured through the **spantree vlan path-cost** command.
Adm Cnx	The administrative connection type: **PTP, NPT,** or **AUT.** Configured through the **spantree vlan connection** command.
Adm Edg	The edge port administrative status: **yes** indicates that the port is an admin edge port; **no** indicates that the port is not an admin edge port**.** Configured through the **spantree vlan connection** command.
Aut Edg	The edge port automatic status: **yes** indicates that the port is an automatic edge port; **no** indicates that the port is not an automatic edge port. Configured through the **spantree cist auto-edge** or **spantree vlan auto-edge** command.
Rstr Tcn	The restricted TCN capability: **yes** indicates that the port supports the restricted TCN capability; **no** indicates that the port does not support the restricted TCN capability. Configured through the **spantree cist restricted-tcn** or **spantree vlan restricted-tcn** command.
Rstr Role	The restricted role port status: **yes** indicates that the port is a restricted role port; **no** indicates that the port is not a restricted role port. Configured through the **spantree cist restricted-role** or **spantree vlan restricted-role** command.

Release History

Release 8.1.1; command introduced.
Release 8.2.1; **Loop Guard** and **Note** output field added.

Related Commands

show spantree ports	Implicit command for displaying Spanning Tree port information for the flat mode CIST instance or a per-VLAN mode VLAN instance.
show spantree msti ports	Displays Spanning Tree port information for an MSTI when the switch is operating in the per-VLAN or flat Spanning Tree mode.

show spantree msti ports

Displays Spanning Tree port information for a flat mode Multiple Spanning Tree Instance (MSTI).

show spantree msti [*msti_id***] ports [forwarding | blocking | active | configured]**

Syntax Definitions

msti_id	An existing MSTI ID number.
forwarding	Displays Spanning Tree operational port parameters for ports that are forwarding for the CIST instance.
blocking	Displays Spanning Tree operational port parameters for ports that are blocked for the CIST instance.
active	Displays a list of active ports associated with the specified instance.
configured	Displays Spanning Tree administrative port parameters for the CIST instance.

Defaults

parameter	default
msti_id	all MSTIs
forwarding | blocking | active | configured	all ports

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If an *msti_id* number is *not* specified, this command displays the Spanning Tree port operational status, path cost, and role values for all associated MSTIs.
- This command displays Spanning Tree port information for an MSTI regardless of which mode (per-VLAN or flat) is active on the switch.
- Note that minimal information is displayed when this command is used in the per-VLAN mode, as MSTIs are not active in this mode. In addition, if MSTP is not the selected flat mode protocol, this command fails.
- The **configured** keyword is only available when an instance number is specified with this command. In addition, this keyword cannot be used in combination with either the **forwarding** or **blocking** keywords.
- Note that MSTI 0 also represents the CIST instance that is always present on the switch. To view the CIST instance using this command, specify zero (0) for the *msti_id* number.

Examples

```
-> show spantree msti ports

output definitions

Msti	The Multiple Spanning Tree Instance (MSTI) number. MSTI 0 represents the CIST. Configured through the **spantree msti** command.
Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
Oper St	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, listening, learning, and forwarding.
Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the **spantree msti path-cost** command.
Desig Cost	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.

output definitions (continued)

RSTR Role/ Root Guard	The role of the port for this Spanning Tree instance. Possible port roles are: **root, designated, alternate, master**, and **backup**.
Prim. Port	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
Op Cnx	Operational connection type: **PTP, NPT**, or **NS** (nonsignificant). Shows the current operational state of the port connection type. See the **spantree vlan connection** command for more information.
Op Edg	Operational connection type: **EDG.** Shows the current operational state of the port connection type. See the **spantree vlan connection** command for more information.
Loop Guard	Displays if the loop-guard is enabled (ENA) or disabled (DIS) on the port.
Desig Bridge ID	The bridge identifier for the designated bridge for this port segment.
Note	Displays the error violation state in case of violation.
PVST+ Cfg	Indicates the current PVST+ port configuration (auto, enable or disable).
PVST+ Stat	Indicates the current status of the PVST+ mode (On or Off).

show spantree vlan ports

Displays Spanning Tree port information for a VLAN instance.

show spantree vlan [*vlan_id***[-***vlan_id2***]] ports [forwarding | blocking | active | configured]**

Syntax Definitions

*vlan_id***[-***vlan_id2***]**	An existing VLAN ID number. Use a hyphen to specify a range of VLAN IDs (10-15)
forwarding	Displays Spanning Tree operational port parameters for ports that are forwarding for the CIST instance.
blocking	Displays Spanning Tree operational port parameters for ports that are blocked for the CIST instance.
active	Displays a list of active ports associated with the specified instance.
configured	Displays Spanning Tree administrative port parameters for the CIST instance.

Defaults

parameter	default
vlan_id	all VLAN instances
forwarding | blocking | active | configured	all ports

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If a *vlan_id* number is *not* specified, this command displays the Spanning Tree port operational status, path cost, and role values for all VLAN instances.
- Specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (e.g., **show spantree vlan 10-15 ports**). Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs— is allowed with this command. Multiple entries are not accepted.
- This command displays Spanning Tree port information for a VLAN instance regardless of which mode (per-VLAN or flat) is active for the switch.
- Note that minimal information is displayed when this command is used in the flat mode, as VLAN instances are not active in this mode.
- The **configured** keyword is only available when a VLAN ID is specified with this command. In addition, this keyword cannot be used in combination with either the **forwarding** or **blocking** keywords.

Examples

```
-> show spantree vlan ports

output definitions

Vlan	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the **vlan** commands
Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (e.g., 0/31).
Oper St	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, listening, learning, and forwarding.
Path Cost	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the **spantree vlan path-cost** command.
Desig Cost	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
Role	The role of the port for this Spanning Tree instance. Possible port roles are: **root, designated, alternate, master**, and **backup**.
Prim. Port	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
Op Cnx	Operational connection type: **PTP, NPT**, or **NS** (nonsignificant). Shows the current operational state of the port's connection type. See the **spantree vlan connection** command for more information.
Op Edg	Operational connection type: **EDG.** Shows the current operational state of the port's connection type. See the **spantree vlan connection** command for more information.
Loop Guard	Displays if the loop-guard is enabled (ENA) or disabled (DIS) on the port.
Desig Bridge ID	The bridge identifier for the designated bridge for this port's segment.
Note	Displays the error violation state in case of violation.

output definitions

Port	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (e.g., 0/31).
Port Pri	The Spanning Tree priority for the port (0–15). The lower the number, the higher the priority. Configured through the **spantree priority** command.
Adm St	The Spanning Tree administrative status of the port: **enabled** or **disabled**. Configured through the **spantree vlan** command to enable or disable Spanning Tree on a port.

output definitions (continued)

Man. Mode	The manual mode setting for the port: **yes** indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; **no** indicates that the Spanning Tree Algorithm is managing the port state. Configured through the **spantree loop-guard** command.
Config Cost	The configured path cost value for this port. Configured through the **spantree vlan path-cost** command.
Adm Cnx	The administrative connection type: **PTP, NPT,** or **AUT**. Configured through the **spantree vlan path-cost** command.
Adm Edg	The edge port administrative status: **yes** indicates that the port is an admin edge port; **no** indicates that the port is not an admin edge port**.** Configured through the **spantree vlan connection** command.
Aut Edg	The edge port automatic status: **yes** indicates that the port is an automatic edge port; **no** indicates that the port is not an automatic edge port. Configured through the **spantree cist auto-edge** or **spantree vlan auto-edge** command.
Rstr Tcn	The restricted TCN capability: **yes** indicates that the port supports the restricted TCN capability; **no** indicates that the port does not support the restricted TCN capability. Configured through the **spantree cist restricted-tcn** or **spantree vlan restricted-tcn** command.
Rstr Role/Root Guard	The restricted status of the port: **Yes** indicates that the port is restricted from becoming the root; **No** indicates that the port is not restricted from becoming the root. Configured through the **spantree cist restricted-role** or **spantree vlan restricted-role** command.
PVST+ Cfg	The type of BPDU used on the port: **AUTO** indicates that IEEE BPDUs are used until a PVST+ BPDU is detected; **ENA** indicates that PVST+ BPDUs are used; **DIS** indicates that IEEE BPDUs are used. Configured through the **spantree pvst+compatibility** command.
PVST+ Stat	Indicates whether or not the PVST+ interoperability status is enabled (**ENA**) or disabled (**DIS**) for the port. Configured through the **spantree pvst+compatibility** command.

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **Loop Guard** and **Note** output fields added.

Related Commands

show spantree ports	Displays Spanning Tree port information for the flat mode CIST instance or a per-VLAN mode VLAN instance.
show spantree cist ports	Displays Spanning Tree port information for a CIST instance when the switch is operating in the per-VLAN or flat Spanning Tree mode.
show spantree msti ports	Displays Spanning Tree port information for an MSTI when the switch is operating in the per-VLAN or flat Spanning Tree mode.

show spantree mode

Displays the current global Spanning Tree mode parameter values for the switch.

show spantree mode

Syntax Definition

NA

Defaults

NA

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The global parameters for spanning tree can be activated or configured using the related commands.

Examples

```
-> show spantree mode

Spanning Tree Global Parameters
  Current Running Mode  : Per VLAN,
  Current Protocol      : N/A (Per VLAN),
  Path Cost Mode        : 32 BIT,
  Auto Vlan Containment : N/A
  Cisco PVST+ mode      : Disabled
Vlan Consistency check   : Disabled
```

output definitions

Current Running Mode	The spantree mode active on the switch. (**Flat** or **Per VLAN**)
Current Protocol	The spantree protocol active on the switch.
Path Cost Mode	The path cost mode value configured on the switch. (**AUTO** or **32 BIT**)
Auto Vlan Containment	The Auto VLAN containment mode configured on the switch (**Enabled** or **Disabled**).
Cisco PVST+ mode	The PVST+ mode configured on the switch (**Enabled** or **Disabled**).
Vlan Consistency check	Specifies if VLAN consistency check is **Enabled** or **Disabled** on the switch.

Related Commands

spantree mode	Assigns a flat Spanning Tree or per-VLAN Spanning Tree operating mode for the switch.
spantree protocol	Configures the Spanning Tree protocol for the flat mode Common and Internal Spanning Tree (CIST) instance or for an individual VLAN instance if the switch is running in the per-VLAN mode.
spantree path-cost-mode	Configures the automatic selection of a 16-bit path cost for STP/RSTP ports and a 32-bit path cost for MSTP ports or sets all path costs to use a 32-bit value.
spantree pvst+compatibility	Enables or disables PVST+ mode on the switch, port or link aggregate enabling them to operate with Cisco switches.
spantree auto-vlan-containment	Enables or disables Auto VLAN Containment (AVC).

show spantree mst

Displays the Multiple Spanning Tree (MST) information for a MST region or the specified port or link aggregate on the switch.

show spantree mst {region | port *chassis/slot/port* | **linkagg** *linkagg_id***}**

Syntax Definitions

chassis	The chassis identifier.
slot/port	Specifies the slot number for the module and the physical port number on that module.
linkagg_id	Link aggregate ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Three MST region attributes (configuration name, revision level, and configuration digest) define an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same values for these attributes are all considered part of the same region. Currently each switch can belong to one MST region at a time.
- This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.
- Specify the port number or link aggregate ID along with the **port** or **linkagg** keyword to get information related to the specified port or link aggregate.

Examples

```
-> show spantree mst region

Configuration Name   = Region 1
Revision Level       = 0
Configuration Digest = 0xac36177f 50283cd4 b83821d8 ab26de62
Revision Max hops    = 20
Cist Instance Number = 0
```

output definitions

Configuration Name	An alphanumeric string that identifies the name of the MST region. Use the **spantree mst region name** command to define this value.
Revision Level	A numeric value that identifies the MST region revision level for the switch.

output definitions (continued)

Configuration Digest	An MST region identifier consisting of a 16 octet hex value (as per the IEEE 802.1Q 2005 standard) that represents all defined MSTIs and their associated VLAN ranges. Use the **spantree msti** and **spantree msti vlan** commands to define VLAN to MSTI associations.
Revision Max hops	The number of maximum hops authorized for region information. Configured through the **spantree mst region max-hops** command.
Cist Instance Number	The number of the CIST instance, which is currently zero as there is only one region per switch. Therefore, only one CIST exists per switch Note that this instance is also known as the flat mode instance and is known as bridge 1 when using STP or RSTP.

```
-> show spantree mst port 1/1/2

```

show spantree msti vlan-map

Displays the range of VLANs associated with the specified Multiple Spanning Tree Instance (MSTI).

show spantree msti [*msti_id***] vlan-map**

Syntax Definitions

msti_id	An existing MSTI ID number.

Defaults

By default, the VLAN to MSTI mapping is displayed for all MSTIs.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If an *msti_id* is not specified, then the VLAN to MSTI mapping for all defined MSTIs is displayed.
- This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.
- Initially all VLANs are associated with the flat mode CIST instance.

Examples

```
-> show spantree msti vlan-map

 Cist
 Name                :
 VLAN list           : 1-9,14-4094

 Msti 1
 Name                :
 VLAN list           : 10-11

 Msti 2
 Name                :
 VLAN list           : 12-13

-> show spantree msti 2 vlan-map

 Msti 2
 Name                : MS1,
 VLAN list           : 12-13
```

output definitions

Cist Instance	Identifies MSTI VLAN mapping information for the CIST instance.
Msti	The MSTI ID number that identifies an association between a Spanning Tree instance and a range of VLANs.
Name	An alphanumeric value that identifies an MSTI name. Use the **spantree msti** command to define an MSTI name.
VLAN list	The range of VLAN IDs that are associated with this MSTI.

Release History

Release 8.1.1; command introduced.

Related Commands

show spantree mst	Displays the MST region information for the switch.
show spantree cist vlan-map	Displays the range of VLANs associated to the CIST instance.
show spantree map-msti	Displays the MSTI that is associated to the specified VLAN

MIB Objects

```

   vStpMstInstanceName
   vStpMstInstanceVlanBitmapState
```

show spantree cist vlan-map

Displays the range of VLANs associated with the flat mode Common and Internal Spanning Tree (CIST) instance.

show spantree cist vlan-map

Syntax Definitions

NA

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.

Examples

```
-> show spantree cist vlan-map

 Cist
 Name           : CIST1,
 VLAN list      : 1-9,14-4094
```

output definitions

Name	An alphanumeric value that identifies the name of the CIST. Use the **spantree msti** command to define a name for this instance.
VLAN list	The range of VLAN IDs that are associated with the CIST instance.

Release History

Release 8.1.1; command introduced.

Related Commands

show spantree mst	Displays the MST region information for the switch.
show spantree msti vlan-map	Displays the range of VLANs associated to the specified MSTI.
show spantree map-msti	Displays the MSTI that is associated to the specified VLAN

MIB Objects

```
vStpMstInstanceTable

8 Shortest Path Bridging Commands

The Alcatel-Lucent OmniSwitch supports Shortest Path Bridging MAC (SPBM), as defined in the IEEE 802.1aq standard. SPB-M uses the Provider Backbone Bridge (PBB) network model to encapsulate (using IEEE 802.1ah headers) and tunnel customer traffic through the network backbone. The shortest path trees (SPTs) upon which the PBB network infrastructure operates are determined using a version of the Intermediate System-to-Intermediate System (IS-IS) link state protocol that supports TLV extensions for SPB (ISIS-SPB).

The SPBM network topology consists of two layers: the backbone infrastructure (control plane) layer and the services (data plane) layer. ISIS-SPB builds the backbone layer by defining loop-free, SPTs through the backbone network. The service layer is based on the PBB framework as defined in the IEEE 802.1ah standard. SPBM supports the 802.1ah MAC-in-MAC method for data encapsulation. SPBM services transport the encapsulated traffic over the ISIS-SPB infrastructure.

This chapter documents the Command Line Interface (CLI) commands used to configure and verify the ISIS-SPB backbone. For commands used to configure and verify the SPBM services layer, see Chapter 47, "Service Manager Commands."

MIB information for the SPB commands is as follows:

Filename: ALCATEL-IND1-ISIS-SPB-MIB
Module: alcatelIND1IsisSpbMib

Filename: ALCATEL-IND1-VLAN-MGR-MIB
Module: alcatelIND1VLANMgrMIB

A summary of the available commands is listed here:

Global SPB Commands	**spb isis admin-state** **spb isis area-address** **spb isis bridge-priority** **spb isis source-id** **spb isis control-address** **spb isis spf-wait** **spb isis lsp-wait**
SPB Backbone VLAN (BVLAN) Commands	**spb bvlan** **spb isis bvlan ect-id** **spb isis control-bvlan** **spb isis bvlan tandem-multicast-mode**
SPB Interface Commands	**spb isis interface**

SPB IP VPN Commands	**spb ipvpn bind** **spb ipvpn redist** **show spb ipvpn bind** **show spb ipvpn redist** **show spb ipvpn route-table**
SPB Graceful Restart Commands	**spb isis graceful-restart** **spb isis graceful-restart helper**
SPB Show Commands	**show spb isis info** **show spb isis bvlans** **show spb isis interface** **show spb isis adjacency** **show spb isis database** **show spb isis nodes** **show spb isis unicast-table** **show spb isis services** **show spb isis spf** **show spb isis multicast-table** **show spb isis multicast-sources** **show spb isis multicast-sources-spf** **show spb isis ingress-mac-filter**

spb bvlan

Configures an SPB backbone VLAN (BVLAN).

spb bvlan {*bvlan_id***[-***bvlan_id2***]} [admin-state {enable | disable}] [name** *description***]**

no spb bvlan *bvlan_id*

Syntax Definitions

*bvlan_id***[-***bvlan_id2***]**	A numeric value that uniquely identifies an individual BVLAN. The valid ID range is 1–4094. Use a hyphen to specify a range of BVLAN IDs (10-20).
enable	Enables the VLAN administrative status.
disable	Disable the VLAN administrative status.
description	An alphanumeric string. Optional name description for the VLAN ID.

Defaults

parameter	default
enable | disable	**enable**
description	**VLAN ID**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a BVLAN from the switch configuration. All BVLAN ports are detached before the BVLAN is removed.
- The description can be any alphanumeric string. Enclose the description in double quotes if it contains more than one word with a space in between.
- The BVLAN configuration must be the same on each SPB bridge to ensure proper ISIS-SPB neighbor discovery and shortest path calculations throughout the provider backbone bridge (PBB) network.
- BVLANs differ from standard VLANs as follows:
  - No Spanning Tree control—the Spanning Tree protocol is automatically disabled on each BVLAN, and all ports associated with each BVLAN will remain in a forwarding state. However, Spanning Tree can remain operational on other types of VLANs.
  - No source MAC address learning—normal hardware learning is disabled on BVLANs. Instead, the forwarding database (FDB) is populated by the ISIS-SPB protocol.
  - There is no flooding of unknown destination or multicast frames.
  - Ingress filtering based on the source MAC address—frames received on ports that do not have an incoming source MAC address pre-programmed by ISIS-SPB are discarded.
- All BVLANs are automatically associated with all ISIS-SPB interfaces. Adding or removing BVLANs from a specific SPB interface is not allowed.

- The maximum number of BVLANs supported is four.
- BVLANs and standard VLANs can co-exist on the same bridge ports.

Examples

```
-> spb bvlan 200 name BVLAN-200
-> spb bvlan 720 admin-state disable
-> spb bvlan 500 name BVLAN-500 admin-state enable
-> no spb bvlan 1020
```

Release History

Release 8.1.1; command introduced.

Related Commands

spb isis control-bvlan	Configures a control BVLAN
spb isis bvlan ect-id	Assigns an equal cost tree (ECT) algorithm ID to the specified BVLAN.
spb isis bvlan tandem-multicast-mode	Configures the tandem multicast mode for the specified SPB backbone VLAN (BVLAN).
spb isis interface	Configures ISIS-SPB network interfaces.
show spb isis bvlans	Displays the BVLAN configuration for the switch.

MIB Objects

```
vlanTable
   vlanNumber
   vlanDescription
   vlanAdmStatus
   vlanOperStatus
   vlanType
```

spb isis bvlan ect-id

Configures the equal cost tree (ECT) identifier for the specified SPB backbone VLAN (BVLAN). The ECT ID assigns a tie-breaking algorithm to the BVLAN that is used for shortest path tree (SPT) calculations.

spb isis bvlan *bvlan_id* **ect-id** *ect_id*

Syntax Definitions

bvlan_id	An existing BVLAN ID.
ect_id	An ECT algorithm ID. The valid range is 1–16.

Defaults

By default, the next available ECT ID number is automatically assigned to a BVLAN when the BVLAN is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to change the existing ECT ID number for the specified BVLAN on each SPB brdige, as necessary, to make sure the specified BVLAN uses the same ECT ID throughout the network.
- The BVLAN ID specified with this command must already exist in the switch configuration.

Examples

```
-> spb isis bvlan 200 ect-id 5
-> spb isis bvlan 720 ect-id 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

spb bvlan	Creates a SPB backbone VLAN (BVLAN).
show spb isis bvlans	Displays the SPB BVLAN configuration for the switch.

```

spb isis control-bvlan

Designates an existing BVLAN that will serve as the control BVLAN for the bridge. Only one BVLAN per bridge is designated as the control BVLAN, which is used to exchange ISIS-SPB control packets with neighboring SPB bridges on behalf of all the BVLANs configured for that bridge.

spb isis control-bvlan *bvlan_id*

Syntax Definitions

bvlan_id	An existing BVLAN ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The BVLAN ID specified with this command must already exist in the switch configuration.
- The control BVLAN ID is the VLAN tag that is applied to ISIS-SPB control frames.
- Configuring an existing BVLAN as the control BVLAN does not exclude that VLAN from carrying data traffic for the SPB domain. In other words, a single VLAN can serve as both a regular BVLAN and the control BVLAN at the same time.

Examples

```
-> spb isis control-bvlan 200
-> spb isis control-bvlan 720
```

Release History

Release 8.1.1; command introduced.

Related Commands

spb bvlan	Configures an SPB BVLAN.
show spb isis bvlans	Displays the BVLAN configuration for the bridge.

MIB Objects

```
alcatelIND1IsisSpbSys
   alcatelIND1IsisSpbSysControlBvlan
```

spb isis bvlan tandem-multicast-mode

Configures the tandem multicast mode for the specified SPB backbone VLAN (BVLAN). This mode is only applicable to associated SPB service instances that are configured to use the tandem replication mode for multicast traffic.

spb isis bvlan *bvlan_id* **tandem-multicast-mode {sgmode | gmode}**

Syntax Definitions

bvlan_id	An existing BVLAN ID.
sgmode	Specifies the source and group (S,G) mode for the BVLAN.
gmode	Specifies the any source and group (*,G)

Defaults

By default, BVLANs are configured to use the (S,G) mode.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The BVLAN ID specified with this command must already exist in the switch configuration.
- The (S,G) mode identifies a source-specific multicast distribution tree.
- The (*,G) mode identifies a shared multicast distribution tree.

Examples

```
-> spb isis bvlan 200 tandem-multicast-mode gmode
-> spb isis bvlan 720 tandem-multicast-mode sgmode
```

Release History

Release 8.1.1; command introduced.

Related Commands

spb bvlan	Creates a SPB backbone VLAN (BVLAN).
show spb isis bvlans	Displays the SPB BVLAN configuration for the switch.

```

spb isis bridge-priority

Configures the bridge priority value for the SPB bridge. This value is used to rank an SPB bridge in relation to other bridges.

spb isis bridge-priority *priority*

Syntax Definitions

priority	A bridge priority value. The valid range is 0–65535.

Defaults

By default, the bridge priority value for the switch is set to 32768.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The lower the bridge priority number assigned, the higher the priority that is associated with the bridge.
- The bridge priority value makes up the upper two bytes of the eight-byte SPB bridge ID. The lower six bytes of the Bridge ID contain the system ID, which is the dedicated bridge MAC address of the SPB bridge.
- Setting a different bridge priority value on different SPB bridges will override the system identifier significance during the shortest path tree (SPT) calculation.

Examples

```
-> spb isis bridge-priority 15
-> spb isis bridge-priority 32768
```

Release History

Release 8.1.1; command introduced.

Related Commands

show spb isis info	Displays the status and configuration information for the SPB bridge.

MIB Objects

```
alcatelIND1IsisSpbSys
   alcatelIND1IsisSpbSysBridgePriority
```

spb isis interface

Configures the specified port or link aggregate as an ISIS-SPB interface on which protocol data units (PDUs) are sent and received to detect neighbors and form adjacencies with other SPB bridges in the network.

spb isis interface {port *chassis_id/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} [admin-state {enable | disable} [hello-interval** *seconds***] [hello-multiplier** *count***] [metric** *metric***]**

no spb isis interface [port *chassis_id/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Administratively enables the SPB interface.
disable	Administratively disables the SPB interface.
seconds	The amount of time, in seconds, to wait between each transmission of a hello packet from this interface. The valid range is 1–20000.
count	An integer value that is multiplied by the hello interval time to determine the amount of time, in seconds, a receiving bridge holds onto the hello packets transmitted from this interface. The valid range is 2–100.
metric	An integer value that specifies the link cost to reach the destination BMAC. The valid range is 1–16777215.

Defaults

parameter	default
enable | disable	**enable**
seconds	**9**
count	**3**
metric	**10**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the ISIS-SPB interface.
- When configuring a link aggregate as an SPB interface, make sure the link aggregate ID number already exists in the switch configuration.

- All SPB interfaces are automatically assigned to all existing BVLANs. There is one ISIS-SPB instance per switch, and each BVLAN and SPB interface are associated with that instance.
- If the SPB interface metric value is set to a different value for each side of a link, the highest metric value is applied to the entire link.
- Administratively enabling ISIS-SPB on the switch triggers ISIS hello packet transmissions on all SPB interfaces.
- SPB interfaces are typically the Network Network Interface (NNI) ports that carry encapsulated customer data traffic through the Provider Backbone Bridging (PBB) network.
- Note that configuring a port or link aggregate as an SPB interface does not prevent configuration of other VLAN tagging on that port. In other words, the SPB interface can forward regular traffic for other VLAN types in addition to encapsulated SPBM traffic.

Examples

```
-> spb isis interface port 4/1/7
-> spb isis interface port 4/1/7 hello-interval 60
-> spb isis interface linkagg 3
-> spb isis interface linkagg 3 hello-multiplier 10
-> spb isis interface port 1/1/10 hello-interval 20 hello-multiplier 5 metric 2
-> no spb isis interface port 4/1/7
-> no spb isis interface linkagg 3
```

Release History

Release 8.1.1; command introduced.

```

spb ipvpn bind

Binds a virtual routing and forwarding (VRF) instance, a Shortest Path Bridging (SPB) service instance identifier (ISID), and an IP gateway together to enable the bidirectional exchange of routes between the VRF and SPB ISID via the Global Route Manager (GRM).

spb ipvpn bind vrf {*vrf_name* **| default} isid** *instance_id* **gateway** *ip_address* **{all-routes | import-route-map** *route_map_name***}**

no spb ipvpn bind vrf {*vrf_name* **| default} isid** *instance_id* **gateway** *ip_address*

Syntax Definitions

vrf_name | **default**	The name of an existing VRF instance for which routes are imported from the Global Routing Table (GRT) to ISIS-SPB. Enter **default** to specify the default VRF instance.
instance_id	An existing ISID that identifies a Shortest Path Bridging (SPB) service in a provider backbone bridge (PBB) network.
ip_address	The IPv4 address of an IP interface that is associated with the specified VRF instance.
all-routes	Imports or exports all routes for this bind entry.
route_map_name	The name of an existing route map to use for filtering VRF routes that are imported from the GRT to ISIS-SPB for this bind entry. There is no filtering from ISIS-SPB to the GRT.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the VRF-ISID bind entry. When the bind is deleted, all routes imported and exported for this binding are retracted.
- The specified VRF name, ISID, gateway IP address, and optional route map name must already exist in the local switch configuration.
- Only one ISID can be bound to a single VRF/IP gateway.
- The VRF-ISID binding is only active when the VRF exists, the ISID is configured on the local switch, and the gateway IP address is associated with an active IP interface that is associated with the VRF instance.
- An active "bind" entry causes ISIS-SPB to export learned routes from the SPB network to the GRM and triggers the GRM to send IP routes from the corresponding VRF to ISIS-SPB using the ISID and gateway IP address as the next hop.

- Routing over SPB requires a physical loopback port configuration in which a pair of loopback ports provide connectivity between VRFs and SPB service access points (SAPs). A VRF-ISID binding identifies the loopback port configuration that will do Layer 3 forwarding on the VRF side of the loopback and SPB bridging on the SAP side of the loopback.

Examples

```
-> spb ipvpn bind vrf1 isid 1000 gateway 10.1.1.1 all-routes
-> spb ipvpn bind vrf2 isid 2000 gateway 20.2.2.1 import-route-map rm_vrf2
-> no spb ipvpn bind vrf1 isid 1000 gateway 10.1.1.1
```

Release History

Release 7.3.2; command introduced.

Related Commands

spb ipvpn redist	Configures the redistribution of routes from a VRF to an ISID or from one ISID to another ISID.
show spb ipvpn bind	Displays VRF-to-ISID bindings that enable the import and export of routes between VRFs and ISIDs.

MIB Objects

   alcatelIND1SpbIPVPNBindGateway
   alcatelIND1SpbIPVPNBindImportRouteMap
   alcatelIND1SpbIPVPNBindRowStatus
```

spb ipvpn redist

Configures the redistribution of routes from a VRF to an ISID or from one ISID to another ISID.

spb ipvpn redist {source-vrf {*vrf_name* **| default} | source-isid** *instance_id***} destination-isid** *instance_id* **{all-routes | route-map** *route_map_name***}**

no spb ipvpn redist {source-vrf *vrf_name* **| source-isid** *instance_id***} destination-isid** *instance_id*

Syntax Definitions

vrf_name | **default**	The source VRF instance from which routes are redistributed. Enter **default** to specify the default VRF instance.
source-isid *instance_id*	The source ISID from which routes are redistributed.
destination-isid *instance_id*	The destination ISID to which routes from either the source VRF or source ISD are redistributed.
all-routes	Imports or exports all routes for this bind entry.
route_map_name	The name of an existing route map to use for filtering routes that are redistributed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the redistribution entry.
- The specified VRF name, ISID, and optional route map name must already exist in the local switch configuration.
- A redistribution entry is only active when the ISID belongs to an active bind entry. This applies to both ISIDs when redistributing between a source and destination ISID.
- An ISID cannot be bound and redistributed to the same VRF instance.

Examples

```
-> spb ipvpn redist source-isid 1000 destination-isid 2000 all-routes
-> spb ipvpn redist source-isid 2000 destination-isid 1000 all-routes
-> spb ipvpn redist source-vrf vrf1 destination-isid 3000 route-map rm_isid2000
-> no spb ipvpn redist source-vrf vrf1 destination-isid 3000
-> no spb ipvpn redist source-isid 2000 destination isid 1000
```

Release History

Release 7.3.2; command introduced.

Related Commands

show spb ipvpn bind

Displays VRF-to-ISID bindings that enable the import and export of routes between VRFs and ISIDs.

show spb ipvpn bind [vrf {*vrf_name* **| default}] [isid** *instance_id***]**

Syntax Definitions

vrf_name | **default**	The name of a VRF instance that is associated with an SPB IPVPN binding. Enter **default** to specify the default VRF instance.
instance_id	An ISID number that is associated with an SPB IPVPN binding.

Defaults

By default, all SPB IPVPN bindings are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **vrf** and **isid** parameters to display the configuration for specific bindings.

Examples

```
-> show spb ipvpn bind
Legend: * indicates bind entry is active
SPB IPVPN Bind Table:
       VRF              ISID            Gateway                 Route-Map
--------------------+------------+---------------------+----------------------
* ospf                  4001         1.1.1.2
* ospf1                 4003         2.2.2.2

Total Bind Entries: 2
```

output definitions

VRF	The name of the VRF instance associated with this binding.
ISID	The ISID number associated with this binding.
Gateway	The gateway IP address associated with this binding. This is the IP address specified for an IP interface that is associated with the VRF in this binding.
Route-Map	The name of an IP route map or **All Routes**.

Release History

Release 7.3.2; command introduced.

Related Commands

spb ipvpn bind	Binds a VRF instance, an ISID, and an IP gateway together to enable the bidirectional exchange of routes between the VRF and ISID via the GRM.

   alcatelIND1SpbIPVPNBindRowStatus
```

show spb ipvpn redist

Displays the SPB IPVPN redistribution configuration for the switch. This configuration controls the redistribution of IP VPN routes from ISID to ISID or from VRF to ISID.

show spb ipvpn redist [vrf | [isid]

Syntax Definitions

vrf	Displays the VRF redistribution table.
isid	Displays the ISID redistribution table.

Defaults

By default, both the VRF and ISID redistribution tables are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **isid** parameter to display the contents of the ISID redistribution table (ISID to ISID).
- Use the **vrf** parameter to display the contents of the VRF redistribution table (VRF to ISID).

Examples

```
-> show spb ipvpn redist
Legend: * indicates redist entry is active
SPB IPVPN Redist ISID Table:
  Source-ISID           Destination-ISID     Route-Map

Routes: 30
```

output definitions

ISID	The ISID number associated with this route.
Destination	Destination IP address. Also includes the mask prefix length notation after the address to indicate the subnet mask value. For example, **/24** indicates the destination IP address has a 24-bit mask (255.255.255.0).
Gateway	IP address of the gateway from which this route was learned.
Source Bridge (Name : BMAC)	The name and BMAC address of the SPB BEB switch that advertised the route.
Metric	The metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.

Release History

Release 7.3.2; command introduced.

Related Commands

show spb ipvpn redist	Displays the SPB IPVPN redistribution configuration for the switch.
show spb ipvpn bind	Displays the VRF-ISID binding configuration.

   alcatelIND1SpbIPVPNRouteNodeName
   alcatelIND1SpbIPVPNRouteMetric
```

spb isis admin-state

Enables or disables the administrative status of ISIS-SPB instance for the switch.

spb isis admin-state {enable | disable}

Syntax Definitions

enable	Administratively enables ISIS-SPB for the switch.
disable	Administratively disables ISIS-SPB for the switch.

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When the ISIS-SPB status is disabled, the configuration settings and related statistics of the protocol remain unaffected.

Examples

```
-> spb isis admin-state enable
-> spb isis admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show spb isis info	Displays status and configuration information for the SPB instance.

MIB Objects

```
alcatelIND1IsisSpbSys
   alcatelIND1IsisSpbSysAdminState
```

spb isis area-address

Configures the area address for the ISIS-SPB instance.

spb isis area-address *area_address*

Syntax Definitions

area_address	A 3-byte integer that specifies the ISIS-SPB area address to join.

Defaults

By default, the area address is set to 0.0.0. for ISIS-SPB.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The default setting of 0.0.0 is the area address typically used for ISIS-SPB.
- Changing the area address with this command is allowed, but make sure to configure each bridge that will participate in the ISIS-SPB instance with the same area address value.
- ISIS-SPB and ISIS-IP instances may co-exist on the same bridge.

Examples

```
-> spb isis area-address 1.1.1
-> spb isis area-address 0.0.0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show spb isis info	Displays status and configuration information for the SPB instance.

MIB Objects

```
alcatelIND1IsisSpbSys
   alcatelIND1IsisSpbSysAreaAddress
```

spb isis source-id

Configures the shortest path (SP) source identifier value for the SPB bridge. This value identifies the source of multicast frames and is relevant only in multicast tandem replication mode.

spb isis source- id {*source_id* **| auto}**

Syntax Definitions

source_id	A source identifier entered as *xx-xx-xx*, where *xx* is a hexidecimal value.
auto	Changes the source ID back to the default value.

Defaults

By default, the last three least significant bytes of the system ID is used for the source ID.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The source ID is the high order 3 bytes for the Group Address DA for the SPB bridge. Note that only 20 bits are used; the top 4 bits are not used.

Examples

```
-> spb isis source-id 00-2a-1d
-> spb isis source-id 07-0b-d3
-> spb isis source-id auto
```

Release History

Release 8.1.1; command introduced.

Related Commands

show spb isis info	Displays status and configuration information for the SPB instance.

MIB Objects

```
alcatelIND1IsisSpbSys
   alcatelIND1IsisSpbmSysSPSourceId
```

spb isis control-address

Changes the ISIS-SPB control MAC address, which is used as the destination address for ISIS-SPB control packets.

spb isis control-address {alll1 | alll2 | allis}

Syntax Definitions

alll1	All Level 1 Intermediate Systems **(**01:80:C2:00:00:14).
alll2	All Level 2 Intermediate Systems (01:80:C2:00:00:15).
allis	All Intermediate Systems (09:00:2B:00:00:05).

Defaults

By default, the control MAC address is set to AllL1.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Changing the ISIS-SPB control MAC address on the OmniSwitch can enhance interoperability with third-party ISIS-SPB devices.

Examples

```
-> spb isis control-address alll1
-> spb isis control-address alll2
-> spb isis control-address allis
```

Release History

Release 8.1.1; command introduced.

Related Commands

show spb isis info	Displays the status and configuration information for the SPB instance.

MIB Objects

```
alcatelIND1IsisSpbSys
   alcatelIND1IsisSpbSysControlAddr
```

spb isis spf-wait

Configures the time intervals between the first, second, and subsequent ISIS-SPB shortest path first (SPF) calculations.

spb isis spf-wait [initial-wait *milliseconds* **| second-wait** *milliseconds*| **max-wait** *milliseconds***]**

Syntax Definitions

max-wait *milliseconds*	Specifies the maximum number of milliseconds to wait between two consecutive SPF calculations. Enter a value that is the same or greater than the second wait time value. The valid range is 1000–120000 milliseconds.
initial-wait *milliseconds*	Specifies the number of milliseconds to wait before triggering an initial SPF calculation after a topology change. The valid range is 10–100000 milliseconds. Specify a value that is the same or less than the maximum wait time value.
second-wait *milliseconds*	Specifies the minimum number of milliseconds to wait between the first and second SPF calculation. The valid range is 1–100000 milliseconds. Specify a value that is the same or less than the maximum wait time value.

Defaults

parameter	default
max-wait *milliseconds*	1000
initial-wait *milliseconds*	100
second-wait *milliseconds*	300

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- To reset all three of the SPF wait time intervals back to their default values, use the **spb isis spf-wait** command without specifying any parameters.
- Subsequent SPF calculations, if required, are generated at exponentially increasing intervals of the SPF **second-wait** parameter value until the **maximum-wait** parameter value is reached. For example, if the second-wait interval value is set to 1000 milliseconds, then the next SPF calculation is triggered after 2000 milliseconds and the next SPF calculation after that is triggered at 4000 milliseconds, and so on, until the maximum-wait interval value is reached.
- When the maximum interval value is reached, the SPF wait interval will stay at the maximum value until there are no more SPF calculations scheduled during that interval. After a full interval without any SPF calculations, the SPF wait interval will reset back to the **initial-wait** parameter interval value.

Examples

```
-> spb isis spf-wait max-wait 2500 initial-wait 1000 second-wait 1500
-> spb isis spf-wait max-wait 5000
-> spb isis spf-wait initial-wait 1000
-> spb isis spf-wait second-wait 2000
-> spb isis spf-wait
```

Release History

Release 8.1.1; command was introduced.

Related Commands

spb isis lsp-wait	Configures the time intervals between the first, second, and subsequent generation of link state PDUs (LSPs).
show spb isis info	Displays status and configuration information for the SPB instance.

MIB Objects

```
alcatelIND1IsisSpbProtocolConfig
   alcatelIND1IsisSpbProtocolSpfMaxWait
   alcatelIND1IsisSpbProtocolSpfInitialWait
   alcatelIND1IsisSpbProtocolSpfSecondWait
```

spb isis lsp-wait

Configures the time intervals between the first, second and subsequently generated link state PDU (LSP).

spb isis lsp-wait {max-wait *milliseconds* **| initial-wait** *milliseconds***| second-wait** *milliseconds***}**

Syntax Definitions

max-wait *milliseconds*	Specifies the maximum number of seconds to wait between two consecutively generated LSPs. Enter a value that is the same or greater than the second wait time value. The valid range is 1000–120000 milliseconds.
initial-wait *milliseconds*	Specifies the number of seconds to wait before triggering an initial LSP generation after a topology change. The valid range is 0–100000 milliseconds. Specify a value that is the same or less than the maximum wait time value.
second-wait *milliseconds*	Specifies the minimum number of seconds to wait between the first and second generated LSPs. The valid range is 1000–100000 milliseconds. Specify a value that is the same or less than the maximum wait time value.

Defaults

parameter	default
max-wait *milliseconds*	1000
initial-wait *milliseconds*	0
second-wait *milliseconds*	300

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- To reset all three of the LSP wait time intervals back to their default values, use the **spb isis lsp-wait** command without specifying any parameters.
- Subsequent LSP, if required, are generated at exponentially increasing intervals of the LSP **second-wait** parameter value until the **maximum-wait** parameter value is reached. For example, if the second-wait interval value is set to 10 seconds, then the next LSP is generation is triggered after 20 seconds and the next LSP generated after that is triggered at 40 seconds, and so on, until the maximum-wait interval value is reached.
- When the maximum interval value is reached, the LSP wait interval will stay at the maximum value until there are no more LSP generations during that interval. After a full interval without any LSP generations, the LSP wait interval will reset back to the **initial-wait** parameter interval value.

Examples

```
-> spb isis lsp-wait max-wait 2000 initial-wait 1000 second-wait 1500
-> spb isis lsp-wait max-wait 5000
-> spb isis lsp-wait initial-wait 2500
-> spb isis lsp-wait second-wait 3000
-> spb isis lsp-wait
```

Release History

Release 8.1.1; command was introduced.

Related Commands

spb isis spf-wait	Configures the time intervals between the first, second, and subsequent shortest path first (SPF) calculations.
show spb isis info	Displays status and configuration information for the SPB instance.

MIB Objects

   alcatelIND1IsisSpbProtocolLspInitialWait
   alcatelIND1IsisSpbProtocolLspSecondWait
```

spb isis overload

Configures the LSP database overload state for the local ISIS-SPB switch and optionally specifies the amount of time the switch remains in this state. When the overload state is enabled, the switch signals to other ISIS-SPB switches that it is not able to accept transit traffic.

spb isis overload [timeout *seconds***]**

no spb isis overload

Syntax Definitions

seconds	Specifies the timeout interval, in seconds. The valid range is 60–1800.

Defaults

By default, the IS-IS overload state is disabled.

parameter	default
seconds	0

Platforms Supported

OmniSwitch 10K, 6900

Usage Guidelines

- Use the **no** form of this command to make the router exit the overload state.
- If the time period is not specified, the router remains in the overload state for an infinite period.
- During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is used only if the destination route is directly reachable by the router (for example, it will not be used for other transit traffic).
- This command can be used when the router is overloaded or before executing a shutdown command to divert traffic around the router.

Examples

```
-> spb isis overload timeout 70
-> no spb isis overload
```

Release History

Release 8.1.1; command was introduced.

Related Commands

spb isis overload-on-boot	Configures the ISIS-SPB instance to operate in an overload state during bootup for a specified time period.
show spb isis info	Displays status and configuration information for the ISIS-SPB instance.

MIB Objects

```
alcatelIND1IsisSpbSysSetOverload
alcatelIND1IsisSpbSysOverloadTimeout
alcatelIND1IsisSpbSysOverloadStatus
```

spb isis overload-on-boot

Configures the ISIS-SPB switch to operate in the overload state after a system bootup for the specified amount of time.

spb isis overload-on-boot [timeout *seconds***]**

no spb isis overload-on-boot

Syntax Definitions

seconds	Specifies the timeout interval, in seconds. The valid range is 60–1800.

Defaults

By default, the ISIS-SPB switch will not operate in the overload state after a bootup.

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to prevent the switch from entering the overload state after bootup.
- An ISIS-SPB switch operating in the overload state is used only if there is no alternate path to reach the destination.
- This command configures the switch to operate in the overload state after a bootup and until the timeout value expires or the **no** form of this command is used.
- The **no spb isis overload** command does not influence the overload-on-boot function.

Examples

```
-> spb isis overload-on-boot timeout 80
-> no spb isis overload-on-boot
```

Release History

Release 8.1.1; command was introduced.

Related Commands

spb isis overload	Sets the ISIS-SPB switch to operate in the overload state.
show spb isis info	Displays status and configuration information for the ISIS- SPB instance.

MIB Objects

   alcatelIND1IsisSpbSysOverloadOnBootTimeout
   alcatelIND1IsisSpbSysOverloadStatus
```

spb isis graceful-restart

Configures graceful restart of the bridge. It allows ISIS-SPB to re-converge faster, minimizing service interruption.

spb isis graceful-restart

no spb isis graceful-restart

Syntax Definitions

N/A

Defaults

By default, the graceful restart functionality is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable graceful restart and remove the graceful restart configuration from the SPB bridge.
- When graceful restart is enabled, the bridge can either be a helper (which helps a neighbor router to restart) ora restarting router, or both.

Examples

```
-> spb isis graceful-restart
-> no spb isis graceful-restart
```

Release History

Release 8.1.1; command was introduced.

Related Commands

spb isis graceful-restart helper	Configures the helper mode of routers for graceful restart.
show spb isis info	Displays status and configuration information for the SPB instance.

MIB Objects

```
alcatelIND1IsisSpbProtocolConfig
   alcatelIND1IsisSpbProtocolGracefulRestart
```

spb isis graceful-restart helper

Administratively enables and disables the ISIS-SPB bridge to operate in the helper mode in response to a bridge performing a graceful restart.

spb isis graceful-restart helper {enable | disable}

Syntax Definitions

enable	Enables the helper mode on the bridge.
disable	Disables the helper mode on the bridge.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When graceful restart is enabled, the helper mode is enabled by default.

Examples

```
-> spb isis graceful-restart helper disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

spb isis graceful-restart	Configures graceful restart on the bridge.

```

output definitions

System Id	The system ID of the SPB bridge. The system ID is the base chassis MAC address of the SPB bridge.
System Hostname	The system name assigned to the SPB bridge. Configured through the **system name** command.

output definitions (continued)

SPSourceID	The shortest path (SP) source ID value for the SPB bridge. This value identifies the source of multicast frames and is relevant only in the multicast tandem replication mode. Configured through the **spb isis source-id** command.
SPBM System Mode	Indicates if the SP source ID was manually set (**manual**) using the **spb isis source-id** command or automatically allocated (**auto**) using the last three least significant bytes of the System ID.
BridgePriority	The bridge priority value assigned to the SPB bridge. Configured through the **spb isis bridge-priority** command.
MT ID	The IS-IS Multi Topology ID.
Control BVLAN	The SPB base VLAN assigned to exchange ISIS-SPB control traffic with other SPB bridges. Configured through the **spb isis control-bvlan** command.
Area Address	The IS-IS area address for this ISIS-SPB instance. Configured through the **spb isis area-address** command.
Level Capability	The level capability of the bridge. Only Level 1 **(L1**) is supported.
Admin State	The state of the SPB instance for the bridge (**Up** or **Down**). Configured through the **spb isis admin-state** command.
LSDB Overload	The LSP database overload state of the switch. Configured through the **spb isis overload** command.
Last Enabled	The date and time when the ISIS-SPB instance was last enabled for the bridge.
Last SPF	The date and duration of the last shortest path first (SPF) calculation.
SPF Wait	The SPF wait time intervals used to trigger SPF calculations after a topology change. Configured through the **spb isis spf-wait** command.
LSP Lifetime	The Lifetime of the LSP, in seconds.
LSP Wait	The LSP wait time intervals used to trigger LSP generations. Configured through the **spb isis lsp-wait** command.
Graceful Restart	Indicates if graceful restart is **Enabled** or **Disabled**. Configured through the **spb isis graceful-restart** command.
GR helper-mode	Indicates if the graceful restart helper mode is **Enabled** or **Disabled**. Configured through the **spb isis graceful-restart helper** command.
# of L1 LSPs	The number of LSPs for Level-1 adjacency.
Control Address	The destination MAC address used for ISIS-SPB control frames. Configured through the **spb isis control-address** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

show spb isis spf	Displays the shortest path first (SPF) information to all known SPB bridges for a specific BVLAN.
show spb isis bvlans	Displays the ISIS-SPB backbone VLAN (BVLAN) configuration for the bridge.
show spb isis interface	Displays the ISIS-SPB network interface configuration for the bridge.

   alcatelIND1IsisSpbProtocolGRHelperMode
   alcatelIND1IsisSpbSysControlAddr
```

show spb isis bvlans

Displays the ISIS-SPB backbone VLAN (BVLAN) configuration for the bridge.

show spb isis nodes

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command also displays the equal cost tree (ECT) algorithm that is assigned to each BVLAN.

Examples

```
-> show spb isis bvlans
SPB ISIS BVLANS:
                              Services Num    Tandem     Root Bridge

------+-------------+-------+--------+-----+----------+--------------------
   501  00-80-c2-01   NO      NO          0  GMODE      BRIDGE-3:00:d1:95:00:30:02
   502  00-80-c2-02   NO      NO          0  SGMODE
   503  00-80-c2-03   YES     NO          4  SGMODE
   504  00-80-c2-04   YES     NO          4  SGMODE

BVLANs:     4
```

output definitions

BVLAN	The VLAN ID number for the SPB BVLAN. Configured through the **spb bvlan** command.
ECT-algorithm	The equal cost tree (ECT) algorithm index (**1–16**) assigned to the BVLAN. Configured through the **spb isis bvlan ect-id** command.
In Use	Indicates whether or not the BVLAN is in use.
Services Mapped	Indicates whether or not any local services are mapped to the BVLAN.
Num ISIDS	The number of services known to the BVLAN.
Tandem Multicast	The tandem multicast mode (**SGMODE** or **GMODE**) for the BVLAN. Configured through the **spb isis bvlan tandem-multicast-mode** command.
Root Bridge (Name : MAC Address)	The system name and bridge MAC address of the root bridge. This value is displayed only for GMODE configurations.

Release History

Release 8.1.1; command was introduced.

Related Commands

show spb isis info	Displays status and configuration information for the SPB instance
show spb isis interface	Displays the ISIS-SPB network interface configuration for the bridge.

MIB Objects

N/A

show spb isis interface

Displays the ISIS-SPB network interface configuration for the switch.

show spb isis interface

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command also shows the operational and administrative status of the interface.
- When an SPB interface is created, the interface is automatically assigned to each SPB BVLAN in the switch configuration.

Examples

```
-> show spb isis interface
SPB ISIS Interfaces:
                                  Oper   Admin   Link      Hello   Hello

Interfaces : 8
```

output definitions

Interface	The slot/port or link aggregate ID of the SPB interface.
Level	The IS-IS Area Level (L1) for the interface.
CircID	The circuit ID of the interface.
Oper-state	The operational state of the interface (**UP** or **DOWN**).
Admin-state	The administrative state of the interface (**UP** or **DOWN**).
Link Metric	The metric value of the router for the corresponding area level.

output definitions

Hello Interval	The number of seconds the interface waits between Hello PDU transmissions.
Hello Multiplier	The number that is multiplied by the Hello Interval to determine the hold time.

Release History

Release 8.1.1; command was introduced.

Related Commands

spb isis interface	Creates an ISIS-SPB network interface.

show spb isis adjacency

Displays information about the ISIS-SPB adjacencies created for the SPB bridge.

show ip isis adjacency [detail]

Syntax Definitions

detail	Displays additional information about the ISIS-SPB adjacencies.

Defaults

By default, a summary list of adjacency information is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip isis adjacency
SPB ISIS Adjacency:
 System
 (Name : SystemId)                    Type State  Hold  Interface
-------------------------------------+----+------+-----+---------
         bridge2 :  00d0.9506.4c62     L1    UP    27       1/1
         bridge3 :  00d0.9507.9732     L1    UP    20       1/2

Adjacencies : 2
```

output definitions

Name	The system name assigned to the adjacent SPB bridge.
SystemId	The system ID of the adjacent SPB bridge. The system ID is the base chassis MAC address of the SPB bridge.
Type	The level (**LI**) of the adjacent bridge.
State	The state of the adjacency (**UP** or **DOWN**).
Hold	The adjacency hold time, in seconds.
Interface	The slot/port or link aggregate ID of the SPB interface on which the adjacency was formed.
Adjacencies	The total number of adjacent SPB bridges.

```
-> show ip isis adjacency detail

Adjacencies : 1
```

output definitions

SystemID	The system ID of the adjacent SPB bridge. The system ID is the base chassis MAC address of the SPB bridge.
B-MAC	The backbone MAC address (system ID) of the adjacent bridge. This is the address that is used as the source address for encapsulated customer traffic that is tunneled through SPB services.
Interface	The slot/port or link aggregate ID of the SPB interface on which the adjacency was formed.
State	The state of the adjacency (**UP** or **DOWN**).
Hold Time	The adjacency hold time, in seconds.
Adj Level	The adjacency level (**L1**) of the SPB bridge.
ExtLocalCktId(YES)	The circuit ID that the peer bridge has assigned to this adjacency.
Restart Support	Indicates if graceful restart is **Enabled** or **Disabled**.
Restart Status	Indicates whether the adjacent SPB bridge is helping the local bridge to restart (**Not currently being helped** or **Currently being helped**).
Restart Suppressed	Indicates whether or not the advertisement of LSPs is suppressed per the request of adjacent SPB bridge (**Enabled** or **Disabled**).
Hostname	The system name assigned to the adjacent SPB bridge.
Up Time	Indicates the time period in seconds, during which the SPB bridge was in the adjacency.
Priority	The bridge priority value of the adjacent SPB bridge.

output definitions

Max Hold	Indicates the maximum hold time of the adjacent SPB bridge.
NLPIDs	The Network Layer Protocol ID (NLPID) of the adjacent bridge (SPB NLPID = 0xC1).

Release History

Release 8.1.1; command was introduced.

Related Commands

show spb isis database	Displays ISIS-SPB topology information maintained in the link state database (LSDB).
show spb isis nodes	Displays the discovered node-level parameter values for all of the ISIS-SPB bridges participating in the topology.

MIB Objects

N/A

show spb isis database

Displays ISIS-SPB topology information maintained in the link state database (LSDB).

show ip isis database [lsp-id *lsp_id***}]**

Syntax Definitions

lsp_id	The LSP ID.

Defaults

By default, the entire LSDB is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the *lsp-id* parameter with this command to view database information for a specific link state packet (LSP).

Examples

```
-> show spb isis database
      Legends : P    = The Partition repair bit is set
                OV   = The overload bit is set
                ATT  = The Attach bit is set
                L1   = Specifies a Level 1 IS type
                L2   = Specifies a Level 2 IS type
      SPB ISIS LSP Database:
       LSP ID                 Sequence    Checksum   Lifetime   Attributes

       00d1.9500.3002.00-00  0x000000a8     0x9bdc        862   L1
       00e0.b188.99be.00-00  0x0000009c     0xa719        762   L1
      Level-1 LSP count : 2
```

output definitions

LSP ID	The LSP ID. Indicates the system ID and the pseudo-node ID of the originating router.
Sequence	The sequence number of the LSP. The sequence number is a value used to identify old and duplicate LSPs.
Checksum	The checksum value of the LSP.
Lifetime	The number of seconds the LSP remains valid. The LSP lifetime value of zero indicates that this LSP is being removed from the LSDB of all the SPB bridges.
Attributes	The level capability of the bridge. This implementation of ISIS-SPB only supports Level 1 (L1).
LSP Count	The number of LSPs in the LSDB.

MIB Objects

N/A

show spb isis nodes

Displays the discovered node-level parameter values for all of the ISIS-SPB switches participating in the topology.

show spb isis nodes

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays the system name, system ID, SPsource ID, and bridge priority parameter values for the bridges discovered within the ISIS-SPB topology.

Examples

```
-> show spb isis nodes
SPB ISIS Nodes:
 System Name          System Id      SourceID BridgePriority
--------------------+--------------+--------+--------------
 Bridge-1             00e0.b1e7.0188  0x70188  32768 (0x8000)
 Bridge-2             00e0.b1e7.0bd3  0x70bd3  32768 (0x8000)
 Bridge-4             e8e7.3200.2a1d  0x02a1d  32768 (0x8000)
 Bridge-5             e8e7.3233.1891  0x31891  32768 (0x8000)
 Bridge-6             e8e7.3233.199d  0x3199d  32768 (0x8000)
 Bridge-7             e8e7.3233.1a29  0x31a29  32768 (0x8000)
 Bridge-8             e8e7.3233.1c81  0x31c81  32768 (0x8000)
```

output definitions

System Name	The system name assigned to the SPB bridge.
System Id	The system ID of the SPB bridge. The system ID is the base chassis MAC address of the SPB bridge.
SourceID	The shortest path (SP) source ID value for the SPB bridge. This value identifies the source of multicast frames and is relevant only in the multicast tandem replication mode.
BridgePriority	The bridge priority value assigned to the SPB bridge.

Release History

Release 8.1.1; command was introduced.

show spb isis info	Displays status and configuration information for the SPB instance

MIB Objects

N/A

show spb isis unicast-table

Displays the unicast forwarding information for the specified BVLANs. Use this command to verify unicast addresses were learned correctly on each SPB switch in the ISIS-SPB backbone topology.

show spb isis unicast-table [bvlan *bvlan_id***]**

Syntax Definitions

bvlan_id	The VLAND ID of an existing BVLAN.

Defaults

By default, the forwarding information for all BVLANs in the SPB topology is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **bvlan** *bvlan_id* parameter to display information for a specific BVLAN.

Examples

```
-> show spb isis unicast-table
SPB ISIS Unicast MAC Table:
        Destination                                Outbound

MAC Addresses: 6
```

output definitions

BVLAN	The VLAN ID number for the SPB BVLAN.
System (Name : BMAC)	The system name of the destination SPB bridge, and the destination unicast BMAC address for that bridge.
Outbound Interface	The interface (port or link aggregate) on which the destination system is reached.

Release History

Release 8.1.1; command was introduced.

Related Commands

show spb isis bvlans	Displays status and configuration information for the SPB instance.
show spb isis multicast-table	Displays the multicast forwarding information for the specified service instance identifier (I-SID).

MIB Objects

N/A

show spb isis services

Displays the service instance identifier (I-SID) mapping for bridges participating in the SPB topology. This command provides a network-wide view of existing services to help verify that SPB services are correctly advertised and learned by ISIS-SPB.

show spb isis services [isid *service_id* **| bvlan** *bvlan_id***]**

Syntax Definitions

service_id	An existing I-SID number.
bvlan_id	The VLAND ID of an existing BVLAN.

Defaults

By default, the mapping for all I-SIDs in the SPB topology is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **isid** *service_id* number to display information for a specific service instance.
- Use the **bvlan** *bvlan_id* parameter to display information for a specific BVLAN.

Examples

```
-> show spb isis services
Legend: * indicates locally configured ISID

ISIDs:    16
```

output definitions

ISID	The service instance identifier.
BVLAN	The VLAN ID number for the SPB BVLAN.
System (Name : BMAC)	The system name of the SPB bridge from where the I-SID was discovered or configured, and the destination unicast BMAC address to which frames associated with the service instance are sent.
Multicast (T/R)	Indicates the multicast service requirement for the instance (**T**ransmit, **R**eceive, or **both**).

Release History

Release 8.1.1; command was introduced.

Related Commands

show spb isis info	Displays status and configuration information for the SPB instance

MIB Objects

N/A

show spb isis spf

Displays the shortest path first (SPF) information to all known SPB bridges for a specific BVLAN.

show spb isis spf bvlan *bvlan_id* **[bmac** *mac_address***]**

Syntax Definitions

bvlan_id	The VLAND ID of an existing BVLAN.
mac_address	An SPB bridge BMAC address.

Defaults

By default, the SPF information for all known BMAC addresses for the specified BVLAN.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **bmac** *mac_address* parameter to display information for a specific SPB bridge.

Examples

```
-> show spb isis spf bvlan 4001
SPB ISIS Path Table:

show spb isis multicast-table

Displays the multicast forwarding information for the specified service instance identifier (I-SID).

show spb isis multicast-table [isid *service_id***]**

Syntax Definitions

service_id	An existing I-SID number.

Defaults

By default, the forwarding information for all services in the SPB topology is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **isid** *service_id* parameter to display information for a specific service instance.

Examples

```
-> show spb isis multicast-table
SPB ISIS Multicast MAC Table:
                                  MCAST Source                  Inbound   Outbound
 ISID  BVLAN MCAST Group Address  (Name:BMAC)                  Interface Interface
------+-----+------------------+-----------------------------+---------+---------
 2000    41   0a:fd:c2:00:01:22   BRIDGE-8  : 00:d0:95:0a:fd:c2   1/1/2      1/1/3

 MAC Addresses: 1
```

output definitions

ISID	The service instance identifier.
BVLAN	The VLAN ID number for the SPB BVLAN associated with the service instance.
MCAST Group Address	The multicast destination group address.
MCAST Source (Name : BMAC)	The system name and BMAC address of the multicast source.
Inbound Interface	The interface (port or link aggregate) on which multicast traffic is received for the service instance.
Outbound Interface	The interface (port or link aggregate) on which multicast traffic is sent for the service instance.

Release History

Release 8.1.1; command was introduced.

Related Commands

show spb isis multicast-sources

Displays all the known multicast sources across the SPB domain and BVLANs.

show spb isis multicast-sources

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command also displays whether or not the source is reachable.

Examples

```
-> show spb isis multicast-sources
SPB ISIS Multicast Source Nodes:
 Multicast Source
 (Name : BMAC)                  Reachable   (# ) BVIDS
-------------------------------+---------+-----------------
 BRIDGE-8  : 00:d0:95:0a:fd:c2    YES      (#2) 4001 4002

 Total SPB Multicast Source Nodes: 1
```

output definitions

Multicast Source (Name : BMAC)	The system name and BMAC address of the multicast source bridge.
Reachable	Indicates whether or not the multicast source node is reachable (**YES** or **NO**).
(#) BVIDS	Indicates the number of BVLANs and the BVLAN IDs on which the bridge acts as a multicast source.

Release History

Release 8.1.1; command was introduced.

MIB Objects

N/A

show spb isis ingress-mac-filter

Displays the ingress MAC filter for multicast traffic for a given BVLAN operating in the (*,G) mode.

show spb isis ingress-mac-filter [port *chassis_id/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***] | bvlan** *bvlan_id* **| bmac** *mac_address***]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
bvlan_id	The VLAND ID of an existing BVLAN.
mac_address	The source MAC address of the multicast traffic allowed on the specified BVLAN and physical port.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the optional command parameters to display specific information with this command.
- Each of the optional command parameters can be combined with any of the other optional parameters within the same command line.

Examples

```
-> show spb isis ingress-mac-filter
SPB ISIS Ingress MAC Table (for GMODE bvlans only):
        Inbound     Multicast source MAC
 BVLAN  Interface   (Name : MAC Address)
------+-----------+---------------------------------------
   40       1/1/1    BRIDGE-1            : 00:d0:95:04:8d:92

MAC Addresses: 1
```

output definitions

BVLAN	The VLAN ID number for the SPB BVLAN.
Inbound Interface	The interface (port or link aggregate) on which the multicast source MAC was received.
System (Name : BMAC)	The system name and MAC address of the multicast traffic source.

Release History

Release 8.1.1; command was introduced.

9 Loopback Detection Commands

Loopback Detection (LBD) automatically detects the loop and shutdown the port involved in the loop. This prevents forwarding loops on ports that have forwarded network traffic which has looped back to the originating switch. LBD detects and prevents Layer 2 forwarding loops on a port either in the absence of other loop detection mechanisms such as STP/RSTP/MSTP, or when these mechanisms cannot detect it (for example, a client's equipment may drop BPDUs, or the STP protocol may be restricted to the network edge). On a linkagg port, if one port of linkagg is getting shutdown due to LBD, then all the ports of linkagg will go to shutdown state.

Loopback Detection is enabled system wide and on a per-port basis. Once a loop is discovered, the port from which the loop originated is placed into an “Inactive” state and when the two ports of a switch is connected to each other through a hub, either the ports will be shutdown or it will be in normal state.

A provider network with a set of multiple switches interconnected together can be logically viewed as a large single switch. The large single switch provides service access points to customers' networks. Configuration faults in customer networks can result in loops spanning both provider and customer networks. This can result in broadcast storms. In order to protect provider's network from broadcast storms, loops that involve SAP ports need to be detected and broken.

The LBD can detect and break loops created on the service-access interface.

For a service-access interface, LBD can be enabled for a specific port or linkagg. LBD for service-access points allows shutting down only the specific interface of the link involved in the loop.

When loopback occurs, a trap is sent and the event is logged. The port which is shutdown due to LBD is automatically recovered if autorecovery-timer is set or the port can manually be enabled again when the problem is resolved.

MIB information for the Loopback Detection commands is as follows:

Filename: alcatelIND1LBD.mib
Module: ALCATEL-IND1-LBD-MIB

A summary of available commands is listed here:

loopback-detection
loopback-detection port
loopback-detection service-access
loopback-detection transmission-timer
loopback-detection autorecovery-timer
show loopback-detection
show loopback-detection port
show loopback-detection statistics port

loopback-detection

Enables or disables Loopback Detection (LBD) or remote-origin LBD globally on the switch.

loopback-detection [remote-origin] {enable | disable}

Syntax Definitions

enable	Enables LBD on the switch.
disable	Disables LBD on the switch.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- LBD can be enabled globally and per port without any dependency. But, loopback-detection will be operational only if LBD is enabled globally and also on the specific port.
- LBD can be configured for a port and the configuration can be applied and retained, whether or not LBD is enabled globally. However, LBD functionality on a port is available only when LBD is enabled globally on the switch.
- Enabling the remote-origin LBD allows to process the LBD frames originated from a remote system. The port from which the LBD frames originated will be shut down.

Examples

```
-> loopback-detection enable
-> loopback-detection disable
-> loopback-detection remote-origin enable
-> loopback-detection remote-origin disable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

loopback-detection port	Enables or disables LBD on a specific port.
show loopback-detection	Displays LBD configuration information.

MIB Objects

```
alaLbdGlobalConfigStatus
alaLbdGlobalRemoteConfigStatus
```

loopback-detection port

Enables or disables LBD or remote-origin LBD on a specific port.

loopback-detection port *chassis_id/slot/port***[**-*port2***] [remote-origin] {enable | disable}**

Syntax Definitions

chassis_id	The chassis ID number.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
enable	Enables LBD on the specified port.
disable	Disables LBD on the specified port.

Defaults

parameter	default
enable | **disable**	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Loopback Detection must be enabled globally to enable LBD functionality on a specific port.
- LBD can be configured for a port and the configuration can be applied and retained, whether or not LBD is enabled globally. However, LBD functionality on a port is available only when LBD is enabled globally on the switch.
- When a LBD port joins a LBD linkagg, then LBD configuration on joined port is removed.
- For per port remote-origin LBD to work, both LBD and remote-origin LBD must be enabled globally.

Examples

```
-> loopback-detection port 1/1/1 enable
-> loopback-detection port 1/1/1-8 enable
-> loopback-detection port 1/1/2 remote-origin enable
-> loopback-detection port 1/1/3-5 remote-origin enable
-> loopback-detection port 1/1/2 remote-origin disable
-> loopback-detection port 1/1/3-5 remote-origin disable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection	Displays LBD configuration information.
show loopback-detection port	Displays LBD port configuration information.

MIB Objects

```
alaLbdPortConfigTable
   alaLbdPortConfigEntry
   alaLbdPortConfigIndex
   alaLbdPortConfigLbdAdminStatus
   alaLbdPortConfigLbdOperStatus
   alaLbdPortRemoteConfigAdminStatus
   alaLbdPortRemoteSrcMacAddr
   alaLbdPortRemoteBridgeID
```

loopback-detection service-access

Allows to detect and break loops created on service access interface. Enables or disables LBD on a specific port or range of ports or linkagg or range of linkagg for service access interface.

loopback-detection service-access {port *chassis/slot/port*[*-port2*] | **linkagg** *agg_id***[-***agg_id2***]} {enable | disable}**

Syntax Definitions

chassis_id	The chassis ID number.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables LBD on the specified port or linkagg.
disable	Disables LBD on the specified port or linkagg.

Defaults

parameter	default
enable | **disable**	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Before configuring the LBD using the “service-access” option, the port or linkagg must be configured for service access. Use the **service access** command, to configure the port or linkagg for service access.
- The service-access option allows shutting down only the specific interface of the link involved in the loop.
- The linkagg must be formed by ports with same path cost.
- LBD is applicable on linkagg only if they are part of the service-access interface.
- LBD cannot be configured on linkagg, which has member ports running LBD configuration and vice versa.
- When a linkagg is in violation or shutdown state, the member ports cannot be deleted from the linkagg.

Examples

```
-> loopback-detection service-access port 1/1/1 enable
-> loopback-detection service-access port 1/1/1-8 enable
-> loopback-detection service-access linkagg 1 enable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection	Displays LBD configuration information.

MIB Objects

```
alaLbdPortConfigTable
   alaLbdPortConfigLbdAdminStatus
   alaLbdUserPortConfigLbdInterfaceType
```

loopback-detection transmission-timer

Configures the LBD transmission timer on the switch.The transmission time is the time period between the consecutive LBD packet transmissions.

loopback-detection transmission-timer *seconds*

Syntax Definitions

seconds	The time period in seconds between LBD packet transmissions. The valid range is 5–600 seconds.

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the timer value is not configured, the default value of 30 seconds is assigned to the transmission period.
- The timer can be modified at any time. However, the new timer value will come into effect only after the timer is restarted.

Examples

```
-> loopback-detection transmission-timer 200
```

Release History

Release 8.2.1; command was introduced.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection	Displays LBD configuration information.

MIB Objects

```
alaLbdGlobalConfigStatus
alaLbdGlobalRemoteConfigStatus
alaLbdGLobalConfigTransmissionTimer
```

loopback-detection autorecovery-timer

Configures the LBD autorecovery timer on the switch.The autorecovery time is the time period in which the switch is recovered from the shutdown state.

loopback-detection autorecovery-timer *seconds*

Syntax Definitions

seconds	The time period, in seconds, in which the switch is recovered from the shutdown state. The valid range is 30–86400 seconds.

Defaults

parameter	default
seconds	300

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the timer value is not configured, the default value of 300 seconds is assigned to the autorecovery period.
- The timer can be modified at any time. However, the new timer value will come into effect only after the timer is restarted.

Examples

```
-> loopback-detection autorecovery-timer 200
```

Release History

Release 8.2.1; command was introduced.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection	Displays LBD configuration information.

MIB Objects

```
alaLbdGlobalConfigStatus
alaLbdGlobalRemoteConfigStatus
alaLbdGlobalConfigAutorecoveryTimer
```

show loopback-detection

Displays the global LBD configuration information for the switch.

show loopback-detection

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to display the global configuration of LBD.
- To view information for a specific port, use the **show loopback-detection port** command.

Examples

```
-> show loopback-detection

Global LBD Status                : enabled,
Global Remote-origin LBD Status  : disabled,
Global LBD Transmission Timer    : 30 sec,
Global LBD Auto-recovery Timer   : 999 sec,
```

output definitions

Global LBD Status	The current status of LBD of the switch (**Enabled** or **Disabled**).
Global Remote-origin LBD Status	The current status of remote-origin LBD of the switch (**Enabled** or **Disabled**).
Global LBD Transmission Timer	Displays the time interval in seconds between LBD packet transmissions.
Global LBD Auto-recovery Timer	Displays the time in which the switch recovered from the shutdown state.

Release History

Release 8.2.1; command was introduced.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection port	Displays LBD configuration information for all ports on the switch.
violation recovery-maximum	Displays the administrative status, link status, violations, recovery time, maximum recovery attempts and the value of the wait-to-restore timer for the specified port or ports.

MIB Objects

```
alaLbdGlobalConfigStatus
alaLbdGlobalRemoteConfigStatus
alaLbdGlobalConfigTransmissionTimer
alaLbdGlobalConfigAutorecoveryTimer
```

show loopback-detection port

Displays global LBD configuration information on the switch. When slot and port number or linkagg ID is specified, the LBD configuration information of the specific port or linkagg ID is displayed.

show loopback-detection {**port** chassis/*slot/port*] | **linkagg** *agg_id*}

Syntax Definitions

port	Displays the LBD configuration for all ports.
chassis_id	The chassis ID number.
slot/port	The slot and port number (3/1).
agg_id	The link aggregate ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The command can be used only on LBD enabled port or linkagg.

Examples

```
-> show loopback-detection
Global LBD Status                : enabled,
Global Remote-origin LBD Status  : disabled,
Global LBD Transmission Timer    : 30 sec,

1/1/1         enabled          enabled                Remote ShutDown
```

output definitions

Global LBD Status	The current status of LBD of the switch (**Enabled** or **Disabled**).
Global Remote-origin LBD Status	The current status of remote-origin LBD of the switch (**Enabled** or **Disabled**).
Global LBD Transmission Timer	Displays the time interval in seconds between LBD packet transmissions.
Global LBD Auto-recovery Timer	Displays the time interval in seconds in which the switch is recovered from the shut down state.
Slot/Port	The slot/port number LBD port.
Admin State	The administrative state of the port (**Enabled** or **Disabled**).
Oper State	The operational state of the port (**Normal** or **Inactive**).
Port LBD Status	Displays the administrative status of the port.
Port Remote-origin LBD Status	Displays the remote-origin LBD status of the port.
Port LBD State	Displays the current operational state of the port.
Remote Src Mac	Displays the MAC address of the remote system. The Remote Src Mac is displayed, only if remote-origin LBD is enabled on the system.
Remote BridgeId	Displays the bridge ID of the remote system. The Remote BridgeId is displayed, only if remote-origin LBD is enabled on the system.
Port LBD Type	Displays the type of the interface – whether a normal edge interface or a service access interface.
Linkagg LBD Status	Displays the administrative status of the linkagg.
Linkagg Remote-origin LBD Status	Displays the remote-origin LBD status of the linkagg.
Linkagg LBD State	Displays the current operational state of the linkagg.
Linkagg LBD Type	Displays the type of the interface – whether a normal edge interface or a service access interface.

Release History

Release 8.2.1; command was introduced.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection port	Displays LBD configuration information for the switch or for a specific port.

MIB Objects

```
alaLbdGlobalConfigStatus
alaLbdGlobalRemoteConfigStatus
alaLbdPortConfigLbdAdminStatus
alaLbdPortConfigLbdOperStatus
alaLbdPortRemoteConfigAdminStatus
alaLbdPortConfigLbdInterfaceType
```

show loopback-detection statistics port

Displays LBD statistics information for a specific port on the switch.

show loopback-detection statistics port chassis/*slot/port*

Syntax Definitions

chassis_id	The chassis ID number.
slot/port	The slot and port number (3/1).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The linkagg ID is not displayed if the linkagg is operationally down.

Examples

```
-> show loopback-detection statistics port 1/1/1

LBD Port Statistics
LBD Packet Send               : 1,
Invalid LBD Packet Received   : 0,
Member of Link Aggregation    : -

-> show loopback-detection statistics port 1/1/3
LBD Port Statistics
LBD Packet Send                : 1,
Invalid LBD Packet Received    : 0,
Member of Aggregation          : 2
```

output definitions

LBD Packet Send	The number of LBD packet sent from the port.
Invalid LBD Packet Received	The number of invalid LBD packets received on the port.
Member of Aggregation	The linkagg ID in which the port is a member.

Release History

Release 8.2.1; command was introduced.

Related Commands

loopback-detection	Enables or disables LBD globally on the switch.
show loopback-detection port	Displays LBD configuration information for the switch or for a specific port.

MIB Objects

```
alaLbdGlobalConfigStatus
alaLbdPortStatsAggId
```

10 Link Aggregation Commands

Link aggregation combines multiple physical links between two switches into one logical link. The aggregate group operates within Spanning Tree as one virtual port and can provide more bandwidth than a single link. It also provides redundancy. If one physical link in the aggregate group goes down, link integrity is maintained.

There are two types of aggregate groups: static and dynamic. Static aggregate groups are manually configured on the switch with static links. Dynamic groups are set up on the switch but they aggregate links as necessary according to the Link Aggregation Control Protocol (LACP).

The dynamic aggregation software is compatible only with the following IEEE standard:

802.3ad — Aggregation of Multiple Link Segments

MIB information for the link aggregation commands is as follows:

Filename: AlcatelIND1LAG.MIB
Module: ALCATEL-IND1-LAG-MIB

A summary of available commands is listed here:

Static link aggregates	**linkagg static agg size** **linkagg static agg name** **linkagg static agg admin-state** **linkagg static port agg**
Dynamic link aggregates	**linkagg lacp agg size** **linkagg lacp agg name** **linkagg lacp agg admin-state** **linkagg lacp agg actor admin-key** **linkagg lacp agg actor system-priority** **linkagg lacp agg actor system-id** **linkagg lacp agg partner system-id** **linkagg lacp agg partner system-priority** **linkagg lacp agg partner admin-key** **linkagg lacp port actor admin-key** **linkagg lacp port actor admin-state** **linkagg lacp port actor system-id** **linkagg lacp port actor system-priority** **linkagg lacp agg partner admin-state** **linkagg lacp port partner admin system-id** **linkagg lacp port partner admin-key** **linkagg lacp port partner admin system-priority** **linkagg lacp port actor port priority** **linkagg lacp port partner admin-port** **linkagg lacp port partner admin port-priority**
Dual Home Link (DHL) Active-Active	**dhl name** **dhl num linka linkb** **dhl num admin-state** **dhl num vlan-map linkb** **dhl num pre-emption-time** **dhl num mac-flushing** **show dhl** **show dhl num** **show dhl num link**
Static and dynamic	**linkagg range** **show linkagg range** **show linkagg** **show linkagg port**

linkagg static agg size

Creates a static aggregate group between two switches. A static aggregate group contains static links.

linkagg static agg *agg_id***[-***agg_id2***] size** *size* **[name** *name***] [admin-state {enable | disable}] [multi-chassis active] [hash {source-mac | destination-mac | source-and-destination-mac | source-ip | destination-ip | source-and-destination-ip | tunnel-protocol}]**

no linkagg static agg *agg_id***[-***agg_id2***]**

Syntax Definitions

agg_id	The ID number corresponding to the static aggregate group.
-agg_id2	The last link aggregate ID in a range of link aggregate IDs.
size	The maximum number of links allowed in the aggregate group.
name	The name of the static aggregate group. Can be any alphanumeric string. Spaces must be contained within quotes (for example, “Static Group 1”).
enable	Specifies that the static aggregate group is active and is able to
disable	Specifies that the static aggregate group is inactive and not able to aggregate links.
multi-chassis active	**Note:** *This parameter is not supported in this release.*
source-mac	Selects the source MAC address hashing option.
destination-mac	Selects the destination MAC address hashing option.
source-and-destination-mac	Selects the source MAC address and destination MAC address hashing option.
source-ip	Selects the source IP hashing option.
destination-ip	Selects the destination IP hashing option.
source-and-destination-ip	Selects the source IP and destination IP hashing option.
tunnel-protocol	Selects the tunnel protocol hashing option.

Defaults

parameter	default
enable | disable	enable
hash_option	**source-and-destination-ip** (Layer 3 traffic) **source-and-destination-mac** (Layer 2 traffic)

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a static aggregate group or a range of static aggregate groups from the configuration.

- If the static aggregate has any attached ports you must delete the attached ports with the **no** form of the **linkagg static port agg** command before you remove the static link aggregate ID. Delete the attached ports using the **no linkagg static port** command.
- Specify the **hash** parameter option when the link aggregate is first created. The hashing algorithm options apply to unicast traffic and are not modifiable once the aggregate is created. If different options are required:
  - Disassociate all ports currently associated with the aggregate.
  - Delete the aggregate from the switch configuration.
  - Create the aggregate again with the new hashing options.
- It is not necessary to administratively down the linkagg ports before changing the hashing algorithm, but doing so is recommended.
- The hashing algorithm does not take into consideration the speed of the ports to distribute the traffic. In other words, the same number of flows is distributed evenly on each port without consideration of the line speed.
- Aggregate load balancing is performed at the ingress side.
- Per-aggregate hashing is local to the switch, so each side of the aggregation can use different configurations for the hashing algorithms.
- Link aggregation follows the global hash control settings configured through the **hash-control brief** or **hash-control extended** commands.
- For example, if the **source-mac** option is specified for L2 hashing:
  - If the global hash-control is in brief mode, hashing is based on source MAC address only.
  - If the global hash-control is in extended mode, hashing is based on source MAC address, VLAN, Ethertype, and source module ID/port.
- For example, if the **source-ip** option is specified for L3 hashing:
  - If the global hash-control is in brief mode, hashing is based on source IP address only.
  - If the global hash-control is in extended mode, hashing is based on source IP address and source UDP-TCP Port.
- To load balance Unknown Destination/Broadcast/Multicast traffic on all the ports of the aggregate, use the **hash-control** command to enable load balancing of DFL traffic.
- Use the **linkagg lacp agg size** command to create a dynamic aggregation (LACP) group.

Examples

```
-> linkagg static agg 3-10 size 8
-> linkagg static agg 4 size 2 admin-state disable
-> linkagg static agg 4 size 2 multichassis-active
-> linkagg static agg 4 size 2 hash source-and-destination-ip
-> no linkagg static agg 3-10
```

Release History

Release 8.1.1; command introduced.

Related Commands

show linkagg	Displays information about static and dynamic (LACP) link aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggSize
   alclnkaggAggLacpType
   alclnkaggAggName
   alclnkaggAggAdminState
   alclnkAggPeerRangeOperMax
```

linkagg static agg name

Configures a name for an existing static aggregate group.

linkagg static agg *agg_id***[-***agg_id2***] name** *name*

no linkagg static agg *agg_id***[-***agg_id2***] name**

Syntax Definitions

agg_id	The ID number corresponding to the static aggregate group.
-agg_id2	The last link aggregate ID in a range of link aggregate IDs.
name	The name of the static aggregation group, can be an alphanumeric string. Spaces must be contained within quotes (for example, “Static Group 1”).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a name from a static aggregate or from a range of static aggregates.
- You must assign names to static link aggregate IDs individually.
- To specify a range of link aggregates, use hyphen between the first and last link aggregate IDs of the range. A range of link aggregate IDs can be used only with the **no** form of this command.

Examples

```
-> linkagg static agg 2 name accounting
-> no linkagg static agg 2-10 name
```

Release History

Release 8.1.1; command introduced.

Related Commands

linkagg static agg size	Creates a static aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggName
```

linkagg static agg admin-state

Enables or disables the administrative state of a static link aggregation group.

linkagg static agg *agg_id*[*-agg_id2*] **admin-state {enable | disable}**

Syntax Definitions

agg_id	The number corresponding to the static aggregate group.
-agg_id	The last link aggregate ID in a range of link aggregate IDs.
enable	Specifies that the static aggregate group is active and is able to
disable	Specifies that the static aggregate group is inactive and not able to aggregate links.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When the administrative state is set to **disable**, the static aggregate group is disabled.

Examples

```
-> linkagg static agg 2 admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

linkagg static agg size	Creates a static aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggAdminState
```

linkagg static port agg

Configures a slot and port for a static aggregate group.

linkagg static port *chassis_id/slot/port***[**-*port2***] agg** *agg_id*

no linkagg static port *chassis_id/slot/port***[**-*port2***]**

Syntax Definitions

chassis_id	The chassis ID number.
slot	The slot number for this aggregate.
port	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
-port2	The last port number in a range of port IDs.
agg_id	The ID number corresponding to the static aggregate group.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove one or more ports from a static aggregate group.
- A port can belong to only one aggregate group.
- Ports that belong to the same static aggregate group need not be configured sequentially and can be on any Network Interface (NI).
- To specify a range of link aggregates, use hyphen between the first and last link aggregate IDs of the range. A range of link aggregate IDs can be used only with the **no** form of this command.

Examples

```
-> linkagg static port 2/1-5 agg 4
-> no linkagg static port 2/1-5
```

Release History

Release 8.1.1; command introduced.

Related Commands

linkagg static agg size	Creates a static aggregate group.
show linkagg port	Displays information about link aggregation ports.

MIB Objects

```
alclnkaggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortLacpType
   alclnkaggAggPortSelectedAggNumber
```

linkagg lacp agg size

Creates a dynamic aggregate group that uses the Link Aggregation Control Protocol (LACP) to establish and maintain link aggregation. The **size** parameter is required to create the link aggregate group.

linkagg lacp agg *agg_id***[-***agg_id2***] size** *size*
[name *name***]**
[admin-state {enable | disable}]
[actor admin-key *actor_admin_key***]**
[actor system-priority *actor_system_priority***]**
[actor system-id *actor_system_id***]**
[partner system-id *partner_system_id***]**
[partner system-priority *partner_system_priority***]**
[partner admin-key *partner_admin_key***]**
[multi-chassis active]
[hash (source-mac | destination-mac | source-and-destination-mac | source-ip | destination-ip | source-and-destination-ip)]

no linkagg lacp agg *agg_id***[-***agg_id2***] size** *size*

Syntax Definitions

agg_id	The ID number corresponding to the dynamic aggregate group.
-agg_id2	The last link aggregate ID in a range of link aggregate IDs.
size	The maximum number of links that can belong to the aggregate.
name	The name of the dynamic aggregate group. can be an alphanumeric string. Spaces must be contained within quotes (for example, “Dynamic Group 1”).
enable	Specifies that the dynamic aggregate group is active and is able to aggregate links.
disable	Specifies that the dynamic aggregate group is inactive and not able to aggregate links.
actor_admin_key	The administrative key value associated with the dynamic aggregate group.
actor_system_priority	The priority of the dynamic aggregate group.
actor_system_id	The MAC address of the dynamic aggregate group on the switch.
partner_system_id	The MAC address of the aggregate group of the remote system which is attached to the aggregate group of the switch.
partner_system_priority	The priority of the remote system to which the aggregation group is attached.
partner_admin_key	The administrative key for the remote partner of the aggregation group.
multi-chassis active	**Note:** *This parameter is not supported in this release.*
source-mac	Selects the source MAC address hashing option.
destination-mac	Selects the destination MAC address hashing option.
source-and-destination-mac	Selects the source MAC address and destination MAC address hashing option.

source-ip	Selects the source IP hashing option.
destination-ip	Selects the destination IP hashing option.
source-and-destination-ip	Selects the source IP and destination IP hashing option.

Defaults

parameter	default
enable | disable	enable
hash_option	**source-and-destination-IP** (Layer 3 traffic) **source-and-destination-mac** (Layer 2 traffic)

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a dynamic aggregate group from the configuration.
- You must disable the group with the **linkagg lacp agg admin-state** command before you can delete a dynamic link aggregate group.
- Optional parameters for the dynamic aggregate group can be configured when the aggregate is created. The dynamic aggregate group can be modified after the optional parameters are assigned.
- Specify the **hash** parameter option when the link aggregate is first created. The hashing algorithm options apply to unicast traffic and are not modifiable once the aggregate is created. If different options are required:
  - Disassociate all ports currently associated with the aggregate.
  - Delete the aggregate from the switch configuration.
  - Create the aggregate again with the new hashing options.
- It is not necessary to administratively down the linkagg ports before changing the hashing algorithm, but doing so is recommended.
- The hashing algorithm does not take into consideration the speed of the ports to distribute the traffic. In other words, the same number of flows is distributed evenly on each port without consideration of the line speed.
- Aggregate load balancing is performed at the ingress side.
- Per-aggregate hashing is local to the switch, so each side of the aggregation can use different configurations for the hashing algorithms.
- Link aggregation follows the global hash control settings configured through the **hash-control brief** or **hash-control extended** commands.
- For example, if the **source-mac** option is specified for L2 hashing:
  - If the global hash-control is in brief mode, hashing is based on source MAC address only.
  - If the global hash-control is in extended mode, hashing is based on source MAC address, VLAN, Ethertype, and source module ID/port.

- For example, if the **source-ip** option is specified for L3 hashing:
  - If the global hash-control is in brief mode, hashing is based on source IP address only.
  - If the global hash-control is in extended mode, hashing is based on source IP address and source UDP-TCP Port.
- To load balance Unknown Destination/Broadcast/Multicast traffic on all the ports of the aggregate, use the **hash-control** command to enable load balancing of DFL traffic.
- Use the **linkagg static agg size** command to create static aggregate groups. See page 10-3 for more information about this command.

Examples

```
-> linkagg lacp agg 2-5 size 4
-> linkagg lacp agg 3 size 2 admin-state disable actor system-priority 65535
-> no linkagg lacp agg 2-5 size 4
```

Release History

Release 8.1.1; command introduced.

Related Commands

show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggSize
   alclnkaggAggLacpType
   alclnkaggAggName
   alclnkaggAggAdminState
   alclnkaggAggActorAdminKey
   alclnkaggAggActorSystemPriority
   alclnkaggAggActorSystemID
   alclnkaggAggPartnerSystemID
   alclnkaggAggPartnerSystemPriority
   alclnkaggAggPartnerAdminKey
```

linkagg lacp agg name

Configures a name for a dynamic aggregate group.

linkagg lacp agg *agg_id* **name** *name*

no linkagg lacp agg *agg_id***[-***agg_id2***] name**

Syntax Definitions

agg_id	The ID number corresponding to the dynamic aggregate group.
-agg_id2	The last link aggregate ID in a range of link aggregate IDs.
name	The name of the dynamic aggregate group. Can be an alphanumeric string. Spaces must be contained within quotes (for example, “Dynamic Group 1”).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a name from a single or a range of dynamic aggregate groups simultaneously.
- Assign names to individual dynamic link aggregate groups separately.

Examples

```
-> linkagg lacp agg 2 name finance
-> no linkagg lacp agg 2-5 name
```

Release History

Release 8.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggName
```

linkagg lacp agg admin-state

Configures the administrative state of a dynamic aggregate group or a range of dynamic aggregate groups.

linkagg lacp agg *agg_id***[-***agg_id2***] admin-state {enable | disable}**

Syntax Definitions

agg_id	The ID number corresponding to the dynamic aggregate group.
-agg_id2	The last link aggregate ID in a range of link aggregate IDs.
enable	Specifies that the dynamic aggregate group is active and is able to aggregate links.
disable	Specifies that the operation of a dynamic aggregate group cannot be performed.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the administrative state is set to **disable**, the operation of a dynamic aggregation (LACP) group cannot be performed.
- You can also enable or disable the admin-state for a range of link aggregate IDs simultaneously, using this command.

Examples

```
-> linkagg lacp agg 2 admin-state disable
-> linkagg lacp agg 2-10 admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregates.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggAdminState
```

linkagg lacp agg actor admin-key

Configures the administrative key associated with a dynamic aggregate group.

linkagg lacp agg *agg_id***[-***agg_id2***] actor admin-key** *actor_admin_key*

no linkagg lacp agg *agg_id***[-***agg_id2***] actor admin-key**

Syntax Definitions

agg_id	The ID number corresponding to the dynamic aggregate group.
-agg_id	The last link aggregate ID in a range of link aggregate IDs.
actor_admin_key	The administrative key value associated with the dynamic aggregate group.

Defaults

parameter	default
actor_admin_key	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to remove an actor admin key from a dynamic aggregate group.

Examples

```
-> linkagg lacp agg 3-5 actor admin-key 2
-> no linkagg lacp agg 3-5 actor admin-key
```

Release History

Release 8.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggActorAdminKey
```

linkagg lacp agg actor system-priority

Configures the priority of the dynamic aggregate group.

linkagg lacp agg *agg_id***[-***agg_id2***] actor system-priority** *actor_system_priority*

no linkagg lacp agg *agg_id***[-***agg_id2***] actor system-priority**

Syntax Definitions

agg_id	The ID number corresponding to the link aggregate group.
-agg_id2	The last link aggregate ID in a range of link aggregate IDs.
actor_system_priority	The priority of the dynamic aggregate group of the switch in relation to other aggregate groups.

Defaults

parameter	default
actor_system_priority	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to return the value to its default.
- Ports with the same system priority value can join the same dynamic aggregate group.
- To assign or remove the actor system-priority for a series of link aggregate IDs, specify the range of link aggregate IDs with the **agg** keyword. Use a hyphen to separate the first and last link aggregate IDs of a range.

Examples

```
-> lacp linkagg 3 actor system-priority 100
-> no lacp linkagg 3 actor system-priority
```

Release History

Release 8.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggActorSystemPriority
```

linkagg lacp agg actor system-id

Configures the MAC address of a dynamic aggregate group on the switch.

linkagg lacp agg *agg_id***[-***agg_id2***] actor system-id** *actor_system_id*

no linkagg lacp agg *agg_id***[-***agg_id2***] actor system-id**

Syntax Definitions

agg_id	The ID number corresponding to the dynamic aggregate group.
-agg_id2	The last link aggregate ID in a range of link aggregate IDs.
actor_system_id	The MAC address of the dynamic aggregate group on the switch in the hexadecimal format *xx:xx:xx:xx:xx:xx*.

Defaults

parameter	default
actor_system_id	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the MAC address assignment (actor system ID) from a dynamic link aggregate or a range of dynamic link aggregates simultaneously.
- You can configure the MAC address for a range of dynamic link aggregate IDs simultaneously. Use a hyphen to separate the first and last link aggregate IDs of a range along with this command.

Examples

```
-> linkagg lacp agg 2 actor system-id 00:20:da:81:d5:b0
-> no linkagg lacp agg 3-10 actor system-id
-> no linkagg lacp agg 11 actor system-id
```

Release History

Release 8.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggActorSystemID
```

linkagg lacp agg partner system-id

Configures the MAC address of the dynamic aggregate group of the remote system that is attached to the dynamic aggregate group of the local switch.

linkagg lacp agg *agg_id***[-***agg_id2***] partner system-id** *partner_system_id*

no linkagg lacp agg *agg_id***[-***agg_id2***] partner system-id**

Syntax Definitions

agg_id	The ID number corresponding to the dynamic aggregate group on the switch.
-agg_id2	The last link aggregate ID in a range of link aggregate IDs.
partner_system_id	The MAC address of the dynamic aggregate group of the remote switch in the hexadecimal format *xx:xx:xx:xx:xx:xx*.

Defaults

parameter	default
partner_system_id	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a partner system ID from a dynamic aggregate group or a range of groups assigned with the same partner system IDs together.
- The *partner_system_id* and the *partner_system_priority* together specify the priority of the remote system.
- You can configure a partner system ID for a range of dynamic link aggregate IDs simultaneously. Use a hyphen to separate the first and last link aggregate IDs of a range along with this command.

Examples

```
-> linkagg lacp agg 2 partner system-id 00:20:da4:32:81
-> linkagg lacp agg 2-10 partner system-id 00:20:da4:32:82
-> no linkagg lacp agg 2-10 partner system-id
```

Release History

Release 8.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggPartnerSystemID
```

linkagg lacp agg partner system-priority

Configures the priority of the dynamic aggregate group of the remote system which is attached to the dynamic aggregate group of the local switch.

linkagg lacp agg *agg_id***[-***agg_id2***] partner system-priority** *partner_system_priority*

no linkagg lacp agg *agg_id***[-***agg_id2***] partner system-priority**

Syntax Definitions

agg_id	The ID number corresponding to the dynamic aggregate group.
-agg_id2	The last link aggregate ID in a range of link aggregate IDs.
partner_system_priority	The priority of the dynamic aggregate group of the remote system which is attached to the dynamic aggregate group of the local switch.

Defaults

parameter	default
partner_system_priority	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to return to the priority value to its default.
- The *partner_system_id* and the *partner_system_priority* together specify the priority of the remote system.
- You can apply the partner system-priority to a range of link aggregate IDs simultaneously. Use a hyphen to separate the first and last link aggregate IDs of a range after the **agg** keyword.

Examples

```
-> linkagg lacp agg 3 partner system-priority 65535
-> linkagg lacp agg 3-6 partner system-priority 65535
-> no linkagg lacp agg 3-6 partner system-priority
```

Release History

Release 8.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggPartnerSystemPriority
```

linkagg lacp agg partner admin-key

Configures the administrative key for the remote partner of the dynamic aggregation group.

linkagg lacp agg *agg_id***[-***agg_id2***] partner admin-key** *partner_admin_key*

no linkagg lacp agg *agg_id***[-***agg_id2***] partner admin-key**

Syntax Definitions

agg_id	The ID number corresponding to the dynamic aggregate group.
-agg_id2	The last link aggregate ID in a range of link aggregate IDs.
partner_admin_key	The administrative key for the remote partner of the dynamic aggregation group.

Defaults

parameter	default
partner_admin_key	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a partner admin-key from a dynamic aggregate group.
- The partner admin-key can be assigned for a range of dynamic link aggregate IDs simultaneously.

Examples

```
-> linkagg lacp agg 3-5 partner admin-key 3
-> no linkagg lacp agg 3-10 partner admin-key
```

Release History

Release 8.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

MIB Objects

```
alclnkaggAggTable
   alclnkaggAggNumber
   alclnkaggAggPartnerAdminKey
```

linkagg lacp port actor admin-key

Configures an actor administrative key for a port, which allows the port to join a dynamic aggregate group.

linkagg lacp port *chassis_id/slot/port***[-***port2***] actor admin-key** *actor_admin_key*
[actor admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}]
[actor system id *actor_system_id***]**
[actor system priority *actor_system_priority***]**
[partner admin system id *partner_admin_system_id***]**
[partner admin-key *partner_admin_key***]**
[partner admin system priority *partner_admin_system_priority***]**
[partner admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}]
[actor port priority *actor_port_priority***]**
[partner admin port *partner_admin_port***]**
[partner admin port priority *partner_admin_port_priority***]**

no linkagg lacp port *chassis_id/slot/port***[-***port2***] [actor admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}]**
[actor system id *actor_system_id***]**
[actor system priority *actor_system_priority***]**
[partner admin system id *partner_admin_system_id***]**
[partner admin-key *partner_admin_key***]**
[partner admin system priority *partner_admin_system_priority***]**
[partner admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}]
[actor port priority *actor_port_priority***]**
[partner admin port *partner_admin_port***]**
[partner admin port priority *partner_admin_port_priority***]**

Syntax Definitions

chassis_id	The chassis ID number.
slot	The slot number for this aggregate.
port	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
-port2	The last port number in a range of slot/port IDs.
actor_admin_key	The administrative key associated with this dynamic aggregate group.
actor admin-state	See the **linkagg lacp port actor admin-state** command.
actor_system_id	The MAC address of this dynamic aggregate group on the switch.
actor_system_priority	The priority of the dynamic aggregate group.
partner_admin_system_id	The MAC address of the dynamic aggregate group of the remote switch.
partner_admin_key	The administrative key for the remote partner of the dynamic aggregation group.

partner_admin_system_priority	The priority of the remote system to which the dynamic aggregation group is attached.
partner admin-state	See the **linkagg lacp agg partner admin-state** command.
actor_port_priority	The priority of the actor port.
partner_admin_port	The administrative state of the partner port.
partner_admin_port_priority	The priority of the partner port.

Defaults

parameter	default
[active] [timeout]	active, timeout, aggregate

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a slot and port from a dynamic aggregate group.
- A port can belong to only one aggregate group.
- Ports that belong to a dynamic link aggregate must be configured to the same link speed.
- Ports that belong to the same dynamic aggregate group need not be configured sequentially and can be on any Network Interface (NI).

Examples

```
-> linkagg lacp agg 3/1 actor admin-key 0
-> no linkagg lacp agg 3/1 actor admin-key
```

Release History

Release 8.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregates.

   alclnkaggAggPortActorPortPriority
   alclnkaggAggPortPartnerAdminPort
   alclnkaggAggPortPartnerAdminPortPriority
```

linkagg lacp port actor admin-state

Configures the system administrative state of the slot and port for the dynamic aggregate group on the local switch. The state values correspond to bits in the actor state octet in the LACPDU frame.

linkagg lacp port *chassis_id/slot/port***[-***port2***] actor admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}**

no linkagg lacp port *chassis_id/slot/port***[-***port2***] actor admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}**

Syntax Definitions

chassis_id	The chassis ID number.
slot	The slot number for this aggregate.
port	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
-port2	The last port number in a range of port IDs.
active	Specifies that bit 0 in the actor state octet is enabled. When this bit is set, the dynamic aggregate group is able to exchange LACPDU frames. By default, this value is set.
timeout	Specifies that bit 1 in the actor state octet is enabled. When this bit is set, a short timeout is used for LACPDU frames. When this bit is disabled, a long timeout is used for LACPDU frames. By default, this value is set.
aggregate	Specifies that bit 2 in the actor state octet is enabled. When this bit is set, the system considers this port to be a potential candidate for aggregation. If this bit is not enabled, the system considers the port to be individual (it can only operate as a single link). By default, this value is set.
synchronize	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 3) is set by the system, the port is allocated to the correct dynamic aggregation group. If this bit is not set by the system, the port is not allocated to the correct dynamic aggregation group.
collect	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 4) is set by the system, incoming LACPDU frames are collected from the individual ports that make up the dynamic aggregate group.
distribute	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 5) is set by the system, distributing outgoing frames on the port is disabled.
default	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 6) is set by the system, it indicates that the actor is using the defaulted partner information administratively configured for the partner.

expire	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 7) is set by the system, the actor cannot receive LACPDU frames.
none	Resets all administrative states to their default configurations.

Defaults

parameter	default
[active] [timeout]	active, timeout, aggregate

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to restore the LACPDU bit settings to their default configuration.
- When the actor admin-state is set to **none**, all bit values are restored to their default configurations.

Examples

```
-> linkagg lacp port 4/2 actor admin-state synchronize collect distribute
-> no linkagg lacp port 4/2 actor admin-state synchronize collect
-> linkagg lacp port 4/2 actor admin-state none
```

Release History

Release 8.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.
show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```
alclnkaggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortActorAdminState
```

linkagg lacp port actor system-id

Configures the system ID (i.e., MAC address) for the local port associated with a dynamic aggregate group.

linkagg lacp port *chassis_id/slot/port***[-***port2***] actor system-id** *actor_system_id*

no linkagg lacp port *chassis_id/slot/port***[-***port2***] actor system-id**

Syntax Definitions

chassis_id	The chassis ID number.
slot	The slot number for this aggregate.
port	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
-port2	The last port number in a range of port IDs.
actor_system_id	The MAC address of the dynamic aggregate group on the switch in the hexadecimal format *xx:xx:xx:xx:xx:xx*.

Defaults

parameter	default
actor_system_id	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the actor system ID from a slot and port or a range of slot and ports associated with a dynamic aggregate group.
- Configure the system ID for a range of local ports simultaneously. Use a hyphen to separate the first and last port IDs of a range after the **port** keyword.

Examples

```
-> linkagg lacp port 3/1-10 actor system-id 00:20:da:06:ba:d3
-> no linkagg lacp port 3/1-10 actor system-id
```

Release History

Release 8.1.1; command introduced.

Related Commands

show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```
alclnkaggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortActorSystemID
```

linkagg lacp port actor system-priority

Configures the system priority of the port on the switch that belongs to the dynamic aggregate group.

linkagg lacp port *chassis_id/slot/port***[-***port2***] actor system-priority** *actor_system_priority*

no linkagg lacp port *chassis_id/slot/port***[-***port2***] actor system-priority**

Syntax Definitions

chassis_id	The chassis ID number.
slot	The slot number for this aggregate.
port	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
-port2	The last port number in a range of port IDs.
actor_system_priority	The priority of the dynamic aggregate group.

Defaults

parameter	default
actor_system_priority	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an actor system priority value from a slot and port or a range of slot and ports associated with a dynamic aggregate group.
- Configure the actor system-priority to a range of ports simultaneously. Use a hyphen to separate the first and last port of a range after the **port** keyword.

Examples

```
-> linkagg lacp port 3/2-10 actor system-priority 65
-> no linkagg lacp port 3/2-10 actor system-priority
```

Release History

Release 8.1.1; command introduced.

Related Commands

MIB Objects

```
AlcLnkAggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortActorSystemPriority
```

linkagg lacp agg partner admin-state

Configures the system administrative state of the slot and port for the dynamic aggregate group on the remote switch. The state values correspond to bits in the actor state octet in the LACPDU frame.

linkagg lacp port *chassis_id//slot/port***[-***port2***] partner admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}**

no linkagg lacp port *chassis_id//slot/port***[-***port2***] partner admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default] [expire] | none}**

Syntax Definitions

chassis_id	The chassis ID number.
slot	The slot number for this aggregate.
port	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
-port2	The last port number in a range of port IDs.
active	Specifies that bit 0 in the partner state octet is enabled. When this bit is set, the dynamic aggregate group is able to exchange LACPDU frames. By default, this value is set.
timeout	Specifies that bit 1 in the partner state octet is enabled. When this bit is set, a short timeout is used for LACPDU frames. When this bit is disabled, a long timeout is used for LACPDU frames. By default, this value is set.
aggregate	Specifies that bit 2 in the partner state octet is enabled. When this bit is set, the system considers this port to be a potential candidate for aggregation. If this bit is not enabled, the system considers the port to be individual (it can only operate as a single link). By default, this value is set.
synchronize	Specifies that bit 3 in the partner state octet is enabled. When this bit is set, the port is allocated to the correct dynamic aggregation group. If this bit is not enabled, the port is not allocated to the correct aggregation group. By default, this value is disabled.
collect	Specifying this keyword has no effect because the system always determines its value. When this bit (bit 4) is set by the system, incoming LACPDU frames are collected from the individual ports that make up the dynamic aggregate group.
distribute	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 5) is set by the system, distributing outgoing frames on the port is disabled.
default	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 6) is set by the system, it indicates that the partner is using the defaulted actor information administratively configured for the actor.

expire	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 7) is set by the system, the partner cannot receive LACPDU frames.
none	Resets all administrative states to their default configurations.

Defaults

parameter	default
[active] [timeout]	active, timeout, aggregate

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to restore the LACPDU bit settings to their default configuration for a single port or a range of ports.
- When the partner admin-state is set to **none**, all bit values are restored to their default configurations.
- Configure the system administrative state for a range of ports simultaneously. Use a hyphen to separate the first and last port of a range after the **port** keyword.

Examples

```
-> lacp port 4/2-10 partner admin-state synchronize collect distribute
-> no lacp agg 4/2-10 partner admin-state synchronize collect
```

Release History

Release 8.1.1; command introduced.

Related Commands

show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```
alclnkaggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortPartnerAdminState
```

linkagg lacp port partner admin system-id

Configures the partner administrative system ID for a dynamic aggregate group port.

linkagg lacp port *chassis_id//slot/port***[**-*port2***] partner admin system-id** *partner_admin_system_id*

no linkagg lacp port *chassis_id//slot/port***[**-*port2***] partner admin system-id**

Syntax Definitions

chassis_id	The chassis ID number.
slot	The slot number for this aggregate.
port	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
-port2	The last port number in a range of port IDs.
partner_admin_system_id	The MAC address of the remote dynamic aggregate group in the hexadecimal format *xx:xx:xx:xx:xx:xx*.

Defaults

parameter	default
partner_admin_system_id	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to remove a partner administrative system ID from a slot and port or a range of slot and ports associated with a dynamic aggregate group.

Examples

```
-> linkagg lacp port 3/1-10 partner admin system-id 00:20:da:05:f6:23
```

Release History

Release 8.1.1; command introduced.

Related Commands

linkagg lacp agg size	Creates a dynamic aggregate group.

MIB Objects

```
AlcLnkAggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortPartnerAdminSystemID
```

linkagg lacp port partner admin-key

Configures the partner administrative key for a dynamic aggregate group port.

linkagg lacp port *chassis_id/slot/port***[-***port2***] partner admin-key** *partner_admin_key*

no linkagg lacp port *chassis_id/slot/port***[-***port2***] partner admin-key**

Syntax Definitions

chassis_id	The chassis ID number.
slot	The slot number for this aggregate.
port	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
-port2	The last port number in a range of port IDs.
partner_admin_key	The administrative key for the remote partner of a dynamic aggregation group.

Defaults

parameter	default
partner_admin_key	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a partner admin key value from a slot and port or a range of slot and ports associated with a dynamic aggregate group.

Examples

```
-> linkagg lacp port 2/1-5 partner admin-key 0
-> no linkagg lacp port 2/1-5 partner admin-key
```

Release History

Release 8.1.1; command introduced.

Related Commands

show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```
AlcLnkAggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortPartnerAdminKey
```

linkagg lacp port partner admin system-priority

Configures the partner system priority for a dynamic aggregate group port.

linkagg lacp port *chassis_id/slot/port***[-***port2***] partner admin system-priority** *partner_admin_system_priority*

no linkagg lacp port *chassis_id/slot/port***[-***port2***] partner admin system-priority**

Syntax Definitions

chassis_id	The chassis ID number.
slot	The slot number for this aggregate.
port	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
-port2	The last port number in a range of port IDs.
partner_admin_system_priority	The priority of the dynamic aggregate group of the remote switch to which the aggregation group is attached.

Defaults

parameter	default
partner_admin_system_priority	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to remove a *partner_system_priority* value from a slot and port or a range of slot and ports associated with a dynamic aggregate group.

Examples

```
-> linkagg lacp port 2/1-5 partner admin system-priority 65
-> no linkagg lacp port 2/1-5 partner admin system-priority
```

Release History

Release 8.1.1; command introduced.

Related Commands

linkagg lacp port actor port priority

Configures the priority for an actor port.

linkagg lacp port *chassis_id/slot/port***[-***port2***] actor port-priority** *actor_port_priority*

no linkagg lacp port *chassis_id/slot/port***[-***port2***] actor port-priority**

Syntax Definitions

chassis_id	The chassis ID number.
slot	The slot number for this aggregate.
port	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
-port2	The last port number in a range of port IDs.
actor_port_priority	The priority of the actor port.

Defaults

parameter	default
actor_port_priority	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to remove an *actor_port_priority* value from a slot and port or a range of slot and ports associated with a dynamic aggregate group.

Examples

```
-> linkagg lacp port 2/1-5 actor port-priority 100
-> no linkagg lacp port 2/1-5 actor port-priority
```

Release History

Release 8.1.1; command introduced.

linkagg lacp port partner admin-port

Configures the administrative status of a partner port.

linkagg lacp port *chassis_id/slot/port***[**-*port2***] partner admin-port** *partner_admin_port*

no linkagg lacp port *chassis_id/slot/port***[**-*port2***] partner admin-port**

Syntax Definitions

chassis_id	The chassis ID number.
slot	The slot number for this aggregate.
port	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
-port2	The last port number in a range of port IDs.
partner_admin_port	The administrative state of the partner port.

Defaults

parameter	default
partner_admin_port	0

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to remove a *partner_admin_port* value from a slot and port or a range of slot and ports associated with a dynamic aggregate group.

Examples

```
-> linkagg lacp port 2/1-5 partner admin-port 255
-> no linkagg lacp port 2/1-5 partner admin-port
```

Release History

Release 8.1.1; command introduced.

show linkagg port	Displays information about ports associated with a particular aggregate group or all aggregate groups.

MIB Objects

```
AlcLnkAggAggPortTable
   alclnkaggAggPortGlobalPortNumber
   alclnkaggAggPortPartnerAdminPortPriority
```

dhl name

Configures a Dual-homed Link (DHL) session associated with the specified session ID number.

dhl *dhl_num* **[name** *name***]**

no dhl *dhl_num*

Syntax Definitions

dhl_num	The DHL session ID number. Valid range is 1–1000.
name	The name of the DHL session.

Defaults

By default, if a name is not assigned to a DHL session, the session is configured as DHL-1.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a DHL session ID from the switch configuration.
- Use the optional **name** parameter to specify a name for the DHL session.
- Only one DHL session can be configured on a switch.
- Once the DHL session ID is created, assign a link A port and a link B port to the session. This is required before administratively enabling the DHL session is allowed.

Examples

```
-> dhl 1 name dhl_session1
-> no dhl 1
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhl num linka linkb	Associates a pair of links (port or linkagg) with the DHL session.
dhl num admin-state	Configures the administrative status of the DHL session.
show dhl num	Displays information about a specific DHL session.

MIB Objects

```
alaDHLSessionTable
   alaDHLSessionIndex
   alaDHLSessionDescr
```

dhl num linka linkb

Configures two ports or two link aggregates or a combination of both as linkA and linkB for the specified DHL session. Only two links are allowed per DHL session; only one DHL session per switch is allowed.

dhl *dhl_num* **linka {port** *chassis/slot/port* **| linkagg** *agg_id***} linkb {port** *chassis/slot/port* **| linkagg** *agg_id***}**

no dhl *dhl_num* **linka {port** *chassis/slot/port* **| linkagg** *agg_id***} linkb {port** *chassis/slot/port* **| linkagg** *agg_id***}**

Syntax Definitions

dhl_num	An existing DHL session ID number.
chassis_id	The chassis ID number.
slot	The slot number to designate as a link for the DHL session.
port	The physical port number to designate as a link for the DHL session.
agg_id	The link aggregate ID number to designate as a link for the DHL session.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the linkA and linkB ports from the specified session ID. Before attempting to remove the links, administratively disable the DHL session.
- Make sure that DHL linkA and linkB are associated with each of the VLAN that the DHL session will protect. Any VLAN not associated with both the links or only associated with one of the links is unprotected.
- DHL linkA *and* linkB should belong to the same default VLAN. In addition, select a default VLAN that is one of the VLANs that the DHL session will protect. For example, if the session is going to protect VLANs 10-20, then assign one of those VLANs as the default VLAN for linkA and linkB.
- Only one DHL session per switch is allowed. Each session can have only two links (linkA and linkB). Specify a physical switch port or a link aggregate (linkagg) ID as a DHL link. The same port or link aggregate is not configurable as both linkA or linkB.
- DHL is not supported on mobile, 802.1x-enabled, GVRP, or UNI ports. DHL is also not supported on a port that is a member of a link aggregate or a port the is enabled for transparent bridging.
- The administrative state of a DHL session is not configurable until a linkA port and a linkB port are associated with the specified DHL session ID number.
- Changing the port designations for linkA and linkB is not recommended while the DHL session is enabled.

- Removing a link aggregate from the switch configuration is not allowed if the aggregate is configured as a link for a DHL session.

Examples

```
-> dhl 1 linka port 1/1 linkb port 1/2
-> dhl 1 linka  linkagg 1  linkb port 1/2
-> dhl 1 linka port 1/1 linkb linkagg 1
-> dhl 1 linka  linkagg 1  linkb linkagg 2
-> no dhl 1 linka port 1/1 linkb port 1/2
```

Release History

Release 8.2.1; command was introduced.

Related Commands

   alaDHLLinkslinkB
```

dhl num admin-state

Enables or disables the administrative state of a DHL session.

dhl *dhl_num* **admin-state {enable | disable}**

Syntax Definitions

dhl_num	An existing DHL session ID number.
enable	Enables the DHL session.
disable	Disables the DHL session.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The DHL session ID specified with this command must already exist in the switch configuration.
- The administrative state cannot be enabled until a linkA port and a linkB port are associated with the specified DHL session ID number.

Examples

```
-> dhl 1 admin-state enable
-> dhl 1 admin-state disable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhl name	Configures a session ID for the DHL session.
dhl num admin-state	Configures the administrative status for the DHL session.
show dhl	Displays the global status of the DHL configuration.
show dhl num	Displays information about a specific DHL session.

MIB Objects

```
alaDHLSessionTable
   alaDHLSessionAdminStatus
```

dhl num vlan-map linkb

Configures a VLAN-MAP (a single VLAN or a range of VLANs) from a common pool of VLANs to operate on DHL link B.

dhl *dhl_num* **vlan-map linkb {***vlan_id***[-***vlan_id***]}**

no dhl *dhl_num* **vlan-map linkb {***vlan_id***[-***vlan_id***]}**

Syntax Definitions

dhl_num	A DHL session ID number.
*vlan_id***[-***vlan_id***]**	A VLAN ID number or a range of VLAN IDs to map to linkB. The valid range is 1–4094.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A DHL session has to be created before a VLAN-MAP can be configured.
- When the DHL session is active, the common VLAN that both the dual homed links belong to is treated as a protected VLAN. The VLAN containing only one dual homed link is treated as an unprotected VLAN. Traffic is forwarded only on the dual homed links belonging to the protected VLAN.
- If a VLAN is removed globally and if the VLAN belongs to a particular dual homed link, then the VLAN will automatically be removed from the dual homed link.
- If one dual homed link, for example linkA, is moved out of a protected VLAN, then the VLAN becomes unprotected and the VPA is removed from the second dual homed link, for example linkB.
- If the admin state of a VLAN is changed to disabled, and if the VLAN is part of a protected VLAN, then the disabled VLAN is removed from the operational DHL VLAN list but will be present in the protected VLAN list.
- If the admin state of a dual homed link, for example linkA, is changed to disabled, then the protected VLANs of the disabled linkA are moved to the other link, for example linkB. When linkA is re-enabled, then the VLANs are moved back to linkA.
- If the VLAN-MAP of linkB is removed, then the VPAs for the linkB will also be removed and the VLANs configured on linkB are moved to linkA.
- If a VLAN is configured as default on one dual homed link, for example linkA, then the same VLAN cannot be configured as tagged on the other link, for example linkB.

Examples

```
-> vlan 10-30
-> vlan 10-20 802.1q 1/1
-> vlan 4
-> vlan port default 1/1-2
-> dhl 1 name dhl_session1
-> dhl 1 linka port 1/1 linkb port 1/2
-> dhl 1 vlan-map linkb 18-20
-> no dhl 1 vlan-map linkb 18-20
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhl name	Configures a session ID for the DHL session.
dhl num admin-state	Configures the administrative status for the DHL session.
show dhl	Displays the global status of the DHL configuration.
show dhl num	Displays information about a specific DHL session.
show dhl num link	Displays information about a specific link.

MIB Objects

```

   alaDHLVlanMapSessionIndex
   alaDHLVlanMapVlanStart
   alaDHLVlanMapVlanEnd
   alaDHLVlanMapRowStatus
```

dhl num pre-emption-time

Configures the pre-emption timer for the DHL session. A pre-emption timer is a recovery-delay timer that is used to delay the switchover of VLANs to their primary links. It is the delay in the resumption of traffic when a link that is down is brought up.

dhl *dhl_num* **pre-emption-time** *seconds*

Syntax Definitions

dhl_num	A DHL session ID number.
seconds	The number of seconds for the delay in the switchover of VLANs to their primary links. The valid range is 0–600.

Defaults

parameter	default
seconds	30 seconds

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Pre-emption timer is applicable only when a failed port is brought up. If both ports are down, the pre-emption timer is activated only when the second port is brought up.
- If the pre-emption timer value is set to 0, then there will be no delay in the VLANs being moved back to their primary link.
- If a link fails when the pre-emption timer is active, that is when the remaining pre-emption time value is not equal to 0, then the timer will be halted.
- When the pre-emption timer is active for a particular link and if the other link goes down, then the VLANs of the link that is down are automatically moved to the port for which the pre-emption timer is active.
- When DHL ports spanned across the NIs or DHC ports are on the same NI but data port is on different NI, it is advised to configure mac-flush mechanism (either Raw/MVRP) for faster convergence.

Examples

```
-> dhl 1 pre-emption-time 40sec
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhl name	Configures a session ID for the DHL session.
show dhl	Displays the global status of the DHL configuration.
show dhl num	Displays information about a specific DHL session.
show dhl num link	Displays information about a specific link.

MIB Objects

```
alaDHLSessionTable
   alaDHLSessionPreemptionTime
```

dhl num mac-flushing

Configures the MAC-flushing technique for the DHL session. The MAC-flushing technique is used to correct any stale MAC entries that are caused when a dual homed link goes down.

dhl *dhl_num* **mac-flushing {none | raw | mvrp}**

Syntax Definitions

dhl_num	A DHL session ID number.
none	Flushing of the MAC address tables does not occur.
raw	Method of flushing when VPAs of the links moved across them due to link up/down or configuration change (VLAN-map). The switch determines the MAC addresses within the affected VLANs
mvrp	Method of flushing when one link fails and the other link issues 'join' declarations to establish connectivity. These new joins are flagged as 'new' and they are forwarded by the core devices causing flushing on the core network for the active VLANs.

Defaults

parameter	default
none | raw | mvrp	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Before enabling MVRP on dual homed links, the Registrar Mode should be set to 'forbidden', failing which an error message is displayed when configuring DHL. If the Registrar Mode is set to 'not forbidden, then changes cannot be made to the MVRP configuration on the dual homed links.
- If the MAC-flushing technique is set to MVRP and if MVRP is not enabled on the dual homed links, then the **show dhl** command displays the active MAC-flushing technique as **none**. When MVRP is enabled on the dual homed links, then the MAC-flushing technique changes to **MVRP** and the Registrar Mode of the links is automatically set to ‘forbidden’.
- If VLANs are moved across the dual homed links as a result of configuration changes, then MAC-flushing is automatically enabled, if configured, excepting dual homed links that are changed on the fly.

Examples

```
-> dhl 1 mac-flushing none
-> dhl 1 mac-flushing raw
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhl name	Configures a session ID for the DHL session.

```

show dhl

Displays the global status of the DHL configuration.

show dhl

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show DHL
 Number  Name    Admin    Oper     Pre-emption    Mac-flushing   Active Mac-flushing
                 state    state    time
-------+------+--------+-------+-----------+-----------------+--------------------
  1      DHL-1   UP       UP      30sec          Raw                Raw
```

output definitions

Number	Number of the DHL session.
Name	The user-defined text description of the DHL session.
Admin state	The administrative status of the DHL session.
Oper state	The operational status of the DHL session.
Pre-emption time	The pre-emption time in seconds of the DHL session.
Mac-flushing	Mac-flushing technique on the DHL session.
Active Mac-flushing	Mac-flushing technique that is currently active on the DHL session.

Release History

Release 8.2.1; command was introduced.

Related Commands

```

output definitions

DHL session Name	The user-defined text description of the DHL session.
Admin state	The current administrative status of the DHL session.
Operational state	The operational state of the DHL session.

output definitions

Pre-emption time	The delay-interval in seconds to move the VLANs back to their original links.
Mac-flushing	Mac-flushing technique on the DHL session.
Active Mac-flushing	The active Mac-flushing technique that is enabled on the specified DHL session.
Protected VLANs	The common VLANs that contain both the dual homed links, for example linkA and linkB.
LinkA	A dual homed link that is part of a pair of DHL links that can be configured per switch.
Port	The port number of linkA.
Operational state	The operational state of the port. The operational states are UP or DOWN.
Un protected VLANs	The VLANs containing only one dual homed link.
Active VLANs	The VLANs that are in an active state.
LinkB	A dual homed link that is part of a pair of DHL links that can be configured per switch.
Port	The port number of linkB.
Operational state	The operational state of the port. The operational states are UP or DOWN.
Un protected VLANs	The VLANs containing only one dual homed link.
VLAN-map	The DHL VLAN map for linkB. This specifies the VLANs that are operational on DHL linkB from the common pool of VLANs between DHL linkA and linkB.
Operational VLANs	The VLANs that are in an operational state.

linkagg range

Modifies the range of standard and MC-LAG link aggregation identifiers.

Note: This command is not supported in this release.

linkagg range local {*agg_id-agg_id* | **none**} **peer** {*agg_id-agg_id* | **none**} **multi-chassis** {*agg_id-agg_id* | **none**}

Syntax Definitions

agg_id	The first or last identifier in the range.
local	The range of standard local aggregate identifiers.
peer	The range of standard peer aggregate identifiers.
multi-chassis	The range of MC-LAG aggregate identifiers.
none	No aggregate identifiers range is specified.

Defaults

parameter	default
local	0-47
peer	48-95
multi-chassis	96-127

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command in conjunction with the MC-LAG feature to change the maximum number of MC-LAG link aggregates that can be configured.
- The switch must be rebooted for the ranges to take affect.
- The maximum number of combined standard and MC-LAG link aggregates is 128.

Examples

```
-> linkagg range local 0-9 peer 10-19 multi-chassis 20-127
-> linkagg range local none peer none multi-chassis 0-127
```

Release History

Release 8.1.1; command introduced.

Related Commands

show linkagg range	Displays the link aggregate ranges.

MIB Objects

```
alclnkaggAggConfig
   alclnkAggLocalRangeOperMin
   alclnkAggLocalRangeOperMax
   alclnkAggLocalRangeConfiguredMin
   alclnkAggLocalRangeConfiguredMax

   alclnkAggMcLagRangeConfiguredMax
```

show linkagg

Displays information about static and dynamic (LACP) aggregate groups.

show linkagg [agg [*agg_id***[-***agg_id2***]]**

Syntax Definitions

agg_id	Specifies the aggregate group ID. Configured through the **linkagg static agg size** or **linkagg lacp agg size** command.
-agg_id2	The last link aggregate ID in a range of link aggregate IDs.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If no aggregation number is specified, information for all aggregate groups is displayed. If an aggregate number is specified, only the information about the relevant aggregate group is displayed. The fields included in the display depend on whether the aggregate group is a static or dynamic.
- Use the **show linkagg port** command to display information about aggregate group ports.

Examples

No aggregate group is specified:

```
-> show linkagg

Number  Aggregate  SNMP Id  Size  Admin State  Oper State     Att/Sel Ports
-------+----------+--------+----+-------------+-------------+--------+-----
   1     Static    40000001   8    ENABLED      UP             2   2
   2     Dynamic   40000002   4    ENABLED      DOWN           0   0
   3     Dynamic   40000003   8    ENABLED      DOWN           0   2
   4     Dynamic   40000004   8    ENABLED      UP             3   3
   5     Static    40000005   2    DISABLED     DOWN           0   0
```

output definitions

Number	The aggregate group number.
Aggregate	The type of aggregate group, which can be **Static** or **Dynamic**.
SNMP Id	The SNMP ID associated with the aggregate group.
Size	The number of links in this aggregate group.

output definitions (continued)

Admin State	The current administrative state of the aggregate group, which can be **ENABLED** or **DISABLED**. You can modify this parameter with the **linkagg static agg admin-state** command (see page 10-8) for static aggregate groups and with the **linkagg lacp agg admin-state** command (see page 10-16) for dynamic aggregate groups.
Oper State	The current operational state of the aggregate group, which can be **UP** or **DOWN**.
Att Ports	The number of ports actually attached to this aggregate group.
Sel Ports	The number of ports that could possibly attach to the aggregate group.

A static aggregate is specified:

```
-> show linkagg agg 5
Static Aggregate
  SNMP Id                   : 40000005,
  Aggregate Number          : 5,
  SNMP Descriptor           : Omnichannel Aggregate Number 5 ref 40000005 size 2,
  Name                      : AGG5,
  Admin State               : ENABLED,
  Operational State         : DOWN,
  Aggregate Size            : 2,
  Number of Selected Ports  : 0,
  Number of Reserved Ports  : 0,
  Number of Attached Ports  : 0,
  Primary Port              : NONE
  Port Selection Hash       : Tunnel-Protocol,
  Wait To Restore Time      : 0 Minutes
```

output definitions

SNMP Id	The SNMP ID associated with this static aggregate group.
Aggregate Number	The group number.
SNMP Descriptor	The standard MIB name for this static aggregate group.
Name	The name of this static aggregate group. You can modify this parameter with the **linkagg static agg name** command (see page 10-6).
Admin State	The administrative state of this static aggregate group, which can be **ENABLED** or **DISABLED**. You can modify this parameter with the **linkagg static agg admin-state** command (see page 10-8).
Operational State	The operational state of this static aggregate group, which can be **UP** or **DOWN**.
Aggregate Size	The number of links configured for this static aggregate group.
Number of Selected Ports	The number of ports that could possibly attach to this static aggregate group.
Number of Reserved Ports	The total number of ports reserved for use in link aggregation by this static aggregate group. (**Note**: This field is not relevant for static aggregate groups.)
Number of Attached Ports	The number of ports actually attached to this static aggregate group.

output definitions (continued)

Primary Port	The port number of the first port to join this static aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.
Port Selection Hash	The hashing option selected for a link aggregate port.
Wait To Restore Time	The wait-to-restore timer value, in minutes, for the aggregate.

A dynamic aggregate group is specified:

```
-> show linkagg agg 1-2

Dynamic Aggregate
  SNMP Id                  : 40000002,
  Aggregate Number         : 2,
  SNMP Descriptor          : Dynamic Aggregate Number 2 ref 40000002 size 4,
  Name                     : AGG 2,
  Admin State              : ENABLED,
  Operational State        : DOWN,
  Aggregate Size           : 4,
  Number of Selected Ports : 0,
  Number of Reserved Ports : 0,
  Number of Attached Ports : 0,
  Primary Port             : NONE,
  Port Selection Hash      : Source Destination Ip,
  Wait To Restore Time     : 0 Minutes
LACP
  MACAddress               : [00:1f:cc:00:00:00],
  Actor System Id          : [00:20:da:81:d5:b0],
  Actor System Priority    : 50,
  Actor Admin Key          : 120,
  Actor Oper Key           : 0,
  Partner System Id        : [00:20:da:81:d5:b1],
  Partner System Priority  : 70,
  Partner Admin Key        : 220,
  Partner Oper Key         : 0
```

output definitions

SNMP Id	The SNMP ID associated with this dynamic aggregate group.
Aggregate Number	The group number of this dynamic aggregate group.
SNMP Descriptor	The standard MIB name for this dynamic aggregate group.
Name	The name of this dynamic aggregate group. You can modify this parameter with the **linkagg lacp agg name** command (see page 10-14).
Admin State	The administrative state of this dynamic aggregate group, which can be **ENABLED** or **DISABLED**. You can modify this parameter with the **linkagg lacp agg admin-state** command (see page 10-16).
Operational State	The operational state of this dynamic aggregate group, which can be **UP** or **DOWN**.
Aggregate Size	The number of links configured for this dynamic aggregate group.
Number of Selected Ports	The number of ports available to this dynamic aggregate group.

output definitions (continued)

Number of Reserved Ports	The total number of ports reserved for use in link aggregation by this dynamic aggregate group.
Number of Attached Ports	The number of ports actually attached to this dynamic aggregate group.
Primary Port	The port number of the first port to join this dynamic aggregate group. If the first port to join the aggregate group is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.
Port Selection Hash	The hashing option selected for a link aggregate port.
Wait To Restore Time	The wait-to-restore timer value, in minutes, for the aggregate.
MACAddress	The MAC address associated with the primary port.
Actor System Id	The MAC address of this dynamic aggregate group. You can modify this parameter with the **linkagg lacp agg actor system-id** command (see page 10-21).
Actor System Priority	The priority of this dynamic aggregate group. You can modify this parameter with the **linkagg lacp agg actor system-priority** command (see page 10-19).
Actor Admin Key	The administrative key associated with this dynamic aggregate group. You can modify this parameter with the **linkagg lacp agg actor admin-key** command (see page 10-18).
Actor Oper Key	The operational key associated with this dynamic aggregate group.
Partner System Id	The MAC address of the remote dynamic aggregate group. You can modify this parameter with the **linkagg lacp agg partner system-id** command (see page 10-23).
Partner System Priority	The priority of the remote system to which this dynamic aggregation group is attached. You can modify this parameter with the **linkagg lacp agg partner system-priority** command (see page 10-25).
Partner Admin Key	The administrative key for the remote partner of the dynamic aggregation. You can modify this parameter with the **linkagg lacp agg partner admin-key** command (see page 10-27).
Partner Oper Key	The operational key of the remote system to which the dynamic aggregation group is attached.

Release History

Release 8.1.1; command introduced.

Displays information about link aggregation ports.

show linkagg {agg *agg_id***[-***agg_id2***]} port [***chassis_id/slot/port***]**

Syntax Definitions

agg_id	The ID number corresponding to the link aggregate group.
-agg_id2	The last link aggregate ID in a range of link aggregate IDs.
chassis_id	The chassis ID number.
slot	The slot number for this aggregate.
port	The port number for this aggregate.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If no slot/port is specified, the information for all slots/ports is displayed.
- If a particular slot or port is specified, the fields displayed depend upon whether the port belongs to a static aggregate group or a dynamic (LACP) aggregate group.
- If only a link aggregate or a range of link aggregates are specified along with the **agg** keyword, the port and related information for only the specified link aggregate IDs are displayed.

Examples

```
-> show linkagg port

Slot/Port Aggregate  SNMP Id   Status   Agg  Oper Link Prim
---------+----------+--------+----------+----+----+----+----+----
   2/1    Static        2001  ATTACHED     1  UP   UP   YES

-> show linkagg agg 1-5 port
Slot/Port  Aggregate  SNMP Id    Status        Agg Oper Link Prim
---------+-----------+--------+--------------+------+----+----+----+-----
   1/16  Static       2016     CONFIGURED       1    UP   UP   YES
   1/17  Static       2017     CONFIGURED       2    UP   UP   NO
   3/1   Static        3001     CONFIGURED      3     UP   UP   NO
   3/2   Static        3045     CONFIGURED       4    UP   UP   NO
   3/3   Static        3069     CONFIGURED       5    UP   UP   NO
```

output definitions

Slot/Port	The slot/port associated with the aggregate group.
Aggregate	The type of aggregate group associated with the port, either **Static** or **Dynamic**.
SNMP Id	The SNMP ID associated with the aggregate group.
Status	The current status of the port, which can be **CONFIGURED**, **PENDING**, **SELECTED**, or **RESERVED**.
Agg	The number of the aggregate groups associated with this port.
Oper	The operational status of the port.
Link	The physical link status of the port.
Prim	Specifies if the port is the primary port of the aggregate. The primary port is the lowest numbered port in a link aggregate.

A port that belongs to a static aggregate is specified:

```
-> show linkagg port 4/1

Static Aggregable Port
  SNMP Id                       : 4001,
  Slot/Port                     : 4/1,
  Administrative State          : ENABLED,
  Operational State             : DOWN,
  Port State                    : CONFIGURED,
  Link State                    : DOWN,
  Selected Agg Number           : 2,
  Port position in the aggregate: 0,
  Primary port                  : NONE
```

output definitions

SNMP Id	The SNMP ID associated with this port.
Slot/Port	The slot and port number.
Administrative State	The current administrative state of this port, which can be **ENABLED** or **DISABLED**.
Operational State	The current operational state of the port, which can be **UP** or **DOWN**.
Port State	The current operational state of the port, which can be **CONFIGURED**, **PENDING**, **SELECTED**, or **RESERVED**.
Link State	The current operational state of the link from this port to its remote partner, which can be **UP** or **DOWN**.
Selected Agg Number	The number associated with the static aggregate group to which the port is attached.
Port position in the aggregate	The rank of this port within the static aggregate group.
Primary Port	The port number of the first port to join this static aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.

A port that belongs to a static link aggregate is specified:

```
-> show linkagg agg 1

Static Aggregate
SNMP Id                  : 40000001,
  Aggregate Number         : 1,
  SNMP Descriptor          : Omnichannel Aggregate Number 1 ref 40000001 size 4,
  Name                     : ,
  Admin State              : ENABLED,
  Operational State        : DOWN,
  Aggregate Size           : 4,
  Number of Selected Ports : 0,
  Number of Reserved Ports : 0,
  Number of Attached Ports : 0,
  Primary Port             : NONE
```

A port that belongs to a dynamic aggregate is specified:

```
-> show linkagg port 2/1

Dynamic Aggregable Port
  SNMP Id                       : 2001,
  Slot/Port                     : 2/1,
  Administrative State          : ENABLED,
  Operational State             : DOWN,
  Port State                    : CONFIGURED,
  Link State                    : DOWN,
  Selected Agg Number           : NONE,
  Primary port                  : UNKNOWN,
LACP
  Actor System Priority         : 10,
  Actor System Id               : [00:d0:95:6a:78:3a],
  Actor Admin Key               : 8,
  Actor Oper Key                : 8,
  Partner Admin System Priority : 20,
  Partner Oper System Priority  : 20,
  Partner Admin System Id       : [00:00:00:00:00:00],
  Partner Oper System Id        : [00:00:00:00:00:00],
  Partner Admin Key             : 8,
  Partner Oper Key              : 0,
  Attached Agg Id               : 0,
  Actor Port                    : 7,
  Actor Port Priority           : 15,
  Partner Admin Port            : 0,
  Partner Oper Port             : 0,
  Partner Admin Port Priority   : 0,
  Partner Oper Port Priority    : 0,
  Actor Admin State             : act1.tim1.agg1.syn0.col0.dis0.def1.exp0
  Actor Oper State              : act1.tim1.agg1.syn0.col0.dis0.def1.exp0,
  Partner Admin State           : act0.tim0.agg1.syn1.col1.dis1.def1.exp0,
  Partner Oper State            : act0.tim0.agg1.syn0.col1.dis1.def1.exp0
```

output definitions

SNMP Id	The SNMP ID associated with this port.
Slot/Port	The slot and port number.

output definitions (continued)

Administrative State	The current administrative state of this port, which can be **ENABLED** or **DISABLED**.
Operational State	The current operational state of the port, which can be **UP** or **DOWN**.
Port State	The current operational state of the port, which can be **CONFIGURED**, **PENDING**, **SELECTED**, or **AGGREGATED**.
Link State	The current operational state of the link from this port to its remote partner, which can be **UP** or **DOWN**.
Selected Agg Number	The number associated with the dynamic aggregate group to which the port is attached.
Primary Port	The port number of the first port to join this dynamic aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.
Actor System Priority	The actor system priority of this port. You can modify this parameter with the **linkagg lacp port actor system-priority** command (see page 10-36).
Actor System Id	The actor system ID (i.e., MAC address) of this port. You can modify this parameter with the **linkagg lacp port actor system-id** command (see page 10-34).
Actor Admin Key	The actor administrative key value for this port. You can modify this parameter with the **linkagg lacp port actor admin-key** command (see page 10-29).
Actor Oper Key	The actor operational key associated with this port.
Partner Admin System Priority	The administrative priority of the remote system to which this port is attached. You can modify this parameter with the **linkagg lacp port partner admin system-priority** command (see page 10-44).
Partner Oper System Priority	The operational priority of the remote system to which this port is attached.
Partner Admin System Id	The administrative MAC address associated with the system ID of a remote partner. This value is used along with Partner Admin System Priority, Partner Admin Key, and Partner Admin Port Priority to manually configure aggregation. You can modify this parameter with the **linkagg lacp port partner admin system-id** command (see page 10-40).
Partner Oper System Id	The MAC address that corresponds to the system ID of the remote partner.
Partner Admin Key	The administrative value of the key for the remote partner. This value is used along with Partner Admin System Priority, Partner Admin System, Partner Admin Port, and Partner Admin Port Priority to manually configure aggregation. You can modify this parameter with the **linkagg lacp port partner admin-key** command (see page 10-42).
Partner Oper Key	The current operational value of the key for the protocol partner.
Attached Agg ID	The ID of the aggregate group that the port has attached itself to. A value of zero indicates that the port is not attached to an aggregate group.
Actor Port	The port number locally assigned to this port.

output definitions (continued)

Actor Port Priority	The actor priority value assigned to the port. You can modify this parameter with the **linkagg lacp port actor port priority** command (see page 10-46).
Partner Admin Port	The administrative value of the port number for the protocol partner. This value is used along with Partner Admin System Priority, Partner Admin System ID, Partner Admin Key, and Partner Admin Port Priority to manually configure aggregation. You can modify this parameter with the **linkagg lacp port partner admin-port** command (see page 10-48).
Partner Oper Port	The operational port number assigned to the port by the protocol partner of the port.
Partner Admin Port Priority	The administrative port priority of the protocol partner. This value is used along with Partner Admin System Priority, Partner Admin System ID, and Partner Admin Key to manually configure aggregation. You can modify this parameter with the **linkagg lacp port partner admin port-priority** command (see page 10-50).
Partner Oper Port Priority	The priority value assigned to the this port by the partner.
Actor Admin State	The administrative state of the port. You can modify this parameter with the **linkagg lacp port actor admin-state** command (see page 10-32).
Actor Oper State	The current operational state of the port.
Partner Admin State	The administrative state of the partner port. You can modify this parameter with the **linkagg lacp agg partner admin-state** command (see page 10-38).
Partner Oper State	The current operational state of the partner port.

Release History

Release 8.1.1; command introduced.

Related Commands

linkagg static port agg	Configures a slot and port for a static aggregate group.
linkagg lacp port actor admin-key	Configures a slot and port for a dynamic aggregate group.
show linkagg	Displays information about static and dynamic (LACP) aggregate groups.

show linkagg range

Displays information about the configured or operational link aggregate range identifiers for standard and MC-LAG link aggregates.

Note: This command is not supported in this release.

show linkagg range [operation | config]

Syntax Definitions

operation	Displays the operational ranges.
config	Displays the configured ranges.

Defaults

By default, both the operational and configured ranges are shown.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **operation** parameter to display only the operational link aggregate identifiers.
- Use the **config** parameter to display only the configured link aggregate identifiers.
- A chassis reboot is required for the configured values to become operational.

Examples

```
-> show linkagg range
                      Operational            Configured
                      Min       Max          Min     Max
--------------------+--------+--------+-------------+-------+
Local                   0       127             0         0
Peer                    0       127             0         0
Multi-Chassis           0       127             0       127
```

output definitions

Operational Min/Max	The currently operational ranges.
Configured Min/Max	The currently configured ranges.
Local	The local link aggregate identifiers.
Peer	The peer link aggregate identifiers.
Multi-Chassis	The MC-LAG link aggregate identifiers.

Release History

Release 8.1.1; command introduced.

Related Commands

11 Virtual Chassis Commands

A Virtual Chassis is a group of switches managed through a single management IP address and that behave as a single bridge or router. It provides both node level and link level redundancy for devices connecting to the aggregation layer via dual-homed standard 802.3ad link aggregation mechanisms. The use of Virtual Chassis provides node level redundancy without the need to use redundancy protocols such as STP and VRRP between the edge and the aggregation/core layer.

MIB information for the Virtual Chassis commands is as follows:

Filename: ALCATEL-IND1-VIRTUAL-CHASSIS-MIB.mib
Filename:ALCATEL-IND1-VC-SPLIT-PROTECTION-MIB.mib

A summary of available commands is listed here:

virtual-chassis configured-chassis-id
virtual-chassis chassis-group
virtual-chassis configured-chassis-priority
virtual-chassis configured-control-vlan
virtual-chassis hello-interval
virtual-chassis vf-link-mode
virtual-chassis auto-vf-link-port
virtual-chassis vf-link-mode
vc-takeover

show virtual-chassis topology
show virtual-chassis consistency
show virtual-chassis vf-link
show virtual-chassis auto-vf-link-port
show virtual-chassis auto-vf-link-port
show virtual-chassis slot-reset-list
show virtual-chassis consistency
show virtual-chassis neighbors
show configuration vcm-snapshot chassis-id

virtual-chassis split-protection admin-state
virtual-chassis split-protection linkagg
virtual-chassis split-protection guard-timer
virtual-chassis split-protection helper admin-state
virtual-chassis split-protection helper linkagg
show virtual-chassis split-protection status
show virtual-chassis split-protection vc-units
show virtual-chassis split-protection helper status

virtual-chassis configured-chassis-id

Assigns a globally unique chassis identifier to the switch.

virtual-chassis chassis-id *oper-chassis* **configured-chassis-id** *config-chassis*

no virtual-chassis chassis-id *oper-chassis* **configured-chassis-id**

Syntax Definitions

oper-chassis	Chassis ID number. The operational/current chassis identifier.
config-chassis	Chassis ID number. The configured/next chassis identifier.

Defaults

parameter	default
oper-chassis	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Two switches that have the same chassis identifier are not allowed to operate in a virtual chassis. If a duplicate chassis identifier is detected one of the switches will be in an inconsistent role and its status will be set to Duplicate-Chassis-ID.
- The configured chassis identifier will only take effect after the next reboot of the target chassis.
- Snapshots produced through the show configuration vcm-snapshot, show configuration snapshot virtual chassis or write memory commands always include the operational chassis identifier.
- Changing the chassis-id will not cause the Control VLAN or Group ID to change. These parameters must also be manually changed if required.

Examples

```
-> virtual-chassis chassis-id 1 configured-chassis-id 2
-> no virtual-chassis chassis-id 0 configured-chassis-id
```

Release History

Release 8.1.1; command introduced.

Related Commands

show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

```
virtualChassisGlobalTable
   virtualChassisOperChasId
   virtualChassisConfigChassisId
```

virtual-chassis chassis-group

Assigns a globally unique chassis group identifier to a chassis. Each peer switch in a virtual chassis domain must use the same group ID number. The group ID number uniquely identifies switches operating in the same virtual chassis.

virtual-chassis [chassis-id *oper-chassis]* **chassis-group** *group*

Syntax Definitions

oper-chassis	Chassis ID number. The operational/current chassis identifier.
group	virtual chassis group identifier (0-255), which is used to identify a group of chassis belonging to the same virtual chassis.

Defaults

parameter	default
group	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Each virtual chassis domain must use a different group ID number to differentiate the domain within the network environment.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches is running as a virtual chassis the chassis group can only be configured with exactly the same value as the master chassis when the configuration applies to a single and specific switch.
- When a set of switches is running as a virtual chassis the chassis group can be configured with any value within the valid range as long as the configuration applies to all switches at the same time.
- It is strongly recommended that the same chassis group value is set for all switches that will participate on the same virtual chassis group. Failure to adhere to this recommendation followed by a system reset will prevent the switches whose values are different from joining the same virtual chassis group.

Examples

```
-> virtual-chassis chassis-id 1 chassis-group 10
-> virtual-chassis chassid-id 2 chassis-group 10
-> virtual-chassis chassis-group 10 // All switches
```

Release History

Release 8.1.1; command introduced.

Related Commands

show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

```
virtualChassisGlobalTable
   virtualChassisOperChasID
   virtualChassisGroup
```

virtual-chassis configured-chassis-priority

Sets the configured chassis priority for a chassis specified by its operational chassis identifier.

virtual-chassis [chassis-id *oper-chassis] configured*-**chassis-priority** *priority*

Syntax Definitions

oper-chassis	Chassis ID number. The operational/current chassis identifier.
priority	Configured chassis priority (0-255) which defines the user preference above all other election criteria, for the target chassis to become the master of the virtual chassis.

Defaults

parameter	default
priority	100

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The highest number configured-chassis-priority will become the Master chassis. Without setting this value the smallest chassis identifier becomes the key parameter used to determine which switch will become the Master.
- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- The configured chassis priority will only take effect after the next reboot of the target switch.

Examples

All switches:

```
-> virtual-chassis configured-chassis-priority 50
```

Chassis 2 only:

```
-> virtual-chassis chassis-id 2 configured chassis-priority 75
```

Release History

Release 8.1.1; command introduced.

Related Commands

show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

```
virtualChassisGlobalTable
   virtualChassisOperChasID
   virtualChassisConfigPriority
```

virtual-chassis configured-control-vlan

Sets the configured control VLAN for a virtual chassis.

virtual-chassis configured-control-vlan *vlan*

Syntax Definitions

vlan	Configured/next virtual chassis control VLAN (2-4094), which is used for all internal control communication between switches over the VFL.

Defaults

parameter	default
vlan	4094

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This configured control VLAN will only take effect after the next reboot.

Examples

```
-> virtual-chassis configured-control-vlan 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

```
virtualChassisGlobalTable
   virtualChassisOperChasID
   virtualChassisConfigControlVlan
```

virtual-chassis hello-interval

Sets the virtual chassis configured hello interval parameter on the chassis. Hello packets are sent periodically on the virtual fabric link (VFL) interfaces to establish a relationship and bidirectional communication between virtual chassis switches. The hello interval value determines how often these packets are sent.

virtual-chassis [chassis-id *oper-chassis]* **hello-interval** *hello*

Syntax Definitions

oper-chassis	Chassis ID number (1-8). The operational/current chassis identifier.
hello	The operational/current virtual chassis hello interval in seconds (1–65535), which defines how frequently the keep-alives related to the virtual chassis hello protocol are exchanged over the VFL links.

Defaults

parameter	default
hello	15

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If no operational chassis identifier is specified or if the value specified is zero, then the value is applied to all switches in the virtual chassis.
- When a set of switches is running as a virtual chassis, the configured hello interval can only be configured with exactly the same value as the master chassis when the configuration applies to a single and specific switch.
- When a set of switches is running as a virtual chassis, the hello interval can be configured with any value within the valid range as long as the configuration applies to all switches at the same time.

Examples

```
-> virtual-chassis hello-interval 10 //All chassis
-> virtual-chassis chassis-id 2 configured-hello-interval 10 //Chassis 2 only
```

Release History

Release 8.1.1; command introduced.

Related Commands

vc-takeover	This command causes a reload of the master chassis from the running configuration in a virtual chassis environment.
show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.
show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology.

MIB Objects

```
virtualChassisGlobalTable
   virtualChassisOperChasID
   virtualChassisOperHelloInterval
```

virtual-chassis vf-link-mode

Configures the Virtual Chassis mode. Virtual Chassis mode determines whether the VFLs are created automatically or statically.

virtual-chassis vf-link-mode {static | auto}

Syntax Definitions

N/A

Defaults

parameter	default
vf-link-mode	auto

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The OS6860/6860E will always be in auto mode, static mode is not supported.

Examples

```
-> virtual-chassis vf-link-mode auto
```

-Release History

Release 8.2.1; command introduced.

Related Commands

show virtual-chassis vf-link	Displays a summary of the configured and operational parameters related to the virtual fabric link on the switch.

MIB Objects

```
virtualChassisGlobalTable
   virtualChassisOperChasID
   virtualChassisVflMode
```

virtual-chassis auto-vf-link-port

Configures the port to be an automatic VFL port.

virtual-chassis auto-vf-link-port *chassis/slot/port*

no virtual-chassis auto-vf-link-port *chassis/slot/port*

Syntax Definitions

chassis/slot/port	The operational chassis identifier, slot, and port.

Defaults

chassis type	default
auto-vf-link-port	Dedicated 20G VFL ports

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The dedicated 20G VFL ports are always configured as automatic VFL ports and cannot be changed.
- This command can be used to configure ports other than the dedicated 20G VFL ports to act as VFL ports.

Examples

```
-> virtual-chassis auto-vf-link-port 1/1/1
-> no virtual-chassis auto-vf-link-port 1/1/1
```

Release History

Release 8.2.1; command introduced.

Related Commands

show virtual-chassis auto-vf-link-port	Displays a summary of the auto VFL ports.

MIB Objects

```
virtualChassisAutoVflPortTable
   virtualChassisAutoVflPortIfindex
   virtualChassisAutoVflPortRowStatus
```

virtual-chassis shutdown

Disables all front-panel port including the user ports and all the VFL member ports on a chassis isolating the chassis from the rest of the virtual chassis topology.

virtual-chassis shutdown [chassis-id *oper-chassis***]**

Syntax Definitions

oper-chassis	Chassis ID number. The operational/current chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command should not be used to shutdown the Master chassis. It is designed for use on Slave chassis and can be used to shutdown a Slave chassis that is being replaced.
- This command will disable all front panel ports, including the user ports and all virtual-fabric link (VFL) member ports on the specified switch.
- After running this command remote access to the target switch is only possible through the local EMP port on that switch.
- The target switch must be reloaded to bring its ports back to an operational state.
- This command is only functional when executed through the master chassis
- After the shutdown command is executed, the target switch assumes the role of master and remains isolated from all other switches in the virtual chassis topology.

Examples

```
-> virtual-chassis shutdown chassis-id 2
```

Release History

Release 8.1.1; command introduced.

Related Commands

show virtual-chassis consistency	Displays the system level mandatory consistency parameters of both the local and peer switches.

MIB Objects

N/A

vc-takeover

This command causes a reload of the master chassis from the running configuration in a virtual chassis environment.

vc-takeover

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If there are no slave chassis present in the system, the command will be rejected.
- This is equivalent to reloading the master chassis from the current running directory using the **reload from** command. However, this command includes and additional check for the existence of a slave chassis before executing.

Examples

```
-> vc-takeover
WARNING - Working Changes Will Be Lost, Confirm VC takeover (Y/N) :
```

Release History

Release 8.1.1; command introduced.

Related Commands

reload from	Reloads the master or slave chassis from the specified directory.

MIB Objects

```
chasEntPhysTable
   chasEntPhysAdminStatus
```

show virtual-chassis topology

This command is used to provide a detailed status of the virtual chassis topology.

show virtual-chassis [chassis-id {*oper-chassis*}**] topology**

Syntax Definitions

oper-chassis	Chassis ID number. The operational/current chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command can be executed on any CMM within any switch of the system.
- When no operational chassis identifier is specified the command will show data related to the entire virtual chassis system.
- A chassis-id of 100 to 108 is used to indicate a duplicate chassis-id.

Examples

```
-> show virtual-chassis topology
Legend: Licenses - A: Advanced; B: Data Center
                                        Config
 Chas  Role         Status              Chas ID  Pri   Group  MAC-Address
-----+------------+-------------------+--------+-----+------+-----------------
1     Master       Running             1        100   1      e8:e7:32:00:2a:55
2     Slave        Running             2        100   1      e8:e7:32:07:9f:e1

-> show virtual-chassis chassis-id 2 topology

Chassis-ID  Is-Direct  Shortest-Path
------------+----------+--------------------
     1         Yes        2/0->1/4
     3         Yes        2/2->3/0
     4         No         2/2->3/0, 3/3->4/2
     5         Yes        2/1->5/1
     6         No         2/0->1/4, 1/0->6/0
```

output definitions

Oper-Chassis-ID (Chas)	Operational/current virtual chassis chassis identifier.
Config Chas ID	The configured/next chassis identifier for the switch specified by operational chassis identifier.
Chassis-Role (Role)	Chassis Role **Unassigned**: Role undefined as election has not completed yet. **Master**: Chassis is central point of management and control. **Slave**: Chassis is an active or functional participant of the virtual chassis topology, but it is not the main entry point for management and control purposes. **Inconsis**: Chassis is not an active or functional participant of the virtual chassis topology due to some inconsistent parameter, which does not match the match the master chassis' settings. **Startup-Err**: Chassis is in start up error mode because it was unable to come up in a virtual chassis. When a chassis assumes the Startup-Err role, its chassis status will be equal to either Invalid-Chassis-Id or Invalid-License, which are described later in this section.
Previous-Chassis-Role	Previous chassis role before the last transition.

output definitions

Chassis-Status (Status)	Chassis Status **Init**: Status undefined as the chassis has not completed its initialization. **Running**: The chassis is fully operational. **Invalid-Chassis-Id**: The chassis is not operational because no valid chassis identifier has been found in the configuration. Typically this means that the vcsetup.cfg file is corrupted, empty or contains an invalid (e.g. out of range) chassis ID identifier. **Invalid-License**: The chassis is not operational in because no valid advanced license has been found. **Hello-Down**: The chassis is isolated from the rest of the virtual chassis topology participants because hello packets have not been received for a period of time greater than the hello timeout. **Duplicate-Chassis**: This chassis is not fully operational because its operational chassis identifier matches the chassis ID of another chassis within the virtual chassis topology. As a result, a new operational chassis identifier from the range (101-102) will be allocated to this chassis. **Mis-Image**: The chassis is not fully operational because its image versions are not consistent with the master chassis' images. In other words, the image version are not compatible and some of the software components running on this chassis are unable to interface with the software operating in the master chassis. **Mis-Chassis-Type**: The chassis is not fully operational because its chassis type is not consistent with the master chassis' type. Different chassis types cannot be mixed in the same virtual chassis topology. **Mis-Hello-Interval**: The chassis is not fully operational because its operational hello interval is not consistent with the master chassis' operational hello interval. **Mis-Control-Vlan**: The chassis is not fully operational because its operational control VLAN is not consistent with the master chassis' operational control VLAN. **Mis-Chassis-Group**: The chassis is not fully operational because its chassis group does not match the master chassis' chassis group and the chassis is connected directly or indirectly to the master chassis through virtual-fabric links. This chassis is unable to join the active virtual chassis topology whose master chassis is part of. **Mis-License-Config**: The chassis is not fully operational because its license settings do not match the master chassis' license configuration. An exact match is required to allow successful operation within the same virtual chassis topology. **Split-Topology**: The chassis is not fully operational and all of its front panel user ports (excluding the virtual-fabric link member ports) are operationally down because a topology split has occurred. This chassis became isolated from the master chassis after all of its active virtual-fabric member ports went down or the virtual chassis manager hello timeout has expired.
Chassis-Group (Group)	Virtual chassis group identifier. Used to identify a group of chassis belonging to the same virtual chassis.
Chassis-MAC (MAC-Address)	Chassis MAC address.
Up-Time	Chassis up time.

output definitions

Designated-NI	Designated network interface module (NI), which is the module responsible for managing the inter-process communication infrastructure responsible for control communication between distinct switches within the virtual chassis topology.
Primary-CMM	Primary CMM slot.
Secondary-CMM	Secondary CMM slot.
Chassis-Type	The switch chassis type.
License	The licenses installed on the chassis.
Hello-Interval	The hello-interval configured for the chassis.
Oper-Chassis-Priority (Pri)	Operational/current chassis priority, which defines the user preference, above all other election criteria, for a switch to become the master chassis of the virtual chassis topology. The greater this value the more likely a switch is to be elected as the master chassis.
Config-Chassis-Priority	Configured/next chassis priority, which defines the user preference above all other election criteria.
Oper-Control-VLAN	Operational/current virtual chassis control VLAN.
Config-Control-VLAN	Configured/next virtual chassis control VLAN, which will take effect after reset thereby becoming the next operational control VLAN.
Number-of-Neighbors	Total number of neighbor switches that are part of the active virtual chassis topology for a given chassis group.
Number-of-Direct-Neighbors	Number of directly attached neighbor switches that are part of the active virtual chassis topology for a given chassis group These are switches directly connected to the local switch through a virtual-fabric link (VFL).
Neighbor	The operational chassis identifier of neighbor switch.
Is-Direct	Flag identifying whether a particular neighbor is directly attached to a given switch.
Shortest-Path	The shortest path from a given switch to a neighbor switch using the notation *chassis/*vfl-id.

Release History

Release 8.1.1; command introduced.

Related Commands

virtual-chassis configured-chassis-id	Assigns a globally unique chassis identifier to the switch.
virtual-chassis chassis-group	Assigns a globally unique chassis group identifier to a switch. Each peer switch in a virtual chassis domain must use the same group ID number.
virtual-chassis configured-chassis-priority	Sets the configured chassis priority for a switch specified by its operational chassis identifier.
virtual-chassis configured-control-vlan	Sets the configured control VLAN for a switch specified by its operational chassis identifier.
virtual-chassis configured-hello-interval	Configures the virtual chassis hello interval parameter on the switch.

show virtual-chassis consistency

This command is used to provide a detailed status of the parameters taken into account to determine the consistency of a group of switches participating in the virtual chassis topology.

show virtual-chassis [chassis-id *oper-chassis***] consistency**

Syntax Definitions

oper-chassis	Chassis ID number. The operational/current chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command provides a list of parameters that must be configured consistently on all switches that will participate on the virtual chassis topology to allow correct system operation.
- In order to determine the consistency of a given parameter, the switch will compare the value of such parameters on a given switch with the settings of the master chassis. Therefore consistency is always defined as a comparison with the master chassis.
- The following parameters are considered consistent if they match the settings of the master chassis: chassis type, license, chassis group, operational control VLAN, configured control VLAN, operational hello interval and configured hello interval.
- The configured chassis identifier parameter is considered consistent if it is different than the settings of the master chassis.

Examples

```
-> show virtual-chassis consistency
Legend: * - denotes mandatory consistency which will affect chassis status
        Licenses - A: Advanced; B: Data Center

       Config                                  Oper     Config

Config-Control-Vlan   4094       4094      OK
```

output definitions

Chassis-ID (Chas)	Operational/current virtual chassis identifier.
Config-Chassis-ID (Conf Chas ID)	The configured/next chassis identifier for the switch specified by operational chassis identifier.
Chassis-Type (Chas Type)	The switch chassis type.
License	The licenses installed on the chassis.
Chassis-Group (Chas Group)	virtual chassis group identifier. Used to identify a group of chassis belonging to the same active virtual chassis topology.
Hello-Interval	Operational/current hello-interval.
Oper-Control-VLAN	Operational/current virtual chassis control VLAN.
Config-Control-VLAN	Configured/next virtual chassis control VLAN, which will take effect after reset thereby becoming the next operational control VLAN.
Status	Defines whether a given switch's parameter is considered consistent with the master chassis' settings. The possible values are: **OK**: The switch is operational and the given switch's parameter value is consistent with the settings of the master chassis. **NOK**: The switch is operational but the given switch's parameter value is inconsistent with the settings of the master chassis. **N/A**: The switch is operational but the virtual chassis topology has not converged and therefore a master chassis is not yet known.

Release History

Release 8.1.1; command introduced.

Related Commands

virtual-chassis configured-chassis-id	Assigns a globally unique chassis identifier to the switch.
virtual-chassis chassis-group	Assigns a globally unique chassis group identifier to a chassis. Each peer switch in a virtual chassis domain must use the same group ID number.
virtual-chassis configured-chassis-priority	Sets the chassis priority for a chassis specified by its operational chassis identifier.
virtual-chassis configured-control-vlan	Sets the configured control VLAN for a chassis specified by its operational chassis identifier.
virtual-chassis configured-hello-interval	Sets the configured hello interval parameter on the switch.

MIB Objects

```
virtualChassisGlobalTable
   virtualChassisOperChasId
   virtualChassisConfigChassisID

   virtualChassisConfigHelloInterval
```

show virtual-chassis vf-link

Displays a summary of the configured and operational parameters related to the virtual fabric links on the virtual chassis topology.

show virtual-chassis [chassis-id *oper-chassis]* **vf-link [member-port]**

Syntax Definitions

oper-chassis	Chassis ID number. The operational/current chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

In a VC of two chassis when both VFL ports connected, they will act as a link aggregate of two VFL ports. The VF Link ID will be displayed as 0.

Examples

```
-> show virtual-chassis vf-link
                              Primary   Config  Active  Def       Speed
 Chassis/VFLink ID  Oper       Port      Port    Port    Vlan      Type
-------------------+----------+---------+-------+-------+---------+-----------
 1/0                UP         1/1/53    1        1      1         21G
 1/1                UP         1/1/54    1        1      1         21G

-> show virtual-chassis chassis-id 1 vf-link member-port
 Chassis/VFLink ID  Chassis/Slot/Port  Oper       Is Primary
-------------------+------------------+----------+-------------
 1/0                1/1/53             Up         Yes
 1/0                1/1/54             Up         No
```

output definitions

Chassis/VFLink ID	Pair operational/current virtual chassis chassis identifier and virtual-fabric link (VFL) identifier.
Oper	Virtual-fabric link (VFL) operational status. The possible values are Up and Down.
Primary Port	Primary port of the virtual-fabric link (VFL) trunk, which is the port where non-unicast packets destined a remote chassis are sent out.
Config Port	Number of ports configured to operate as virtual-fabric link (VFL) member ports, i.e. ports that potentially may join a virtual-fabric link (VFL).

output definitions

Active Port	Number of virtual-fabric link (VFL) member ports that are operational, i.e. the LACP protocol is fully operational for those ports.
Def Vlan	Operational default VLAN on the virtual-fabric link (VFL).
Chassis/Slot/Port	The operational chassis/slot/port identifying a particular virtual–fabric link (VFL) member port.
Is Primary	Indicates if this port is the primary port of the VFL.

Release History

Release 8.1.1; command introduced.

Related Commands

virtual-chassis configured-chassis-id	Assigns a globally unique chassis identifier to the switch.

MIB Objects

```

show virtual-chassis auto-vf-link-port

Displays a summary of the auto VFL ports.

show virtual-chassis [chassis-id *oper_chassis***] auto-vf-link-port [***chassis/slot/port***]**

Syntax Definitions

oper_chassis	Chassis ID number (0-6 on OS6900 / 0-2 on OS10K). The operational/ current chassis identifier.
oper_chassis/slot/port	The operational chassis identifier, slot, and port.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command can be executed on any switch within the virtual chassis topology.

Examples

```
-> show virtual-chassis auto-vf-link-port
Chassis/Slot/Port    Chassis/VFL ID      VFL member status
-------------------+-----------------+----------------------
1/1/1                1/0                Down
1/1/3                1/1                Up
```

output definitions

Chassis/Slot/Port	The chassis/slot/port identifier.
Chassis/VFL ID	The VFL identifier.
VFL member status	The status of the VFL member port. Up or Down.

Release History

Release 8.2.1; command introduced.

Related Commands

virtual-chassis auto-vf-link-port	Configures the port to be an automatic VFL port.

MIB Objects

```
virtualChassisLinkTable
   virtualChassisOperChasID
   virtualChassisVflMemberPortRowStatus
```

show virtual-chassis chassis-reset-list

This command displays the list of all chassis that must be reset along with a specified chassis in order to prevent a virtual chassis topology split.

show virtual-chassis [chassis-id *oper-chassis***] chassis-reset-list**

Syntax Definitions

oper-chassis	Chassis ID number. The operational/current chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When no operational chassis identifier is specified the command will show data related to the entire virtual chassis system.

Examples

```
->  show virtual-chassis chassis-reset-list
Chas  Chassis reset list
-----+--------------------
1     1
2     2

-> show virtual-chassis chassis-id 1 chassis-reset-list
Chas  Chassis reset list
-----+--------------------
1     1
```

output definitions

Chas	Operational/current virtual chassis chassis identifier.
Chassis reset list	A list of operational chassis identifiers, which define which switches must be reset, along with the switch given by Chas in order to prevent a split of the virtual chassis topology.

Release History

Release 8.1.1; command introduced.

Related Commands

show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology

MIB Objects

```
virtualChassisChassisResetListTable
   virtualChassisOperChasId
   virtualChassisChassisResetList
```

show virtual-chassis slot-reset-list

For a given chassis and network interface module (NI), this command displays status information specifying whether bringing down or extracting such network interface module (NI) will lead to a virtual chassis topology split.

show virtual-chassis [chassis-id *oper-chassis***] slot-reset-list**

Syntax Definitions

oper-chassis	Chassis ID number. The operational/current chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When no operational chassis identifier is specified the command will show data related to the entire virtual chassis system.
- On the OmniSwitch 6860, the slot number depicted in this command always refers to the main board of the switch (i.e. slot number 1). In other words, this command does not present the status related to expansion boards.

Examples

```
-> show virtual-chassis slot-reset-list
Chas  Slot    Reset status
-----+-------+--------------
1     1       Split
2     1       Split

-> show virtual-chassis chassis-id 1 slot-reset-list
Chas  Slot    Reset status
-----+-------+--------------
1     1       Split
```

output definitions

Chas	Operational/current virtual chassis chassis identifier.
Slot	Slot number identifying a particular network interface module (NI). For an OS6860 the slot number is always be equal to 1.

output definitions

Reset Status	For the network interface module (NI) identified by the pair (Chas, Slot), this command displays status information specifying whether bringing down or extracting such network interface module (NI) will lead to a virtual chassis topology split according to the following definitions. **Supported**: The network interface module can be reset without splitting the virtual chassis topology. **Split**: Resetting this network interface module will cause a virtual chassis topology split.

Release History

Release 8.1.1; command introduced.

Related Commands

show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology

MIB Objects

```
virtualChassisSlotResetStatusTable
   virtualChassisOperChasID
   virtualChassisSlotResetStatus
```

show virtual-chassis neighbors

This command displays a list of which neighbors are connected via which VFL for a virtual chassis.

show virtual-chassis [chassis-id *oper-chassis***] neighbors**

Syntax Definitions

oper-chassis	Chassis ID number (1-8). The operational/current chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When no operational chassis identifier is specified the command will show data related to the entire virtual chassis system.

Examples

```
->  show virtual-chassis neighbors

Chas VFL VFL
 ID   0   1
----+---+---
  1   6   2
  2   1   3
  3   2   4
  4   3   5
  5   4   6
  6   5   1

-> show virtual-chassis chassis-id 2 neighbors

Chas VFL VFL
 ID   0   1
----+---+---+
  2   1   3
```

output definitions

Chas ID	Operational/current virtual chassis chassis identifier.
VFL	The VLF identifier connecting to the remote chassis listed in the table.

Release History

Release 8.1.1; command introduced.

Related Commands

show virtual-chassis topology	Displays details about the configured and operational parameters related to all switches participating in the virtual chassis topology

MIB Objects

```
virtualChassisVflTable
   virtualChassisOperChasID
   virtualChassisVflId
   virtualChassisVflDirectNeighborChasId
```

show configuration vcm-snapshot chassis-id

Displays a snapshot of the switch specific virtual chassis configuration.

show configuration vcm-snapshot chassis-id *oper-chassis*

Syntax Definitions

oper-chassis	Chassis ID number. The operational/current chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A.

Examples

```
-> show configuration vcm-snapshot chassis-id 1
! Virtual Chassis Manager:
virtual-chassis chassis-id 1 configured-chassis-id 1
virtual-chassis chassis-id 1 configured-control-vlan 4091
virtual-chassis chassis-id 1 chassis-group 1

! IP:
ip interface local chassis-id 1 emp address 10.255.76.21 mask 255.255.255.0
```

Release History

Release 8.1.1; command introduced.

Related Commands

show configuration snapshot	Displays the configured and operational parameters related to the virtual-chassis feature on the switch.

MIB Objects

N/A

virtual-chassis split-protection admin-state

Enable or disables the VC split protection feature.

virtual-chassis split-protection admin-state {enable | disable}

Syntax Definitions

enable	Enables VC split protection.
disable	Disables VC split protection.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- VCSP cannot be enabled before assigning a Linkagg.
- VCSP cannot be enabled on a device that is already running the helper functionality.
- The virtual chassis and its helper cannot have the same Group ID.

Examples

```
-> virtual-chassis split-protection admin-state enable
-> virtual-chassis split-protection admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show virtual-chassis split-protection status	Displays all the information related to VCSP when enabled.
virtual-chassis split-protection linkagg	Assigns a link aggregate for use with VCSP.

MIB Objects

```
alaVCSPConfigInfo
   alaVCSPAdminState
```

virtual-chassis split-protection linkagg

Assigns a link aggregate for use with VCSP.

virtual-chassis split-protection linkagg *agg_id*

no virtual-chassis split-protection linkagg

Syntax Definitions

agg_id	The link aggregate ID number to associate with the helper for VCSP support. The valid range is 0–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the link aggregate assignment.
- This command must be used to configure VC split protection linkagg before enabling VC split protection.

Examples

```
-> virtual-chassis split-protection linkagg 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show virtual-chassis split-protection status	Displays all the information related to VCSP when enabled.

MIB Objects

```
alaVCSPConfigInfo
   alaVCSPLinkaggID
```

virtual-chassis split-protection guard-timer

Configures the timer value for how long the master will wait to receive VCSP PDUs before beginning transmission of VCSP PDUs.

virtual-chassis split-protection guard-timer *time*

Syntax Definitions

time	Time interval to wait on boot up before choosing any state. The valid range is 30–100 seconds.

Defaults

parameter	default
time	30 seconds

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Changes to the Guard timer only take affect after reboot or by disabling and re-enabling VC split protection.

Examples

```
-> virtual-chassis split-protection guard-timer 60
```

Release History

Release 8.1.1; command was introduced. Not supported in this release.

Related Commands

show virtual-chassis split-protection status	Displays all the information related to VCSP when enabled.

MIB Objects

```
alaVCSPConfigInfo
   alaVCSPGuardTimer
```

virtual-chassis split-protection helper admin-state

Enables or disables the helper functionality on the helper device.

virtual-chassis split-protection helper admin-state {enable | disable}

Syntax Definitions

enable	Enables VC split protection helper functionality.
disable	Disables VC split protection helper functionality.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command on the helper device to enable the helper functionality.
- The helper functionality cannot be enabled on a device that is running VCSP.
- The virtual chassis and its helper cannot have the same Group ID.

Examples

```
-> virtual-chassis split-protection helper admin-state enable
-> virtual-chassis split-protection helper admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

virtual-chassis split-protection helper linkagg	Configures the link aggregate on which to apply the VCSP protocol for the helper device.

MIB Objects

```
alaVCSPHelperGlobalConfig
   alaVCSPHelperAdminState
```

virtual-chassis split-protection helper linkagg

Configures the link aggregate ID on which to apply the VCSP protocol on the helper device.

virtual-chassis split-protection helper linkagg *agg_id*

no virtual-chassis split-protection helper linkagg

Syntax Definitions

agg_id	The link aggregate ID number to associate with the helper for VCSP support. The valid range is 0–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the link aggregate assignment.
- Use this command on the helper device to enable the VCSP protocol on the helper link aggregate.

Examples

```
-> virtual-chassis split-protection helper linkagg 1
-> no virtual-chassis split-protection helper linkagg
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show virtual-chassis split-protection status	Displays the VCSP Helper status of the link aggregation ID assigned.
virtual-chassis split-protection helper admin-state	Enables or disables the helper functionality.

MIB Objects

```
alaVCSPHelperLinkaggTable
   alaVCSPHelperLinkaggId
   alaVCSPHelperLinkaggRowStatus
```

show virtual-chassis split-protection status

Displays all the information related to VCSP when enabled.

show virtual-chassis split-protection status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show virtual-chassis split-protection status
VCSP admin status:       enabled
VCSP operational status: Active
VCSP linkagg:            31
VCSP Guard Timer:        30
VCSP Uptime:             00d:00h:00m:00s,
VCSP Protection Uptime:  00d:00h:00m:00s
```

Release History

Release 8.1.1; command was introduced.

Related Commands

virtual-chassis split-protection admin-state	Enable or disables the VC split protection feature.

MIB Objects

```
alaVCSPConfigInfo
   alaVCSPAdminState
   alaVCSPOperState
   alaVCSPLinkaggId
   alaVCSPGuardTimer
   alaVCSPUptime
   alaVCSPProtectionStateUptime
```

show virtual-chassis split-protection vc-units

Displays the VCSP state of all VC units.

show virtual-chassis split-protection vc-units

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show virtual-chassis split-protection vc-units

CHASSIS     STATE
----------+-----------
 1          ACTIVE
 2          ACTIVE
```

Release History

Release 8.1.1; command was introduced.

Related Commands

virtual-chassis split-protection admin-state	Enable or disables the VC split protection feature.

MIB Objects

```
alaVCSPStateTable
   alaVCSPTableSlotNiNumber
   alaVCSPTableOperState
```

show virtual-chassis split-protection helper status

Displays the VCSP Helper status of the assigned link aggregation ID.

show virtual-chassis split-protection helper status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show virtual-chassis split-protection helper status
VC Split-Protection Helper Status : Enabled
 Link Aggregation Id            VC Split-Protection Status
------------------------+-----------------------------------------------------
           3                        Enabled
```

Release History

Release 8.1.1; command was introduced.

Related Commands

virtual-chassis split-protection helper admin-state	Enables or disables the helper functionality.

MIB Objects

```
alaVCSPHelperGlobalConfig
   alaVCSPHelperLinkaggId
   alaVCSPHelperState
```

12 Ethernet Ring Protection Commands

Ethernet Ring Protection (ERP) is a protection switching mechanism for Ethernet ring topologies, such as multi-ring and ladder networks. The implementation of ERP on Alcatel-Lucent OmniSwitch is based on ERP Version 2 (ITU-T G.8032/Y.1344 to 2010) using the Ring Automatic Protection Switching (R-APS) protocol to coordinate and prevent network loops within a bridged Ethernet ring.

ERPv2 supports multi-rings and ladder to ladder networks. ERPv2 functionalities allow configuration of Sub-Rings within a Master Ethernet Ring, interconnected nodes and shared links between the rings.

MIB information for Ethernet Ring Protection commands is as follows:

Filename: AlcatelIND1Erp.mib
Module: ALCATEL-IND1-ERP-MIB

A summary of available commands is listed here:

erp-ring
erp-ring rpl-node
erp-ring wait-to-restore
erp-ring enable
erp-ring guard-timer
erp-ring sub-ring
erp-ring virtual-channel
erp-ring revertive
erp-ring clear
erp-ring ethoam-event
clear erp statistics
show erp
show erp statistics
show erp statistics

erp-ring

Creates an Ethernet Ring Protection (ERP) using the specified ports and service VLAN ID. The service VLAN transmits ERP control traffic, such as Ring Automatic Protection Switching (R-APS) messages, through the ring. The specified level number identifies an APS Management Entity Group (MEG) to which the service VLAN belongs.

erp-ring *ring_id* **port1 {***chassis/slot/port* **| linkagg** *agg_num***} port2 {***chassis/slot/port* | **linkagg** *agg_num***} service-vlan** *vlan_id* **level** *level_num* **[guard-timer** *guard_timer***] [wait-to-restore-timer** *wtr_timer***] [enable | disable]**

no erp-ring *ring_id*

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
agg_num	The link aggregate ID number.
vlan_id	The service VLAN ID number.The valid range is 1 to 4094.
level_num	The MEG level number for the service VLAN. The valid range is 0 to 7.
guard-timer	The guard timer value, in centi seconds, for the ring node.
wtr-timer	The wait-to-restore timer value, in minutes, for the Ring Protection Link (RPL) node.
enable	Administratively enables the ERP ring
disable	Administratively disables the ERP ring.

Defaults

parameter	default
guard_timer	50
wtr_timer	5
**enable	disable**	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a ring from the switch configuration. Administratively disable the ring ports before deleting the ring to avoid creating any network loops. Once the ring is deleted, ensure that the same ports are administratively enabled under Spanning Tree control.
- The specified ring identification number must be unique within a switch.

- ERP is not supported on mobile ports, mirroring ports, link aggregate member ports, high availability ports, Multicast VLAN receiver ports (ERP is supported on Multicast VLAN sender ports only), VLAN Stacking user network interface (UNI) ports, or RRSTP ring ports.
- If a port is tagged with the service VLAN ID or the service VLAN is the default VLAN for the port, then the port is not eligible to become an ERP ring port.
- Specify an existing VLAN ID for the service VLAN ID. Use the same VLAN ID and level number for the service VLAN on each switch that participates in the ERP ring.
- If the ERP switch participates in an Ethernet OAM Maintenance Domain (MD), configure the ERP service VLAN to use the same level number that is used for the Ethernet OAM MD.
- Specify a static VLAN ID for the ERP service VLAN; dynamic VLANs are not configurable as service VLANs.
- The service VLAN can belong to only one ERP ring at a time. A maximum of 64 rings are allowed per switch.
- The specified service VLAN ID must not participate in a Spanning Tree instance that is associated with non-ERP VLANs. Ideally, change the Spanning Tree configuration for the VLAN ID prior to using this command.
- An ERP ring port can belong to only one ERP ring at a time.
- Create an ERP type NNI-SVLAN binding before establishing an ERP ring on that SVLAN-NNI binding.

Examples

```
-> erp-ring 1 port1 1/1/1 port2 2/1/4 service-vlan 10 level 2 enable
-> erp-ring 2 port1 linkagg 1 port2 2/1/10 service-vlan 20 level 2
-> erp-ring 3 port1 linkagg 2 port2 linkagg 4 service-vlan 30 level 7
-> no erp-ring 2
```

Release History

Release 8.1.1; command introduced.

Related Commands

show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.
ethernet-service svlan nni	Creates an NNI-SVLAN binding.

MIB Objects

```
alaErpRingTable
   alaErpRingServiceVid
   alaErpRingMEGLevel
   alaErpRingStatus
   alaErpRingPort1
   alaErpRingPort2
   alaErpRingWaitToRestore
   alaErpRingGuardTimer
   alaErpRingRowStatus
```

erp-ring rpl-node

Configures a switch as a Ring Protection Link (RPL) node. This command also identifies the ERP port as an RPL connection port. The RPL remains blocked to prevent loops within the ERP ring.

erp-ring *ring_id* **rpl-node {port** *chassis/slot/port* **| linkagg** *agg_num***}**

no erp-ring *ring_id* **rpl-node**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1 to 2147483647.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
agg_num	The link aggregate ID number.

Defaults

NA

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the RPL designation for the specified ring.
- The RPL node can be configured only when the ring is disabled. RPL configuration applied to the Ethernet ring while it is enabled is rejected.
- The specified ERP ring ID must exist in the switch configuration.
- This command applies only to ERP ring ports; ports not configured as ERP ring ports are not eligible to become RPL ports.
- Only one of the two ring ports configured for the switch can be designated as an RPL node port.

Examples

```
-> erp-ring 1 rpl-node port 2/1/1
-> erp-ring 2 rpl-node linkagg 2
-> no erp-ring 2 rpl-node
```

Release History

Release 8.1.1; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
erp-ring wait-to-restore	Configures the wait-to-restore timer value for the Ring Protection Link (RPL) node.
show erp	Displays the ERP ring configuration for the switch.

MIB Objects

```
alaErpRingPortEntry
   alaErpRingPortIfIndex
   alaErpRingPortType
```

erp-ring wait-to-restore

Configures the wait-to-restore timer value for the Ring Protection Link (RPL) switch. This timer determines the number of minutes the RPL switch waits before returning the RPL ports to a blocked state after the ERP ring has recovered from a link failure.

erp-ring *ring_id* **wait-to-restore** *wtr_timer*

no erp-ring *ring_id* **wait-to-restore**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1 to 2147483647.
wtr_timer	The number of minutes to wait before restoring the RPL to a blocked state. The valid range is 1 to 12.

Defaults

By default, the wait-to-restore timer value is set to 5 minutes.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to set the timer back to the default setting of 5 minutes.
- The specified ERP ring ID must exist in the switch configuration.
- This command applies only on a switch that serves as the RPL node for the ERP ring.

Examples

```
-> erp-ring 1 wait-to-restore 6
-> no erp-ring 1 wait-to-restore
```

Release History

Release 8.1.1; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
erp-ring rpl-node	Configures a Ring Protection Link (RPL) port connection.
show erp	Displays the ERP ring configuration for the switch.

MIB Objects

```
alaErpRingId
   alaErpRingWaitToRestoreTimer
```

erp-ring enable

Enables or disables an ERP ring identified by the specified ring ID. This command applies to enabling or disabling existing ERP rings.

erp-ring *ring_id* **{enable** | **disable}**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1to2147483647.

Defaults

By default, ERP rings are disabled when they are created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The specified ring ID must exist in the switch configuration.
- Enabling a ring is also allowed at the time the ring is created.

Examples

```
-> erp-ring 1 enable
-> erp-ring 1 disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
show erp	Displays the ERP ring configuration for the switch.

MIB Objects

```
alaErpRingId
   alaErpRingStatus
```

erp-ring guard-timer

Configures the guard timer value for the specified ERP ring node. The guard timer is used to prevent ring nodes from receiving outdated Ring Automatic Protection Switching (R-APS) messages. During the amount of time determined by this timer, all received R-APS messages are ignored by the ring protection control process.

erp-ring *ring_id* **guard-timer** *guard_timer*

no erp-ring *ring_id* **guard-timer**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1–2147483647.
guard_timer	The guard timer value. The valid range is 1–200 centi-secs.

Defaults

parameter	default
guard_timer	50

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to set the timer back to the default value of 50 centi-secs.
- The specified ring ID must exist in the switch configuration.

Examples

```
-> erp-ring 1 guard-timer 10
-> no erp-ring 1 guard-timer
```

Release History

Release 8.1.1; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
show erp	Displays the ERP ring configuration for the switch.

MIB Objects

```
alaErpRingId
   alaErpRingGuardTimer
```

erp-ring sub-ring

Creates an Ethernet Ring Protection (ERP) sub-ring.

erp-ring *ring_id* **sub-ring-port {***chassis/slot/port* **| linkagg** *agg_num***} service-vlan** *vlan_id* **level** *level_num* **[guard-timer** *guard_timer***] [wait-to-restore-timer** *wtr_timer***] [enable | disable]**

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
agg_num	The link aggregate ID number.
vlan_id	The service VLAN ID number.The valid range is 1 to 4094.
level_num	The MEG level number for the service VLAN. The valid range is 0 to 7.
guard-timer	The guard timer value, in centi-secs, for the ring node.
wtr-timer	The wait-to-restore timer value, in minutes, for the Ring Protection Link (RPL) node.
enable	Administratively enables the ERP sub-ring
disable	Administratively disables the ERP sub-ring.

Defaults

parameter	default
guard_timer	50
wtr_timer	5
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a sub-ring from the switch configuration. Administratively disable ring ports before deleting the ring to avoid creating any network loops. Once the ring is deleted, ensure that the same ports are administratively enabled under Spanning Tree control.
- The specified ring identification number must be unique within a switch.
- ERP is not supported on mobile ports, mirroring ports, link aggregate member ports, high availability ports, Multicast VLAN receiver ports (ERP is supported on Multicast VLAN sender ports only), VLAN Stacking user network interface (UNI) ports, or RRSTP ring ports.
- If a port is tagged with the service VLAN ID or the service VLAN is the default VLAN for the port, the port is not eligible to become an ERP ring port.

- Specify an existing VLAN ID for the service VLAN ID. Use the same VLAN ID and level number for the service VLAN on each switch that participates in the ERP ring.
- If the ERP switch participates in an Ethernet OAM Maintenance Domain (MD), configure the ERP service VLAN to use the same level number that is used for the Ethernet OAM MD.
- Specify a static VLAN ID for the ERP service VLAN; dynamic VLANs are not configurable as service VLANs.
- The service VLAN can belong to only one ERP ring at a time. A maximum of four rings are allowed per switch.
- The specified service VLAN ID must not participate in a Spanning Tree instance that is associated with non-ERP VLANs. Ideally, change the Spanning Tree configuration for the VLAN ID prior to using this command.
- An ERP ring port can belong to only one ERP ring at a time.
- An ERP type NNI-SVLAN binding must be created before establishing an ERP ring on that SVLAN-NNI binding.

Examples

```
-> erp-ring 1 sub-ring-port 1/1/1 service-vlan 10 level 2 enable
-> erp-ring 2 sub-ring-port linkagg 1 port2 2/1/10 service-vlan 20 level 2
-> no erp-ring 2
```

Release History

Release 8.1.1; command introduced.

Related Commands

erp-ring	Creates an Ethernet Ring Protection (ERP) ring.
show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.
ethernet-service svlan nni	Creates a NNI-SVLAN binding.

MIB Objects

```
alaErpRingTable
   alaErpRingId
   alaErpRingServiceVid
   alaErpRingMEGLevel
   alaErpRingStatus
   alaErpRingPort1
   alaErpRingPort2
   alaErpRingWaitToRestore
   alaErpRingGuardTimer
   alaErpRingRowStatus
```

erp-ring virtual-channel

Enables or disables an Ethernet Ring Protection (ERP) Ring Virtual Channel.

erp-ring *ring_id* **virtual-channel [enable | disable]**

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
enable	Administratively enables the ERP virtual channel. If enabled, Ring Automatic Protection Switching (R-APS) protocol messages are encapsulated and transmitted over a virtual channel configured on the major ring.
disable	Administratively disables the ERP virtual channel. If disabled, R-APS messages are terminated at the interconnection nodes between the rings but not blocked at the Ring Protection Link (RPL) of the sub-ring.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The specified ring identification number must be unique within a switch.
- The ring identified by Ring ID must be created before configuring the virtual channel state for ring node.

Examples

```
-> erp-ring 2 virtual-channel disable
-> erp-ring 1 virtual-channel enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

erp-ring	Creates an Ethernet Ring Protection (ERP) ring.
erp-ring sub-ring	Creates an Ethernet Ring Protection (ERP) ring sub ring.
show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.

MIB Objects

```
alaErpRingTable
   alaErpRingId
   alaErpRingVirtualChannel
```

erp-ring revertive

Enables or Disables revertive mode on the specified node.

erp-ring *ring_id* **revertive [enable | disable]**

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
enable	Administratively enables Revertive Mode. Now, if the RPL is unblocked due to a failure within the ring, the RPL automatically reverts to the “Blocked” state when the failed link recovers.
disable	Administratively Disables Revertive Mode. Now, if the RPL is unblocked due to a failure within the ring, the RPL does not automatically revert to “Blocked” state when the failed link recovers.

Defaults

parameter	default
enable | disable	enable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The specified ring identification number must be unique within a switch.
- The ring identified by the Ring ID must be created using the **erp-ring** command, before configuring the revertive mode for ring node.

Examples

```
-> erp-ring 1 revertive enable
-> erp-ring 2 revertive disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

erp-ring	Creates an Ethernet Ring Protection (ERP) ring.
erp-ring sub-ring	Creates an Ethernet Ring Protection (ERP) ring sub ring.
erp-ring clear	Clears any pending state (for example, non-revertive restoring).
show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.

MIB Objects

```
alaErpRingTable
   alaErpRingId
   alaErpRingRevertive
```

erp-ring clear

Clears any pending state (for example, non-revertive restoring).

erp-ring *ring_id* **clear**

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
clear	Clears any pending state on the ring.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The specified ring identification number must be unique within a switch.

Examples

```
-> erp-ring 1 clear
```

Release History

Release 8.1.1; command introduced.

Related Commands

erp-ring	Creates an Ethernet Ring Protection (ERP) ring.
erp-ring sub-ring	Creates an Ethernet Ring Protection (ERP) ring sub ring.
show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.

MIB Objects

```
alaErpRingTable
   alaErpRingId
   alaErpRingClearAction
```

erp-ring ethoam-event

Configures a ring port to accept a “loss of connectivity” event from Ethernet OAM for a remote endpoint.

erp-ring *ring_id* **ethoam-event {***chassis/slot/port* **| linkagg** *agg_num***} remote-endpoint** *mep_id*

no erp-ring *ring_id* **ethoam-event {***chassis/slot/port* **| linkagg** *agg_num***}**

Syntax Definitions

ring_id	The ERP ring ID number. The valid range is 1 to 2147483647.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
agg_num	The link aggregate ID number.
mep_id	The remote endpoint ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The specified ring identification number must be unique within a switch.

Examples

```
-> erp-ring 1 ethoam-event 1/1/1 remote-endpoint 10
-> erp-ring 1 ethoam-event linkagg 1 remote-endpoint 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

erp-ring	Creates an Ethernet Ring Protection (ERP) ring.
erp-ring sub-ring	Creates an Ethernet Ring Protection (ERP) ring sub ring.
show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.

MIB Objects

```
alaErpRingTable
   alaErpRingId
   alaErpRingPortIfIndex
   alaErpRingPortEthOAMEvent
   alaErpRingPortRmepId
```

clear erp statistics

Clears ERP statistics for all rings, a specific ring, or a specific ring port.

clear erp statistics [ring *ring_id* **[port** *chassis/slot/port* **| linkagg** *agg_num***]]**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1 to 2147483647.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
agg_num	The link aggregate ID number.

Defaults

By default, statistics are cleared for all ERP rings in the switch configuration.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter a ring ID to clear the statistics for a specific ring.
- Enter a ring ID and a ring port number or link aggregate ID to clear the statistics for a specific port or link aggregate.
- The specified ring ID must exist in the switch configuration.
- The specified port must belong to the ring identified by the ring ID.

Examples

```
-> clear erp statistics
-> clear erp statistics ring 5
-> clear erp statistics ring 5 port 1/1/2
-> clear erp statistics ring 5 linkagg 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

erp-ring	Configures an ERP ring.
show erp	Displays the ERP ring configuration for the switch.
show erp statistics	Displays ERP ring statistics.

MIB Objects

```
alaErpClearStats
alaErpRingTable
   alaErpRingId
   alaErpRingClearStats
alaErpRingPortTable
   alaErpRingPortIfIndex
   alaErpRingPortClearStats
```

show erp

Displays the ERP configuration information for all rings, a specific ring, or for a specific ring port.

show erp [ring *ring_id* **| [port** *chassis/slot/port* **| linkagg** *agg_num***]]**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1 to 2147483647.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
agg_num	The link aggregate ID number.

Defaults

By default, configuration information is displayed for all ERP rings in the switch configuration.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter a ring ID to display the configuration for a specific ring.
- Enter a ring port number or a link aggregate ID to display the configuration for a specific port or link aggregate.
- The specified ring ID must exist in the switch configuration.

Examples

```
-> show erp
Legends: *    to Inactive Configuration
         WTR  to Wait To Restore
         MEG  to Maintenance Entity Group

output definitions

Ring ID	The ERP ring ID number.
Ring Ports	The slot and port number of the ring ports.
Ring Status	The ring status **(enabled** or **disabled)**.
Service VLAN	The Service VLAN ID.
WTR Timer	The wait-to-restore timer value in minutes for RPL node.
Guard Timer	The guard timer value in centi-secs for the ring node.
MEG Level	The Service VLAN Management Entity Group (MEG) level.
Ring State	Indicates the state of the ring.
Ring Node Type	Indicates the type of the ring node.
Last State Change	Indicates the time when the last state change occurred.

  Ethoam Event         : enabled,
  Rmepid               : 10
```

output definitions

Ring ID	The ERP ring ID number.
Ring Port Status	The status of the ring port (**blocking** or **forwarding**).
Ring Port Type	The type of ring port (**RPL** or **non-RPL**).

output definitions (continued)

Ethoam Event	Indicates whether or not the ring port will accept Ethernet OAM loss of connectivity events (**enabled** or **disabled)**.
Rmepid	The remote Ethernet OAM MEP ID number from which this port accepts loss of connectivity events. This field displays only when the ring port is configured to receive such events.

Release History

Release 8.1.1; command introduced.

show erp statistics

Displays the ERP statistics for all rings, a specific ring, or a specific ring port.

show erp statistics [ring *ring_id* **[port** *chassis/slot/port* **| linkagg** *agg_num***]]**

Syntax Definitions

ring_id	An existing ERP ring ID number. The valid range is 1 to 2147483647.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
agg_num	The link aggregate ID number.

Defaults

By default, statistics are displayed for all ERP rings in the switch configuration.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter a ring ID to display the statistics for a specific ring.
- Enter a ring ID and a ring port number or link aggregate ID to display the statistics for a specific port or link aggregate.
- The specified ring ID must exist in the switch configuration.
- The specified port must belong to the ring identified by the ring ID.

Examples

```
-> show erp statistics

output definitions

Ring ID	The ERP ring ID number.
Ring Port	The slot and port number of the ring port.
R-APS	The type of Ring Automatic Switching Protocol (R-APS) event message (**NR** = no request, **RB** = RPL is blocked, **SF** = signal failure). APS is the protocol ERP uses to monitor and control ring links.
Send	Total number of R-APS messages sent.
Recv	Total number of R-APS messages received.
Drop	Total number of R-APS messages dropped.

13 MVRP Commands

MVRP (Multiple VLAN Registration Protocol) provides a mechanism for maintaining the contents of Dynamic VLAN Registration Entries for each VLAN, and for propagating the information they contain to other Bridges. MVRP uses MRP (Multiple Registration Protocol) as the underlying mechanism, for the maintenance and propagation of the VLAN information.

MVRP acts as an MRP application, sending and receiving MVRP information encapsulated in an Ethernet frame on a specific MAC address. MVRP allows both end stations and Bridges in a Bridged Local Area Network to issue and revoke declarations relating to membership of VLANs.

A summary of the available commands is listed here:

mvrp
mvrp port
mvrp maximum-vlan
mvrp registration
mvrp applicant
mvrp timer join
mvrp timer leave
mvrp timer leaveall
mvrp timer periodic-timer
mvrp periodic-transmission
mvrp restrict-vlan-registration
mvrp restrict-vlan-advertisement
mvrp static-vlan-restrict
show mvrp configuration
show mvrp port
show mvrp linkagg
show mvrp timer
show mvrp statistics
show mvrp last-pdu-origin
show mvrp vlan-restrictions
show mvrp vlan-restrictions
mvrp clear-statistics

mvrp

Enables or disables MVRP globally on the switch.

mvrp {enable | disable}

Syntax Definitions

enable	Enables MVRP globally on the switch.
disable	Disables MVRP globally on the switch.

Defaults

By default, MVRP is disabled on the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Disabling MVRP globally deletes all the MVRP learned VLANs.
- MVRP is supported only when the switch is operating in the flat Spanning Tree mode and it is not supported in the per-VLAN mode.

Examples

```
-> mvrp enable
-> mvrp disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp configuration	Displays the global configuration for MVRP.

MIB Objects

```
alaMvrpGlobalStatus
```

mvrp port

Enables or disables MVRP on specific ports on the switch.

mvrp port *chassis/slot/port* **[–** *port2***] {enable | disable}**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
enable	Enables MVRP on a port.
disable	Disables MVRP on a port.

Defaults

By default, MVRP is disabled on all the ports.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- MVRP can be enabled on switch ports regardless of whether it is globally enabled on the switch. However, for the port to become an active participant in the MVRP operation, MVRP must be enabled globally on the switch.
- When MVRP is globally enabled on the switch and is not enabled on the port, that port is excluded from the MVRP protocol operation.
- MVRP can be enabled only on fixed ports, 802.1 Q ports, aggregate ports, and VLAN Stacking Network ports. Other ports (mirroring ports, aggregable ports, VLAN Stacking User ports) do not support MVRP.

Examples

```
-> mvrp port 1/1/2 enable
-> mvrp port 1/1/2 disable
-> mvrp port 1/1/1-10 enable
-> mvrp port 1/1/1-10 disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp statistics	Displays the MVRP statistics for all the ports, aggregates, or specific ports.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortStatus
```

mvrp linkagg

Enables or disables MVRP on specific aggregates on the switch.

mvrp linkagg *agg_id***[-***agg_id2***] {enable | disable}**

Syntax Definitions

*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables MVRP on a port.
disable	Disables MVRP on a port.

Defaults

By default, mvrp is disabled on all the ports.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- MVRP can be enabled on switch ports regardless of whether it is globally enabled on the switch. However, for the port to become an active participant in the MVRP operation, MVRP must be enabled globally on the switch.
- When MVRP is globally enabled on the switch and is not enabled on the port, that port is excluded from the MVRP protocol operation.
- MVRP can be enabled only on fixed ports, 802.1 Q ports, aggregate ports, and VLAN Stacking Network ports. Other ports (mirroring ports, aggregable ports, mobile ports, VPLS Access ports, VLAN Stacking User ports) do not support MVRP.
- To use the *agg_id* parameter, the link aggregate group must be created.

Examples

```
-> mvrp linkagg 10 enable
-> mvrp linkagg 10 disable
-> mvrp linkagg 2-5 enable
-> mvrp linkagg 1-5 disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp statistics	Displays the MVRP statistics for all the ports, aggregates, or specific ports.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortStatus
```

mvrp maximum-vlan

Configures the maximum number of dynamic VLANs that can be created by MVRP.

mvrp maximum-vlan *vlan_limit*

Syntax Definitions

vlan_limit	The maximum number of VLANs to be created by MVRP. The valid range is 32–4094.

Defaults

The default value is 256.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command can be used even when MVRP is not enabled on the switch. However, MVRP must be enabled on the switch for creating dynamic VLANs.
- If the VLAN limit to be set is less than the current number of dynamically learnt VLANs, then the new configuration takes effect only after the MVRP is disabled and re-enabled on the switch. The VLANs learnt earlier are retained if this operation is not performed.

Examples

```
-> mvrp maximum-vlan 100
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp configuration	Displays the global configuration for MVRP.
show mvrp vlan-restrictions	Displays the list of VLANS learned through MVRP and their details.

MIB Objects

```
alaMvrpMaxVlanLimit
```

mvrp registration

Configures the MVRP registration mode for specific ports or aggregates.

mvrp {port *chassis/slot/port***[**– *port2***] | linkagg** *agg_id* **[**-*agg_id2***]} registration {normal | fixed | forbidden}**

Syntax Definitions

*chassis/slot/port***[**– *port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
normal	Specifies that both registration and de-registration of VLANs are allowed. VLANs can be mapped either dynamically (through MVRP) or statically (through management application) on such a port.
fixed	Specifies that only static mapping of VLANs is allowed on the port but de-registration of previously created dynamic or static VLANs is not allowed.
forbidden	Specifies that dynamic VLAN registration or de-registration is not allowed on the port. Any dynamic VLANs created earlier is de-registered.

Defaults

parameter	default
normal | fixed | forbidden	**normal**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/1/2 registration forbidden
-> mvrp port 1/1/5 registration normal
-> mvrp linkagg 10 registration fixed
-> mvrp linkagg 20 registration forbidden
-> mvrp port 2/1/5-10 registration normal
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigRegistrarMode
```

mvrp applicant

Configures the applicant mode of specific ports on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.

mvrp {port *chassis/slot/port* **[–** *port2***] | linkagg** *agg_id***[-***agg_id2***]} applicant {participant | non-participant | active}**

Syntax Definitions

*chassis/slot/port***[–** *port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
participant	Specifies that MVRP PDU exchanges are only allowed when the port is in the STP forwarding state.
non-participant	Specifies that MVRP PDU's are not sent in this mode and PDU's received are processed and learning happens as expected.
active	Specifies that MVRP PDU exchanges are allowed when the port is in the STP forwarding state or STP blocking state. This is applicable for both advertisement and registration.

Defaults

parameter	default
participant | non-participant | active	**active**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/1/2 applicant active
-> mvrp port 1/1/3 applicant participant
-> mvrp port 1/1/4 applicant non-participant
-> mvrp linkagg 10 applicant active
-> mvrp linkagg 15-19 applicant participant
-> mvrp linkagg 20 applicant non-participant
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigtable
   alaMvrpPortConfigApplicantMode
```

mvrp timer join

Specifies the join time interval between transmit opportunities for the dynamically registering VLANs on the switch.

mvrp {port *chassis/slot/port***[–** *port2***] | linkagg** *agg_id***[-***agg_id2***]} timer join** *timer-value*

Syntax Definitions

*chassis/slot/port***[–** *port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
timer-value	Specifies the value of the join timer in milliseconds. The valid range is 250 milliseconds to 1073741773 milliseconds.

Defaults

parameter	default
timer-value	600 milliseconds

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/1/2 timer join 600
-> mvrp port 1/1/2-12 timer join 600
-> mvrp linkagg 3 timer join 600
-> mvrp linkagg 3-6 timer join 600
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp timer	Displays the timer values configured for all the ports or a specific port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigJoinTimer
   alaMvrpPortConfigLeaveTimer
   alaMvrpPortConfigLeaveAllTimer
   alaMvrpPortConfigPeriodicTimer
```

mvrp timer leave

Specifies the period of time that the switch has to wait in the Leave state before changing to the unregistered state.

mvrp {port *chassis/slot/port* **[–** *port2***] | linkagg** *agg_id***[-***agg_id2***]} timer leave** *timer-value*

Syntax Definitions

*chassis/slot/port***[–** *port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
timer-value	Specifies the value of the Leave Timer in milliseconds. The valid range is 750 milliseconds to 2147483647 milliseconds.

Defaults]

parameter	default
timer-value	1800 milliseconds

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- Leave timer value must be greater than or equal to twice the Join timer value, plus six times the timer resolution (16.66 milliseconds). Leave timer must be at least be greater than twice the join timer plus100 milliseconds.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/1/2 timer leave 1800
-> mvrp port 1/1/2-12 timer leave 1800
-> mvrp linkagg 3 timer leave 1800
-> mvrp linkagg 3-6 timer leave 1800
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp timer	Displays the timer values configured for all the ports or a specific port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigJoinTimer
   alaMvrpPortConfigLeaveTimer
   alaMvrpPortConfigLeaveAllTimer
   alaMvrpPortConfigPeriodicTime
```

mvrp timer leaveall

Specifies the frequency with which the LeaveAll messages are communicated.

mvrp {port *chassis/slot/port* **[**– *port2***] | linkagg** *agg_id***[-***agg_id2***]} timer leaveall** *timer-value*

Syntax Definitions

*chassis/slot/port***[**– *port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
timer-value	Specifies the value of the LeaveAll Timer in milliseconds. The valid range is 750 milliseconds to 2147483647 milliseconds.

Defaults

parameter	default
timer-value	30000 milliseconds

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- Leaveall timer value must be greater than or equal to the Leave timer value. It is recommended to have the leaveall timer 15 times greater than the leave timer.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/1/2 timer leaveall 30000
-> mvrp port 1/1/2-12 timer leaveall 30000
-> mvrp linkagg 3 timer leaveall 30000
-> mvrp linkagg 3-6 timer leaveall 30000
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp timer	Displays the timer values configured for all the ports or a specific port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigJoinTimer
   alaMvrpPortConfigLeaveTimer
   alaMvrpPortConfigLeaveAllTimer
   alaMvrpPortConfigPeriodicTimer
```

mvrp timer periodic-timer

Specifies the MVRP periodic-timer time interval for the dynamically registering VLANs on the switch.

mvrp {port *chassis/slot/port* **[**– *port2***] | linkagg** *agg_id***[**-*agg_id2***]} timer periodic-timer** *timer-value*

Syntax Definitions

*chassis/slot/port***[**– *port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
timer-value	Specifies the value of the Periodic Timer in seconds. The valid range is between 1 to 2147483647 milliseconds.

Defaults

parameter	default
timer-value	*1 second*

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/1/2 timer periodic-timer 1
-> mvrp port 1/1/2 timer periodic-timer 1
-> mvrp linkagg 3 timer periodic-timer 1
-> mvrp linkagg 3-6 timer periodic-timer 1
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp timer	Displays the timer values configured for all the ports or a specific port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigJoinTimer
   alaMvrpPortConfigLeaveTimer
   alaMvrpPortConfigLeaveAllTimer
   alaMvrpPortConfigPeriodicTimer
```

mvrp periodic-transmission

Enables the periodic transmission status on a port or aggregate of ports.

mvrp {port *chassis/slot/port***[**– *port2***] | linkagg** *agg_id***[-***agg_id2***]} periodic-transmission {enable|disable}**

Syntax Definitions

*chassis/slot/port***[**– *port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Enables periodic transmission status on a port.
disable	Disables periodic transmission status on a port.

Defaults

By default, periodic-transmission status is disabled on all the ports.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/1/2 periodic-transmission enable
-> mvrp port 1/1/2 periodic-transmission disable
-> mvrp linkagg 10 periodic-transmission enable
-> mvrp linkagg 10 periodic-transmission disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigPeriodicTransmissionStatus
```

mvrp restrict-vlan-registration

Restricts MVRP processing from dynamically registering the specified VLAN or VLANs on the switch.

mvrp {port *chassis/slot/port***[**– *port2***] | linkagg** *agg_id***[-***agg_id2***]} restrict-vlan-registration vlan** *vlan_list*

no mvrp {port *chassis/slot/port***[**– *port2***] | linkagg** *agg_id***[-***agg_id2***]} restrict-vlan-registration vlan** *vlan_list*

Syntax Definitions

*chassis/slot/port***[**– *port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
vlan_list	The VLAN ID or the VLAN ID range (for example, 1-10).

Defaults

By default, MVRP dynamic VLAN registrations are not restricted.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to allow registration of dynamic VLAN IDs through MVRP processing.
- If the specified VLAN exists on the switch, the VLAN is mapped to the receiving port.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/1/2 restrict-vlan-registration vlan 5
-> no mvrp port 1/1/2 restrict-vlan-registration vlan 5
-> mvrp linkagg 10 restrict-vlan-registration vlan 6-10
-> no mvrp port 3/1/1 restrict-vlan-registration vlan 6-10
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortRestrictVlanConfigTable
   alaMvrpPortRestrictRowStatus
   alaMvrpPortRestrictVlanAttributeType
   alaMvrpPortRestrictVlanID
```

mvrp restrict-vlan-advertisement

Restricts the advertisement of VLANs on a specific port or an aggregate of ports.

mvrp {port *chassis/slot/port***[**–*port2***] | linkagg** *agg_id***[-***agg_id2***]} restrict-vlan-advertisement vlan** *vlan_list*

no mvrp {port *chassis/slot/port***[**–*port2***] | linkagg** *agg_id***[-***agg_id2***]} restrict-vlan-advertisement vlan** *vlan_list*

Syntax Definitions

*chassis/slot/port***[**– *port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
vlan_list	The list of VLAN IDs or the VLAN ID range (for example, 1-10).

Defaults

By default, MVRP VLAN advertisement is not restricted.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command affects the MVRP processing only if the applicant mode is set to participant or active.
- Use the **no** form of this command to allow the propagation of VLANs.
- To use the *agg_id* parameter, the link aggregate group must be created and enabled.

Examples

```
-> mvrp port 1/1/2 restrict-vlan-advertisement vlan 5
-> no mvrp port 1/1/2 restrict-vlan-advertisement vlan 5
-> mvrp linkagg 10 restrict-vlan-advertisement vlan 6-10
-> no mvrp port 1/1/2 restrict-vlan-advertisement vlan 6-10
-> no mvrp port 1/1/1-2 restrict-vlan-advertisement vlan 6-10
```

Release History

Release 8.1.1; command introduced.

Related Commands

mvrp applicant	Configures the applicant mode of specific ports on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.
mvrp timer join	Configures the applicant mode of specific link aggregates on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortRestrictVlanConfigTable
   alaMvrpPortRestrictRowStatus
   alaMvrpPortRestrictVlanAttributeType
   alaMvrpPortRestrictVlanID
```

mvrp static-vlan-restrict

Restricts a port from becoming a member of a statically created VLAN or a range of VLANs.

mvrp {port *chassis/slot/port***[–** *port2***] | linkagg** *agg_id***[-***agg_id2***]} static-vlan-restrict vlan** *vlan_list*

no mvrp {port *chassis/slot/port***[–** *port2***] | linkagg** *agg_id***[-***agg_id2***]} static-vlan-restrict vlan** *vlan_list*

Syntax Definitions

*chassis/slot/port***[–** *port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
vlan_list	The list of VLAN IDs or the VLAN ID range (for example, 1-10).

Defaults

By default, ports are assigned to the static VLAN based on MVRP PDU processing.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command applies only to static VLANs and does not apply to dynamic VLANs.
- Use the **no** form of this command to set the specified port and VLAN to the default value.

Examples

```
-> mvrp port 1/1/2 static-vlan-restrict vlan 5
-> no mvrp port 1/1/2 static-vlan-restrict vlan 5
-> mvrp port 1/1/2 static-vlan-restrict vlan 6-9
-> no mvrp port 1/1/2 static-vlan-restrict vlan 6-9
-> mvrp linkagg 3 static-vlan-restrict vlan 4-5
-> no mvrp linkagg 3 static-vlan-restrict aggregate vlan 4-5
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortRestrictVlanConfigTable
   alaMvrpPortRestrictRowStatus
   alaMvrpPortRestrictVlanAttributeType
   alaMvrpPortRestrictVlanID
   alaMvrpPortConfigRegistrationToStaticVlan
   alaMvrpPortConfigRegistrationToStaticVlanLearn
   alaMvrpPortConfigRegistrationToStaticVlanRestrict
```

show mvrp configuration

Displays the global configuration for MVRP.

show mvrp configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show mvrp configuration
MVRP Enabled : yes,
Maximum VLAN Limit : 256
```

output definitions

MVRP Enabled	Indicates whether MVRP is globally enabled.
Maximum VLAN Limit	The maximum number of VLANs that can be learned by MVRP in the system.

Release History

Release 8.1.1; command introduced.

Related Commands

mvrp	Enables or disables MVRP globally on the switch.
mvrp maximum-vlan	Configures the maximum number of dynamic VLANs that can be created by MVRP.

MIB Objects

```
alaMvrpGlobalStatus
alaMvrpMaxVlanLimit
```

show mvrp port

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

show mvrp port {*chassis/slot/port***[-***port2***]} [enable | disable]**

Syntax Definitions

*chassis/slot/port***[–** *port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
enable	To display only the enabled ports.
disable	To display only the disabled ports.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

```

show mvrp timer

Displays the timer values configured for all the ports or a specific port.

show mvrp {port *chassis/slot/port***[–** *port2***] | linkagg** *agg_id***[-***agg_id2***]} timer {join | leave | leaveall | periodic-timer}**

Syntax Definitions

*chassis/slot/port***[–** *port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
join	To display only the join timer.
leave	To display only the leave timer.
leaveall	To display only the leaveall timer.
periodic-timer	To display only the periodic-timer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **join**, **leave**, **leaveall**, or **periodic-timer** parameter with this command to view the specific timer values configured on all the ports.
- Use the *agg_id* or *chassis/slot/port* parameter with this command to display the timer values configured for a specific port.

Examples

```
-> show mvrp timer

Port    Join Timer     Leave Timer    LeaveAll Timer   Periodic Timer

```

output definitions

Port	Displays the slot/port number.
Join Timer	Displays the value of Join Timer in milliseconds.
Leave Timer	Displays the value of the Leave Timer in milliseconds.

output definitions (continued)

LeaveAll Timer	Displays the value of the LeaveAll Timer in milliseconds.
Periodic Timer	Displays the value of the Periodic Timer in seconds.

Release History

Release 8.1.1; command introduced.

Related Commands

mvrp timer join	Specifies the join time interval between transmit opportunities for the dynamically registering VLANs on the switch.
mvrp timer leave	Specifies the period of time that the switch has to wait in the Leave state before changing to the unregistered state.
mvrp timer leaveall	Specifies the frequency with which the LeaveAll messages are communicated.
mvrp timer periodic-timer	Specifies the MVRP periodic-timer time interval for the dynamically registering VLANs on the switch.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortConfigTable
   alaMvrpPortConfigJoinTimer
   alaMvrpPortConfigLeaveTimer
   alaMvrpPortConfigLeaveAllTimer
   alaMvrpPortConfigPeriodicTimer
```

show mvrp statistics

Displays the MVRP statistics for all the ports, aggregates, or specific ports.

show mvrp {port *chassis/slot/port***[–** *port2***] | linkagg** *agg_id***[-***agg_id2***] } statistics**

Syntax Definitions

*chassis/slot/port***[–** *port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If no port or link aggregate is specified the MVRP statistics are displayed for all ports.
- Use the *agg_id* or *chassis/slot/port* parameter with this command to display the MVRP statistics for a specific port.

Examples

```
-> show mvrp port 1/1/21 statistics

output definitions

New Received	The number of new MVRP messages received on the switch.
Join In Received	The number of MVRP Join In messages received on the switch
Join Empty Received	The number of MVRP Join Empty messages received on the switch.
Leave In Received	The number of MVRP Leave In messages received on the switch.
In Received	The total MVRP messages received on the switch.
Empty Received	The number of MVRP Empty messages received on the switch.
Leave All Received	The number of MVRP Leave All messages received on the switch.

output definitions (continued)

New Transmitted	The number of new MVRP messages sent by the switch.
Join In Transmitted	The number of MVRP Join In messages sent by the switch
Join Empty Transmitted	The number of MVRP Join Empty messages sent by the switch.
Leave Transmitted	The number of MVRP Leave messages sent by the switch.
In Transmitted	The number of MVRP In messages sent by the switch.
Empty Transmitted	The number of MVRP empty messages sent by the switch.
LeaveAll Transmitted	The number of Leave All messages sent by the switch.
Failed Registrations	The number of failed registrations.
Total Mrp PDU Received	The number of total MRP PDUs received by the switch.
Total Mrp Msgs Received	The number of total MRP messages received by the switch.
Total Mrp Msgs Transmitted	The number of total MRP messages sent by the switch.
Invalid Msgs Received	The number of invalid messages received by the switch.

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp configuration	Clears MVRP statistics for all ports, an aggregate of ports, or a specific port.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configuration for a specific port or an aggregate of ports.

show mvrp last-pdu-origin

Displays the source MAC address of the last MVRP message received on specific ports or aggregates.

show mvrp {port *chassis/slot/port***[–** *port2***] | linkagg** *agg_id***[-***agg_id2***]} last-pdu-origin**

Syntax Definitions

*chassis/slot/port***[–** *port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show mvrp port 1/1/1-3 last-pdu-origin

Port     Last PDU Origin
--------+------------------
1/1/1      00:d0:95:ee:f4:64
1/1/2      00:d0:95:ee:f4:65
1/1/3      00:d0:95:ee:f4:66

->show mvrp port 1/1/21 last-pdu-origin

Port     Last PDU Origin
--------+------------------
1/1/21      00:d0:95:ee:f4:64
```

output definitions

Port	Displays the slot and port number.
Last PDU origin	The source MAC address of the last PDU message received on the specific port.

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp linkagg	Displays the MVRP configuration for a specific port or an aggregate of ports.
show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

MIB Objects

```
alaMvrpPortStatsTable
   alaMvrpPortLastPduOrigin
```

show mvrp vlan-restrictions

Displays the VLAN MVRP configuration on a specific port or an aggregate of ports.

show mvrp {port *chassis/slot/port***[–** *port2***] | linkagg** *agg_id***[-***agg_id2***]} vlan-restrictions**

Syntax Definitions

*chassis/slot/port***[–** *port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the *agg_id* or *chassis/slot/port* parameter with this command to display the MVRP statistics for a specific port.

Examples

```
-> show mvrp port 1/1/21 vlan-restrictions

VLAN ID             Static      Restricted      Restricted
                 Registration   Registration    Applicant
---------------+---------------+---------------+-----------
     1               LEARN          FALSE          FALSE
     2               LEARN          FALSE          FALSE
     3               LEARN          FALSE          FALSE
     4               LEARN          FALSE          FALSE
     5               LEARN          FALSE          FALSE
     6               LEARN          FALSE          FALSE
     7               LEARN          FALSE          FALSE
    11               RESTRICT       FALSE          FALSE
    12               RESTRICT       FALSE          FALSE
    53               LEARN          TRUE           FALSE
    55               LEARN          FALSE          TRUE
```

output definitions

VLAN ID	The VLAN identification number for a preconfigured VLAN that handles the MVRP traffic for this port.
Static Registration	Indicates if the port is restricted (**RESTRICT**) or not restricted (**LEARN**) from becoming a member of the static VLAN.

output definitions (continued)

Restricted Registration	Indicates if the VLAN is restricted (**TRUE**) or not restricted (**FALSE**) from dynamic registration on the port.
Restricted Applicant	Indicates if the VLAN is restricted for advertisement from the port (**TRUE**) or not (**FALSE**).

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp port	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
show mvrp linkagg	Displays the MVRP configuration for a specific port or an aggregate of ports.

MIB Objects

```

   alaMvrpPortConfigRestrictedRegistrationBitmap
   alaMvrpPortConfigRestrictedApplicantBitmap
   alaMvrpPortConfigRegistrationToStaticVlan
```

mvrp clear-statistics

Clears MVRP statistics for all the ports, an aggregate of ports, or a specific port.

mvrp [port *chassis/slot/port***[–***port2***] | linkagg** *agg_id***[-***agg_id2***]] clear-statistics**

Syntax Definitions

*chassis/slot/port***[–** *port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).

Defaults

If no ports are specified, the MVRP statistics are deleted for all the ports.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the *agg_id* or *chassis/slot/port* parameter with this command to clear MVRP statistics for a specific port.

Examples

```
-> mvrp clear-statistics
-> mvrp port 1/1/2 clear-statistics
-> mvrp linkagg 10 clear-statistics
```

Release History

Release 8.1.1; command introduced.

Related Commands

show mvrp statistics	Displays the MVRP statistics for all the ports, aggregates, or specific ports.

MIB Objects

```
alaMvrpGlobalClearStats
   alaMvrpPortStatsTable
   alaMvrpPortStatsClearStats
```

14 802.1AB Commands

802.1AB is an IEEE standard for exchanging information with neighboring devices and maintaining a database of it. The information is exchanged as an LLDPDU (Link Layer Discovery Protocol Data Unit) in TLV (Time, Length, Value) format. This chapter details configuring and monitoring 802.1AB on a switch.

Alcatel-Lucent's version of 802.1AB complies with the following:

- IEEE 802.1AB-2009 Station and Media Access Control Discovery
- ANSI-TIA 1057-2006 Link Layer Discovery Protocol for Media End Point Devices .

MIB information for the 802.1AB commands is as follows:

Filename: LLDP-MIB
Module: lldpMIB

Filename: LLDP-EXT-DOT1-MIB
Module: lldpXdot1MIB

Filename: LLDP-EXT-DOT1-V2-MIB
Module: lldpV2Xdot1MIB

Filename: LLDP-EXT-DOT3-MIB
Module: lldpXdot3MIB

A summary of available commands is listed here:

lldp nearest-edge mode
lldp transmit hold-multiplier
lldp reinit delay
lldp notification interval
lldp lldpdu
lldp notification
lldp network-policy
lldp med network-policy
lldp tlv management
lldp tlv dot1
lldp tlv dot3
lldp tlv med
show lldp system-statistics
show lldp statistics
show lldp local-system
show lldp local-port
show lldp local-management-address
show lldp config
show lldp network-policy
show lldp med network-policy
show lldp agent-destination-address
show lldp remote-system
show lldp remote-system med
show lldp remote-system application-tlv

Configuration procedures for 802.1AB are explained in "Configuring 802.1AB," *OmniSwitch AOS Release 8 Network Configuration Guide*.

lldp nearest-edge mode

Enables or disables the nearest-edge mode for the switch. When enabled, the switch will use the LLDP destination MAC address (01:20: DA: 02:01:73) to send LLDPDUs.

lldp nearest-edge mode {enable | disable}

Syntax Definitions

enable	Enables the nearest-edge mode.
disable	Disables the nearest-edge mode.

Defaults

NA

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The **nearest-edge** MAC address is used in conjunction with the Auto Download Configuration feature to advertise the management VLAN.
- This mode is used to learn the Management VLAN ID from a centralized Remote Configuration management switch.

Examples

```
-> lldp nearest-edge mode enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show lldp local-system	Displays local system information.

MIB Objects

```
lldpDestMac
```

lldp transmit

Sets the transmit options and time interval for LLDPDUs.

lldp transmit {credit-max *num* | **fast-init** *num* | **fast-transmit** *seconds* | **interval** *seconds***}**

Syntax Definitions

credit-max *num*	The number of consecutive LLDPDUs that can be transmitted at any time. The valid range is 1 - 100.
fast-init *num*	The number of consecutive LLDPDUs that can be transmitted when MED endpoint neighbor is detected. The valid range is 1 to 8.
fast-transmit *seconds*	The fast transmit interval between LLDPDUs, in seconds. Selection of time interval between transmissions during fast transmission period. The valid range is 1 - 3600.
interval *seconds*	The transmit interval between LLDPDUs, in seconds. The valid range is 5 - 32768.

Defaults

parameter	default
seconds	30
fast-init *num*	4
fast-transmit *seconds*	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The LLDP protocol must be enabled before using this command.
- The transmission of LLDP-MED TLV only starts when the switch has detected a MED capable endpoint in the port.
- LLDPDU has a length restriction of 1500 bytes. If the set of MED TLVs selected in the local system is greater than 1500 bytes, then, the LLDPDU is sent containing the mandatory TLVs, and as many of the optional TLVs in the set that fit in the remaining LLDPDU.

Examples

```
-> lldp transmit interval 40
-> lldp credit max num 25
-> lldp fast-init num 5
-> lldp fast-transmit seconds 5
```

Release History

Release 8.1.1; command introduced.

Related Commands

lldp transmit hold-multiplier	Sets the transmit hold multiplier value, which is used to calculate the Time To Live TLV.
show lldp local-system	Displays local system information.

MIB Objects

```
lldpV2configuration
   lldpV2MessageTxInterval
```

lldp transmit hold-multiplier

Sets the transmit hold multiplier value, which is used to calculate the Time To Live TLV.

lldp transmit hold-multiplier *num*

Syntax Definitions

num	The transmit hold multiplier value. The valid range is 2-10.

Defaults

parameter	default
num	4

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The LLDP protocol must be enabled before using this command.
- The Time To Live is a multiple of transmit interval and transmit hold multiplier.

Examples

```
-> lldp transmit hold-multiplier 6
```

Release History

Release 8.1.1; command introduced.

Related Commands

lldp nearest-edge mode	Sets the transmit time interval for LLDPDUs.
show lldp local-system	Displays local system information.

MIB Objects

```
lldpV2configuration
   lldpV2MessageTxHoldMultiplier
```

lldp reinit delay

Sets the time interval that must elapse before the current status of a port is reinitialized after a status change.

lldp reinit delay *seconds*

Syntax Definitions

seconds	The number of seconds to reinitialize the ports status after a status change. The valid range is 1-10.

Defaults

parameter	default
seconds	2

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The LLDP protocol must be enabled before using this command.

Examples

```
-> lldp reinit delay 4
```

Release History

Release 8.1.1; command introduced.

Related Commands

show lldp local-system	Displays local system information.

MIB Objects

```
lldpV2configuration
   lldpV2ReinitDelay
   lldpPortConfigAdminStatus
```

lldp notification interval

Sets the time interval that must elapse before a notification about the local system MIB change is generated.

lldp notification interval *seconds*

Syntax Definitions

seconds	The minimum number of seconds for generating a notification-event. The valid range is 5-3600.

Defaults

parameter	default
seconds	5

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The LLDP protocol and notification must be enabled before using this command.
- In a specified interval, it is not possible to generate more than one notification-event.

Examples

```
-> lldp notification interval 25
```

Release History

Release 8.1.1; command introduced.

Related Commands

lldp notification	Specifies the switch to control per port notification status about the remote device change.
show lldp local-system	Displays local system information.

MIB Objects

```
lldpV2configuration
   lldpV2NotificationInterval
```

lldp lldpdu

Specifies the switch to control the transmission and the reception of LLDPDUs per LLDP agent 1for a particular chassis, a slot, or a port. Specifies the LLDP destination MAC address sent in LLPDUs.

lldp [nearest-bridge | nearest-customer | non-tpmr | all] {port *chassis/slot/port* **[***-port]* **| slot** *chassis/slot* **| chassis} lldpdu {tx | rx | tx-and-rx | disable}**

Syntax Definitions

nearest-bridge	Specifies the destination MAC address as 01:80:C2:00:00:0E.
nearest-customer	Specifies the destination MAC address as 01:80:C2:00:00:00.
non-tpmr	Specifies the destination MAC address as 01:80:C2:00:00:03.
all	Specifies that all three LLDP agents must be supported.
*chassis/slot/port***[***-port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis_id/slot	The chassis ID and slot number for a specific module (3/1).
chassis	Specifies the whole chassis.
tx	Transmits LLDPDUs.
rx	Receives LLDPDUs.
tx-and-rx	Transmits and receives LLDPDUs.
disable	Disables LLDPDUs transmission and reception.

Defaults

parameter	default
tx | rx | tx-and-rx | disable	**tx-and-rx**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The port can be set to receive, transmit, or transmit and receive LLDPDUs using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.

Examples

```
-> lldp port 1/1/2 lldpdu tx-and-rx
-> lldp slot 1/1 lldpdu tx
-> lldp nearest-customer port 1/2 lldpdu tx-and-rx
-> lldp chassis lldpdu disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

lldp lldpdu	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.
lldp notification	Specifies the switch to control per port notification status about the remote device change.
show lldp local-system	Displays local system information.

MIB Objects

```
lldpDestMac
lldpPortConfigTable
   lldpPortConfigPortNum
   lldpPortConfigAdminStatus
```

lldp notification

Specifies the switch to control per LLDP agent per port notification status about the remote device change. Also specifies the LLDP destination MAC address sent in LLDPDUs.

lldp [nearest-bridge | nearest-customer | non-tpmr | all] {port *chassis/slot/port***[-***port 1***] | slot** *chassis/slot* | **chassis} notification {enable | disable}**

Syntax Definitions

nearest-bridge	Specifies the destination MAC address as 01:80:C2:00:00:0E.
nearest-customer	Specifies the destination MAC address as 01:80:C2:00:00:00.
non-tpmr	Specifies the destination MAC address as 01:80:C2:00:00:03.
all	Specifies that all three LLDP agents must be supported.
*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis_id/slot	The chassis ID and slot number for a specific module (3/1).
enable	Enables the notification of local system MIB changes.
disable	Disables the notification.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The LLDPDU administrative status must be in the receive state before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.

Examples

```
-> lldp chassis port 1/1/2 notification enable
-> lldp nearest-bridge port 1/1/3 notification enable
-> lldp slot 1/1 notification disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

lldp notification interval	Sets the time interval that must elapse before a notification about the local system MIB change is generated.
lldp lldpdu	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.

MIB Objects

```
lldpV2PortConfigTable
   lldpV2PortConfigPortNum
   lldpV2PortConfigNotificationEnable
```

lldp network-policy

Configures a local Network Policy on the switch for a specific application type.

lldp network-policy *policy_id* **application {voice | voice-signaling | guest-voice | guest-voice-signaling | softphone-voice | video-conferencing | streaming-video | video-signaling} vlan {untagged | priority-tag |** *vlan-id***} [l2-priority** *802.1p_value***] [dscp** *dscp_value***]**

no lldp network-policy *policy_id* - [*policy_id2*]

Syntax Definitions

policy_id -[*policy_id2*]	A network policy identifier (0-31) which is associated to a port. Supported only with the **no** form of the command
voice	Specifies a voice application type.
voice-signaling	Specifies a voice-signaling application type.
guest-voice	Specifies a guest-voice application type.
guest-voice-signaling	Specifies a guest-voice-signaling application type.
softphone-voice	Specifies a softphone-voice application type.
video-conferencing	Specifies a video-conferencing application type.
streaming-video	Specifies a streaming-video application type.
video-signaling	Specifies a video-signaling application type.
untagged	Specifies that a VLAN port is untagged.
priority-tag	Specifies the internal priority that would be assigned to the VLAN**.**
vlan_id	VLAN identifier. Valid range is 1–4094.
802.1p_value	The Layer-2 priority value assigned to the VLAN. Valid range is 0–7.
dscp_value	Priority value assigned to the DSCP (Differentiated Service Code Point) header. Valid range is 0–63.

Defaults

parameter	default
802.1p_value **for voice application**	**5**
802.1p_value **for other applications**	**0**
dscp_value	**0**

By default the VLAN ID is configured in the voice network profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the configured network policy from the system.
- When a network policy is deleted, all the associated values and port bindings are also deleted.
- A maximum of 32 network policies can be configured on a single VLAN.
- Once a policy is created, the application type, VLAN ID, 802.1p, and DSCP values can be modified.
- If a network policy ID is bound to a port, it cannot be modified.
- Use a hyphen to specify a range of Policy IDs and a space to separate multiple Policy IDs in the command.
- The range for Policy IDs is supported only with the **no** form of this command.

Examples

```
-> lldp network-policy 10 application voice vlan 20
-> lldp network-policy 11 application guest-voice-signaling vlan untagged l2–
priority 3
-> lldp network-policy 20 application voice vlan priority-tag dscp 39
-> lldp network-policy 20 application voice-signaling vlan 23 l2-priority 2 dscp 43
-> no lldp network-policy 10

-> no lldp network-policy 10-20
```

Release History

Release 8.1.1; command introduced.

Related Commands

lldp tlv med	Configures whether or not LLDP-MED TLVs are included in transmitted LLDPDUs.
show lldp network-policy	Displays the network policy details for a given policy ID.
show lldp med network-policy	Displays the network policy configured on a slot or port.

MIB Objects

```
aLldpXMedLocMediaPolicyTable
   alaLldpXMedLocMediaPolicyId
   alaLldpXMedLocMediaPolicyAppType
   alaLldpXMedLocMediaPolicyVlanType
   alaLldpXMedLocMediaPolicyVlanID
   alaLldpXMedLocMediaPolicyPriority
   alaLldpXMedLocMediaPolicyDscp
   alaLldpXMedLocMediaPolicyUnknown
   alaLldpXMedLocMediaPolicyTagged
   alaLldpXMedLocMediaPolicyRowStatus
```

lldp med network-policy

Associates an existing network policy per LLDP agent per port, slot, or chassis. Also specifies the LLDP destination MAC address sent in LLDPDUs.

lldp [nearest-bridge | nearest-customer | non-tpmr | all] {port *chassis/slot/port* **| slot** *chassis/slot* | **chassis} med network-policy** *policy_id* - [*policy_id2*]

no lldp {port *chassis/slot/port* **| slot** *chassis/slot* | **chassis} med network-policy** *policy_id* - [*policy_id2*]

Syntax Definition

nearest-bridge	Specifies the destination MAC address as 01:80:C2:00:00:0E.
nearest-customer	Specifies the destination MAC address as 01:80:C2:00:00:00.
non-tpmr	Specifies the destination MAC address as 01:80:C2:00:00:03.
all	Specifies that all three LLDP agents must be supported.
*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis_id/slot	The chassis ID and slot number for a specific module (3/1).
chassis	Specifies all switch ports.
policy_id - [*policy_id2*]	A network policy identifier (0–31).

Defaults

NA

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disassociate a network policy from a port.
- The network policy must already be configured in the system before associating it with a port.
- A maximum of 8 network policies can be associated to a port.
- Two or more network policy IDs with the same application type cannot be associated to a port.

Examples

```
-> lldp chassis med network-policy 22
-> lldp slot 1/1 med network-policy 1-4 5 6
-> lldp por 2/1/3 med network-policy 12
-> no lldp slot 2/3 med network-policy 12
```

Release History

Release 8.1.1; command introduced.

Related Commands

lldp tlv med	Configures whether or not LLDP-MED TLVs are included in transmitted LLDPDUs.
show lldp network-policy	Displays the MED Network Policy details for a given policy ID.
show lldp med network-policy	Displays the network policy configured on a slot or port. If no option is specified, network policies configured on all ports of the chassis are displayed.

MIB Objects

```
alaLldpXMedLocMediaPolicyPortTable
   alaLldpXMedLocMediaPolicyPortIfIndex
   alaLldpXMedLocMediaPolicyId
   alaLldpXMedLocMediaPolicyPortRowStatus
```

lldp tlv management

Specifies the switch to control per LLDP agent per port management TLVsto be incorporated in the LLDPDUs. Also specifies the LLDP destination MAC address sent in LLDPDUs.

lldp [nearest-bridge | nearest-customer | non-tpmr | all] {port *chassis_id/slot/port* **[-***port* **] | slot** *chassis_id/slot* | **chassis} tlv management {port-description | system-name | system-description | system-capabilities | management-address} {enable | disable}**

Syntax Definitions

nearest-bridge	Specifies the destination MAC address as 01:80:C2:00:00:0E.
nearest-customer	Specifies the destination MAC address as 01:80:C2:00:00:00.
non-tpmr	Specifies the destination MAC address as 01:80:C2:00:00:03.
all	Specifies that all three LLDP agents must be supported.
*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis_id/slot	The chassis ID and slot number for a specific module (3/1).
port-description	Enables or disables the transmission of port description TLV in LLDPDU.
system-name	Enables or disables the transmission of system name TLV in LLDPDU.
system-description	Enables or disables transmission of system description TLV in LLDPDU.
system-capabilities	Enables or disables transmission of system capabilities TLV in LLDPDU.
management-address	Enables or disables transmission of management address on per port.
enable	Enables management TLV LLDPDU transmission.
disable	Disables management TLV LLDPDU transmission.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.

Examples

```
-> lldp nearest-customer port 1/1/2 tlv management port-description enable
-> lldp non-tpmr slot 1/1 tlv management management-address enable
-> lldp slot 1/1 tlv management system-name disable
-> lldp chassis tlv management system-capabilities enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

lldp lldpdu	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.
show lldp local-system	Displays local system information.
show lldp local-port	Displays per port information.
show lldp remote-system	Displays per local port and information of remote system.

MIB Objects

```
lldpPortConfigTable
   lldpLocPortPortNum
   lldpPortConfigTLVsTxEnable
lldpV2configManAddrTable
   lldpV2ConfigManAddrPortsTxEnable
```

lldp tlv dot1

Specifies the switch to control per agent per port 802.1 TLVs to be incorporated in the LLDPDUs.

lldp [nearest-bridge] | non-tpmr | customer-bridge | all] {port *chassis/slot/port* **[-***port1* **] | slot** *chassis/slot* | **chassis} tlv dot1 {port-vlan | vlan-name} {enable | disable}**

Syntax Definitions

nearest-bridge	Specifies the destination MAC address as 01:80:C2:00:00:0E.
nearest-customer	Specifies the destination MAC address as 01:80:C2:00:00:00.
non-tpmr	Specifies the destination MAC address as 01:80:C2:00:00:03.
all	Specifies that all three LLDP agents must be supported.
*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis_id/slot	The chassis ID and slot number for a specific module (3/1).
port-vlan	Enables or disables transmission of port VLAN TLV in LLDPDU.
vlan-name	Enables or disables transmission of VLAN name TLV in LLDPDU.
enable	Enables 802.1 TLV LLDPDU transmission.
disable	Disables 802.1 TLV LLDPDU transmission.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- If one TLV is included then the other TLV is automatically included when you use this command.

Examples

```
-> lldp port 1/1/1 tlv dot1 port-vlan enable
-> lldp nearest-bridge slot 1/1 tlv dot1 vlan-name enable
-> lldp nearest-bridge slot 1/1 tlv dot1 port-vlan enable
-> lldp slot 1/1 tlv dot1 vlan-name disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

lldp tlv management	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.
show lldp statistics	Displays per port statistics.
show lldp local-port	Displays per port information.

MIB Objects

```
lldpV2PortConfigTable
   lldpV2PortConfigPortNum
lldpV2Xdot1ConfigPortVlanTable
   lldpV2Xdot1ConfigPortVlanTxEnable
lldpV2Xdot1ConfigVlanNameTable
   lldpV2Xdot1ConfigVlanNameTxEnable
```

lldp tlv dot3

Specifies the switch to control per port 802.3 TLVs to be incorporated in the LLDPDUs.

lldp [nearest-bridge] | non-tpmr | customer-bridge | all] {port *chassis/slot/port* **[-***port***] | slot** *chassis/slot* | **chassis} tlv dot3 {mac-phy | power-via-mdi} {enable | disable}**

Syntax Definitions

nearest-bridge	Specifies the destination MAC address as 01:80:C2:00:00:0E.
nearest-customer	Specifies the destination MAC address as 01:80:C2:00:00:00.
non-tpmr	Specifies the destination MAC address as 01:80:C2:00:00:03.
all	Specifies that all three LLDP agents must be supported.
*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis_id/slot	The chassis ID and slot number for a specific module (3/1).
mac-phy	Uses the PoE controller to determine the amount of PoE power based on the powered device PoE class.
power-via-mdi	Configures the switch to use the power via MDI TLV in the LLDPDU sent by the powered device.
enable	Enables 802.3 TLV LLDPDU transmission.
disable	Disables 802.3 TLV LLDPDU transmission.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.

Examples

```
-> lldp port 1/1/4 tlv dot3 mac-phy enable
-> lldp slot 1/1 tlv dot3 mac-phy disable
-> lldp all slot 1/1 tlv dot3 mac-phy disable
-> lldp port 1/1/3 tlv dot3 power-via-mdi enable
-> lldp nearest-bridge port 1/1/4 tlv dot3 mac-phy enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

lldp tlv management	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.
lldp tlv dot1	Specifies the switch to control per port 802.1 TLVs to be incorporated in the LLDPDUs.
show lldp statistics	Displays per port statistics.

MIB Objects

```
lldpV2PortConfigTable
   lldpV2PortConfigPortNum
lldpV2Xdot3PortConfigTable
   lldpV2Xdot3PortConfigTLVsTxEnable
```

lldp tlv med

Specifies the switch to control per LLDP agent per port LLDP-MED (Media Endpoint Device) TLVs to be incorporated into the LLDPDUs. Also configures the per port transmission of Network Policy TLVs and whether this information must be included in the LLDPDUs.

lldp {port *chassis_id/slot/port* **[-***port***] | slot** *chassis/slot* | **chassis} tlv med {power | ext-power-via-mdi | capability | network-policy} {enable | disable}**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis_id/slot	The chassis ID and slot number for a specific module (3/1).
ext-power-via-mdi	Enables or disables the TIA-1057 Extended power-via-MDI TLV.
capability	Enables or disables transmission of LLDP-MED capabilities TLV in LLDPDU.
network-policy	Enables or disables transmission of LLDP-MED network policy TLV in LLDPDU.
enable	Enables LLDP-MED TLV LLDPDU transmission.
disable	Disables LLDP-MED TLV LLDPDU transmission.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- To associate a network policy to a port, first create the VLAN, and associate a port to it. Then create the network policy and then bind it to a port.
- If this command is applied to a slot or chassis, then any configurations on specific ports is overwritten.
- The transmission of LLDP-MED Network Policy TLVs is disabled by default.

Examples

```
-> lldp port 1/1/4 tlv med ext-power-via-mdi enable
-> lldp slot 1/1 tlv med capability enable
-> lldp chassis tlv med power disable
-> lldp port 1/1/3 tlv med network-policy disable
-> lldp chassis tlv med network-policy enable
-> lldp chassis tlv med network-policy disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

lldp tlv management	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.
lldp tlv dot1	Specifies the switch to control per port 802.1 TLVs to be incorporated in the LLDPDUs.
lldp tlv dot3	Specifies the switch to control per port 802.3 TLVs to be incorporated in the LLDPDUs.

MIB Objects

```
lldpV2PortConfigTable
   lldpV2PortConfigPortNum
lldpV2XMedPortConfigTable
   lldpV2XMedPortConfigTLVsTxEnable
```

show lldp system-statistics

Displays system-wide statistics.

show lldp system-statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show lldp system-statistics
 Local LLDP Agent System Statistics:
  Remote Systems Last Change  = 0 days 0 hours 3 minutes and 10 seconds,
  Remote Systems MIB Inserts  = 2,
  Remote Systems MIB Deletes  = 0,
  Remote Systems MIB Drops    = 0,
  Remote Systems MIB Age Outs = 0
```

output definitions

Remote Systems Last Change	The last change recorded in the tables associated with the remote system.
Remote Systems MIB Inserts	The total number of complete inserts in the tables associated with the remote system.
Remote Systems MIB Deletes	The total number of complete deletes in tables associated with the remote system.
Remote Systems MIB Drops	The total number of LLDPDUs dropped because of insufficient resources.
Remote Systems MIB Age Outs	The total number of complete age-outs in the tables associated with the remote system.

Release History

Release 8.1.1; command introduced.

Related Commands

lldp notification	Specifies the switch to control per port notification status about the remote device change.
lldp notification interval	Sets the time interval that must elapse before a notification about the local system MIB change is generated.

MIB Objects

```
lldpStatistics
   lldpStatsRemTablesLastChangeTime
   lldpStatsRemTablesInserts
   lldpStatsRemTablesDeletes
   lldpStatsRemTablesDrops
   lldpStatsRemTablesAgeouts
```

show lldp statistics

Displays per port statistics.

show lldp [nearest-bridge | non-tpmr | customer-bridge | all] [port *chassis/slot/port* **[-***port***] slot** *chassis/slot***] statistics**

Syntax Definitions

nearest-bridge	Specifies the destination MAC address as 01:80:C2:00:00:0E.
nearest-customer	Specifies the destination MAC address as 01:80:C2:00:00:00.
non-tpmr	Specifies the destination MAC address as 01:80:C2:00:00:03.
all	Specifies that all three LLDP agents must be supported.
*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis_id/slot	The chassis ID and slot number for a specific module (3/1).

Defaults

By default, statistics for all LLDP ports are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the *slot/port* option is not specified, statistics for the chassis are displayed.
- If the statistics are zero they are not displayed.

Examples

```
-> show lldp statistics
  Chas/       LLDPDU    LLDPDU   LLDPDU    LLDPDU   LLDPDU     TLV      TLV       Device

```

output definitions

Slot/Port	Slot number for the module and physical port number on that module.
LLDPDU Tx	The total number of LLDPDUs transmitted on the port.
LLDPDU Rx	The total number of valid LLDPDUs received on the port.

output definitions (continued)

LLDPDU Errors	The total number of invalid LLDPDUs discarded on the port.
LLDPDU Discards	The total number of LLDPDUs discarded on the port.
TLV Unknown	The total number of unrecognized LLDP TLVs on the port.
TLV Discards	The total number of LLDP TLVs discarded on the port.
Device Ageouts	The total number of complete age-outs on the port.

Release History

Release 8.1.1; command introduced.

Related Commands

lldp lldpdu	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.
lldp tlv management	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.

```

show lldp local-system

Displays local system information.

show lldp local-system

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show lldp local-system
Local LLDP Agent System Data:
  Chassis ID Subtype           = 4 (MAC Address),
  Chassis ID                   = e8:e7:32:9a:45:cf,
  System Name                  = OS6860-DC1,
  System Description           = Alcatel-Lucent OS6860E-P48 8.1.1.266.R01
  Capabilities Supported       = Bridge Router,
  Capabilities Enabled         = Bridge Router,
  LLDPDU Transmit Interval     = 5 seconds,
  TTL Hold Multiplier          = 4,
  Reintialization Delay        = 2 seconds,
  Maximum Transmit Credit      = 5 ,
  LLDPDUs in Fast Transmission = 4 ,
  LLDPDU Fast Transmit Interval= 1 ,
  MIB Notification Interval    = 5 seconds,
  LLDP Nearest-edge Mode       = Enabled,
  Management Address Type      = 1 (IPv4),
  Management IP Address        = 0.0.0.0,
```

output definitions

Chassis ID Subtype	The subtype that describe chassis ID.
Chassis ID	The chassis ID (MAC address).
System Name	The name of the system.
System Description	The description of the system.
Capabilites Supported	The capabilities of the system.
Capabilites Enabled	The enabled capabilities of the system.

output definitions (continued)

LLDPDU Transmit Interval	The LLDPDU transmit interval.
TTL Hold Multiplier	The hold multiplier used to calculate TTL.
Maximum Transmit Credit	The maximum transmit LLDPDUs allowed as per configuration.
LLDPDUs in Fast Transmission	The LLDPDUs in fast transmission.
LLDPDU Fast Transmit Interval	The time interval set for LLDPDUs in fast transmission.
Reintialization Delay	The minimum time interval before the reinitialization of local port objects between port status changes.
MIB Notification Interval	The minimum time interval between consecutive notifications of local system MIB change.
Management Address Type	The type of management address used in LLDPDU.
Management IP Address	The management IP address. The loopback0 IP address is configured for the management IP address to be transmitted.

Release History

Release 8.1.1; command introduced.

Related Commands

lldp reinit delay	Sets the time interval that must elapse before the current status of a port is reinitialized after a status change.
lldp transmit hold-multiplier	Sets the transmit hold multiplier value, which is used to calculate the Time To Live TLV.
lldp transmit	Sets the minimum time interval between successive LLDPDUs transmitted.

```

output definitions

Chas/Slot/Port	Specifies the LLDP port number.
Admin Status	Specifies the Administrative status of the LLDP port.The options are - Disabled, Rx, Tx, and Rx+Tx.
Notify Trap	Specifies if the Notify Trap feature is disabled or enabled on a particular port
Std TLV Mask	Specifies the standard TLV mask set for the port.

output definitions

Mgmt Address	Specifies whether transmission of the per port IPv4 management address is enabled or disabled.
802.1 TLV	Specifies whether 802.1 TLV status is enabled or disabled on the LLDP port.
802.3 Mask	Specifies the standard 802.3 mask set for the port.
MED Mask	Specifies the standard MED mask set for the port.
App-Prio TLV	Specifies whether the Application Priority TLV status is enabled or disabled for the LLDP port.

Release History

Release 8.1.1; command introduced.

Related Commands

lldp lldpdu	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.
lldp notification	Specifies the switch to control per port notification status about the remote device change.
lldp tlv management	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.
lldp tlv dot3	Specifies the switch to control per port 802.3 TLVs to be incorporated in the LLDPDUs.

show lldp network-policy

Displays the MED Network Policy details for a given policy ID.

show lldp network-policy [*policy_id***]**

Syntax Definitions

policy_id	Policy identifier for a network policy definition. Valid range is between 0 and 31.

Defaults

By default, all configured policies are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Network policy must be configured on the system before using this command.
- Enter a policy ID with this command to display information for a specific policy.

Examples

```
-> show lldp network-policy
Legend: 0 Priority Tagged Vlan
        - Untagged Vlan

Network         Application       Vlan    Layer2   DSCP
Policy ID        Type              Id    Priority  Value
----------+---------------------+------+--------+-------
     1      voice                  4000   7        33
    12      guest-voice               -   -        44

    31      guest-voice-signaling    23   2        1

-> show lldp network-policy 1
Legend: 0 Priority Tagged Vlan
        - Untagged Vlan
d
```

output definitions

Network Policy ID	Policy identifier for a network policy definition.
Application Type	Indicates the type of application configured on the port or VLAN.
VLAN ID	The VLAN ID assigned to the port on which the network policy is configured.
Layer2 Priority	Layer 2 priority to be used for the specified application type.
DSCP Value	DSCP value to be used to provide Diffserv node behavior for the specified application type.

Release History

Release 8.1.1 command introduced.

Related Commands

lldp network-policy	Configures a local network policy on a switch for an application type.

```

show lldp med network-policy

Displays the network policy configured on a slot or port. If no option is specified, network policies configured on all ports of the chassis are displayed.

show lldp [slot *chassis/slot*| **port** *chassis/slot/port***] med network-policy**

Syntax Definitions

chassis_id/slot	The chassis ID and slot number for a specific module (3/1).
*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).

Defaults

By default, all ports with associated policies are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Network policy must be configured on the system before using this command.
- Enter a slot or slot/port number with this command to display information for a specific slot or port.

Examples

```
-> show lldp slot 1/1 med network-policy

 chassis/slot/port     Network Policy ID
-------------+-------------------------
    1/1/1                 1 3 5 7 21 23 30 31
    1/1/2                 1 2 3 4 7 8 9 10
    .
    .
    .
```

output definitions

Chassis/Slot/Port	Slot number for the module and physical port number on that module.
Network Policy ID	Policy identifier for a network policy definition.

Release History

Release 8.1.1; command introduced.

Related Commands

lldp tlv med	Configures whether or not LLDP-MED TLVs are included in transmitted LLDPDUs.
lldp network-policy	Configures a local network policy on a switch for an application type.

show lldp agent-destination-address

This command shows destination MAC addresses used in LLDPDUs.

show lldp agent-destination-address

Syntax Definitions

N/A

Defaults

By default, all ports with associated policies are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A.

Examples

```
-> show lldp  agent-destination-address
                                  Destination
       LldpAgentName              Mac Address
------+--------------------------+-----------------+
  1     Nearest-Bridge           00-80-C2-00-00-0E
  2     Non-TPMR-Bridge          00-80-C2-00-00-03
  3     Nearest-Customer-Bridge  00-80-C2-00-00-00
```

output definitions

LLDP Agent Name	The LLDP Agent name (Nearest-Bridge, Non-TPMR-Bridge, Nearest-Customer-Bridge).
Destination MAC Address	The destination MAC address.

Release History

Release 8.1.1; command introduced.

Related Commands

```

output definitions

Remote LLDP Agents on Local Slot/Port	The LLDP Agents port number to which the remote system entry is associated. (**Remote LLDP Nearest-Bridge Agents on Local Port, Remote LLDP Nearest-Customer Agents on Local Port, Remote LLDP Non-TPMR Agents on Local Port)**
Chassis ID Subtype	The sub type that describes chassis ID.
Chassis ID	The chassis ID (MAC address).
Port ID Subtype	The sub type that describes port ID
Port ID	The port ID (Port MAC).
Port Description	The description of the port (which includes the port number and the AOS version).
System Name	The name of the system.
System Description	The description of the system.
Capabilites Supported	The capabilities of the system.
Capabilites Enabled	The enabled capabilities of the system.

Release History

Release 8.1.1; command introduced.

Related Commands

show lldp local-port	Displays per port information.
show lldp local-system	Displays local system information.

MIB Objects

show lldp remote-system med

Displays remote system MED information for a single port or all ports on a slot.

show lldp [port *chassis/slot/port* **[-***port* **] | slot** *chassis/slot***] remote-system med {network-policy | inventory}**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis_id/slot	The chassis ID and slot number for a specific module (3/1).
network-policy	Display network-policy TLVs from remote Endpoint Devices
inventory	Display inventory management TLVs from remote Endpoint Devices

Defaults

By default, a list of all LLDP ports is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

Examples

```
-> show lldp port 1/1/22 remote-system med network-policy
Chas/Slot/  Remote   Application      Unknown    Tagged    Vlan     Layer2   DSCP
Port        ID         Type         Policy Flag Flag       Id     Priority  Value
---------+------+--------------+-----------+---------+------+----------+------
 1/1/22   1        Voice(01)         Defined  Untagged   345       4        34
 1/1/22   2        Guest Voice(4)    Defined  Untagged    50       3        46
```

output definitions

Slot/Port	The Slot number to which the remote system entry is associated and the physical port number on that module.
Remote ID	The Index of the Remote Device.
Application Type	The Application type of the peer entity. 1. Voice 2. Voice Signaling 3. Guest Voice 4. Guest Voice Signaling 5. Softphone Voice 6. Video Conferencing 7. Streaming Video 8. Video Signaling

output definitions (continued)

Unknown Policy Flag	Whether the network policy for the specified application type is currently defined or unknown.
Tagged Flag	Whether the specified application type is using a **tagged** or an **untagged** VLAN.
VLAN ID	The VLAN identifier (VID) for the port.
Layer 2 Priority	Layer 2 priority to be used for the specified application type.
DSCP Value	DSCP value to be used to provide Diffserv node behavior for the specified application type.

```
-> show lldp port 2/47 remote-system med inventory
Remote LLDP Agents on Local Slot/Port 1/22:
  Remote ID  1:

show lldp remote-system application-tlv

Displays remote system Application Priority TLV information for a single port or all ports on a slot.

Note. *This command is currently not supported.*

show lldp [port *chassis/slot/port* **[-***port***] | slot** *chassis/slot***] remote-system application-tlv**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis_id/slot	The chassis ID and slot number for a specific module (3/1).

Defaults

By default, a list of all LLDP ports is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

Examples

```
-> show lldp remote-system application-tlv
Chas/Slot/    Remote
 Port      ID        Selector                       Protocol     Priority
------+----------+------------------------------+-----------+------------+
  1/1/2           1    Ethertype                       35078         3 [fcoe]
  1/1/2           1    Tcp/Sctp                        3260          4 [iscsi]
  1/1/20          1    Tcp/Sctp                        3190          3
  1/1/20          1    Udp/Dccp                        300           4
  1/1/20          1    Tcp/Udp/Sctp/Dccp               300           4
```

output definitions

Slot/Port	The port to which the remote system entry is associated.
Remote ID	The Index of the Remote Device.
Selector	The protocol selector.
Protocol	The protocol Ethertype or well-known port.
Priority	The 802.1p priority value for the specified protocol to use.

Release History

Release 8.1.1; command introduced.

Related Commands

show lldp config	Displays the general LLDP configuration information for LLDP ports.

15 SIP Commands

SIP Snooping feature address the key challenge of real time delivery and monitoring requirements for media streams from SIP devices. SIP snooping feature provides plug and play support to the device, where it automatically identifies the ports used. It also enhances the security of device.

SIP Snooping prioritizes voice and video traffic over non-voice traffic. To summarize, SIP Snooping:

- Identifies and marks the SIP and its corresponding media streams. Each media stream contains Real Time Protocol (RTP) and Real Time Control Protocol (RTCP) flows. Marking is done using the DSCP field in the IP header.
- Provides user configured QOS treatment for SIP/RTP/RTCP traffic flows based on its marking.
- Also snoops voice quality metrics of media streams from their RTCP packets and displays them to the user with knowledge of media reception quality in real time and helps to diagnose the problems on their quality. Also in addition, trap will be generated when voice quality parameters like Jitter, Round trip time, Packet-lost, R-factor and MOS values of media streams crosses user configured threshold.

This chapter includes SIP commands and their descriptions..

MIB information for SIP commands is as follows:

Filename: AlcatelIND1SIPSnooping.MIB
Module: ALCATEL-IND1-CHASSIS-MIB

A summary of the available commands is listed here:

sip-snooping admin-state
sip-snooping port admin-state
sip-snooping mode
sip-snooping trusted server
sip-snooping sip-control
sip-snooping sos-call number
sip-snooping sos-call dscp
sip-snooping udp port
sip-snooping tcp port
sip-snooping threshold
sip-snooping logging-threshold num-of-calls
show sip-snooping call-records
clear sip-snooping statistics
show sip-snooping config
show sip-snooping ports
show sip-snooping statistics
show sip-snooping registered-clients

sip-snooping admin-state

Enables or disables the SIP snooping on the switch.

sip-snooping admin-state {enable | disable}

Syntax Definitions

enable	Enables SIP snooping
disable	Disables SIP snooping

Defaults

By default, SIP-snooping is disabled on the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If SIP snooping is disabled at the port level, enabling SIP snooping globally will not override the configuration of that port.
- If SIP snooping is disabled and enabled, it is mandatory that the phones re-register for successful DSCP marking.

Examples

```
-> sip-snooping admin-state enable
-> sip-snooping admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

sip-snooping port admin-state	Configures the status of SIP snooping on a single port, a range of ports, or on a link aggregate of ports.
show sip-snooping ports	Shows the SIP snooping port level data.
show sip-snooping config	Shows the configuration done for SIP snooping.

MIB Objects

`aluSIPSnoopingStatus`

sip-snooping port admin-state

Configures the status of SIP snooping on a single port, a range of ports, or on a link aggregate.

sip-snooping {port *chassis/slot/port***[-***port2***] | linkagg** *agg_num***} admin-state {enable | disable}**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
agg_num	A link aggregate ID number.
enable	Enables SIP snooping to mirror all SIP PDU that ingress on that port
disable	Disables SIP snooping and will not mirror SIP PDU that ingress on that port.

Defaults

By default, SIP snooping is disabled on the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command for port/linkagg level SIP Snooping configuration on the switch.
- SIP snooping must be enabled globally to activate port/linkagg level configuration.
- Even after SIP snooping is globally disabled, port/linkagg level configuration is saved. This configuration will be used when SIP snooping is enabled globally again.
- Port level configuration is not allowed on a member port of a linkagg.
- If a port joins a linkagg, port level configuration is overridden by the linkagg configuration. Port level configuration will be activated if the port leaves the linkagg.

Examples

```
-> sip-snooping port 1/1/5-6 admin-state enable
-> sip-snooping linkagg 1 admin-state enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping ports	Shows the SIP snooping port level data.

MIB Objects

```
aluSIPSnoopingSlotPortIndex
   aluSIPSnoopingRowStatus
```

sip-snooping mode

Configures the SIP snooping mode for the specified port or link aggregate.

sip-snooping {port *chassis/slot/port***[-***port2***] | linkagg** *agg_num***} mode {force-edge | force-non-edge | automatic}**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
agg_num	The link aggregate ID number.
force-edge	Media TCAM entries to be created for dialogs that transverse the specific port
force-non-edge	No Media TCAM entries for dialogs that transverse the specific port.
automatic	Sets to default mode. The port's edge/non-edge mode is derived by the switch/router based on LLDP received or not on the port.

Defaults

By default, the SIP snooping mode is set to automatic.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command for port/linkagg level SIP Snooping configuration on the switch.
- Force-edge-port/force-non-edge port option to overwrite default port mode learned by either received or not received switch/router capability through LLDP.
- Port level configuration is not allowed on a member port of a linkagg.
- If a port joins a linkagg, port level configuration is overridden by linkagg configuration. Port level configuration will be activated if it leaves the linkagg.

Examples

```
-> sip-snooping port 1/1/5-6 mode force-edge
-> sip-snooping linkagg 1 mode force-non-edge
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping ports	Shows the SIP snooping port level data.

MIB Objects

```
aluSIPSnoopingSlotPortIndex
   aluSIPSnoopingPortConfigPortMode
```

sip-snooping trusted server

Configure the IP addresses of the trusted servers on a switch.

sip-snooping trusted-server [*ip_address1 ip_address2 ip_address ...ip_address8***]**

no sip-snooping trusted-server {*ip_address* **| all}**

Syntax Definitions

*ip_address*1**[-***ip_address2***]**	The IP address of one or more trusted servers.
all	Specifies all the IP addresses.

Defaults

By default, no trusted servers are configured. All SIP based calls using any call server will be supported.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used to configure the IP addresses of the trusted servers. If a trusted server is configured, then only the calls initiated through those servers will be supported.
- A maximum of 8 trusted servers can be configured.
- If no trust servers are configured, all SIP based calls using any call server will be supported.
- Use the **no** form of the command to remove any trusted IP or all trusted IP addresses.

Examples

```
-> sip-snooping trusted-server 192.254.32.22 192.254.32.33
-> no sip-snooping trusted-server 192.254.32.22
-> no sip-snooping trusted-server all
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping config	Shows the configuration done for SIP snooping.

MIB Objects

```
aluSIPSnoopingSIPTrustedServerIPAddress1
aluSIPSnoopingSIPTrustedServerIPAddress2
aluSIPSnoopingSIPTrustedServerIPAddress3
aluSIPSnoopingSIPTrustedServerIPAddress4
aluSIPSnoopingSIPTrustedServerIPAddress5

aluSIPSnoopingSIPTrustedServerIPAddress7
aluSIPSnoopingSIPTrustedServerIPAddress8
```

sip-snooping sip-control

Configures SIP control DSCP marking.

sip-snooping sip-control dscp *num*

sip-snooping sip-control no dscp

Syntax Definitions

num	The DSCP number. The valid range is 1–4 Mbps.

Defaults

By default no marking/prioritizing or rate limit is performed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used for the SIP control DSCP marking. A built-in rate limiter of 1 Mbps is configured to rate limit SIP PDUs being marked by the switch.
- The packet gets its priority as normal packet, either from the QoS port configuration (trust the packet DSCP or untrusted) or from a user configured QoS policy.
- Use **no** form of the command is to set default mode.

Examples

```
-> sip-snooping sip-control dscp 40
-> sip-snooping sip-control no dscp
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping config	Shows the configuration done for SIP snooping.

MIB Objects

`aluSIPSnoopingSIPControlDSCP`

sip-snooping sos-call number

Configures the SOS call strings in SIP snooping.

sip-snooping sos-call number *string1 string2* **…** *string4*

no sip-snooping sos-call number {*string* | **all}**

Syntax Definitions

string1 **…** *string4*	Specifies the SOS call string.
all	Specifies all the SOS call strings.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used for the configuration of the SOS call strings. A maximum of 4 SOS call strings can be configured for an exact match on the “to” URI (user part only)
- No support of regular expression. If no string is specified, no SOS call can be identified in the system.
- Use **no** form of this command to remove existing SOS call strings.

Examples

```
-> sip-snooping sos-call number “911” “2233”
-> no sip-snooping sos-call number “911”
-> no sip-snooping sos-call number all
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping config	Displays the SIP snooping configuration.

MIB Objects

```
aluSIPSnoopingSOSCallNumber1
aluSIPSnoopingSOSCallNumber2
aluSIPSnoopingSOSCallNumber3
aluSIPSnoopingSOSCallNumber4
```

sip-snooping sos-call dscp

Configures the SOS-Call RTP/RTCP DSCP marking.

sip-snooping sos-call dscp *num*

Syntax Definitions

num	Specifies the DSCP number.

Defaults

The default configuration is 46 EF.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used for the configuration of the SOS-Call RTP/RTCP DSCP marking. A built-in rate limiter of 128 kbps is configured to rate limit a uni-direction media stream being marked by the switch.
- SOS calls are identified only for the Audio media type. All other media type calls are considered normal calls.

Examples

```
-> sip-snooping sos-call dscp 56
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping config	Displays the SIP snooping configuration for the switch.
show qos dscp-table	Displays the internal priority mapping and drop precedence value for each of the DSCP values.

MIB Objects

`aluSIPSnoopingSOSCallRTPDSCP`

sip-snooping udp port

Configures the UDP port for SIP Snooping.

sip-snooping udp-port *udp-port1 udp-port 2* **...** *udp-port 8*

no sip-snooping udp-port {*udp-port* **| all}**

Syntax Definitions

udp-port 1 **...** *udp-port 8*	Specifies the UDP port for SIP snooping.
all	Specifies all the UDP ports designated for SIP snooping.

Defaults

By default no UDP ports and SIP mirroring is performed with the method name and SIP2.0 strings.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A maximum of 8 UDP ports can be configured on a switch.
- Use **no** form of this command to remove any UDP port configured earlier.

Examples

```
-> sip-snooping udp-port 5260 5060
-> no sip-snooping udp-port 5260
-> no sip-snooping udp-port all
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping config	Shows the configuration done for SIP snooping.

MIB Objects

```
aluSIPSnoopingSIPUDPPort1
aluSIPSnoopingSIPUDPPort2
aluSIPSnoopingSIPUDPPort3

aluSIPSnoopingSIPUDPPort5
aluSIPSnoopingSIPUDPPort6
aluSIPSnoopingSIPUDPPort7
aluSIPSnoopingSIPUDPPort8
```

sip-snooping tcp port

Configures the Server listening TCP ports for SIP Snooping.

sip-snooping tcp-port *tcp-port1 tcp-port 2* **...** *tcp-port 8*

no sip-snooping tcp-port {*tcp-port* **| all}**

Syntax Definitions

tcp-port 1 **...** *tcp-port 8*	Specifies the TCP port for SIP snooping.
all	Specifies all the SOS call strings.

Defaults

By default, TCP port is 5260.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A maximum of 8 TCP ports can be configured on a switch.
- The default port will be overwritten if the user configures any other port.
- Use the **no** form of this command to remove any TCP port configured earlier.

Examples

```
-> sip-snooping tcp-port 5260 5060
-> no sip-snooping tcp-port 5260
-> no sip-snooping tcp-port all
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping config	Shows the configuration done for SIP snooping.

MIB Objects

```
aluSIPSnoopingSIPTCPPort1
aluSIPSnoopingSIPTCPPort2
aluSIPSnoopingSIPTCPPort3
aluSIPSnoopingSIPTCPPort4
aluSIPSnoopingSIPTCPPort5
aluSIPSnoopingSIPTCPPort6
aluSIPSnoopingSIPTCPPort7
aluSIPSnoopingSIPUDPPort8
```

sip-snooping threshold

Configure the various thresholds of SIP snooping.

sip-snooping threshold {audio | video | other} {jitter *jitter_ms_num* **| packet-lost** *% num* **| round-trip-delay** *round_trip_delay_ms_num* **| r-factor** *rfactor_num*| **mos** *mos_num***}**

Syntax Definitions

audio	Specify threshold for audio.
video	Specify threshold for video.
other	Specify threshold for other.
jitter_ms_num	Specify jitter in milliseconds. The valid range is 0–300.
% num	Specify packet lost in percentage. The valid range is 0–99%
round_trip_delay_ms_num	Set round trip delay in milliseconds. The valid range is 0–500
rfactor_num	Specify R-factor number. The valid range is 0–100
mos_num	Specify MOS number. The valid range is 0–5.

Defaults

parameter	default
RTCP monitoring	Enable
Jitter Threshold (audio/video/other)	50/100/100 ms
Packet-lost Threshold (audio/video/other)	10 /20/20%
RTT Threshold (audio/video/other)	180 /250/250 ms
R-factor Threshold (audio/video/other)	70/80/80
MOS Threshold (audio/video/other)	3.6/3.0/3.0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Setting a threshold value to 0 disables threshold checking for that parameter.

Examples

```
-> sip-snooping threshold audio jitter 50
-> sip-snooping threshold audio packet-lost 10
-> sip-snooping threshold video jitter 80
-> sip-snooping threshold video round-trip-delay 180
```

Release History

Release 8.1.1; command was introduced.

Related Commands

   aluSIPSnoopingThresholdRoundTripDelay
   aluSIPSnoopingThresholdRFactor
   aluSIPSnoopingThresholdMOS
```

sip-snooping logging-threshold num-of-calls

Configures the threshold for the number of calls to be logged into the flash file.

sip-snooping logging-threshold num-of-calls *num*

Syntax Definitions

num	Specifies the maximum number of calls to be logged.

Defaults

By default, 200 calls can be logged.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command is used to configure the threshold for the number of calls to be logged into the flash file.

Examples

```
-> sip-snooping logging-threshold num-of-calls 300
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping config	Displays the SIP snooping configuration for the switch.

MIB Objects

```

```

show sip-snooping call-records

Displays the SIP-snooping active/ended call records.

show sip-snooping call-records {active-calls | ended-calls} [full | threshold-violation]

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command is used to show the SIP-snooping active/ended call records.

Examples

```
-> show sip-snooping call-records ended-calls full

clear sip-snooping statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command is used to clear all the SIP-snooping statistics.

Examples

```
-> clear sip-snooping statistics
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping statistics	Displays SIP snooping statistics.

MIB Objects

```
aluSIPSnoopingClearStats
```

show sip-snooping config

Displays the SIP snooping configuration for the switch.

show sip-snooping config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command is used to show the SIP snooping status and configuration for the switch.

Examples

```
-> show sip-snooping config
Sip-snooping Status : Enable,
Sip-control DSCP : 40,
SOS-Call RTP/RTCP DSCP : 35,
SOS-Call Number : 911, 2233,
Jitter Threshold (audio/video/other) : 50ms/100ms/100ms,
Packet-Lost Threshold (audio/video/other) : 10/20/20,
Round-Trip-Delay Threshold (audio/video/other) : 180ms/250ms/250ms,
R-factor Threshold (audio/video/other) : 70/80/80,
MOS Threshold (audio/video/other) :3.6/3.0/3.0 ,
Logging Number of calls : 200,
UDP-Port(s) : 5060, 5260
TCP-Port(s) : 5260
Trusted Server IP(s) : 192.254.32.11,192.254.32.22,192.254.32.33
Reserved HW resource : 1,
CPU Rate Limiter for SIP PDUS : 1 mbps,
```

output definitions

Sip-snooping Status	Indicates whether the SIP Snooping status is Enable or Disable.
Sip-control DSCP	Displays the SIP control DSCP value
SOS-Call RTP/RTCP DSCP	Displays the SOS-Call RTP/RTCP DSCP number.
SOS-Call Number	Displays the emergency call number.
Jitter Threshold	Displays the Jitter threshold in milliseconds.
Packet-Lost Threshold	Displays the packet lost threshold in percentage.
Round-Trip-Delay Threshold	Displays the Round-Trip-Delay threshold period in milliseconds.
R-factor Threshold	Displays the R-Factor value.

output definitions (continued)

MOS Threshold	Displays the MOS for SIP Snooping.
Logging Number of calls	Displays the maximum number of calls to be logged in flash file
UDP-Ports	Displays the SIP Snooping UDP Ports.
TCP Ports	Displays the SIP Snooping TCP ports.
Trusted Server IP(s)	Displays the truster server IP addresses.

Release History

Release 8.1.1; command was introduced.

Related Commands

show sip-snooping ports

Displays configuration information for SIP snooping ports.

show sip-snooping ports

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command is used to show the SIP-snooping port-level data.

Examples

```
-> show sip-snooping ports
Legend : sip snooping : * status disabled (Sip-snooping globally disabled)
Port       sip-snooping         Edge/Non-edge
-----------------------------------------------------
1/1        enable               automatic
1/3        enable (*)           force-edge
1/3        enable (*)           force-non-edge
```

output definitions

Port	Displays ports configured for sip-snooping.
sip-snooping	Displays the status of sip-snooping on the port, **enable** or **disable**.
Edge/Non-edge	Displays the edge status of the port.

Release History

Release 8.1.1; command was introduced.

Total other streams                    : ,
Total audio streams that crossed threshold       : ,
Total video streams that crossed threshold       : ,
Total other streams that crossed threshold       : ,
Active Streams that crossed threshold            : ,
Number of Active calls                 : ,
Number of active audio streams         : ,
Number of active video streams         : ,
Number of active other streams         : ,
Number of SIP packet received by hardware :
Number of SIP packet received by software :
Number of SIP packet received per method: INVITE(100) ACK(101) BYE(200)
UPDATE(40) PRACK(20)
Number of SIP response packet received:
Number of discarded/malformed/unsupported SIP packets:
Number of discarded SIP packets not from/to trusted servers:
Number of dropped SIP packet due the software error:
(NI overflow, NI/CMM, CMM overflow)
Total Emergency Calls                  :
```

output definitions

Total calls processed	Total calls processed for SIP Snooping.
Total audio streams	Displays the total audio streams.
Total video streams	Displays the total video streams.

output definitions (continued)

Total other streams	Displays the total other streams.
Total audio streams that crossed threshold	Displays the total audio streams that have exceeded threshold.
Total video streams that crossed threshold	Displays the total video streams that have exceeded threshold.
Total other streams that crossed threshold	Displays the total other streams that have exceeded threshold.
Number of Active calls	Displays the number of active calls.
Number of Active audio streams	Displays the number of active audio streams.
Number of Active video streams	Displays the number of active video streams.
Number of Active other streams	Displays the number of active other streams.
Number of SIP packet received by hardware	Displays the total SIP packet received by hardware.
Number of SIP packet received by software	Displays the total SIP packet received by software.
Number of SIP packet received by per method	Displays the method by which the SIP packet is received. The various per method are Invite, Ack, Bye, Update and Prack.
Number of SIP response packet received	Displays the total number of SIP response packet received.
Number of discarded/ malformed/unsupported SIP packets	Displays the total number of discarded, malformed or unsupported SIP packets.
Number of discarded SIP packets not from/to trusted servers	Displays the total number of discarded SIP packets not from or to trusted servers
Number of dropped SIP packet due the software error	Displays the Total number of SIP packets dropped due the software error. (i.e. NI overflow, NI/CMM, CMM overflow etc.)
Total Emergency Calls	Displays the total number of Emergency Calls.

Release History

show sip-snooping registered-clients

Shows the registered SIP clients learned by the switch.

show sip-snooping registered-clients

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command is used to show the registered SIP clients learned by the switch.

Examples

```
-> show sip-snooping registered-clients

 S/N           Registered Client IP Address
-----------------------------------------------
 1               10.135.22.18
 2               10.135.22.25
 3               10.135.23.124
```

output definitions

Registered Client IP Address	The IP address of the registered client.

Release History

Release 8.1.1; command was introduced.

Related Commands

alaSIPSnoopingRegisteredClientAddr
```

16 IP Commands

This chapter details Internet Protocol (IP) commands for the switch. IP is a network-layer (Layer 3) protocol that contains addressing information and some control information that enables packets to be forwarded. IP is documented in RFC 791 and is the primary network-layer protocol in the Internet protocol suite. Along with the Transmission Control Protocol (TCP), IP represents the heart of the Internet protocols.

IP is enabled on the switch by default and there are few options that can, or need to be, configured. This chapter provides instructions for basic IP configuration commands. It also includes commands for several Layer 3 and Layer 4 protocols that are associated with IP:

- Address Resolution Protocol (ARP)—Used to match the IP address of a device with its physical (MAC) address.
- Internet Control Message Protocol (ICMP)—Specifies the generation of error messages, test packets, and informational messages related to IP. ICMP supports the **ping** command that is used to determine if hosts are online.
- Transmission Control Protocol (TCP)—A major data transport mechanism that provides reliable, connection-oriented, full-duplex data streams. While the role of TCP is to add reliability to IP, TCP relies upon IP to do the actual delivering of datagrams.
- User Datagram Protocol (UDP)—A secondary transport-layer protocol that uses IP for delivery. UDP is not connection-oriented and does not provide reliable end-to-end delivery of datagrams. But some applications can safely use UDP to send datagrams that do not require the extra overhead added by TCP.

The IP commands also include protection from Denial of Service (DoS) attacks. The goal of this feature is to protect a switch from well-known DoS attacks and to notify the administrator or manager when an attack is underway. Also, notifications can be sent when port scans are being performed.

Note. If all devices are on the same VLAN or if the IP interfaces are created on multiple VLANs to enable routing of packets, packets can be forwarded using IP. However, IP routing requires one of the IP routing protocols: Routing Information Protocol (RIP) or Open Shortest Path First (OSPF). See the following chapters for the appropriate CLI commands: Chapter 19, “RIP Commands,” Chapter 23, “OSPF Commands.” For more information on VLANs and RIP, see the applicable chapters in the Configuration Guide. For more information on OSPF, see the “Configuring OSPF” chapter in the *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide*.

MIB information for the IP commands is as follows:

Filename: IpForward.mib
Module: IpForward

Filename: Ip.mib
Module: Ip

Filename: AlcatelIND1Ip.mib
Module: alcatelIND1IPMIB

Filename: AlcatelIND1Iprm.mib
Module: alcatelIND1IPRMMIB

A summary of the available commands is listed here:

IP	**ip interface** **ip interface tunnel** **ip router primary-address** **ip router router-id** **ip static-route** **ip route-pref** **ip default-ttl** **ping** **traceroute** **ip directed-broadcast** **ip service** **ip service port** **ip service source-ip** **show ip traffic** **show ip interface** **show ip routes** **show ip route-pref** **show ip redist** **show ip access-list** **show ip route-map** **show ip router database** **show ip emp-routes** **show ip config** **show ip protocols** **show ip router-id** **show ip service** **show ip service source-ip**

ip interface

Configures an IP interface to enable IP routing on a VLAN or allow remote access. Without an IP interface, traffic is bridged within the VLAN or across connections to the same VLAN on other switches.

ip interface {*if_name* | **emp | master emp | local chassis-id** *chassis-id***} [address | vip-address** *ip_address***] [mask** *subnet_mask***] [admin-state [enable | disable]] [vlan** *vlan_id***] [forward | no forward] [local-proxy-arp | no local-proxy-arp] [e2 | snap] [primary | no primary]**

no ip interface *if_name*

Syntax Definitions

if_name	Text string of the interface name. Use quotes around string if description contains multiple words with spaces between them (for example, “Alcatel-Lucent Marketing”). This value is case sensitive.
master emp	Modifies the EMP port IP address of the master chassis when operating in virtual chassis mode.
local chassis-id *chassis-id*	Modifies the EMP port IP address of the local chassis when operating in virtual chassis mode.
emp	Modifies the shared EMP port IP address.
address *ip_address*	An IP host address (for example, 10.0.0.1, 171.15.0.20) to specify the IP router network.
vip-address *ip_address*	**Note.** *This field is not supported in this release.*
subnet_mask	A valid IP address mask (for example, 255.0.0.0, 255.255.0.0) to identify the IP subnet for the interface.
enable	Enables the administrative status for the IP interface.
disable	Disables the administrative status for the IP interface.
vlan_id	An existing VLAN ID number (1–4094).
forward	Enables forwarding of IP frames to other subnets.
no forward	Disables forwarding of IP frames. The router interface still receives frames from other hosts on the same subnet.
local-proxy-arp	Enables Local Proxy ARP on the specified interface.
no local-proxy-arp	Disables Local Proxy ARP on the specified interface.
e2	Enter **e2** or **ethernet2** to specify Ethernet-II encapsulation.
snap	SNAP encapsulation.
primary	Designates the specified IP interface as the primary interface for the VLAN.
no primary	Removes the configured primary IP interface designation for the VLAN. The first interface bound to the VLAN becomes the primary by default.

Defaults

parameter	default
ip_address	0.0.0.0
subnet_mask	IP address class
enable | disable	**enable**
vlan_id	none (unbound)
forward | no forward	**forward**
local-proxy-arp | no local-proxy-arp	**no local-proxy-arp**
e2 | snap	**e2**
primary | no primary	First interface bound to a VLAN.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an IP interface.
- IP multi-netting is supported. As a result, it is possible to configure up to 16 IP interfaces per VLAN. Each interface is configured with a different subnet, thus allowing traffic from each configured subnet to coexist on the same VLAN.
- When local proxy ARP is enabled for any one IP router interface associated with a VLAN, the feature is applied to the entire VLAN. It is not necessary to enable it for each interface. However, if the IP interface that has this feature enabled is moved to another VLAN, Local Proxy ARP is enabled for the new VLAN and must be enabled on another interface for the old VLAN.
- When Local Proxy ARP is enabled, all traffic is routed instead of bridged within the VLAN. ARP requests return the MAC address of the IP router interface. The same MAC address is assigned to each interface configured for a VLAN.
- Local Proxy ARP takes precedence over any switch-wide ARP or Proxy ARP function. It is not necessary to have Proxy ARP configured to use Local Proxy ARP. The two features are independent of each other.
- By default, the first interface bound to a VLAN becomes the primary interface for that VLAN. Use the **primary** keyword with this command to configure a different IP interface as the primary.
- To create an IP interface for network management purposes, specify **Loopback0** (case sensitive) as the name of the interface. The Loopback0 interface is not bound to any VLAN, so it always remains operationally active.

Examples

```
-> ip interface “Marketing”
-> ip interface “Payroll address” 18.12.6.3 vlan 255
-> ip interface “Human Resources” 10.200.12.101 vlan 500 no forward snap
-> ip interface “Distribution” 11.255.14.102 vlan 500 local-proxy-arp primary
```

Release History

Release 8.1.1; command introduced

Related Commands

show ip interface	Displays the status and configuration of IP interfaces.

MIB Objects

   alaIpInterfaceOperReason
   alaIpInterfaceRouterMac
   alaIpInterfaceBcastAddr
   alaIpInterfacePrimAct
```

ip interface tunnel

Configures the end points for a GRE or IPIP tunnel.

ip interface *if_name* **tunnel [source** *ip_address***] [destination** *ip_address***] [protocol {ipip | gre}]**

Syntax Definitions

if_name	Text string. Use quotes around string if description contains multiple words with spaces between them (for example, “Alcatel-Lucent Marketing”). This value is case sensitive.
source *ip_address*	Source IP address of the tunnel.
destination *ip_address*	Destination IP address of the tunnel.
ipip	Specifies the tunneling protocol as IPIP.
gre	Specifies the tunneling protocol as GRE.

Defaults

parameter	default
ipip | gre	**ipip**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

You can configure an interface as either a VLAN or tunnel interface.

Examples

```
-> ip interface “tnl-1” tunnel source 23.23.23.1 destination 155.2.2.2 protocol gre
-> ip interface “tnl-1” tunnel source 23.23.23.1 destination 155.2.2.2 protocol
ipip
```

Release History

Release 8.1.1; command introduced

Related Commands

show ip interface	Displays the status and configuration of IP interfaces.

MIB Objects

```
alaIpInterfaceTable
   alaIpInterfaceName
   alaIpInterfaceTunnelSrc
   alaIpInterfaceTunnelDst
   alaIpInterfaceDeviceType
```

ip router primary-address

Configures the router primary IP address. By default, the router primary address is derived from the first IP interface that becomes operational on the router.

ip router primary-address *ip_address*

Syntax Definitions

iip_address	32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The router primary address must be a valid IP unicast host address.
- The router primary IP address is used by BGP to derive its unique BGP Identifier, if the router ID is not a valid IP unicast address.
- It is recommended that the primary address be explicitly configured on dual CMM chassis.

Examples

```
-> ip router primary-address 172.22.2.115
```

Release History

Release 8.1.1; command introduced

Related Commands

ip router router-id	Configures the router ID for the router.

MIB Objects

```
alaDcrTmConfig
   alaDrcTmIpRouterPrimaryAddress
```

ip router router-id

Configures the router ID for the router. By default, the router primary address of the router is used as the router ID. However, if a primary address has not been explicitly configured, the router ID defaults to the address of the first IP interface that becomes operational.

ip router router-id *ip_address*

Syntax Definitions

iip_address	32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The router ID can be any 32-bit number.
- If the router ID is not a valid IP unicast host address, the BGP identifier is derived from the router primary address.
- It is recommended that the router ID be explicitly configured on dual CMM chassis.
- The router ID is used by OSPF and BGP for unique identification of the router in the network.

Examples

```
-> ip router router-id 172.22.2.115
```

Release History

Release 8.1.1; command introduced

Related Commands

ip router primary-address	Configures the router primary IP address.

MIB Objects

```
alaDcrTmConfig
   alaDrcTmIpRouterId
```

ip static-route

Creates/deletes an IP static route. Static routes are user-defined; they carry a higher priority than routes created by dynamic routing protocols. That is, static routes always have priority over dynamic routes, regardless of the metric value.

ip static-route *ip_address* **[mask** *mask***] {gateway** *gateway_address* [**bfd-state {enable | disable}] | interface** *interface_name* | **follows** *ip_address***} [metric** *metric***]**

no ip static-route *ip_address* **[mask** *mask***] [gateway** *gateway_address* {**bfd-state [enable | disable]}** \
interface *interface_name* | **follows** *ip_address*] **[metric** *metric***]**

Syntax Definitions

iip_address	Destination IP address of the static route.
mask	Subnet mask corresponding to the destination IP address.
gateway	IP address of the gateway**.**
bfd-state	Configures the bfd status for the gateway.
interface_name	Interface name used to reach the destination IP address.
follows *ip_address*	The static route follows this IP address. The route uses the same gateway (and interface) that is used to reach the host corresponding to the IP address specified.
metric	Metric or cost (hop count) for the static route. You can set a priority for the static route by assigning a metric value. The lower the metric value, the higher the priority. Valid range is 1–65535.

Defaults

parameter	default
metric	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- By default, static routes have a higher priority over dynamic routes; however, it can be changed using the **ip route-pref** command.
- Static routes do not age out of the routing tables; however, they can be deleted. Use the **no** form of this command to delete a static route.
- A static route will be active if the interface it is using is "UP”.
- The subnet mask is not required if you want to use the natural subnet mask. By default, the switch imposes a natural mask on the IP address.
- In case of directly connected NAT routers interface name can be used instead of gateway IP address, provided the router is enabled for proxy-ARP to handle ARP requests for the route addresses.

- To configure a blackhole route, use the **interface** parameter with the "Loopback" interface name.

Examples

```
-> ip static-route 171.11.0.0/16 gateway 171.11.2.1
-> ip static-route 12.0.0.0/8 interface Loopback
-> ip static-route 171.11.0.0 follows 192.168.10.1
```

Release History

Release 8.1.1; command introduced

Related Commands

ip route-pref	Configures the route preference of a router.
show ip routes	Displays the IP Forwarding table.
show ip router database	Displays the IP router database contents.

MIB Objects

```
alaIprmStaticRoute
   alaIprmStaticRouteDest
   alaIprmStaticRouteMask
   alaIprmStaticRouteNextHop
   alaIprmStaticRouteMetric
   alaIprmStaticRouteStatus
   alaIprmStaticRouteType
   alaIprmStaticRouteBfdStatus
```

ip route-pref

Configures the route preference of a router.

[vrf *if_name***] ip route-pref {static | rip | ospf | isisl2 | isisl1 | ibgp | ebgp | import} value**

Syntax Definitions

if_name	The alphanumeric name (1–20 characters) assigned to the VRF instance.
static	Configures the route preference of static routes.
ospf	Configures the route preference of OSPF routes
isisl2	Configures the route preference of ISIS L2 routes.
isisl1	Configures the route preference of ISIS L1 routes.
rip	Configures the route preference of RIP routes.
ebgp	Configures the route preference of external BGP routes.
ibgp	Configures the route preference of internal BGP routes.
import	Configures the route preference for the routes that are imported.
value	Route preference value.

Defaults

parameter	default
static *value*	2
ospf *value*	110
isisl2 *value*	118
isisl1 *value*	115
rip *value*	120
ebgp *value*	190
ibgp *value*	200
import *value*	210

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Route preference of local routes cannot be changed.
- The route preference configured for ISIS L1 and L2 is applicable for both ISIS IPv4 and ISIS IPv6 routes. The configured value can be viewed in both “show ip route-pref” and “show ipv6 route-pref” commands.

Examples

```
-> ip route-pref ebgp 20
-> ip route-pref rip 60
-> ip route-pref import 210
```

Release History

Release 8.1.1; command introduced

Related Commands

show ip route-pref	Displays the configured route-preference of a router.
ip import	Configures a route map to import routes from GRT to the destination VRF.
show ip import	Displays the import route configuration details.

MIB Objects

```
alaIprmRtPrefTable
   alaIprmRtPrefEntryType
   alaIprmRtPrefEntryValue
```

ip default-ttl

Configures the Time To Live value (TTL) for IP packets. The TTL value is the maximum number of hops an IP packet travels before being discarded.

ip default-ttl *hops*

Syntax Definitions

hops	TTL value, in hops. Valid range is 1–255.

Defaults

parameter	default
hops	64

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This value represents the default value inserted into the TTL field of the IP header for datagrams originating from this switch whenever a TTL value is not supplied by the transport layer protocol.

Examples

```
-> ip default-ttl 30
```

Release History

Release 8.1.1; command introduced

Related Commands

show ip config	Displays IP configuration parameters.

MIB Objects

```
IpDefaultTTL
```

ping

Tests whether an IP destination can be reached from the local switch. This command sends an ICMP echo request to a destination and then waits for a reply. To ping a destination, enter the **ping** command and enter either the IP address or hostname of the destination. The switch pings the destination using the default frame count, packet size, interval, and timeout parameters (6 frames, 64 bytes, 1 second, and 5 seconds respectively). You can also customize any or all of these parameters as described below.

ping {*ip_address* | *hostname***} [source-interface** *ip_interface***] [count** *count***] [size** *packet_size***] [interval** *seconds***] [timeout** *seconds***] [data-pattern** *string***] [dont-fragment] [tos** *tos_val***]**

Syntax Definitions

ip_address	IPv4 address of the system to ping.
hostname	DNS name of the system to ping.
count	Number of frames to be transmitted.
packet_size	Size of the data portion of the packet sent for this ping, in bytes. Valid range is 1–65507.
interval *seconds*	Polling interval. The switch polls the host at time intervals specified in seconds.
timeout *seconds*	Number of seconds the program waits for a response before timing out.
source-interface *ip_interface*	IP address or interface name to use as the source IP for the ping packets.
data-pattern *string*	The data pattern to be used in the data field of the ping packets.
dont-fragment	Sets the don't-fragment bit in the IP packet.
tos *tos_val*	Type of Service field in the IP header.

Defaults

parameter	default
count	6
packet_size	64
interval *seconds*	1
timeout *seconds*	5
dont-fragment	0
tos *tos_val*	0
data-pattern *string*	Repeating sequence of ASCII characters 0x4 onwards to 0xff

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If you change the default values, they are only applied to the current ping. The next time you use the ping command, the default values are used unless you again enter different values.

Examples

```
-> ping 10.255.11.242

PING 10.255.11.242: 56 data bytes
64 bytes from 10.255.11.242: icmp_seq=0. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=1. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=2. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=3. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=4. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=5. time=0. ms
----10.255.11.242 PING Statistics----
6 packets transmitted, 6 packets received, 0% packet loss
round-trip (ms) min/avg/max = 0/0/0

-> ping 10.0.0.1 source-interface mgmt
-> ping 10.0.0.1 tos 1
-> ping 10.0.0.1 timeout 10
-> ping 10.0.0.1 interval 10
-> ping 10.0.0.1 dont-fragment
-> ping 10.0.0.1 data-pattern AB
```

Release History

Release 8.1.1; command introduced

Related Commands

traceroute	Finds the path taken by an IP packet from the local switch to a specified destination.

MIB Objects

N/A

traceroute

Finds the path taken by an IP packet from the local switch to a specified destination. This command displays the individual hops to the destination as well as some timing information.

traceroute {*ip_address* | *hostname***} [max-hop** *max_hop_count***] [min-hop** *min_hop_count***] [source-interface** *ip_interface***] [probes** *probe_count***] [timeout** *seconds***] [port** *port_number_value***]**

Syntax Definitions

ip_address	IPv4 address of the host whose route you want to trace.
hostname	DNS name of the host whose route you want to trace.
max_hop_count	Maximum hop count for the trace. The valid range is 1–255.
min_hop_count	Minimum hop count for the trace. The valid range is 1–30.
source-interface *ip_interface*	Source IP interface to be used in the traceroute packets.
probes *probe_count*	The number of packets (retry) sent for each hop-count. The valid range is 1–10000.
timeout *seconds*	The time to wait for the response of each probe packet.
port *port_number_value*	The destination port number to be used in the probing packets.

Defaults

parameter	default
max-hop *max_hop_count*	30
min-hop *min_hop_count*	1
source-interface *ip_interface*	Outgoing IP interface as per route lookup
probes *probe_count*	3
timeout *seconds*	5
port *port_number_value*	33334

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When using this command, you must enter the name of the destination as part of the command line (either the IP address or host name).

Examples

```
-> traceroute 128.251.17.224

traceroute to 128.251.17.224, 30 hops max, 40 byte packets
 1  10.255.11.254 0 ms  0 ms  0 ms
 2  172.23.0.251 0 ms  16.6667 ms  0 ms
 3  128.251.14.253 0 ms  0 ms  0 ms
 4  128.251.17.224 0 ms  0 ms  0 ms

-> traceroute 128.251.17.224 max-hop 3
traceroute to 128.251.17.224, 3 hops max, 40 byte packets
 1  10.255.11.254 0 ms  0 ms  0 ms
 2  172.23.0.251 16.6667 ms  0 ms  0 ms
 3  128.251.14.253 0 ms  0 ms  0 ms
-> traceroute 10.0.0.1 source-interface mgmt
-> traceroute 10.0.0.1 min-hop 3
-> traceroute 10.0.0.1 probes 3
-> traceroute 10.0.0.1 timeout 10
-> traceroute 10.0.0.1 port-number 1025
```

Release History

Release 8.1.1; command introduced

Related Commands

show ip routes	Displays the IP Forwarding table.

MIB Objects

N/A

ip directed-broadcast

Enables or disables IP directed broadcasts routed through the switch. An IP directed broadcast is an IP datagram that has all zeros or all 1s in the host portion of the destination address. The packet is sent to the broadcast address of a subnet to which the sender is not directly attached.

ip directed-broadcast {enable | disable}

Syntax Definitions

N/A

Defaults

The default value is **disable**.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Directed broadcasts are used in denial-of-service “smurf” attacks. In a smurf attack, a continuous stream of ping requests are sent from a falsified source address to a directed broadcast address. This results in a large stream of replies, which can overload the host of the source address. By default, the switch drops directed broadcasts. Directed broadcasts must not be enabled.

Examples

```
-> ip directed-broadcast enable
```

Release History

Release 8.1.1; command introduced

Related Commands

show ip interface	Displays the status and configuration of IP interfaces.
show ip routes	Displays the IP Forwarding table.
show ip config	Displays IP configuration parameters.

MIB Objects

```
alaIpDirectedBroadcast
```

ip service

Enables (opens) or disables (closes) well-known or user-defined TCP/UDP service ports. Selectively enabling or disabling these types of ports provides an additional method for protecting against unauthorized switch access or Denial of Service (DoS) attacks.

[vrf *vrf_name***] ip service {all |** *service_name* | **port** *service_port***} admin-state {enable | disable}**

Syntax Definitions

vrf_name	The name of an existing VRF instance in which services are to be enabled or disabled.
all	Configures access to all TCP/UDP ports.
service_name	The name of the TCP/UDP service to enable or disable. (Refer to the table in the "Usage Guidelines" section for a list of supported service names.)
service_port	A TCP/UDP service port number. Configures access by port number rather than by service name. (Refer to the table in the "Usage Guidelines" section for a list of well-known port numbers.) If a user-defined port number is specified, the valid range is 20000–20999.
enable	Enables access to the service.
disable	Disables access to the service.

Defaults

All TCP/UDP ports are open by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Using this command to enable or disable HTTP also enables or disables HTTPS and vice versa. To enable or disable these protocols individually use the **ip service port** command.
- This command only applies to TCP/UDP service ports opened by default. It does not affect ports that are opened by applications, such as RIP, BGP, and so on.
- Use the **all** option with this command to configure access to all well-known TCP/UDP service ports.
- To designate which port to enable or disable, specify either the name of a service or the well-known port number associated with that service. Specifying a name and a port number in a single command line is not supported.
- When using service names, it is possible to specify more than one service in a single command line by entering each service name separated by a space. See the "Example" section for more information.
- When specifying a service port number, the **port** keyword is required and that only one port number is allowed in a single command.

- The following table lists the **ip service** command options for specifying TCP/UDP services and also includes the well-known port number associated with each service:

service name	port
ftp	21
ssh	22
telnet	23
http	80
https	443
ntp	123
snmp	161

- If a VRF is specified, the service is enabled or disabled in the specified VRF. By default, the services are enabled in the 'default' VRF.

Examples

```
-> ip service all admin-state disable
-> ip service ftp admin-state enable
-> ip service port 20000 admin-state enable
-> vrf vrf1 ip service ftp admin-state enable
```

Release History

Release 8.1.1; command introduced

Related Commands

ip service port	Configures a user-defined TCP/UDP port for the specified service.
show ip service	Displays the IP service TCP/UDP port configuration and status.

MIB Objects

```
alaIpServiceTable
   alaIpServiceType
   alaIpServicePort
   alaIpServiceStatus
alaIpPortServiceTable
   alaIpPortServicePort
   alaIpPortServiceStatus
```

ip service port

Configures a user-defined TCP/UDP service port for the specified service.

ip service {*service_name***} port {default |** *service_port***}**

Syntax Definitions

service_name	The name of the TCP/UDP service to enable or disable. (Refer to the table in the "Usage Guidelines" section for a list of supported service names.)
default	Sets the port back to the well-known port for the specified service.
service_port	A TCP/UDP service port number (Refer to the table in the "Usage Guidelines" section for a list of supported service names.) Valid range is the default service port number or 20000-20999.

Defaults

By default, the service uses the well-known TCP/UDP port number for that service.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **default** parameter with this command to set the port for the specified service back to the well-known default port for that service. For example, if the FTP port was previously changed to "20000", then the **ip service ftp port default** command would set the FTP port back to "21".
- The following table lists the **ip service port** command options for specifying TCP/UDP services and also includes the default well-known port number associated with each service:

service name	port
ftp	21
ssh	22
telnet	23
http	80
https	443

- The NTP and SNMP services are not supported with the **ip service port** command.
- Use the **ip service** command to enable or disable the status for a well-known or user-defined TCP/UDP service port.

Examples

```
-> ip service ftp port 20000
-> ip service ftp port default
-> ip service telnet port 20003
-> ip service telnet port default
```

Release History

Release 8.1.1; command introduced

```

ip service source-ip

Configures a user-defined source IP address as the outgoing IP interface for the IP service.

[vrf *vrf_name***] ip service source-ip {Loopback0 |** *interface_name***} [tftp] [telnet] [tacacs] [swlog] [ssh] [snmp] [sflow] [radius] [ntp] [ldap] [ftp] [dns] [all]**

[vrf *vrf_name***] no ip service source-ip {Loopback0 |** *interface_name***} [tftp] [telnet] [tacacs] [swlog] [ssh] [snmp] [sflow] [radius] [ntp] [ldap] [ftp] [dns] [all]**

Syntax Definitions

vrf_name	Name of the VRF.
Loopback0	Uses the Loopback0 interface as the source IP for the IP service.
interface_name	Specifies the name of the interface.
tftp	Configures the source IP address to be used by TFTP.
telnet	Configures the source IP address to be used by TELNET.
tacacs	Configures the source IP address to be used by TACACS.
swlog	Configures the source IP address to be used by SWLOG.
ssh	Configures the source IP address to be used by SSH.
snmp	Configures the source IP address to be used by SNMP.
sflow	Configures the source IP address to be used by sFlow.
radius	Configures the source IP address to be used by RADIUS.
ntp	Configures the source IP address to be used by NTP.
ldap	Configures the source IP address to be used by the LDAP server.
ftp	Configures the source IP address to be used by FTP.
dns	Configures the source IP address to be used by DNS.
all	Configures the source IP address to be used by all the applications.

Defaults

By default, the outgoing interface is taken as the source IP address for all the applications.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If for a particular application, specific source IP address is configured and the “all” option is also set, the configured source IP address for the application is used as the outgoing interface.
- Use the **no** form of this command to revert to the default behavior.
- This feature is supported on non-default VRF.

Examples

```
-> ip service source-ip Loopback0 ntp
-> ip service source-ip ipVlan100 ftp
-> no ip service source-ip Loopback0 ntp
```

Release History

Release 8.2.1; command introduced

Related Commands

show ip service source-ip	Displays the source IP interfaces configured for the applications.

MIB Objects

```
alaIpServiceSourceIPTable
   alaIpServiceSourceIPAppIndex
   alaIpServiceSourceIPName
```

ip redist

Controls the conditions for redistributing IPv4 routes between different protocols.

[vrf *vrf_name***] ip redist {local | static | rip | ospf | isis | bgp | import} into {rip | ospf | isis | bgp} {all-routes | route-map** *route_map_name***} [admin-state {enable | disable}]**

no ip redist {local | static | rip | ospf | isis | bgp | import} into {rip | ospf | isis | bgp} [all-routes | route-map | *route_map_name***]**

Syntax Definitions

vrf_name	The name of an existing VRF instance.
local	Redistributes local routes.
static	Redistributes static routes.
import	Redistributes routes to other routing protocols that are imported.
rip	Specifies RIP as the source or destination (into) protocol.
ospf	Specifies OSPF as the source or destination (into) protocol.
isis	Specifies IS-IS as the source or destination (into) protocol.
bgp	Specifies BGP as the source or destination (into) protocol.
all-routes	Redistributes all routes. This option does not allocate route-map resources.
route_map_name	Name of an existing route map that controls the redistribution of routes between the source and destination protocol.
enable	Enables the administrative status of the redistribution configuration.
disable	Disables the administrative status of the redistribution configuration.

Defaults

If a VRF name is not specified with this command, routes are redistributed within the context of the active VRF instance.

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a route map redistribution configuration. If a route map name is not specified, all route maps associated with the redistribution configuration are removed.
- The source and destination protocols must be loaded and enabled before redistribution occurs.
- If the metric calculated for the redistributed route is greater than 15 (RIP_UNREACHABLE) or greater than the metric of an existing pure RIP route, the new route is not redistributed.

- Use the **ip route-map** commands described in this chapter to create a route map. Refer to the "Configuring IP" chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.

Examples

```
-> ip redist rip into bgp route-map rip-to-bgp1
-> ip redist rip into bgp route-map rip-to-bgp2
-> no ip redist rip into bgp route-map rip-to-bgp2
-> ip redist ospf into rip route-map ospf-to-rip
-> ip redist ospf into rip route-map ospf-to-rip disable
-> ip redist import into ospf route-map R1 status enable
```

Release History

Release 8.1.1; command introduced

Related Commands

show ip redist	Displays the route map redistribution configuration.
ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
ip import	Configures a route map to import routes from GRT to the destination VRF.
show ip import	Displays the import route configuration details.

MIB Objects

```
alaRouteMapRedistProtoTable
   alaRouteMapRedistSrcProtoId
   alaRouteMapRedistDestProtoId
   alaRouteMapRedistRouteMapIndex
   alaRouteMapRedistStatus
   alaRouteMapRedistAddressType
   alaRouteMapRedistRowStatus
```

ip access-list

Creates an access list for adding multiple IPv4 addresses to route maps.

ip access-list *access_list_name*

no ip access-list *access_list_name*

Syntax Definitions

access_list_name	Name of the access list (up to 20 characters).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to delete the access list.

Examples

```
-> ip access-list access1
-> no ip access-list access1
```

Release History

Release 8.1.1; command introduced

Related Commands

ip access-list address	Adds IPv4 addresses to the specified IPv4 access list.
show ip access-list	Displays the details of the access list.

MIB Objects

```
alaRouteMapAccessListNameTable
   alaRouteMapAccessListName
   alaRouteMapAccessListNameIndex
   alaRouteMapAccessListNameAddressType
   alaRouteMapAccessListNameRowStatus
```

ip access-list address

Adds multiple IPv4 addresses to the specified IPv4 access list.

ip access-list *access_list_name* **address** *address/prefixLen* **[action {permit | deny}] [redist-control {all-subnets | no-subnets | aggregate}]**

no ip access-list *access_list_name* **address** *address/prefixLen*

Syntax Definitions

access_list_name	Name of the access list (up to 20 characters).
address/prefixLen	IP address/prefix length to be added to the access list.
permit	Permits the IP address.
deny	Denies the IP address.
all-subnets	Permits or denies all the subnet routes that match the network portion of the IP address as specified by the mask length.
no-subnets	Permits or denies only those routes that exactly match the IP address and the mask length.
aggregate	Permits an aggregate route if there are one or more routes that match or are subnets of this address.

Defaults

parameter	default
permit | deny	**permit**
all-subnets | no-subnets | aggregate	**all-subnets**

Usage Guidelines

- Use the **no** form of this command to delete the address from the access list.
- The *access_list_name* must exist before you add multiple addresses to the list.
- The **action** parameters (**permit** and **deny**) determine if a route that matches the **redist-control** configuration for the IP address is allowed or denied.
- The **redist-control** parameters (**all-subnets, no-subnets**, and **aggregate**) defines the criteria used to determine if a route matches an address in the access list.
- Configuring the combination of **redist-control aggregate** with **action deny** is not allowed.
- Use this command multiple times with the same access list name to add multiple addresses to the existing access list.

Examples

```
-> ip access-list access1 address 10.0.0.0/8 action permit
-> ip access-list access1 address 11.1.0.0/16 action permit
```

```
-> ip access-list access1 address 10.1.1.0/24 redist-control aggregate
-> no ip access-list access1 address 10.0.0.0/8
```

Release History

Release 8.1.1; command introduced

Related Commands

ip access-list	Creates an access list for adding multiple IPv4 addresses to route maps.
show ip access-list	Displays the contents of an IPv4 access list.

MIB Objects

   alaRouteMapAccessListRowStatus
```

ip route-map action

Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.

ip route-map *route_map_name* **[sequence-number** *number***] action {permit | deny}**

no ip route-map *route_map_name* **[sequence-number** *number***]**

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
permit	Selects a route.
deny	Filters a route.

Defaults

parameter	default
number	50
permit | deny	**permit**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the entire route map by specifying only the *route_map_name*.
- Use the **no** form of this command to delete a specific sequence in the route map by specifying the **sequence-number**.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- Use this command to change the status of an existing route map to permit or deny.

Examples

```
-> ip route-map route1 sequence-number 10 action permit
-> no ip route-map route1
```

Release History

Release 8.1.1; command introduced

Related Commands

show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapSequenceTable
   alaRouteMapSequenceIndex
   alaRouteMapSequenceNumber
   alaRouteMapSequenceAction
   alaRouteMapSequenceRowStatus
```

ip route-map match ip address

Matches the route with the specified IPv4 address or an address defined in the specified IPv4 access list.

ip route-map *route_map_name* **[sequence-number** *number***] match ip-address {***access_list_name* **|** *ip_address/prefixLen* **[redist-control {all-subnets | no-subnets | aggregate}] [permit | deny]**

no ip route-map *route_map_name* **[sequence-number** *number***] match ip-address {***access_list_name* **|** *ip_address/prefixLen* **[redist-control {all-subnets | no-subnets | aggregate}] [permit | deny]**

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
access_list_name	The name of an IPv4 access list that contains IPv4 addresses to match.
ip_address/prefixLen	The destination IP address along with the prefix length of the routes to be selected.
all-subnets	Selects all the subnet routes that match the network portion of the IP address as specified by the mask length.
no-subnets	Selects only those routes that exactly match the IP address and the mask length.
aggregate	Creates an aggregate route if there are one or more routes that match the IP address.
permit	Permits a route based on the IP address or prefix constrained by redist-control.
deny	Denies a route based on the IP address or prefix constrained by redist-control.

Defaults

parameter	default
number	50
permit | deny	**permit**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **match ip-address redist-control** parameter in the route map.
- Specify either the name of an existing IPv4 access list or an IPv4 address/prefix length with this command.
- Configuring the combination of **redist-control aggregate** with **deny** is not allowed.
- Multiple addresses in the same route map sequence are matched using the longest prefix match.

- If the best matching address is type **deny,** then the route is not selected. If the best matching address is type **permit** and the route map action is **deny,** the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name*, **sequence-number,** and *access_list_name* (if used) must exist before you configure this **match** criteria.

Examples

```
-> ip route-map 3 match ip-address 10.1.1.1/8 redist-control no-subnets deny
-> no ip route-map 3 match ip-address 10.1.1.1 redist-control no-subnets deny
-> ip route-map route1 sequence-number 10 match ip-address list1
-> no ip route-map route1 sequence-number 10 match ip-address list1
```

Release History

Release 8.1.1; command introduced

Related Commands

   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match ipv6 address

Matches the route with the specified IPv6 address or an address defined in the specified IPv6 access list.

ip route-map *route_map_name* **[sequence-number** *number***] match ipv6-address** {access_list_name | *ipv6_address/prefixLen* **[redist-control {all-subnets | no-subnets | aggregate}] [permit | deny]**

no ip route-map *route_map_name* **[sequence-number** *number***] match ipv6-address** *ipv6_address/prefixLen* **[redist-control {all-subnets | no-subnets | aggregate}] [permit | deny]**

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
access_list_name	The name of an IPv4 access list that contains IPv4 addresses to match.
ipv6_address/prefixLen	The destination IPv6 address along with the prefix length of the routes to be selected.
all-subnets	Selects all the subnet routes that match the network portion of the IP address as specified by the mask length.
no-subnets	Selects only those routes that exactly match the IP address and the mask length.
aggregate	Creates an aggregate route if there are one or more routes that match the IPv6 address.
permit	Permits a route based on the IPv6 address or prefix constrained by redist-control.
deny	Denies a route based on the IPv6 address or prefix constrained by redist-control.

Defaults

parameter	default
number	50
permit | deny	**permit**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **match ipv6-address redist-control** parameter in the route map.
- Specify either the name of an existing IPv6 access list or an IPv6 address/prefix length with this command.
- Configuring the combination of **redist-control aggregate** with **deny** is not allowed.
- Multiple addresses in the same route map sequence are matched using the longest prefix match.

- If the best matching address is type **deny,** then the route is not selected. If the best matching address is type **permit** and the route map action is **deny,** the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map 3 match ipv6-address 2001::1/64 redist-control no-subnets deny
-> no ip route-map 3 match ipv6-address 2001::1/64 redist-control no-subnets deny
-> ip route-map route1 sequence-number 10 match ipv6-address list1
-> no ip route-map route1 sequence-number 10 match ipv6-address list1
```

Release History

Release 8.1.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
ipv6 access-list	Creates an access list for adding multiple IPv6 addresses to route maps.
ipv6 access-list address	Adds IPv6 addresses to the specified IPv6 access list.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match ip-nexthop

Matches any routes that have a next-hop router address permitted by the specified access list name or the IP address specified in the route map.

ip route-map *route_map_name* **[sequence-number** *number***] match ip-nexthop {***access_list_name* | *ip_address/prefixLen* **[permit | deny]}**

no ip route-map *route_map_name* **[sequence-number** *number***] match ip-nexthop {***access_list_name* | *ip_address/prefixLen* **[permit | deny]}**

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
access_list_name	The name of the access list that matches the route nexthop IP address.
ip_address/prefixLen	The IP address along with the prefix length that matches any nexthop IP address within the specified subnet.
permit	Permits a route based on the IP nexthop.
deny	Denies a route based on the IP nexthop.

Defaults

parameter	default
number	50
permit | deny	**permit**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **match ip-nexthop** parameter in the route map.
- If the best matching nexthop is type **deny,** then the route is not selected. If the best matching nexthop is type **permit** and the route map action is **deny,** the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name*, **sequence-number,** and *access_list_name* must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match ip-nexthop list1
-> no ip route-map route1 sequence-number 10 match ip-nexthop list1
-> ip route-map route1 sequence-number 10 match ip-nexthop 10.0.0.0/8
-> no ip route-map route1 sequence-number 10 match ip-nexthop 10.0.0.0/8
```

Release History

Release 8.1.1; command introduced

Related Commands

ip access-list	Creates an access list for adding multiple IPv4 addresses to route maps.
ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match ipv6-nexthop

Matches any routes that have an IPv6 next-hop router address permitted by the specified access list name or the IPv6 address specified in the route map.

ip route-map *route_map_name* **[sequence-number** *number***] match ipv6-nexthop {***access_list_name* **|** *ipv6_address/prefixLen* **[permit | deny]}**

no ip route-map *route_map_name* **[sequence-number** *number***] match ipv6-nexthop {***access_list_name* **|** *ipv6_address/prefixLen* **[permit | deny]}**

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
access_list_name	The name of the access list that matches the route nexthop IPv6 address.
ipv6_address/prefixLen	The IPv6 address along with the prefix length that matches any nexthop IPv6 address within the specified subnet.
permit	Permits a route based on the IPv6 nexthop.
deny	Denies a route based on the IPv6 nexthop.

Defaults

parameter	default
number	50
permit | deny	**permit**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **match ipv6-nexthop** parameter in the route map.
- If the best matching nexthop is type **deny,** then the route is not selected. If the best matching nexthop is type **permit** but the route map action is **deny,** the route is not selected.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name*, **sequence-number,** and *access_list_name* must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match ipv6-nexthop list1
-> no ip route-map route1 sequence-number 10 match ipv6-nexthop list1
-> ip route-map route1 sequence-number 10 match ipv6-nexthop 2001::/64
-> no ip route-map route1 sequence-number 10 match ipv6-nexthop 2001::/64
```

```

ip route-map match tag

Matches the tag value specified in the route map with the one that the routing protocol learned the route on.

ip route-map *route_map_name* **[sequence-number** *number***] match tag** *tag-number*

no ip route-map *route_map_name* **[sequence-number** *number***] match tag** *tag-number*

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
tag-number	The tag number.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **match tag** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match tag 4
-> no ip route-map route1 sequence-number 10 match tag 4
```

Release History

```

ip route-map match ipv4-interface

Matches the IPv4 interface name specified in the route map with the one that the routing protocol learned the route on.

ip route-map *route_map_name* **[sequence-number** *number***] match ipv4-interface** *interface-name*

no ip route-map *route_map_name* **[sequence-number** *number***] match ipv4-interface** *interface-name*

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
interface-name	Specifies the interface name of the outgoing interface of the route.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **match ipv4-interface** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match ipv4-interface int4
-> no ip route-map route1 sequence-number 10 match ipv4-interface int4
```

Release History

Release 8.1.1; command introduced

```

ip route-map match ipv6-interface

Matches the IPv6 interface name specified in the route map with the one that the routing protocol learned the route on.

ip route-map *route_map_name* **[sequence-number** *number***] match ipv6-interface** *interface-name*

no ip route-map *route_map_name* **[sequence-number** *number***] match ipv6-interface** *interface-name*

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
interface-name	Specifies the interface name of the outgoing interface of the route.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **match ipv6-interface** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match ipv6-interface int6
-> no ip route-map route1 sequence-number 10 match ipv6-interface int6
```

Release History

   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match metric

Matches the metric value specified in the route map with the actual metric value of the route.

ip route-map *route_map_name* **[sequence-number** *number***] match metric** *metric* **[deviation** *deviation***]**

no ip route-map *route_map_name* **[sequence-number** *number***] match metric** *metric* **[deviation** *deviation***]**

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
metric	The metric value that matches a specified metric.
deviation	The deviation value. If deviation is included, the route metric can have any value within the range (metric-deviation to metric+deviation).

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **match metric** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match metric 4
-> no ip route-map route1 sequence-number 10 match metric 4
```

Release History

Release 8.1.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match route-type

Matches the specified route type with actual route type of the route.

ip route-map *route_map_name* **[sequence-number** *number***] match route-type {internal | external [type1 | type2] | level1 | level2}**

no ip route-map *route_map_name* **[sequence-number** *number***] match route-type {internal | external [type1 | type2] | level1 | level2}**

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
internal	Matches OSPF/BGP internal routes.
external	Matches OSPF/BGP external routes.
type1	Matches OSPF external Type-1 routes, which gives the full metric calculation for the complete path including internal as well as external cost.
type2	Matches OSPF external Type-2 routes, which gives the external redistribution metric only to the ASBR.
level1	Matches IS-IS Level-1 routes only.
level2	Matches IS-IS Level-2 routes only.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **match route-type** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 match route-type internal
-> no ip route-map 111 sequence-number 50 match route-type internal
```

Release History

Release 8.1.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map match protocol

Matches the protocol specified in the route map with the protocol of the route.

ip route-map *route_map_name* **[sequence-number** *number***] match protocol {local | static | rip | ospf | isis | bgp}**

no ip route-map *route_map_name* **[sequence-number** *number***] match protocol {local | static | rip | ospf | isis | bgp}**

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
local	Matches a local interface route.
static	Matches a static route.
rip	Matches a RIP route.
ospf	Matches an OSPF route.
isis	Matches an IS-IS route.
bgp	Matches a BGP route.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **match protocol** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **match** criteria.

Examples

```
-> ip route-map route1 sequence-number 10 match protocol local
-> no ip route-map route1 sequence-number 10 match protocol local
```

Release History

Release 8.1.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set metric

Configures the metric value of the route being distributed.

ip route-map *route_map_name* **[sequence-number** *number***] set metric** *metric* **[effect {add | subtract | replace | none}]**

no ip route-map *route_map_name* **[sequence-number** *number***] set metric** *metric* **[effect {add | subtract | replace | none}]**

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
metric	Configures the metric value of the route. A value of 0 is not allowed.
add	Adds the configured metric value to the actual metric value.
subtract	Subtracts the configured metric value from the actual metric value.
replace	Replaces the actual metric value with the configured metric value.
none	Uses the actual metric value of the route. The configured metric value is ignored. Use any value except 0.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **set metric** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 set metric 30 effect add
-> no ip route-map 111 sequence-number 50 set metric 30 effect add
```

Release History

Release 8.1.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set metric-type

Configures the metric type for the redistributed route.

ip route-map *route_map_name* **[sequence-number** *number***] set metric-type {internal | external [type1 | type2]}**

no ip route-map *route_map_name* **[sequence-number** *number***] set metric-type {internal | external [type1 | type2]}**

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
internal	Sets the metric type to internal for routes redistributed into BGP.
external	Sets the metric type to external for routes redistributed into BGP.
type1	Sets the metric type to external type1 for routes redistributed into OSPF, which gives the full metric calculation for the complete path including internal as well as external cost.
type2	Sets the metric type to external type2 for routes redistributed into OSPF, which gives the external redistribution metric only to the ASBR.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **set metric-type** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 set metric-type internal
-> no ip route-map 111 sequence-number 50 set metric-type internal
```

Release History

Release 8.1.1; command introduced

Related Commands

   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set tag

Configures the tag value of the selected routes.

ip route-map *route_map_name* **[sequence-number** *number***] set tag** *tag-number*

no ip route-map *route_map_name* **[sequence-number** *number***] set tag** *tag-number*

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
tag-number	Configures the tag number.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **set tag** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 set tag 23
-> no ip route-map 111 sequence-number 50 set tag 23
```

Release History

Release 8.1.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.

```
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set community

Configures the community name of the route being redistributed into BGP.

ip route-map *route_map_name* **[sequence-number** *number***] set community** *community_string*

no ip route-map *route_map_name* **[sequence-number** *number***] set community** *community_string*

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
community_string	Defines a community for an aggregate route. Community names range from 0 to 70 characters.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **set community** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 set community 29
-> no ip route-map 111 sequence-number 50 set community 29
```

Release History

Release 8.1.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
show ip route-map	Displays the configured IP route maps.

```

ip route-map set local-preference

Configures the local preference value for a route being distributed into BGP.

ip route-map *route_map_name* **[sequence-number** *number***] set local-preference** *value*

no ip route-map *route_map_name* **[sequence-number** *number***] set local-preference** *value*

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
value	Configures the local-preference value for routes being redistributed in to BGP. The range is 0–4294967295.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **set local-preference** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.
- The local preference attribute is used to set preference to an exit point from the local autonomous system (AS).
- If there are multiple exit points from the AS, the local preference attribute is used to select the exit point for a specific route.

Examples

```
-> ip route-map 111 sequence-number 50 set local-preference 4
-> no ip route-map 111 sequence-number 50 set local-preference 4
```

```

ip route-map set level

Configures the level of the selected ISIS route.

ip route-map *route_map_name* **[sequence-number** *number***] set level {level1 | level2 | level1-2}**

no ip route-map *route_map_name* **[sequence-number** *number***] set level {level1 | level2 | level1-2}**

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
level1	Matches IS-IS Level-1 routes only.
level2	Matches IS-IS Level-2 routes only.
level1-2	Matches IS-IS Level1-2 routes**.**

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **set level** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.

Examples

```
-> ip route-map 111 sequence-number 50 set level level1
-> no ip route-map 111 sequence-number 50 set level level1
```

   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set ip-nexthop

Configures the IP address of the next hop in a route map.

ip route-map *route_map_name* **[sequence-number** *number***] set ip-nexthop** *ip_address*

no ip route-map *route_map_name* **[sequence-number** *number***] set ip-nexthop** *ip_address*

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
ip_address	IP address of the next hop.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **set ip-nexthop** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.

Examples

```
-> ip route-map 222 sequence-number 50 set ip-nexthop 128.251.17.224
-> no ip route-map 222 sequence-number 50 set ip-nexthop 128.251.17.224
```

Release History

Release 8.1.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.

   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

ip route-map set ipv6-nexthop

Configures the IPv6 address of the next hop in a route map.

ip route-map *route_map_name* **[sequence-number** *number***] set ipv6-nexthop** *ipv6_address*

no ip route-map *route_map_name* **[sequence-number** *number***] set ipv6-nexthop** *ipv6_address*

Syntax Definitions

route_map_name	The name of the route map (up to 20 characters).
number	A number that links together the route maps. The range is 1–100.
ip6_address	IPv6 address of the next hop.

Defaults

parameter	default
number	50

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the **set ipv6-nexthop** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route_map_name* and **sequence-number** must exist before you configure this **set** criteria.

Examples

```
-> ip route-map 222 sequence-number 50 set ipv6-nexthop 2001::1
-> no ip route-map 222 sequence-number 50 set ipv6-nexthop 2001::1
```

```

vrf

Configures and selects a virtual routing and forwarding (VRF) instance on the switch.

vrf [*vrf_name* | **default] [profile {max | low}]**

no vrf *vrf_name*

Syntax Definitions

vrf_name	The alphanumeric name (1–20 characters) assigned to the VRF instance.
default	Optional. Selects the default VRF instance.
max	Creates a VRF with the maximum profile capabilities.
low	Creates a VRF with the minimum (lowest) capabilities. Low profile VRFs use less system resources.

Defaults

A default VRF instance exists in the switch configuration. All applications that are not VRF aware belong to this instance.

Parameter	Default
vrf_name | **default**	default VRF instance
max | low	max profile

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a VRF instance. Deleting the default instance is not allowed. In addition, any interfaces configured for a VRF instance are automatically removed when the instance is deleted.
- To return to the default VRF instance from within the context of another instance, enter the **vrf** command with or without the optional **default** parameter (for example, **vrf** or **vrf default**).
- Configuring a VRF instance name is case sensitive. In addition, if the name specified does not exist, a VRF instance is automatically created. As a result, it is possible to create instances or delete a wrong instance accidentally.
- If the name of an existing instance is specified with this command, VRF changes the command prompt to reflect the specified instance name. All CLI commands entered at this point are applied within the context of the active VRF instance.
- It is also possible to configure other instances from within the CLI context of the default VRF instance by entering the **vrf** command followed by the instance name. For example, entering **vrf IpOne ip interface intf100 address 100.1.1.1/24 vlan 100** is applied to the IpOne instance even though IpOne is not the active CLI context.

- The type of profile assigned to a VRF instance determines the routing protocols and capabilities supported within that instance. For example, low profile VRFs only support IPv4 and VRRP with routing capabilities restricted to static and imported routes. In addition, limiting low profiles to 9 routes and 3 IP interfaces is highly recommended.
- Profiles are not configurable for the default VRF, which provides full routing capabilities.
- Changing the profile for an existing VRF instance is not allowed. To change the profile, first delete the VRF then create it again with a different profile.

Examples

```
-> vrf IpOne
IpOne:: ->

IpOne:: -> vrf IpTwo
IpTwo:: ->

IpTwo:: -> vrf
->

IpTwo:: -> vrf default
->

-> vrf IpOne ip interface intf100 address 100.1.1.1/24 vlan 100
->

-> vrf IpThree profile low
IpThree::->
```

Release History

Release 8.1.1; command introduced

Related Commands

show vrf	Displays the VRF instance configuration for the switch.
show vrf-profiles	Displays the VRF profile resources for the switch.
ip export	Exports VRF routes to the Global Routing Table (GRT).
ip import	Imports VRF routes from the GRT.

MIB Objects

```
alaVirutalRouterNameTable
   alaVirtualRouterName
   alaVirtualRouterNameIndex
   alaVirtualRouterNameRowStatus
   alaVirtualRouterProfile
```

ip export

Exports routes from the source VRF to the Global Routing Table (GRT) or to all VRF instances. All routes are exported or a route map can be specified to filter exported routes

[vrf *vrf_name***] ip export {all-routes | route-map** *route_map_name* | **to-all-vrfs {all-routes | route-map** *route_map_name***}}**

[vrf *vrf_name***] no ip export**

Syntax Definitions

vrf_name	The name of an existing VRF instance. Routes are exported from this source VRF to the GRT.
all-routes	Exports all routes from the source VRF to the GRT. This option does not allocate route-map resources.
route_map_name	The name of an existing route-map to use for filtering routes that are exported from the source VRF to the GRT.
to-all-vrfs all-routes	Exports all routes to all of the other VRF instances, except to VRFs that already have an import configured for the source (export) VRF.
to-all-vrfs *route_map_name*	The name of an existing route map to use for filtering routes that are exported from the source VRF to all other VRF instances.

Defaults

- If a source VRF name is not specified with this command, routes are exported from within the context of the active VRF instance to the GRT.
- If there are no VRF instances configured on the switch, the routes are exported from the default VRF to the GRT.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable exporting of routes from the VRF to GRT.
- The route map name specified with this command must already exist in the switch configuration. See the **ip route-map** commands in this guide and the “Configuring IP” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.
- A route map created to filter exported VRF routes can contain any of the following match and set options:
  - Match options: ip-address, ip-next-hop, tag, protocol, ipv4-interface, metric, route-type
  - Set options: tag, metric
- Only one route map per source VRF or ISID is allowed for filtering exported routes.
- Only those FDB (Forwarding Routing Database) routes that match the conditions of the route map are exported to GRT.

- Modifying a route map that is assigned to a VRF or ISID through the **ip import** or **ip export** command is not supported.

Examples

The following commands export routes from the current VRF routing table (or from the default VRF if there are no other VRFs configured) to the GRT:

```
-> ip export route-map R1
-> ip export all-routes
-> ip export to-all-vrfs all-routes
-> ip export to-all-vrfs route-map R2
-> no ip export
```

The following commands export routes from the “vrf2” routing table to the GRT even though the command line is operating within the context of the default VRF instance:

```
-> vrf vrf2 ip export route-map R1
-> vrf vrf2 ip export all-routes
-> vrf vrf2 ip export to-all-vrfs all-routes
-> vrf vrf2 ip export to-all-vrfs route-map R2
-> no vrf vrf2 ip export
```

The following commands first change the command line context to the “vrf1” instance so that all subsequent commands export routes from “vrf1” without having to specify the VRF name with each command:

```
-> vrf vrf1
vrf1::-> ip export route-map R1
vrf1::-> ip export all-routes
vrf1::-> ip export to-all-vrfs all-routes
vrf1::-> ip export to-all-vrfs route-map R2
vrf1::-> no ip export
```

Release History

Release 8.1.1; command introduced

Related Commands

vrf	Configures and selects a virtual routing and forwarding (VRF) instance on the switch.
ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
ip route-map match protocol	Matches the protocol specified in the route map with the protocol of the route.
show ip export	Displays the export route configuration details.
show ip global-route-table	Displays the GRT for all the routes that are exported from the VRFs.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaIprmExportRouteMap
alaIprmExportToAllVrfsRouteMap
```

ip import

Imports VRF or Shortest Path Bridging (SPB) service instance identifier (ISID) routes from the GRT to the destination VRF. All routes are imported or a route map can be specified to filter imported routes.

[vrf *dest_vrf_name***] ip import {vrf {***src_vrf_name* **| default} | isid** *instance_id***} {all-routes | route-map** *route_map_name***}**

[vrf *dest_vrf_name***] no ip import {vrf {***src_vrf_name* **| default} | isid** *instance_id***}**

Syntax Definitions

dest_vrf_name	The name of the destination VRF instance into which routes are imported from the GRT.
src_vrf_name	The name of the source VRF instance for which routes are imported from the GRT into the destination VRF instance.
default	Default VRF. The routes are imported from the default VRF instance.
instance_id	An existing ISID number that identifies a SPB service in a provider backbone bridge (PBB) network. The routes for this ISID number are imported from the GRT into the current or specified VRF instance.
all-routes	Imports all routes from the source VRF instance. Imported routes are not filtered.
route_map_name	The name of an existing route map to use for filtering routes that are imported from the GRT to the destination VRF. Imported routes are filtered based on the options defined in the route map.

Defaults

If a destination VRF name is not specified with this command, routes are imported from the GRT into the context of the active VRF instance.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the IP import routes configuration for the specified VRF instance or ISID.
- The route map name specified with this command must already exist in the switch configuration. See the **ip route-map** commands in this guide and the “Configuring IP” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.
- A route map created to filter imported VRF or ISID routes can contain any of the following match and set parameter options:
  - Match options: ip-address, ip-next-hop, tag, metric
  - Set options: tag
- Only one route map per source (imported) VRF or ISID is allowed.

- Modifying a route map that is assigned to a VRF or ISID through the **ip import** or **ip export** command is not supported.
- Leaked routes are only for forwarding. If a local route is leaked, that interface is not accessible in the importing VRF. Another switch will not be able to ping the interface in the import VRF.

Examples

```
-> ip import vrf V1 route-map R2
-> ip import vrf V2 all-routes
-> ip import isid 1500 route-map R1
-> ip import isid 2000 all-routes
-> no ip import vrf V1
-> no ip import isid 1500
```

Release History

Release 8.1.1; command introduced.

Related Commands

vrf	Configures and selects a virtual routing and forwarding (VRF) instance on the switch.
ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
ip route-map match protocol	Matches the protocol specified in the route map with the protocol of the route.
show ip import	Displays the import route configuration details.
show ip global-route-table	Displays the GRT for all the routes that are exported from the VRFs.
show ip route-map	Displays the configured IP route maps.

MIB Objects

```
alaIprmImportVrfTable
   alaIprmImportVrfName
   alaIprmImportVrfRouteMap
   alaIprmImportVrfRowStatus
alaIprmImportIsidTable
   alaIprmImportIsid
   alaIprmImportIsidRouteMap
   alaIprmImportIsidRowStatus
```

show ip export

Displays the export route configuration details.

[vrf *vrf_name***] show ip export**

Syntax Definitions

vrf_name	The name of an existing VRF instance.

Defaults

By default, the export route configuration for the active VRF instance is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If a VRF is specified, the export route configuration for that VRF is displayed.

Examples

```
-> show ip export
Export Route Map: leak-out

-> vrf vrf1 show ip export
Export Route Map: none (all-routes)

vrf2::-> show ip export
Export Route Map: none (all-routes) -> To All VRFs
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip export	Exports routes from the source VRF to the Global Routing Table (GRT) or to all VRF instances.

MIB Objects

```
alaIprmExportRouteMap
alaIprmExportToAllVrfsRouteMap
```

show ip import

Displays the import route configuration details.

[vrf *vrf_name***] show ip import**

Syntax Definitions

vrf_name	The name of an existing VRF instance.

Defaults

By default, the import route configuration for the active VRF instance is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If a VRF is specified, the import route configuration for that VRF is displayed.

Examples

```
-> show ip import
Type  Source               RouteMap
-----+--------------------+----------------------
vrf    Customer1           leak-in
vrf    Customer2           none (all-routes)
isid   1000                isid1000-filter
```

output definitions

Type	The type of imported route (**vrf** or **isid**).
Source	The name of the VRF instance or the Shortest Path Bridging service instance identifier (ISID) from which routes are imported to the VRF.
RouteMap	The name of the route map filter or **none (all-routes)**.

Release History

Release 8.1.1; command introduced.

Related Commands

ip import	Imports VRF or Shortest Path Bridging ISID routes from the GRT to the destination VRF.

MIB Objects

```
alaIprmImportVrfTable
   alaIprmImportVrfName
   alaIprmImportVrfRouteMap
   alaIprmImportVrfRowStatus
alaIprmImportIsidTable
   alaIprmImportIsid
   alaIprmImportIsidRouteMap
   alaIprmImportIsidRowStatus
```

show ip global-route-table

Displays the contents of the Global Routing Table (GRT) for all the routes that are exported from VRF instances or from Shortest Path Bridging instance service identifiers (ISIDs). This command is only available within the context of the default VRF instance.

show ip global-route-table [export-vrf *vrf_name***]**

Syntax Definitions

vrf_name	The name of an existing VRF instance.

Defaults

By default, exported routes are displayed for all VRF instances and ISIDs.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **export-vrf** parameter to display exported routes for a specific VRF instance.

Examples

```
-> show ip global-route-table
Type  Source               Destination        Gateway         Metric     Tag
-----+--------------------+------------------+---------------+----------+----------
 vrf   Customer1            10.0.0.0/8         12.1.1.2        1          100
 vrf   Customer2            11.0.0.0/8         12.1.1.3        2          0
isid   1000                 12.0.0.0/8         12.1.1.4        1          2
```

output definitions

Type	The type of exported route (**vrf** or **isid**).
Source	The name of the VRF instance or the Shortest Path Bridging service instance identifier (ISID) from which routes are exported to the GRT.
Destination	The address of the route.
Gateway	The next hop for the destination address.
Metric	The metric of the exported route.
Tag	The tag of the exported route.

Release History

Release 8.1.1; command introduced.

Related Commands

ip export	Configures a route map to export routes from the source VRF to Global Routing Table (GRT).
show ip export	Displays the export route configuration details.

MIB Objects

   alaGrtRouteDistinguisher
   alaGrtRouteDest
   alaGrtRouteMaskLen
   alaGrtRouteNextHop
   alaGrtRouteMetric
   alaGrtRouteTag
   alaGrtRouteVrfName
   alaGrtRouteIsid
```

arp

Adds a permanent entry to the ARP table. To forward packets, the switch dynamically builds an ARP Table to match the IP address of a device with its physical (MAC) address. These entries age out of the table when the timeout value is exceeded. This command is used to add a permanent entry to the table. Permanent entries do not age out of the table.

arp *ip_address mac_address* **[alias] [arp-name** *name***] [interface** *interface_name***] [port** *chassis/slot/port***] [linkagg** *agg_num***]**

no arp *ip_address* **[alias]**

Syntax Definitions

ip_address	IP address of the device you are adding to the ARP table.
mac_address	MAC address of the device in hexadecimal format (for example, 00.00.39.59.f1.0c).
alias	Specifies that the switch will act as an alias (or proxy) for this IP address. When the alias option is used, the switch responds to all ARP requests for the specified IP address with its own MAC address. You can also enable the proxy feature for an IP interface using the **ip interface** command. When enabled, ARP requests return the MAC address of the IP router interface and all traffic within the VLAN is routed.
name	The name to assign to this ARP entry.
interface *interface_name*	Name of the interface to be used for ARP resolution.
chassis/slot/port	The chassis ID, slot, and port number (3/1/1) for a specific port.
agg_num	The link aggregate ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a permanent ARP entry.
- Configuring a permanent ARP entry with a multicast address is also supported. This is done by specifying a multicast address for the *ip_address* parameter instead of a unicast address.
- Using the **arp alias** command is not related to proxy ARP as defined in RFC 925. Instead, **arp alias** is similar to the Local Proxy ARP feature, except that it is used to configure the switch as a proxy for only *one* IP address.
- As most hosts support the use of address resolution protocols to determine cache address information (called dynamic address resolution), it is not required to specify permanent ARP cache entries.

- Only the IP address is required when deleting an ARP entry from the table.

Examples

```
-> arp 171.11.1.1 00:05:02:c0:7f:11
```

Release History

Release 8.1.1; command introduced.

Related Commands

clear arp-cache	Deletes all dynamic entries from the ARP table.
ip interface	Enables or disables the Local Proxy ARP feature for an IP interface. When enabled, all traffic within the VLAN is routed. ARP requests return the MAC address of the IP router interface.
show arp	Displays the ARP table.

MIB Objects

```
ipNetToMediaTable
   ipNetToMediaIfIndex
   ipNetToMediaNetAddress
   ipNetToMediaPhyAddress
   ipNetToMediaType
alaIpNetToMediaTable
   alaIpNetToMediaPhyAddress
   alaIpNetToMediaProxy
```

clear arp-cache

Deletes all dynamic entries from the ARP table.

clear arp-cache

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only clears dynamic entries. If permanent entries have been added to the table, they must be removed using the **no** form of the **ip service** command.
- Dynamic entries remain in the ARP table until they time out. The switch uses the MAC Address table timeout value as the ARP timeout value. Use the **mac-learning aging-time** command to set the timeout value.

Examples

```
-> clear arp-cache
```

Release History

Release 8.1.1; command introduced

Related Commands

ip service	Adds a permanent entry to the ARP table.
show arp	Displays the ARP table.

MIB Objects

```
alaIpClearArpCache
```

ip dos arp-poison restricted-address

Adds or deletes an ARP Poison restricted address.

ip dos arp-poison restricted-address *ip_address*

no ip dos arp-poison restricted-address *ip_address*

Syntax Definitions

ip_address	32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of the command to remove an already configured ARP Poison restricted address.

Examples

```
-> ip dos arp-poison restricted-address 192.168.1.1
-> no ip dos arp-poison restricted-address 192.168.1.1
```

Release History

Release 8.1.1; command introduced

Related Commands

ip service	Adds a permanent entry to the ARP table.
show arp	Displays the ARP table.

MIB Objects

```
alaDoSArpPoisonTable
   alaDoSArpPoisonIpAddr
   alaDosArpPoisonRowStatus
```

arp filter

Configures an ARP filter that determines if ARP Request packets containing a specific IP address are processed by the switch or discarded.

arp filter *ip_address* **[mask** *ip_mask***] [***vlan_id***] [sender | target] [allow | block]**

no arp filter *ip_address*

Syntax Definitions

ip_address	The IP address to use for filtering ARP packet IP addresses.
ip_mask	An IP mask that identifies which part of the ARP packet IP address is examined for filtering (for example, mask 255.0.0.0 filters on the first octet of the ARP packet IP address).
vlan_id	A VLAN ID that specifies that only ARP packets for a specific VLAN are filtered.
sender	The sender IP address in the ARP packet is used for ARP filtering.
target	The target IP address in the ARP packet is used for ARP filtering.
allow	ARP packets that meet filter criteria are processed.
block	ARP packets that meet filter criteria are discarded.

Defaults

parameter	default
vlan_id	0 (no VLAN)
ip_mask	255.255.255.255
sender | target	**target**
allow | block	**block**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete an ARP filter.
- If there are no filters configured for the switch, all ARP Request packets received are processed.
- Up to 200 filters are allowed on each switch.
- If sender or target IP address in an ARP Request packet does not match any filter criteria, the packet is processed by the switch.
- ARP filtering is used in conjunction with the Local Proxy ARP application; however, ARP filtering is available for use on its own and/or with other applications.

Examples

```
-> arp filter 171.11.1.1
-> arp filter 172.0.0.0 mask 255.0.0.0
-> arp filter 198.0.0.0 mask 255.0.0.0 sender
-> arp filter 198.172.16.1 vlan 200 allow
-> no arp filter 171.11.1.1
```

Release History

Release 8.1.1; command introduced

Related Commands

clear arp filter	Clears all ARP filters from the filter database.
ip interface	Enables or disables the Local Proxy ARP feature on an IP interface. When enabled, all traffic within the VLAN is routed. ARP requests return the MAC address of the IP router interface.
show arp filter	Displays the ARP filter configuration.

MIB Objects

```
alaIpArpFilterTable
   alaIpArpFilterIpAddr
   alaIpArpFilterIpMask
   alaIpArpFilterVlan
   alaIpArpFilterMode
   alaIpArpFilterType
```

clear arp filter

Clears the ARP filter database of all entries.

clear arp-cache

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command clears all ARP filters configured on the switch. To remove an individual filter entry, use the **no** form of the **arp filter** command.

Examples

```
-> clear arp filter
```

Release History

Release 8.1.1; command introduced

Related Commands

arp filter	Configures an ARP filter to allow or block the processing of specified ARP Request packets.
show arp filter	Displays the ARP filter configuration.

MIB Objects

```
alaIpClearArpFilter
```

icmp type

Enables or disables a specific type of ICMP message, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp type *type* **code** *code* **{{enable | disable} | min-pkt-gap** *gap***}**

Syntax Definitions

type	The ICMP packet type. This is conjunction with the ICMP code that determines the type of ICMP message being specified.
code	The ICMP code type. This is conjunction with the ICMP type that determines the type of ICMP message being specified.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
gap	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable | **disable**	disabled
gap	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command allows the user to enable or disable all types of ICMP messages, and set the minimum packet gap between messages of the specified type.
- While this command can be used to enable or disable all ICMP message, some of the more common ICMP messages have their own CLI commands, as described in the pages below. The following ICMP messages have specific commands to enable and disable:

ICMP Message	Command
Network unreachable (type 0, code 3)	**icmp unreachable**
Host unreachable (type 3, code 1)	**icmp unreachable**
Protocol unreachable (type 3, code 2)	**icmp unreachable**
Port unreachable (type 3, code 3)	**icmp unreachable**
Echo reply (type 0, code 0)	**icmp echo**
Echo request (type 8, code 0)	**icmp echo**
Timestamp request (type 13, code 0)	**icmp timestamp**
Timestamp reply (type 14, code 0)	**icmp timestamp**
Address Mask request (type 17, code 0)	**icmp addr-mask**
Address Mask reply (type 18, code 0)	**icmp addr-mask**

- Enabling **Host unreachable** and **Network unreachable** messages are not recommended as it can cause the switch instability due to high-CPU conditions depending upon the volume of traffic required by these messages.

Examples

```
-> icmp type 4 code 0 enabled
-> icmp type 4 code 0 min-pkt-gap 40
-> icmp type 4 code 0 disable
```

Release History

```

icmp unreachable

Enables or disables ICMP messages pertaining to unreachable destinations, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp unreachable [net-unreachable | host-unreachable | protocol-unreachable | port-unreachable] {{enable | disable} | min-pkt-gap *gap***}**

Syntax Definitions

net-unreachable	Sets the unreachable network ICMP message.
host-unreachable	Sets the unreachable host ICMP message.
protocol-unreachable	Sets the unreachable protocol ICMP message.
port-unreachable	Sets the unreachable port ICMP message.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
gap	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable | disable	disabled
gap	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command enables ICMP messages relating to unreachable destinations. Unreachable networks, hosts, protocols, and ports can all be specified.
- Enabling **host-unreachable** and **net-unreachable** messages are not recommended as it can cause the switch instability due to high-CPU conditions depending upon the volume of traffic required by these messages.
- The unreachable ICMP messages can also be enabled, disabled, and modified using the **icmp type** command. See the **icmp type** command information on the type and code for the unreachable ICMP messages.

Examples

```
-> icmp unreachable net-unreachable enable
-> icmp unreachable host-unreachable enable
-> icmp unreachable protocol-unreachable enable
-> icmp unreachable port-unreachable enable
-> icmp unreachable port-unreachable min-pkt-gap 50
```

Release History

Release 8.1.1; command introduced

```

icmp echo

Enables or disables ICMP echo messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp echo [request | reply] {{enable | disable} | min-pkt-gap *gap***}**

Syntax Definitions

request	Specifies the echo request ICMP message.
reply	Specifies the echo reply ICMP message.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
gap	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable | disable	**enable**
gap	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command sets the ICMP echo messages. An echo request is sent to a destination, and must be responded to with an echo reply message that contains the original echo request.
- Using this command without specifying a request or reply enables, disables, or sets the minimum packet gap for both types.
- The echo ICMP messages can also be enabled, disabled, and modified using the **icmp type** command. See the **icmp type** command information on the type and code for the echo ICMP messages.

Examples

```
-> icmp echo reply enable
-> icmp echo enable
-> icmp echo request enable
-> icmp echo request min-pkt-gap 50
```

Release History

```

icmp timestamp

Enables or disables ICMP timestamp messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp timestamp [request | reply] {{enable | disable} | min-pkt-gap *gap***}**

Syntax Definitions

request	Specifies timestamp request messages.
reply	Specifies timestamp reply messages.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
gap	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable | disable	**enable**
gap	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The data received (a timestamp) in the message is returned in the reply together with an additional timestamp. The timestamp is 32 bits of milliseconds since midnight UT. The Originate timestamp is the time the sender last touched the message before sending it, the Receive timestamp is the time the echoer first touched it on receipt, and the Transmit timestamp is the time the echoer last touched the message on sending it.
- Using this command without specifying a request or reply enables, disables, or sets the minimum packet gap for both types.
- The timestamp ICMP messages can also be enabled, disabled, and modified using the **icmp type** command. See the **icmp type** command information on the type and code for the timestamp ICMP messages.

Examples

```
-> icmp timestamp reply enable
-> icmp timestamp enable
-> icmp timestamp request enable
-> icmp timestamp request min-pkt-gap 50
```

Release History

```

icmp addr-mask

Enables or disables ICMP address mask messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

icmp add-mask [request | reply] {{enable | disable} | min-pkt-gap *gap***}**

Syntax Definitions

request	Specifies request address mask messages.
reply	Specifies reply address mask messages.
enable	Enables the specified ICMP message.
disable	Disables the specified ICMP message.
gap	The number of microseconds required between ICMP messages of this type.

Defaults

parameter	default
enable | disable	**enable**
gap	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A gateway receiving an address mask request must return it with the address mask field set to the 32-bit mask of the bits identifying the subnet and network, for the subnet on which the request was received.
- Using this command without specifying a request or reply enables, disable, or set the minimum packet gap for both types.
- The address mask ICMP messages can also be enabled, disabled, and modified using the **icmp type** command. See the **icmp type** command information on the type and code for the address mask ICMP messages.

Examples

```
-> icmp addr-mask reply enable
-> icmp addr-mask enable
-> icmp addr-mask request enable
-> icmp addr-mask request min-pkt-gap 50
```

```

ip dos scan close-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP or UDP packet is received on a closed port.

ip dos scan close-port-penalty *penalty_value*

Syntax Definitions

penalty_value	A penalty value added to the penalty scan value. This value can be any non-negative integer.

Defaults

parameter	default
penalty_value	10

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command creates a point value that is added to the total port scan penalty value when a TCP or UDP packet is received that is destined for a closed port.

Examples

```
-> ip dos scan close-port-penalty 25
```

Release History

Release 8.1.1; command introduced

Related Commands

ip dos scan threshold	Sets the threshold for the port scan value, at which a DoS attack is recorded.
ip dos trap	Sets whether the switch generates SNMP DoS traps when an attack is detected.

MIB Objects

```
alaDoSConfig
   alaDoSPortScanClosePortPenalty
```

ip dos scan tcp open-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP packet is received on an open port.

ip dos scan tcp open-port-penalty *penalty_value*

Syntax Definitions

penalty_value	A penalty value added to the penalty scan value. This value can be any non-negative integer.

Defaults

parameter	default
penalty_value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command creates a point value that is added to the total port scan penalty value when a TCP packet is received that is destined for an open port.
- The switch does not distinguish between a legal TCP packet and a port scan packet.

Examples

```
-> ip dos scan tcp open-port-penalty 10
```

Release History

Release 8.1.1; command introduced

Related Commands

ip dos scan threshold	Sets the threshold for the port scan value, at which a DoS attack is recorded.
ip dos trap	Sets whether the switch generates SNMP DoS traps when an attack is detected.

MIB Objects

```
alaDoSConfig
   alaDoSPortScanTcpOpenPortPenalty
```

ip dos scan udp open-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a UDP packet is received on an open port.

ip dos scan udp open-port-penalty *penalty_value*

Syntax Definitions

penalty_value	A penalty value added to the penalty scan value. This value can be any non-negative integer.

Defaults

parameter	default
penalty_value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command creates a point value that is added to the total port scan penalty value when a UDP packet is received that is destined for an open port.
- The switch does not distinguish between a legal UDP packet and a port scan packet.

Examples

```
-> ip dos scan udp open-port-penalty 15
```

Release History

Release 8.1.1; command introduced

Related Commands

ip dos scan threshold	Sets the threshold for the port scan value, at which a DoS attack is recorded.
ip dos trap	Sets whether the switch generates SNMP DoS traps when an attack is detected.

MIB Objects

```
alaDoSConfig
   alaDoSPortScanUdpOpenPortPenalty
```

ip dos scan threshold

Sets the threshold for the port scan value, at which a DoS attack is recorded.

ip dos scan threshold *threshold_value*

Syntax Definitions

threshold_value	A numerical value representing the total acceptable penalty before a DoS attack is noted. This value can be any non-negative integer.

Defaults

parameter	default
threshold_value	1000

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the total port scan penalty value exceeds this value, a port scan attack is recorded.
- The penalty value is incremented by recording TCP or UDP packets that are bound for open or closed ports. Such packets are given a penalty value, which are added. The commands for setting the packet penalty value are the **ip dos scan close-port-penalty**, **ip dos scan tcp open-port-penalty**, and **ip dos scan udp open-port-penalty** commands.

Examples

```
-> ip dos scan threshold 1200
```

Release History

Release 8.1.1; command introduced

Related Commands

ip dos scan close-port-penalty	Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP or UDP packet is received on a closed port.
ip dos scan tcp open-port-penalty	Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP packet is received on an open port.
ip dos scan udp open-port-penalty	Assigns a penalty value to be added to the Denial of Service penalty scan value when a UDP packet is received on an open port.
show ip dos config	Displays the configuration parameters of the DoS scan for the switch.

MIB Objects

```
alaDoSConfig
   alaDoSPortScanThreshold
```

ip dos trap

Sets whether or not the switch generates SNMP DoS traps when an attack is detected.

ip dos trap {enable | disable}

Syntax Definitions

enable	Enables the generation of DoS traps.
disable	Disables the generation of DoS traps.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command controls whether the switch generates an SNMP trap when a DoS attack is detected. It is assumed a DoS attack has occurred when the port scan penalty threshold is exceeded. This value is set using the **ip dos scan threshold** command.

Examples

```
-> ip dos trap enable
-> ip dos trap disable
```

Release History

Release 8.1.1; command introduced

Related Commands

ip dos scan threshold	Sets the threshold for the port scan value, at which a DoS attack is recorded.
show ip dos config	Displays the configuration parameters of the DoS scan for the switch.

MIB Objects

```
alaDoSConfig
   alaDoSTrapCnt1
```

ip dos scan decay

Sets the decay speed of the port scan penalty value for the switch when calculating DoS attacks.

ip dos scan decay *decay_value*

Syntax Definitions

decay_value	The decay value amount for reducing the port scan penalty. This value can be any non-negative integer.

Defaults

parameter	default
decay_value	2

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The port scan penalty value is reduced every minute by dividing by the amount set in using this command. For example, if the decay value is set to 10, every minute the total port scan penalty value is divided by 10.

Examples

```
-> ip dos scan decay 10
```

Release History

Release 8.1.1; command introduced

Related Commands

ip dos scan threshold	Sets the threshold for the port scan value, at which a DoS attack is recorded.
show ip dos config	Displays the configuration parameters of the DoS scan for the switch.

MIB Objects

```
alaDoSConfig
   alaDoSPortScanDecay
```

ip dos type

Enables or disables detection for the specified type of DoS attack.

ip dos type {port-scan | ping-of-death | land | loopback-src | invalid-ip | invalid-multicast | unicast-ip-mcast-mac | ping-overload | arp-flood | arp-poison} admin-state {enable | disable}

Syntax Definitions

port-scan	Detects port scans by monitoring TCP or UDP packets sent to open or closed ports.
ping-of-death	Detects the number of ICMP Ping-of-Death attacks (the switch receives ping packets that exceed the largest IP datagram size of 65535 bytes).
land	Detects the number of Land attacks (the switch receives spoofed packets with the SYN flag set on any open port that is listening).
loopback-src	Detects the number of loopback source attacks (the switch receives packets with 127.0.0.0/8 as the IP source address).
invalid-ip	Detects invalid IP packets (the switch receives packets with an invalid source or destination IP address).
invalid-multicast	Detects invalid Multicast packets (the switch receives packets with an invalid multicast address).
unicast-ip-mcast-mac	Detects a unicast IP and multicast MAC mismatch (the switch receives IP packets with multicast/broadcast source mac-address, non-matching destination IP and mac-address).
ping-overload	Detects a ping overload attack (the switch is flooded with a large number of ICMP packets).
arp-flood	Detects ARP flooding (the switch is flooded with a large number of ARP requests).
arp-poison	Detects ARP poisoning (the switch receives replies to an ARP request generated by the switch for a user-specified restricted address).
enable	Enables DoS attack detection.
disable	Disables DoS attack detection.

Defaults

By default, detection is enabled for all the specified IP DoS attack types, except for ping overload.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When detection is enabled for ping overload, the attack is not detected until the number of ICMP packets received exceeds 100 packets-per-second.
- ARP flooding is rate limited to 500 packets-per-second on the switch. As a result, ARP flooding is not detected until the number of ARP requests exceeds 500 packets-per-second.

- When detection is enabled for unicast IP/multicast MAC mismatches (**unicast-ip-mcast-mac**), ping overload attacks (**ping-overload**), or ARP flooding attacks (**arp-flood**), packets are not dropped when the attack is detected.

Examples

```
-> ip dos type ping-overload admin-state enable
-> ip dos type land admin-state disable
```

Release History

Release 8.1.1; command introduced

Related Commands

show ip dos config	Displays the DoS scan configuration for the switch.
show ip dos statistics	Displays statistics for the detected DoS attacks.

MIB Objects

```
alaDoSTable
   alaDoSType
   alaDoSStatus
```

show ip traffic

Displays IP datagram traffic and errors.

show ip traffic

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The statistics show the cumulative totals since the last time the switch was powered on or since the last reset of the switch was executed.
- Packets received on a port that is a member of the UserPorts group are dropped if they contain a source IP network address that does not match the IP subnet for the port. This is done to block spoofed IP traffic. If the UserPorts group function is active and spoofed traffic was detected and blocked, the output display of this command includes statistics regarding the spoofed traffic.
- The presence of spoofing event statistics in the output display of this command indicates that an attack was prevented, not that the switch is currently under attack.
- If statistics for spoofed traffic are not displayed, then a spoofing attempt has not occurred since the last time this command was issued.

Examples

```
-> show ip traffic

IP statistics
  Datagrams received
    Total                   =   621883,
    IP header error         =        0,
    Destination IP error    =    51752,
    Unknown protocol        =        0,
    Local discards          =        0,
    Delivered to users      =   567330,
    Reassemble needed       =        0,
    Reassembled             =        0,
    Reassemble failed       =        0

  Datagrams sent
    Fowarded                =     2801,
    Generated               =   578108,
    Local discards          =        0,
    No route discards       =        9,
```

```
Fragmented              =     2801,
Fragment failed         =        0,
Fragments generated     =        0
```

output definitions

Total	Total number of input datagrams received including the datagrams received in the error.
IP header error	Number of IP datagrams discarded due to errors in the IP header (for example, bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discarded in processing IP options).
Destination IP error	Number of IP datagrams discarded because the IP header destination field contained an invalid address. This count includes invalid addresses (for example, 0.0.0.0) and addresses of unsupported classes (for example, Class E).
Unknown protocol	Number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
Local discards	Number of IP datagrams received that were discarded, even though they had no errors to prevent transmission (for example, lack of buffer space). This does not include any datagrams discarded while awaiting reassembly. This value must be zero.
Delivered to users	Total number of datagrams received that were successfully delivered to IP user protocols (including ICMP).
Reassemble needed	Number of IP fragments received that needed to be reassembled.
Reassembled	Number of IP datagrams received that were successfully reassembled.
Reassemble failed	Number of IP failures detected by the IP reassembly algorithm for all reasons (for example, timed out, error). This is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
Fragmented	Number of successfully fragmented IP datagrams.
Fragment failed	Number of packets received and discarded by IP that were not fragmented. This situation can happen if a large packet has the “Don’t Fragment” flag set.
Forwarded	Number of IP datagrams forwarded by the switch.
Generated	Total number of IP datagrams that local IP user protocols (including ICMP) generated in response to requests for transmission. This does not include any datagrams counted as “Forwarded”.
Local discards	Number of output IP datagrams that were discarded, even though they had no errors to prevent transmission (for example, lack of buffer space). This number includes datagrams counted as “Forwarded” if the packets are discarded for these reasons.
No route discards	Number of IP datagrams received and discarded by IP because no route could be found to transmit them to their destination. This includes any packets counted as “Forwarded” if the packets are discarded for these reasons. It also includes any datagrams that a host cannot route because all of its default routers are down.

output definitions (continued)

Fragments generated	The of IP datagram fragments generated as a result of fragmentation.
Routing entry discards	Number of packets received and discarded by IP even though no problems were encountered to prevent their transmission to their destination (for example, discarded because of lack of buffer space).

Release History

Release 8.1.1; command introduced

Related Commands

show icmp statistics	Displays ICMP statistics and errors.

MIB Objects

N/A

show ip interface

Displays the configuration and status of IP interfaces.

show ip interface [*if_name* | **emp | vlan** *vlan id***]**

Syntax Definitions

if_name	The name associated with the IP interface.
emp	Displays the configuration and status of the Ethernet Management Port interface.
vlan_id	VLAN ID (displays a list of IP interfaces associated with a VLAN).

Defaults

By default, all IP interfaces are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The basic **show ip interface** command displays information about all configured IP interfaces on the switch.
- Use the optional **vlan** parameter to display a list of interfaces configured for the specified VLAN.
- Specify an optional interface *name* to display detailed information about an individual interface.
- Use the optional **emp** parameter to display detailed information about the EMP interface.

Examples

```
-> show ip interface
Total 13 interfaces
        Name            IP Address     Subnet Mask   Status Forward  Device
--------------------+---------------+---------------+------+-------+--------

```

output definitions

Name	Interface name. This is the name configured for the interface (for example, Accounting). **EMP** refers to the Ethernet Management Port. **Loopback** refers to a loopback interface configured for testing.
IP Address	IP address of the interface. Configured through the **ip interface** command.
Subnet Mask	IP subnet mask for the interface IP address. Configured through the **ip interface** command.
Status	Interface status: • **UP**—Interface is ready to pass packets. • **DOWN**—Interface is down.
Forward	Indicates whether the interface is actively forwarding packets (**YES** or **NO**).
Device	The type of device bound to the interface: • **unbound**—No device is bound to the interface. • **vlan**—The VLAN ID that is bound to the interface. • **EMP**—The Ethernet Management Port is bound to the interface. • **Loopback**—A loopback interface is configured for testing. • **GRE tunnel**—GRE tunnel is configured for the interface. • **IPIP tunnel**—IPIP tunnel is configured for the interface. Configured through the **ip interface** command.

```
-> show ip interface Marketing
Interface Name = Marketing
  SNMP Interface Index           =   13600007,
  IP Address                     =   172.16.105.10,
  Subnet Mask                    =   255.255.0.0,
  Broadcast Address              =   172.16.255.255,
  Device                         =   vlan 200,
  Encapsulation                  =   eth2,
  Forwarding                     =   disabled,

  Operational State              =   down,
  Operational State Reason       =   device-down,
  Router MAC                     =   00:d0:95:6a:f4:5c,
  Local Proxy ARP                =   disabled,
  Maximum Transfer Unit          =   1500,
  Primary (config/actual)        =   no/yes
```

output definitions

SNMP Interface Index	Interface index.
IP Address	IP address associated with the interface. Configured through the **ip interface** command.
Subnet Mask	IP subnet mask for the interface. Configured through the **ip interface** command.
Broadcast Address	Broadcast address for the interface.

output definitions (continued)

Device	The type of device bound to the interface: • **unbound**—No device is bound to the interface. • **vlan**—The VLAN ID that is bound to the interface. • **EMP**—The Ethernet Management Port is bound to the interface. • **Loopback**—A loopback interface is configured for testing. • **GRE tunnel**—GRE tunnel is configured for the interface. • **IPIP tunnel**—IPIP tunnel is configured for the interface. Configured through the **ip interface** command. The **GRE tunnel** and **IPIP tunnel** devices are supported only on the OmniSwitch 10K switches.
Encapsulation	Displays the IP router encapsulation (**eth2** or **snap**) that the interface uses when routing packets. Configured through the **ip interface** command.
Forwarding	Indicates whether IP forwarding is active for the interface (**enabled** or **disabled**). Configured through the **ip interface** command.
Administrative State	Administrative state of the IP interface (**enabled** or **disabled**), which is independent of the state of the underlying device. Configured through the **ip interface** command.
Operational State	Indicates whether the interface is active (**up** or **down**).
Operation State Reason	Indicates why the operational state of the interface is down: • **unbound**—No device is bound to the interface. • **device-down—**Device bound to the interface is down. • **admin-down—**The admin state of the interface is down. • **no-such-device—**Device does not exist. • **no-router-mac—**No MAC address available for the interface. • **tunnel-src-invalid—**The source IP address of the tunnel is invalid. • **tunnel-dst-unreachable—**The destination IP address of the tunnel is not reachable. The **tunnel-src-invalid** and **tunnel-dst-unreachable** Operational State reasons are supported only on the OmniSwitch 10K switches. These two reasons are only applicable for the **GRE tunnel** and **IPIP tunnel** device types. **Operational State Reason** field is only included in the display output when the operational state of the interface is **down**.
Router MAC	Switch MAC address assigned to the interface. Each interface assigned to the same VLAN shares the same switch MAC address.
Local Proxy ARP	Indicates whether Local Proxy ARP is active for the interface (**enabled** or **disabled**). Configured through the **ip interface** command.
Maximum Transfer Unit	The Maximum Transmission Unit size set for the interface. Configured through the **ip interface** command.
Primary (config/actual)	Indicates if the interface is the configured and/or actual primary interface for the device (VLAN, EMP, Loopback). If the actual status is set to **yes** and the config status is set to **no**, the interface is the default interface for the VLAN. Configured through the **ip interface** command.

Release History

Release 8.1.1; command introduced

Related Commands

ip interface	Configures an IP interface to enable IP routing on a VLAN. Without an IP interface, traffic is bridged within the VLAN or across connections to the same VLAN on other switches.
ip interface tunnel	Configures the end points for the GRE and IPIP tunnels.
show icmp statistics	Displays ICMP statistics and errors.

MIB Objects

show ip routes

Displays the IP Forwarding table.

[vrf *vrf_name***] show ip routes [summary]**

Syntax Definitions

vrf_name	The alphanumeric name (1–20 characters) assigned to the VRF instance.
summary	Displays a summary of routing protocols that appear in the IP Forwarding table.

Defaults

By default, all routes are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The IP Forwarding table includes static routes as well as all routes learned through routing protocols (for example, RIP, OSPF).
- Use the optional **summary** keyword to display a list of routing protocols and the number of routes for each protocol that appear in the IP Forwarding table.
- The imported routes are also displayed under the protocol field as IMPORT in the show output.

Examples

```
-> show ip routes

+ = Equal cost multipath routes
 Total 4 routes

  Dest Address      Gateway Addr        Age       Protocol
------------------+-----------------+---------+-----------
  0.0.0.0/0          10.255.11.254     01:50:33   STATIC

Other                   0

TOTAL =                 5
```

output definitions

Dest Addr	Destination IP address/mask length.
Gateway Addr	IP address of the gateway from which this address was learned.
Age	Age of the entry. If the entry is less than a day old, it is displayed in *hh/mm/ss* format. If it is more than a day old, it is displayed in *dd/hh* format (for example, a route that is 2 days and 12 hours old is displayed as 2d12h).
Protocol	Protocol by which this IP address was learned (for example, RIP). LOCAL indicates a local interface.
Route Count	The number of routes that appear in the IP Forwarding table for each protocol type listed.

Release History

Release 8.1.1; command introduced

Related Commands

ping	Used to test whether an IP destination can be reached from the local switch.
traceroute	Used to find the path taken by an IP packet from the local switch to a specified destination.
show ip routes	Displays a list of all routes (static and dynamic) that exist in the IP router database.

MIB Objects

```

show ip route-pref

Displays the IPv4 routing preferences of a router.

[vrf *vrf_name***] show ip route-pref**

Syntax Definitions

vrf_name	The alphanumeric name (1–20 characters) assigned to the VRF instance.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The imported routes are also displayed under the protocol field as IMPORT in the show output.

Examples

```
-> show ip route-pref
  Protocol    Route Preference Value
------------+-----------------------
  Local                  1
  Static                 2
  OSPF                 110
  ISISL1               115
  ISISL2               118
  RIP                   120
  EBGP                 190
  IBGP                 200
  Import               210
```

Release History

Release 8.1.1; command introduced

Related Commands

ip route-pref	Configures the route preference of a router.

MIB Objects

```
alaIprmRtPrefTable
  alaIprmRtPrefEntryType
  alaIprmRtPrefEntryValue
```

show ip redist

Displays the IPv4 route map redistribution configuration.

[vrf *vrf_name***] show ipv6 redist [rip | ospf | isis | bgp]**

Syntax Definitions

vrf_name	The alphanumeric name (1–20 characters) assigned to the VRF instance.
rip	Displays route map redistribution configurations that use RIP as the destination (into) protocol.
ospf	Displays route map redistribution configurations that specify OSPF as the destination (into) protocol.
isis	Displays route map redistribution configurations that specify ISIS as the destination (into) protocol.
bgp	Displays the route map redistribution configurations that specify BGP as the destination (into) protocol at this time.

Defaults

By default, all route map redistribution configurations are shown.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Specify a destination protocol with this command to display only those configurations that redistribute routes into the specified protocol.

Release History

Release 8.1.1; command introduced

Examples

```
-> show ip redist

Source       Destination
Protocol     Protocol     Status    Route Map
-------------+------------+---------+-------------------
RIP          OSPF         Enabled   ipv4rm
BGP          RIP          Enabled   ipv4rm
IMPORT       RIP          Enabled   ipv4rm
```

```
-> show ip redist rip

Source       Destination
Protocol     Protocol     Status    Route Map
-------------+------------+---------+--------------------
BGP          RIP          Enabled   ipv4rm
IMPORT       RIP          Enabled   ipv4rm
```

output definitions

Source Protocol	The protocol from which the routes are learned.
Destination Protocol	The protocol into which the source protocol routes are redistributed.
Status	The administrative status (**Enabled** or **Disabled**) of the route map redistribution configuration.
Route Map	The name of the route map that is applied with this redistribution configuration.

Related Commands

ip service source-ip	Controls the conditions for redistributing different IPv6 routes between protocols.

MIB Objects

```
alaRouteMapRedistProtoTable
   alaRouteMapRedistSrcProtoId
   alaRouteMapRedistDestProtoId
   alaRouteMapRedistRouteMapIndex
   alaRouteMapRedistStatus
   alaRouteMapRedistAddressType
   alaRouteMapRedistRowStatus
```

show ip access-list

Displays the details of the access list.

show ip access-list [*access_list_name***]**

Syntax Definitions

access_list_name	Name of the access list.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If the *access_list_name* is not specified in this command, all the access lists are displayed.

Examples

```
-> show ip access-list
                    Address /                   Redistribution
Name                Prefix Length      Effect  Control
--------------------+------------------+-------+-------------
al_3                10.0.0.0/8         permit  all-subnets
al_3                11.0.0.0/8         permit  all-subnets
al_4                1.0.0.0/8          permit  no-subnets
al_4                10.0.0.0/8         permit  all-subnets

-> show ip access-list al_4

                    Address /                   Redistribution
Name                Prefix Length      Effect  Control
--------------------+------------------+-------+-------------
al_4                1.0.0.0/8          permit  no-subnets
al_4                10.0.0.0/8         permit  all-subnets
```

output definitions

Name	Name of the access list.
Address/Prefix Length	IP address that belongs to the access list.
Effect	Indicates whether the IP address is permitted or denied.
Redistribution Control	Indicates the conditions specified for redistributing the matched routes.

Release History

Release 8.1.1; command introduced

Related Commands

ip access-list	Creates an access list for adding multiple IPv4 addresses to route maps.
ip access-list address	Adds multiple IPv4 addresses to the access list.

MIB objects

```
alaRouteMapAccessListIndex
alaRouteMapAccessListAddressType
alaRouteMapAccessListAddress
alaRouteMapAccessListPrefixLength

alaRouteMapAccessListRedistControl
```

show ip route-map

Displays the IP route maps configured on the switch.

show ip route-map [*route_map_name***]**

Syntax Definitions

route_map_name	The name of the specific route map.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If the *route_map_name* is not specified in this command, all the route maps are displayed.

Examples

```
-> show ip route-map
Route Maps: configured: 1 max: 200
Route Map: Route_map1 Sequence Number: 50 Action permit
  match ip address 10.0.0.0/8 redist-control all-subnets permit
  set metric 100 effect replace
```

Release History

Release 8.1.1; command introduced

Related Commands

ip route-map action	Creates a route map for selecting or filtering routes for tasks such as redistribution and VRF route leaking. It also sets the action of the route map to permit or deny.
ip route-map match ip address	Matches the route with the specified IPv4 address or with addresses contained in an IPv4 access list specified by the access list name.
ip route-map match ipv6 address	Matches the route with the specified IPv6 address or with addresses contained in an IPv6 access list specified by the access list name
ip route-map match ip-nexthop	Matches the routes that have a next-hop router address permitted by the specified access list.
ip route-map match ipv6-nexthop	Matches the routes that have an IPv6 next-hop router address permitted by the specified access list
ip route-map match tag	Permits or denies a route based on the specified next-hop IP address.
ip route-map match tag	Matches the tag value specified in the route map with the one that the routing protocol learned the route on.
ip route-map match metric	Matches the metric value specified in the route map with the one that the routing protocol learned the route on.
ip route-map match route-type	Matches the specified route type with the one that the routing protocol learned the route on.

MIB Objects

```
alaRouteMapRedistProtoTable
   alaRouteMapRedistRouteMapIndex
alaRouteMapTable
   alaRouteMapIndex
   alaRouteMapSequence
   alaRouteMapType
   alaRouteMapValue
   alaRouteMapRowStatus
```

show ip router database

Displays a list of all routes (static and dynamic) that exist in the IP router database. This database serves as a central repository where routes are first processed and where duplicate routes are compared to determine the best route for the Forwarding Routing Database. If a route does not appear in the IP router database list, then the switch does not know about it. In the case of dynamically learned routes, this could indicate that the route was never received by the switch.

[vrf *vrf_name***] show ip router database [protocol** *type* | **gateway** *ip_address* | **dest {***ip_address/prefixlen* | *ip_address***}]**

Syntax Definitions

vrf_name	The alphanumeric name (1–20 characters) assigned to the VRF instance.
type	Routing protocol type (local, static, OSPF, RIP, or BGP).
ip_address	Destination IP address.
ip_address/prefixlen	The destination IP address along with the prefix length of the routes processed for redistribution.

Defaults

By default, all routes are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Command options are not mutually exclusive. You can use them on the same command line to narrow and/or customize the output display of this command. For example, use the **protocol** and **dest** options to display only those routes that are of a specific protocol type and have the specified destination network.
- The IP forwarding table is derived from IP router database processing performed by the switch and contains only unique routes that the switch currently uses. Use the **show ip route** command to view the forwarding table.
- If an expected route does not appear in the IP forwarding table, use the **show ip router database** command to see if the switch knows about the route and/or if a duplicate route with a higher precedence was selected instead.
- The switch compares the protocol of duplicate routes to determine which one to use. Regardless of whether a route has a higher priority metric value, protocol determines precedence. Local routes are given the highest level of precedence followed by static, OSFP, RIP, then BGP routes. As a result, a route that is known to the switch does not appear in the IP forwarding table if a duplicate route with a higher protocol precedence exists.
- A list of inactive static routes is also included in the **show ip router database** output display. A route becomes inactive if the interface for its gateway goes down. Inactive routes are unable to get to their destination and further investigation is warranted to determine why their gateway is unavailable.

- Static routes that appear as inactive are not included in the main IP router database listing. If an inactive route becomes active, however, it is removed from the inactive list and added to the active route list.
- The imported routes are also displayed under the protocol field as IMPORT in the show output.

Examples

```
-> show ip router database

Legend: + indicates routes in-use
        b indicates BFD-enabled static route
        r indicates recursive static route, with following address in brackets
        i indicates static interface route

Destination         Gateway        Interface   Protocol  Metric   Tag   Misc-Info

---------------+--------------+--------+-------+-----------
1.0.0.0/8         8.4.5.3        1        0
```

output definitions

Destination	Destination IP address. Also includes the mask prefix length notation after the address to indicate the subnet mask value. For example, **/24** indicates the destination IP address has a 24-bit mask (255.255.255.0).
Gateway	IP address of the gateway from which this route was learned.
Interface	The interface associated with the gateway.

output definitions

Protocol	Protocol by which this IP address was learned: LOCAL, STATIC, OSPF, RIP, BGP).
Metric	RIP metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.
Tag	The tag associated with the route.
Misc-Info	Any additional information about the route.

Release History

Release 8.1.1; command introduced

Related Commands

show ip routes	Displays the IP Forwarding table.

MIB Objects

```
alaIprmRouteTable
   alaIprmRouteDest
   alaIprmRouteMask
   alaIprmRouteTos
   alaIprmRouteNextHop
   alaIprmRouteProto
   alaIprmRouteMetric
   alaIprmRoutePriority
```

show ip emp-routes

Displays the IP routes associated with the Ethernet Management Port (EMP).

show ip emp-routes

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command displays the routes that are connected to the Ethernet Management Port (EMP).
- The EMP cannot handle routing protocols such as RIP or OSPF.
- The default route for the switch cannot be set up on the EMP.

Examples

```
-> show ip emp-routes
Dest Address      Subnet Mask       Gateway Addr      Age       Protocol
------------------+-----------------+-----------------+---------+-----------
  127.0.0.1         255.255.255.255   127.0.0.1            2d 4h  LOCAL
  172.17.1.10       255.255.255.255   10.255.11.225        1d 5h  LOCAL
```

output definitions

Dest Addr	Destination IP address.
Subnet Mask	Destination IP address IP subnet mask.
Gateway Addr	IP address of the gateway from which this address was learned.
Age	Age of the entry. If the entry is less than a day old, it is displayed in *hh/mm/ss* format. If it is more than a day old, it is displayed in *dd/hh* format (for example, a route that is 2 days and 12 hours old is displayed as 2d12h).
Protocol	Protocol by which this IP address was learned (for example, RIP). NETMGT indicates a static route. LOCAL indicates a local interface.

Release History

Release 8.1.1; command introduced

Related Commands

ping	Tests whether an IP destination can be reached from the local switch.
traceroute	Finds the path taken by an IP packet from the local switch to a specified destination.

MIB Objects

N/A

show ip config

Displays IP configuration parameters.

show ip config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip config
IP directed-broadcast   =   OFF,
IP default TTL          =   64
```

output definitions

IP directed-broadcast	Indicates whether the IP directed-broadcast feature is on or off.
IP default TTL	IP default TTL interval.

Release History

Release 8.1.1; command introduced

Related Commands

ip directed-broadcast	Enables or disables IP directed broadcasts routed through the switch.
ip default-ttl	Sets TTL value for IP packets.

MIB Objects

N/A

show ip protocols

Displays switch routing protocol information and status.

show ip protocols

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip protocols
IP Protocols
RIP status                              = Not Loaded,
OSPF status                             = Loaded,
ISIS status                             = Not Loaded,
BGP status                              = Loaded,
PIM status                              = Loaded,
DVMRP status                            = Not Loaded,
RIPng status                            = Not Loaded,
OSPF3 status                            = Loaded,
```

output definitions

RIP status	Whether RIP is loaded or not.
OSPF status	Whether OSPF is loaded or not.
BGP status	Whether BGP is loaded or not.
DVMRP status	Whether DVMRP is loaded or not.
PIMSM status	Whether PIMSM is loaded or not.
RIPng status	Whether RIP is loaded or not.
OSPF3 status	Whether OSPFv3 is loaded or not.

Release History

Release 8.1.1; command introduced

Related Commands

ip router primary-address	Configures the router primary IP address.
ip router router-id	Configures the router ID for the router.

MIB Objects

```
alaIpRouteSumTable
   alaIpRouteProtocol
```

show ip router-id

Displays the primary IP address and router ID of the switch, if configured.

show ip router-id

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip router-id
Router ID    = 1.1.1.1,
Primary addr = 31.0.0.1
```

output definitions

Router ID	The set routing ID. The router ID is how the router is identified in IP.
Primary addr	The primary interface address the route uses.

Release History

Release 8.1.1; command introduced

Related Commands

ip router primary-address	Configures the router primary IP address.
ip router router-id	Configures the router ID for the router.

MIB Objects

```
alaIpRouteSumTable
   alaIpRouteProtocol
```

show ip service

Displays the status of TCP/UDP service ports.

show ip service

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The display output from this command also includes the service port number.

Examples

```
-> show ip service
Name                     Port    Status
---------------------+-------+---------

proprietary              1025   disabled
```

output definitions

Name	Name of the TCP/UDP service.
Port	The TCP/UDP well-known port number associated with the service.
Status	The status of the well-known service port: **enabled** (port is closed) or **disabled** (port is open).

Release History

Release 8.1.1; command introduced

Related Commands

ip service	Enables (opens) or disables (closes) well-known TCP/UDP service ports.

```

show ip dos arp-poison

Displays the number of attacks detected for configured ARP poison restricted-addresses.

show ip dos arp-poison

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip dos arp-poison
 IP Address                          Attacks
-------------------------------------+------------
192.168.1.1                             0
192.168.1.2                             0
192.168.1.3                             0
```

output definitions

IP Address	The configured ARP Poison restricted-addresses.
Attacks detected	The number of ARP Poison attacks detected for each address.

Release History

Release 8.1.1; command introduced

Related Commands

ip dos arp-poison restricted-address	Adds or deletes an ARP Poison restricted address.

MIB Objects

```
alaDoSArpPoisonTable
   alaDoSArpPoisonIpAddr
   alaDoSArpPoisonDetected
```

show arp

Displays the ARP table. The ARP table contains a listing of IP addresses and their corresponding translations to physical MAC addresses.

show arp [*ip_address* **|** *mac_address***]**

Syntax Definitions

ip_address	IP address of the entry you want to view.
mac_address	MAC address of the entry you want to view.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the basic command (**show arp**) to view all of the entries in the table. Enter a specific IP address or MAC address to view a specific entry.

Examples

```
-> show arp
Total 8 arp entries
 Flags (P=Proxy, A=Authentication, V=VRRP, R=Remote, B=BFD, H=HAVLAN, I=Interface)

 IP Addr           Hardware Addr       Type       Flags   Port     Interface
-----------------+------------------+----------+-------+--------+----------
 10.255.11.59      00:50:04:b2:c9:ee   DYNAMIC               3/20  vlan 1
 10.255.11.48      00:50:04:b2:ca:11   DYNAMIC               3/20  vlan 1
 10.255.11.201     00:10:83:03:e7:e4   DYNAMIC               3/20  vlan 1
 10.255.11.14      00:10:5a:04:19:a7   DYNAMIC               3/20  vlan 1
 10.255.11.64      00:b0:d0:62:fa:f1   DYNAMIC               3/20  vlan 1
 10.255.11.25      00:b0:d0:42:80:24   DYNAMIC               3/20  vlan 1
 10.255.11.26      00:b0:d0:42:82:59   DYNAMIC               3/20  vlan 1
 20.0.0.22         e4:c2:33:00:21:12   STATIC     I          1/20  ip20
 10.255.11.254     00:20:da:db:00:47   DYNAMIC               3/20  vlan 1
```

output definitions

IP Address	Device IP address.
Hardware Addr	MAC address of the device that corresponds to the IP address.
Type	Indicates whether the ARP cache entries are dynamic or static.

output definitions (continued)

Flags	Indicates the type of entry: • P = Proxy • A = Authentication (AVLAN) • V = VRRP • R = Remote • B = BFD • H = HAVLAN • I = Interface
Port	The port on the switch attached to the device identified by the IP address.
Interface	The interface to which the entry belongs (for example, VLAN, EMP).

Release History

Release 8.1.1; command introduced

Related Commands

ip service	Adds a permanent entry to the ARP table.
clear arp-cache	Deletes all dynamic entries from the ARP table.

MIB Objects

```

show arp filter

Displays a list of ARP filters configured for the switch.

show arp filter [*ip_address***]**

Syntax Definitions

ip_address	IP address of the filter entry you want to view.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If an IP address is not specified with this command, a list of all ARP filters is displayed.
- Enter a specific IP address to view the configuration for an individual filter.

Examples

```
-> show arp filter
 IP Addr           IP Mask             Vlan   Type       Mode
-----------------+------------------+------+----------+-------
171.11.1.1         255.255.255.255        0   target     block
172.0.0.0          255.0.0.0              0   target     block
198.0.0.0          255.0.0.0              0   sender     block
198.172.16.1       255.255.255.255      200   target     allow

-> show arp filter 198.172.16.1
 IP Addr           IP Mask             Vlan   Type       Mode
-----------------+------------------+------+----------+-------
198.0.0.0          255.0.0.0              0   sender     block
198.172.16.1       255.255.255.255      200   target     allow
```

output definitions

IP Addr	The ARP packet IP address to which the filter is applied.
IP Mask	The IP mask that specifies which part of the IP address to which the filter is applied.
Vlan	A VLAN ID. The filter is applied only to ARP packets received on ports associated with this VLAN.
Type	Indicates which IP address in the ARP packet (**sender** or **target**) is used to identify if a filter exists for that address.
Mode	Indicates whether to **block** or **allow** a switch response to an ARP packet that matches the filter.

Release History

Release 8.1.1; command introduced

Related Commands

arp filter	Adds a permanent entry to the ARP table.
clear arp filter	Deletes all dynamic entries from the ARP table.

MIB Objects

```
alaIpArpFilterTable
   alaIpArpFilterIpAddr
   alaIpArpFilterIpMask
   alaIpArpFilterVlan
   alaIpArpFilterMode
   alaIpArpFilterType
```

show icmp control

Allows the viewing of the ICMP control settings.

show icmp control

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command to view the status of the various ICMP messages. It is also useful to determine the type and code of the less common ICMP messages.

Examples

```
-> show icmp control
  Name                                Type   Code   Status    min-pkt-gap(us)
--------------------------------------+------+------+---------+-----------------
  echo reply                            0      0   enabled             0
  network unreachable                   3      0   enabled             0
  host unreachable                      3      1   enabled             0
  protocal unreachable                  3      2   enabled             0
  port unreachable                      3      3   enabled             0
  frag needed but DF bit set            3      4   enabled             0
  source route failed                   3      5   enabled             0
  destination network unknown           3      6   enabled             0
  destination host unknown              3      7   enabled             0

  time exceeded during transmit        11      0   enabled             0
  time exceeded during reassembly      11      1   enabled             0
  ip header bad                        12      0   enabled             0
  required option missing              12      1   enabled             0
  timestamp request                    13      0   enabled             0
```

```
timestamp reply                    14      0   enabled          0
information request(obsolete)      15      0   enabled          0
information reply(obsolete)        16      0   enabled          0
address mask request               17      0   enabled          0
address mask reply                 18      0   enabled          0
```

output definitions

Name	The name of the ICMP message.
Type	The ICMP message type. This along with the ICMP code specifies the ICMP message.
Code	The ICMP message code. This along with the ICMP type specifies the ICMP message.
Status	Whether this message is **Enabled** or **Disabled**.
min-pkt-gap	The minimum packet gap, in microseconds, for this ICMP message. The minimum packet gap is the amount of time that must pass between ICMP messages of like types.

Release History

Release 8.1.1; command introduced

Related Commands

icmp type	Enables or disables a specific type of ICMP message, and sets the minimum packet gap.
icmp unreachable	Enables or disables ICMP messages pertaining to unreachable destinations, and sets the minimum packet gap.
icmp echo	Enables or disables ICMP echo messages, and sets the minimum packet gap.
icmp timestamp	Enables or disables ICMP timestamp messages, and sets the minimum packet gap.
icmp addr-mask	Enables or disables ICMP address mask messages, and sets the minimum packet gap.
icmp messages	Enables or disables all ICMP messages.

MIB Objects

N/A

show icmp statistics

Displays Internet Control Message Protocol (ICMP) statistics and errors. ICMP is a network layer protocol within the IP protocol suite that provides message packets to report errors and other IP packet processing information back to the source. ICMP generates several kinds of useful messages, including Destination Unreachable, Echo Request and Reply, Redirect, Time Exceeded, and Router Advertisement and Solicitation. If an ICMP message cannot be delivered, no second one is generated. This is to avoid an endless flood of ICMP messages.

show icmp [statistics]

Syntax Definitions

statistics	Optional syntax.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the ICMP Table to monitor and troubleshoot the switch.

Examples

```
-> show icmp
Messages                  Received    Sent
--------------------------+-----------+------------
  Total                         2105        2105
  Error                            0           0
  Destination unreachable          0           0
  Time exceeded                    0           0
  Parameter problem                0           0
  Source quench                    0           0
  Redirect                         0           0
  Echo request                  2105           0
  Echo reply                       0        2105
  Time stamp request               0           0
  Time stamp reply                 0           0
  Address mask request             0           0
  Address mask reply               0           0
```

output definitions

Total	Total number of ICMP messages the switch received or attempted to send. This counter also includes all the messages that were counted as errors.
Error	Number of ICMP messages the switch sent/received but was unable to process because of ICMP-specific errors (for example, bad ICMP checksums, bad length).

output definitions (continued)

Destination unreachable	Number of “destination unreachable” messages that were sent/received by the switch.
Time exceeded	Number of “time exceeded” messages that were sent/received by the switch. These messages occur when a packet is dropped because the TTL counter reaches zero. When a large number of these messages occur, it is a symptom that packets are looping, that congestion is severe, or that the TTL counter value is set too low. These messages also occur when all the fragments trying to be reassembled do not arrive before the reassembly timer expires.
Parameter problem	Number of messages sent/received which indicate that an illegal value has been detected in a header field. These messages can indicate a problem in the sending IP software of the host or gateway.
Source quench	Number of messages sent/received that tell a host that it is sending too many packets. A host must attempt to reduce its transmissions upon receiving these messages.
Redirect	Number of ICMP redirect messages sent/received by the switch.
Echo request	Number of ICMP echo messages sent/received by the switch to see if a destination is active and unreachable.
Echo reply	Number of echo reply messages received by the switch.
Time stamp request	Number of time stamp request messages sent/received by the switch.
Time stamp reply	Number of time stamp reply messages sent/received by the switch.
Address mask request	Number of address mask request messages that were sent/received by the switch in an attempt to determine the subnet mask for the network.
Address mask reply	Number of address mask reply messages that were sent/received by the switch.

Release History

Release 8.1.1; command introduced

Related Commands

show udp statistics	Displays UDP errors and statistics.

MIB Objects

N/A

show tcp statistics

Displays TCP statistics.

show tcp statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show tcp statistics
Total segments received =   235080,
Error segments received =        0,
Total segments sent     =   363218,
Segments retransmitted  =       38,
Reset segments sent     =       97,
Connections initiated   =    57185,
Connections accepted    =      412,
Connections established =        1,
Attempt fails           =    24393,
Established resets      =      221
```

output definitions

Total segments received	Total number of segments received, including the segments received in the error. This count includes segments received on currently established connections.
Error segments received	Total number of segments received in error (for example, bad TCP checksums).
Total segments sent	Total number of segments sent, including those on current connections but excluding those containing only retransmitted octets.
Segments retransmitted	Number of TCP segments transmitted containing one or more previously transmitted octets.
Reset segments sent	Number of TCP segments containing the reset flag.
Connections initiated	Number of connections attempted.
Connections accepted	Number of connections allowed.
Connections established	Number of successful connections.

output definitions (continued)

Attempt fails	Number of times attempted TCP connections have failed.
Established resets	Number of times TCP connections have been reset from the "Established" or "Close Wait" state to the “Closed” state.

  10.255.11.223          2530   10.255.11.25              389    TIME-WAIT
```

output definitions

Local Address	Local IP address for this TCP connection. If a connection is in the LISTEN state it accepts connections for any IP interface associated with the node. The IP address 0.0.0.0 is used.
Local Port	Local port number for this TCP connection. The range is 0–65535.

output definitions (continued)

Remote Address	Remote IP address for this TCP connection.
Remote Port	Remote port number for this TCP connection. The range is 0–65535.
State	State of the TCP connection, as defined in RFC 793. A connection progresses through a series of states during its lifetime: • Listen—Waiting for a connection request from any remote TCP and port. • Syn Sent—Waiting for a matching connection request after having sent a connection request. • Syn Received—Waiting for a confirming connection request acknowledgment after having both received and sent a connection request. • Established—Open connection. Data received can be delivered to the user. This is the normal state for the data transfer phase of the connection. • Fin Wait 1—Waiting for a connection termination request from the remote TCP, or an acknowledgment of the connection termination request previously sent. • Fin Wait 2—Waiting for a connection termination request from the remote TCP. • Close Wait—Waiting for a connection termination request from the local user. • Closing—Waiting for a connection termination request acknowledgment from the remote TCP. • Last Ack—Waiting for an acknowledgment of the connection termination request previously sent to the remote TCP (which includes an acknowledgment of its connection termination request). • Time Wait—Waiting for enough time to pass to be sure the remote TCP received the acknowledgment of its connection termination request. • Closed—No connection state.

Release History

Release 8.1.1; command introduced

Related Commands

show ip interface	Displays the status and configuration of IP interfaces.
show tcp statistics	Displays TCP statistics.

MIB Objects

N/A

show udp statistics

Displays UDP errors and statistics.

show udp statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays cumulative statistics since the last time the switch was powered on or since the last reset of the switch.

Examples

```
-> show udp statistics
Total datagrams received   =   214937,
Error datagrams received   =        0,
No port datagrams received =    32891,
Total datagrams sent       =   211884
```

output definitions

Total datagrams received	Total number of UDP datagrams delivered to UDP applications.
Error datagrams received	Number of UDP datagrams that could not be delivered for any reason.
No port datagrams received	Number of UDP datagrams that could not be delivered for reasons other than lack of application at the destination.
Total datagrams sent	Total number of UDP datagrams sent from this switch.

Release History

Release 8.1.1; command introduced

Related Commands

show udp ports	Displays the UDP Listener table.

MIB Objects

N/A

show udp ports

Displays the UDP Listener table. The table shows the local IP addresses and the local port number for each UDP listener.

show udp ports

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- An IP address of zero (0.0.0.0) indicates that it is listening on all interfaces.
- This table contains information about the UDP end-points on which a local application is currently accepting datagrams.

Examples

```
-> show udp port
Local Address     Local Port
------------------+--------------
  0.0.0.0                  67
  0.0.0.0                 161
  0.0.0.0                 520
```

output definitions

Local Address	Local IP address for this UDP connection.
Local Port	Local port number for this UDP connection.

Release History

Release 8.1.1; command introduced

Related Commands

show udp statistics	Displays UDP errors and statistics.

MIB Objects

N/A

show ip dos config

Displays the DoS scan configuration for the switch.

show ip dos config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command allows the user to view the configuration parameters of the DoS scan. The scan keeps a record of the penalties incurred by certain types of packets on TCP and UDP ports. When the set penalty threshold is reached, it is assumed a DoS attack is in progress, and a trap is generated to inform the system administrator.

Examples

```
-> show ip dos config

   Dos type                                    Status
-------------------------------------------+-----------------
   port scan                                   ENABLED
   ping of death                               ENABLED
   loopback-src                                ENABLED
   invalid-ip                                  ENABLED
   invalid-multicast                           ENABLED
   unicast dest-ip/multicast-mac               ENABLED
   ping overload                               DISABLED
   arp flood                                   ENABLED
   arp poison

DoS trap generation                            =  ENABLED,
DoS port scan threshold                        =  1000,
DoS port scan decay                            =  2,
DoS port scan close port penalty               =  10,
DoS port scan TCP open port penalty            =  0,
DoS port scan UDP open port penalty            =  0,
Dos MAximum Ping Rate                          =  100
Dos Maximum ARP Request Rate                   =  500
```

output definitions

DoS Type	The type of DoS attack.
Status	Whether or not detection for this type of DoS attack is enabled. Configured through the **ip dos type** command.
DoS trap generation	Displays the status of DoS trap generation. It is either **ENABLED** or **DISABLED**. This is set using the **ip dos trap** command.
DoS port scan threshold	The penalty threshold setting. When enough packets have increased the penalty number to this setting, a trap is generated to warn the administrator that a DoS attack is in progress. This is set using the **ip dos scan threshold** command.
DoS port scan decay	The decay value for the switch. The penalty value of the switch is decreased by this number every minute. This is set using the **ip dos scan decay** command.
DoS port scan close port penalty	The penalty value for packets received on closed UDP and TCP ports. The penalty number for the switch is increased by this amount every time a packet is received on a closed UDP or TCP port. This is set using the **ip dos scan close-port-penalty** command.
DoS port scan TCP open port penalty	The penalty value for packets received on open TCP ports. The penalty number for the switch is increased by this amount every time a packet is received on an open TCP port. This is set using the **ip dos scan tcp open-port-penalty** command.
DoS port scan UDP open port penalty	The penalty value for packets received on open UDP ports. The penalty number for the switch is increased by this amount every time a packet is received on an open UDP port. This is set using the **ip dos scan udp open-port-penalty** command.

```

show ip dos statistics

Displays the statistics for detected DoS attacks on the switch.

show ip dos statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command displays the number of attacks the switch has detected for several types of DoS attacks.
- If an attack is detected and reported, it does not necessarily mean that an attack occurred. The switch assumes a DoS attack is underway anytime the penalty threshold is exceeded. It is possible for this threshold to be exceeded when no attack is in progress.
- Statistics for the “unicast dest-ip/multicast-mac” DoS type are not reported for the multicast MAC address attack. In this case, the packet is dropped at a lower level so IP never sees the attack. IP only collects and reports statistics for IP attacks.

Examples

```
-> show ip dos statistics

  DoS type                            Attacks detected
----------------------------------+-------------------------
  port scan                                          0
  ping of death                                      0
  land                                               0
  loopback-src                                       0
  invalid-ip                                         0
  invalid-multicast                                  0
  unicast dest-ip/multicast-mac                     52
  ping overload                                      0
  arp flood                                          0
  arp poison                                         0
```

output definitions

DoS type	The type of DoS attack.
Attacks detected	The number of attacks detected for each DoS type.

Release History

Release 8.1.1; command introduced

Related Commands

ip dos type	Enables or disables detection for a specific type of DoS attack.
show ip dos config	Displays the DoS scan configuration for the switch.

MIB Objects

```
alaDoSTable

```

show vrf

Displays the Multiple VRF instance configuration for the switch.

show vrf [*vrf_name* | **default]**

Syntax Definitions

vrf_name	The name of an existing VRF instance.
default	Selects the default VRF instance.

Defaults

By default, a list of all VRF instances is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the *vrf_name* parameter to display route-map resource information for a specific VRF instance.
- Use the **default** parameter to display route-map resource information for the default VRF instance.
- The type of profile (low or max) assigned to a VRF determines the routing capabilities and the amount of route-map resources available for that specific VRF instance.

Examples

```
-> show vrf
 Virtual Routers     Profile Protocols
--------------------+-------+------------------
default              default BGP PIM VRRP
customer1            max     RIP OSPF
customer2            max     RIP OSPF
customer3            low

Total Number of Virtual Routers: 4
```

output definitions

Virtual Routers	The name of the VRF instance.
Profile	The type of profile applied to this instance (**low** or **max**).
Protocols	The protocols loaded within the context of this instance.

```
-> show vrf customer1
Legend:          in use/max
route-maps       :    3/30,
sequences        :    5/60,
tlvs             :    8/100,
access-lists     :    0/20,
address blocks   :    0/40,
match interfaces :    3/100
```

```
-> show vrf customer3
Legend:          in use/max
route-maps       :    0/10,
sequences        :    0/20,
tlvs             :    0/20,
access-lists     :    0/10,
address blocks   :    0/10,
match interfaces :    0/10

-> show vrf default
Legend:          in use/max
route-maps       :    0/200,
sequences        :    0/400,
tlvs             :    0/1000,
access-lists     :    0/200,
address blocks   :    0/500,
match interfaces :    0/2000
```

output definitions

route-maps	The number of route maps used and the maximum allowed.
sequences	The number of route map sequences used and the maximum allowed.
tlvs	The number of TLV blocks used and the maximum allowed. The TLV blocks contain the route-map match and set clauses.
access-lists	The number of route-map access lists used and the maximum allowed.
address blocks	The number of address blocks used and the maximum allowed. The address blocks hold access list addresses.
match interfaces	The number of route-map interfaces used in match clauses and the maximum allowed.

Release History

Release 8.1.1; command introduced.

Related Commands

vrf	Configures a Multiple VRF instance for the switch.

show vrf-profiles

Displays the current VRF profile usage and the maximum route-map resources allowed for each profile type (default, low, and max).

show vrf-profiles

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command also provides an estimate of the number of low profile VRFs that can be created.

Examples

```
-> show vrf-profiles
EST: Estimated number of low profile VRFs that can be created
RM:  Maximum route-maps
SEQ: Maximum sequences
TLV: Maximum TLVs (used to hold match and set clauses)
AL:  Maximum access-lists
AB:  Maximum address blocks (used to hold addresses)
ITF: Maximum route-map interfaces used in match clauses

Profile          Inuse EST  RM   SEQ  TLV  AL   AB   ITF
---------------+-----+----+----+----+----+----+----+----
default              1    -  200  400 1000  200  500 2000
low                  2  329   10   20   20   10   10   10
max                  3    -   30   60  100   20   40  100
```

17 IPv6 Commands

This chapter details Internet Protocol Version 6 (IPv6) commands for the switch (including RIPng commands). IPv6 (documented in RFC 2460) is designed as a successor to IPv4. The changes from IPv4 to IPv6 fall primarily into the following categories:

Expanded Routing and Addressing Capabilities - IPv6 increases the IP address size from 32 bits to 128 bits, to support more levels of addressing hierarchy and a much greater number of addressable nodes, and simpler auto-configuration of addresses. The scalability of multicast routing is improved by adding a "scope" field to multicast addresses.

Header Format Simplification - Some IPv4 header fields were dropped or made optional, to reduce the common-case processing cost of packet handling and to keep the bandwidth cost of the IPv6 header as low as possible despite the increased size of the addresses. Even though the IPv6 addresses are four times longer than the IPv4 addresses, the IPv6 header is only twice the size of the IPv4 header.

Anycast Addressing - A new type of address called a "anycast address" is defined, to identify sets of nodes where a packet sent to an anycast address is delivered to one of the nodes. The use of anycast addresses in the IPv6 source route allows nodes to control the path on which their traffic flows.

Improved Support for Options - Changes in the way IP header options are encoded allows for more efficient forwarding, less stringent limits on the length of options, and greater flexibility for introducing new options in the future.

Authentication and Privacy Capabilities - IPv6 includes the definition of extensions which provide support for authentication, data integrity, and confidentiality. This is included as a basic element of IPv6 and will be included in all implementations.

MIB information for the IPv6 and RIPng commands is as follows:

Filename: Ipv6.mib
Module: Ipv6-MIB

Filename: AlcatelIND1Ipv6.mib
Module: alcatelIND1IPv6MIB

Filename: AlcatelIND1Iprmv6.mib
Module: alcatelIND1IprmV6MIB

Filename: AlcatelIND1Ripng.mib
Module: alcatelIND1RipngMIB

A summary of the IPv6 commands is listed here:

IPv6	**ipv6 interface** **ipv6 address** **ipv6 address global-id** **ipv6 address local-unicast** **ipv6 dad-check** **ipv6 hop-limit** **ipv6 pmtu-lifetime** **ipv6 neighbor stale-lifetime** **ipv6 neighbor** **ipv6 neighbor limit** **ipv6 neighbor vrf-limit** **ipv6 ra-filter** **ipv6 static-route** **ipv6 route-pref** **ipv6 virtual-source-mac** **traceroute6** **show ipv6 icmp statistics** **show ipv6 interface** **show ipv6 ra-filter** **show ipv6 neighbors** **clear ipv6 neighbors** **show ipv6 prefixes** **show ipv6 routes** **show ipv6 route-pref** **show ipv6 router database** **show ipv6 tcp listeners** **show ipv6 tcp connections** **show ipv6 tunnel configured** **show ipv6 tunnel 6to4** **show ipv6 information**
IPv6 Route Map Redistribution	**ipv6 redist** **ipv6 access-list** **ipv6 access-list address** **show ipv6 redist** **show ipv6 access-list**
IPv6 RIP	**ipv6 load rip** **ipv6 rip admin-state** **ipv6 rip invalid-timer** **ipv6 rip garbage-timer** **ipv6 rip holddown-timer** **ipv6 rip jitter** **ipv6 rip route-tag** **ipv6 rip update-interval** **ipv6 rip triggered-sends** **ipv6 rip interface** **ipv6 rip interface metric** **ipv6 rip interface recv-status** **ipv6 rip interface send-status** **ipv6 rip interface horizon** **show ipv6 rip** **show ipv6 rip interface** **show ipv6 rip peer** **show ipv6 rip routes**
IPv6 DHCP	**ipv6 dhcp relay admin-state** **ipv6 dhcp relay interface admin-state** **ipv6 dhcp relay destination** **show ipv6 dhcp relay**

ipv6 interface

Configures an IPv6 interface on a VLAN or IPv6 tunnel.

ipv6 interface *if_name* **[vlan** *vid* **| tunnel {***tid* **| 6to4}] admin-state [enable | disable]**
[base-reachable-time *time***]**
[ra-send {yes | no}]
[ra-max-interval *interval***]**
[ra-managed-config-flag {true | false}]
[ra-other-config-flag {true | false}]
[ra-reachable-time *time***]**
[ra-retrans-timer *time***]**
[ra-default-lifetime *time* **| no ra-default-lifetime]**
[ra-min-interval *interval* **| no ra-min-interval]**
[ra-clock-skew *time***]**
[ra-send-mtu] {yes | no}
[mtu *size***]**
[retrans-timer *time***]**
[dad-transmits *count***]**
[ra-hop-limit *count***]**
[[no] local-proxy-nd] [neighbor-limit *count* **| no neighbor-limit]**
[retrans-backoff *backoff***] [retrans-max** *max***]**
no ipv6 interface *if_name*

Syntax Definitions

if_name	IPv6 interface name.
vlan	Identifies a VLAN interface.
vid	VLAN ID number.
tunnel	Identifies a configured tunnel interface.
tid	Tunnel ID number.
6to4	Identifies the 6to4 tunnel interface.
base-reachable-time *time*	Base value used to compute the reachable time for neighbors reached through this interface.
ra-send	Specifies whether the router advertisements are sent on this interface.
ra-max-interval *interval*	Maximum time, in seconds, allowed between the transmission of unsolicited multicast router advertisements in this interface. The range is 4 - 1,800.
ra-managed-config-flag	Value to be placed in the managed address configuration flag field in router advertisements sent on this interface.
ra-other-config-flag	Value to be placed in the other stateful configuration flag in router advertisements sent on this interface.
ra-reachable-time *time*	Value, in milliseconds, to be placed in the reachable time field in router advertisements sent on this interface. The range is 0 - 3,600,000. The special value of zero indicates that this time is unspecified by the router.

ra-retrans-timer *time*	Value, in milliseconds, to be placed in the retransmit timer field in router advertisements sent on this interface. The value zero indicates that the time is unspecified by the router.
mtu *size*	The maximum transmission unit for a tunnel interface. Use the **vlan** command's mtu-ip to set for a VLAN.
retrans-timer *time*	The amount of time, in milliseconds, between retransmission of a neighbor solicitation during neighbor discovery.
dad-transmits *count*	The number of neighbor solicitations to send during Duplicate Address Detection.
ra-hop-limit *count*	The value placed in the current hop limit field of router advertisements sent on this interface.
ra-default-lifetime *time*	Value, in seconds, to be placed in the router lifetime field in router advertisements sent on this interface. The time must be zero or between the value of "ra-max-interval" and 9,000 seconds. A value of zero indicates that the router is not to be used as a default router. The "no ra-default-lifetime" option will calculate the value using the formula (3 * ra-max-interval).
ra-min-interval *interval*	Value, in seconds, allowed between the transmission of unsolicited multicast router advertisements on this interface. The interval must be a minimum of 3 and not more than 75 times the value of ra-max-interval.The "no ra-min-interval" option will calculate the value using the formula (.33 * ra-max-interval).
ra-clock-skew *time*	Value, in seconds. The router advertisement clock skew allows the link propagation delays and poorly synchronized clocks on routers participating in router discover over this interface. The timer differences that fall within the clock skew value are treated as valid times.
enable | disable	Administratively enable or disable the interface.
ra-send-mtu	Specifies whether the MTU option is included in the router advertisements sent on the interface.
[no] local-proxy-nd	Enable or disable Local Proxy Neighbor Discovery (LPND) on the interface. The default value is **no**.
neighbor-limit *count*	Sets the neighbor cache limit for the interface.
no neighbor-limit	Removes the limit set for neighbor cache. The default value is **no**.
retrans-backoff *backoff*	Sets the Neighbor Unreachability Detection (NUD) exponential back-off base value. The configurable values are 1, 2 or 3. The default value is 1. This allows the exponentially increase of the interval between retransmissions of the Neighbor Solicitation (NS), providing a longer interval over which the neighbor can respond.
retrans-max *max*	Sets the maximum number of neighbor solicitations to be sent during ND and NUD. The range is from 1 to 10 with a default value of 3. This allows the number of neighbor solicitations sent for neighbor discovery to be increased.

Defaults

parameter	default
ra-send	yes
ra-max-interval	600
ra-managed-config-flag	false
ra-reachable-time	0
ra-retrans-timer	0
ra-default-lifetime	calculated
ra-min-interval	calculated
ra-send-mtu	no
ra-clock-skew	600
base-reachable-time	360
retrans-timer	1000
dad-transmits	1
ra-other-config-flag	false
ra-hop-limit	64
local-proxy-nd	no
neighbor-limit	no
retrans-backoff	1
retrans-max	3

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete an interface.
- When you create an IPv6 interface, it is enabled by default.
- All IPv6 VLAN and tunnel interfaces must have a name.
- When creating an IPv6 interface you must specify a VLAN ID or Tunnel ID. When modifying or deleting an interface, you do not need to specify one of these options unless the name assigned to the interface is being changed. If it is present with a different value from when the interface was created, the command will be in error.
- A default **6to4** tunnel named “tunnel_6to4” is automatically created. It can only be enabled/disabled or it configuration modified, it cannot be deleted.
- A 6to4 interface cannot send advertisements (**ra-send**).
- To enable IPv6 routing you must first create a VLAN, then create an IPv6 interface on the VLAN. See Chapter 5, “VLAN Management Commands,” for information on creating VLANs.

- To route IPv6 traffic over an IPv4 network, you must create an IPv6 tunnel using the **ipv6 interface** command.
- Use the **no** option to disable the Local Proxy Neighbor Discovery on the interface.

Examples

```
-> ipv6 interface Test vlan 1
-> ipv6 interface Test_Tunnel tunnel 2
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 interface	Displays IPv6 Interface Table.
show ipv6 tunnel configured	Displays IPv6 Configured Tunnel.
show ipv6 tunnel 6to4	Displays IPv6 6to4 tunnel information.
show ipv6 information	Displays IPv6 information.

```

ipv6 interface tunnel source destination

Configures the source and destination IPv4 addresses for a configured tunnel.

ipv6 interface *if_name* **tunnel {[source** *ipv4_source***] [destination** *ipv4_destination***]}**

Syntax Definitions

if_name	Name assigned to the tunnel interface.
ipv4_source	Source IPv4 address for the configured tunnel.
ipv4_destination	Destination IPv4 address for the configured tunnel.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **ipv6 interface** command to create an IPv6 tunnel interface.
- A configured tunnel interface cannot be enabled until both its v4 source and destination addresses have been specified.

Examples

```
-> ipv6 interface Test tunnel 2 source 192.0.2.1 destination 198.51.100.1
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 interface	Creates an IPv6 tunnel interface.
show ipv6 tunnel configured	Displays IPv6 tunnel information.

MIB Objects

```
IPv6IfIndex
   alaIPv6ConfigTunnelv4Source
   alaIPv6ConfigTunnelv4Dest
   alaIPv6ConfigTunnelRowStatus
```

ipv6 address

Configures an IPv6 address for an IPv6 interface on a VLAN, configured tunnel, or a 6to4 tunnel. There are different formats for this command depending on the address type.

ipv6 address *ipv6_address /prefix_length* **[anycast] {***if_name* | **loopback}**

no ipv6 address *ipv6_address* **[anycast] {***if_name* **| loopback}**

ipv6 address *ipv6_prefix* **eui-64 {***if_name* | **loopback}**

no ipv6 address *ipv6_prefix* **eui-64 {***if_name* | **loopback}**

Syntax Definitions

ipv6_address	IPv6 address.
prefix_length	The number of bits that are significant in the IPv6 address (mask). (3..128).
anycast	Indicates the address is an anycast address.
eui-64	Append an EUI-64 identifier to the prefix.
if_name	Name assigned to the interface.
loopback	Configures the loopback interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete an address.
- You can assign multiple IPv6 addresses to an IPv6 interface.
- No default value for prefix length.
- The “eui” form of the command is used to add or remove an IPv6 address for a VLAN or configured tunnel using an EUI-64 interface ID in the low order 64 bits of the address.

Examples

```
-> ipv6 address 2001:DB8:4132:86::19A/64 Test_Lab
-> ipv6 address 2002:C633:6489::35/64 Test_6to4
```

Release History

Release 8.1.1; command introduced.

Related Commands

IPv6IfIndex
alaIPv6InterfaceAddressTable
   alaIPv6InterfaceAddress
   alaIPv6InterfaceAddressAnycastFlag
   alaIPv6InterfaceEUI64AddressPrefixLength
   alaIPv6InterfaceEUI64AddressrowStatus

For EUI-64 Addresses:
alaIPv6InterfaceEUI64AddresssTable
   alaIPv6InterfaceEUI64Address
   alaIPv6InterfaceEUI64AddressPrefixLength
   alaIPv6InterfaceEUI64AddressRowStatus
```

ipv6 address global-id

Automatically generates or allows a new global ID to be entered.

ipv6 address global-id {generate | *globalID***}**

Syntax Definitions

generate	Automatically generates the global ID.
globalID	A 5-byte global ID value specified in the form hh:hhhh:hhhh.

Defaults

By default, the IPv6 global ID is set to all zeros.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Global ID needs to be automatically generated or configured explicitly.
- A 40-bit global identifier is used to make the local IPv6 address prefixes globally unique.
- The global ID will be generated the first time a local unicast address is added through the **ipv6 address local-unicast** command or when the **ipv6 address global-id** command is executed.

Examples

```
-> ipv6 address global-id generate
-> ipv6 address global-id 32:57a3:8fed
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 address local-unicast	Creates a IPv6 local unicast address using the configured global ID.
ipv6 bgp unicast	Enables or disables unicast IPv6 updates for the BGP routing process.
show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaIPv6GlobalID
```

ipv6 address local-unicast

Creates a IPv6 local unicast address using the configured global ID.

ipv6 address local-unicast [global-id *globalID***] [subnet-id** *subnetID***] {interface-id** *interfaceID* **| eui-64} [prefix-length** *prefixLength***]** *{if-name* **| loopback}**

[no] ipv6 address local-unicast [global-id *globalID***] [subnet-id** *subnetID***] {interface-id** *interfaceID* **| eui-64} [prefix-length** *prefixLength***]** *{if-name* **| loopback}**

Syntax Definitions

globalID	A 5-byte global ID value specified in the form hh:hhhh:hhhh.
subnetID	A 2-byte Subnet ID specified in the form 0xhhhh. The valid range is 0x0000-0xffff or 0-65535.
interfaceID	An interface identifier specified in the form hhhh:hhhh:hhhh:hhhh.
eui-64	Automatically-generated EUI-64 value to be used for interface identfier.
prefixLength	The number of bits that are significant in the IPv6 address (mask). The valid range is 0-128; however, the default value should rarely be overridden.
if-name	The name assigned to the interface.
loopback	The loopback for the loopback interface.

Defaults

parameter	default
prefixLength	64

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the local unicast address. However, addresses are normally deleted using the **ipv6 address** command.
- If the global ID value is not explicitly specified, the default global ID set by the **ipv6 address global-id** command is used.
- If the global ID value is explicitly configured using the **ipv6 address local-unicast** command, the address' global ID will not be changed if the **ipv6 address global-id** command is executed.
- The use of a double-colon abbreviation for the interface identifier similar to that used for full IPv6 addresses is allowed.

Examples

```
-> ipv6 address local-unicast global-id 0073:110:255 subnet-id 23 interface-id
215:60ff:fe7a:adc0 prefix-length 64 loopback
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 address global-id	Automatically generates or allows a new global ID to be entered.
show ipv6 information	Displays IPv6 information.

MIB Objects

```
alaIPv6LocalUnicastGlobalID
alaIPv6LocalUnicastSubnetID

alaIPv6LocalUnicastPrefixLength
```

ipv6 dad-check

Runs a Duplicate Address Detection (DAD) check on an address that was marked as duplicated.

ipv6 dad-check *ipv6_address if_name*

Syntax Definitions

ipv6_address	IPv6 address.
ip_name	Name assigned to the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The switch performs DAD check when an interface is attached and its VLAN first enters the active state. Use this command to rerun a DAD check on an address that was marked as duplicated.

Examples

```
-> ipv6 dad-check 2001:db8::1/32 Test_Lab
```

Release History

Release 8.1.1; command introduced.

Related Commands

N/A

MIB Objects

```
alaIPv6InterfaceAddressTable

```

ipv6 hop-limit

Configures the value placed in the hop limit field in the header of all IPv6 packets that are originated by the switch. It also configures the value placed in the hop limit field in router advertisements.

ipv6 hop-limit *value*

no ipv6 hop-limit

Syntax Definitions

value	Hop limit value. The range is 0 - 255.

Defaults

parameter	default
value	64

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to return the hop limit to its default value.
- Inputting the value 0 (zero) will result in the default (64) hop-limit.

Examples

```
-> ipv6 hop-limit 64
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 information	Displays IPv6 information.

MIB Objects

```
ipv6MibObjects
   Ipv6DefaultHopLimit
```

ipv6 pmtu-lifetime

Configures the minimum lifetime for entries in the path MTU Table.

ipv6 pmtu-lifetime *time*

Syntax Definitions

time	Minimum path MTU entry lifetime, in minutes. Valid range is 10–1440.

Defaults

parameter	default
time	10

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ipv6 pmtu-lifetime 30
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ra-filter	Displays the IPv6 path MTU Table.
show ipv6 information	Displays IPv6 information.

MIB Objects

```
alaIPv6ConfigTable
   alaIPv6PMTUMinLifetime
```

ipv6 neighbor stale-lifetime

Configures the minimum lifetime for neighbors in the unconfirmed state.

ipv6 neighbor stale-lifetime *stale-lifetime*

Syntax Definitions

stale-lifetime	Minimum lifetime for neighbor entries in the stale state (5–2800).

Defaults

parameter	default
stale-lifetime	10

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ipv6 neighbor stale-lifetime 1400
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 neighbors	Displays IPv6 Neighbor Table.
show ipv6 information	Displays IPv6 information.

MIB Objects

```
IPv6IfIndex
   alaIPv6NeighborTable
   alaIPv6NeighborStaleLifetime
```

ipv6 neighbor

Configures a static entry in IPv6 Neighbor Table.

ipv6 neighbor *ipv6_address hardware_address* **{***if_name***} {port** *chassis/slot/port* | **linkagg** *add_num*}
no ipv6 neighbor *ipv6_address* **{***if_name***}**

Syntax Definitions

ipv6_address	IPv6 address that corresponds to the hardware address.
hardware_address	MAC address in hex format (e.g., 00:00:39:59:F1:0C).
if_name	Name assigned to the interface on which the neighbor resides.
chassis/slot/port	The chassis ID, slot, and port number (3/1/1) for a specific port.
agg_num	A link aggregate ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to remove an entry from IPv6 Neighbor Table.

Examples

```
-> ipv6 neighbor 4132:86::203 00:d0:c0:86:12:07 Test port 1/1/1
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 neighbors	Displays IPv6 Neighbor Table.

MIB Objects

```
IPv6IfIndex
alaIPv6NeighborTable
   alaIPv6NeighborNetAddress
   alaIPv6NeighborPhysAddress
   alaIPv6NeighborSlot
   alaIPv6NeighborPort
   alaIPv6NeighborRowStatus
   alaIPv6NeighborStaleLifetime
```

ipv6 neighbor limit

Configures the system-wide maximum limit for the number of neighbor entries in the cache.

ipv6 neighbor limit *count*

no ipv6 neighbor limit

Syntax Definitions

count	The system-wide maximum limit for the number of neighbor entries in the cache. The valid range is from 200 to no limit. The default value is none.

Defaults

The default value is none.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to remove the cache limit.

Examples

```
-> ipv6 neighbor limit 200
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 interface	Creates an IPv6 tunnel interface.
show ipv6 information	Displays IPv6 information.

MIB Objects

```
alaIPv6NeighborTable
   alaIPv6NeighborLimit
```

ipv6 neighbor vrf-limit

Configures the maximum limit for the number of neighbor entries in a VRF's cache.

ipv6 neighbor vrf-limit *count*

no ipv6 neighbor vrf-limit

Syntax Definitions

count	The maximum limit for the number of VRF neighbor entries in the cache. The valid range is from 200 to no limit.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to remove the cache limit.

Examples

```
-> ipv6 neighbor vrf-limit 200
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 interface	Creates an IPv6 tunnel interface.
show ipv6 information	Displays IPv6 information.

MIB Objects

```
alaIPv6NeighborTable
   alaIPv6NeighborVRFLimit
```

ipv6 ra-filter

Configures the Router Advertisement (RA) filtering on IPv6 VLAN interfaces. When RA filtering is enabled on an interface, RAs received on any port or linkagg will be discarded. If one or more trusted ports or linkaggs are configured, RAs received on them will be accepted and sent on to any connected IPv6 nodes.

ipv6 ra-filter *if-name* **[trusted-port {***chassis/slot/port* **| linkagg** *agg_num***}]**

no ipv6 ra-filter *if-name* **[trusted-port {***chassis/slot/port* **| linkagg** *agg_num***}]**

Syntax Definitions

if-name	Specify the name of the interface on which RA filtering is being configured.
chassis/slot/port	The chassis ID, slot, and port number (3/1/1) for a trusted port.
agg_num	A trusted link aggregate ID number.

Defaults

By default all ports and linkaggs are untrusted.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to remove a trusted port or linkagg.

Examples

```
-> ipv6 ra-filter vlan-23
-> ipv6 ra-filter vlan-23 trusted-port 1/1/22
```

The following command returns port 1/1/22 to the untrusted state:

```
-> no ipv6 ra-filter vlan-23 trusted-port 1/1/22
```

The following command disables RA filtering on the IPv6 interface “vlan-23”:

```
-> no ipv6 ra-filter vlan-23
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 interface	Creates an IPv6 tunnel interface.
show ipv6 information	Displays IPv6 information.
show ipv6 interface	Displays IPv6 Interface Table.
show ipv6 ra-filter	Displays the RA filter configuration for an IPv6 interface.

MIB Objects

```
IPv6IfIndex
   alaIPv6InterfaceRAFilter
   alaIPv6RAFilterTrustedChassis
   alaIPv6RAFilterTrustedSlot
   alaIPv6RAFilterTrustedPort
   alaIPv6RAFilterTrustedRowStatus
```

ipv6 prefix

Configures an IPv6 prefix on an interface. Used for configuring prefixes for router advertisements.

ipv6 prefix *ipv6_address /prefix_length if_name*
[valid-lifetime *time***]**
[preferred-lifetime *time***]**
[on-link-flag {true | false}
[autonomous-flag {true | false}] *if_name*

no ipv6 prefix *ipv6_address /prefix_length if_name*

Syntax Definitions

ipv6_address	IPv6 address of the interface.
prefix_length	The number of bits that are significant in the IPv6 address (mask). (1...127).
valid-lifetime *time*	Length of time, in seconds, that this prefix will remain valid, i.e. time until deprecation. A value of 4,294,967,295 represents infinity.
preferred-lifetime *time*	Length of time, in seconds, that this prefix will remain preferred, i.e. time until deprecation. A value of 4,294,967,295 represents infinity.
on-link-flag	On-link configuration flag. When “true” this prefix can be used for on-link determination.
autonomous-flag	Autonomous address configuration flag. When “true”, indicates that this prefix can be used for autonomous address configuration (i.e., can be used to form a local interface address).
if_name	Name assigned to the interface.

Defaults

parameter	default
valid-lifetime *time*	2,592,000
preferred-lifetime *time*	604,800
on-link-flag	true
autonomous-flag	true

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to delete a prefix.

Examples

```
-> ipv6 prefix 4132:86::/64 Test
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 prefixes	Displays IPv6 prefixes used in router advertisements.

MIB Objects

```
IPv6IfIndex

   alaIP6vInterfacePrefixonLinkFlag
   alaIP6vInterfacePrefixAutonomousFlag
   alaIP6vInterfacePrefixRowStatus
```

ipv6 static-route

Creates/deletes an IPv6 static route. Static routes are user-defined; they carry a higher priority than routes created by dynamic routing protocols. That is, static routes always have priority over dynamic routes, regardless of the metric value.

ipv6 static-route *ipv6_prefix/prefix_length* **gateway** *ipv6_address* **[***if_name***] [metric** *metric***]**

no ipv6 static-route *ipv6_prefix/prefix_length* **gateway** *ipv6_address* **[***if_name***]**

Syntax Definitions

ipv6_prefix	IPv6 network that is the destination of this static route.
prefix_length	The number of bits (0...128) that are significant in the iPv6 address (mask).
gateway *ipv6_address*	IPv6 address of the next hop used to reach the destination IPv6 address.
if_name	If the next hop is a link-local address, the name of the interface used to reach it.
metric	Metric or cost (hop count) for the static route. You can set a priority for the static route by assigning a metric value. The lower the metric value, the higher the priority. Valid range is 1–15.

Defaults

parameter	default
metric	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to remove a static route.

Examples

```
-> ipv6 static-route 212:95:5::/64 gateway fe80::2d0:95ff:fe6a:f458 v6if-137 metric 3
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 routes	Displays IPv6 Forwarding Table.
show ipv6 router database	Displays a list of all routes (static and dynamic) that exist in the IPv6 router database.

MIB Objects

```
alaIprmv6StaticRouteTable
   alaIprmv6StaticRouteDest
   alaIprmv6StaticRoutePrefixLength
   alaIprmv6StaticRouteNextHop
   alaIprmv6StaticRouteIfIndex
   alaIprmv6StaticRouteMetric
   alaIprmv6StaticRouteRowStatus
```

ipv6 route-pref

Configures the route preference of a router.

ipv6 route-pref {static | ospf | rip | ebgp | ibgp} *value*

Syntax Definitions

static	Configures the route preference of static routes.
ospf	Configures the route preference of OSPF3 routes.
rip	Configures the route preference of RIPng routes.
ebgp	Configures the route preference of external BGP routes.
ibgp	Configures the route preference of internal BGP routes.
value	Route preference value.

Defaults

parameter	default
static *value*	2
ospf *value*	110
rip *value*	120
ebgp *value*	190
ibgp *value*	200

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Route preference of local routes cannot be changed.
- The valid route preference range is 1–255.
- The IPv6 version of BGP is not supported in the current release.

Examples

```
-> ipv6 route-pref ospf 20
-> ipv6 route-pref rip 60
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 route-pref	Displays the configured route preference of a router.

MIB Objects

```
alaIprmRtPrefTable
   alaIprmRtPrefLocal
   alaIprmRtPrefStatic
   alaIprmRtPrefOspf
   alaIprmRtPrefRip
   alaIprmRtPrefEbgp
   alaIprmRtPrefIbgp
```

ipv6 virtual-source-mac

Configures the source MAC to be used for packets being sent from a VRRP instance.

ipv6 virtual-source-mac {on | off }

Syntax Definitions

on	The switch will use the VRRP virtual MAC address for all packets.
off	The switch will use the physical MAC address for all packets except VRRP advertisements.

Defaults

parameter	default
virtual-source-mac	off

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to change which MAC address the switch will use as the source MAC when sending packets from a VRRP instance.
- This command has no affect on VRRP advertisements, the VRRP virtual MAC will always be used.

Examples

```
-> ipv6 virtual-source-mac on
-> ipv6 virtual-source-mac off
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 route-pref	Displays the configured route preference of a router.

MIB Objects

N/A

ping6

Tests whether an IPv6 destination can be reached from the local switch. This command sends an ICMPv6 echo request to a destination and then waits for a reply. To ping a destination, enter the **ping6** command and enter either the destination's IPv6 address or hostname. The switch will ping the destination using the default frame count, packet size, and interval (6 frames, 64 bytes, and 1 second respectively). You can also customize any or all of these parameters as described below.

ping6 {*ipv6_address* | *hostname***}** [*if_name*] **[count** *count***] [size** *data_size***] [interval** *seconds***]**

Syntax Definitions

ipv6_prefix	IP address of the system to ping.
hostname	DNS name of the system to ping.
if_name	If the target is a link-local address, the name of the interface used to reach it.
count	Number of packets to be transmitted.
size	Size of the data portion of the packet sent for this ping, in bytes.
seconds	Interval, in seconds, at which ping packets are transmitted.

Defaults

parameter	default
count	6
size	8
interval *seconds*	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If you change the default values, they will only apply to the current ping. The next time you use the ping command, the default values will be used unless you again enter different values.
- When the next hop address is a local link address, the name of the interface used to reach the destination must be specified.

Examples

```
-> ping6 2001:db8:302::44
-> ping6 fe80::2d0:95ff:fe6a:f458 vlanif-23
```

Release History

Release 8.1.1; command introduced.

Related Commands

traceroute6	Finds the path taken by an IPv6 packet from the local switch to a specified destination.

MIB Objects

N/A

traceroute6

Finds the path taken by an IPv6 packet from the local switch to a specified destination. This command displays the individual hops to the destination as well as some timing information.

traceroute6 {*ipv6_address* | *hostname*} [*if_name*] **[max-hop** *hop_count***] [dest-port** *port_number***] [probe-count** *probe***] [size** *size***] [host-names** {*yes*|*no*}**]**

Syntax Definitions

ipv6_address	Destination IPv6 address. IPv6 address of the host whose route you want to trace.
hostname	DNS name of the host whose route you want to trace.
if_name	If the target is a link-local address, the name of the interface used to reach it.
hop_count	Maximum hop count for the trace.
port	Specific UDP port destination. By default, the destination port is chosen by traceroute6.
size	The initial size for the probe packets. During the trace the packet size will be adjusted downward as path MTU information is received. The default and maximum value is 24,000 bytes with a minimum of 1,280 bytes.
host-names	Specify whether each hop should be shown as an IPv6 address or the host name corresponding to the address.
probe	Number of probes to be sent to a single hop.

Defaults

parameter	default
hop_count	32
probe	3
host-names	no

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When using this command, you must enter the name of the destination as part of the command line (either the IPv6 address or hostname).
- Use the optional **max-hop** parameter to set a maximum hop count to the destination. If the trace reaches this maximum hop count without reaching the destination, the trace stops.

Examples

```
-> traceroute6 41EA:103::65C3
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 virtual-source-mac	Tests whether an IPv6 destination can be reached from the local switch.

MIB Objects

N/A

show ipv6 icmp statistics

Displays IPv6 ICMP statistics.

show ipv6 icmp statistics [*if_name*]

Syntax Definitions

if_name	Destination IPv6 address. IPv6 address of the host whose route you want to trace.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the ICMP table to monitor and troubleshoot the switch.

Examples

```
-> show ipv6 icmp statistics
Message                          Current    Previous   Change
-------------------------------+----------+----------+----------
Received Total                         857          0         857
  Errors                                 0          0           0

output definitions

Total	Total number of ICMPv6 messages the switch received or attempted to send.
Errors	Number of ICMPv6 messages the switch sent or received but was unable to process because of ICMPv6-specific errors (bad checksums, bad length, etc.).
Destination Unreachable	Number of Destination Unreachable messages that were sent or received by the switch.
Packet Too Big	Number of Packet Too Big messages sent or received by the switch.
Administratively Prohibited	Number of Destination Unreachable/Communication Administratively Prohibited messages sent or received by the switch.
Time Exceeded	Number of Time Exceeded messages sent or received by the switch.
Parameter Problems	Number of Parameter Problem messages sent or received by the switch.
Echo Requests	Number of Echo Request messages sent or received by the switch.
Echo Replies	Number of Echo Reply messages sent or received by the switch.
Group Membership Queries	Number of Group Membership Queries sent or received by the switch.
Group Membership Responses	Number of Group Membership Responses sent or received by the switch.
Group Membership Reductions	Number of Group Membership Reductions sent or received by the switch.
Router Solicitations	Number of Router Solicitations sent or received by the switch.
Router Advertisements	Number of Router Advertisements sent or received by the switch.
Neighbor Solicitations	Number of Neighbor Solicitations sent or received by the switch.
Neighbor Advertisements	Number of Neighbor Advertisements sent or received by the switch.
Redirects	Number of Redirect messages sent or received by the switch.

show ipv6 interface

Displays IPv6 Interface Table.

show ipv6 interface [*if_name* | **loopback**]

Syntax Definitions

if_name	Interface name. Limits the display to a specific interface.
loopback	Limits display to loopback interfaces.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If you do not specify an interface name, all IPv6 interfaces are displayed.
- Specify an interface name (e.g., VLAN 12) to obtain a more detailed information about a specific interface.

Examples

```
-> show ipv6 interface

Name                 IPv6 Address/Prefix Length               Status    Device
---------------------+----------------------------------------+---------+--------
smbif-5              fe80::2d0:95ff:fe12:f470/64              Active    VLAN 955
                     212:95:5::35/64
                     212:95:5::/64
v6if-to-eagle        fe80::2d0:95ff:fe12:f470/64              Disabled  VLAN 1002
                     195:35::35/64
                     195:35::/64
tunnel_6to4          2002:d423:2323::35/64                    Active    6to4 Tunnel
                     2002:d423:2323::/64

                     137:35:35::35/64
                     137:35:35::/64                           Active    loopback
loopback             ::1/128                                  Active    Loopback
```

output definitions

Name	Interface name. This is usually the VLAN on which the interface is configured.
IPv6 Address/Prefix Length	IPv6 address and prefix length assigned to the interface. If an interface has more than one IPv6 address assigned to it, each address is shown on a separate line.
Status	Interface status (e.g., Active/Inactive).
Device	The device on which the interface is configured (e.g., VLAN 955).

```
-> show ipv6 interface tunnel_6to4
tunnel_6to4
  IPv6 interface index          = 16777216(0x
  Administrative status         = Disabled
  Operational status            = Inactive
  Link-local address(es):
  Global unicast address(es):
  Anycast address(es):
  VRRP address(es):
  Joined group addresses:
    ff02::1
  Maximum Transfer Unit (MTU)   = 1280
  Neighbor reachable time (sec) = 465
  Base reachable time (sec)     = 360
  Retransmit timer (ms)         = 1000
  Retransmit backoff            = 1
  Retransmit max                = 3
  DAD transmits                 = 1
  Send Router Advertisements    = No
  Maximum RA interval (sec)     = 600
  Minimum RA interval (sec)     = 198
  RA managed config flag        = False
  RA other config flag          = False
  RA reachable time (ms)        = 0
  RA retransmit timer (ms)      = 0
  RA default lifetime (sec)     = 1800
  RA hop limit                  = 64
  RA send MTU option            = No
  RA clock skew (sec)           = 600
  RA filtering                  = Disabled
  Neighbor cache limit          = 100
  Local Proxy ND                = Disabled
```

output definitions

IPv6 interface index	IPv6IfIndex value that should be used in SNMP requests pertaining to this interface.
Administrative status	Administrative status of this interface (Enabled/Disabled).
Operational status	Indicates whether the physical interface is connected to a device (Active/Inactive).
Link-local address	Link-local address assigned to the interface.
Global unicast address(es)	Global unicast address(es) assigned to the interface.
Anycast address(es)	The anycast addresses assigned to the interface.
VRRP address(es)	Addresses assigned to the interface because a VRRP virtual router is active. If (accept) is present, the switch will accept packets destined to the address. If not present, any such packets will be discarded.
Joined group address(es)	Addresses of the multicast groups that this interface has joined.
Maximum Transfer Unit	Interface MTU value.
Neighbor reachable time (sec)	The amount of time that a neighbor reached through this interface will remain in the reachable state.
Base reachable time (sec)	The base reachable time used to calculate the current neighbor reachable time.

output definitions (continued)

Retransmit timer (ms)	The interval at which neighbor solicitations will be retransmitted during the neighbor discovery process.
Retransmit backoff	The NUD exponential backoff base value.
Retransmit max	The maximum number of neighbor solicitations to be sent during ND/ NUD.
DAD transmits	The number of neighbor solicitations that will be sent as part of the Duplicate Address Detection process.
Send Router Advertisements	Indicates if the router sends periodic router advertisements and responds to router solicitations on the interface.
Maximum RA interval (sec)	Maximum time between the transmission of unsolicited router advertisements over the interface.
Minimum RA interval (sec)	Minimum time between the transmission of unsolicited router advertisements over the interface (0.33 * Maximum RA Interval).
RA managed config flag	True/False value in the managed address configuration flag field in router advertisements.
RA other config flag	The True/False value in the other stateful configuration flag field in router advertisements sent over this interface.
RA reachable time (ms)	Value placed in the reachable time field in the router advertisements sent over this interface.
RA retransmit timer (ms)	Value placed in the retransmit timer field in router advertisements sent over this interface.
RA default lifetime (sec)	The value placed in the router lifetime field in the router advertisements sent over this interface.
RA hop limit	The value placed in the current hop limit field in the router advertisements sent over this interface.
RA Send MTU option	Specifies whether the MTU option is included in the router advertisements sent over this interface.
RA clock skew (sec)	The clock skew allowed for router advertisements on this interface.
RA filtering	Specifies if RA filtering is enabled or disabled on the interface.
Neighbor cache limit	The interface's neighbor cache limit. “none” if value not set.
Local Proxy ND	Specifies if Local Proxy Neighbor Discovery is enabled or disabled on the interface.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 address	Configures an IPv6 address on a VLAN, configured tunnel, or a 6to4 tunnel.
ipv6 interface	Configures an IPv6 interface on a VLAN.
ipv6 interface tunnel source destination	Configures the Router Advertisement (RA) filtering on IPv6 VLAN interfaces. When RA filtering is enabled, by default it is enabled on all the ports and linkaggs and any RAs received on them will be discarded. The command also allows to configure the trusted ports and linkaggs to receive RAs.

show ipv6 ra-filter

Displays the RA filter configuration for an IPv6 interface.

show ipv6 ra-filter *if-name*

Syntax Definitions

if_name	IPV6 interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 ra-filter vlan-23

RA Filtering: Enabled
Trusted ports:
  1/1/22
  linkagg 7
```

output definitions

RA Filtering	Indicates if RA filtering is enabled or disabled on the interface.
Trusted ports	Shows the RA filtering trusted ports on the interface. “none” will be displayed if there are no trusted ports. Ports are displayed as chassis/slot/port (chassis will only be present when running in a virtual chassis configuration). Linkaggs are displayed as linkagg id.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 interface tunnel source destination	Configures the Router Advertisement (RA) filtering on IPv6 VLAN interfaces. When RA filtering is enabled, by default it is enabled on all the ports and linkaggs and any RAs received on them will be discarded. The command also allows to configure the trusted ports and linkaggs to receive RAs.

   alaIPv6RAFilterTrustedSlot
   alaIPv6RAFilterTrustedPort
```

show ipv6 pmtu table

Displays the IPv6 Path MTU Table.

show ipv6 pmtu table

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 pmtu table

1-PMTU Entry
PMTU entry minimum lifetime = 10m
Destination Address                                      MTU      Expires
---------------------------------------------------------+--------+-------
fe80::02d0:c0ff:fe86:1207                                1280     1h 0m
```

output definitions

Destination Address	IPv6 address of the path's destination.
MTU	Path’s MTU.
Expires	Minimum remaining lifetime for the entry.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 pmtu-lifetime	Configures the minimum lifetime for entries in the path MTU Table.

MIB Objects

```
alaIPv6ConfigTable
   alaIPv6PMTUDest
   alaIPv6PMTUexpire
```

show ipv6 neighbors

Displays IPv6 Neighbor Table.

show ipv6 neighbors [*ipv6_prefix/prefix_length* | *if_name* | **hw** *hardware_address* | **static]**

Syntax Definitions

ipv6_prefix/prefix_length	IPv6 prefix. Restricts the display to those neighbors starting with the specified prefix.
if_name	Interface name. Restricts the display to those neighbors reached through the specified interface.
hardware_address	MAC address. Restricts the display to the specified MAC address.
static	Restricts display to statically configured neighbors.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If you do not specify an option (e.g., if_name), all IPv6 neighbors are displayed.

Examples

```
-> show ipv6 neighbors
Total 2 neighbors

IPv6 Address      Hardware Address  Reachability Lifetime    Port    Interface
-----------------+-----------------+-----------+----------+-------+-------------
2001:db8:39::11   0a:3f:1e:ac:7b:38 Unconfirmed   39s       1/1/ 1    vlan-41
fe80::83f:1eff:feac:7b38 0a:3f:1e:ac:7b:38 Confirmed 8m 21s  1/1/ 1   vlan-41
```

output definitions

IPv6 Address	The neighbor's IPv6 address.
Hardware Address	The MAC address corresponding to the IPv6 address.
Reachability	The neighbor's reachability: • Incomplete • Confirmed • Unconfirmed
Lifetime	The time the entry will remain in its current state.
Port	The port used to reach the neighbor.
Interface	The neighbor's interface name (e.g., vlan_1)

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 neighbor	Configures a static entry in the IPv6 Neighbor Table.

MIB Objects

```
ipv6IfIndex
alaIPv6NeighborTable
   alaIPv6NeighborNetAddress
   alaIPv6NeighborPhysAddress
   alaIPv6NeighborSlot
   alaIPv6NeighborPort
   alaIPv6NeighborType
   alaIPv6NeighborState
```

clear ipv6 neighbors

Removes all entries, except static entries, from IPv6 Neighbor Table.

clear ipv6 neighbors

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This commands only clears dynamic entries. If static entries have been added to the table, they must be removed using the **no** form of the **ipv6 neighbor** command.

Examples

```
-> clear ipv6 neighbors
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 neighbor	Configures a static entry in IPv6 Neighbor Table.
show ipv6 neighbors	Displays IPv6 Neighbor Table.

MIB Objects

```
alaIPv6NeighborTable
   alaIPv6ClearNeighbors
```

show ipv6 prefixes

Displays IPv6 prefixes used in router advertisements.

show ipv6 prefixes

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 prefixes

Legend: Flags: A = Autonomous Address Configuration, L = OnLink

                                          Valid     Preferred
Name           IPv6 Address/Prefix Length   Lifetime   Lifetime   Flags   Source
---------------+----------------------------+----------+----------+-------+---------
vlan 955       212:95:5::/64                 2592000    604800     LA     dynamic
vlan 1002      195:35::/64                   2592000    604800     LA     dynamic
6to4tunnel     2002:d423:2323::/64           2592000    604800     LA     dynamic
tunnel 2       137:35:35::/64                2592000    604800     LA     dynamic
```

output definitions

Name	The interface name. This is usually the VLAN on which the interface is configured.
IPv6 Address/Prefix Length	The IPv6 prefix and prefix length for a Router Advertisement Prefix Option.
Valid Lifetime	Length of time, in seconds, that this prefix will remain valid (i.e., time until deprecation). A value of 4,294,967,295 represents infinity.
Preferred Lifetime	Length of time, in seconds, that this prefix will remain preferred (i.e. time until deprecation). A value of 4,294,967,295 represents infinity.
Flags	**L** - Prefix can be used for onlink determination. **A** - Prefix can be used for autonomous address configuration (i.e., can be used to form a local interface address).
Source	**config** - Prefix has been configured by management. **dynamic** - Router Advertisements are using interface prefixes.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 neighbor limit	Configures an IPv6 prefix on an interface. Used for configuring prefixes for router advertisements.

MIB Objects

```

show ipv6 routes

Displays IPv6 Forwarding Table.

show ipv6 routes [*ipv6_prefix/prefix_length* | **static]**

Syntax Definitions

ipv6_prefix/prefix_length	IPv6 prefix. Restricts the display to those routes starting with the specified prefix.
static	Restricts display to statically configured routes.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If you do not specify an option (e.g., “static”), all IPv6 interfaces are displayed.

Examples

```
-> show ipv6 routes

Legend:Flags:U = Up, G = Gateway, H = Host, S = Static, C = Cloneable, D = Dynamic,

```

output definitions

Destination Prefix	IPv6 destination address and prefix.
Gateway Address	IPv6 address of the gateway used to reach the destination network.
Interface	The device the interface is using (e.g., VLAN 6to4tunnel); or loopback.
Age	Age of the entry. Entries less than 1 day old are displayed in hh:mm:ss format. Entries more than 1 day old are displayed in dd:hh format.
Protocol	Protocol by which the route was learned.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 static-route	Configures a static entry in the IPv6 route.

MIB Objects

IPv6RouteTable
   IPv6Routes
   IPv6RoutesPrefix
   IPV6RoutesStatic
alaIPv6StaticRouteTable
   alaIPv6StaticRouteEntry
```

show ipv6 route-pref

Displays the IPv6 routing preference of the router.

show ipv6 route-pref

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The IPv6 version of BGP is not supported in the current release.

Examples

```
> show ipv6 route-pref
  Protocol    Route Preference Value
------------+-----------------------
  Local                   1
  Static                  2
  OSPF                  110
  ISISL1                115
  ISISL2                118
  RIP                   120
  EBGP                  190
  IBGP                  200
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 route-pref	Configures the IPv6 route preference of a router.

MIB Objects

N/A

show ipv6 router database

Displays a list of all routes (static and dynamic) that exist in the IPv6 router database. This database serves as a central repository where routes are first processed for redistribution and where duplicate routes are compared to determine the best route to use. If a route does not appear in the IPv6 router database list, then the switch does not know about it. In the case of dynamically learned routes, this could indicate that the route was never received by the switch.

show ipv6 router database [protocol *type* | **gateway** *ipv6_address* | **dest** *ipv6_prefix/prefix_length***]**

Syntax Definitions

type	Routing protocol type (local, static, OSPF, RIP, or BGP).
gateway *ipv6_address*	IPv6 address of the next hop used to reach the destination IPv6 address.
ipv6_prefix	IPv6 network that is the destination of this static route.
prefix_length	The number of bits that are significant in the iPv6 address (mask). (0...128).

Defaults

By default, all routes are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The IPv6 forwarding table is derived from IPv6 router database processing performed by the switch and contains only unique routes that the switch currently uses. Use the **show ipv6 routes** command to view the forwarding table.
- If an expected route does not appear in the IPv6 forwarding table, use the **show ipv6 router database** command to see if the switch knows about the route and/or if a duplicate route with a higher precedence was selected instead.
- The switch compares the protocol of duplicate routes to determine which one to use. Regardless of whether or not a route has a higher priority metric value, protocol determines precedence. Local routes are given the highest level of precedence followed by static, OSFP, RIP, then BGP routes. As a result, a route that is known to the switch may not appear in the IP forwarding table if a duplicate route with a higher protocol precedence exists.
- A list of inactive static routes is also included in the **show ipv6 router database** output display. A route becomes inactive if the interface for its gateway goes down. Inactive routes are unable to get to their destination and further investigation is warranted to determine why their gateway is unavailable.
- Routes that appear as inactive are not included in the main IP router database listing. If an inactive route becomes active, however, it is removed from the inactive list and added to the active route list.

Examples

```
-> show ipv6 router database
Legend: + indicates routes in use

Total IPRM IPv6 routes: 5

Destination/Prefix  Gateway Address           Interface         Protocol  Metric
------------------+------------------------+-----------------+---------+-------
::/0               2002:d468:8a89::137       v6if-6to4-137      Static    1
137:35:35::/64     fe80::2d0:95ff:fe12:f470  v6if-tunnel-137    OSPF      2
195:35::/64        fe80::2d0:95ff:fe12:f470  v6if-to-eagle      OSPF      2
212:95:5::/64      fe80::2d0:95ff:fe12:f470  smbif-5            Local     1
2002::/16          2002:d423:2323::35        v6if-6to4-137      Local     1

Inactive Static Routes:

VLAN  Destination/Prefix   Gateway Address          Metric
-----+------------------+------------------------+-------
1510  212:95:5::/64       fe80::2d0:95ff:fe6a:f458   1
```

output definitions

Destination/Prefix	IPv6 destination address and prefix.
Gateway Address	IPv6 address of the gateway used to reach the destination network.
Interface	The device the interface is using (e.g., VLAN 6to4tunnel); or loopback.
Protocol	Protocol by which this IPv6 address was learned: LOCAL, STATIC, OSPF, RIP, BGP).
Metric	RIP metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.
VLAN	The VLAN on which the route was *learned*, not forwarded. Note that **N/A** appears in this field for static routes as they are not learned on a VLAN.

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 routes	Displays the IPv6 Forwarding Table.

MIB Objects

show ipv6 tcp connections

Displays the TCP connections over the IPV6 table.

show ipv6 tcp connections

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 tcp connections

Local Address               Port  Remote Address               Port   State
----------------------------+-----+----------------------------+-----+------
2001:0000:0200::23            23  2001:0000:0400::143          1867   established
2001:0000:0200::23          8734  2001:0000:0200::19           8735   timeWait
```

output definitions

Local Address	The local IPV6 address for the TCP connection .
Port	The local port number of the TCP connection.
Remote Address	The remote IPV6 address for the TCP connection.
Port	The remote port number of the TCP connection.
State	The state of the TCP connection.

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 tcp listeners	Displays the TCP connections over the IPV6 listeners (endpoints awaiting a connection request).

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceStatus
   alaRipngRouteTag
   alaRipngInvalidTimer
   alaRipngGarbageTimer
   alaRipngHolddownTimer

```

show ipv6 tcp listeners

Displays the TCP connections over the IPV6 listeners (endpoints awaiting a connection request).

show ipv6 tcp listeners

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 tcp listeners

Local Address                                Port
---------------------------------------------+-----
::0                                             21
::0                                             23
::0                                             80
```

output definitions

Local Address	The local IPV6 address for this TCP listener. A value of ::0 indicates that the listener will accept a connection request sent to any of the switch's addresses.
Port	The local port number on which the listener is awaiting connection requests.

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 tcp connections	Displays the TCP connections over the IPV6 table.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceStatus
   alaRipngRouteTag
   laRipngInvalidTimer
   alaRipngGarbageTimer
   alaRipngHolddownTimer
   alaRipngJitter
   alaRipngTriggeredSends
```

show ipv6 traffic

Displays IPv6 traffic statistics.

show ipv6 traffic [*if_name*]

Syntax Definitions

if_name	Interface name. Restricts the display to the specified interface instead of global statistics.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The statistics show the cumulative totals since the last time the switch was powered on, the last reset of the switch was executed or the traffic statistics were cleared using the command.

Examples

```
-> show ipv6 traffic
Message                  Current    Previous   Change
-----------------------+----------+----------+----------

  Local discards               5          0          5
  Fragmented                   0          0          0
  Fragmentation failed         0          0          0
  Fragments generated          0          0          0
  Multicast packets           34          0         34
```

output definitions

Total	Total number of input packets received, including those received in error.
Header errors	Number of input packets discarded due to errors in their IPv6 headers (e.g., version number mismatch, other format errors, hop count exceeded, and errors discovered in processing their IPv6 options).
Too big	Number of input packets that could not be forwarded because their size exceeded the link MTU of the outgoing interface.
No route	Number of input packets discarded because no route could be found to transmit them to their destination.
Address errors	Number of input packets discarded because the IPv6 address in their IPv6 header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., ::0) and unsupported addresses (e.g., addresses with unallocated prefixes).
Unknown protocol	Number of locally-addressed packets received successfully but discarded because of an unknown or unsupported protocol.
Truncated packets	Number of input packets discarded because the packet frame did not carry enough data.
Local discards	Number of input IPv6 packets for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any packets discarded while awaiting re-assembly.
Delivered to users	Total number of packets successfully delivered to IPv6 user protocols (including ICMP).
Reassembly needed	Number of IPv6 fragments received that needed to be reassembled.
Reassembly failed	Number of failures detected by the IPv6 reassembly algorithm (for whatever reason: timed out, errors, etc.).
Multicast packets	Number of multicast packets received.
Forwarded	Number of output packets that this entity received and forwarded to their final destinations.
Generated	Total number of IPv6 packets that local IPv6 user-protocols (including ICMP) supplied to IPv6 in requests for transmission. Note that this counter does not include any packets counted by the Forwarded statistic.
Local discards	Number of output IPv6 packets for which no problem was encountered to prevent their transmission to their destination, but were discarded (e.g., for lack of buffer space). Note that this counter would include packets counted by the Forwarded statistic if any such packets met this (discretionary) discard criterion.
Fragmented	Number of IPv6 packets successfully fragmented.
Fragmentation failed	Number of IPv6 packets discarded because they needed to be fragmented but could not be.
Fragments generated	Number of output packet fragments generated as a result of fragmentation.
Multicast packets	Number of multicast packets transmitted.

Release History

Release 8.1.1; command introduced.

   alaIPv6Tunnel6to4
   alaIPv6ConfigTunnelv4Source
   alaIPv6ConfigTunnelv4Dest
```

show ipv6 udp ports

Displays UDP Over IPv6 Listener Table. This table contains information about UDP/IPv6 endpoints.

show ipv6 udp ports

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Only endpoints utilizing IPv6 addresses are displayed in this table.

Examples

```
-> show ipv6 udp ports

Local Address                                Port  Interface
---------------------------------------------+-----+-------------------
::                                            521
```

output definitions

Local Address	Local IPv6 address for this UDP listener. If a UDP listener accepts packets for any IPv6 address associated with the switch, the value is ::0.
Port	Local Port number for the UDP connection.
Interface	Name of the interface the listener is using or “unknown.”

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 routes	Displays TCP Over IPv6 Connection Table.

MIB Objects

```
IPv6UdpTable
   IPv6UdpEntry
   IPv6UdpLocalAddress
   IPv6UdpLocalPort
   IPv6UdpIfIndex
```

show ipv6 information

Displays IPv6 information.

show ipv6 information

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 information
Default hop limit                       = 64
Path MTU entry minimum lifetime (min)   = 10
Neighbor stale lifetime (min)           = 10
Local Unicast Global ID                 = 70:3302:a472
Use VRRP virtual source MAC             = Off
Neighbor cache limit                    = 8000
VRF neighbor cache limit                = 8000
```

output definitions

Default hop limit	The value placed in the hop limit field in router advertisements.
Path MTU entry minimum lifetime	Minimum lifetime for entries in the path MTU.
Neighbor stale lifetime	Minimum lifetime for neighbor entries in the stale state.
Local Unicast Global ID	The default global ID value used in unique local unicast addresses.“none” if a global ID has not been configured.
VRRP virtual source MAC	If On, when a packet's source address is a VRRP virtual IPv6 address, the corresponding VRRP virtual MAC will be used as the source MAC address. If Off, the interface's real MAC will be used as the source MAC address.
Neighbor cache limit	The system-wide neighbor cache limit. “none” if the value is not set.
VRF neighbor cache limit	The neighbor cache limit in use for the VRF in which the command was executed. the value will be “none” if not set.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 neighbor	Configures a static entry in the IPv6 Neighbor Table.
ipv6 interface tunnel source destination	Configures the system-wide maximum limit for the number of neighbor entries in the cache. Setting the limit avoids the memory exhaustion denial of service attack.
ipv6 interface tunnel source destination	Configures the maximum limit for the number of VRF's neighbor entries in the cache. Setting the VRF limit ensures that any VRF does not exhaust all the space in the neighbor cache.
ipv6 interface tunnel source destination	Configures the Router Advertisement (RA) filtering on IPv6 VLAN interfaces. When RA filtering is enabled, by default it is enabled on all the ports and linkaggs and any RAs received on them will be discarded. The command also allows to configure the trusted ports and linkaggs to receive RAs.

   alaIPv6NeighborInterfaceLimitDefault
   alaIPv6NeighborVRFLimit
```

ipv6 redist

Controls the conditions for redistributing IPv6 routes between different protocols.

ipv6 redist {local | static | rip | ospf | isis | bgp} into {rip | ospf | isis | bgp} {all-routes | route-map *route_map_name***} [admin-state {enable | disable}]**

no ipv6 redist {local | static | ospf | isis | bgp} into {rip | ospf | isis | bgp} [all-routes | route-map *route_map_name***]**

Syntax Definitions

local	Redistributes local IPv6 routes.
static	Redistributes static IPv6 routes.
rip	Specifies RIP as the source or destination (into) protocol.
ospf	Specifies OSPF as the source or destination (into) protocol.
bgp	This parameter is currently not supported.
isis	This parameter is currently not supported.
all-routes	Redistributes all routes. This option does not allocate route-map resources.
route_map_name	Name of an existing route map that will control the redistribution of routes between the source and destination protocol.
enable	Enables the administrative status of the redistribution configuration.
disable	Disables the administrative status of the redistribution configuration.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a route map redistribution configuration. Note that if a route map name is not specified, all route maps associated with the redistribution configuration are removed.
- The source and destination protocols must be loaded and enabled before redistribution occurs.
- The IPv6 version of BGP is not supported in the current release.
- Use the **ip route-map** commands described in the “IP Commands” chapter of this guide to create a route map. Refer to the “Configuring IP” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about how to create a route map.

Examples

```
-> ipv6 redist rip into ospf route-map rip-to-ospf1
-> ipv6 redist rip into ospf route-map rip-to-ospf2
-> no ipv6 redist rip into ospf route-map rip-to-ospf2
-> ipv6 redist local into rip route-map local-to-rip
-> ipv6 redist local into rip route-map local-to-rip disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 redist	Displays the route map redistribution configuration.

MIB Objects

```
alaRouteMapRedistProtoTable
   alaRouteMapRedistSrcProtoId
   alaRouteMapRedistDestProtoId
   alaRouteMapRedistRouteMapIndex
   alaRouteMapRedistStatus
   alaRouteMapRedistAddressType
   alaRouteMapRedistRowStatus
```

ipv6 access-list

Creates an IPv6 access list that is used to specify multiple IPv6 addresses for a route map configuration.

ipv6 access-list *access-list-name*

no ipv6 access-list *access-list-name*

Syntax Definitions

access-list-name	Name of the IPv6 access list (up to 20 characters).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to delete the access list.

Examples

```
-> ipv6 access-list access1
-> no ipv6 access-list access1
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 access-list address	Adds IPv6 addresses to an existing IPv6 access list.
show ipv6 access-list	Displays the contents of an IPv6 access list.

MIB Objects

```
alaRouteMapAccessListNameTable
   alaRouteMapAccessListName
   alaRouteMapAccessListNameIndex
   alaRouteMapAccessListNameAddressType
   alaRouteMapAccessListNameRowStatus
```

ipv6 access-list address

Adds IPv6 addresses to the specified IPv6 access list.

ipv6 access-list *access-list-name* **address** *address/prefixLen* **[action {permit | deny}] [redist-control {all-subnets | no-subnets | aggregate}]**

no ipv6 access-list *access-list-name* **address** *address/prefixLen*

Syntax Definitions

access-list-name	Name of the IPv6 access list (up to 20 characters).
address/prefixLen	IPv6 address along with the prefix length to be added to the access list.
permit	Permits the IPv6 address for redistribution.
deny	Denies the IPv6 address for redistribution.
all-subnets	Redistributes or denies all the subnet routes that match the network portion of the IP address as specified by the mask length.
no-subnets	Redistributes or denies only those routes that exactly match the IP address and the mask length.
aggregate	Redistributes an aggregate route if there are one or more routes that match or are subnets of this address.

Defaults

parameter	default
permit | deny	**permit**
all-subnets | no-subnets | aggregate	**all-subnets**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the address from the access list.
- The *access-list-name* should exist before you add multiple IPv6 addresses to the IPv6 access list.
- The **action** parameters (**permit** and **deny**) determine if a route that matches the **redist-control** configuration for the IP address is allowed or denied redistribution.
- The **redist-control** parameters (**all-subnets, no-subnets**, and **aggregate**) defines the criteria used to determine if a route matches an address in the access list.
- Note that configuring the combination of **redist-control aggregate** with **action deny** is not allowed.
- Use this command multiple times with the same access list name to add multiple addresses to the existing IPv6 access list.

Examples

```
-> ipv6 access-list access1 address 2001::1/64 action permit
-> ipv6 access-list access1 address 2001::1/64 redist-control aggregate
-> no ipv6 access-list access1 address 2001::1/64
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 access-list	Creates an IPv6 access list that is used to specify multiple IPv6 addresses for a route map configuration.
show ipv6 access-list	Displays the contents of an IPv6 access list.

MIB Objects

```
alaRouteMapAccessListTable
   alaRouteMapAccessListIndex
   alaRouteMapAccessListAddress
   alaRouteMapAccessListAddressType
   alaRouteMapAccessListPrefixLength
   alaRouteMapAccessListAction
   alaRouteMapAccessListRedistControl
   alaRouteMapAccessListRowStatus
```

show ipv6 redist

Displays the IPv6 route map redistribution configuration.

show ipv6 redist [rip | ospf | bgp]

Syntax Definitions

rip	Displays the route map redistribution configurations that specify RIP as the destination (into) protocol.
ospf	Displays the route map redistribution configurations that specify OSPF as the destination (into) protocol.
bgp	This parameter is not supported.

Defaults

By default all route map redistribution configurations are shown.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Specify a destination protocol with this command to display only those configurations that redistribute routes into the specified protocol.
- The IPv6 version of BGP is not supported in the current release.

Release History

Release 8.1.1; command introduced.

Examples

```
-> show ipv6 redist

Source       Destination
Protocol     Protocol     Status    Route Map
-------------+------------+---------+--------------------
localIPv6    RIPng        Enabled   ipv6rm
RIPng        OSPFv3       Enabled   ipv6rm

-> show ipv6 redist ospf

Source       Destination
Protocol     Protocol     Status    Route Map
-------------+------------+---------+--------------------
RIPng        OSPFv3       Enabled   ipv6rm
```

output definitions

Source Protocol	The protocol from which the routes are learned.
Destination Protocol	The protocol into which the source protocol routes are redistributed.
Status	The administrative status (**Enabled** or **Disabled**) of the route map redistribution configuration.
Route Map	The name of the route map that is applied with this redistribution configuration.

Related Commands

ipv6 redist	Controls the conditions for redistributing IPv6 routes between different protocols.

MIB Objects

```
alaRouteMapRedistProtoTable
   alaRouteMapRedistSrcProtoId
   alaRouteMapRedistDestProtoId
   alaRouteMapRedistRouteMapIndex
   alaRouteMapRedistStatus
   alaRouteMapRedistAddressType
   alaRouteMapRedistRowStatus
```

show ipv6 access-list

Displays the contents of the specified IPv6 access list.

show ip access-list [*access-list-name***]**

Syntax Definitions

access-list-name	Name of the IPv6 access list.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If the *access-list-name* is not specified in this command, all the access lists will be displayed.

Examples

```
-> show ipv6 access-list
                    Address /                   Redistribution
Name                Prefix Length      Effect   Control
--------------------+------------------+-------+-------------
al_3                128::/64           permit   all-subnets
al_4                124::/64           permit   no-subnets

-> show ipv6 access-list 4

                    Address /                   Redistribution
Name                Prefix Length      Effect   Control
--------------------+------------------+-------+-------------
al_4                124::/64           permit   no-subnets
```

output definitions

Name	Name of the IPv6 access list.
Address/Prefix Length	IPv6 address that belongs to the access list.
Effect	Indicates whether the IPv6 address is permitted or denied for redistribution.
Redistribution Control	Indicates the conditions specified for redistributing the matched routes.

Release History

Release 8.1.1; command introduced

Related Commands

ipv6 access-list	Creates an IPv6 access list for adding multiple IPv6 addresses to route maps.
ipv6 access-list address	Adds multiple IPv6 addresses to the IPv6 access list.

MIB objects

```
alaRouteMapAccessListIndex
   alaRouteMapAccessListAddressType
   alaRouteMapAccessListAddress
   alaRouteMapAccessListPrefixLength
   alaRouteMapAccessListAction
   alaRouteMapAccessListRedistControl
```

ipv6 load rip

Loads RIPng into memory. When the switch is initially configured, you must load RIPng into memory to enable RIPng routing.

ipv6 load rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **ipv6 rip admin-state** command to enable RIPng on the switch.

Examples

```
-> ipv6 load rip
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 rip admin-state	Enables/disables RIPng routing on the switch.
show ipv6 rip	Displays RIPng status and general configuration parameters.

MIB Objects

```
alaDrcTmConfig
   alaDrcTmIPRipngStatus
```

ipv6 rip admin-state

Enables or disables RIPng on the switch.

ipv6 rip admin-state {enable | disable}

Syntax Definitions

N/A

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

RIPng must be loaded on the switch (**ipv6 load rip**) to enable RIP on the switch.

Examples

```
-> ipv6 rip admin-state enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 load rip	Loads RIPng into memory.
show ipv6 rip	Displays RIPng status and general configuration parameters.

MIB Objects

```
alaProtocolripng
   alaRipngProtoStatus
```

ipv6 rip invalid-timer

Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.

ipv6 rip invalid-timer *seconds*

Syntax Definitions

seconds	Time, in seconds, that a route will remain in an “Active” state. Valid range is 1 - 300.

Defaults

parameter	default
seconds	180

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This timer is reset each time a routing update is received.

Examples

```
-> ipv6 rip invalid-timer 300
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 rip garbage-timer	Configures the RIPng garbage timer value.
ipv6 rip holddown-timer	Configures the amount of time a route is placed in a holddown state.

MIB Objects

```
alaProtocolripng
   alaRipngInvalidTimer
```

ipv6 rip garbage-timer

Configures the RIPng garbage timer value. When a route in the RIB exceeds the configured Invalid Timer Value, the route is moved to a “Garbage” state in the the RIB. The garbage timer is the length of time a route will stay in this state before it is flushed from the RIB.

ipv6 rip garbage-timer *seconds*

Syntax Definitions

seconds	Time, in seconds, that a route will remain in the RIPng Routing Table before it is flushed from the RIB. Valid range is 0 - 180.

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **ipv6 rip invalid-timer** command to set the Invalid Timer Value.

Examples

```
-> ipv6 rip garbage-timer 180
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 rip invalid-timer	Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.
ipv6 rip holddown-timer	Configures the amount of time a route is placed in a holddown state.

MIB Objects

```
alaProtocolripng
   alaRipngGarbageTimer
```

ipv6 rip holddown-timer

Configures the amount of time a route is placed in a holddown state. Whenever a route is seen from the same gateway with a higher metric than the route in RIB, the route goes into holddown. This excludes route updates with an INFINITY metric.

ipv6 rip holddown-timer *seconds*

Syntax Definitions

seconds	Time, in seconds, that a route will remain in a holddown state. Valid range is 0 - 120.

Defaults

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

While in holddown, the route continues being announced as usual and used in RIB. This interval is used to control route flap dampening.

Examples

```
-> ipv6 rip holddown-timer 60
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 rip invalid-timer	Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.
ipv6 rip garbage-timer	Configures the RIPng garbage timer value.

MIB Objects

```
alaProtocolripng
   alaRipngHolddownTimer
```

ipv6 rip jitter

Configures an offset value for RIPng updates. This is the maximum (positive or negative) value that can be used to offset the update interval. For example, with an update interval of 30 seconds, and a jitter value of 5 seconds, the RIPng update packet would be sent somewhere (random) between 25 and 35 seconds from the previous update.

ipv6 rip jitter *value*

Syntax Definitions

value	Time, in seconds, that a routing update is offset. Valid range is 0 to one-half the updated interval value (e.g., if the updated interval is 30, the range would be 0 - 300).

Defaults

parameter	default
value	5

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

As you increase the number of RIPng interfaces/peers, it is recommended that you increase the Jitter value to reduce the number of RIPng updates being sent over the network.

Examples

```
-> ipv6 rip jitter 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 rip update-interval	Configures the RIPng update interval.
show ipv6 rip	Displays RIPng status and general configuration information.

MIB Objects

```
alaProtocolripng
   alaRipngJitter
```

ipv6 rip route-tag

Configures the route tag value for RIP routes generated by the switch.

ipv6 rip route-tag *value*

Syntax Definitions

value	Route tag value. Valid range is 0 – 65535.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This value does not apply to routes learned from other routers. For these routes, the route tag propagates with the route.

Examples

```
-> ipv6 rip route-tag 30
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 rip	Displays RIPng status and general configuration information.

MIB Objects

```
alaProtocolripng
   alaRipngRouteTag
```

ipv6 rip update-interval

Configures the RIPng update interval. This is the interval, in seconds, that RIPng routing updates will be sent out.

ipv6 rip update-interval *seconds*

Syntax Definitions

seconds	Interval, in seconds, that RIPng routing updates are sent out. Valid range is 0–120.

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command, along with the **ipv6 rip jitter** command to configure RIPng updates.

Examples

```
-> ipv6 rip update-interval 30
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 rip jitter	Configures an offset value for RIPng updates.
show ipv6 rip	Displays RIPng status and general configuration information.

MIB Objects

```
alaRipng
   alaRipngUpdateInterval
```

ipv6 rip triggered-sends

Configures the behavior of triggered updates.

ipv6 rip triggered-sends {all | updated-only | none}

Syntax Definitions

updated-only	Only route changes that are causing the triggered update are included in the update packets.
none	RIPng routes are not added to triggered updates.

Defaults

parameter	default
all | updated-only | none	**updated-only**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If set to **all**, all routes are sent in the update, not just route changes, which increases RIPng traffic on the network.
- If set to **none**, no triggered updates are sent, which can cause delays in network convergence.

Examples

```
-> ipv6 rip triggered-sends none
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 rip	Displays RIPng status and general configuration information.

MIB Objects

```
alaProtocolripng
   alaRipngTriggeredSends
```

ipv6 rip interface

Creates or deletes a RIPng interface.

ipv6 rip interface *if_name*

[no] ipv6 rip interface *if_name*

Syntax Definitions

if_name	IPv6 interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- By default, a RIPng interface is created in the enabled state.
- Routing is enabled on a VLAN when you create a router port. However, to enable RIPng routing, you must also configure and enable a RIPng routing interface on the VLAN's IP router port. For more information on VLANs and router ports, see Chapter 5, "VLAN Management Commands".
- RIPng will support a maximum of 20 interfaces.

Examples

```
-> ipv6 rip interface Test_Lab
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 redist	Loads RIPng into memory.
ipv6 rip admin-state	Enables or disables RIPng on the switch.
ipv6 rip interface recv-status	Configures IPv6 RIPng interface “Receive” status. When this status is set to "enable", packets can be received on this interface.
ipv6 rip interface send-status	Configures IPv6 RIPng interface “Send” status. When this status is set to "enable", packets can be sent on this interface.
show ipv6 rip interface	Displays information for all or specified RIPng interfaces.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceStatus
```

ipv6 rip interface metric

Configures the RIPng metric or cost for a specified interface. You can set priorities for routes generated by a switch by assigning a metric value to routes generated by that switch's RIPng interface. For example, routes generated by a neighboring switch may have a hop count of 1. However, you can lower the priority of routes generated by that switch by increasing the metric value for routes generated by the RIPng interface.

ipv6 rip interface *if_name* **metric** *value*

Syntax Definitions

if_name	IPv6 interface name.
value	Metric value. Valid range is 1 - 15.

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When you configure a metric for a RIPng interface, this metric cost is added to the metric of the incoming route.

Examples

```
-> ipv6 rip Test_Lab metric 1
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 rip interface	Creates or deletes a RIPng interface.
show ipv6 rip interface	Displays information for all or specified RIPng interfaces.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceMetric
```

ipv6 rip interface recv-status

Configures IPv6 RIPng interface “Receive” status. When this status is set to "enable", packets can be received on this interface. When it is set to "disable", packets will not be received on this interface.

ipv6 rip interface *if_name* **recv-status {enable | disable}**

Syntax Definitions

if_name	IPv6 interface name.
enable	Enables the “Receive” status for the specified interface.
disable	Disables the “Receive” status for the specified interface.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

RIPng must be loaded (**ipv6 load rip**) and enabled (**ipv6 rip admin-state**) on the switch to send or receive packets on the interface.

Examples

```
-> ipv6 rip interface Test_Lab recv-status disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 redist	Loads RIPng into memory.
ipv6 rip admin-state	Enables/disables RIPng on the switch.
ipv6 rip interface send-status	Configures IPv6 RIPng interface “Send” status.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceRecvStatus
```

ipv6 rip interface send-status

Configures IPv6 RIPng interface “Send” status. When this status is enabled, packets can be sent from this interface. When it is disabled, packets will not be sent from this interface.

ipv6 rip interface *if_name* **send-status {enable | disable}**

Syntax Definitions

if_name	IPv6 interface name.
enable	Enables the “Send” status for the specified interface.
disable	Disables the “Send” status for the specified interface.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

RIPng must be loaded (**ipv6 load rip**) and enabled (**ipv6 rip admin-state**)on the switch to send or receive packets on the interface.

Examples

```
-> ipv6 rip interface Test_Lab send-status enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 redist	Loads RIPng into memory.
ipv6 rip admin-state	Enables/disables RIPng on the switch.
ipv6 rip interface recv-status	Configures IPv6 RIPng interface “Receive” status.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceSendStatus
```

ipv6 rip interface horizon

Configures the routing loop prevention mechanisms.

ipv6 rip interface *if_name* **horizon {none | split-only | poison}**

Syntax Definitions

if_name	IPv6 interface name.
none	Disables loop prevention mechanisms.
split-only	Enables split-horizon, without poison-reverse.
poison	Enables split-horizon with poison-reverse.

Defaults

parameter	default
none | split-only | poison	**poison**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If set to **none** the route is not sent back to the peer.
- If set to **split-only**, the route received from the peer is sent back with an increased metric.
- If set to **poison** the route received from the peer is sent back with an “infinity” metric.

Examples

```
-> ipv6 rip interface Test_Lab none
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 rip interface	Displays information for all or specified RIPng interfaces.
show ipv6 rip routes	Displays all or a specific set of routes in the RIPng Routing Table.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceHorizon
```

show ipv6 rip

Displays the RIPng status and general configuration parameters.

show ipv6 rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 rip

Status              = Enabled,
Number of routes    = 10,
Route tag           = 0,
Update interval     = 30,
Invalid interval    = 180,
Garbage interval    = 120,
Holddown interval   = 0,
Jitter interval     = 5,
Triggered Updates   = All Routes,
```

output definitions

Status	RIPng protocol status (enabled or disabled).
Number of routes	Number of RIPng routes in Forwarding Information Base (FIB).
Route tag	Route tag value for RIP routes generated by the switch. Default is 0.
Invalid interval	Invalid Timer setting, in seconds.
Garbage interval	Garbage Timer setting, in seconds.
Holddown interval	Holddown Timer setting, in seconds.
Jitter interval	Jitter setting.
Triggered updates	Triggered Updates setting (All Routes, Updated Routes, and None).

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 rip admin-state	Enables or disables RIPng routing on the switch.
ipv6 rip route-tag	Configures the route tag value for RIP routes generated by the switch.
ipv6 rip update-interval	Configures the Interval, in seconds, so that RIPng routing updates are sent out.
ipv6 rip invalid-timer	Configures the amount of time a route remains active in RIB before being moved to the "garbage" state.
ipv6 rip invalid-timer	Configures the RIPng garbage timer value. Routes move into the garbage collection state because the timer expired or a route update with an INFINITY metric was received.
ipv6 rip holddown-timer	Configures the amount of time a route is placed in a holddown state.
ipv6 rip jitter	Configures an offset value for RIPng updates. This is the maximum (positive or negative) value that can be used to offset the update interval.
ipv6 rip triggered-sends	Configures the behavior of triggered updates.

MIB Objects

```
alaRipngInterfaceTable
   alaRipngInterfaceStatus
   alaRipngRouteTag
   laRipngInvalidTimer
   alaRipngGarbageTimer
   alaRipngHolddownTimer
   alaRipngJitter
   alaRipngTriggeredSends
```

show ipv6 rip interface

Displays information for all or specified RIPng interfaces.

show ipv6 rip interface [*if_name*]

Syntax Definitions

if_name	IPv6 interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If you do not specify an interface, all IPv6 RIP interfaces are displayed.

Examples

```
-> show ipv6 rip interface

    Interface                       Packets
       Name          Status     Recvd   Sent     Metric
--------------------+----------+---------+--------+---------
Test_Lab            Active     12986     12544    1
Test_Lab_2          Active     12556     12552    1

-> show ipv6 rip interface if3

Name                           = Test_Lab,
IPv6 interface index           = 3,
Interface status               = Active,
Next Update                    = 27 secs,
Horizon Mode                   = Split and Poison-reverse,
MTU size                       = 1500,
Metric                         = 1,
Send status                    = Enabled,
Receive status                 = Enabled,
Packets received               = 12986,
Packets sent                   = 12544,
```

output definitions

Interface name	Interface name.
IPv6 interface index	IPv6 index of this interface.
Status	Interface status (Active/Inactive).
Packets Recvd	Number of packets received by the interface.

output definitions (continued)

Packets Sent	Number of packets sent by the interface.
Metric	RIPng metric (cost) configured for the interface.
IPv6 interface index	IPv6 interface index number.
Interface status	Interface status (Active/Inactive).
Next update	Seconds remaining until the next update on this interface.
Horizon mode	Interface Horizon Mode (routing loop prevention mechanisms). Displayed modes are none/split-only/poison-reverse.
MTU size	Maximum transmission size for RIPng packets on the interface.
Send status	Interface “Send” status. When this status is set to "enable", packets can be sent from this interface. When it is set to "disable", packets will not be sent from this interface.
Receive status	Interface “Receive” status. When this status is set to "enable", packets can be received by this interface. When it is set to "disable", packets cannot be received by this interface.
Packets received	Number of packets received by the interface.
Packets sent	Number of packets sent by the interface.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 rip interface	IPv6 interface name.
ipv6 rip admin-state	Enables or disables RIPng routing on the switch.
ipv6 rip interface recv-status	Configures the interface “Receive” status. When this status is set to "enable", packets can be received by this interface. When it is set to "disable", packets cannot be received by this interface.
ipv6 rip interface send-status	Configures the interface “Send” status. When this status is set to "enable", packets can be sent from this interface. When it is set to "disable", packets will not be sent from this interface.
ipv6 rip interface metric	Configures the RIPng metric (cost) for the interface.
ipv6 rip interface horizon	Configures the interface Horizon Mode (routing loop prevention mechanisms).
show ipv6 rip	Displays RIPng status and general configuration parameters (e.g., force holddown timer).

MIB Objects

```

   alaRipngInterfaceRecvStatus
```

show ipv6 rip peer

Displays a summary of the observed RIPng peers, or specific information about a peer when a peer address is provided.

show ipv6 rip peer [*ipv6_addresss*]

Syntax Definitions

ipv6_addresss	IPv6 address of the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If you do not specify a peer, all IPv6 RIP peers are displayed.

Examples

```
-> show ipv6 peer
                              Seen on       Packets   Last
Address                       Interface     Recv      Update
------------------------------+-------------+--------+----------
fe80::200:39ff:fe1f:710c      vlan172       23       20
fe80::2d0:95ff:fe12:da40      bkbone20      33       2
fe80::2d0:95ff:fe12:da40      vlan150       26       25

-> show ipv6 rip peer fe80::2d0:95ff:fe12:da40

Peer#1 address          = fe80::2d0:95ff:fe12:da40,
Seen on interface       = bkbone20,
Last Update             = 8 secs,
Received packets        = 33,
Received bad packets    = 0
Received routes         = 5,
Received bad routes     = 0

Peer#2 address          = fe80::2d0:95ff:fe12:da40,
Seen on interface       = vlan150,
Last Update             = 1 secs,
Received packets        = 27,
Received bad packets    = 0
Received routes         = 2,
Received bad routes     = 0
```

output definitions

Address	IPv6 address of the peer.
Seen on Interface	Interface used to reach the peer.
Packets Recvd	Number of packets received from the peer.
Last Update	Number of seconds since the last update was received from the peer.
Peer address	Peer IPv6 address.
Received packets	Number of packets received from the peer.
Received bad packets	Number of bad packets received from the peer.
Received routes	Number of RIPng routes received from the peer.
Received bad routes	Number of bad RIPng routes received from the peer.

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 rip interface	Displays all or specified RIPng interface status.
show ipv6 rip routes	Displays all or a specific set of routes in RIPng Routing Table.

MIB Objects

show ipv6 rip routes

Displays all or a specific set of routes in RIPng Routing Table.

show ipv6 rip routes [dest <*ipv6_prefix/prefix_length*>**] | [gateway** <*ipv6_addr*>**] | [detail** <*ipv6 prefix/prefix_length*>**]**

Syntax Definitions

dest	Displays all routes whose destination matches the IPv6 prefix/prefix length.
gateway	Displays all routes whose gateway matches the specified IPv6 address.
detail	Displays detailed information about a single route matching the specified destination.
ipv6_addr	IPv6 address.
ipv6_prefix/prefix length	IPv6 address and prefix/prefix length.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If you do not enter one of the optional parameters, all IPv6 RIP routes are displayed.

Examples

```
-> show ipv6 rip routes

Legends: State: A = Active, H = Holddown, G = Garbage
Destination     Gateway                      State    Metric Proto
--------------+----------------------------+-------+------+------
100::1/128      +fe80::200:39ff:fe1f:710c     A       2      Rip
100::100:1/128  +fe80::200:39ff:fe1f:710c     A       2      Rip
400::/100       +fe80::2d0:95ff:fe12:e050     A       1      Local
900::/100       +fe80::2d0:95ff:fe12:e050     A       1      Local
8900::/100      +fe80::2d0:95ff:fe12:da40     A       2      Rip
9800::/100      +fe80::2d0:95ff:fe12:da40     A       2      Rip
9900::/100      +fe80::2d0:95ff:fe12:e050     A       1      Local
```

```
-> show ipv6 rip routes detail 9900::/100

Destination     = 9900::,
Mask length     = 100,
Gateway(1)      = fe80::2d0:95ff:fe12:e050,
Protocol        = Local,
Out Interface   = nssa23,
Metric          = 1,
Status          = Installed,
State           = Active,
Age             = 10544s,
Tag             = 0,
Gateway(2)      = fe80::2d0:95ff:fe12:da40,
Protocol        = Rip,
Out Interface   = bkbone20,
Metric          = 2,
Status          = Not Installed,
State           = Active,
Age             = 15s,
Tag             = 0,
```

output definitions

Destination	IPv6 address/address length of the destination.
Gateway	IPv6 gateway used to reach the destination.
State	Route status (Active/Inactive).
Metric	Routing metric for this route.
Protocol	Protocol used to learn the route.
Mask Length	Prefix Length.
Out Interface	The interface used to reach the destination.
Status	Route status (Active/Inactive).
Age	The number of seconds since the route was last updated.
Tag	The route tag value for the route.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 dhcp relay admin-state

Enables or disables the DHCPv6 Relay feature on a per-VRF basis.

ipv6 dhcp relay admin-state {enable | disable}

Syntax Definitions

enable	Enables the DHCPv6 Relay feature.
disable	Disables the DHCPv6 Relay feature.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

DHCPv6 Relay must still be explicitly enabled on the interfaces from which received DHCP client messages are to be relayed.

Examples

```
-> ipv6 dhcp relay admin-state enable
-> ipv6 dhcp relay admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 dhcp relay interface admin-state	Enables or disables the relay of DHCPv6 client messages received on an interface.
show ipv6 dhcp relay	Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

MIB Objects

```
alaDHCPv6Config
   alaDHCPv6RelayAdminStatus
```

ipv6 dhcp relay interface admin-state

Enables or disables the relay of DHCPv6 client messages received on an interface.

ipv6 dhcp relay *if-name* **admin-state {enable | disable}**

Syntax Definitions

if-name	IPv6 interface name.
enable	Enables the DHCPv6 Relay on an interface.
disable	Disables the DHCPv6 Relay on an interface.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

At least one relay destination should be configured before enabling the DHCPv6 relay on an interface.

Examples

```
-> ipv6 dhcp relay int1 admin-state enable
-> ipv6 dhcp relay int1 admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 dhcp relay destination	Configures the DHCPv6 relay destination.
show ipv6 dhcp relay	Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

MIB Objects

```
alaDHCPv6RelayInterfaceTable
   alaDHCPv6RelayInterfaceAdminStatus
```

ipv6 dhcp relay destination

Configures the DHCPv6 relay destination.

ipv6 dhcp relay *if-name* **destination** *ip6-address scope-if-name*

no ipv6 dhcp relay *if-name* **destination** *ip6-address scope-if-name*

Syntax Definitions

if-name	IPv6 interface name.
ip6-address	The IPv6 address of the relay destination.
scope-if-name	Name of the interface for the local-link. This should be specified if the relay destination is a local-link.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Maximum five destinations can be configured for an interface.
- If the relay destination is a local-link then the interface-ID of the local-link should be specified.
- Use the **no** form of the command to remove the configured DHCPv6 relay destination for an interface.

Examples

```
-> ipv6 dhcp relay int1 destination 3001::3
-> ipv6 dhcp relay int1 destination fe80::64 int1
-> no ipv6 dhcp relay int1 destination 3001::3
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 dhcp relay	Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

MIB Objects

```
alaDHCPv6RelayDestinationTable
   alaDHCPv6RelayDestinationEntry
   alaDHCPv6RelayDestinationAddressType
   alaDHCPv6RelayDestinationAddress
   alaDHCPv6RelayDestinationRowStatus
```

show ipv6 dhcp relay

Displays all the interface on which the DHCPv6 relay is configured, the relay destinations, and the status of the DHCPv6 relay.

show ipv6 dhcp relay

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The interface for which the DHCPv6 relay is disabled for the VRF and which do not have relay destination configured will not be displayed in the output.

Examples

```
-> show ipv6 dhcp relay

DHCPv6 Relay: Enabled

Interface                  Relay Destination(s)                      Status
---------------------------+----------------------------------------+--------
vlan-41                    ff02::1:2                                 Enabled
vlan-103                   2001:dbc8:8003::17                        Disabled
                           2001:dbc8:8004::99
vlan-200                   fe80::cd0:deff:fe28:1ca5 vlan-201         Enabled
tunnel-2                   2001:dbc8:a23::ea77                       Enabled
```

output definitions

DHCPv6 Relay	Specifies if the DHCPv6 Relay feature is enabled in the current VRF.
Interface	Displays the interface on which DHCPv6 Relay is enabled.
Relay Destination(s)	Displays the configured DHCPv6 Relay destination(s) for the interface.
Status	Displays the status of DHCPv6 Relay on the interface.

Release History

Release 8.1.1; command introduced.

Related Commands

MIB Objects

```
alaDHCPv6RelayAdminStatus
alaDHCPv6RelayInterfaceEntry
alaDHCPv6RelayDestinationAddress
alaDHCPv6RelayInterfaceAdminStatus
```

18 IPsec commands

IPsec is a suite of protocols for securing IPv6 communications by authenticating and/or encrypting each IPv6 packet in a data stream. IPsec provides security services such as Encrypting traffic, Integrity validation, Authenticating the peers, and Anti-replay.

IPsec protocols operate at network layer using appropriate security protocols, cryptographic algorithms, and cryptographic keys. The security services are provided through use of two security protocols, the Authentication Header (AH) and the Encapsulating Security Payload (ESP), and through the use of cryptographic key management procedures and protocols.

There are two modes of IPsec operation: transport mode and tunnel mode. In transport mode, only the data you transfer (payload) in the IPv6 packet is encrypted and/or authenticated and only the payloads that are originated and destined between two intermediate systems are processed with IPsec. In tunnel mode, the entire IPv6 packet with both the data and the message headers is encrypted and/or authenticated. In tunnel mode, all the IPv6 packets that passess through the endpoints are processed by IPsec. The current implementation of IPsec supports only the transport mode.

Note. The current implementation of IPsec supports only IPv6.

The pre-configured Security Policy determines the traffic that is to be rendered with IPsec protection. A Security Association (SA) specifies the actual IPsec actions to be performed (e.g encryption using 3DES, authentication with HMAC-SHA1). A security association is bundle of algorithms and parameters (such as keys) that is being used to encrypt and authenticate a particular flow in one direction. Security Associations can be manually configured or negotiated through IKE. The current implementation of IPsec does not support the negotiation of SA through IKE and SAs need to be configured manually.

A summary of the available commands is listed here:

ipsec key
ipsec security-key
ipsec policy
ipsec policy rule
ipsec sa
show ipsec policy
show ipsec sa
show ipsec key
show ipsec ipv6 statistics

ipsec key

Adds, modifies or deletes the authentication and encryption keys for a manually configured IPsec SA.

ipsec key *name* **{sa-authentication | sa-encryption} [encrypted]** *key*

no ipsec key *name* **{sa-authentication | sa-encryption}**

Syntax Definitions

name	The name of this key (maximum 20 characters).
sa-authentication	Indicates that the key value is used for Authentication Header.
sa-encryption	Indicates that the key value is used for Encapsulated Security Payload.
encrypted	Not user configured, used only by switch in config file.
key	Specifies the key value. The key value can be either in the hexadecimal format or as a string.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The *name* parameter must be same as the name of the manually configured SA that uses this SA authentication and encryption key.
- The length of the key value must match the value that is required by the encryption or authentication algorithm that uses the key. The required key length for the supported algorithm are as follows:

algorithm	key length
3des-cbc	192 bits
aes-cbc	128, 192, or 256 bits
hmac-md5	128 bits
hmac-sha1	160 bits
aes-xcbc-mac	128

- The combination of the key's name and type must be unique.
- The **encrypted** option is used when the key commands are written to the vcboot.cfg or other snapshot file. This option can not be specified by the user when entering CLI commands.

Examples

```
-> ipsec key sa_md5_in sa-authentication takd03c9@skL68L%
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipsec sa	Adds, modifies, or deletes a manually configured IPsec Security Association (SA).
show ipsec key	Displays the keys for the manually configured IPsec SA.

MIB Objects

```
AlaIPsecKeyTable
   alaIPsecKeyName
   alaIPsecKeyType
   alaIPsecKeyEncrypted
   alaIPsecKey
```

ipsec security-key

Sets the master security key for the switch. The master security key is used to encrypt and decrypt the configured SA keys.

ipsec security-key [*old_key***]** *new_key*

Syntax Definitions

old_key	The current master security key. The key can be specified either in the hexadecimal format or as a string.
new_key	The new key value. The key can be specified either in the hexadecimal format or as a string.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The *old_key* parameter must always be specified when you modify an existing key. Setting the key for first time does not require the *old_key*.
- If the value of the *old_key* is incorrect, the attempt to set a new key fails.
- While the SA keys can be configured without a master security key; the configured SA keys are written to the configuration file unencrypted, and a warning is logged.
- The security key must be 16 characters or 16 bytes if in hex form (32 hex digits).
- If the master security key is reset using **debug clear ipsec security key** command, the currently configured SA keys are deleted.

Examples

```
-> ipsec security-key “old key value ab” 0xa38d901bde77af091a2485ce0a14a8cc
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipsec key	Adds, modifies or deletes the authentication and encryption keys for a manually configured IPsec SA.

MIB Objects

```
AlaIPsecSecurityKeyTable
   alaIPsecSecurityKeyCurrent
   alaIPsecSecurityKeyNew
```

ipsec policy

Adds, modifies, or removes a security policy.

ipsec policy *name* **[priority** *priority***] [source {***ipv6_address* **[***/prefix_length***]} [port** *port***]] [destination {***ipv6_address* **[***/prefix_length***]} [port** *port***]] [protocol {any | icmp6 [type** *type***]| tcp | udp | ospf | vrrp | number** *protocol***}] [in | out] [discard | ipsec | none] [description** *description***] [admin-state {enable | disable}]**

no ipsec policy *name*

Syntax Definitions

name	The name for the policy
priority	The priority for the policy. Values may range from 1 to 1000. The lower the value, the higher the priority.
source *ipv6_address*	Specifies the source address of the IPv6 traffic that is covered by the policy.
source */prefix_length*	Specifies the prefix length of the source address of the IPv6 traffic that is covered by the policy.
source port	Specifies the source port of the IPv6 traffic that is covered by the policy. The value 0 can be specified to match packets originated from any port.
destination *ipv6_address*	Specifies the destination address of the IPv6 traffic that is covered by the policy.
destination */prefix-length*	Specifies the prefix length of the destination address of the IPv6 traffic that is covered by the policy.
destination *port*	Specifies the destination port of the IPv6 traffic that is covered by the policy. The value 0 can be specified to match packets destined to any port.
protocol	Specifies that the particular protocol specific traffic to be covered by the policy (Refer to the table in the “Usage Guidelines“ section below for various protocol options).
in	Specifies that the policy is applied to the inbound IPv6 traffic.
out	Specifies that the policy is applied to the outbound IPv6 traffic.
discard	Specifies the policy to discard the IPv6 packet, if it matches the criteria.
ipsec	Specifies the policy to send the IPv6 packet for IPsec processing, if it matches the criteria.
none	Specifies IPsec should not process the packet.
description	The detailed description of the policy.
admin-state enable	Administratively enables the policy.
admin-state disable	Administratively disables the policy.

Defaults

parameter	default
priority	100
port	0
any | icmp6 | tcp | udp | ospf | vrrp | number	**any**
icmp6 *type*	not present
discard | ipsec | none	**ipsec**
admin-state	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If two policies can cover the same traffic, the policy with the highest priority is applied. If two policies have the same priority, the one configured first has precedence.
- The following table lists the various **protocol** options in this command:

protocol
any
icmp6[type *type***]**
tcp
udp
ospf
vrrp
number *protocol*

  The **any** option must be used to apply the policy to all protocol traffic. Otherwise, an upper-layer protocol (or protocol number) may be specified to restrict the policy to the specified protocol traffic. The optional *type* parameter of **icmp6** can also be specified to restrict the policy for certain type of ICMPv6 packets.
- If the **ipsec** option is specified this policy cannot be enabled until at least one rule has been defined. The policy rules specify that IPsec algorithms be applied to the traffic that matches the policy.

Examples

```
-> ipsec policy tcp_out source 2001:db8:3::12 destination 201:db8:4::a3e protocol
tcp out ipsec description “Outbound TCP traffic” admin-state disable
-> no ipsec policy tcp_out
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipsec policy rule	Adds, modifies, or removes an IPsec rule for a security policy.
show ipsec policy	Displays information about the security policies.

MIB Objects

```
AlaIPsecSecurityPolicyTable
   alaIPsecSecurityPolicyName
   alaIPsecSecurityPolicyPriority
   alaIPsecSecurityPolicySource
   alaIPsecSecurityPolicySourceType
   alaIPsecSecurityPolicySourcePrefixLength
   alaIPsecSecurityPolicySourcePort
   alaIPsecSecurityPolicyDestination
   alaIPsecSecurityPolicyDestinationType
   alaIPsecSecurityPolicyDestinationPrefixLength

   alaIPsecSecurityPolicyICMPv6Type
   alaIPsecSecurityPolicyDirection
   alaIPsecSecurityPolicyAction
   alaIPsecSecurityPolicyDescription
   alaIPsecSecurityPolicyAdminState
```

ipsec policy rule

Adds, modifies, or removes an IPsec rule for a security policy.

ipsec policy *name* **rule** *index* **[ah | esp]**

no ipsec policy *name*

Syntax Definitions

name	The name of the security policy created by using the **ipsec policy** command.
index	The index of this rule. Values may range from 1 to 10.
ah	Specifies that the rule requires the presence of an Authentication Header (AH).
esp	Specifies that the rule requires the presence of an Encrypted Security Payload header (ESP).

Defaults

N/A.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

You can use the *index* parameter to specify the order in which the multiple rules for the same security policy is applied to the original layload.

Examples

```
-> ipsec policy alucent rule 1 ah
-> no ipsec policy alucent
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipsec policy	Adds, modifies, or removes a security policy.

MIB Objects

```
AlaIPsecSecurityPolicyRuleTable
   alaIPsecSecurityPolicyName
   alaIPsecSecurityPolicyRuleIndex
   alaIPsecSecurityPolicyRuleProtocol
```

ipsec sa

Adds, modifies, or deletes a manually configured IPsec Security Association (SA).

ipsec sa *name* **{esp | ah} [source** *ipv6_address* **] [destination** *ipv6_address***] [spi** *spi***] [encryption {null | 3des-cbc | aes-cbc [key-size** *key_length***]}] [authentication {none | hmac-md5 | hmac-sha1 | aes-xcbc-mac}] [description** *description***] [admin-state {enable | disable}]**

no ipsec sa *name*

Syntax Definitions

name	The name assigned to this IPsec SA.
esp	Specifies the type of security association as ESP.
ah	Specifies the type of security association as AH.
source *ipv6_address*	Specifies the source address of the IPv6 traffic that is covered by the SA.
destination *ipv6_address*	Specifies the destination address of the IPv6 traffic that is covered by the SA.
spi	The Security Parameters Index (SPI) for the SA.
encryption	Specifies the encryption algorithm to be used for traffic covered by the SA. This parameter must be used only when the SA type is ESP.
key_length	key length for the specified encryption algorithm.
authentication	Specifies the authentication algorithm to be used for traffic covered by the SA.
description	The detailed description of the SA.
admin-state enable	Administratively enables the SA.
admin-state disable	Administratively disables the SA.

Defaults

parameter	Defaults
encryption	**none**
authentication	**none**
admin-state	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The **encryption** parameter must be specified with the **none** option, if **ESP** is being used to verify integrity only.

- If **null** is specified as the option for **encryption**, an integrity algorithm must be specified using the **authentication** parameter.
- To override a default key length in an **encryption** algorithm, the key length must be specified after the protocol name.The key length supported for various algorithm are as follows:

encryption algorithm	key length (in bits)
aes-cbc	128(default), 192, and 256

- For AH SAs, one of the authentication algorithms such as aes-xcbc-mac, hmac-md5 or hmac-sha1 must be specified.

Examples

```
-> ipsec sa esp_in_1 esp source 2001:db8:3::13d destination 2001:db8:1::24 spi
10392 encryption aes-cbc authentication hmac-sha1
-> no ipsec sa esp_in_1
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipsec sa	Displays information about manually configured IPsec Security Associations.

MIB Objects

```
AlaIPsecSAConfigTable
   alaIPsecSAConfigName
   alaIPsecSAConfigType

   alaIPsecSAConfigAdminState
```

show ipsec policy

Displays information about the security policies.

show ipsec policy [*name***]**

Syntax Definitions

name	The policy name.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the *name* parameter to display information about a specific security policy.

Examples

```
-> show ipsec policy
Name          Source-> Destination            Protocol  Direction  Action   State
------------+--------------------------------+--------+----------+--------+--------
ftp-in-drop   ::/0->2001:db8:3::13d              TCP         in   discard  active
telnet-in-1   2001:db8::/48->2001:db8:1::24     TCP         in     ipsec  active
telnet-out-1  2001:db8:1::24->2001:db8::/48     TCP        out    ipsec  active
```

output definitions

Name	The name of the security policy.
Source -> Destination	Indicates the source and destination of traffic covered by this policy.
Protocol	Indicates the protocol traffic covered by this policy. The protocol name (TCP) or protocol number (80) is displayed in this field.
Direction	Indicates whether the policy has been applied to the incoming or outgoing traffic.
Action	Indicates the action to be taken on the traffic covered by this policy.
State	Indicates the operational state of this policy.

```
-> show ipsec policy telnet-out-1
Name        = telnet-out-1
Source      = 2001:db8:1::24
Destination = 2001:db8::/48
Protocol    = TCP
Direction   = out
Action      = ipsec
State       = active
Rules:
  1) esp
```

```
  2) ah
Description:
  Require AH and ESP headers on outgoing telnet traffic.
```

output definitions

Name	The name of the security policy.
Source	Indicates the source of the traffic covered by this policy.
Destination	Indicates the destination of the traffic covered by this policy.
Protocol	Indicates the protocol traffic covered by this policy. The protocol name (TCP) or protocol number (80) is displayed in this field.
Direction	Indicates whether the policy has been applied to the incoming or outgoing traffic.
Action	Indicates the action to be taken on the traffic covered by this policy.
State	Indicates the operational state of this policy.
Rules	Indicates the rules specified for this policy.
Description	The description for this policy.

Release History

Release 8.1.1; command introduced.

Related Commands

ipsec policy	Adds, modifies, or removes a security policy.

MIB Objects

   alaIPsecSecurityPolicyAction
   alaIPsecSecurityPolicyOperationalState
   alaIPsecSecurityPolicyRuleIndex
   alaIPsecSecurityPolicyRuleProtocol
   alaIPsecSecurityPolicyDescription
```

show ipsec sa

Displays information about manually configured IPsec Security Associations.

show ipsec sa [*name* **| esp | ah]**

Syntax Definitions

name	The name of the Security Association.
esp	Restricts the display to ESP type SAs.
ah	Restricts the display to AH type SAs.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the *name* parameter to display the information about a specific SA.
- Use esp or ah option to display the information about their respective type SAs.

Examples

```
-> show ipsec sa
Name           Type  Source-> Destination[SPI]           State   Encryption
Authentication
--------------+----+-----------------------------------+--------+----------------
telnet-in-esp  ESP  2001:db8::/49->2001:db8:1::24        active   aes-cbc(128)
hmac-sha1
telnet-out-esp ESP 2001:db8:1::24->2001:db8::/48         active   aes-cbc(128)
hmac-sha1
```

output definitions

Name	The SA name.
Type	The SA type: AH or ESP.
Source -> Destination [SPI]	The traffic source, traffic destination, and SPI for this SA.
State	The operational state of this SA.
Encryption	The encryption algorithm used for this SA.
Authentication	The authentication algorithm in use for this SA.

```
-> show ipsec sa telnet-in-esp

Name           = telnet-in-esp
Type           = ESP
Source         = 2001:db8::/48
Destination    = 2001:db8:1::24
SPI            = 8920
Encryption     = aes-cbc(128)
Authentication = hmac-sha1

State          = active
Description:
  Security association for traffic from 2001:db8::/48 to
  2001:db8:1::24.
```

output definitions

Name	The SA name.
Type	The SA type: AH or ESP.
Source	The traffic source for this SA.
Destination	The traffic destination for this SA.
SPI	The SA's SPI.
Encryption	The encryption algorithm used for this SA.
Authentication	The authentication algorithm used for this SA.
State	The operational state of this SA.
Description	The SA's description.

Release History

Release 8.1.1; command introduced.

Related Commands

ipsec sa	Adds, modifies, or deletes a manually configured IPsec Security Association (SA).

MIB Objects

```
AlaIPsecSAConfigTable
   alaIPsecSAConfigName
   alaIPsecSAConfigType
   alaIPsecSAConfigSource
   alaIPsecSAConfigSourceType
   alaIPsecSAConfigDestination
   alaIPsecSAConfigDestinationType
   alaIPsecSAConfigSPI
   alaIPsecSAConfigOperationalState
   alaIPsecSAConfigEncryptionAlgorithm
   alaIPsecSAConfigEncryptionKeyLength
   alaIPsecSAConfigAuthenticationAlgorithm
   alaIPsecSAConfigAuthenticationKeyLength
   alaIPsecSAConfigDescription
```

show ipsec key

Displays the keys for the manually configured IPsec SA.

show ipsec key [sa-encryption | sa-authentication]

Syntax Definitions

sa-encryption	Displays the encryption keys.
sa-authentication	Displays the authentication keys.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The key values are not be displayed due to security reasons.

Examples

```
-> show ipsec key sa-encryption
Encryption Keys
Name                 Length (bits)
--------------------+-------------
sa_1                            192
sa_2                            160
sa_3                             64

-> show ipsec key sa-authentication
Authentication Keys
Name                 Length (bits)
--------------------+-------------
sa_1                            128
sa_5                            160
```

output definitions

Name	The name of the SA for which the key is used.
Length	The length of the key in bits.

Release History

Release 8.1.1; command introduced.

Related Commands

ipsec key	Adds, modifies or deletes the authentication and encryption keys for a manually configured IPsec SA.

MIB Objects

```
AlaIPsecKeyTable
   alaIPsecKeyName
   alaIPsecKey
```

show ipsec ipv6 statistics

Displays IPsec statistics.

show ipsec ipv6 statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
Inbound:
  Discarded                 = 2787
  Policy violation          = 0
  Authentication Failure    = 0
  No SA found               = 0
Outbound:
  Discarded                 = 5135
  No SA found               = 19
```

output definitions

Discarded	The number of incoming packets discarded because they matched a discard policy.
Policy violation	The number of incoming packets that don't have the IPsec protection required by a security policy.
Authentication Failure	Authentication of a packet failed.
No SA found	No SA found matching the information present in a packet.

Release History

Release 8.1.1; command introduced.

19 RIP Commands

Routing Information Protocol (RIP) is an Interior Gateway Protocol (IGP) that uses hop count as its routing metric. RIP-enabled switches update neighboring switches by transmitting a copy of their own routing table. The RIP routing table always uses the most efficient route to a destination, that is, the route with the fewest hops and longest matching prefix.

The switch supports RIP version 1 (RIPv1), RIP version 2 (RIPv2), and RIPv2 that is compatible with RIPv1. It also supports simple and MD5 authentication, on an interface basis, for RIPv2.

The RIP commands comply with the following RFCs: RFC1058, RFC2453, RFC1722, RFC1723, and RFC1724.

MIB information for the RIP commands is as follows:

Filename: RIPv2.mib
Module: rip2

Filename: AlcatelIND1Rip.mib
Module: alaRipMIB

A summary of the available commands is listed here:

ip load rip
ip rip admin-state
ip rip interface
ip rip interface admin-state
ip rip interface metric
ip rip interface send-version
ip rip interface recv-version
ip rip interface ingress-filter
ip rip interface egress-filter
ip rip force-holddowntimer
ip rip host-route
ip rip route-tag
ip rip interface auth-type
ip rip interface auth-key
ip rip update-interval
ip rip invalid-timer
ip rip garbage-timer
ip rip holddown-timer
show ip rip
show ip rip routes
show ip rip interface
show ip rip peer

ip load rip

Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.

ip load rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- In simple networks where only IP forwarding is required, you may not want to use RIP. If you are not using RIP, it is best not to load it to save switch resources.
- To remove RIP from switch memory, you must manually edit the **vcboot.cfg** file. The **vcboot.cfg** file is an ASCII text-based file that controls many of the switch parameters. Open the file and delete all references to RIP. You must reboot the switch when this is complete.
- Use the **ip rip admin-state** command to enable RIP on the switch.

Examples

```
-> ip load rip
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip rip admin-state	Enables/disables RIP routing on the switch.
show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaDrcTmConfig
   alaDrcTmIPRipStatus
```

ip rip admin-state

Enables/disables RIP on the switch. RIP performs well in small networks. By default, RIP packets are broadcast every 30 seconds, even if no change has occurred anywhere in a route or service. Depending on the size and speed of the network, these periodic broadcasts can consume a significant amount of bandwidth.

ip rip admin-state {enable | disable}

Syntax Definitions

enable	Enables RIP routing on the switch.
disable	Disables RIP routing on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- RIP must be loaded on the switch (**ip load rip**) to enable RIP on the switch.
- A RIP network can be no more than 15 hops (end-to-end). If there is a 16th hop, that network is identified as infinity and the packet is discarded.

Examples

```
-> ip rip admin-state enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip load rip	Loads RIP into the switch memory.
show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipProtoStatus
```

ip rip interface

Creates/deletes a RIP interface. Routing is enabled on a VLAN when you create a router interface. However, to enable RIP routing, you must also configure and enable a RIP routing interface on the VLAN's IP router interface.

ip rip interface {*interface_name***}**

no ip rip interface {*interface_name***}**

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- By default, a RIP interface is created in the disabled state. To enable RIP routing on the interface, you must enable the interface by using the **ip rip interface admin-state** command.
- You can create a RIP interface even if an IP router interface has not been configured. However, RIP will not function unless an IP router interface is configured with the RIP interface.
- For more information on VLANs and router ports, see Chapter 5, "VLAN Management Commands".

Examples

```
-> ip rip interface rip-1
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip interface	Creates a VLAN router interface.
ip load rip	Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.
ip rip admin-state	Enables/disables RIP routing on the switch.
ip rip interface admin-state	Enables/disables a RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfStatus
```

ip rip interface admin-state

Enables/disables a RIP interface. By default, a RIP interface is created in the disabled state. After creating a RIP interface, you must use this command to enable the interface.

ip rip interface {*interface_name***} admin-state {enable | disable}**

Syntax Definitions

interface_name	The name of the interface.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You must first create a RIP interface by using the **ip rip interface** command before enabling the interface.
- You can create a RIP interface even if an IP router interface has not been configured. However, RIP will not function unless an IP router interface is configured with the RIP interface.
- For more information on VLANs and router ports, see Chapter 5, “VLAN Management Commands”.

Examples

```
-> ip rip interface rip-1 admin-state enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip interface	Creates a VLAN router interface.
ip load rip	Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.
ip rip admin-state	Enables/disables RIP routing on the switch.
ip rip interface	Creates/deletes a RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfStatus
```

ip rip interface metric

Configures the RIP metric or cost for a specified interface. You can set priorities for routes generated by a switch by assigning a metric value to routes generated by that switch's RIP interface. For example, routes generated by a neighboring switch may have a hop count of 1. However, you can lower the priority of routes generated by that switch by increasing the metric value for routes generated by the RIP interface.

ip rip interface {*interface_name***} metric** *value*

Syntax Definitions

interface_name	The name of the interface.
value	Metric value. Valid range is 1–15.

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When you configure a metric for a RIP interface, this metric cost is added to the metric of the incoming route.

Examples

```
-> ip rip interface rip-1 metric 2
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip rip interface	Enables/disables RIP on a specific interface.
show ip rip peer	Displays active RIP neighbors (peers). An active peer is a switch that has sent a RIP packet within the last 180 seconds.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfDefaultMetric
```

ip rip interface send-version

Configures the send option for a RIP interface. This defines the type(s) of RIP packets that the interface will send.

ip rip interface {*interface_name***} send-version {none | v1 | v1compatible | v2}**

Syntax Definitions

interface_name	The name of the interface.
none	RIP packets will not be sent by the interface.
v1	Only RIPv1 packets will be sent by the interface.
v1compatible	Only RIPv2 broadcast packets (not multicast) will be sent by the interface.
v2	Only RIPv2 packets will be sent by the interface.

Defaults

parameter	default
none | v1 | v2 | v1compatible	**v2**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Using this command will override RIP default behavior.
- Other devices must be able to interpret the information provided by this command or there will not be proper routing information exchanged between the switch and other devices on the network.

Examples

```
-> ip rip interface rip-1 send-version v1
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip rip interface recv-version	Configures the receive option for a RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfSend
```

ip rip interface recv-version

Configures the receive option for a RIP interface. This defines the type(s) of RIP packets that the interface will accept.

ip rip interface {*interface_name***} recv-version {v1 | v2 | both | none}**

Syntax Definitions

interface_name	The name of the interface.
v1	Only RIPv1 packets will be received by the interface.
v2	Only RIPv2 packets will be received by the interface.
both	Both RIPv1 and RIPv2 packets will be received by the interface.
none	Interface ignores any RIP packets received.

Defaults

parameter	default
v1 | v2 | both | none	**both**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Using this command will override RIP default behavior.
- Other devices must be able to interpret the information provided by this command or there will not be proper routing information exchanged between the switch and other devices on the network.

Examples

```
-> ip rip interface rip-1 recv-version both
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip rip interface send-version	Configures the send option for a RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfReceive
```

ip rip interface ingress-filter

Assigns an ingress route map filter to the specified RIP interface. Received route advertisements are compared against ingress filters. When a prefix matches the corresponding filter, that prefix is accepted on the interface. When a prefix does not match the filter, the prefix is dropped as if it was never received.

ip rip interface {*interface_name***} ingress-filter {***filter_name***}**

Syntax Definitions

interface_name	The name of an existing RIP interface.
filter_name	The name of an existing route-map filter.

Defaults

By default, no such filter is associated with the RIP interface.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- One route-map filter is configurable in each direction (ingress/egress) for each RIP interface.
- Configuring multiple filters in the same direction for a single RIP interface is not supported.

Examples

```
-> ip route-map ripfilter1 action permit
-> ip route-map ripfilter1 match ip-address 202.5.0.0/16 deny
-> ip rip interface vlan-100 Ingress-filter RipFilter1
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip rip interface egress-filter	Assigns an egress route map filter to a RIP interface.
show ip rip interface	Displays RIP interface status and configuration.

MIB Objects

N/A

ip rip interface ingress-filter

Assigns an ingress route map filter to the specified RIP interface. Received route advertisements are compared against ingress filters. When a prefix matches the corresponding filter, that prefix is accepted on the interface. When a prefix does not match the filter, the prefix is dropped as if it was never received.

ip rip interface {*interface_name***} ingress-filter {***filter_name***}**

Syntax Definitions

interface_name	The name of an existing RIP interface.
filter_name	The name of an existing route-map filter.

Defaults

By default, no such filter is associated with the RIP interface.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- One route-map filter is configurable in each direction (ingress/egress) for each RIP interface.
- Configuring multiple filters in the same direction for a single RIP interface is not supported.

Examples

```
-> ip route-map ripfilter1 action permit
-> ip route-map ripfilter1 match ip-address 202.5.0.0/16 deny
-> ip rip interface vlan-100 ingress-filter RipFilter1
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip rip interface egress-filter	Assigns an egress route map filter to a RIP interface.
show ip rip interface	Displays RIP interface status and configuration.

MIB Objects

N/A

ip rip interface egress-filter

Assigns an egress route map filter to the specified RIP interface. Outbound route advertisements are compared against egress filters. When a prefix matches the corresponding filter, that prefix is sent on the interface. When a prefix does not match the filter, the prefix is dropped as if it did not exist in the RIP RIB.

ip rip interface {*interface_name***} egress-filter {***filter_name***}**

Syntax Definitions

interface_name	The name of an existing RIP interface.
filter_name	The name of an existing route-map filter.

Defaults

By default, no such filter is associated with the RIP interface.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- One route-map filter is configurable in each direction (ingress/egress) for each RIP interface.
- Configuring multiple filters in the same direction for a single RIP interface is not supported.

Examples

```
-> ip route-map ripfilter1 action permit
-> ip route-map ripfilter1 match ip-address 202.5.0.0/16 deny
-> ip rip interface vlan-100 egress-filter RipFilter1
```

Release History

Release 8.1.1; command introduced.

Related Commands

iip rip interface ingress-filter	Assigns an ingress route map filter to a RIP interface.
show ip rip interface	Displays RIP interface status and configuration.

MIB Objects

N/A

ip rip force-holddowntimer

Configures the forced hold-down timer value, in seconds, that defines an amount of time during which routing information regarding better paths is suppressed. A route enters into a forced hold-down state when an update packet is received that indicates the route is unreachable and when this timer is set to a non-zero value. After this timer has expired and if the value is less than 120 seconds, the route enters a hold-down state for the rest of the period until the remainder of the 120 seconds has also expired. During this time the switch will accept any advertisements for better paths that are received.

ip rip force-holddowntimer *seconds*

Syntax Definitions

seconds	The forced hold-down time interval, in seconds. The valid range is 0–120.

Defaults

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The forced hold-down timer is not the same as the RIP hold-down timer. The forced hold-down timer defines a separate interval that overlaps the hold-down state. During the forced hold-down timer interval, the switch will not accept *better* routes from other gateways.
- The forced hold-down time interval can become a subset of the hold-down timer (120 seconds) by using this command to set a value less than 120.
- To allow the routing switch to use better routes advertised during the entire hold-down time period, leave the forced hold-down timer set to the default value.

Examples

```
-> ip rip force-holddowntimer 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (for example, forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipForceHolddownTimer
```

ip rip host-route

Specifies whether or not RIP can add host routes (routes with a 32-bit mask) to the RIP table.

ip rip host-route

no ip rip host-route

Syntax Definitions

N/A

Defaults

The default is to enable a default host route.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to prevent RIP from adding host routes to the RIP table.
- When enabled, RIPv1 will interpret an incoming route announcement that contains any 1 bit in the host portion of the IP address as a host route, implying a mask of 255.255.255.255.

Examples

```
-> ip rip host-route
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip rip routes	Displays the RIP Routing Database.

MIB Objects

```
alaProtocolRip
   alaRipHostRouteSupport
```

ip rip route-tag

Configures the route tag value for RIP routes generated by the switch.

ip rip route-tag *value*

Syntax Definitions

value	Route tag value. Valid range is 0–2147483647.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Only RIPv2 supports route tags.

Examples

```
-> ip rip route-tag 0
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaRipRedistRouteTag
```

ip rip interface auth-type

Configures the type of authentication that will be used for the RIP interface. By default, there is no authentication used for RIP. However, you can configure a password for a RIP interface. To configure a password, you must first select the authentication type (simple or MD5), then configure a password.

ip rip interface {*interface_name***} auth-type {none | simple | md5}**

Syntax Definitions

interface_name	The name of the interface.
none	No authentication will be used.
simple	Simple authentication will be used.
md5	MD5 authentication will be used.

Defaults

parameter	default
none | simple	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Regardless of which authentication type is used (simple or MD5), both switches on either end of a link must share the same password.

Examples

```
-> ip rip interface rip-1 auth-type none
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip rip interface auth-key	Configures the text string that will be used as the password for the RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfAuthType
```

ip rip interface auth-key

Configures the text string that will be used as the password for the RIP interface. If you configure simple or MD5 authentication, you must configure a text string that will be used as the password for the RIP interface.

ip rip interface {*interface_name***} auth-key** *string*

Syntax Definitions

interface_name	The name of the interface.
string	16-byte text string.

Defaults

The default authentication string is a null string.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Regardless of which authentication type is used (simple or MD5), both switches on either end of a link must share the same password.

Examples

```
-> ip rip interface rip-1 auth-key nms
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip rip interface auth-type	Configures the type of authentication that will be used for the RIP interface.

MIB Objects

```
rip2IfConfTable
   rip2IfConfAddress
   rip2IfConfAuthKey
```

ip rip update-interval

Configures the time interval during which RIP routing updates are sent out.

ip rip update-interval *seconds*

Syntax Definitions

seconds	The RIP routing update interval, in seconds. The valid range is 1–120.

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The update interval value must be less than or equal to one-third the invalid interval value.

Examples

```
-> ip rip update-interval 45
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipUpdateInterval
```

ip rip invalid-timer

Configures the RIP invalid timer value that defines the time interval during which a route will remain active in Routing Information Base (RIB) before moving to the invalid state.

ip rip invalid-timer *seconds*

Syntax Definition

seconds	The RIP invalid timer value, in seconds. The valid range is 3–360.

Defaults

parameter	default
seconds	180

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The invalid time interval value must be three times the update interval value.

Examples

```
-> ip rip invalid-timer 270
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipInvalidTimer
```

ip rip garbage-timer

Configures the RIP garbage timer value that defines the time interval, which must elapse before an expired route is removed from the RIB.

ip rip garbage-timer *seconds*

Syntax Definition

seconds	The RIP garbage timer value, in seconds. The valid range is 0–180.

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

During the RIP garbage interval, the router advertises the route with a metric of INFINITY (i.e., 16 hops).

Examples

```
-> ip rip garbage-timer 180
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipGarbageTimer
```

ip rip holddown-timer

Configures the RIP hold-down timer value that defines the time interval during which a route remains in the hold-down state.

ip rip holddown-timer *seconds*

Syntax Definition

seconds	The hold-down time interval, in seconds. The valid range is 0–120.

Defaults

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When RIP detects a route with higher metric than the route in the RIB, the route with the higher metric goes into the hold-down state. The route updates with a metric of INFINITY are rejected.

Examples

```
-> ip rip holddown-timer 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip rip	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

MIB Objects

```
alaProtocolRip
   alaRipHolddownTimer
```

show ip rip

Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

show ip rip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip rip

Status                    = Enabled
Number of routes          = 9
Host Route Support        = Enabled
Route Tag                 = 42
Update interval           = 30
Invalid interval          = 180
Garbage interval          = 120
Holddown interval         = 0
Forced Hold-Down Timer    = 0
```

output definitions

Status	RIP status (**Enabled** or **Disabled**).
Number of routes	Number of network routes in the RIP routing table.
Host Route Support	Host route status (**Enabled** or **Disabled**). Indicates whether or not RIP can add host routes (routes with a 32-bit mask) to the RIP table.
Route Tag	Route tag value for RIP routes generated by the switch. Valid values are 0–2147483647.
Update interval	The RIP routing update interval, in seconds.
Invalid interval	The RIP invalid timer value, in seconds.
Garbage interval	The RIP garbage timer value, in seconds.
Holddown interval	The hold-down time interval, in seconds.
Forced Hold-Down Timer	The forced hold-down time interval, in seconds.

Release History

Release 8.1.1; command introduced.

Related Commands

ip rip admin-state	Enables/disables RIP routing on the switch.
ip rip force-holddowntimer	Configures the interval during which a RIP route remains in the forced hold-down state.
ip rip update-interval	Configures the time interval during which RIP routing updates are sent out.
ip rip invalid-timer	Configures the RIP invalid timer value that defines the time interval during which a route will remain active in Routing Information Base (RIB) before moving to the invalid state.
ip rip garbage-timer	Configures the RIP garbage timer value that defines the time interval, which must elapse before an expired route is removed from the RIB.
ip rip holddown-timer	Configures the RIP hold-down timer value that defines the time interval during which a route remains in the hold down state.

MIB Objects

```
alaProtocolRip
   alaRipProtoStatus
   alaRipRouteNumber
   alaRipHostRouteSupport
   alaRipRedistRouteTag
   alaRipUpdateInterval
   alaRipInvalidTimer
   alaRipGarbageTimer
   alaRipHolddownTimer
   alaRipForceHolddownTimer
```

show ip rip routes

Displays the RIP routing database. The routing database contains all of the routes learned through RIP.

show ip rip routes [*ip_address ip_mask***]**

Syntax Definitions

ip_address	32-bit IP address.
ip_mask	The mask corresponding to the IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

To view all RIP routes, enter the basic command syntax (**show ip rip routes**). To view a specific route, enter the destination IP address and mask.

Examples

```
-> show ip rip routes

Legends: State: A = Active, H = Holddown, G = Garbage
Destination        Gateway          State Metric Proto
-----------------+----------------+----+------+------
2.0.0.0/8          +5.0.0.14          A    2      Rip
                    4.0.0.7           A    3      Rip

                    5.0.0.14          A    3      Rip
```

output definitions

Destination	Destination network IP address.
Gateway	The Gateway IP address (switch from which the destination address was learned).
State	The associated state of the route, which can be **A** (**Active**), **H** (**Holddown**), or **G** (**Garbage**).
Metric	Metric associated with this network. Generally, this is the RIP hop count (the number of hops from this switch to the destination switch).
Proto	The type of route (**Local**, **Rip**, or **Redist**).

```
-> show ip rip routes 2.0.0.0 255.0.0.0

Destination             = 2.0.0.0,
Mask length             = 8,
Gateway(1)              = 5.0.0.14,
  Protocol              = Rip,
  Out Interface         = intf5,
  Metric                = 2,
  Status                = Installed,
  State                 = Active,
  Age                   = 19s,
  Tag                   = 0,
Gateway(2)              = 4.0.0.7,
  Protocol              = Rip,
  Out Interface         = intf4,
  Metric                = 3,
  Status                = Not Installed,
  State                 = Active,
  Age                   = 12s,
  Tag                   = 0,
```

output definitions

Destination	Destination network IP address.
Mask length	Length of the destination network IP subnet mask.
Gateway	The Gateway IP address (switch from which the destination address was learned).
Protocol	The type of the route (**Local**, **Rip**, or **Redist**).
Out Interface	The RIP interface through which the next hop is reached.
Metric	Metric associated with this network. Generally, this is the RIP hop count (the number of hops from this switch to the destination switch).
Status	The RIP interface status (Installed or Not Installed).
State	The associated state of the route (**Active**, **Holddown**, or **Garbage**).
Age	The age of the route in seconds (the number of seconds since this route was last updated or otherwise determined to be correct).
Tag	The associated route tag.

Release History

Release 8.1.1; command introduced.

Related Commands

ip rip host-route	Enables/disables a host route to an individual host on a network.

```

show ip rip interface

Displays RIP interface status and configuration.

show ip rip interface [*interface_name***]**

Syntax Definitions

interface_name	The interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Enter an IP address to view a specific interface. Enter the basic **show ip rip interface** command to show status for all interfaces.

Examples

```
-> show ip rip interface rip-1

Interface IP Name                     = rip-1,
Interface IP Address                  = 11.11.11.1
IP Interface Number (VLANId)          = 4,
Interface Admin status                = enabled,
IP Interface Status                   = enabled,
Interface Config AuthType             = None,
Interface Config AuthKey Length       = 0,
Interface Config Send-Version         = v2,
Interface Config Receive-Version      = both,
Interface Config Default Metric       = 1,
Received Packets                      = 154,
Received Bad Packets                  = 0,
Received Bad Routes                   = 0,
Sent Updates                          = 8
```

output definitions

Interface IP Name	The IP Interface name.
Interface IP Address	Interface IP address.
IP Interface Number	Interface VLAN ID number.
Interface Admin Status	The RIP administrative status (enabled/disabled).
IP Interface Status	Interface status (enabled /disabled).
Interface Config AuthType	The type of authentication that will be used for the RIP interface (None or Simple).

output definitions (continued)

Interface Config AuthKey Length	The authentication key length used for the RIP interface.
Interface Config Send-Version	Interface send option (none, v1, v2, and v1 compatible).
Interface Config Receive-Version	Interface receive option (none, v1, v2, and both).
Interface Config Default Metric	Default redistribution metric.
Received Packets	Number of packets received on the interface.
Received Bad Packets	Number of bad packets received and discarded. Normally this value is zero (0).
Received Bad Routes	Number of bad routes received and discarded. Normally this value is zero (0).
Sent Updates	Number of RIP routing table updates sent.

Release History

Release 8.1.1; command introduced.

Related Commands

ip rip interface	Enables/disables RIP for a specific interface.

MIB Objects

```

show ip rip peer

Displays active RIP neighbors (peers). An active peer is a switch that has sent a RIP packet within the last 180 seconds. If a peer does not send a RIP packet (request or response) within 180 seconds, it is aged out and will not be displayed.

show ip rip peer [*ip_address*]

Syntax Definitions

ip_address	32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip rip peer

                Total   Bad     Bad             Secs since
    IP Address   Recvd  Packets Routes Version  last update
----------------+------+-------+------+-------+-----------
  100.10.10.1      1      0       0      2       3
```

output definitions

IP Address	Peer IP address.
Total recvd	Total number of RIP packets received from the peer.
Bad Packets	Number of bad packets received from peer.
Bad Routes	Number of bad routes received from peer.
Version	Peer's RIP version as seen on the last packet received.
Secs since last update	Number of seconds since the last packet was received from the peer.

Release History

Release 8.1.1; command introduced.

Related Commands

show ip rip interface	Displays the RIP interface status and configuration.

MIB Objects

   rip2PeerRcvBadRoutes
```

20 BFD Commands

Bidirectional Forwarding Detection (BFD) is a hello protocol, which can be configured to interact with routing protocols for the detection of path failures and can reduce the convergence time in a network. BFD is supported with the BGP, OSPF, VRRP, and Static Routes.

When BFD is configured and enabled, BFD sessions are created and timers are negotiated between BFD neighbors. If a system does not receive a BFD control packet within the negotiated time interval, the neighbor system is considered down. Rapid failure detection notices are then sent to the routing protocol, which initiates a routing protocol recalculation. This process can reduce the time of convergence in a network.

BFD can be operated in two different modes: Asynchronous mode with Echo enabled and Echo-Only mode. Demand mode is not supported.

In Asynchronous mode, the systems continuously send BFD control packets between each other as part of a BFD session. If there are no packets received for a minimum time interval negotiated between the systems, then the neighbor system is considered down.

In Echo mode, a stream of BFD echo packets are transmitted in a forwarding path for which the neighboring system would loop the packets and send them back. If the number of packets transmitted is not echoed back, then the system is declared down. Echo mode can be operated along with Asynchronous mode.

MIB information for the BFD commands is as follows:

Filename: ALCATEL-IND1-BFD-MIB
Module: ALCATEL-IND-BFD-MIB

A summary of the available commands is listed here:

Global BFD commands	**ip bfd admin-state**
	ip bfd transmit
	ip bfd receive
	ip bfd multiplier
	ip bfd echo-interval
	ip bfd interface
	show ip bfd
	show ip bfd sessions
	show ip bfd sessions statistics

BFD Interface commands	**ip bfd interface** **ip bfd interface admin-state** **ip bfd interface transmit** **ip bfd interface receive** **ip bfd interface multiplier** **ip ospf bfd-state** **ip bfd interface echo-interval** **show ip bfd interfaces**
Commands to configure BFD supported protocols	**ip ospf bfd-state** **ip ospf bfd-state all-interfaces** **ip ospf interface bfd-state** **ip ospf interface bfd-state drs-only** **ip ospf interface bfd-state all-neighbors** **ip bgp bfd-state** **ip bgp bfd-state all-neighbors** **ip bgp neighbor bfd-state** **vrrp bfd-state** **vrrp track address bfd-state** **ip static-route all bfd-state** **ip static-route bfd-state**

ip bfd admin-state

Enables or disables the global BFD protocol status for the switch.

ip bfd admin-state {enable | disable}

Syntax Definitions

enable	Enables BFD.
disable	Disables BFD.

Defaults

By default, BFD is disabled for the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Disabling BFD does not remove the existing BFD configuration from the switch.
- When BFD is disabled, all BFD functionality is disabled for the switch, but configuring BFD is still allowed.
- Configuring BFD global parameters is not allowed when BFD is enabled for the switch.

Examples

```
-> ip bfd admin-state enable
-> ip bfd admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip bfd	Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalAdminStatus
```

ip bfd transmit

Configures the global transmit time interval for BFD control packets. This command specifies the minimum amount of time BFD waits between each transmission of control packets.

ip bfd transmit *transmit_interval*

Syntax Definitions

transmit_interval	The transmit time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
transmit_interval	300 milliseconds

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The transmit time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd transmit** command does not override the value set for the interface using the **ip bfd interface transmit** command.
- The global transmit time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd transmit 500
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bfd interface transmit	Configures the transmit time interval for a specific BFD interface.
show ip bfd	Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalTxInterval
```

ip bfd receive

Configures the global receive time interval for BFD control packets. This command specifies the minimum amount of time BFD waits to receive control packets before determining there is a problem.

ip bfd receive *receive_interval*

Syntax Definitions

receive_interval	The receive time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
receive_interval	300 milliseconds

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The minimum receive time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd receive** command does not override the value set for the interface using the **ip bfd interface receive** command.
- The global receive time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd receive 500
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bfd interface receive	Configures the receive time interval for a specific BFD interface.
show ip bfd	Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalRxInterval
```

ip bfd multiplier

Configures the global BFD detection time multiplier. This command specifies a number that is used to calculate the BFD detection time used in the asynchronous mode. The detection time value that is specified determines how long to wait before declaring that the BFD session is down.

ip bfd multiplier *num*

Syntax Definitions

num	The detection time multiplier number. The valid range is 3–255.

Defaults

By default, the multiplier value is set to 3.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The global detection time multiplier is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd multiplier** command does not override the value set for the interface using the **ip bfd interface multiplier** command.
- The global detection time multiplier serves as the default multiplier value for a BFD interface. The default multiplier value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd multiplier 5
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bfd interface multiplier	Configures the detection time multiplier for a BFD interface.
show ip bfd	Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalDetectMult
```

ip bfd echo-interval

Configures the global BFD echo packet time interval. The echo function is available with the asynchronous mode. Echo packets are transmitted to BFD peers to see if they loop back to the peer from which they originated.

ip bfd echo-interval *echo_interval*

Syntax Definitions

echo_interval	The echo time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
echo_interval	300 milliseconds

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The echo packet time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd echo-interval** command does not override the value set for the interface using the **ip bfd interface echo-interval** command.
- The global echo packet time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

Examples

```
-> ip bfd echo-interval 500
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bfd interface echo-interval	Configures the echo packet time interval for a BFD interface.
show ip bfd	Displays the BFD global status and general configuration parameters.

MIB Objects

```
alaBfdGlobalEchoRxInterval
```

ip bfd interface

Configures a BFD interface.

ip bfd interface *if_name*

no ip bfd interface *if_name*

Syntax Definitions

if_name	The name of an existing IP interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a BFD interface.
- The interface name must be an existing IP interface name that is configured with an IP address.

Examples

```
-> ip bfd interface bfd-vlan-101
-> no ip bfd interface bfd-vlan-101
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bfd interface admin-state	Configures the administrative status of a BFD interface.
show ip bfd interfaces	Displays the status and statistics of a BFD interface.
show ip bfd sessions	Displays the status and statistics of the BFD sessions.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfAddrType
   alaBfdIntfAddr
   alaBfdIntfIndex
```

ip bfd interface admin-state

Enables or disables the administrative status of a BFD interface.

ip bfd interface *if_name* **admin-state {enable | disable}**

Syntax Definitions

if_name	The name of an existing BFD interface.
enable	Enables the BFD interface.
disable	Disables the BFD interface.

Defaults

By default, a BFD interface is disabled when it is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The BFD interface must be enabled to participate in the BFD protocol.

Examples

```
-> ip bfd interface bfd-vlan-101 admin-state enable
-> ip bfd interface bfd-vlan-101 admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bfd interface	Creates a BFD interface.
show ip bfd interfaces	Displays the status and statistics of a BFD interface.
show ip bfd sessions	Displays the status and statistics of BFD sessions.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfAdminStatus
```

ip bfd interface transmit

Configures the transmit time interval for the BFD interface. This command specifies the minimum amount of time BFD waits between each transmission of control packets from the interface.

ip bfd interface *if_name* **transmit** *transmit_interval*

Syntax Definitions

if_name	The name of an existing BFD interface.
transmit_interval	The transmit time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
transmit_interval	300 milliseconds

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The global transmit time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface transmit time interval using the **ip bfd interface transmit** command does not change the global value configured with the **ip bfd transmit** command.

Examples

```
-> ip bfd interface bfd-vlan-101 transmit 500
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bfd interface	Creates a BFD interface.
ip bfd transmit	Configures a global BFD transmit time interval.
show ip bfd interfaces	Displays the status and statistics of a BFD interface.
show ip bfd sessions	Displays the status and statistics of the BFD sessions.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfDesiredMinTxInterval
```

ip bfd interface receive

Configures the receive time interval for the BFD interface. This command specifies the minimum amount of time BFD waits to receive control packets on the interface before determining there is a problem.

ip bfd interface *if_name* **receive** *receive_interval*

Syntax Definitions

if_name	The name of an existing BFD interface.
receive_interval	The receive time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
receive_interval	300 milliseconds

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The global receive time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface transmit time interval using the **ip bfd interface receive** command does not change the global value configured with the **ip bfd receive** command.

Examples

```
-> ip bfd interface bfd-vlan-101 receive 500
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bfd interface	Creates a BFD interface.
ip bfd receive	Configures a global BFD receive time interval.
show ip bfd interfaces	Displays the BFD interface configuration table.
show ip bfd sessions	Displays the BFD interface configuration table.

MIB Objects

```
alaBfdIntfTable
   alaBfdReqMinRxInterval
```

ip bfd interface multiplier

Configures the BFD interface detection time multiplier. This command specifies a number that is used to calculate the BFD detection time used in the asynchronous mode. When an interface stops receiving packets from a neighbor, the interface uses the detection time value to determine how long to wait before declaring that the BFD session is down.

ip bfd interface *if_name* **multiplier** *num*

Syntax Definitions

if_name	The name of an existing BFD interface.
num	The detection time multiplier number. The valid range is 3–255.

Defaults

By default, the multiplier value is set to 3.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The detection time between neighbors is calculated by multiplying the negotiated transmit time interval by the detection time multiplier.

Examples

```
-> ip bfd interface bfd-vlan-101 multiplier 5
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bfd interface	Creates a BFD interface.
show ip bfd interfaces	Displays the BFD interface configuration table.
show ip bfd sessions	Displays the BFD interface configuration table.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfDetectMult
```

ip bfd interface echo-interval

Configures the echo time interval for the BFD interface. The echo function is available with the asynchronous mode. Echo packets are transmitted to BFD peers to see if they loop back to the peer from which they originated.

ip bfd interface *if_name* **echo-interval** *echo_interval*

Syntax Definitions

if_name	The name of an existing IP interface.
echo_interval	The echo time interval, in milliseconds. The valid range is 100–999.

Defaults

parameter	default
echo_interval	300 milliseconds

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The global echo time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface echo time interval using the **ip bfd interface echo-interval** command does not change the global value configured with the **ip bfd echo-interval** command.

Examples

```
-> ip bfd interface bfd-vlan-101 echo-interval 500
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bfd interface	Creates a BFD interface.
ip bfd echo-interval	Configures a global BFD echo time interval.
show ip bfd interfaces	Displays the BFD interface configuration table.
show ip bfd sessions	Displays the BFD interface configuration table.

MIB Objects

```
alaBfdIntfTable
   alaBfdIntfReqMinEchoRxInterval
```

ip ospf bfd-state

Enables or disables the BFD status for the OSPF protocol.

ip ospf bfd-state {enable | disable}

Syntax Definitions

enable	Enables BFD Status.
disable	Disables BFD Status.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- All the status changes on the neighbors are received from the BFD level and the OSPF protocol acts based upon the BFD message.
- Whenever a neighbor goes down, OSPF will inform BFD to remove that neighbor from the BFD active list.

Examples

```
-> ip ospf bfd-state enable
-> ip ospf bfd-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf bfd-state all-interfaces	Enables or disables BFD for all OSPF interfaces configured.
ip ospf interface bfd-state	Enables or disables BFD for a specific OSPF interface.
ip ospf interface bfd-state drs-only	Establishes BFD sessions only on neighbors in full state.
ip ospf interface bfd-state all-neighbors	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

MIB Objects

```
alaProtocolospf
   alaOspfBfdStatus
```

ip ospf bfd-state all-interfaces

Enables or disables BFD for all OSPF interfaces in the switch configuration.

ip ospf bfd-state all-interfaces {enable | disable}

Syntax Definitions

enable	Enables BFD for all the OSPF interfaces.
disable	Disables BFD for all the OSPF interfaces.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf bfd-state all-interfaces enable
-> ip ospf bfd-state all-interfaces disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf bfd-state	Enables or disables the BFD status for the OSPF protocol.
ip ospf interface bfd-state	Enables or disables BFD for a specific OSPF interface.
ip ospf interface bfd-state drs-only	Establishes BFD sessions only on neighbors in full state.
ip ospf interface bfd-state all-neighbors	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

MIB Objects

```
alaProtocolospf
   alaOspfBfdAllInterfaces
```

ip ospf interface bfd-state

Enables or disables BFD for a specific OSPF interface.

ip ospf interface *if_name* **bfd-state {enable | disable}**

Syntax Definitions

if_name	The name of an existing OSPF interface.
enable	Enables the OSPF interface.
disable	Disables the OSPF interface.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf interface int1 bfd-state enable
-> ip ospf interface int2 bfd-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf bfd-state	Enables or disables the BFD status for the OSPF protocol.
ip ospf bfd-state all-interfaces	Enables or disables BFD for all OSPF interfaces configured.
ip ospf interface bfd-state drs-only	Establishes BFD sessions only on neighbors in full state.
ip ospf interface bfd-state all-neighbors	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

MIB Objects

```
alaOspfIfAugEntry
   ospfIfIpAddress
   alaOspfIfBfdStatus
```

ip ospf interface bfd-state drs-only

Establishes BFD sessions only with neighbors that are in the full state.

ip ospf interface *if_name* **bfd-state drs-only**

Syntax Definitions

if_name	The name of an existing OSPF interface.

Defaults

parameter	default
drs-only	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The specified OSPF interface must be enabled to interact with BFD.
- The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf interface int1 bfd-state drs-only
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bfd interface admin-state	Enables or disables the BFD status for OSPF protocol.
ip ospf bfd-state all-interfaces	Enables or disables BFD for all OSPF interfaces configured.
ip ospf interface bfd-state	Enables or disables BFD for a specific OSPF interface.
ip ospf interface bfd-state all-neighbors	Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

MIB Objects

```
alaOspfIfAugEntry
   ospfIfIpAddress
   alaOspfIfBfdDrsOnly
```

ip ospf interface bfd-state all-neighbors

Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

ip ospf interface *if_name* **bfd-state all-neighbors {enable | disable }**

Syntax Definitions

if_name	The name of an existing OSPF interface.

Defaults

parameter	default
all-neighbors	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The specified OSPF interface must be enabled to interact with BFD.
- The BFD status for OSPF must be enabled before OSPF can interact with BFD.

Examples

```
-> ip ospf interface int1 bfd-state all-neighbors enable
-> ip ospf interface int1 bfd-state all-neighbors disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bfd interface admin-state	Enables or disables the BFD status for OSPF protocol.
ip ospf bfd-state all-interfaces	Enables or disables BFD for all OSPF interfaces configured.
ip ospf interface bfd-state	Enables or disables BFD for a specific OSPF interface.
ip ospf interface bfd-state drs-only	Establishes BFD sessions only on neighbors in full state.

MIB Objects

```
alaOspfIfAugEntry
   ospfIfIpAddress
   alaOspfIfBfdDrsOnly
```

ip bgp bfd-state

Enables or disables BFD for the BGP protocol.

ip bgp bfd-state {enable | disable}

Syntax Definitions

enable	Enables BGP.
disable	Disables BGP.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- All the status changes on the neighbors are received from the BFD level and the BGP protocol acts based upon the BFD message.
- Whenever a neighbor goes down, BGP will inform BFD to remove that neighbor from the BFD active list.

Examples

```
-> ip bgp bfd-state enable
-> ip bgp bfd-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp bfd-state all-neighbors	Enables or disables BFD for all BGP neighbors.
ip bgp neighbor bfd-state	Enables or disables BFD for a specific neighbor.

MIB Objects

```
alaBgpGlobal
   alaBgpBfdStatus
```

ip bgp bfd-state all-neighbors

Enables or disables BFD for all BGP neighbors.

ip bgp bfd-state all-neighbors {enable | disable}

Syntax Definitions

enable	Enables BFD for all the BGP neighbors.
disable	Disables BFD for all the BGP neighbors.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The BFD status for BGP must be enabled before BGP can interact with BFD.

Examples

```
-> ip bgp bfd-state all-neighbors enable
-> ip bgp bfd-state all-neighbors disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp bfd-state	Enables or disables BGP with BFD protocol.
ip bgp neighbor bfd-state	Enables or disables the BFD for a specific BGP neighbor.

MIB Objects

```
alaBgpGlobal
   alaBgpBfdAllNeighbors
```

ip bgp neighbor bfd-state

Enables or disables BFD for a specific BGP neighbor.

ip bgp neighbor *ipv4_address* **bfd-state {enable | disable}**

Syntax Definitions

ipv4_address	The IP address of the BGP neighbor.
enable	Enables BGP neighbor.
disable	Disables BGP neighbor.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The BFD status for BGP must be enabled before BGP can interact with BFD.

Examples

```
-> ip bgp neighbor 135.10.10.2 bfd-state enable
-> ip bgp neighbor 135.10.10.2 bfd-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp bfd-state	Enables or disables BGP with BFD protocol.
ip bgp bfd-state all-neighbors	Enables or disables BFD for all BGP neighbors.

MIB Objects

```
alaBgpPeerEntry
   alaBgpPeerName
   alaBgpPeerBfdStatus
alaBgpGlobal
   alaBgpBfdAllNeighbors
```

vrrp bfd-state

Enables or disables VRRP with the BFD protocol.

vrrp bfd-state {enable | disable}

Syntax Definitions

enable	Enables BFD for VRRP.
disable	Disables BFD for VRRP.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- BFD support for VRRP is done only for tracking policy configuration for a remote address.
- The BFD status for VRRP must be enabled before VRRP can interact with BFD.

Examples

```
-> vrrp bfd-state enable
-> vrrp bfd-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp track address bfd-state	Enables or disable BFD for a specific tracking policy.

MIB Objects

```
alaVrrpConfig
   alaVrrpBfdStatus
```

vrrp track address bfd-state

Enables or disable BFD for a specific track policy.

vrrp track *track_id* **address** *ipv4_address* **bfd-state {enable| disable}**

Syntax Definitions

track_id	The VRRP track number.
ipv4_address	The remote IP address.
enable	Enables BFD.
disable	Disables BFD.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- BFD support for VRRP is done only for tracking policy configuration for a remote address.
- The BFD status for VRRP must be enabled before VRRP can interact with BFD.

Examples

```
-> vrrp track 2 address 10.1.1.1 bfd-state enable
-> vrrp track 3 address 10.1.1.2 bfd-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp bfd-state	Enables or disables VRRP with BFD protocol.

MIB Objects

```
alaVRRPConfig
   alaVrrpTrackBfdStatus
```

show ip bfd

Displays the global BFD configuration table.

show ip bfd

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip bfd
BFD Version Number              = 1,
Admin Status                    = Enabled,
Desired Tranmit Interval        = 300,
Minimum Receive Interval        = 300,
Detection Time Multiplier       = 3,
Minimum Echo Receive Interval   = 300,
Applications Registered         = STATIC-ROUTING OSPF PIM
```

output definitions

BFD Version Number	Refers to BFD version.
Admin Status	Refers to BFD global admin status.
Desired Transmit Interval	Refers to BFD global Tx interval.
Minimum Receive Interval	Refers to BFD global Rx interval.
Detection Time Multiplier	Refers to the BFD Detection Time multiplier number.
Minimum Echo Receive Interval	Refers to BFD echo Rx interval.
Applications Registered	Refers to applications registered to BFD.

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; Output updated to include PIM protocol application.

Related Commands

ip bfd admin-state	Configures BFD at global level.
ip bfd interface	Configures BFD at interface level.

MIB Objects

```
alaBfdIntfTable
   alaBfdGlobalVersionNumber
   alaBfdGlobalAdminStatus
   alaBfdGlobalTxInterval
   alaBfdGlobalRxInterval
   alaBfdGlobalDetectMult
   alaBfdGlobalEchoRxInterval
   alaBfdGlobalProtocolApps
```

show ip bfd interfaces

Displays the BFD interface configuration table.

show ip bfd interfaces [*if_name***]**

Syntax Definitions

if_name	The name of the BFD interface.

Defaults

By default, the configuration for all BFD interfaces is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Enter an interface name to display information for a specific BFD interface.

Examples

```
-> show ip bfd interfaces
Interface  Admin    Tx        Min Rx   Min EchoRx Detect     OperStatus
Name       Status   Interval  Interval Interval   Multiplier
---------+--------+---------+---------+----------+----------+----------
one        enabled   300      300       300         3         UP
two        enabled   300      300       300         3         UP

-> show ip bfd interfaces one
Interface Name                  = one,
Interface IP Address            = 100.1.1.1,
Admin Status                    = Enabled,
Desired Transmit Interval       = 300,
Minimum Receive Interval        = 300,
Detection Time Multiplier       = 3,
Minimum Echo Receive Interval   = 300,
Authentication Present          = No,
Oper Status                     = UP
```

output definitions

Interface Name	Refers to BFD Interface name.
Admin status	Refers to BFD interface admin status.
Desired Transmit Interval	Refers to BFD interface Tx interval.
Minimum Receive Interval	Refers to BFD interface Rx interval.
Detection Time Multiplier	Refers to BFD interface Detection Time Multiplier.
Minimum Echo Receive Interval	Refers to BFD interface echo Rx interval.

output definitions (continued)

Authentication Present	Refers to availability of BFD message authentication on the BFD interface.
Oper Status	Refers to BFD interface operational status.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bfd admin-state	Configures BFD at global level.
ip bfd interface	Configures BFD at interface level.

```

show ip bfd sessions

Displays all the BFD sessions for the switch.

show ip bfd sessions [*session_num*] **[slot** *chassis/slot_num*]

Syntax Definitions

chassis	The chassis identifier.
num	The BFD session number. Valid range is 1–1024.
slot	The current slot position used by the switch.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip bfd sessions
 Local   Interface  Neighbor    State  Remote  Negotiated   Negotiated   Session
 Discr   Name       Address            Discr   Rx Interval  Tx Interval  Type
------+-----------+-----------+------+-------+------------+------------+--------
 1       one        100.1.1.10   UP     0        0             0           ECHO
 2       one        101.1.1.11   UP     10       300           300         ASYNC

-> show ip bfd sessions slot 1
 Local  Interface  Neighbor   State  Remote  Negotiated   Negotiated   EchoRx
 Discr  Name       Address           Discr   Rx Interval  Tx Interval
------+----------+----------+------+-------+------------+------------+-------
  1       one     100.1.1.10   UP      0         0            0         300

Local discriminator              = 1,
Neighbor IP Address              = 100.1.1.10,
Requested Session Type           = ECHO,
Interface IP Address             = 100.1.1.1,
Source UDP Port                  = 49152,
State                            = UP,
Session Operating Mode           = ECHO only,
Remote discriminator             = 0,
Negotiated Tx interval           = 0,
Negotiated Rx interval           = 0,
Echo Rx interval                 = 300,
Multiplier                       = 3,
Applications Registered:         = STATIC-ROUTING PIM
```

output definitions

Local discriminator	The local discriminator.
Neighbor IP address	The IP address of the BFD neighbor.
Requested Session Type	The bit map of the session type that is requested. .
Interface IP address	The IP address of the outgoing BFD interface for this session.
Source UDP Port	The unique source UDP port used to send BFD packets for this session.
State	The state of the BFD session.
Session Operating Mode	The current operating mode of the BFD session.
Remote discriminator	The remote discriminator.
Negotiated Tx interval	The negotiated transmit interval.
Negotiated Rx interval	The negotiated receive interval.
Echo Rx interval	The Echo packet receive interval.
Detection Time Multiplier	The BFD Detection Time multiplier number.
Applications Registered	The bit map object of applications that are registered with this BFD session.

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; Output updated to include PIM protocol application.

Related Commands

ip bfd admin-state	Configures BFD at global level.
ip bfd interface	Configures BFD at interface level.
show ip bfd sessions statistics	Displays the statistics for all BFD sessions.

MIB Objects

```

```

ip static-route all bfd-state

Enables BFD for all static routes.

ip static-route all bfd-state {enable | disable}

Syntax Definitions

enable	Enables BFD.
disable	Disables BFD.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When there are static route configured in the switch, BFD is enabled to track the gateway.
- If the route is not reachable, it will be moved to the inactive database.

Examples

```
-> ip static-route all bfd-state enable
-> ip static-route all bfd-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

N/A

MIB Objects

```
alaIprmConfig
   alaIprmStaticallbfd
```

ip static-route bfd-state

Enables or disables BFD for a specific static route.

ip static-route *ipv4_prefix/pfx_length* **gateway** *ipv4_host_address* **bfd-state {enable| disable}**

Syntax Definitions

ipv4_prefix	The destination IP address.
pfx_length	The prefix length for the destination IP address.
gateway *ipv4_host_address*	The gateway IP address.
enable	Enables BFD.
disable	Disables BFD.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

BFD is enabled to track the gateway of static routes.

Examples

```
-> ip static-route 192.100.1.0/24 gateway 100.1.1.10 bfd-state enable
-> ip static-route 192.100.1.0/24 gateway 100.1.1.10 bfd-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip static-route all bfd-state	Enables BFD for all static routes.

   alaIprmStaticRouteDest
   alaIprmStaticRouteMask
   alaIprmStaticRouteNextHop
   alaIprmStaticRouteBfdStatus
```

21 DHCP Relay Commands

Bootstrap Protocol (BOOTP) and Dynamic Host Configuration Protocol (DHCP) packets contain configuration information for network hosts. DHCP Relay enables forwarding of BOOTP/DHCP packets between networks. This allows routing of DHCP traffic between clients and servers. It is not necessary to enable DHCP Relay if DHCP traffic is bridged through one network (the clients and servers are on the same physical network).

This chapter includes a description of DHCP Relay commands that are used to define the IP address of DHCP servers, maximum number of hops, and forward delay time. Configure DHCP Relay on the switch where routing of BOOTP/DHCP packets occur. These CLI commands are applicable for all VRF instances.

MIB information for DHCP Relay commands is as follows:

Filename: AlcatelIND1UDPRelay.MIB
Module: ALCATEL-IND1-UDP-RELAY-MIB

A summary of the available commands is listed here.

IP Helper	**ip helper address** **ip helper vlan address** **ip helper standard** **ip helper per-vlan-only** **ip helper forward-delay** **ip helper maximum-hops** **ip helper agent-information** **ip helper agent-information policy** **ip helper pxe-support** **ip helper boot-up** **ip helper boot-up enable** **show ip helper** **show ip helper statistics** **no ip helper statistics**
UDP	**ip udp relay port** **ip udp relay service** **ip udp relay service vlan** **show ip udp relay** **show ip udp relay statistics** **ip udp relay no statistics**

DHCP Server Commands	**dhcp-server** **dhcp-server restart** **show dhcp-server leases** **show dhcp-server statistics** **clear dhcp-server statistics** **dhcpv6-server** **dhcpv6-server restart** **show dhcpv6-server leases** **clear dhcpv6-server statistics** **show dhcpv6-server statistics** **dhcp-message-service** **dhcp-message-service restart** **show message-service status**
DHCP Snooping	**dhcp-snooping admin-state** **dhcp-snooping mac-address-verification** **dhcp-snooping option-82-data-insertion** **dhcp-snooping bypass option-82-check** **dhcp-snooping option-82 format** **dhcp-snooping vlan** **dhcp-snooping port** **dhcp-snooping linkagg** **dhcp-snooping ip-source-filter** **dhcp-snooping binding admin-state** **dhcp-snooping binding timeout** **dhcp-snooping binding action** **dhcp-snooping binding persistency** **dhcp-snooping binding** **show dhcp-snooping ip-source-filter** **show dhcp-snooping vlan** **show dhcp-snooping port** **show dhcp-snooping binding**

ip helper address

Adds or deletes a DHCP server IP address. DHCP Relay forwards BOOTP/DHCP broadcasts to and from the specified address. If multiple DHCP servers are used, configure one IP address for each server.

ip helper address *ip_address*

no ip helper address [*ip_address***]**

Syntax Definitions

ip_address	DHCP server IP address (for example 21.0.0.10).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete an IP address from the DHCP Relay service. If an address is not specified, then all addresses are deleted.
- Using this command enables a Global DHCP Relay service on the switch. When the DHCP Relay is specified by the DHCP server IP address, the service is called Global DHCP.
- When the DHCP Relay is specified by the VLAN number of the DHCP request, the service is referred to as Per-VLAN DHCP.
- Global DHCP and Per-VLAN DHCP are mutually exclusive. You can only configure one or the other.
- Use this command to configure DHCP Relay on switches where packets are routed between IP networks.

Examples

```
-> ip helper address 75.0.0.10
-> no ip helper address 31.0.0.20
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip helper vlan address	Specifies or deletes DHCP Relay based on the VLAN of the DHCP request.
ip helper forward-delay	Sets the forward delay time value. DHCP Relay does not process a client packet unless the packet contains an elapsed boot time value that is equal to or greater than the configured value of the forward delay time.
ip helper maximum-hops	Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperTable
   iphelperService
   iphelperForwAddr
```

ip helper vlan address

Configures a DHCP Relay service for the specified VLAN. This command is used when a per-VLAN only relay service is active on the switch. It does not apply when a standard relay service is used.

ip helper vlan *vlan_id***[-***vlan_id2***] address** *ip_address*

no ip helper vlan *vlan_id***[-***vlan_id2***] address** *ip_address*

Syntax Definitions

vlan_id	VLAN identification number (for example 3) of the DHCP server VLAN.
vlan_id2	The last VLAN ID number in a contiguous range of VLAN IDs.
ip_address	IP address (for example 21.0.0.10) of the DHCP server VLAN.

Defaults

If no VLAN identification number is entered, VLAN ID 0 is used by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Specifying multiple VLAN IDs and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range of VLAN ID entries. (for example, 10-15).
- The **ip helper vlan address** command works only if the **per-vlan-only** forwarding option is active. Use the **ip helper per-vlan-only** command to enable this option.
- Configure DHCP Relay on switches where packets are routed between IP networks.
- The IP interface must be defined for the VLANs before using this command.
- Use the **no** form of this command to delete the DHCP server VLAN from the DHCP Relay.

Examples

```
-> ip helper vlan 3 address 75.0.0.10
-> ip helper vlan 250-255 address 198.206.15.2
-> no ip helper vlan 3 address 75.0.0.1
-> no ip helper vlan 1601 address 198.206.15.20
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip helper per-vlan-only	Sets the DHCP Relay forwarding option to process only DHCP packets received from a specific, identified VLAN.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperTable
   iphelperService
   iphelperVlan
```

ip helper standard

Sets the DHCP Relay forwarding option to standard. All DHCP packets are processed by a global relay service.

ip helper standard

Syntax Definitions

N/A

Defaults

By default, the DHCP Relay forwarding option is set to **standard**.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

To process DHCP packets on a per VLAN basis, or to change the DHCP Relay forwarding option from standard to per VLAN, use the **ip helper per-vlan-only** command.

Examples

```
-> ip helper standard
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperStatTable
   iphelperForwOption
```

ip helper per-vlan-only

Sets the DHCP Relay forwarding option to process only DHCP packets received from a specific, identified VLAN. This option allows each VLAN to have its own relay.

ip helper per-vlan-only

Syntax Definitions

N/A

Defaults

By default, the UDP forwarding option is set to **standard**.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the forwarding option is set to **per-vlan-only**, the **standard** (global) DHCP relay service is not available. These two types of services are mutually exclusive.
- To process DHCP packets on a per VLAN basis, or to change the DHCP Relay forwarding option from standard to per VLAN, use the **ip helper per-vlan-only** command.
- Using the **per-vlan-only** forwarding option requires you to specify a DHCP server IP address for each VLAN that provides a relay service. The **ip helper vlan address** command performs this function and at the same time enables relay for the specified VLAN.

Examples

```
-> ip helper per-vlan-only
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip helper vlan address	Configures a DHCP Relay service for the specified VLAN.
ip helper standard	Sets DHCP Relay forwarding option to standard. All DHCP packets are processed.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperStatTable
   iphelperForwOption
```

ip helper forward-delay

Sets the forward delay time value for the DHCP Relay configuration. The BOOTP/DHCP packet sent from the client contains the elapsed boot time. This is the amount of time, in seconds, since the client last booted. DHCP Relay does not process the packet unless the elapsed boot time value of the client is equal to or greater than the configured value of the forward delay time.

ip helper forward-delay *seconds*

Syntax Definitions

seconds	Forward delay time value in seconds.

Defaults

By default, the forward delay time is set to three seconds.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The time specified applies to all defined IP helper addresses.
- If a packet contains an elapsed boot time value that is less than the specified forward delay time value, DHCP Relay discards the packet.

Examples

```
-> ip helper forward-delay 300
-> ip helper forward-delay 120
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip helper address	Adds or deletes one or more DHCP server IP addresses to the DHCP Relay configuration.
ip helper maximum-hops	Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperStatTable
   iphelperForwDelay
```

ip helper maximum-hops

Sets the maximum number of hops value for the DHCP Relay configuration. This value specifies the maximum number of relays a BOOTP/DHCP packet is allowed to traverse until it reaches its server destination. Limiting the number of hops that can forward a packet prevents packets from looping through the network.

ip helper maximum-hops *hops*

Syntax Definitions

hops	The maximum number of relays.

Defaults

By default, the maximum hops value is set to four hops.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If a packet contains a hop count equal to or greater than the *hops* value, DHCP Relay discards the packet.
- The maximum hops value only applies to DHCP Relay and is ignored by other services.

Examples

```
-> ip helper maximum-hops 1
-> ip helper maximum-hops 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip helper address	Adds or deletes one or more DHCP server IP addresses to the DHCP Relay configuration.
ip helper forward-delay	Sets the forward delay time value. DHCP Relay does not process a client packet unless the packet contains an elapsed boot time value that is equal to or greater than the configured value of the forward delay time.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperStatTable
   iphelperMaxHops
```

ip helper agent-information

Enables or disables the DHCP relay agent information option (Option-82) feature. When this feature is enabled, local relay agent information is inserted into client DHCP packets when the agent forwards these packets to a DHCP server.

ip helper agent-information {enable | disable}

Syntax Definitions

enable	Enables the relay agent Option-82 feature for the switch.
disable	Disables the relay agent Option-82 feature for the switch.

Defaults

By default, this feature is disabled on the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command enables the DHCP Option-82 feature for the entire switch; it is not configurable on a per-VLAN basis.
- When the relay agent receives a DHCP packet that already contains the Option-82 field, the packet is processed based on the agent information policy configured for the switch. This policy is configured using the **ip help agent-information policy** command.

Examples

```
-> ip helper agent-information enable
-> ip helper agent-information disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip helper agent-information policy	Configures a policy to determine how the relay agent handles DHCP packets that already contain the Option-82 field.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperAgentInformation
```

ip helper agent-information policy

Configures a policy that determines how the DHCP relay agent handles the DHCP packets that already contain an Option-82 field.

ip helper agent-information policy {drop | keep | replace}

Syntax Definitions

drop	Drop DHCP packets that already contain an Option-82 field.
keep	Keep the existing Option-82 field information and continue to relay the DHCP packet.
replace	Replace the existing Option-82 field information with local relay agent information and continue to relay the DHCP packet.

Defaults

By default, DHCP packets that already contain an Option-82 field are dropped.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The agent information policy is not applied if the DHCP relay agent receives a DHCP packet from a client that contains a non-zero value for the gateway IP address (giaddr). In this case, the agent does not insert the relay agent information option into the DHCP packet and forwards the packet to the DHCP server.
- Note that if a DHCP packet contains a gateway IP address (giaddr) value that matches a local subnet and also contains the Option-82 field, the packet is dropped by the relay agent.

Examples

```
-> ip helper agent-information policy drop
-> ip helper agent-information policy keep
-> ip helper agent-information policy replace
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip helper agent-information	Enables the insertion of relay agent information Option-82 into DHCP packets.
show ip helper	Displays current DHCP Relay configuration information.
show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperAgentInformationPolicy
```

ip helper pxe-support

Enables or disables relay agent support for Preboot Execution Environment (PXE) devices.

ip helper pxe-support {enable | disable}

Syntax Definitions

enable	Enables PXE support.
disable	Disables PXE support.

Defaults

By default, PXE support is disabled for the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

PXE support is disabled by default and it is a user-configurable option using the **ip helper pxe-support** command.

Examples

```
-> ip helper pxe-support enable
-> ip helper pxe-support disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip helper	Displays current DHCP Relay configuration information.

MIB Objects

```
iphelperPXESupport
```

ip helper boot-up

Enables or disables automatic IP address configuration for default VLAN 1 when an unconfigured switch boots up. If enabled, the switch broadcasts a BootP or a DHCP request packet at boot time. When the switch receives an IP address from a BootP/DHCP server, the address is assigned to default VLAN 1.

Note: Automatic IP address configuration only supports the assignment of a *permanent* IP address to the switch. Make sure that the DHCP server is configured with such an address before using this feature.

ip helper boot-up {enable | disable}

Syntax Definitions

enable	Enables automatic IP address configuration for default VLAN 1.
disable	Disables automatic IP address configuration for default VLAN 1.

Defaults

By default, this feature is disabled on the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **ip helper boot-up enable** command to specify BootP or DHCP for the request packet type.
- If an IP router port already exists for VLAN 1, a request packet is not broadcast even if automatic IP address configuration is enabled for the switch.

Examples

```
-> ip helper boot-up enable
-> ip helper boot-up disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip helper boot-up enable	Specifies BootP or DHCP as the type of request packet the switch broadcasts at boot time.

MIB Objects

```
iphelperStatTable
   iphelperBootupOption
```

ip helper boot-up enable

Specifies the type of packet to broadcast (BootP or DHCP) when automatic IP address configuration is enabled for the switch.

Note: Automatic IP address configuration only supports the assignment of a *permanent* IP address to the switch. Make sure that the DHCP server is configured with such an address before using this feature.

ip helper boot-up enable {bootp | dhcp}

Syntax Definitions

bootp	Broadcasts a BOOTP formatted request packet.
dhcp	Broadcasts a DHCP formatted request packet.

Defaults

parameter	default
BOOTP | DHCP	**BOOTP**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command is only valid if automatic IP address configuration is already enabled for the switch.

Examples

```
-> ip helper boot-up enable DHCP
-> ip helper boot-up enable BOOTP
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip helper boot-up	Enables or disables automatic IP configuration for the switch.

MIB Objects

```
iphelperStatTable
   iphelperBootupPacketOption
```

ip udp relay port

Enables or disables UDP port relay for user-defined service ports that are not well-known.

ip udp relay port *port_num* **[description** *description***]**

ip udp relay no port *port_num*

Syntax Definitions

port_num	A service port number that is not well-known or user-defined.
description	A description of the user-defined service for the specified port.

Defaults

By default, relay is enabled on the BOOTP/DHCP well-known ports.

parameter	default
name	UDP port #

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable the user-defined service for the specified port.
- Use the **port** parameter to specify service port numbers that are not well known.

Examples

```
-> ip udp relay port 54
-> ip udp relay port 54 description “Generic Service”
-> ip udp relay no port 54
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip udp relay service vlan	Specifies the VLAN to which traffic from the specified UDP service port is forwarded.

MIB Objects

```
iphelperxServicePortAssociationTable
   iphelperxServicePortAssociationService
   iphelperxServicePortAssociationPort
   iphelperxServicePortAssociationName
iphelperxPortServiceAssociationTable
   iphelperxPortServiceAssociationService
   iphelperxPortServiceAssociationPort
   iphelperxPortServiceAssociationName
```

ip udp relay service

Enables or disables UDP port relay for generic UDP service ports (NBNS, NBDD, or other well-known UDP ports).

ip udp relay service {tftp | tacacs | ntp | nbns | nbdd | dns} [description *description***]**

ip udp relay no service {tftp | tacacs | ntp | nbns | nbdd | dns}

Syntax Definitions

tftp	TFTP well-known port 69.
tacacs	TACACS well-known port 65.
ntp	NTP well-known port 123.
nbns	NBNS well-known ports 137.
nbdd	NBDD well-known port 138.
dns	DNS well-known port 53.
description	A description of the UDP service.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable UDP Relay for the specified service port.
- The *description* parameter is only used with any of the **service** keywords and provides a user-defined description to identify the port service.
- When UDP Relay is disabled for BOOTP/DHCP, the **ip helper** configuration is *not* retained and all dependant functionality (automatic IP configuration for VLAN 1, Telnet and HTTP client authentication, and so on) is disrupted.
- Up to three types of UDP Relay services are supported at any one time and in any combination.
- If port relay is enabled for the NBDD well-known port, NBNS is not automatically enabled by default.
- Note that when UDP port relay is enabled for NTP, relay cannot forward NTP packets that contain a destination IP address that matches a VLAN router IP address on the switch.

Examples

```
-> ip udp relay service DNS
-> ip udp relay service DNS description DNS_1
-> ip udp relay no service DNS
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip udp relay service vlan	Specifies the VLAN to which traffic from the specified UDP service port is forwarded.

MIB Objects

```
iphelperxServicePortAssociationTable
   iphelperxServicePortAssociationService
   iphelperxServicePortAssociationPort
   iphelperxServicePortAssociationName
iphelperxPortServiceAssociationTable
   iphelperxPortServiceAssociationService
   iphelperxPortServiceAssociationPort
   iphelperxPortServiceAssociationName
```

ip udp relay service vlan

Specifies a VLAN on which traffic destined for a UDP port is forwarded.

ip udp relay service {tftp | tacacs | ntp | nbns | nbdd | dns} | port *port_num* **[description** *description***] vlan** *vlan_id***[-***vlan_id2***]**

ip udp relay service {tftp | tacacs | ntp | nbns | nbdd | dns} | port *port_num* **no vlan** *vlan_id***[-***vlan_id2***]**

Syntax Definitions

tftp	TFTP well-known port 69.
tacacs	TACACS well-known port 65.
ntp	NTP well-known port 123.
nbns	NBNS well-known ports 137.
nbdd	NBDD well-known port 138.
dns	DNS well-known port 53.
port_num	A user-defined port number.
description	A description of the UDP service.
vlan_id	A numeric value that uniquely identifies an individual VLAN.
-vlan_id2	The last VLAN ID number in a contiguous range of VLAN IDs. Use a hyphen to specify a range of VLANs (for example, 1-5).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the VLAN association with the UDP service port.
- The UDP port must be created before using this command.
- Use the **service** keyword to define a well-known UDP port. Use the **port** keyword to specify a user-defined port.
- Only specify service port numbers that are *not* well known when using the *port* parameter with this command. For example, do not specify port 53 as it is the well-known port number for the DNS UDP service. Instead, use the **DNS** parameter to enable relay for port 53.
- Specifying a VLAN for the BOOTP/DHCP service does not work if the **per-vlan-only** forwarding option is not active. Use the **ip helper per-vlan-only** command to enable this option.

Examples

```
-> ip udp relay service DNS vlan 10
-> ip udp relay service DNS vlan 500-550
-> ip udp relay service DNS no vlan 10
-> ip udp relay port 3047 vlan 20
-> ip udp relay port 3047 no vlan 20
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip udp relay port	Enables or disables UDP port relay for user-defined service ports that are not well-known.
ip udp relay service	Enables or disables relay for UDP service ports.

MIB Objects

```
iphelperxPortServiceAssociationTable
   iphelperxPortServiceAssociationService
```

show ip helper

Displays the current DHCP Relay and Relay Agent Information.

show ip helper

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Displays information for all IP addresses configured.

Examples

The following example shows the show ip helper command output:

```
-> show ip helper
Ip helper :
  Forward Delay(seconds)         = 300,
  Max number of hops             = 5,
  Relay Agent Information        = Enabled,
  Relay Agent Information Policy = Keep,
  PXE support                    = Enabled,
  Forward option                 = standard mode,
  Bootup Option                  = Disable,
  Bootup Packet Option           = DHCP
        Forwarding address list (Standard mode):
          128.100.16.1
```

output definitions

Forward Delay	The current forward delay time (default is three seconds). Use the **ip helper forward-delay** command to change this value.
Max number of hops	The current maximum number of hops allowed (default is four hops). Use the **ip helper maximum-hops** command to change this value.
Relay Agent Information	Indicates the status (**Enabled** or **Disabled**) of the DHCP relay agent information option feature. Configured through the **ip helper agent-information** command.
Relay Agent Information Policy	The policy configured to determine how the DHCP relay agent handles the DHCP packets that already contain an Option-82 field.

output definitions

PXE support	Specifies the status (**Enabled** or **Disabled**) of the relay agent support for PXE devices. By default the PXE support is disabled. Configured through the **ip helper pxe-support** command.
Forward option	The current forwarding option setting: **standard mode**.
Bootup Option	Indicates whether or not automatic IP address configuration for default VLAN 1 is done when the switch boots up (**Enabled** or **Disabled**). Configured through the **ip helper boot-up** command.
Bootup Packet Option	Indicates if the Bootup Option broadcasts a **DHCP** or **BOOTP** packet to obtain an IP address for default VLAN 1. Configured through the **ip helper boot-up enable** command. Note that this field does not appear if the Bootup Option is disabled.
Forwarding Addresses	IP addresses for DHCP servers that receive BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the **ip helper address** command to add or remove DHCP server IP addresses from the DHCP Relay configuration.

Release History

Release 8.1.1; command introduced.

Related Commands

show ip helper statistics	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

MIB Objects

```
iphelperTable
   iphelperService
   iphelperForwAddr
   iphelperForwDelay
   iphelperMaxHops
iphelperAgentInformation
iphelperAgentInformationPolicy
iphelperStatTable
   iphelperBootupOption
   iphelperBootupPacketOption
```

show ip helper statistics

Displays the number of packets DHCP Relay has received, the number of packets dropped due to forward delay and maximum hops violations. It also displays the number of packets processed since the last time these statistics were displayed. It includes statistics that apply to a specific DHCP server, such as the number of packets transmitted to the server and the difference between the number of packets received from a client and the number transmitted to the server.

show ip helper statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to clear all DHCP Relay statistics.

Examples

```
-> show ip helper statistics

 Global Statistics :
    Reception From Client :
      Total Count =         12, Delta =         12,
    Forw Delay Violation :
      Total Count =          3, Delta =          3,
    Max Hops Violation :
      Total Count =          0, Delta =          0,
    Agent Info Violation :
      Total Count =          0, Delta =          0,
    Invalid Gateway IP :
      Total Count =          0, Delta =          0,
    Invalid Agent Info From Server :
      Total Count =          0, Delta =          0,
 Server Specific Statistics :
    Server  5.5.5.5
        Tx Server :
          Total Count =          9, Delta =          9
```

output definitions

Reception From Client	Number of packets DHCP Relay has received from the DHCP client.
Forw Delay Violation	Number of packets dropped as a result of forward delay violations. A violation occurs if a client packet contains an elapsed boot time value that is less than the configured DHCP Relay forward delay time value.

output definitions (continued)

Max Hops Violation	Number of packets dropped as a result of maximum hop violations. A violation occurs if a packet contains a hop count equal to or greater than the configured DHCP Relay maximum hops value.
Agent Info Violation	Number of packets dropped as a result of a relay agent information (Option-82) violation. A violation occurs if an Option-82 DHCP packet contains a zero gateway IP address (giaddr) and the relay agent information policy is set to **Drop** or a DHCP packet has no Option-82 field and contains a non-zero giaddr.
Invalid Gateway IP	Number of packets dropped as a result of a gateway IP violation. A violation occurs if an Option-82 DHCP packet contains a gateway IP address (giaddr) that matches a local subnet address.
Invalid Agent Info From Server	Number of invalid Option-82 DHCP server packets dropped by the relay agent.
Delta	Total number of packets processed since the last time the **ip helper statistics** were checked during any user session.
Server	DHCP server IP address that receives BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the **ip helper address** command to add or remove DHCP server IP addresses from DHCP Relay configuration.
Tx Server	Number of packets DHCP Relay has transmitted to the DHCP server.
Delta	The difference between the number of packets received from the client and the number of packets transmitted to the DHCP server since the last time DHCP Relay statistics were checked during any user session.

Release History

Release 8.1.1; command introduced.

   iphelperResetAll
```

show ip udp relay

Displays the VLAN assignments to which the traffic received on the UDP service ports is forwarded. Displays the current configuration for UDP services by service name or by service port number.

show ip udp relay [service {tftp | tacacs | ntp | nbns | nbdd | dns} | port *port_num***]**

Syntax Definitions

tftp	TFTP well-known port 69.
tacacs	TACACS well-known port 65.
ntp	NTP well-known port 123.
nbns	NBNS well-known port 137.
nbdd	NBDD well-known ports 138.
dns	DNS well-known port 53.
port_num	A user-specified port that is not a well-known port.

Defaults

By default, the configuration for all UDP services is shown.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **show ip udp relay** command without the additional parameters to display information related to all the ports.
- Enter a service name with this command along with the **service** parameter to display information about an individual service.
- Mention a port number along with the **port** parameter, to get the UDP relay information for the specific user defined or well-known port.

Examples

```
-> show ip udp relay

Service          Port     VLANs
---------------+--------+----------------
DNS              53       2  4
TACACS           65       3
```

output definitions

Service	The active UDP service name. Configured through the **ip udp relay port** command.

output definitions (continued)

Port	The UDP service port number. Configured through the **ip udp relay port** command.
VLANs	The VLAN assigned to the UDP service port that forwards traffic destined for that port. Configured through the **ip udp relay service vlan** command.

```
-> show ip udp relay service DNS

Service    Port(s)  Description
---------+--------+------------------
  4        53       DNS

-> show ip udp relay port

Service    Port(s)  Description
---------+--------+------------------
  4        54       Generic_Service
  5        66       Tservice

-> show ip udp relay port 54

Service    Port(s)  Description
---------+--------+------------------
   4       54       Generic_Service
```

output definitions

Service	The UDP service number. (**1** through **7** for well-known service ports and **8** and above for user-defined service ports).
Port(s)	The UDP service port number.
Description	A description of the UDP service.

Release History

Release 8.1.1; command introduced.

Related Commands

show ip udp relay	Displays the VLAN assignments to which the traffic received on the specified UDP service port is forwarded.
show ip udp relay statistics	Displays the current statistics for each UDP port relay service.

MIB Objects

```
iphelperTable
   iphelperService

show ip udp relay statistics

Displays the current statistics for each UDP port relay service. These statistics include the name of the service, the forwarding VLAN(s) configured for that service, and the number of packets the service has sent and received.

show ip udp relay statistics [service {tftp | tacacs | ntp | nbns | nbdd | dns}] [port [*port_num***]]**

Syntax Definitions

tftp	TFTP well-known port 69.
tacacs	TACACS well-known port 65.
ntp	NTP well-known port 123.
nbns	NBNS well-known port 137.
nbdd	NBDD well-known ports 138.
dns	DNS well-known port 53.
port_num	A user-specified port that is not a well-known port.

Defaults

By default, the statistics for all UDP services is shown.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter a service name with the **service** parameter to display information about an individual service.
- Enter a port number with the **port** parameter to display information about an individual service.

Examples

```
-> show ip udp relay statistics

Service          Vlan     Pkts Sent   Pkts Recvd
---------------+--------+-----------+----------
145                       0           0
DNS              2         10          10
                 4         15          15
TACACS           3          0           0

-> show ip udp relay statistics service tacacs

Service          Vlan     Pkts Sent   Pkts Recvd
---------------+--------+-----------+-----------
TACACS            3        0            0
```

```
-> show ip udp relay statistics port 1776

Service              Vlan     Pkts Sent   Pkts Recvd
-------------------+--------+-----------+-----------
A UDP Protocol       18       2           2
```

output definitions

Service	The active UDP service name.
VLAN	The VLAN assigned to the UDP service port that forwards traffic destined for that port. Use the **ip udp relay service vlan** command to configure this value.
Pkts Sent	The number of packets sent from this service port to the server.
Pkts Recvd	The number of packets received by this service port from a client.

Release History

Release 8.1.1; command introduced.

Related Commands

show ip udp relay	Displays current configuration for UDP services by service name or by service port number.

```

no ip helper statistics

Resets the IP helper statistics for the specified VRF instances.

no ip helper statistics [global-only | server-only | address *ip_address* | **vlan** *vlan_id* **{address** *ip_address***}]**

Syntax Definitions

global-only	Specifies that only the global IP helper statistics must be reset.
server-only	Specifies that only the IP helper statistics related to the server must be reset.
ip_address	Specifies the IP address for the flat mode instance.
vlan_id	Specifies the VLAN ID for the per-VLAN mode instance.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command works only for VRF instances.
- To reset all the IP helper related statistics, use this command without the additional keywords.
- To reset the IP helper statistics for the flat mode instance, provide the related IP address with the **address** keyword
- To reset the IP helper statistics for the per-vlan mode instance, provide the VLAN ID with the **vlan** keyword and the related IP address with the **address** keyword.

Examples

```
-> no ip helper statistics
-> no ip helper statistics global-only
-> no ip helper statistics server-only
-> no ip helper statistics address 172.6.5.1
-> no ip helper statistics vlan 20 address 172.6.5.1
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip helper statistics	Displays the current statistics for each UDP port relay service.

MIB Objects

```
iphelperStatsTable
   iphelperResetAllStats
   iphelperResetSrvStats
```

ip udp relay no statistics

Resets all the generic UDP Relay Service related statistics.

ip udp relay no statistics

Syntax Definitions

N/A

Defaults

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

On applying this command, the UDP relay statistics are cleared and the **show ip udp relay statistics** command display no information.

Examples

```
-> ip udp relay no statistics
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip udp relay statistics	Displays the current statistics for each UDP port relay service.

MIB Objects

```
genericUdpRelayTable
   genericUdpRelayStatReset
```

dhcp-server

Enables or disables the DHCP server operation.

dhcp-server {enable | disable}

Syntax Definitions

enable	Enables the DHCP server.
disable	Disables the DHCP server.

DefaultsDefaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When DHCP server is enabled on the switch, DHCP relay and DHCP snooping will not be supported on the default VRF of the switch.
- DHCP server must be restarted when changes are made to the **dhcpd.conf** or **dhcpd.pcy** file. Use the **dhcp-server restart** command to restart the DHCP server.

Examples

```
-> dhcp-server enable
-> dhcp-server disable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

show dhcp-server leases	Displays the leases offered by the DHCP server.
dhcp-server restart	Allows to restart the DHCP server when the **dhcpd.conf** or **dhcpd.pcy** file is modified.
clear dhcp-server statistics	Clears the statistics of the DHCP server.

MIB Objects

```
alaDhcpSrvGlobalConfigStatus
```

dhcp-server restart

Allows to restart the DHCP server when the **dhcpd.conf** or **dhcpd.pcy** file is modified.

dhcp-server restart

Syntax Definitions

restart	Restarts the DHCP server.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The command can be used to restart the DHCP server when the dhcpd.conf or dhcpd.pcy file is modified.

Examples

```
-> dhcp-server restart
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhcp-server	Enables or disables the DHCP server operation.

MIB Objects

```
alaDhcpSrvGlobalRestart
```

show dhcp-server leases

Displays the leases offered by the DHCP server.

show dhcp-server leases [ip- address *ip_address* **| mac-address** *mac_address***] [type {static | dynamic}] [count]**

Syntax Definitions

ip_address	Specifies IP address of the interface configured with DHCP server.
mac_address	Specifies MAC address of the interface configured with DHCP server.
static	Displays only static leases.
dynamic	Displays only dynamic leases.
count	Count of DHCP messages recorded.

Defaults

By default, all leases are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

DHCP server should be enabled before using this command.

Examples

```
-> show dhcp-server leases

Total leases: 8

show dhcp-server statistics

Displays the statistics of the DHCP server.

show dhcp-server statistics [packets | hosts | subnets | all]

Syntax Definitions

packets	Displays general statistical information along with specific information about data packets received, dropped, and transmitted.
hosts	Displays general statistical information along with specific information about leases related to the DHCP server.
subnets	Displays general statistical information along with specific information about all the subnets.
all	Displays all statistical information related to the DHCP server.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

DHCP server should be enabled before using this command.

Examples

output definitions

General stats	Denotes general DHCP Server statistics.
Name	Specifies the name assigned to the DHCP server.
Status	Specifies up or down status of the DHCP server.
Total subnets used	Specifies the total number of subnets being used.
Total subnets managed	Specifies the total number of subnets being managed by the DHCP server.
Total subnets unused	Specifies the total number of subnets being unused.
Total subnets full	Specifies the total number of subnets where all the IP addresses are used.
DHCP Server System Up Time	Shows the DHCP Server System Up Time Performance Monitor counter.
Sync time	Specifies the time for DHCP server to contact and synchronize with the designated time server.
Last sync time	Specifies the last time the synchronization occurred.
Next sync time	Specifies the next time the synchronization should be scheduled.
Packet stats	Denotes statistical information about the data packet transmission.

output definitions (continued)

Total DHCP Discovers	Specifies the total number of DHCPDISCOVER packets sent by the clients to the DHCP server.
Total DHCP Offers	Specifies the total number of DHCPOFFER packets sent by the server to the clients.
Total DHCP Requests	Specifies the total number of DHCPREQUEST packets sent by the clients in response to the DHCPOFFER packets.
Total DHCP Request Grants	Specifies the total number of DHCP request grants provided by the server to the clients.
Total DHCP Request Renews	Specifies the total number of DHCP lease renew requests sent by the clients to the DHCP server.
Total DHCP Declines	Specifies the total number of DHCP requests declined by the DHCP server.
Total DHCP Acks	Specifies the total number of DHCPACK acknowledgement packets sent by the DHCP server to the clients.
Total DHCP Nacks	Specifies the total number of DHCP Negative acknowledgements sent from the DHCP server to the clients. The DHCPNACK message is sent when all the IP addresses available to the server are exhausted and the client sends a DHCPREQUEST.
Total DHCP Releases	Specifies the total number of DHCPRELEASE packets sent by the DHCP server to release IP addresses from its clients.
Total DHCP Informs	Specifies the total number of DHCPINFORM packets sent by the clients to obtain DHCP options from the DHCP server.
Total Bootp requests	Specifies the total number of BOOTP requests sent by the clients to the DHCP server.
Total Bootp response	Specifies the total number of BOOTP response packets sent by the DHCP server to the clients.
Total Unknown packets	Specifies the total number of unknown or badly formatted DHCP packets received by the DHCP server.
Leases stats	Denotes statistical information about leases provided by the DHCP server.
Hosts Managed	Specifies the total number of clients managed by the DHCP server.
Hosts used	Specifies the total number of clients using the IP addresses provided by the DHCP server.
Hosts unused	Specifies the total number of clients managed by the DHCP server which are not being used.
Hosts Pending	Specifies the total number of DHCP IP address requests which are pending by the DHCP server.
Hosts unavailable	Specifies the total number of DHCP hosts which are unavailable i.e; whose lease period have expired.
Static DHCP	Denotes statistical information about the hosts configured with Static DHCP.
Automatic DHCP	Denotes statistical information about the hosts configured with Automatic DHCP.

output definitions (continued)

Static BootP	Denotes statistical information about the hosts configured under Static BootP. **Note:** BootP Relay is disabled when DHCP server is enabled on the switch.
Automatic BootP	Denotes statististical information about the hosts configured with Automatic BootP.
Subnet statistics	Denotes all DHCP related statististical information for individual subnets.
Range	Specifies the range of IP addresses in the individual subnet.
Mask	Specifies the subnet mask.
Type	Specifies whether the type of IP address allocation is dynamic or static.

Release History

Release 8.2.1; command introduced.

Related Commands

clear dhcp-server statistics	Clears the DHCP Server lease statistics.

MIB Objects

N/A

clear dhcp-server statistics

Clears the packet counters of DHCP server statistics.

clear dhcp-server statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command to clear the packet counters of DHCP server statistics.

Examples

```
-> clear dhcp-server statistics
```

Release History

Release 8.2.1; command introduced.

Related Commands

show dhcp-server statistics	Displays the DHCP Server lease statistics.

MIB Objects

N/A

dhcpv6-server

Enables or disables the DHCPv6 server operation.

dhcpv6-server {enable | disable}

Syntax Definitions

enable	Enables the DHCPv6 server.
disable	Disables the DHCPv6 server.

DefaultsDefaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The **dhcpdv6.conf** and **dhcpdv6.pcy** files will be parsed when the DHCPv6 status is enabled for the first time.
- There will be one instance of DHCPv6 for the default VRF.

Examples

```
-> dhcpv6-server enable
-> dhcpv6-server disable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

show dhcpv6-server leases	Displays the leases offered by the DHCPv6 server.
dhcpv6-server restart	Allows to restart the DHCPv6 server when the **dhcpdv6.conf** or **dhcpdv6.pcy** file is modified.
clear dhcpv6-server statistics	Displays the statistics of the DHCPv6 server.

MIB Objects

```
alaDhcpv6SrvGlobalConfigStatus
```

dhcpv6-server restart

Allows to restart the DHCPv6 server when the **dhcpdv6.conf** or **dhcpdv6.pcy** file is modified.

dhcpv6-server restart

Syntax Definitions

restart	Restarts the DHCPv6 server.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> dhcpv6-server restart
```

Release History

Release 8.2.1; command was introduced.

Related Commands

dhcpv6-server	Enables or disables the DHCPv6 server operation.

MIB Objects

```
alaDhcpv6SrvGlobalRestart
```

show dhcpv6-server leases

Displays the leases offered by the DHCPv6 server.

show dhcpv6-server leases [ip- address *ipv6_address* **| type {static | dynamic}] [count]**

Syntax Definitions

ipv6_address	Specifies IPv6 address of the interface configured with DHCPv6 server.
static	Displays only static leases.
dynamic	Displays only dynamic leases.
count	Count of DHCPv6 messages recorded.

Defaults

By default, all leases are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show dhcpv6-server leases

Total leases: 8

IP Address          Lease Granted        Pref Lease Expiry     Valid Lease Expiry   Type
------------------+--------------------+--------------------+-----------
2001:100::2        DEC 15 14:10:59 2009  DEC 19 01:30:59 2009  DEC 19 05:30:59 2009 STATIC
2001:100::3        DEC 15 14:11:05 2009  DEC 19 01:31:05 2009  DEC 19 05:31:05 2009 DYNAMIC
2001:200::2        DEC 15 14:11:48 2009  DEC 19 01:31:48 2009  DEC 19 05:31:48 2009 DYNAMIC

-> show dhcpv6-server leases ip-address 2001:100::3
IP Address          Lease Granted       Pref Lease Expiry      Valid Lease Expiry   Type
-------------------+-------------------+--------------------+--------------------+-----
2001:100::3         DEC 15 14:11:05 2009  DEC 19 01:31:05 2009  DEC 19 05:31:05 2009 DYNAMIC

-> show dhcpv6-server leases type static

Total leases: 1
IP Address       Lease Granted       Pref Lease Expiry      Valid Lease Expiry   Type
-----------------+-----------------+--------------------+--------------------+-------
2001:100::2      DEC 15 14:10:59 2009  DEC 19 01:30:59 2009  DEC 19 05:30:59 2009 STATIC
```

output definitions

IP address	The IP address allocated to the client.
Lease Granted	The date and time at which lease is granted.

output definitions (continued)

Pref Lease Expiry	The date and time at which lease expires.
Type	The type of lease offered.

Release History

Release 8.2.1; command introduced.

Related Commands

clear dhcpv6-server statistics	Clears the DHCPv6 server lease statistics.

MIB Objects

```
alaDhcpv6SrvLeaseTable
   alaDhcpv6SrvLeaseIpAddress
   alaDhcpv6SrvLeaseLeaseGrant
   alaDhcpv6SrvLeaseLeaseExpiry
   alaDhcpv6SrvLeaseType
```

show dhcpv6-server statistics

Displays the statistics of the DHCPv6 server.

show dhcpv6-server statistics [packets | hosts | subnets | all]

Syntax Definitions

packets	Displays general statistical information along with specific information about data packets received, dropped, and transmitted.
hosts	Displays general statistical information along with specific information about leases related to the DHCPv6 server.
subnets	Displays general statistical information along with specific information about all the subnets.
all	Displays all statistical information related to the DHCPv6 server.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

DHCPv6 server should be enabled before using this command.

Examples

```
-> show dhcpv6-server statistics

```

output definitions

General	Denotes general DHCPv6 Server statistics.
DHCPv6 Server Name	Specifies the name assigned to the DHCPv6 server.
DHCPv6 Server Status	Specifies up or down status of the DHCPv6 server.
Total subnets used	Specifies the total number of subnets being used.
Total subnets managed	Specifies the total number of subnets being managed by the DHCPv6 server.
Total subnets unused	Specifies the total number of subnets being unused.
Total subnets full	Specifies the total number of subnets where all the IP addresses are used.
DHCP Server System Up Time	Shows the DHCPv6 Server System Up Time Performance Monitor counter.
Sync time	Specifies the time for DHCPv6 server to contact and synchronize with the designated time server.
Last sync time	Specifies the last time the synchronization occurred.
Next sync time	Specifies the next time the synchronization should be scheduled.
Packet stats	Denotes statistical information about the data packet transmission.
Total DHCP Discovers	Specifies the total number of DHCPDISCOVER packets sent by the clients to the DHCPv6 server.
Total DHCP Offers	Specifies the total number of DHCPOFFER packets sent by the server to the clients.
Total DHCP Requests	Specifies the total number of DHCPREQUEST packets sent by the clients in response to the DHCPOFFER packets.
Total DHCP Request Grants	Specifies the total number of DHCPv6 request grants provided by the server to the clients.

output definitions (continued)

Total DHCP Request Renews	Specifies the total number of DHCPv6 lease renew requests sent by the clients to the DHCPv6 server.
Total DHCP Declines	Specifies the total number of DHCPv6 requests declined by the DHCPv6 server.
Total DHCP Acks	Specifies the total number of DHCPACK acknowledgement packets sent by the DHCPv6 server to the clients.
Total DHCP Nacks	Specifies the total number of DHCPv6 Negative acknowledgements sent from the DHCPv6 server to the clients. The DHCPNACK message is sent when all the IP addresses available to the server are exhausted and the client sends a DHCPREQUEST.
Total DHCP Releases	Specifies the total number of DHCPRELEASE packets sent by the DHCPv6 server to release IP addresses from its clients.
Total DHCP Informs	Specifies the total number of DHCPINFORM packets sent by the clients to obtain DHCPv6 options from the DHCPv6 server.
Total Bootp requests	Specifies the total number of BOOTP requests sent by the clients to the DHCPv6 server.
Total Bootp response	Specifies the total number of BOOTP response packets sent by the DHCPv6 server to the clients.
Total Unknown packets	Specifies the total number of unknown or badly formatted DHCPv6 packets received by the DHCPv6 server.
Leases stats	Denotes statistical information about leases provided by the DHCPv6 server.
Hosts Managed	Specifies the total number of clients managed by the DHCPv6 server.
Hosts used	Specifies the total number of clients using the IP addresses provided by the DHCPv6 server.
Hosts unused	Specifies the total number of clients managed by the DHCPv6 server which are not being used.
Hosts Pending	Specifies the total number of DHCPv6 IP address requests which are pending by the DHCPv6 server.
Hosts unavailable	Specifies the total number of DHCPv6 hosts which are unavailable (for example, hosts whose lease period has expired).
Static DHCP	Denotes statististical information about the hosts configured with Static DHCPv6.
Automatic DHCP	Denotes statististical information about the hosts configured with Automatic DHCPv6.
Static BootP	Denotes statististical information about the hosts configured under Static BootP. **Note:** BootP Relay is disabled when DHCPv6 server is enabled on the switch.
Automatic BootP	Denotes statististical information about the hosts configured with Automatic BootP.
Subnet statistics	Denotes all DHCPv6 related statististical information for individual subnets.
Range	Specifies the range of IP addresses in the individual subnet.

output definitions (continued)

Mask	Specifies the subnet mask.
Type	Specifies whether the type of IP address allocation is dynamic or static.

Release History

Release 8.2.1; command introduced.

Related Commands

clear dhcpv6-server statistics	Clears the DHCPv6 Server lease statistics.

MIB Objects

N/A

clear dhcpv6-server statistics

Clears the packet counters of DHCPv6 server statistics.

clear dhcpv6-server statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command to clear the packet counters of DHCPv6 server statistics.

Examples

```
-> clear dhcpv6-server statistics
```

Release History

Release 8.2.1; command introduced.

Related Commands

show dhcpv6-server statistics	Displays the DHCPv6 Server lease statistics.

MIB Objects

N/A

dhcp-message-service

Enable or disable the message service operation.

dhcp-message-service {enable | disable}

Syntax Definitions

enable	Enables the operational status of the message service.
disable	Disables the operational status of the message service.

Defaults

By default, the operational status of the message service is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The **conf** and **pcy** files are parsed when message service is enabled.
- There is one instance of the message service for the default VRF in the switch that can be enabled or disabled.

Examples

```
-> dhcp-message-service enable
-> dhcp-message-service disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

dhcp-message-service restart	Restarts the message service after the msgd.conf file is modified.

MIB Objects

```
alaMsgSrvGlobalConfigStatus
```

dhcp-message-service restart

Restarts the message service after the msgd.conf file or dhcpd.pcy is modified.

dhcp-message-service restart

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Before using this command, enable the message service status using the **dhcp-message-service** command.

Examples

```
-> message-service restart
```

Release History

Release 8.2.1; command introduced.

Related Commands

dhcp-message-service	Enable or disable the message service operation.

MIB Objects

```
alaMsgSrvGlobalRestart
```

show message-service status

Displays the status and statistical information related to the message service running on the switch.

show message-service status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show message-service status
Message Service is enabled
```

Release History

Release 8.2.1; command introduced.

Related Commands

dhcp-message-service	Enable or disable the message service operation.
dhcp-message-service restart	Restarts the message service, after the msgd.conf file is modified.

MIB Objects

N/A

dhcp-snooping admin-state

Enables or disables DHCP Snooping for the switch.

dhcp-snooping admin-state {enable | disable}

Syntax Definitions

enable	Enables DHCP Snooping for the switch.
disable	Disables DHCP Snooping for the switch.

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A.

Examples

```
-> dhcp-snooping admin-state enable
-> dhcp-snooping admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

dhcp-snooping vlan	.Enables or disables DHCP Snooping on a per VLAN basis.
show ip helper	Displays the current DHCP configuration for the switch.

MIB Objects

```
dhcpSnoopingTable
   dhcpSnoopingMode
```

dhcp-snooping mac-address-verification

Globally enables or disables MAC address verification for incoming DHCP traffic. When this feature is enabled, the source MAC address is compared to the client hardware MAC address in the DHCP packet. If these two addresses do not match, the DHCP packet is dropped.

dhcp-snooping mac-address-verification admin-state {enable | disable}

Syntax Definitions

enable	Enables DHCP MAC address verification for the switch.
disable	Disables DHCP MAC address verification for the switch.

Defaults

By default, this feature is enabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- DHCP Snooping must be enabled before using this command.
- When DHCP Snooping is enabled at the switch level, MAC address verification and Option-82 data insertion are enabled by default. In addition, the trust mode for all ports is set to the DHCP client only mode.
- Changing the enabled or disabled status for MAC address verification is only allowed when DHCP Snooping is globally enabled for the switch.

Examples

```
-> dhcp-snooping mac-address-verification admin-state enable
-> dhcp-snooping mac-address-verification admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

ip udp relay no statistics	.Globally enables or disables DHCP Snooping for the switch.
dhcp-snooping option-82-data-insertion	Globally enables or disables DHCP Option-82 data insertion for DHCP packets.

MIB Objects

```
dhcpSnoopingTable
   dhcpSnoopingMacAddrVerificationStatus
```

dhcp-snooping option-82-data-insertion

Globally enables or disables DHCP Option-82 data insertion for DHCP packets. When this feature is enabled, the relay agent inserts the Option-82 field into DHCP packets before forwarding them to the DHCP server.

dhcp-snooping option-82-data-insertion admin-state {enable | disable}

Syntax Definitions

enable	Enables inserting the DHCP Option-82 field into DHCP packets.
disable	Disables inserting the DHCP Option-82 field into DHCP packets.

Defaults

By default, this feature is enabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- DHCP Snooping must be enabled before using this command.
- When DHCP Snooping is enabled at the switch level, Option-82-data-insertion and MAC address verification are enabled by default. In addition, the trust mode for all ports is set to the DHCP client only mode.

Examples

```
-> dhcp-snooping option-82-data-insertion admin-state enable
-> dhcp-snooping option-82-data-insertion admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

dhcp-snooping option-82 format	Configures the type of information that is inserted in both the Circuit ID and Remote ID sub option of the Option-82 field.
ip udp relay no statistics	.Globally enables or disables DHCP Snooping for the switch.
dhcp-snooping ip-source-filter	Enables or disables the DHCP Snooping binding table functionality
show ip helper	Displays the current DHCP configuration for the switch.

MIB Objects

```
dhcpSnoopingTable
   dhcpSnoopingOpt82InsertionStatus
```

dhcp-snooping bypass option-82-check

Enables or disables checking for an Option-82 field in DHCP packets ingressing on untrusted ports.

dhcp-snooping bypass option-82-check admin-state {enable | disable}

Syntax Definitions

enable	Bypasses the Option-82 field check.
disable	Checks DHCP packets for the Option-82 field.

Defaults

By default, this feature is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When this feature is disabled (the default), DHCP packets ingressing on untrusted ports are checked to see if they contain the Option-82 field. If this field is present, the DHCP packet is discarded.
- When this feature is enabled, DHCP packets ingressing on untrusted ports are *not* checked to see if they contain the Option-82 field. In this case, the Option-82 field is ignored and all DHCP packets are processed.
- Using this command is only allowed when DHCP Snooping is enabled globally for the switch or at the VLAN level.

Examples

```
-> dhcp-snooping bypass option-82-check admin-state enable
-> dhcp-snooping bypass option-82-check admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

ip udp relay no statistics	Globally enables or disables DHCP Snooping for the switch.
show ip helper	Displays the current DHCP configuration for the switch.

MIB Objects

```
dhcpSnoopingTable
   dhcpSnoopingBypassOpt82CheckStatus
```

dhcp-snooping option-82 format

Configures the type of information that is inserted into both the Circuit ID and Remote ID sub option fields of the Option-82 field.

dhcp-snooping option-82 format [base-mac | system-name | user-string *string* | **interface-alias | auto-interface-alias | ascii [{ remote-id | circuit-id} {base-mac | cvlan | interface | interface-alias | system-name | user-string** *string* **| vlan} {delimiter** *string***}]]**

no dhcp-snooping option-82 format [base-mac | system-name | user-string *string* | **interface-alias | auto-interface-alias | ascii [{ remote-id | circuit-id} {base-mac | cvlan | interface | interface-alias | system-name | user-string** *string* **| vlan} {delimiter** *string***}]]**

Syntax Definitions

user-string	A user defined text string. Supports up to 64 characters.
system-name	The system name of the switch.
interface-alias	The alias configured for the interface.
base-mac	The base MAC address of the switch.
auto-interface-alias	The switch automatically generates the interface-alias in the following format: SystemName_slot_port. asciiASCII format.
ascii	ASCII format. **remote-id** | **circuit-id**: Select the sub-id fields of option-82 to configure ascii. **vlan**: The VLAN ID of which the client is a member. string: A user-defined text string. **system-name**: The system name of the switch. **interface-alias**: The alias configured for the interface. **interface**: The interface name. **cvlan**: The Customer VLAN ID. **base-mac**: The base MAC address of the switch. **delimiter**: The delimiter character that separates fields within the Circuit ID and Remote ID ASCII string value. Valid characters are | (pipe), \ (backward slash), / (forward slash), - (dash), _ (underscore), and " " (space).

Defaults

parameter	default
user-string *string* **| system-name | interface-alias | base-mac | auto-interface-alias | ascii**	base-mac
ascii	base-mac

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The string parameter specifies user-defined information to insert into the Circuit ID and Remote ID fields.
- When entering a string for user-defined Option-82 information, quotes are required around ambiguous characters, such as hex characters, spaces, etc, so they are interpreted as text. For example, the string “Building B Server” requires quotes because of the spaces between the words.
- The interface-alias parameter will use the alias configured with the interfaces alias command. If no alias is configured a NULL string will be inserted.
- A maximum of 63 characters can be inserted when using the interface-alias and auto-interface-alias commands, remaining characters will be truncated.
- The Option-82 format option is a global setting, the format specified will be applied to all ports on the switch.
- The data specified with this command is added to the Circuit ID and Remote ID fields only when DHCP Option-82 data insertion is enabled for the switch.
- When DHCP Snooping is enabled at the switch level, Option-82 data insertion is enabled by default.
- The ASCII option is used to specify the type of information that is configured in ASCII text string format and then inserted into the Option-82 Circuit ID sub option. Each parameter provided with this command represents a different type of information.
- Configuring the Circuit ID or Remote ID sub option in ASCII format allows up to five fields (types) of information within the ASCII string. However, if the contents of all the fields combined exceeds 127 characters, then the ASCII string is truncated.
- Specifying at least one parameter with ASCII option is required. If multiple parameters are selected, then specifying one of the valid delimiter characters is also required.
- Use the no form of this command to remove the type of information that is inserted into both the Circuit ID and Remote ID sub option fields of the Option-82 field.s option-82-check admin-state disable.

Examples

```
-> dhcp-snooping option-82 format user-string “Building B Server”
-> dhcp-snooping option-82 format system-name
-> dhcp-snooping option-82 format base-mac
-> dhcp-snooping option-82 format interface-alias
-> dhcp-snooping option-82 format auto-interface-alias
-> no dhcp-snooping option-82 format user-string “Building B Server”
```

Release History

Release 8.2.1; command introduced.

```

dhcp-snooping vlan

Enables or disables DHCP Snooping on a per VLAN basis. When this feature is enabled, all DHCP packets received on ports associated with the DHCP Snooping VLAN are filtered.

dhcp-snooping vlan *vlan_id* **[mac-address-verification {enable | disable}] [option-82-data-insertion {enable | disable}] [admin-state]**

no dhcp-snooping vlan *vlan_id*

Syntax Definitions

vlan_id	The VLAN identification number (1–4094).
mac-address verification	Enables or disables verifying the source MAC address of DHCP packets with the client MAC address contained in the same packet.
option-82 data-insertion	Enables or disables inserting Option-82 information into DHCP packets.
admin-state	Enables or disables DHCP snooping feature for specified VLAN.

Defaults

By default, DHCP Snooping is disabled. When this feature is enabled for the specified VLAN, the following default parameter values apply:

parameter	default
mac-address verification	Enabled
option-82 data-insertion	Enabled

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable DHCP Snooping for the specified VLAN.
- The MAC address verification and Option-82 data insertion are applied to packets received on ports associated with the DHCP Snooping VLAN.
- If the DHCP relay agent Option-82 feature is enabled, DHCP Snooping is not available. These two features are mutually exclusive.
- If the DHCP Snooping feature is globally enabled for the switch, then configuring snooping on a per-VLAN basis is not allowed. The opposite is also true; invoking VLAN based snooping prevents the use of switch level snooping.
- Note that disabling the Option-82 data insertion operation for a VLAN is not allowed when the binding table functionality is enabled.

Examples

```
-> dhcp-snooping vlan 100 admin-state enable
-> dhcp-snooping vlan 100 admin-state disable
-> dhcp-snooping vlan 100 admin-state enable mac-address-verification enable
```

Release History

Release 8.2.1; command introduced.

Related Commands

   dhcpSnoopingVlanNumber
   dhcpSnoopingVlanMacVerificationStatus
   dhcpSnoopingVlanOpt82DataInsertionStatus
```

dhcp-snooping port

Configures the DHCP Snooping trust mode for the port. The trust mode determines if the port will accept all DHCP traffic, block all DHCP traffic, or accept only client DHCP traffic.

dhcp-snooping port *chassis/slot1/port1***[-***port1a***] {block | client-only | trust}**

Syntax Definitions

*chassis/slot1/port1***[-***port1a***]**	Specifies the chassis ID, slot number for the module and the physical port number on that module (e.g. 1/3/1 specifies chassis 1 of port 1 on slot 3). Use a hyphen to specify a range of ports (e.g. 1/3/1-16).
block	Blocks all DHCP traffic on the port.
client-only	Allows only DHCP client traffic on the port.
trust	Allows all DHCP traffic on the port. The port behaves as if DHCP Snooping was not enabled.

Defaults

By default, the trust mode for a port is set to **client-only** when the DHCP Snooping feature is enabled for the switch or for a VLAN.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The DHCP trust mode only applies when the DHCP Snooping feature is enabled for the switch or for a VLAN.
- If DHCP Snooping is enabled at the switch level, the trust mode applies to all switch ports.
- If DHCP Snooping is enabled for a specific VLAN, then the trust mode applies to only those ports that are associated with that VLAN.
- Use the **show dhcp-snooping port** command to display the current trust mode for a port and statistics regarding the number of packets dropped due to DHCP Snooping violations.

Examples

```
-> dhcp-snooping port 1/1/24 trust
-> dhcp-snooping port 1/1/1-10 block
-> dhcp-snooping port 1/1/8 client-only
```

Release History

Release 8.2.1; command introduced.

Related Commands

ip udp relay no statistics	Globally enables or disables DHCP Snooping for the switch.
dhcp-snooping vlan	Enables or disables DHCP Snooping on a per-VLAN basis.

MIB Objects

```
dhcpSnoopingPortTable
   dhcpSnoopingPortIfIndex
   dhcpSnoopingPortTrustMode
```

dhcp-snooping linkagg

Configures the DHCP Snooping trust mode for the link aggregate. The trust mode determines if the link aggregate will accept all DHCP traffic, block all DHCP traffic, or accept only client DHCP traffic.

dhcp-snooping linkagg *agg_id* **{block | client-only | trust}**

Syntax Definitions

agg_id	Specifies the link aggregate ID number.
block	Blocks all DHCP traffic on the link aggregate.
client-only	Allows only DHCP client traffic on the link aggregate.
trust	Allows all DHCP traffic on the link aggregate. The port behaves as if DHCP Snooping was not enabled.

Defaults

By default, the trust mode for a link aggregate is set to **client-only** when the DHCP Snooping feature is enabled for the switch or for a VLAN.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The DHCP trust mode only applies when the DHCP Snooping feature is enabled for the switch or for a VLAN.
- If DHCP Snooping is enabled at the switch level, the trust mode applies to all link aggregates.
- If DHCP Snooping is enabled for a specific VLAN, then the trust mode applies to only those link aggregates that are associated with that VLAN.
- Use the **show dhcp-snooping port** command to display the current trust mode for a link aggregate and statistics regarding the number of packets dropped due to DHCP Snooping violations.

Examples

```
-> dhcp-snooping linkagg 1 trust
-> dhcp-snooping linkagg 2 block
-> dhcp-snooping linkagg 3 client-only
```

Release History

Release 8.2.1; command introduced.

Related Commands

ip udp relay no statistics	Globally enables or disables DHCP Snooping for the switch.
dhcp-snooping vlan	Enables or disables DHCP Snooping on a per-VLAN basis.

MIB Objects

```
dhcpSnoopingPortTable
   dhcpSnoopingPortIfIndex
   dhcpSnoopingPortTrustMode
```

dhcp-snooping ip-source-filter

Enables or disables the IP source filtering capability at a port, link aggregation, or VLAN level. When this function is enabled, the switch allows the traffic that matches the client IP address, MAC address, port, and VLAN combination obtained from the DHCP snooping binding table entry.

dhcp-snooping ip-source-filter {vlan *vlan_id* **| port** *chassis/slot/port***[-***port2***] | linkagg** *agg_id***} admin-state {enable | disable}**

Syntax Definitions

vlan_id	The VLAN identification number (1–4094).
*chassis/slot1/port1***[-***port2***]**	Specifies the chassis and slot number for the module and the physical port number on that module. Use a hyphen to specify a range of ports.
agg_id	Specifies the link aggregate identification number.
enable	Enables IP source filtering for the specified port, link aggregation, or VLAN.
disable	Disables IP source filtering for the specified port, link aggregation, or VLAN level.

Defaults

By default, IP source filtering is disabled for a port or link aggregate, or VLAN.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Source filtering can be enabled only on the VLANs on which the DHCP Snooping is enabled.
- Source filtering can be enabled
  - on the ports that are associated with a VLAN on which DHCP Snooping is enabled.
  - on all the ports when DHCP Snooping is globally enabled for the switch.

Examples

```
-> dhcp-snooping ip-source-filter port 1/1/1 enable
-> dhcp-snooping ip-source-filter linkagg 2 enable
-> dhcp-snooping ip-source-filter vlan 10 enable
-> dhcp-snooping ip-source-filter vlan 20 disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show ip udp relay	Displays the ports or VLANs on which IP source filtering is enabled.

MIB Objects

```
dhcpSnoopingPortIpSourceFiltering
   dhcpSnoopingPortIfIndex
   dhcpSourceFilterVlanNumber
   dhcpSourceFilterVlanFilteringStatus
```

dhcp-snooping binding admin-state

Enables or disables the DHCP Snooping binding table functionality. The binding table contains the MAC address, IP address, lease time, binding type (dynamic or static), VLAN number, and the interface information that corresponds to a local untrusted port on the switch.

dhcp-snooping binding admin-state {enable | disable}

Syntax Definitions

enable	Enables the creation of binding table entries.
disable	Disables the creation of binding table entries.

Defaults

By default, the binding table functionality is enabled when the DHCP Snooping feature is enabled for the switch or for a VLAN.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Note that enabling the binding table functionality is not allowed if Option-82 data insertion is *not* enabled at either the switch or VLAN level.

Examples

```
-> dhcp-snooping binding admin-state disable
-> dhcp-snooping binding admin-state enable
```

Release History

Release 8.2.1; command introduced.

Related Commands

dhcp-snooping binding timeout	Configures the amount of time between each automatic save of the binding table contents to a file on the switch.
dhcp-snooping binding action	Synchronizes the contents of the DHCP Snooping binding table with the contents of the **dhcpBinding.db** file saved on the switch.

MIB Objects

```
dhcpSnoopingBindingTable
   dhcpSnoopingBindingStatus
```

dhcp-snooping binding timeout

Configures the amount of time between each automatic save of the DHCP Snooping binding table contents maintained in memory to a file on the switch. This functionality preserves binding table contents across switch reboots.

dhcp-snooping binding timeout *seconds*

Syntax Definitions

seconds	The number of seconds (60 to 600) to wait before the next save.

Defaults

By default, the timeout value is set to 300 seconds.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The timeout value is only valid if the DHCP Snooping binding table functionality is enabled.
- The contents of the binding table is saved to the **dhcpBinding.db** file in the **/flash/switch** directory.
- The **dhcpBinding.db** file is time stamped when a save of the binding table contents is successfully completed.

Examples

```
-> dhcp-snooping binding timeout 600
-> dhcp-snooping binding timeout 250
```

Release History

Release 8.2.1; command introduced.

Related Commands

dhcp-snooping ip-source-filter	.Enables or disables the DHCP Snooping binding table functionality.
dhcp-snooping binding action	Synchronizes the contents of the DHCP Snooping binding table with the contents of the **dhcpBinding.db** file saved on the switch.

MIB Objects

```
dhcpSnoopingBindingTable
   iphelperDhcpSnoopingBindingDatabaseSyncTimeout
```

dhcp-snooping binding action

Triggers a purge or renew action against the DHCP Snooping binding table. A purge action clears the contents of the table. A renew action populates the table with entries saved in the **dhcpBinding.db** file.

dhcp-snooping binding action {purge | renew}

Syntax Definitions

purge	Clears all binding table entries that are maintained in switch memory.
renew	Populates the binding table with entries saved in the **dhcpBinding.db file** located in the **/flash/switch** directory on the switch.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The DHCP Snooping binding table is maintained in the switch memory. Binding table entries are saved on a periodic basis to the **dhcpBinding.db** file on the switch. Use the **purge** and **renew** options available with this command to sync the binding table contents with the contents of the **dhcpBinding.db** file.

Examples

```
-> dhcp-snooping binding action purge
-> dhcp-snooping binding action renew
```

Release History

Release 8.2.1; command introduced.

Related Commands

dhcp-snooping ip-source-filter	.Enables or disables the DHCP Snooping binding table functionality.
dhcp-snooping binding timeout	Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

MIB Objects

```
dhcpSnoopingBindingDatabaseAction
```

dhcp-snooping binding persistency

Retains the entries in the DHCP Snooping binding table for the duration of the lease regardless of the existence of the MAC address in the MAC address table.

dhcp-snooping binding persistency admin-state {enable | disable}

Syntax Definitions

enable	Enables DHCP Snooping binding persistency.
disable	Disables DHCP Snooping binding persistency.

Defaults

By default, DHCP Snooping binding persistency is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- With this option disabled, the entry will be removed if the MAC address is missing from the MAC address table when the database is synchronized.
- Use the **show ip helper** command to display the current status.

Examples

```
-> dhcp-snooping binding persistency admin-state enable
-> dhcp-snooping binding persistency admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

dhcp-snooping ip-source-filter	Enables or disables the DHCP Snooping binding table functionality.
dhcp-snooping binding timeout	Configures the amount of time between each automatic save of the binding table contents to a file on the switch.

MIB Objects

```
dhcpSnoopingBindingPersistencyStatus
```

dhcp-snooping binding

Creates a static entry in the binding table.

dhcp-snooping binding *mac_address* **port** *chassis/slot/port* **address** *ip_address* **vlan** *vlan_id*

no dhcp-snooping binding *mac_address* **port** *chassis/slot/port* **address** *ip_address* **vlan** *vlan_id*

Syntax Definitions

mac_address	The client MAC address.
chassis/slot/port	The chassis, slot, and port number that received the DHCP request.
ip_address	The IP address that the DHCP server offered to the client.
vlan_id	The VLAN identification number (1–4094) of the VLAN to which the client belongs.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Static binding table entries are created using this command. If DHCP Snooping binding table functionality is not enabled, creating a static entry is not allowed.
- Dynamic binding table entries are created when the relay agent receives a DHCPACK packet.
- Use the **no** form of this command to remove a static entry from the DHCP Snooping binding table.

Examples

```
-> dhcp-snooping binding 00:2a:95:51:6c:10 port 1/1/15 address 17.15.3.10 vlan 200
-> no dhcp-snooping binding 00:2a:95:51:6c:10 port 1/1/15 address 17.15.3.10 vlan
200
```

Release History

Release 8.2.1; command introduced.

Related Commands

dhcp-snooping binding timeout	Configures the amount of time between each automatic save of the binding table contents to a file on the switch.
dhcp-snooping binding action	Synchronizes the contents of the DHCP Snooping binding table with the contents of the **dhcpBinding.db** file saved on the switch.

MIB Objects

```
dhcpSnoopingBindingTable
   dhcpSnoopingBindingMacAddress
   dhcpSnoopingBindingIfIndex
   dhcpSnoopingBindingIpAddress
   dhcpSnoopingBindingVlan
   dhcpSnoopingBindingRowStatus
```

show dhcp-snooping ip-source-filter

Displays the ports or VLANs on which IP source filtering is enabled.

show dhcp-snooping ip-source-filter {vlan | port}

Syntax Definitions

vlan	Displays the VLANs on which IP source filtering is enabled.
port	Displays the ports on which IP source filtering is enabled.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The show output displays only those ports or VLANs on which IP source filtering is enabled.
- This command also displays the status of the link aggregate ports when source filtering is enabled at VLAN or port level.

Examples

```
-> show dhcp-snooping ip-source-filter port
Slot   IP Src
Port  Filtering
------+-----------
1/7    Enabled
1/12   Enabled
```

output definitions

Slot/Port	Specifies the slot and port number.
IP Src Filtering	Specifies if IP source filtering status. **Enabled** or **Disabled**.

```
-> show dhcp-snooping ip-source-filter vlan
Vlan ID IP Src Filtering
-------+-----------
 10     Enabled
 11     Enabled
 12     Enabled
 13     Enabled
```

output definitions

Vlan ID	VLAN number.
IP Src Filtering	Specifies if IP source filtering status. **Enabled** or **Disabled**.

Release History

Release 8.2.1; command introduced.

Related Commands

dhcp-snooping ip-source-filter	Enables or disables the IP source filtering at a port, link aggregation, or VLAN level.

MIB Objects

```
dhcpSnoopingPortIpSourceFiltering
   dhcpSnoopingPortIfIndex
   dhcpSourceFilterVlanNumber
   dhcpSourceFilterVlanFilteringStatus
```

show dhcp-snooping vlan

Displays a list of VLANs that have DHCP Snooping enabled and whether or not MAC address verification and Option-82 data insertion is enabled for each VLAN.

show dhcp-snooping vlan

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command only applies if DHCP Snooping is enabled at the VLAN level.
- Use the **show ip helper** command to determine the status of DHCP Snooping at the switch level.

Examples

```
-> show dhcp-snooping vlan
VLAN    Opt82        MAC Addr
 ID    Insertion   Verification
------+----------+--------------
 50       Enabled      Enabled
 60       Enabled      Enabled
 100      Disabled     Enabled
 200      Enabled      Disabled
 1500     Disabled     Disabled
```

output definitions

VLAN ID	The VLAN identification number for the DHCP Snooping VLAN.
MAC Address Verification	Indicates whether or not MAC address verification is enabled for the VLAN (**Enabled** or **Disabled**). Configured through the **dhcp-snooping vlan** command.
Opt-82 Data Insertion	Indicates whether or not Option-82 data insertion is enabled for the VLAN (**Enabled** or **Disabled**). Configured through the **dhcp-snooping vlan** command.

Release History

Release 8.2.1; command introduced.

Related Commands

show ip helper	Displays current DHCP Relay configuration information.
show dhcp-snooping port	Displays the trust mode and DHCP violation statistics for all switch ports that are filtered by DHCP Snooping.

MIB Objects

```
dhcpSnoopingVlanTable
   dhcpSnoopingVlanNumber
   dhcpSnoopingVlanMacVerificationStatus
   dhcpSnoopingVlanOpt82DataInsertionStatus
```

show dhcp-snooping port

Displays the trust mode and DHCP Snooping violation statistics for all switch ports that are filtered by DHCP Snooping.

show dhcp-snooping port

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If DHCP Snooping is operating at the switch level, then information for all switch ports is displayed.
- If DHCP Snooping is operating at the VLAN level, then information for only those ports that are associated with a DHCP Snooping VLAN is displayed.
- The violation statistics displayed only apply to ports that are in the client only trust mode. When the trust mode for a port is changed from **client-only** to **trusted** or **blocked**, the violation counters are set to zero (0).

Examples

```
-> show dhcp-snooping port
Slot      Trust        IP Src    Opt82       MAC      Server     Relay    Binding
Port      Mode       Filtering Violation  Violation  Violation  Violation Violation
-----+-------------+----------+----------+----------+----------+---------|---------
1/1        Blocked    Disabled      0          0          0          0        0
1/2    Client-Only    Enabled       0          0          0          0        0
1/3    Client-Only    Enabled       0          0          0          0        0
1/4    Client-Only    Enabled       0          0          0          0        0
1/5    Client-Only    Enabled       0          0          0          0        0
1/6        Blocked    Disabled      0          0          0          0        0
1/7    Client-Only    Enabled       0          0          0          0        0
1/8    Client-Only    Enabled       0          0          0          0        0
1/9    Client-Only    Enabled       0          0          0          0        0
1/10       Trusted    Disabled      0          0          0          0        0
1/11       Trusted    Disabled      0          0          0          0        0
1/12       Trusted    Disabled      0          0          0          0        0
```

output definitions

Slot/Port	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
Trust Mode	The DHCP Snooping trust mode for the port (**Blocked**, **Client-Only**, or **Trusted**). Configured through the **dhcp-snooping port** command.
IP Src Filtering	Indicates whether or not IP source filtering is enabled for the port (**Enabled** or **Disabled**). Configured through the **dhcp-snooping ip-source-filter** command.
Opt82 Violation	The number of DHCP packets dropped due to a DHCP Snooping Option-82 violation.
MAC Violation	The number of DHCP packets dropped due to a mismatch between the packet source MAC address and the client hardware address contained within the packet.
Server Violation	The number of DHCP server packets dropped because they originated from outside the network or firewall.
Relay Violation	The number of DHCP packets dropped because the packet included a relay agent IP address that was not 0.0.0.0.
Binding Violation	The number of DHCP packets dropped due to a mismatch between packets received and binding table information.

Release History

Release 8.2.1; command introduced.

Related Commands

show ip helper	Displays current DHCP Relay configuration information.
show dhcp-snooping vlan	Displays a list of DHCP Snooping VLANs.

MIB Objects

```
dhcpSnoopingPortTable
   dhcpSnoopingPortIfIndex
   dhcpSnoopingPortTrustMode
   dhcpSnoopingPortIpSourceFiltering
   dhcpSnoopingPortOption82Violation
   dhcpSnoopingPortMacAddrViolation
   dhcpSnoopingPortDhcpServerViolation
   dhcpSnoopingPortRelayAgentViolation
   dhcpSnoopingPortBindingViolation
```

show dhcp-snooping binding

Displays the contents of the DHCP Snooping binding table (database).

show dhcp-snooping binding

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **dhcp-snooping ip-source-filter** command to create a static entry in the binding table.
- Dynamic binding table entries are created when the relay agent receives a DHCPACK packet.

Examples

```
-> show dhcp-snooping binding
       MAC           Slot        IP          Lease    VLAN     Binding
     Address         Port      Address       Time      ID       Type
------------------+------+--------------+---------+-------+-----------
00:ae:22:e4:00:08    1/4    10.255.11.23     2000      5      Dynamic
10:fe:a2:e4:32:08    2/15   10.255.91.53     2000      2      Dynamic
```

output definitions

MAC Address	The MAC address of the client.
Slot/Port	The slot/port designation for the switch port that received the DHCP request
IP Address	The IP address offered by the DHCP server.
Lease Time	The IP address lease time assigned by the DHCP server. A value of 0 indicates a static entry.
VLAN ID	The VLAN ID of the VLAN to which the client belongs.
Binding Type	Indicates whether the binding table entry is **dynamic** or **static**. Static entries are created using the **dhcp-snooping binding** command.

Release History

Release 8.2.1; command introduced.

Related Commands

show ip helper	Displays current DHCP Relay configuration information.
show dhcp-snooping vlan	Displays a list of DHCP Snooping VLANs.
show dhcp-snooping port	Displays the trust mode and DHCP violation statistics for all switch ports that are filtered by DHCP Snooping.

MIB Objects

   dhcpSnoopingBindingType
```

22 VRRP Commands

The Virtual Router Redundancy Protocol (VRRP) eliminates the single point of failure in a default route environment. VRRP specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the VRRP/VRRP3 routers on the LAN. The VRRP/VRRP3 router, which controls the IP/IPv6 address associated with a virtual router is called the master router, and forwards packets to that IP/IPv6 address. If the master router becomes unavailable, the highest priority backup router will transition to the master state. The Alcatel-Lucent implementation of VRRP also supports the collective management of virtual routers on a switch.

Note. VRRP3 does not support the collective management functionality in this release.

The VRRP and VRRP3 commands comply with RFC 2787 and RFC 3768, respectively.

MIB information is as follows:

Filename: IETF-VRRP.MIB
Module: VRRP-MIB

Filename: AlcatelIND1VRRP.MIB
Module: ALCATEL-IND1-VRRP-MIB

Filename: AlcatelIND1VRRP3.MIB
Module: ALCATEL-IND1-VRRP3-MIB

A summary of the available VRRP commands is listed here:

show vrrp track-association
show vrrp group
show vrrp group-association
show vrrp3
show vrrp3 statistics
show vrrp3 track-association

vrrp

Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.

vrrp *vrid vlan_id* **admin-state [enable | disable] [priority** *priority***] [preempt | no preempt] [[advertising] interval** *seconds***]**

no vrrp *vrid vlan_id*

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
vlan_id	The VLAN on which the virtual router is configured. The VLAN must already be created and available on the switch.
enable	Enables the virtual router. A virtual router may only be enabled if an IP address is configured for the virtual router.
disable	Disables the virtual router. Cannot be combined on the same line with other parameters.
priority	The priority for this virtual router to become the master router. The range is 1 (lowest priority) to 255 (highest priority). The priority should be set to 255 only if this router is the actual owner of the virtual router's IP address.
preempt	Specifies that a higher priority router may preempt a lower priority master router.
no preempt	Specifies that a higher priority router may not preempt a lower priority master router.
seconds	The interval in seconds after which the master router will send VRRP advertisements. The advertising interval must be same for all VRRP routers configured with the same VRID. The valid range is 1–255 seconds.

Defaults

parameter	default
enable | disable	**disable**
priority	100
preempt | no preempt	**preempt**
seconds	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a virtual router from the configuration.

- Use the **vrrp address** command to configure an IP address for the virtual router. This must be done before the virtual router can be enabled.
- To disable the virtual router, rather than to remove it, use the **disable**. Note that **disable** cannot be used with any other optional parameter.
- A virtual router must be disabled before it can be modified.
- **Advertising** is an optional command parameter. When prefaced before **interval**, it displays the same information as **vrrp** *vrid vlan_id* **interva**formation about configuring priority:
- A value of 255 indicates that the VRRP router owns the IP address; that is, the router contains the real physical interface to which the IP address is assigned. The system automatically sets this value to 255 if it detects that this router is the IP address owner. If the priority is set to 255 and the virtual router is not the IP address owner, then the priority will be set to the default value of 100. The IP address owner will always be the master router if it is available.
- VRRP routers backing up a virtual router must use priority values from 1 to 255. The default priority value for VRRP routers backing up a virtual router is 100. If you configure more than one backup, their priority values should be different. The **preempt** or **no preempt** setting specifies whether or not a higher priority router may preempt a lower priority master router.

Examples

```
-> vrrp 23 1 priority 75
-> vrrp 23 1 admin-state enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp address	Configures an IP address for a virtual router.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVrrp3OperTable
   alaVrrp3OperAdminState
   alaVrrp3OperPriority
   alaVrrp3OperPreemptMode
   alaVrrp3OperAdvertisementinterval
   alaVrrp3OperRowStatus
```

vrrp address

Configures an IP address for a virtual router.

vrrp *vrid vlan_id* **address** *ip_address*

vrrp *vrid vlan_id* **no address** *ip_address*

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
vlan_id	The VLAN on which the virtual router is configured.
ip_address	The virtual IP address associated with the specified virtual router.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A virtual router IP address must be configured before the virtual router can be enabled.
- **ip** is an optional command parameter. It displays the same information as **vrrp address**.

Examples

```
-> vrrp 1 3 address 10.10.3.2
-> vrrp 1 3 no address 10.10.3.2
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable to disable a virtual router.
show vrrp statistics	Displays statistics about VRRP packets for all virtual routers configured on the switch or for a specific virtual router.

MIB Objects

```
alaVrrp3AssoIpAddrTable
   alaVrrp3AssoIpAddrRowStatus
```

vrrp track

Creates a new tracking policy or modifies an existing tracking policy.

vrrp track *track_id* **admin-state [enable | disable] [priority** *value***] [ipv4-interface** *name* | **ipv6-interface** *name* **| port** *chassis//slot/port* **| address** *address***]**

no vrrp track *track_id*

Syntax Definitions

track_id	The ID of the tracking policy; the range is 1 to 255.
enable	Enables the tracking policy.
disable	Disables the tracking policy.
value	The value to be decremented from the priority value of the virtual router monitoring this tracking policy when the operational state of the tracking policy is down. The valid range is 0–255.
name	The name of the IPv4 or IPv6 interface that this policy will track.
chassis	The chassis identifier.
slot/port	The slot/port number that this policy will track.
address	The remote IP or IPv6 address that this policy will track.

Defaults

parameter	default
enable | disable	**enable**
value	25

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a tracking policy.
- Use the **disable** option to disable the tracking policy, rather than removing it from the switch.

Examples

```
-> vrrp track 2 admin-state enable priority 50 ipv4-interface Marketing
-> vrrp track 3 admin-state enable priority 60 ipv6-interface Sales
-> vrrp track 3 admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp track-association	Associates a VRRP tracking policy with a virtual router.
show vrrp track	Displays information about tracking policies on the switch.

MIB Objects

```
alaVRRPTrackTable
   alaVrrpTrackState
   alaVrrpTrackAdminState
   alaVrrpTrackPriority
   alaVrrpTrackEntityType
   alaVrrpTrackEntityVlan
   alaVrrpTrackEntityPort
   alaVrrpTrackEntityIpAddress
   alaVrrpTrackEntityIpv6Interface
   alaVrrpTrackEntityInterface
   alaVrrpTrackRowStatus
```

vrrp track-association

Associates a VRRP tracking policy with a virtual router.

vrrp *vrid vlan_id* **track-association** *track_id*

vrrp *vrid vlan_id* **no track-association** *track_id*

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
vlan_id	The VLAN ID of the virtual router.
track_id	The ID of the tracking policy associated with the virtual router; the range is 1 to 255.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to remove a tracking policy from a virtual router.

Examples

```
-> vrrp 2 4 track-association 1
-> vrrp 2 4 no track-association 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.
show vrrp track-association	Displays the tracking policies associated with virtual routers.

MIB Objects

```
alaVrrpAssoTrackTable
   alaVrrpAssoTrackId
   alaVrrpTrackRowStatus
```

vrrp trap

Enables or disables SNMP traps for VRRP.

vrrp trap

no vrrp trap

Syntax Definitions

N/A

Defaults

By default, SNMP traps for VRRP are enabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

SNMP traps must be enabled globally on the switch for VRRP traps to actually be sent.

Examples

```
-> vrrp trap
-> no vrrp trap
```

Release History

Release 8.1.1; command was introduced.

Related Commands

snmp-trap filter-ip	Enables or disables SNMP trap filtering.

MIB Objects

```
vrrpOperGroup
   vrrpNotificationCntl
```

vrrp delay

Configures the amount of time allowed for routing tables to stabilize before virtual routers are started.

vrrp delay *seconds*

Syntax Definitions

seconds	The amount of time after a reboot that virtual routers will wait before they go active; the range is 0 to 180 seconds.

Defaults

parameter	default
seconds	45 seconds

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command to prevent loss of workstation connectivity before a virtual router becomes master.

Examples

```
-> vrrp delay 50
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVRRPStartDelay
```

vrrp interval

Modifies the default advertising interval value assigned to the virtual routers on the switch.

vrrp interval *seconds*

Syntax Definitions

seconds	The default advertising interval for the virtual routers. The valid range is 1–255 seconds.

Defaults

parameter	default
seconds	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Modifying the default advertising interval value will affect the value assigned by default to any new virtual routers that are created.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

Examples

```
-> vrrp interval 50
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp all	Changes the administrative status of all the virtual routers on the switch.
vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVrrpv2Config
   alaVrrpDefaultInterval
```

vrrp priority

Modifies the default priority value assigned to the virtual routers on the switch.

vrrp priority *priority*

Syntax Definitions

priority	The default priority value for the virtual routers. The valid range is 1–255.

Defaults

parameter	default
priority	100

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Modifying the default priority value will affect the value assigned by default to any new virtual routers that are created.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using the **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

Examples

```
-> vrrp priority 50
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp all	Changes the administrative status of all the virtual routers on the switch.
vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVrrpv2Config
   alaVrrpDefaultPriority
```

vrrp preempt

Modifies the default preempt mode assigned to the virtual routers on the switch.

vrrp [preempt | no preempt]

Syntax Definitions

preempt	Specifies that a higher priority router may preempt a lower priority master router by default.
no preempt	Specifies that a higher priority router may not preempt a lower priority master router by default.

Defaults

parameter	default
preempt | no preempt	**preempt**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Modifying the default preempt mode will affect the mode assigned by default to any new virtual routers that are created.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using the **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

Examples

```
-> vrrp preempt
-> vrrp no preempt
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp all	Changes the administrative status of all the virtual routers on the switch.
vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVrrpv2Config
   alaVrrpDefaultPreemptMode
```

vrrp all

Changes the administrative status of all the virtual routers on the switch.

vrrp admin-state [disable | enable | enable-all]

Syntax Definitions

disable	Disables all the virtual routers on the switch.
enable	Enables the virtual routers that have not previously been disabled individually or collectively through the **vrrp group all** command.
enable-all	Enables all the virtual routers on the switch including those virtual routers that have been disabled individually or collectively through the **vrrp group all** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command changes the administrative status of all the virtual routers on the switch by executing a single command.
- This command will not affect the ability to change the administrative status of an individual virtual router.

Examples

```
-> vrrp admin-state disable
-> vrrp admin-state enable
-> vrrp admin-state enable-all
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp interval	Modifies the default advertising interval value assigned to the virtual routers on the switch.
vrrp priority	Modifies the default priority value assigned to the virtual routers on the switch.
vrrp preempt	Modifies the default preempt mode assigned to the virtual routers on the switch.
vrrp set	Sets the new default parameter values to existing virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVrrpv2Config
   alaVrrpAdminState
```

vrrp set

Sets the new default parameter values to existing virtual routers on the switch.

vrrp set [interval | priority | preempt | all | none] [override]

Syntax Definitions

interval	Sets the VRRP advertisement interval value to the new default value.
priority	Sets the priority value to the new default value.
preempt	Sets the preempt mode to the new default mode.
all	Sets all the parameters value to the new default value.
none	Resets all the parameter values to their default values.
override	Overrides the specified parameters configured value with the new default value.

Defaults

parameter	default
interval | priority | preempt | all	**all**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- All the virtual routers must be disabled before using this command.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using the **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

Examples

```
-> vrrp set priority
-> vrrp set priority override
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp interval	Modifies the default advertising interval value assigned to the virtual routers on the switch.
vrrp priority	Modifies the default priority value assigned to the virtual routers on the switch.
vrrp preempt	Modifies the default preempt mode assigned to the virtual routers on the switch.
vrrp all	Changes the administrative status of all the virtual routers on the switch.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVrrpv2Config
   alaVrrpSetParam
   alaVrrpOverride
```

vrrp group

Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.

vrrp group *vrgid* **[interval** *seconds***] [priority** *priority***] [preempt | no preempt]**

no vrrp group *vrgid*

Syntax Definitions

vrgid	The virtual router group ID, in the range from 1–255.
seconds	The default advertising interval for the virtual router group. The valid range is 1–255 seconds.
priority	The default priority value for the virtual router group. The valid range is 1–255.
preempt	Specifies that a higher priority router may preempt a lower priority master router by default.
no preempt	Specifies that a higher priority router may not preempt a lower priority master router by default.

Defaults

parameter	default
seconds	1
priority	100
preempt | no preempt	**preempt**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the virtual router group.
- The configuration parameters can be modified at any time, but will not have any effect on the virtual routers in the group until the virtual routers are enabled again. To apply the group default value to the virtual routers in a group, you must first disable the virtual router group, then apply the group default value using the **vrrp group set** command and enable the virtual router group again.
- If any of the virtual routers in the group are running with their configured value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual router group, then override the configured value by using the **vrrp group set** command with the **override** option and enable the virtual router group again.
- When a virtual router group is deleted, the virtual routers assigned to the group become unassigned. However, this does not have any impact on the virtual routers.

Examples

```
-> vrrp group 25 interval 50 priority 50 no preempt
-> no vrrp group 25
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp group all	Changes the administrative status of all the virtual routers in a virtual router group using a single command.
vrrp group set	Sets the new modified default value to all the virtual routers in a virtual router group.
vrrp group-association	Adds a virtual router to a virtual router group.
show vrrp group	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

MIB Objects

```
alaVrrpGroupTable
   alaVrrpGroupInterval
   alaVrrpGroupPriority
   alaVrrpGroupPreemptMode
   alaVrrpGroupRowStatus
```

vrrp group all

Changes the administrative status of all the virtual routers in a virtual router group using a single command.

vrrp group *vrgid* **admin-state [disable | enable | enable-all]**

Syntax Definitions

vrgid	The virtual router group ID, in the range from 1–255.
disable	Disables all the virtual routers in the group.
enable	Enables those virtual routers that have not previously been disabled individually in the group.
enable-all	Enables all the virtual routers in the group including those virtual routers that have been disabled individually.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If a virtual router in a group is disabled on an individual basis, it can only be reenabled by using the **enable-all** option in this command.
- This command will not affect the ability to change the administrative status of an individual virtual router.

Examples

```
-> vrrp group 25 admin-state disable
-> vrrp group 25 admin-state enable
-> vrrp group 25 admin-state enable-all
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp group	Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.
vrrp group set	Sets the new modified default value to all the virtual routers in a virtual router group.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.
show vrrp group	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

MIB Objects

```
alaVrrpGroupTable
   alaVrrpGroupAdminState
```

vrrp group set

Sets the new modified default value to all the virtual routers in a virtual router group.

vrrp group *vrgid* **set [interval | priority | preempt | all] [override]**

Syntax Definitions

vrgid	The virtual router group ID, in the range from 1–255.
interval	Sets the VRRP advertisement interval value to the new default value.
priority	Sets the priority value to the new default value.
preempt	Sets the preempt mode to the new default mode.
all	Sets all the parameters' value to the new default value.
override	Overrides the parameter's configured value with the group default value.

Defaults

parameter	default
interval | priority | preempt | all	**all**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- All the virtual routers must be disabled before using this command.
- To apply the group default value to the virtual routers in a group, you must disable the virtual router group, then apply the group default value using the **vrrp group set** command and enable the virtual router group again.
- If any of the virtual routers in the group are running with their own configured parameter value, then that value will take priority over the group default value. To override the configured value with the group default value, you must first disable the virtual router group, then override the configured value by using the **vrrp group set** command with the **override** option and enable the virtual router group again.

Examples

```
->vrrp group 10 set priority
->vrrp group 10 set priority override
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp group	Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.
vrrp group all	Changes the administrative status of all the virtual routers in a virtual router group using a single command.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.
show vrrp group	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

MIB Objects

```
alaVrrpGroupTable
   alaVrrpGroupSetParam
   alaVrrpGroupOverride
```

vrrp group-association

Adds a virtual router to a virtual router group.

vrrp *vrid vlan_id* **group-association** *vrgid*

vrrp *vrid vlan_id* **no group-association** *vrgid*

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
vlan_id	The VLAN on which the virtual router is configured. The VLAN must already be created and available on the switch.
vrgid	The virtual router group ID, in the range from 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the virtual router from the virtual router group.
- A virtual router need not be disabled in order to be added to a virtual router group. However, the virtual router will not adopt the group's default parameter values until it is reenabled.
- A virtual router need not be disabled to be removed from a group.

Examples

```
-> vrrp 25 1 group-association 10
-> vrrp 25 1 no group-association 10
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show vrrp group-association	Displays the virtual routers that are associated with a group.

MIB Objects

```
alaVrrpAssoGroupTable
   alaVrrpAssoGroupRowStatus
```

vrrp3

Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.

vrrp3 *vrid vlan_id* **admin-state [enable | disable] [priority** *priority***] [preempt | no preempt][accept | no accept] [[advertising] interval** *centiseconds***]**

no vrrp3 *vrid vlan_id*

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
vlan_id	The VLAN on which the virtual router is configured. The VLAN must already be created and available on the switch.
enable	Enables the virtual router.
disable	Disables the virtual router. Cannot be combined on the same line with other parameters.
priority	The priority for this virtual router to become the master router. The range is 1 (lowest priority) to 255 (highest priority). The priority should be set to 255 only if this router is the actual owner of the virtual router's IP address.
preempt	Specifies that a higher priority router may preempt a lower priority master router.
no preempt	Specifies that a higher priority router may not preempt a lower priority master router.
accept	Specifies that the master router, which is not the IPv6 address owner will accept the packets addressed to the IPv6 address owner as its own.
no accept	Specifies that the master router, which is not the IPv6 address owner will not accept the packets addressed to the IPv6 address owner as its own.
centiseconds	The interval in centiseconds after which the master router will send VRRP3 advertisements. The advertising interval must be the same for all VRRP3 routers configured with the same VRID. The valid range is 1–4096 centiseconds.

Defaults

parameter	default
enable | disable	**disable**
priority	100
preempt | no preempt	**preempt**
accept | no accept	**accept**
centiseconds	100

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a virtual router from the configuration.
- Use the **vrrp3 address** command to configure an IPv6 address for the virtual router.
- To disable the virtual router, rather than to remove it, use the **disable** option. Note that the **disable** option cannot be used with any other optional parameter.
- A virtual router must be disabled before it can be modified.
- The maximum number of virtual routers supported is based on the 100 centisecond interval. A smaller interval will result in a relatively lesser number of virtual routers.
- The advertising interval cannot be less than 10 centiseconds.
- **Advertising** is an optional command parameter. When prefaced before **interval**, it displays the same information as **vrrp3** *vrid vlan_id* **interval**.

Examples

```
-> vrrp3 23 1 priority 75
-> vrrp3 23 1 admin-state enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp3 address	Configures an IPv6 address for a virtual router.
show vrrp3	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

```
alaVrrp3OperTable
   alaVrrp3OperAdminState
   alaVrrp3OperPriority
   alaVrrp3OperPreemptMode
   alaVrrp3OperAcceptMode
   alaVrrp3OperAdvinterval
   alaVrrp3OperRowStatus
```

vrrp3 address

Configures an IPv6 address for a virtual router.

vrrp3 *vrid vlan_id* **address [***ipv6Addr* **|** *ipv6v4Addr***]**

vrrp3 *vrid vlan_id* **no address [***ipv6Addr* **|** *ipv6v4Addr***]**

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
vlan_id	The VLAN on which the virtual router is configured.
address	The virtual IPv6 address associated with the specified virtual router.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

IP is an optional command parameter. It displays the same information as **vrrp3 address**.

Examples

```
-> vrrp3 1 3 address 213:100:1::56
-> vrrp3 1 3 no address 213:100:1::56
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp3	Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.
show vrrp3 statistics	Displays statistics for all virtual routers configured on the switch or for a specific virtual router.

MIB Objects

```
alaVrrp3AssoIpAddrTable
   alaVrrp3AssoIpAddrRowStatus
```

vrrp3 trap

Enables or disables SNMP traps for VRRP3.

vrrp3 trap

no vrrp3 trap

Syntax Definitions

N/A

Defaults

By default, SNMP traps for VRRP3 are enabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

SNMP traps must be enabled globally on the switch for VRRP3 traps to actually be sent.

Examples

```
-> vrrp3 trap
-> no vrrp3 trap
```

Release History

Release 8.1.1; command was introduced.

Related Commands

snmp-trap filter-ip	SNMP traps must be enabled with this command.

MIB Objects

```
alaVrrp3OperGroup
   alaVrrp3NotificationCntl
```

vrrp3 track-association

Associates a VRRP3 tracking policy with a virtual router.

vrrp3 *vrid vlan_id* **track-association** *track_id*

vrrp3 *vrid vlan_id* **no track-association** *track_id*

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
vlan_id	The VLAN ID of the virtual router.
track_id	The ID of the tracking policy associated with the virtual router; the range is 1 to 255.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a tracking policy from a virtual router.
- Use the **vrrp track** command to create a tracking policy for an IPv6 interface.

Examples

```
-> vrrp3 2 4 track-association 1
-> vrrp3 2 4 no track-association 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp3	Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.
show vrrp3 track-association	Displays the tracking policies associated with VRRP3 virtual routers.

MIB Objects

```
alaVrrp3AssoTrackTable
   alaVrrp3AssoTrackId
   alaVrrp3TrackRowStatus
```

show vrrp

Displays the virtual router configuration for all virtual routers or for a specific virtual router.

show vrrp [*vrid***]**

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **show vrrp** command to display information about configuration parameters, which may be set through the **vrrp** command. Use the **show vrrp statistics** command to get information about VRRP packets.

Examples

The following is an example of the output display on an OmniSwitch 6860, 6860E:

```
-> show vrrp
VRRP trap generation: Enabled
VRRP startup delay: 75
               IP           Admin                            Adv.
VRID  VLAN   Address(es)    Status   Priority  Preempt    Interval
----+ ----+ -------------+----------+----------+----------+---------
  1    1   192.168.170.1   Enabled     255        Yes          1
           192.168.170.2
  2   15   10.2.25.254     Disabled    100         No          1
```

The following is an example of the output display on an OmniSwitch 6860, 6860E:

```
-> show vrrp
VRRP default advertisement interval: 5 seconds
VRRP default priority: 100
VRRP default preempt: Yes
VRRP trap generation: Enabled
VRRP startup delay: 45  (expired)

            IP              Admin                        Adv.
VRID VLAN   Address(es)    Status  Priority Preempt Interval
----+----+--------------+--------+--------+------+--------
   1  101 192.60.245.240  Enabled        100 Yes          5
   2  102 192.60.246.240  Enabled        100 Yes          5
```

```
-> show vrrp 1
Virtual Router VRID = 1 on VLAN = 1
   Admin Status       = Enabled
   Priority           = 255
   Preempt            = Yes
   Adv. Interval      = 1
   Virtual MAC        = 00-00-5E-00-02-01
   IP Address(es)
      192.168.170.1
      192.168.170.2
```

output definitions

VRRP default advertisement interval	The default advertising interval for all virtual routers on the switch.
VRRP default priority	The default priority value for all virtual routers on the switch.
VRRP default preempt	The default preempt mode for all virtual routers on the switch.
VRRP trap generation	Indicates whether or not the VRRP trap generation is enabled or disabled; configured through the **vrrp track** command.
VRRP startup delay	The amount of time after a reboot that virtual routers will wait before they go active; allows time for routing tables to stabilize. Configured through the **vrrp delay** command.
VRID	Virtual router identifier. Configured through the **vrrp** command.
VLAN	The VLAN associated with the VRRP instance. Configured through the **vrrp** command.
IP Address(es)	The assigned IP addresses. Configured through the **vrrp address** command.
Admin Status	The administrative status of this virtual router instance; **enabled** allows the virtual router instance to operate; **disabled** disables the virtual router instance without deleting it.
Priority	Indicates the VRRP router's priority for the virtual router. For more information about priority, see the **vrrp** command description on page 22-3.
Preempt	Controls whether a higher priority virtual router will preempt a lower priority master router: preempt indicates that a higher priority virtual router will preempt a lower priority master; no preempt indicates that the first backup router to take over for the master will not be preempted by a virtual router with a higher priority. In either case, the IP address owner will always take over it if is available.
Virtual MAC	Displays the virtual MAC address for the virtual router. The first 5 bytes are always 00-00-5E-00-02. The last byte indicates the VRID. This field displays N/A when the virtual router is in the **backup** or **initialize** state.
Adv. Interval	Indicates the time interval, in seconds, between sending advertisement messages. Only the master router sends advertisements.

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.
vrrp address	Configures an IP address for a virtual router.
vrrp interval	Modifies the default advertising interval value assigned to the virtual routers on the switch.
vrrp priority	Modifies the default priority value assigned to the virtual routers on the switch.
vrrp preempt	Modifies the default preempt mode assigned to the virtual routers on the switch.
show vrrp statistics	Displays statistics for all virtual routers configured on the switch or for a specific virtual router.

MIB Objects

```
alaDispVrpp3Config
   alaVRRPDefaultInterval
   alaVRRPDefaultPriority
   alaVRRPDefaultPreemptMode
   alaVrrp3AssoIpAddr
   alaVrrp3OperAdminState
   alaVrrp3OperPriority
   alaVrrp3OperPreemptMode
   alaVrrp3OperAcceptMode
```

show vrrp statistics

Displays statistics about VRRP packets for all virtual routers configured on the switch or for a specific virtual router.

show vrrp [*vrid***] statistics**

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **show vrrp statistics** command to display information about VRRP packets. Use the **show vrrp** command to display information about the virtual router configuration.

Examples

```
-> show vrrp statistics
Checksum   Version      VRID
 Errors     Errors      Errors
----------+-----------+---------
         0          0         0

VRID  VLAN   State          UpTime   Become Master   Adv. Rcvd
----+ ----+ -------------+----------+--------------+------------
  1      1  master          378890            1             0
  2     15  backup            4483            0            44
  7      2  initialize           0            0             0
```

output definitions

Checksum Errors	The total number of VRRP packets received with an invalid checksum value.
Version Errors	The total number of VRRP packets received with an invalid version number.
VRID Errors	The total number of VRRP packets received with invalid VRIDs.
VRID	The virtual router identifier.
VLAN	The VLAN associated with the VRRP instance.

output definitions (continued)

State	The operational state of the VRRP router instance; **initialize** specifies that the interface or VLAN is either disabled or down, or if the startup delay timer has not expired; **backup** specifies that this instance is monitoring the availability of the master router; **master** specifies that this instance is functioning as the master router.
UpTime	Time interval (in hundredths of a second) since this virtual router was last initialized.
Become Master	The total number of times this virtual router's state has transitioned from backup to master.
Adv. Rcvd	The total number of VRRP advertisements received by this instance.

```
-> show vrrp 1 statistics
Virtual Router VRID = 1 on VLAN = 1
   State                                = master
   UpTime (1/100th second)              = 378890
   Become master                        = 1
   Advertisements received              = 0
   Type errors                          = 0
   Advertisement interval errors        = 0
   Authentication errors                = 0
   IP TTL errors                        = 0
   IP address list errors               = 0
   Packet length errors                 = 0
   Zero priority advertisements sent    = 0
   Zero priority advertisements received  = 0
```

output definitions

VRID	The virtual router identifier.
VLAN	The VLAN associated with the VRRP instance.
State	The operational state of this VRRP router instance; **initialize** specifies that the interface or VLAN is either disabled or down, or the startup delay timer has not expired; **backup** specifies that this instance is monitoring the availability of the master router; **master** specifies that this instance is functioning as the master router.
UpTime	Time interval (in hundredths of a second) since this virtual router was last initialized.
Become master	The total number of times this virtual router's state has transitioned from backup to master.
Advertisements received	The total number of VRRP advertisements received by this instance.
Type errors	The total number of VRRP packets received with an invalid value in the VRRP type field.
Advertisement interval errors	The total number of VRRP packets received in which the advertisement interval differs from the one configured for the virtual router.
Authentication errors	The total number of VRRP packets received with an unknown or invalid authentication type.
IP TTL errors	The total number of VRRP packets received with a TTL value other than 255.

output definitions (continued)

IP address list errors	The total number of VRRP packets in which the IP address list does not match the configured list for the virtual router.
Packet length errors	The total number of VRRP packets received with a length less than the length of the VRRP header.
Zero priority advertisements sent	The total number of VRRP advertisements with a priority of 0 sent by the virtual router.
Zero priority advertisements received	The total number of VRRP advertisements with a priority of 0 received by the virtual router.

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp	Configures a new VRRP virtual router or modifies an existing one. Used to enable to disable a virtual router.
show vrrp	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

show vrrp track

Displays information about tracking policies on the switch.

show vrrp track [*track_id***]**

Syntax Definitions

track_id	The ID of the tracking policy for which you want to display information.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Enter the tracking ID to display information about a particular policy; if no tracking policy ID is entered, information for all tracking policies is displayed.

Examples

```
-> show vrrp track
Track                      Admin    Oper
 ID         Policy         State    State  Pri
-----+-----------------+----------+------+-----
   1    PORT 1/1         Enabled    Up      25
   2    192.10.150.42    Enabled    Down    25
```

output definitions

Track ID	The ID of the tracking policy.
Policy	The slot/port, IP address, or VLAN tracked by the policy.
Admin State	Whether the tracking policy is administratively enabled or disabled.
Oper State	Indicates whether the operating state of the tracking policy is Up or Down.
Pri	The value to be decremented from the priority value of the virtual router monitoring this tracking policy when the operational state of the tracking policy is down.

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp track	Creates a new tracking policy or modifies an existing tracking policy.

MIB Objects

```
alaVRRPTrackTable
   alaVrrpTrackState
   alaVrrpTrackAdminState
   alaVrrpTrackPriority
   alaVrrpTrackEntityType
   alaVrrpTrackEntityVlan
   alaVrrpTrackEntityPort
   alaVrrpTrackEntityIpAddress
   alaVrrpTrackEntityIpv6Interface
   alaVrrpTrackEntityInterface
```

show vrrp track-association

Displays the tracking policies associated with virtual routers.

show vrrp [*vrid***] track-association [***track_id***]**

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
track_id	The ID of the tracking policy for which you want to display information.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If a track ID is specified, only information about that track ID is displayed. If the virtual router ID and track ID are not specified, information about all virtual routers and their associated tracking policies is displayed.

Examples

```
-> show vrrp 2 track-association
           Conf  Cur  Track                      Admin   Oper  Track
VRID VLAN  Pri   Pri   ID        Policy           State   State  Pri
----+----+-----+-----+-----+----------------+----------+-----+------
   2    1  100   100     1  VLAN    1           Enabled  Up       25
                        2    10.255.11.101     Enabled  Up       25
```

output definitions

VRID	The virtual router identifier.
VLAN	The VLAN ID associated with the virtual router.
Conf Pri	The priority configured for the virtual router through the **vrrp** command.
Cur Pri	The priority currently being used for the virtual router. If the tracking policy is in effect because the tracked entity is down, the current priority will be equal to the configured priority (Conf Pri) minus the tracking priority (Track Pri). Otherwise the current priority will be equal to the configured priority.
Track ID	The ID of the tracking policy.
Policy	The VLAN, IP address, or slot/port being tracked by this policy.
Admin State	The administrative state of the tracking policy configured through the **vrrp track** command.

output definitions (continued)

Oper State	Whether the tracking policy is operational (Up) or not (Down).
Track Pri	The amount to be decremented from the configured virtual router priority when the tracking policy is applied.

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp track-association	Associates a VRRP tracking policy with a virtual router.
vrrp track	Creates a new tracking policy or modifies an existing tracking policy.

MIB Objects

alaVrrpAssoTrackTable
   alaVrrpAssoTrackId
alaVRRPTrackTable
   alaVrrpTrackState
   alaVrrpTrackAdminState
   alaVrrpTrackPriority
   alaVrrpTrackEntityType
   alaVrrpTrackEntityVlan
   alaVrrpTrackEntityPort
   alaVrrpTrackEntityIpAddress
   alaVrrpTrackEntityInterface
```

show vrrp group

Displays the default parameter values for all the virtual router groups or for a specific virtual router group.

show vrrp group [*vrgid***]**

Syntax Definitions

vrgid	The virtual router group ID, in the range from 1–255.

Defaults

By default, the default parameter values are displayed for all the virtual router groups.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the *vrgid* parameter with this command to display the default values for a specific virtual router group.

Examples

```
-> show vrrp group 2
Virtual Router Group GROUPID = 2
  Interval = 11
  Priority = 250
  Preempt Mode = Yes
  3 Associated Virtual Routers
```

output definitions

Group ID	The virtual router group identifier.
Adv Interval	Indicates the time interval, in seconds, between the sending of advertisement messages. Only the master router sends advertisements.
Priority	Indicates the VRRP router's priority for the virtual router group. For more information about priority, see the **vrrp** command description on page 22-3.
Preempt Mode	Controls whether a higher priority virtual router will preempt a lower priority master; preempt indicates that a higher priority virtual router will preempt a lower priority master; no preempt indicates that the first backup router to take over for the master will not be preempted by a virtual router with a higher priority. In either case, the IP address owner will always take over it if is available.

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp group	Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.
vrrp group all	Changes the administrative status of all the virtual routers in a virtual router group using a single command.

MIB Objects

```
alaVrrpGroupTable
   alaVrrpGroupInterval
   alaVrrpGroupPriority
   alaVrrpGroupPreemptMode
```

show vrrp group-association

Displays the virtual routers that are associated with a group.

show vrrp group-association [*vrgid***]**

Syntax Definitions

vrgid	The virtual router group ID, in the range from 1–255.

Defaults

By default, all virtual router group associations are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the *vrgid* parameter with this command to display the association details of a specific virtual router group.

Examples

```
-> show vrrp group-association 2
GROUPID VRID  VLAN
-------+----+-----+
    2     3      2
          4      2
          5      2
```

output definitions

GROUPID	The virtual router group identifier.
VRID	The virtual router identifier.
VLAN	The VLAN associated with the VRRP instance. Configured through the **vrrp** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp group-association	Adds a virtual router to a virtual router group.

MIB Objects

```
alaVrrpAssoGroupTable
   alaVrrp3OperVrId
```

show vrrp3

Displays the virtual router configuration for all virtual routers or for a specific virtual router.

show vrrp3 [*vrid***]**

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **show vrrp3** command to display information about configuration parameters, which may be set through the **vrrp3** command. Use the **show vrrp3 statistics** command to get information about VRRP3 packets.

Examples

```
-> show vrrp3
VRRP trap generation: Enabled
VRRP startup delay: 45  (expired)

            1100::30
```

output definitions

VRRP trap generation	Whether or not VRRP trap generation is enabled or disabled.
VRRP startup delay	The amount of time after a reboot that virtual routers will wait before they go active; allows time for routing tables to stabilize.
VRID	Virtual router identifier. Configured through the **vrrp3** command.
VLAN	The VLAN associated with the VRRP3 instance. Configured through the **vrrp3** command.
IPv6 Address(es)	The assigned IPv6 addresses. Configured through the **vrrp3 address** command.
Admin Status	The administrative status of this virtual router instance; **enabled** allows the virtual router instance to operate; **disabled** disables the virtual router instance without deleting it.
Priority	Indicates the VRRP3 router's priority for the virtual router. For more information about priority, see the **vrrp3** command description on page 22-28.
Preempt	Controls whether a higher priority virtual router will preempt a lower priority master: preempt indicates that a higher priority virtual router will preempt a lower priority master; no preempt indicates that the first backup router to take over for the master will not be preempted by a virtual router with a higher priority. In either case the IP address owner will always take over it if is available.
Accept	Displays whether the master router, which is not the IPv6 address owner will accept the packets addressed to the IPv6 address owner as its own.
Virtual MAC	Displays the virtual MAC address for the virtual router when the router is in the **master** state. The first 5 bytes are always 00-00-5E-00-02. The last byte indicates the VRID. This field displays N/A when the virtual router is in the **backup** or **initialize** state.
Adv. Interval	Indicates the time interval, in seconds, between sending advertisement messages. Only the master router sends advertisements.

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp3	Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.
vrrp3 address	Configures an IPv6 address for a virtual router.
show vrrp3 statistics	Displays statistics for all virtual routers configured on the switch or for a specific virtual router.

MIB Objects

```
alaVrrp3OperTable
   alaVrrp3OperAdminState
   alaVrrp3OperPriority
   alaVrrp3OperPreemptMode
   alaVrrp3OperAcceptMode
   alaVrrp3OperAdvinterval
```

show vrrp3 statistics

Displays statistics about VRRP3 packets for all virtual routers configured on the switch or for a specific virtual router.

show vrrp3 [*vrid***] statistics**

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **show vrrp3 statistics** command to display information about VRRP3 packets. Use the **show vrrp3** command to display information about the virtual router configuration.

Examples

```
-> show vrrp3 statistics
 Checksum    Version     VRID
  Errors     Errors     Errors
----------+----------+----------
         0          0          0

VRID VLAN   State      UpTime   Become Master Adv. Rcvd

   1  101 Master           2983             1          0
   2  102 Master          60675             1          0
   3  103 Master          60675             1          0
   4  104 Master          60675             1          0
   5  105 Master          60675             1          0
   6  106 Master          60675             1          0
   7  107 Master          60675             1          0
   8  108 Master          60675             1          0
   9  109 Master          60675             1          0
  10  110 Master          60675             1          0
```

output definitions

Checksum Errors	The total number of VRRP3 packets received with an invalid checksum value.
Version Errors	The total number of VRRP3 packets received with an invalid version number.
VRID Errors	The total number of VRRP3 packets received with invalid VRIDs.
VRID	The virtual router identifier.

output definitions (continued)

VLAN	The VLAN associated with the VRRP3 instance.
State	The administrative state of the VRRP3 instance; **initialize** specifies that the interface or vlan is either disabled or down and the startup delay timer has not expired; **backup** specifies that this instance is monitoring the availability of the master router; **master** specifies that this instance is functioning as the master router.
UpTime	Time interval (in hundredths of a second) since this virtual router was last initialized.
Become Master	The total number of times this virtual router's state has transitioned from backup to master.
Adv. Rcvd	The total number of VRRP3 advertisements received by this instance.

Release History

Release 8.1.1; command was introduced.

Related Commands

vrrp3	Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.
show vrrp3	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

MIB Objects

   alaVrrp3OperState
```

show vrrp3 track-association

Displays the tracking policies associated with VRRP3 virtual routers.

show vrrp3 [*vrid***] track-association [***track_id***]**

Syntax Definitions

vrid	The virtual router ID, in the range from 1–255.
track_id	The ID of the tracking policy for which you want to display information.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If a track ID is specified, only information about that track ID is displayed. If the virtual router ID and track ID are not specified, information about all virtual routers and their associated tracking policies is displayed.

Examples

```
-> show vrrp3 track-association
           Conf  Cur  Track                        Admin   Oper  Track
VRID VLAN  Pri   Pri   ID             Policy       State   State  Pri
----+----+-----+-----+-----+--------------------+--------+-----+------
   1  101  200   200     1  PORT 1/37             Enabled  Up      25
```

output definitions

VRID	The virtual router identifier.
VLAN	The VLAN ID associated with the virtual router.
Conf Pri	The priority configured for the virtual router through the **vrrp3** command.
Cur Pri	The priority currently being used for the virtual router. If the tracking policy is in effect because the tracked entity is down, the current priority will be equal to the configured priority (Conf Pri) minus the tracking priority (Track Pri). Otherwise the current priority will be equal to the configured priority.
Track ID	The ID of the tracking policy.
Policy	The VLAN, IPv6 address, or slot/port being tracked by this policy.
Admin State	The administrative state of the tracking policy.

output definitions (continued)

Oper State	Indicates whether the tracking policy is operational (Up) or not (Down).
Track Pri	The amount to be decremented from the configured virtual router priority when the tracking policy is applied.

Release History

Release 8.1.1; command was introduced.

Related Commands

23 OSPF Commands

Open Shortest Path First routing (OSPF) is a shortest path first (SPF) or link-state protocol. OSPF is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPF chooses the least-cost path as the best path.

Each participating router distributes its local state (for example, the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPF allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an *area*. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

Alcatel-Lucent's version of OSPF complies with RFCs 1370, 1850, 2328, 2370, 3101, and 3623.

MIB information for OSPF is as follows:

Filename: AlcatelIND1DrcTm.mib
Module: ALCATEL-IND1-DRCTM-MIB

Filename: AlcatelIND1Ospf.mib
Module: ALCATEL-IND1-OSPF-MIB

Filename: IETF_OSPF.MIB
Module: OSPF-MIB

The following is a list of the commands for configuring OSPF:

Global OSPF Commands	**ip ospf admin-state** **ip load ospf** **ip ospf asbr** **ip ospf exit-overflow-interval** **ip ospf extlsdb-limit** **ip ospf host** **ip ospf mtu-checking** **ip ospf default-originate** **ip ospf default-originate** **ip ospf default-originate** **ip ospf route-tag** **ip ospf spf-timer** **ip ospf virtual-link** **ip ospf neighbor** **show ip ospf** **show ip ospf border-routers** **show ip ospf ext-lsdb** **show ip ospf host** **show ip ospf lsdb** **show ip ospf neighbor** **show ip ospf routes** **show ip ospf routes** **show ip ospf routes** **show ip ospf virtual-link** **show ip ospf virtual-neighbor**
OSPF Area Commands	**ip ospf area** **ip ospf area default-metric** **ip ospf area range** **show ip ospf area** **show ip ospf area range** **show ip ospf area stub**
OSPF Interface Commands	**ip ospf interface** **ip ospf interface admin-state** **ip ospf interface area** **ip ospf interface auth-key** **ip ospf interface auth-type** **ip ospf interface dead-interval** **ip ospf interface hello-interval** **ip ospf interface md5** **ip ospf interface md5 key** **ip ospf interface type** **ip ospf interface cost** **ip ospf interface poll-interval** **ip ospf interface priority** **ip ospf interface retrans-interval** **ip ospf interface transit-delay** **show ip ospf interface**
OSPF Graceful Restart Commands	**ip ospf restart-support** **ip ospf restart-interval** **ip ospf restart-helper admin-state** **ip ospf restart-helper strict-lsa-checking admin-state** **ip ospf restart initiate** **show ip ospf restart**

ip ospf admin-state

Enables or disables the administration status of OSPF on the router.

ip ospf admin-state {enable | disable}

Syntax Definitions

enable	Enables OSPF.
disable	Disables OSPF.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The OSPF protocol must be enabled for it to route traffic.

Examples

```
-> ip ospf admin-state enable
-> ip ospf admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf	Displays OSPF status and general configuration parameters.

MIB Objects

```
ospfGeneralGroup
   ospfAdminStat
```

ip load ospf

Loads the OSPF software on the router.

ip load ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Example

```
-> ip load ospf
```

Release History

Release 8.1.1; command was introduced.

Related Commands

N/A

MIB Objects

```
ALADRCTMCONFIG
   alaDrcTmIPOspfStatus
```

ip ospf asbr

Configures the router as an Autonomous System Border Router (ASBR). A router running multiple protocols or acting as a gateway to other exterior routers is an ASBR. *This command is currently not supported.*

ip ospf asbr

no ip ospf asbr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Autonomous System Border Routers (ASBRs) are routers that exchange information with routers from another autonomous system (AS).
- The **no** variant of this command removes the ASBR classification of the selected router.

Examples

```
-> ip ospf asbr
-> no ip ospf asbr
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf	Displays OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf
   alaOspfAsBdRtr
```

ip ospf exit-overflow-interval

This command sets the overflow interval value.

ip ospf exit-overflow-interval *seconds*

Syntax Definitions

seconds	The number of seconds the router waits before attempting to leave the overflow state.

Defaults

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The overflow interval is the time whereby the routing router will wait before attempting to leave the database overflow state; the interval begins upon the routing router's arrival into this state.
- When the routing router leaves the overflow state, it can once again create non-default and external link state advertisements (LSAs) for autonomous systems (AS).
- Note that the router will not leave the overflow state (until it is restarted) when the overflow interval value is set to 0.

Example

```
-> ip ospf exit-overflow-interval 10
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

MIB Objects

```
ospfGeneralGroup
   ospfExitOverflowInterval
```

ip ospf extlsdb-limit

Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.

ip ospf extlsdb-limit *limit*

Syntax Definitions

limit	The maximum number of LSDB entries allowed on the router. The accepted value is any number greater than or equal to 1. If 0 is entered, there is no limit.

Defaults

parameter	default
limit	-1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command allows you to set a limit to the number of external LSDBs learned by the router. An external LSDB is created when the router learns a link address that exists outside of its Autonomous System (AS).
- When the limit is set, and it is exceeded, older addresses that were previously learned are removed from the routing table to make room for the new external LSDB.

Example

```
-> ip ospf extlsdb-limit 25
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf	Displays OSPF status and general configuration parameters.

MIB Objects

```
ospfGeneralGroup
   ospfExtLsdbLimit
```

ip ospf host

Creates and deletes an OSPF entry for directly attached hosts. Allows for the modification of the host parameters of Type of Service (ToS) and metric.

ip ospf host *ip_address* **tos** *tos* **[metric** *metric***]**

no ip ospf host *ip_address* **tos** *tos*

Syntax Definitions

ip_address	The 32-bit IP address in dotted decimal format of the OSPF host. See the example below for more information.
tos	The type of service (ToS) of the specified OSPF host. The valid range is 0- 15. Only ToS value 0 is supported at this time.
metric	The cost metric value assigned to the specified host. The valid range is 0 and up.

Defaults

parameter	default
metric	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The **no** variant of this command removes the record of the OSPF host.
- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. ToS routing is the ability to make a forwarding decision based on a destination address and a desired Quality of Service (QoS). ToS routing allows link selection based on QoS when more than one path exists between a source and a destination.A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path.

Examples

```
-> ip ospf host 172.22.2.115 tos 1 metric 10
-> no ip ospf host 172.22.2.115 tos 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf host	Displays information on configured OSPF hosts.

MIB Objects

```
ospfHostTable
   ospfHostStatus
   ospfHostIpAddress
   ospfHostTOS
   ospfHostMetric
```

ip ospf mtu-checking

Enables or disables the use of Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

ip ospf mtu-checking

no ip ospf mtu-checking

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The **no** form of this command disables MTU checking.
- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

Examples

```
-> ip ospf mtu-checking
-> no ip ospf mtu-checking
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf
   alaOspfMTUCheck
```

ip ospf default-originate

Configures a default external route into the OSPF routing domain.

ip ospf default-originate {only | always} [metric-type {type1 | type2}] [metric *value***]**

no ip ospf default-originate

Syntax Definitions

only	Advertises only when there is a default route in the routing table.
always	Advertises the default route regardless of whether the routing table has a default route.
type1	Sets the external route as type1.
type2	Sets the external route as type2.
value	The metric value.The valid range is 1-65535.

Defaults

parameter	default
type1 | type2	**type2**
value	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of the command to delete redistributed default routes.

Examples

```
-> ip ospf default-originate always
-> ip ospf default-originate only metric 10
-> ip ospf default-originate always metric-type type1 metric 5
-> no ip ospf default-originate
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf asbr	Configures the router as an Autonomous System Border Router (ASBR). *This command is currently not supported.*

MIB Objects

```
alaProtocolOspf
   alaOspfDefaultOriginate
   alaOspfDefaultOriginateMetricType
   alaOspfDefaultOriginateMetric
```

ip ospf route-tag

Configures a tag value that is applied to internal routes for potential redistribution.

ip ospf route-tag *tag*

Syntax Definitions

tag	The set tag value. The valid range is 0–2,147,483,647.

Defaults

parameter	default
tag	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

A 32-bit value tagged to each OSPF internal route that is redistributed into other routing protocol domains. The lower 16-bits typically indicate the autonomous system number.

Example

```
-> ip ospf route-tag 2
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf	Displays OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf
   alaOspfRedistRouteTag
```

ip ospf spf-timer

Configures timers for Shortest Path First (SPF) calculation.

ip ospf spf-timer [delay *delay_seconds***] [hold** *hold_seconds***]**

Syntax Definitions

delay_seconds	Specifies time (from 0 to 65535 seconds) between the reception of an OSPF topology change and the start of an SPF calculation.
hold_seconds	Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations.

Defaults

parameter	default
delay_seconds	5
hold_seconds	10

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command allows you to configure the time between SPF calculations. Using the delay timer, you can determine how much time to postpone an SPF calculation after the router receives a topology change. Using the hold timer, you can configure the amount of time that must elapse between consecutive SPF calculations.
- Note that if either of these values is set to 0, there will be no delay in the SPF calculation. This means that SPF calculations will occur immediately upon the reception of a topology change and/or that back-to back SPF calculations can take place with no break in-between the two.

Example

```
-> ip ospf spf-timer delay 20 hold 35
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

MIB Objects

```
alaProtocolOspf
   alaOspfTimerSpfDelay
   alaOspfTimerSpfHold
```

ip ospf virtual-link

Creates or deletes a virtual link. A virtual link is used to restore backbone connectivity if the backbone is not physically contiguous.

ip ospf virtual-link *area_id router_id* **[auth-type {none | simple | md5}] [auth-key** *key_string***] [dead-interval** *seconds***] [hello-interval** *seconds***] [retrans-interval** *seconds***] [transit-delay** *seconds***]**

no ip ospf virtual-link *area_id router_id*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
router_id	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
none	Sets the virtual link authorization type to no authentication.
simple	Sets the virtual link authorization type to simple authentication. If **simple** is selected, a key must be specified as well.
md5	Sets the virtual link authorization type to MD5 authentication.
key_string	Sets the virtual link authorization key. The key can be up to 8 ASCII characters. See the example for more details.
dead-interval *seconds*	Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647.
hello-interval *seconds*	Sets the virtual link hello interval, which is the time interval between OSPF hellos sent on this virtual link. The valid range is 1–65535.
retrans-interval *seconds*	Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPF packets. The valid range is 0–3600.
transit-delay *seconds*	Sets the virtual link transit delay, which is the number of seconds to transmit OSPF packets over this link. The valid range is 0–3600.

Defaults

parameter	default
none | simple | md5	**none**
key_string	null string
dead-interval *seconds*	40
hello-interval *seconds*	10
retrans-interval *seconds*	5
transit-delay *seconds*	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The **no** form of the command deletes the virtual link.
- It is possible to define areas in such a way that the backbone is no longer contiguous. In this case the system administrator can ensure backbone connectivity physically.
- Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.
- If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.
- The **dead-interval** value should be the same for all routers on the same network. This value should be some multiple of the value given for the hello interval.

Examples

```
-> ip ospf virtual-link 0.0.0.1 172.22.2.115
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 auth-key "techpubs"
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 auth-type simple
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 dead-interval 50
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 hello-interval 20
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 retrans-interval 20
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 transit-delay 50
-> no ip ospf virtual-link 0.0.0.1 172.22.2.115
```

Release History

Release 8.1.1; command was introduced.

   ospfVirtIfHelloInterval
   ospfVirtIfRetransInterval
   ospfVirtIfTransitDelay
```

ip ospf neighbor

Creates a static neighbor on a non-broadcast interface.

ip ospf neighbor *neighbor_id* **{eligible | non-eligible}**

no ip ospf neighbor *neighbor_id*

Syntax Definitions

neighbor_id	A unique 32-bit IP address identical to the neighbor's interface address.
eligible	Sets this router as eligible to be the DR.
non-eligible	Sets this router as not eligible to be the DR.

Defaults

parameter	default
eligible | non-eligible	**eligible**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- NBMA (Non Broadcast Multi Access), PMP (Point-to-Multipoint), and P2P (Point-to-Point) OSPF non-broadcast modes are supported over Ethernet interfaces (broadcast media).
- Neighboring routers on non-broadcast OSPF networks must be statically configured, because lack of OSPF multicast capabilities prevents using normal OSPF Hello protocol discovery.
- In the case of NBMA interface the static neighbor eligibility for becoming a DR can be configured while it is not necessary for point-to-multipoint and point-to-point interfaces.
- An interface connected to this neighbor must also be configured as a non-broadcast interface, which can be either point-to-multipoint or point-to-point, by using the **ip ospf interface type** command.
- For the correct working of an OSPF NBMA network, a fully meshed network is mandatory. Also, the neighbor eligibility configuration for a router on every other router should match the routers interface priority configuration.

Examples

```
-> ip ospf neighbor 1.1.1.1 non-eligible
-> no ip ospf neighbor 1.1.1.1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf interface type	Configures the OSPF interface type.
show ip ospf neighbor	Displays information on OSPF non-virtual neighbor routers.

MIB Objects

```
ospfNbrTable
   ospfNbrPriority
   ospfNbmaNbrStatus
```

ip ospf area

Assigns an OSPF interface to a specified area.

ip ospf area *area_id* **[summary {enable | disable}] | [type {normal | stub | nssa}]**

no ip ospf area *area_id*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
enable	Enables summarization.
disable	Disables summarization.
normal	Sets the area as a regular OSPF area.
stub	Configures an OSPF area as a stub area.
nssa	Configures an OSPF area as a Not So Stubby Area (NSSA)

Defaults

parameter	default
enable | disable	**enable**
normal | stub | nssa	**normal**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The **no** form deletes the area.
- The **summary** options are used to enable or disable route summarization for stub and NSSA areas. Stub and NSSA areas will not receive LSA type 3 unless summary is enabled.
- The **type** command allows you to chose what type of area this is going to be.

Examples

```
-> ip ospf area 0.0.0.1
-> ip ospf area 0.0.0.1 type stub
-> ip ospf area 0.0.0.1 type normal
-> no ip ospf area 0.0.0.1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf area default-metric	Creates or deletes an OSPF default metric.
ip ospf area range	Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
show ip ospf area	Displays either all OSPF areas, or a specified OSPF area.

MIB Objects

```
ospfAreaTable
   ospfImportAsExtern
   ospfAreaSummary
   ospfAreaId
```

ip ospf area default-metric

Creates or deletes a default metric for stub or Not So Stubby Area (NSSA) areas. The default metric configures the type of cost metric that a default area border router (ABR) will advertise in the default summary Link State Advertisement (LSA).

ip ospf area *area_id* **default-metric** *tos* **[[cost** *cost***] | [type {ospf | type 1 | type 2}]**

no ip ospf area *area_id* **default-metric** *tos*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
tos	Type of service. The valid range is 0–15. Only ToS value 0 is supported at this time.
cost	The numerical cost of this area and ToS. Only 0 is supported in the current release.
ospf	Advertises external routes as OSPF autonomous system external (ASE) routes.
type1	Advertises external routes as a Type 1 (non-OSPF) metric.
type2	Advertises external routes as a Type 2 (calculated weight value from non-OSPF protocol) metric.

Defaults

parameter	default
tos	0
ospf | type 1 | type 2	**ospf**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The **no** form deletes the default metric from the specified area.
- The **type** command configures the type of cost metric for the specified ToS.To ensure that internal routers receiving external route advertisements choose the correct route, all border routers advertising a particular external network should be configured to advertise the route using the same metric type. That is, they must all advertise the route using an OSPF, Type 1, or Type 2 metric.

Examples

```
-> ip ospf area 1.1.1.1 default-metric 0
-> no ip ospf area 1.1.1.1 default-metric 0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf area	Creates or deletes an OSPF area.
ip ospf area range	Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
show ip ospf area	Displays either all OSPF areas, or a specified OSPF area.

MIB Objects

```
ospfStubAreaTable
   ospfStubAreaId
   ospfStubTOS
   ospfStubStatus
   ospfStubMetric
   ospfStubMetricType
```

ip ospf area range

Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

ip ospf area *area_id* **range {summary | nssa}** *ip_address subnet_mask* **[effect {admatching | noMatching}]**

no ip ospf area *area_id* **range {summary | nssa}** *ip_address subnet_mask*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
summary	Advertises the address range as a summary link state advertisement (LSA).
nssa	Advertises the address range of Not So Stubby Area (NSSA) routes as a Type 5 advertisement.
ip_address	A 32-bit IP address for the range's area.
subnet_mask	A 32-bit subnet mask that determines how many bits of the IP address denote the network number.
admatching	Determines that routes specified falling within the specified range will be advertised.
noMatching	Determines that any route falling within the specified range will not be advertised.

Defaults

parameter	default
summary | nssa	**summary**
admatching | noMatching	**admatching**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Route summarization is the consolidation of addresses within an area which are advertised as a single route. When network numbers in an area are assigned consecutively, the area border router can be configured, using this command, to advertise a route that aggregates all the individual networks within the range.
- Using this command causes a single route to be advertised, for an address range in the specified area, to other areas.
- An NSSA (Not So Stubby Area) is similar to a stub area. However, where autonomous system (AS) external routes cannot be imported into a stub area, an NSSA will allow the importing of some AS external routes.

- Area ranges, once created, are enabled by default. Classless Inter-Domain Routing (CIDR) can work with OSPF to make route summarization more efficient. This is especially true for the summarization of routes in the global database. OSPF area address ranges can be configured on area border routers

Examples

```
-> ip ospf area 1.1.1.1 range summary 172.22.2.0 255.255.255.0
-> no ip ospf area 1.1.1.1 range summary 172.22.2.0 255.255.255.0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf area	Creates or deletes an OSPF area.
ip ospf area default-metric	Creates or deletes an OSPF default metric.
show ip ospf area range	Displays all or specified route summaries in a given area.

MIB Objects

```
ospfAreaAggregateTable
   ospfAreaAggregateAreaId
   ospfAreaAggregateLsdbType
   ospfAreaAggregateNet
   ospfAreaAggregateMask
   ospfAreaAggregateEffect
   ospfAreaAggregateStatus
```

ip ospf interface

Creates and deletes an OSPF interface.

ip ospf interface {*interface_name***}**

no ip ospf interface {*interface_name***}**

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to delete an OSPF interface.
- The interface name cannot contain spaces.

Examples

```
-> ip ospf interface vlan-101
-> no ip ospf interface vlan-101
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfIpAddress
alaOspfIfAugTable
   alaOspfIfIntfName
```

ip ospf interface admin-state

Enables or disables the administrative status on an OSPF interface.

ip ospf interface {*interface_name***} admin-state {enable | disable}**

no ip ospf interface {*interface_name***} admin-state {enable | disable}**

Syntax Definitions

interface_name	The name of the interface.
enable	Enables the OSPF interface.
disable	Disables the OSPF interface.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to delete an OSPF interface.
- The OSPF interface must be enabled for it to participate in the OSPF protocol.

Examples

```
-> ip ospf interface vlan-101 admin-state enable
-> ip ospf interface vlan-101 admin-state disable
-> no ip ospf interface vlan-101 admin-state enable
-> no ip ospf interface vlan-101 admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfAdminStat
```

ip ospf interface area

Configures an OSPF area identifier for this interface.

ip ospf interface {*interface_name***} area** *area_id*

Syntax Definitions

interface_name	The name of the interface.
area_id	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

An interface must be assigned to an area to become operational.

Examples

```
-> ip ospf interface vlan-101 area 0.0.0.1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf area	Displays either all the OSPF areas, or a specified OSPF area.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfAreaId
```

ip ospf interface auth-key

Configures an OSPF authentication key for simple authentication on an interface.

ip ospf interface {*interface_name***} auth-key** *key_string*

Syntax Definitions

interface_name	The name of the interface.
key_string	An authentication key (8 characters maximum).

Defaults

The default for the authentication key string is a null string.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Sets a password as a simple text string of 8 ASCII characters.
- Must be used in conjunction with the **auth-type** command, described on page 23-30, set to **simple**.

Examples

```
-> ip ospf interface vlan-101 auth-key pass
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf interface auth-type	Sets the authentication type.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfAuthKey
```

ip ospf interface auth-type

Sets the OSPF interface authentication type. Authentication allows the router to only respond to other routers that have the correct authentication information.

ip ospf interface {*interface_name***} auth-type [none | simple | md5]**

Syntax Definitions

interface_name	The name of the interface.
none	No authentication.
simple	Simple, clear text authentication.
md5	MD5 encrypted authentication.

Defaults

parameter	default
none | simple | md5	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to set the type of authentication that the OSPF interface uses to validate requests for route information from other OSPF neighbors on this interface.
- Simple authentication is authentication that uses only a text string as the password. The authentication type **simple** is used in conjunction with the **auth-key** keyword described, on page 23-29.
- MD5 authentication is encrypted authentication that uses an encryption key string and a key identification number. Both of these are necessary as the password. The authentication type **md5** is used in conduction with the commands described on page 23-34 and page 23-36. One command enables MD5 and the other sets the key identification number.

Examples

```
-> ip ospf interface vlan-101 auth-type-simple
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf interface auth-key	Sets the password for simple authentication.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfAuthType
```

ip ospf interface dead-interval

Configures the OSPF interface dead interval.

ip ospf interface {*interface_name***} dead-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The dead interval, in seconds. The valid range is 1–65535.

Defaults

parameter	default
seconds (broadcast and point-to-point)	40
seconds (NBMA and point-to-multipoint)	120

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This is the interval, in seconds, after which a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or the multiple of the hello interval.

Examples

```
-> ip ospf interface vlan-101 dead-interval 50
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf interface hello-interval	Configures the OSPF interface hello interval.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfRtrDeadInterval
```

ip ospf interface hello-interval

Configures the OSPF interface hello interval.

ip ospf interface {*interface_name***} hello-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The hello interval, in seconds. The valid range is 0–65535. A value of 0 creates a passive OSPF interface.

Defaults

parameter	default
seconds (broadcast and point-to-point)	10
seconds (NBMA and point-to-multipoint)	30

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This is the interval between two consecutive hello packets sent out on this interface.

Examples

```
-> ip ospf interface vlan-101 hello-interval 50
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfHelloInterval
```

ip ospf interface md5

Creates and deletes the OSPF interface MD5 key identification number.

ip ospf interface {*interface_name***} md5** *key_id* **[enable | disable]**

Syntax Definitions

interface_name	The name of the interface.
key_id	A key identification number. The key identification number specifies a number that allows MD5 encrypted routers to communicate. Both routers must use the same key ID. The valid range is 1–255.
enable	Enables the interface key.
disable	Disables the interface key.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- MD5 authentication can be used to encrypt information sent over the network. MD5 authentication works by using shared secret keys. Keys are used to sign the packets with an MD5 checksum, and they cannot be forged or tampered with. Since the keys are not included in the packet, snooping the key is not possible.
- This command is used in conjunction with the commands described on page 23-30 and page 23-36.
- The **no** variant deletes the key ID number.

Examples

```
-> ip ospf interface vlan-101 md5 100
-> ip ospf interface vlan-101 md5 10 disable
-> ip ospf interface vlan-101 md5 10 enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf interface auth-type	Sets the OSPF interface authentication type.
ip ospf interface md5 key	Configures the OSPF key ID and key.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
alaOspfIfMd5Table
   alaOspfIfMd5IpAddress
   alaOspfIfMd5KeyId
```

ip ospf interface md5 key

Configures the OSPF key string. This interface MD5 string, along with the key identification number, enables the interface to encode MD5 encryption.

ip ospf interface {*interface_name***} md5** *key_id* **key** *key_string*

Syntax Definitions

interface_name	The name of the interface.
key_id	The key ID. The valid range is 1–255.
key_string	A key string.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used in conjunction with the commands described above on page 23-30 and page 23-34.
- For MD5 authentication to function properly the same key string must be configured on the neighboring router for that interface.

Examples

```
-> ip ospf interface vlan-101 md5 100 key 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf interface auth-type	Sets the OSPF interface authentication type.
ip ospf interface md5	Creates and deletes the OSPF interface MD5 key identification number.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
alaOspfIfMd5Table
   alaOspfIfMd5IpAddress
   alaOspfIfMd5KeyId
   alaOspfIfMd5Key
```

ip ospf interface type

Configures the OSPF interface type.

ip ospf interface {*interface_name***} type {point-to-point | point-to-multipoint | broadcast | non-broadcast}**

Syntax Definitions

interface_name	The name of the interface.
point-to-point	Sets the interface to be a point-to-point OSPF interface.
point-to-multipoint	Sets the interface to be a point-to-multipoint OSPF interface.
broadcast	Sets the interface to be a broadcast OSPF interface.
non-broadcast	Sets the interface to be NBMA (Non Broadcast Multi Access) OSPF interface.

Defaults

parameter	default
broadcast | non-broadcast | point-to-point| point-to-multipoint	**broadcast**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command sets an interface to be broadcast, non-broadcast, point-to-point, or point-to-multipoint.
- If the type is non-broadcast or point-to-multipoint, static neighbors should be configured.

Examples

```
-> ip ospf interface vlan-101 type non-broadcast
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf neighbor	Creates a static neighbor on a Non Broadcast Multi Access (NBMA) interface.
show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfType
```

ip ospf interface cost

Configures the OSPF interface cost.

ip ospf interface {*interface_name***} cost** *cost*

Syntax Definitions

interface_name	The name of the interface.
cost	The interface cost. The valid range is 0 to 65535.

Defaults

parameter	default
cost	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The configured interface cost, if any, is used during OSPF route calculations.

Examples

```
-> ip ospf interface vlan-101 cost 10
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfMetricTable
   ospfIfMetricIpAddress
   ospfIfMetricValue
```

ip ospf interface poll-interval

Configures the OSPF poll interval for a Non Broadcast Multi Access (NBMA) interface.

ip ospf interface {*interface_name***} poll-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The poll interval, in seconds. The valid range is 1–2147483647.

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This parameter configures the larger time interval, in seconds, between hello packets sent to an inactive neighbor.

Examples

```
-> ip ospf interface vlan-101 poll-interval 500
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfPollInterval
```

ip ospf interface priority

Configures the OSPF interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

ip ospf interface {*interface_name***} priority** *priority*

Syntax Definitions

interface_name	The name of the interface.
priority	The interface priority. The valid range is 0–255.

Defaults

parameter	default
priority	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

Examples

```
-> ip ospf interface vlan-101 priority 100
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfRtrPriority
```

ip ospf interface retrans-interval

Configures the OSPF interface retransmit interval.

ip ospf interface {*interface_name***} retrans-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The retransmit interval, in seconds. The valid range 0–3600.

Defaults

parameter	default
seconds	5

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The number of seconds between link retransmission of OSPF packets on this interface.

Examples

```
-> ip ospf interface vlan-101 retrans-interval 500
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfRetransInterval
```

ip ospf interface transit-delay

Configures the OSPF interface transit delay.

ip ospf interface {*interface_name***} transit-delay** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The transit delay, in seconds. The valid range is 0–3600.

Defaults

parameter	default
seconds	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

Examples

```
-> ip ospf interface vlan-101 transit-delay 100
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf interface	Displays the status and statistics of an OSPF interface.

MIB Objects

```
ospfIfTable
   ospfIfTransitDelay
```

ip ospf restart-support

Configures support for the graceful restart feature on an OSPF router.

ip ospf restart-support {planned-unplanned | planned-only}

no ip ospf restart-support

Syntax Definitions

planned-unplanned	Specifies support for planned and unplanned restarts.
planned-only	This parameter is currently not supported.

Defaults

Graceful restart is disabled be default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to disable support for the graceful restart feature on an OSPF router.
- The minimum hardware configuration for this command is a redundant CMM configuration.

Examples

```
-> ip ospf restart-support planned-unplanned
-> no ip ospf restart-support
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf restart	Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
   alaOspfRestartSupport
```

ip ospf restart-interval

Configures the grace period for achieving a graceful OSPF restart.

ip ospf restart-interval [*seconds***]**

Syntax Definitions

seconds	The hitless restart timeout interval, in seconds. The valid range is 0–1800.

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch 10K switches with a single CMM.

Example

```
-> ip ospf restart-interval 600
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf restart-support	Administratively enables and disables support for the graceful restart feature on an OSPF router.
show ip ospf restart	Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
   alaOspfRestartInterval
```

ip ospf restart-helper admin-state

Administratively enables and disables the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart.

ip ospf restart-helper [admin-state {enable | disable}]

Syntax Definitions

enable	Enables the capability of an OSPF router to operate in helper mode.
disable	Disables the capability of an OSPF router to operate in helper mode.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch 10K switches with a single CMM.

Examples

```
-> ip ospf restart-helper admin-state disable
-> ip ospf restart-helper admin-state enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf restart-support	Administratively enables and disables support for the graceful restart feature on an OSPF router.
ip ospf restart-helper strict-lsa-checking admin-state	Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.
show ip ospf restart	Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
   alaOspfRestartHelperSupport
```

ip ospf restart-helper strict-lsa-checking admin-state

Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

ip ospf restart-helper strict-lsa-checking admin-state {enable | disable}

Syntax Definitions

enable	Enables whether or not a changed LSA will result in termination of graceful restart by a helping router.
disable	Disables whether or not a changed LSA will result in termination of graceful restart by a helping router.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch 10K switches with a single CMM.

Examples

```
-> ip ospf restart-helper strict-lsa-checking admin-state disable
-> ip ospf restart-helper strict-lsa-checking admin-state enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf restart-support	Administratively enables and disables support for the graceful restart feature on an OSPF router.
ip ospf restart-helper admin-state	Administratively enables and disables the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart.
show ip ospf restart	Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
   alaOspfRestartHelperSupport
```

ip ospf restart initiate

Initiates a planned graceful restart.

ip ospf restart initiate

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You must execute this command on the primary CMM before executing a **takeover** command.
- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch 10K switches with a single CMM.

Example

```
-> ip ospf restart initiate
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf restart	Displays the OSPF graceful restart related configuration and status.

MIB Objects

```
alaProtocolOspf
   alaOspfRestartInitiate
```

show ip ospf

Displays the OSPF status and general configuration parameters.

show ip ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used to display the general configuration parameters of the OSPF router.
- See the Related Commands section below to modify the displayed parameters.

Examples

```
-> show ip ospf

Router Id                        = 10.255.11.242,
OSPF Version Number              = 2,
Admin Status                     = Enabled,
Area Border Router?             = No,
AS Border Router Status          = Disabled,
Route Redistribution Status      = Disabled,
Route Tag                        = 0,
SPF Hold Time (in seconds)      = 10,
SPF Delay Time (in seconds)     = 5,
MTU Checking                     = Disabled,
# of Routes                      = 0,
# of AS-External LSAs           = 0,
# of self-originated LSAs       = 0,
# of LSAs received              = 0,
External LSDB Limit              = -1,
Exit Overflow Interval           = 0,
# of SPF calculations done      = 0,
# of Incr SPF calculations done  = 0,
# of Init State Nbrs            = 0,
# of 2-Way State Nbrs           = 0,
# of Exchange State Nbrs        = 0,
# of Full State Nbrs            = 0,
# of attached areas             = 1,
# of Active areas               = 0,
# of Transit areas              = 0,
# of attached NSSAs             = 0
```

output definitions

Router Id	The unique identification for the router.
OSPF Version Number	The version of OSPF the router is running.
Admin Status	Whether OSPF is currently enabled or disabled on the router.
Area Border Router?	Whether the router status is an area router or not.
AS Border Router Status	Whether the area Autonomous System Border Router status of this router is enabled or disabled.
Route Redistribution Status	Whether route redistribution is enabled or disabled on the router. This is set using the **ip ospf default-originate** command.
Route Tag	Shows the route tag for this router.
SPF Hold Time	Shows the time in seconds between the reception of an OSPF topology change and the start of a SPF calculation.
SPF Delay Time	Shows the time in seconds between consecutive SPF calculations.
MTU Checking	Shows whether Maximum Transfer Unit checking is enabled or disabled. This is set using the **ip ospf mtu-checking** command.
# of routes	The total number of OSPF routes known to this router.
# of AS-External LSAs	The number of external routes learned from outside the router's Autonomous System (AS).
# of self-originated LSAs	The number of times a new Link State Advertisement has been sent from this router.
# of LSAs received	The number of times a new Link State Advertisement has been received by this router.
External LSDB Limit	The maximum number of entries allowed in the external Link State Database.
Exit Overflow Interval	The number of seconds the router remains in the overflow state before attempting to leave it. This is set using the **ip ospf exit-overflow-interval** command.
# of SPF calculations done	The number of SPF calculations that have occurred.
# of Incr SPF calculations done	The number of incremental SPF calculations done.
# of Init State Nbrs	The number of neighbors in the initialization state.
# of 2-Way State Nbrs	The number of OSPF 2-way state neighbors on this router.
# of Exchange State Nbrs	The number of neighbors in the exchange state.
# of Full State Nbrs	The number of neighbors in the full state.
# of attached areas	The number of areas that are configured on the router.
# of Active areas	The number of areas that are active.
# of Transit areas	The number of transit areas that are configured on the router.
# of attached NSSAs	The number of Not So Stubby Areas that are configured on the router.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf admin-state	Enables or disables the administration of OSPF on the router.
ip ospf mtu-checking	Enables or disables the use of Maximum Transfer Unit (MTU) checking.
ip ospf spf-timer	Configures timers for SPF calculation.
ip ospf default-originate	Enables or disables OSPF redistribution
ip ospf asbr	Configures the router as an Autonomous System Border Router (ASBR). *This command is currently not supported.*
ip ospf extlsdb-limit	Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.
ip ospf exit-overflow-interval	This command sets the overflow interval value.
ip ospf route-tag	Configures a tag value for Autonomous System External (ASE) routes created.
ip router router-id	Configures the router ID for the router.

show ip ospf border-routers

Displays information regarding all or specified border routers.

show ip ospf border-routers [*area_id***] [***router_id***] [***tos***] [***gateway***]**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
router_id	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
tos	The Type of Service. The valid range is 0–15. Only ToS value 0 is supported at this time.
gateway	The 32-bit IP address of the gateway for the border router being displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used to display a list of border routers known by this OSPF router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.
- See the related commands sections below to modify the list.

Examples

```
-> show ip ospf border-routers 10.0.0.0

Router Id              Area Id            Gateway         TOS    Metric
-----------------+-----------------+-------------------+------+--------
10.0.0.0           1.0.0.1            143.209.92.71       1       1
```

output definitions

Router ID	The unique identification for the router.
Area ID	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
Gateway	The next hop interface on which the border router has been learned.
ToS	The Type of Service. Only ToS value 0 is supported at this time.
Metric	The cost to the border router.

Release History

Release 8.1.1; command was introduced.

Related Commands

N/A

MIB Objects

```
alaOspfBdrRouterAreaId
alaOspfBdrRouterId
alaOspfBdrRouterTos
alaOspfBdrRouterMetric
```

show ip ospf ext-lsdb

Displays external Link State Advertisements known by this router.

show ip ospf ext-lsdb [linkstate-id *ls_id***] [router-id** *router_id***]**

Syntax Definitions

ls_id	The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database.
router_id	The Router ID. The ID is a unique 32-bit value such as an IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used to display the external link state database (LSDB) for the OSPF router.
- This command can be used for OSPF debugging purposes, specifically to narrow down sections of attached areas to determine which sections are receiving the specified external LSAs. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf ext-lsdb

      LS Id         Orig Router-Id     SeqNo      Age     Protocol
-----------------+-----------------+----------+--------+----------
  198.168.100.100    198.168.100.100      10      100     STATIC
```

output definitions

LS Id	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
Orig Router-Id	The router ID of the router that originated the external LSDB.
SeqNo	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
Age	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.
Protocol	The type of protocol, if any.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf extlsdb-limit	Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.

MIB Objects

```
ospfExtLsdbTable
   ospfExtLsdbLsid
   ospfExtLsdbRouterId
   ospfExtLsdbSequence
   ospfExtLsdbAge
   ospfExtLsdbType
```

show ip ospf host

Displays information on the configured OSPF hosts.

show ip ospf host [*ip_address***]**

Syntax Definitions

ip_address	A 32-bit IP address for a directly attached host.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used to display general information for OSPF hosts directly attached to this router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf host 172.22.2.115

   Host Address     TOS     Metric     Status       AreaId
-----------------+-------+----------+--------+-----------------
 143.209.92.12       1            0      Up     0.0.0.0
```

output definitions

Host Address	A 32-bit IP address for a directly attached host. This can be set using the **ip ospf host** command.
ToS	The Type of Service traffic from the host is labeled as. ToS is set using the **ip ospf host** command.
Metric	The metric assigned to the host. Metric is set using the **ip ospf host** command.
Status	Whether the host is enabled or disabled.
AreaId	The area identification for the host's area.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf host	Creates and deletes an OSPF entry for directly attached hosts.

MIB Objects

```
ospfHostTable
   ospfHostIpAddress
   ospfHostTOS
   ospfHostMetric
   ospfHostStatus
   ospfHostAreaID
```

show ip ospf lsdb

Displays LSAs in the Link State Database associated with each area.

show ip ospf lsdb [*area_id*] **[rtr | net | netsum | asbrsum] [linkstate-id** *ls_id***] [router-id** *router_id***]**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
rtr	Specifies router LSAs.
net	Specifies network LSAs.
netsum	Specifies network summary LSAs.
asbrsum	Specifies Autonomous System Border Router summary LSAs.
ls_id	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
router_id	The Router ID. The ID is a unique 32-bit value such as an IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used to display the Link State Database (LSDB) of the OSPF router. This command can be used for OSPF debugging purposes, specifically to narrow down sections of an area to determine which sections are receiving the specified link state advertisements. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.
- You can view link state advertisements by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you must also supply a valid link state ID.

Examples

```
-> show ip ospf lsdb
    Area Id       Type        LS Id        Orig Router-Id     SeqNo      Age
---------------+-------+---------------+----------------+------------+-----
0.0.0.1          OSPF   198.168.100.100  198.168.100.100     1         100
```

output definitions

Area Id	The area identification for the area to which the record belongs.
Type	The protocol type from where the route was learned.
LS Id	The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database.
Orig Router-Id	The router ID of the router that originated the external LSDB.

output definitions (continued)

SeqNo	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
Age	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

```

show ip ospf neighbor

Displays information on OSPF non-virtual neighbor routers.

show ip ospf neighbor [*ip_address*]

Syntax Definitions

ip_address	A 32-bit IP address of the neighboring router.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used to display all non-virtual neighbors of the OSPF router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf neighbor

IP Address        Area Id          Router Id      Vlan  State  Mode
----------------+----------------+---------------+----+-------+--------
1.1.1.1          255.255.255.255  0.0.0.0        0     Down   Static
```

output definitions

IP Address	The IP address of the neighbor.
Area Id	A unique 32-bit value, such as an IP address, that identifies the neighboring router in the Autonomous System.
Router Id	The unique identification for the neighboring router.
VlanId	The VLAN corresponding to this interface on which the neighbor is reachable.
State	The state of the OSPF neighbor adjacency.
Mode	What type of neighbor, either **Dynamic** (learned) or **Static**.

```
-> show ip ospf neighbor 1.1.1.1
Neighbor's IP Address                = 1.1.1.1,
Neighbor's Router Id                 = 0.0.0.0,
Neighbor's Area Id                   = 255.255.255.255,
Neighbor's DR Address                = 0.0.0.0,
Neighbor's BDR Address               = 0.0.0.0,
Neighbor's Priority                  = 1,
Neighbor's State                     = Down,
Hello Suppressed ?                   = No,
Neighbor's type                      = Static,
DR Eligible                          = Yes,
# of State Events                    = 0,
Mode                                 = Slave,
MD5 Sequence Number                  = 0,
Time since Last Hello                = 0 sec,
# of Outstanding LS Requests         = 0,
# of Outstanding LS Acknowledgements = 0,
# of Outstanding LS Retransmissions  = 0,
Restart Helper Status               = Not Restarting,
Restart Age (in seconds)            = 0 sec,
Last Restart Helper Exit Reason     = None
```

output definitions

Neighbor's IP Address	The IP address of the neighbor.
Neighbor's Router Id	The identification number for the selected host's record. It is most often the router's IP address.
Neighbor's Area Id	Identifier of the OSPF Area to which the neighbor is attached. 255.255.255.255 shows that this neighbor is not attached to any area.
Neighbor's DR Address	The address of the neighbors Designated Router.
Neighbor's BDR Address	The address of the neighbors Backup Designated Router.
Neighbor's Priority	The priority value for this neighbor becoming the DR.
Neighbor's State	The condition of the OSPF neighbor's state machine.
Hello Suppressed	Whether sending hello messages to this neighbor is suppressed.
Neighbor's type	What type of neighbor this is, either dynamic or static.
DR Eligible	Shows the eligibility status of the static neighbor. If it is configured as "ineligible" during creation of the neighbor, it shows up as **No**. Otherwise, if configured as Eligible (the default), it shows up as **Yes**.
# of State Events	The number of state events restricted for this neighbor and the local router.
Mode	The role the neighbor has with the local router during DD Exchange, which can be Master or Slave.
MD5 Sequence Number	The sequence number of the MD5 authorization key.
Time since Last Hello	The amount of time (in seconds) since the last HELLO messages was received from this neighbor.
# of Outstanding LS Requests	The number of Link State requests to this neighbor that have not received a response from this neighbor.
# of Outstanding LS Acknowledgements	Number of Link state Acknowledgements queued up by the local router to be sent to the neighbor.

output definitions (continued)

# of Outstanding LS Retransmissions	The number of Link State updates to the neighbor that need to be retransmitted by the OSPF router.
Restart Helper Status	Indicates whether the router is acting as a hitless restart helper for the neighbor.
Restart Age	The remaining time, in seconds, for the current OSPF hitless restart interval if the router is acting as a restart helper for the neighbor.
Last Restart Helper Exit Reason	The outcome of the last attempt at acting as a hitless restart helper for the neighbor.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf neighbor	Creates a static neighbor on a Non Broadcast Multi Access (NBMA) interface.

MIB Objects

```

   alaOspfNbrRestartHelperStatus
   alaOspfNbrRestartHelperAge
   alaOspfNbrRestartHelperExitReason
```

show ip ospf routes

Displays the OSPF routes known to the router.

show ip ospf routes [*ip_addr mask tos gateway***]**

Syntax Definitions

ip_addr	The 32-bit IP address of the route destination in dotted decimal format.
mask	The IP subnet mask of the route destination.
tos	The Type of Service of the route.
gateway	The next hop IP address for this router.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If no variables are entered, all routes are displayed. If the variables are entered, then only routes matching the specified criteria are shown. All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

Examples

```
-> show ip ospf routes

Destination/Mask          Gateway       Metric   Vlan     Type
--------------------+-----------------+--------+------+----------
198.168.100.100       195.5.2.8          0        5       AS-Ext
```

output definitions

Destination/Mask	The destination address of the route. This can also display the destination IP address mask if it is known.
Gateway	The gateway address of the route.
Metric	The cost of the route.
Vlan	The VLAN number on which the gateway can be routed.
Type	The type of OSPF route.

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip ospf	Displays the OSPF status and general configuration parameters.

MIB Objects

```
Alcatel1INDOspf
   alaOspfRouteDest
   alaOspfRouteMask
   alaOspfRouteNextHop
   alaOspfRouteMetric1
```

show ip ospf virtual-link

Displays virtual link information. A virtual link is used to connect OSPF backbone routers that are not physically contiguous.

show ip ospf virtual-link [*router_id***]**

Syntax Definitions

router_id	The router ID of the remote end of the virtual link that is to be viewed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf virtual-link
                                        State
 Transit AreaId      Router-id    Link / Adjacency  AuthType   OperStatus
----------------+----------------+----------------+----------+------------
1.1.1.1           172.17.1.1     P2P  / Full       none       up
```

output definitions

Transit AreaId	The area identification for the area assigned to the virtual link.
Router-Id	The destination router identification for the virtual link.
State Link	The state of the virtual link with regards to the local router.
State Adjacency	The state of the virtual link adjacency.
AuthType	The type of authorization employed by the virtual link.
OperStatus	Displays whether the virtual link is enabled or disabled.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf virtual-link	Creates or deletes a virtual link.
show ip ospf virtual-neighbor	Displays OSPF virtual neighbors.

MIB Objects

```
ospfVirtIfTable
   ospfVirtIfAreaId
   ospfVirtIfNeighbor
   ospfVirtIfState
   ospfVirtIfAuthType
```

show ip ospf virtual-neighbor

Displays OSPF virtual neighbors. A virtual neighbor is connected to the router through a virtual link rather than a physical one.

show ip ospf virtual-neighbor *area_id router_id*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
router_id	A unique 32-bit value, such as an IP address, that identifies the configured OSPF area in the AS.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used to display all virtual neighbors for the OSPF router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ip ospf virtual-neighbor 0.0.0.0 10.0.0.1

     AreaId           RouterId     Priority Events RxmtQLen LastHello  State
----------------+---------------+--------+------+--------+---------+-------
 0.0.0.0           10.0.0.0           1        10     100      323     INIT
```

output definitions

AreaId	The area identification for the area of which the virtual neighbor is a part.
RouterId	The router identification of the virtual neighbor.
Priority	The number used to determine whether the virtual neighbor will become the designated router for its area.
Events	The number of OSPF control message sent by the neighbor to the router.
RxmtQlen	The length (in number of packets) of the retransmit queue.
LastHello	The last Hello message sent by the neighbor
State	The current state the virtual neighbor is in relative to the router; this will be INIT, Exchange, or Full.

```
-> show ip ospf virtual-neighbor 0.0.0.1 2.0.0.254
Neighbor's IP Address               = 2.0.0.254,
Neighbor's Router Id                = 2.0.0.254,
Neighbor's Area Id                  = 0.0.0.1,
Neighbor's DR Address               = 2.0.0.1,
Neighbor's BDR Address              = 2.0.0.254,
Neighbor's Priority                 = 1,
Neighbor's State                    = Full,
Hello Suppressed ?                  = No,
Neighbor's type                     = Dynamic,
# of State Events                   = 6,
Mode = Master,
MD5 Sequence Number                 = 0,
Time since Last Hello               = 5 sec,
Last DD I_M_MS                      =
# of Outstanding LS Requests        = 0,
# of Outstanding LS Acknowledgements= 0,
# of Outstanding LS Retransmissions = 0,
Restart Helper Status               = Not Restarting,
Restart Age (in seconds)            = 0 sec,
Last Restart Helper Exit Reason     = None
```

output definitions

Neighbor's IP Address	The IP address of the virtual neighbor.
Neighbor's Router Id	The identification number for the selected host's record. It is most often the router's IP address.
Neighbor's Area Id	Identifier of the OSPF Area to which the virtual neighbor is attached. 255.255.255.255 shows that this virtual neighbor is not attached to any area.
Neighbor's DR Address	The address of the virtual neighbor's Designated Router.
Neighbor's BDR Address	The address of the virtual neighbor's Backup Designated Router.
Neighbor's Priority	The priority value for this virtual neighbor becoming the DR.
Neighbor's State	The condition of the OSPF virtual neighbor's state machine.
Hello Suppressed	Whether sending hello messages to this virtual neighbor is suppressed.
Neighbor's type	What type of virtual neighbor this is, either dynamic or static.
DR Eligible	Shows the eligibility status of the virtual neighbor. If it is configured as "ineligible" during creation of the neighbor, it shows up as **No**. Otherwise, if configured as Eligible (the default), it shows up as **Yes**.
# of State Events	The number of state events restricted for this virtual neighbor and the local router.
Mode	The role the virtual neighbor has with the local router during DD Exchange, which can be Master or Slave.
MD5 Sequence Number	The sequence number of the MD5 authorization key.
Time since Last Hello	The amount of time (in seconds) since the last HELLO messages was received from this virtual neighbor.
Last DD I_M_MS	The initialize (I), more (M) and master (MS) bits, and Options field Data Description (DD) packet received from the virtual neighbor. This parameter is used to determine whether the next DD packet has been received or not.

output definitions (continued)

# of Outstanding LS Requests	The number of Link State requests to this virtual neighbor that have not received a response from this virtual neighbor.
# of Outstanding LS Acknowledgements	Number of Link state Acknowledgements queued up by the local router to be sent to the virtual neighbor.
# of Outstanding LS Retransmissions	The number of Link State updates to the virtual neighbor that need to be retransmitted by the OSPF router.
Restart Helper Status	Indicates whether the router is acting as a hitless restart helper for the virtual neighbor.
Restart Age	The remaining time, in seconds, for the current OSPF hitless restart interval if the router is acting as a restart helper for the virtual neighbor.
Last Restart Helper Exit Reason	The outcome of the last attempt at acting as a hitless restart helper for the virtual neighbor.

Release History

show ip ospf area

Displays either all OSPF areas, or a specified OSPF area.

show ip ospf area [*area_id*]

Syntax Definitions

area_id	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Allows you to view the details of a specified OSPF area.
- Not specifying an OSPF area will display all known areas for the OSPF router.
- See the Related Commands section below for information on modifying an area.

Examples

```
-> show ip ospf area

    Area Id      AdminStatus      Type       OperStatus
---------------+-------------+-------------+------------
1.1.1.1           disabled     normal       down
0.0.0.1           disabled     normal       down

-> show ip ospf area 0.0.0.0

Area Identifier                          = 1.1.1.1,
Admin Status                             = Disabled,
Operational Status                       = Down,
Area Type                                = normal,
Area Summary                             = Enabled,
Time since last SPF Run                  = 00h:00m:27s,
# of Area Border Routers known           = 0,
# of AS Border Routers known             = 0,
# of LSAs in area                        = 0,
# of SPF Calculations done               = 0,
# of Incremental SPF Calculations done   = 0,
# of Neighbors in Init State             = 0,
# of Neighbors in 2-Way State            = 0,
# of Neighbors in Exchange State         = 0,
# of Neighbors in Full State             = 0,
# of Interfaces attached                 = 0
Attached Interfaces                      = vlan-213
```

output definitions

Area Identifier	The unique 32-bit value, such as IP address, that identifies the OSPF area in the AS.
Admin Status	Whether the area is enabled or disabled.
Operational Status	Whether the area is active.
Area Type	The area type. This field will be **normal**, **stub**, or **NSSA**.
Area Summary	Whether Area Summary is enabled or disabled.
Time since last SPF Run	The last time the Shortest Path First calculation was performed.
# of Area Border Routers known	The number of Area Border Routers in the area.
# of AS Border Routers known	The number of Autonomous System Border Routers in the area.
# of LSAs	The total number of Link State Advertisements for the Area.
# of SPF Calculations	The number of times the area has calculated the Shortest Path.
# of Incremental SPF Calculations	The number of incremental Shortest Path First calculations that have been performed in the area.
# of Neighbors in Init State	The number of OSPF neighbors that are in initialization.
# of Neighbors in 2-Way State	The number of OSPF 2-way state neighbors in this area.
# of Neighbors in Exchange State	The number of OSPF neighbors that are currently establishing their status.
# of Neighbors in Full State	The number of OSPF neighbors.
# of Interfaces attached	The number of OSPF interfaces.
Attached Interfaces	The names of the OSPF interfaces attached to this area.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf area	Creates or deletes an OSPF area, assigning default metric, cost, and type.
ip ospf area range	Creates a route summarization instance whereby a range of addresses will be advertised as a single route.
show ip ospf interface	Displays OSPF interface information.

MIB Objects

```
ospfAreaTable
   ospfAreaId
   ospfImportAsExtern
   ospfSpfRuns
   ospfAreaBdrRtrCount
   ospfAsBdrRtrCount
   ospfAreaLsaCount
   ospfAreaSummary
   ospfAreaStatus
alaOspfIfAugTable
   alaOspfIfIntfName
```

show ip ospf area range

Displays all or specified route summaries in a given area.

show ip ospf area *area_id* **range [{summary | nssa}** *ip_address ip_mask***]**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
summary	Specifies that routes are summarized.
nssa	Specifies the Not So Stubby Area (NSSA) routers are summarized.
ip_address	A 32-bit IP address.
ip_mask	A 32-bit subnet mask.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Allows you to view the details of a specified OSPF area range.
- See the Related Commands section below for information on modifying an area.

Examples

```
-> show ip ospf area 0.0.0.0 range

     AreaId        Type     Destination        Advertise
---------------+---------+------------------+-----------
0.0.0.0          Summary   192.168.12.1/24   Matching
0.0.0.0          NSSA      143.209.92.71/24  noMatching
```

output definitions

AreaId	The area identification for the area range.
Type	The type of area the range is associated with.
Destination	The destination address of the range.
Advertise	Shows the filter effect of the range. LSAs in the range are either advertised (Matching) or not advertised (noMatching).

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf area range	Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

MIB Objects

```
ospfAreaRangeTable
   ospfAreaRangeAreaId
   ospfAreaRangeNet
   ospfAreaRangeMask
   ospfAreaRangeStatus
   ospfAreaRangeEffect
```

show ip ospf area stub

Displays stub default area metrics, if configured.

show ip ospf area *area_id* **stub**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip ospf area 0.0.0.1 stub

    Area Id       TOS     Metric    MetricType
---------------+-------+----------+------------
0.0.0.1           1          1        ospf
```

output definitions

Area Id	The identification number of the stub area.
TOS	The Type of Service assignment.
Metric	The metric assignment of the default router in the stub area.
MetricType	The metric type of the stub area. It will be either **ospf**, **type1**, or **type2**.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf area	Creates or deletes an OSPF area.

MIB Objects

```
ospfStubAreaTable
   ospfStubAreaId
   ospfStubTOS
   ospfStubMetric
   ospfStubStatus
   ospfStubMetricType
```

show ip ospf interface

Displays OSPF interface information.

show ip ospf interface [*interface_name***]**

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Not specifying an interface name displays all known interfaces for the OSPF router.

Examples

No interface name is specified:

```
-> show ip ospf interface
    Interface                DR           Backup DR      Admin    Oper
      Name                 Address         Address       Status  Status  State
--------------------+---------------+---------------+--------+------+-------
vlan-213              213.10.10.1     213.10.10.254    enabled   up    DR
vlan-215              215.10.10.254   215.10.10.1      enabled   up    BDR
```

output definitions

Interface Name	The name of the interface.
DR Address	The designated router IP address on this network segment. Make sure you configure a VLAN for the router IP. (See Chapter 5, "VLAN Management Commands," for more information.)
Backup DR Address	The IP address of the backup designated router.
Vlan	The VLAN to which the interface is assigned.
Admin Status	The current administration status of the interface, either **enabled** or **disabled**.
Oper Status	Whether the interface is an active OSPF interface.
State	The current state of the OSPF interface. It will be **down**, **up**, **dp**, **dr**, or **other**.

The following is an example of MD5 authentication (an interface name is used in this example).

```
-> show ip ospf interface vlan-3
Interface IP Name                     = vlan-3
VLAN Id                               = 3,
Interface IP Address                  = 100.10.10.2,
Interface IP Mask                     = 255.255.255.0,
Admin Status                          = Enabled,
Operational Status                    = Up,
OSPF Interface State                  = BDR,
Interface Type                        = Broadcast,
Area Id                               = 0.0.0.2,
Designated Router IP Address          = 100.10.10.88,
Designated Router RouterId            = 100.10.10.88,
Backup Designated Router IP Address   = 100.10.10.2,
Backup Designated Router RouterId     = 192.169.1.2,
MTU  (bytes)                          = 1500,
Metric Cost                           = 1,
Priority                              = 1,
Hello Interval (seconds)              = 10,
Transit Delay (seconds)               = 1,
Retrans Interval (seconds)            = 5,
Dead Interval (seconds)               = 40,
Poll Interval (seconds)               = 120,
Link Type                             = Broadcast,
Authentication Type                   = md5,
#   Id   Key   Status   StartAccept  StopAccept  StartGen  StopGen
--+----+-----+----------+-----------+-----------+---------+--------
1  1     Set  Enabled       0           0         0        0
# of Events                           = 2,
# of Init State Neighbors             = 0,
# of 2-Way State Neighbors            = 0,
# of Exchange State Neighbors         = 0,
# of Full State Neighbors             = 1
BFD status                            = Disabled,
DR-Only Option for BFD                = Disabled
```

Note. See the table on the following page for output definitions.

The following is an example of simple authentication (an interface name is used in this example):

```
-> show ip ospf interface vlan-3
Interface IP Name                     = vlan-3
VLAN Id                               = 3,
Interface IP Address                  = 100.10.10.2,
Interface IP Mask                     = 255.255.255.0,
Admin Status                          = Enabled,
Operational Status                    = Up,
OSPF Interface State                  = DR,
Interface Type                        = Broadcast,
Area Id                               = 0.0.0.2,
Designated Router IP Address          = 100.10.10.2,
Designated Router RouterId            = 192.169.1.2,
Backup Designated Router IP Address   = 0.0.0.0,
Backup Designated Router RouterId     = 0.0.0.0,
MTU  (bytes)                          = 1500,
Metric Cost                           = 1,
Priority                              = 1,
Hello Interval (seconds)              = 10,

# of 2-Way State Neighbors            = 0,
# of Full State Neighbors             = 0
BFD Status                            = Disabled,
DR-Only Option for BFD                = Disabled
```

Output fields when an interface name is specified are described below:

output definitions

Interface IP Name	The name of the VLAN to which the interface is assigned.
VLAN Id	The VLAN to which the interface is assigned.
Interface IP Address	The IP address assigned to the interface.
Interface IP Mask	The IP mask associated with the IP address assigned to the interface.
Admin Status	The current administration status of the interface, either **enabled** or **disabled**.
Operational Status	Whether the interface is an active OSPF interface.
OSPF Interface State	The current state of the OSPF interface. It will be **down**, **up**, **dp**, **dr**, or **other**.
Interface Type	The OSPF interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint.
Area Id	The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area.
Designated Router IP Address	The designated router IP address.

output definitions (continued)

Designated Router RouterId	The identification number of the designated router.
Backup Designated Router IP Address	The IP address of the backup designated router.
Backup Designated Router RouterId	The identification number of the backup designated router.
MTU	The Maximum Transfer Unit (in bytes) for the interface.
Metric Cost	The cost added to routes learned on this interface.
Priority	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
Hello Interval	The number of seconds between hello messages sent out on the interface.
Transit Delay	The estimated number of seconds required to transmit a link state update over this interface.
Retrans Interval	The number of seconds the interface waits before resending hello messages.
Dead Interval	The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead.
Poll Interval	The larger time interval, in seconds, between hello messages sent to inactive neighbors.
Link Type	The IP interface type, either **broadcast** or **non broadcast**.
Authentication Type	The type of authentication used by this interface, either **none**, **simple**, or **md5**.
#	The indexing of the MD5 key. (This field is only displayed for MD5 authentication.)
Id	A key identifier that identifies the algorithm and MD5 secret key associated with this interface. (This field is only displayed for MD5 authentication.)
Key	Indicates whether the MD5 key has been set or not. (This field is only displayed for MD5 authentication.)
Status	The status of the configured MD5 authentication key. (This field is only displayed for MD5 authentication.)
StartAccept	The time that the OSPF router will start accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.)
StopAccept	The time that the OSPF router will stop accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.)
StartGen	The time that the OSPF router will start using this key for packet generation. (This field is only displayed for MD5 authentication.)
StopGen	The time that the OSPF router will stop using this key for packet generation. (This field is only displayed for MD5 authentication.)
Authentication Key	This field displays whether the authentication key has been configured or not. (This field is only displayed for simple and no authentication.)
# of Events	The number of interface state machine events.

output definitions (continued)

# of Init State Neighbors	The number of OSPF neighbors in the initialization state.
# of 2-Way State Neighbors	The number of OSPF 2-way state neighbors on this interface.
# of Exchange State Neighbors	The number of OSPF neighbors in the exchange state.
# of Full State Neighbors	The number of OSPF neighbors in the full state. The full state is a neighbor that is recognized and passing data between itself and the interface.
BFD Status	The status of BFD on this interface.
DR-Only Option for BFD	The BFD setting for this interface. If DR-Only only is disabled then the setting is All Neighbors.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip ospf interface	Creates and deletes an OSPF interface.
ip ospf interface auth-key	Configures an OSPF authentication key for simple authentication on an interface.
ip ospf interface dead-interval	Configures the OSPF interface dead interval.
ip ospf interface hello-interval	Configures the OSPF interface hello interval.
ip ospf interface md5	Creates and deletes the OSPF interface MD5 key identification number.
ip ospf interface md5 key	Configures the OSPF key string.
ip ospf interface cost	Configures the OSPF interface cost.
ip ospf interface poll-interval	Configures the OSPF poll interval for a Non Broadcast Multi Access (NBMA) interface.
ip ospf interface priority	Configures the OSPF interface priority.
ip ospf interface retrans-interval	Configures the OSPF interface retransmit interval.
ip ospf interface transit-delay	Configures the OSPF interface transit delay.
ip ospf interface auth-type	Sets the OSPF interface authentication type.
ip ospf interface area	Configures an OSPF interface area.
ip ospf interface type	Configures the OSPF interface type.
ip ospf interface admin-state	Enables or disables the administration status on an OSPF interface.

show ip ospf restart

Displays the OSPF graceful restart related configuration and status.

show ip ospf restart

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch 10K switches with a single CMM.

Examples

```
-> show ip ospf restart
Restart Support                    = Enabled,
Restart Interval (in seconds)      = 120,
Restart Status                     = Not Restarting,
Restart Age (in seconds)           = 0,
Last Restart Exit Reason           = None,
Restart Helper Support             = Enabled,
Restart Helper Strict Checking     = Enabled,
Restart Helper Mode                = NotHelping
```

output definitions

Restart Support	The administrative status of OSPF graceful restart, which can be **Enabled** or **Disabled**.
Restart Interval	The configured OSPF hitless restart timeout interval, in seconds. Use the **ip ospf restart-interval** command to modify this parameter.
Restart Status	The current status of OSPF graceful restart, which can be **Not Restarting**, **Unplanned Restart** (after a CMM takeover), or **Planned Restart** (before CMM takeover).
Restart Age	The remaining time, in seconds, for the current OSPF graceful restart interval.
Last Restart Exit Reason	The outcome of the last attempt at a graceful restart. If the value is **None**, then no restart has yet been attempted. If the value is **In Progress**, then a restart attempt is currently underway. Other possible values include **Completed** (successfully completed), **Timed Out** (timed out), and **Topology Changed** (aborted due to topology change).

output definitions (continued)

Restart Helper Support	The administrative status of the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart, which can be **Enabled** or **Disabled**. Use the **ip ospf restart-helper admin-state** command to modify this parameter.
Restart Helper Strict Checking	The administrative status of whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router, which can be **Enabled** or **Disabled**. Use the **ip ospf restart-helper strict-lsa-checking admin-state** command to modify this parameter.
Restart Helper Mode	Whether this OSPF router is operating as a helper to a restarting router.

24 OSPFv3 Commands

Open Shortest Path First version 3 (OSPFv3) routing is a shortest path first (SPF) or link-state protocol. This protocol is compatible with 128-bit IPv6 address space, while OSPF is compatible with 32-bit IPv4 address space. OSPFv3 is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPFv3 chooses the least-cost path as the best path.

Each participating router distributes its local state (i.e., the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPFv3 allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an *are*a. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

Alcatel-Lucent's version of OSPFv3 complies with RFCs 2740, 1826, 1827, 2553, 2373, 2374, and 2460.

MIB information for OSPFv3 is as follows:

Filename: AlcatelIND1DrcTm.mib
Module: ALCATEL-IND1-DRCTM-MIB

Filename: AlcatelIND1Ospf3.mib
Module: ALCATEL-IND1-OSPF3-MIB

Filename: IETF-OSPF-OSPFv3.MIB
Module: OSPF-OSPFv3-MIB

The following is a list of the commands for configuring OSPFv3:

Global OSPFv3 Commands	**ipv6 ospf admin-state** **ipv6 load ospf** **ipv6 ospf host** **ipv6 ospf mtu-checking** **ipv6 ospf route-tag** **ipv6 ospf spf-timer** **ipv6 ospf virtual-link** **show ipv6 ospf** **show ipv6 ospf border-routers** **show ipv6 ospf host** **show ipv6 ospf lsdb** **show ipv6 ospf neighbor** **show ipv6 ospf routes** **show ipv6 ospf virtual-link**
OSPFv3 Area Commands	**ipv6 ospf area** **show ipv6 ospf area**
OSPFv3 Interface Commands	**ipv6 ospf interface** **ipv6 ospf interface suppress-link-lsa** **ipv6 ospf interface type** **ipv6 ospf neighbor** **ipv6 ospf interface area** **ipv6 ospf interface dead-interval** **ipv6 ospf interface hello-interval** **ipv6 ospf interface cost** **ipv6 ospf interface priority** **ipv6 ospf interface retrans-interval** **ipv6 ospf interface transit-delay** **show ipv6 ospf interface**

ipv6 ospf admin-state

Enables or disables the OSPFv3 administrative status for the router.

ipv6 ospf admin-state {enable | disable}

Syntax Definitions

enable	Enables OSPFv3.
disable	Disables OSPFv3.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The OSPFv3 protocol should be enabled to route traffic.

Examples

```
-> ipv6 ospf admin-state enable
-> ipv6 ospf admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf	Displays OSPFv3 status and general configuration parameters.

MIB Objects

```
ospfv3GeneralGroup
   ospfv3AdminStat
```

ipv6 load ospf

Loads the OSPFv3 software on the router.

ipv6 load ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Example

```
-> ipv6 load ospf
```

Release History

Release 8.1.1; command introduced.

Related Commands

N/A

MIB Objects

```
ALADRCTMCONFIG
   alaDrcTmIPOspf3Status
```

ipv6 ospf host

Creates or deletes an OSPFv3 entry for directly attached hosts.

ipv6 ospf host *ipv6_address* **[area** *area_id***] [metric** *metric***]**

no ipv6 ospf host *ipv6_address* **area** *area_id*

Syntax Definitions

ipv6_address	The 128-bit IP address of the OSPF host.
area_id	Area to which the host route belongs.
metric	The cost metric value assigned to the specified host. The valid range is 0–65535.

Defaults

parameter	default
metric	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove the record of the OSPFv3 host.
- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path.
- This command allows you to modify the host parameter **metric**.

Examples

```
-> ipv6 ospf host 2001::1/64 metric 10
-> no ipv6 ospf host 2001::1/64 metric 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf host	Displays information on the configured OSPFv3 hosts.

MIB Objects

```
ospfv3HostTable
   ospfv3HostStatus
   ospfv3HostAreaID
   ospfv3HostAddress
   ospfv3HostMetric
```

ipv6 ospf mtu-checking

Enables or disables Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

ipv6 ospf mtu-checking

no ipv6 ospf mtu-checking

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to disable MTU checking.
- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

Examples

```
-> ipv6 ospf mtu-checking
-> no ipv6 ospf mtu-checking
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf	Displays the OSPFv3 status and general configuration parameters.

MIB Objects

```
alaProtocolOspf3
   alaOspf3MTUCheck
```

ipv6 ospf route-tag

Configures a tag value for the Autonomous System External (ASE) routes created.

ipv6 ospf route-tag *tag*

Syntax Definitions

tag	The set tag value. The valid range is 0–2, 147, 483, 647.

Defaults

parameter	default
tag	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command allows you to set a tag value for ASE routes that are learned by this OSPF router. The tag value allows for quick identification.
- OSPF ASE route advertisements contain a tag value field. This field allows the exchange of information between autonomous system border routers (ASBRs).

Examples

```
-> ipv6 ospf route-tag 2
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf	Displays OSPFv3 status and general configuration parameters.

MIB Objects

```
alaProtocolOspf3
   alaOspf3RedistRouteTag
```

ipv6 ospf spf-timer

Configures timers for Shortest Path First (SPF) calculation.

ipv6 ospf spf-timer [delay *delay_seconds***] [hold** *hold_seconds***]**

Syntax Definitions

delay_seconds	Specifies time (from 0 to 65535 seconds) between the reception of an OSPF topology change and the start of an SPF calculation.
hold_seconds	Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations.

Defaults

parameter	default
delay_seconds	5
hold_seconds	10

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command allows you to configure the time interval between SPF calculations.
- Use the delay timer to determine how much time to postpone an SPF calculation after the router receives a topology change.
- Use the hold timer to configure the amount of time that must elapse between consecutive SPF calculations.
- There will be no delay in the SPF calculation if either the delay timer or hold timer is set to 0. The SPF calculations will occur immediately upon the reception of a topology change and/or that back-to back SPF calculations can take place with no break in-between the two.

Examples

```
-> ipv6 ospf spf-timer delay 20 hold 35
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf	Displays the OSPFv3 status and general configuration parameters.

MIB Objects

```
alaProtocolOspf3
   alaOspf3TimerSpfDelay
   alaOspf3TimerSpfHold
```

ipv6 ospf virtual-link

Creates or deletes a virtual link. A virtual link restores the backbone connectivity if the backbone is not physically contiguous.

ipv6 ospf virtual-link area *area_id* **router** *router_id* **[dead-interval** *seconds***] [hello-interval** *seconds***] [retrans-interval** *seconds***] [transit-delay** *seconds***]**

no ipv6 ospf virtual-link area *area_id* **router** *router_id*

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
router_id	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
dead-interval *seconds*	Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647.
hello-interval *seconds*	Sets the virtual link hello interval, which is the time interval between OSPF hellos sent on this virtual link. The valid range is 1–65535.
retrans-interval *seconds*	Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPF packets. The valid range is 0–3600.
transit-delay *seconds*	Sets the virtual link transit delay, which is the number of seconds to transmit OSPF packets over this link. The valid range is 0–3600.

Defaults

parameter	default
dead-interval *seconds*	40
hello-interval *seconds*	10
retrans-interval *seconds*	5
transit-delay *seconds*	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to delete the virtual link.
- You can define areas in such a way that the backbone is no longer contiguous. In this case, the system administrator can ensure backbone connectivity physically.
- Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.
- If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.
- The **dead-interval** value should be the same for all the routers on the same network. This value should be a multiple of the value provided for the **hello-interval**.

Examples

```
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 dead-interval 50
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 hello-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 retrans-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 transit-delay 50
-> no ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf virtual-link	Displays the virtual link information.

```

ipv6 ospf area

Assigns an OSPFv3 interface to a specified area.

ipv6 ospf area *area_id* **[type {normal | stub [default-metric** *metric***]} | [summarize** *range* **[filter] [cost** *cost***]]**

no ipv6 ospf area *area_id*

Syntax Definitions

area_id	A unique 32-bit value in IPv4 address format.
normal	Sets the area as a regular OSPFv3 area.
stub	Configures an OSPFv3 area as a stub area.
metric	Defines the metric to be used for default routes injected into the stub.
summarize	Configures the inter-area route summarization for range.
range	Aggregate range in IPv6 Address/PrefixLength format.
filter	Filter routes described by summarization range.
cost	Cost to use for summarized route (transferred in cost parameter).

Defaults

parameter	default
normal | stub	**normal**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to delete the OSPFv3 area. It can also be used to deactivate summarization.
- The **default-metric** parameter defines the metric to be used for default routes injected into the stub area.

Examples

```
-> ipv6 ospf area 0.0.0.1
-> ipv6 ospf area 0.0.0.1 stub
-> ipv6 ospf area 0.0.0.1 type normal
-> no ipv6 ospf area 0.0.0.1
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf area	Displays either all the OSPFv6 areas, or a specified OSPFv6 area.

```

ipv6 ospf interface

Creates or deletes an OSPFv3 interface.

ipv6 ospf interface *interface_name*

no ipv6 ospf interface *interface_name*

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to delete an OSPFv3 interface.
- The interface name cannot contain spaces.

Examples

```
-> ipv6 ospf interface vlan-101
-> no ipv6 ospf interface vlan-101
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
```

ipv6 ospf interface suppress-link-lsa

Allows to suppress the announcements of the Link State Advertisements (LSAs).

ipv6 ospf interface *interface_name* **suppress-link-lsa**

no ipv6 ospf interface *interface_name* **suppress-link-lsa**

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of the command to disable LSA suppression.

Examples

```
-> ipv6 ospf interface vlan-101 suppress-link-lsa
-> no ipv6 ospf interface vlan-101 suppress-link-lsa
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   alaOspf3SuppressLinkLsa
```

ipv6 ospf interface type

Allows to configure the type of OSPFv3 interface.

ipv6 ospf interface *interface_name* **type {broadcast | point-to-point | point-to-multipoint | nbma}**

Syntax Definitions

interface_name	The name of the interface.
broadcast	The interface is a broadcast interface.
point-to-point	The interface is a point-to-point interface.
point-to-multipoint	The interface is a point-to-multipoint interface.
nbma	The interface is a nbma interface.

Defaults

parameter	default
broadcast | point-to-point | point-to-multipoint | nbma	**broadcast**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The OSPFv3 interface must be enabled to participate in the OSPFv3 protocol.

Examples

```
-> ipv6 ospf interface vlan-101 type nbma
-> ipv6 ospf interface vlan-101 type point-to-point
-> ipv6 ospf interface vlan-101 type point-to-multipoint
-> ipv6 ospf interface vlan-101 type broadcast
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfStatus
   ospfv3IfType
```

ipv6 ospf neighbor

Allows to configure OSPFv3 neighbor on non-broadcast interface type. The neighbor configuration is required on NBMA and point-to-multipoint interface to run OSPFv3.

ipv6 ospf neighbor *nbr_ipv6_address* **interface** *interface_name* **{eligible | ineligible}**

no ipv6 ospf neighbor *nbr_ipv6_address*

Syntax Definitions

nbr_ipv6_address	Local ipv6 address of the neighbor to be linked.
interface_name	The name of the interface on which the neighbor is reachable.
eligible	Indicates the neighbor is eligible to become the designated router.
ineligible	Indicates the neighbor is ineligible to become the designated router.

Defaults

parameter	default
eligible | ineligible	**eligible**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to delete the neighbor configuration.
- The OSPFv3 interface must be configured before configuring the OSPFv3 neighbor.
- This command is not applicable for broadcast interface type and is optional for point-to-point interface type.

Examples

```
-> ipv6 ospf neighbor fe80::2e0:b1ff:fe7e:5f1e interface vlan-101 eligible
-> ipv6 ospf neighbor fe80::2e0:b1ff:fe7e:5f1e interface vlan-101 ineligible
-> no ipv6 ospf neighbor fe80::2e0:b1ff:fe7e:5f1e interface vlan-101
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.
ipv6 ospf interface suppress-link-lsa	Allows to configure the type of OSPFv3 interface.

MIB Objects

```
ospfv3NbrTable
   ospfv3NbrPriority
   ospfv3NbmaNbrStatus
```

ipv6 ospf interface admin-state

Enables or disables the administration status on an OSPFv3 interface.

ipv6 ospf interface *interface_name* **admin-state {enable | disable}**

no ipv6 ospf interface *interface_name*

Syntax Definitions

interface_name	The name of the interface.
enable	Enables the OSPFv3 interface.
disable	Disables the OSPFv3 interface.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to delete an OSPFv3 interface.
- The OSPFv3 interface must be enabled to participate in the OSPFv3 protocol.

Examples

```
-> ipv6 ospf interface vlan-101 admin-state enable
-> ipv6 ospf interface vlan-101 admin-state disable
-> no ipv6 ospf interface vlan-101
-> no ipv6 ospf interface vlan-101
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfAdminStat
```

ipv6 ospf interface area

Configures an OSPFv3 area identifier for this interface.

ipv6 ospf interface *interface_name* **area** *area_id*

Syntax Definitions

interface_name	The name of the interface.
area_id	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

An interface must be assigned to an area to become operational.

Examples

```
-> ipv6 ospf interface vlan-101 area 0.0.0.1
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf area	Displays either all the OSPFv3 areas, or a specified OSPFv3 area.
show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfAreaId
```

ipv6 ospf interface dead-interval

Configures the OSPFv3 interface dead interval.

ipv6 ospf interface *interface_name* **dead-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The dead interval, in seconds. The valid range is 1–65535.

Defaults

parameter	default
seconds (broadcast and point-to-point)	40
seconds (NBMA and point-to-multi-point)	120

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- After the dead interval, a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or multiples of the hello interval.

Examples

```
-> ipv6 ospf interface vlan-101 dead-interval 50
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 ospf interface hello-interval	Configures the OSPFv3 interface hello interval.
show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfRtrDeadInterval
```

ipv6 ospf interface hello-interval

Configures the OSPFv3 interface hello interval.

ipv6 ospf interface *interface_name* **hello-interval** *seconds*

Syntax Definitions

interface_name	The name of the interface.
seconds	The hello interval, in seconds. The valid range is 0–65535. A value of 0 creates a passive OSPF interface.

Defaults

parameter	default
seconds (broadcast and point-to-point)	10
seconds (NBMA and point-to-multi-point)	30

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This is the interval between two consecutive hello packets sent out on this interface.

Examples

```
-> ipv6 ospf interface vlan-101 hello-interval 50
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 ospf interface dead-interval	Configures the OSPFv3 interface dead interval.
show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfHelloInterval
```

ipv6 ospf interface cost

Configures the OSPFv3 interface cost.

ipv6 ospf interface *interface_name* **cost** *cost*

Syntax Definitions

interface_name	The name of the interface.
cost	The interface cost. The valid range is 0–65535.

Defaults

parameter	default
cost	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The configured interface cost (if any) is used during OSPFv3 route calculations.

Examples

```
-> ipv6 ospf interface vlan-101 cost 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfMetricValue
```

ipv6 ospf interface priority

Configures the OSPFv3 interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

ip ospf interface *interface_name* **priority** *priority*

Syntax Definitions

interface_name	The name of the interface.
priority	The interface cost. The valid range is 0–65535.

Defaults

parameter	default
priority	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

Examples

```
-> ipv6 ospf interface vlan-101 priority 100
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfRtrPriority
```

ipv6 ospf interface retrans-interval

Configures the OSPFv3 interface retransmit time interval.

ipv6 ospf interface *interface_name* **retrans-interval** *interval*

Syntax Definitions

interface_name	The name of the interface.
interval	The retransmit interval, in seconds. The valid range 0–3600.

Defaults

parameter	default
interval	5

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The number of seconds between link retransmission of OSPFv3 packets on this interface.

Examples

```
-> ipv6 ospf interface vlan-101 retrans-interval 500
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfRetransInterval
```

ipv6 ospf interface transit-delay

Configures the OSPFv3 interface transit time delay.

ipv6 ospf interface *interface_name* **transit-delay** *delay*

Syntax Definitions

interface_name	The name of the interface.
delay	The transit delay, in seconds. The valid range is 0–3600.

Defaults

parameter	default
seconds	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

Examples

```
-> ipv6 ospf interface vlan-101 transit-delay 100
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 ospf interface	Displays the status and statistics of an OSPFv3 interface.

MIB Objects

```
ospfv3IfTable
   ospfv3IfIndex
   ospfv3IfTransitDelay
```

show ipv6 ospf

Displays the OSPFv3 status and general configuration parameters.

show ipv6 ospf

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used to display the general configuration parameters of the OSPFv3 router.
- See the Related Commands section below to modify the displayed parameters.

Examples

```
-> show ipv6 ospf

Status                          = Enabled,
Router ID                       = 5.5.5.5,
# Areas                         = 2,
# Interfaces                    = 4,
Area Border Router              = Yes,
AS Border Router                = No,
External Route Tag              = 0,
SPF Hold (seconds)              = 10,
SPF Delay (seconds)             = 5,
MTU checking                    = Enabled,
# SPF calculations performed    = 3,
Last SPF run (seconds ago)      = N/A,
# of neighbors that are in:
  Full state                    = 3,
  Loading state                 = 0,
  Exchange state                = 0,
  Exstart state                 = 0,
  2way state                    = 0,
  Init state                    = 0,
  Attempt state                 = 0,
  Down state                    = 0,
```

output definitions

Status	Displays whether OSPFv3 is currently enabled or disabled on the router.
Router Id	The unique identification for the router.
# Areas	Number of areas to which the router belongs.
# Interface	Number of interfaces participating in OSPF
Area Border Router	Displays whether the router status is an area router or not.
AS Border Router	Displays whether the area Autonomous System Border Router status of this router is enabled or disabled.
External Route Tag	Displays the route tag for this router.
SPF Hold (seconds)	Displays the time in seconds between the reception of an OSPFv3 topology change and the start of a SPF calculation.
SPF Delay (seconds)	Displays the time in seconds between consecutive SPF calculations.
MTU Checking	Displays whether Maximum Transfer Unit checking is enabled or disabled. This is set using the **ipv6 ospf mtu-checking** command.
# SPF calculations performed	Displays the number of SPF calculation performed.
Last SPF run (seconds ago)	N/A
Full state	Displays the number of neighbor routers that are in Full state.
Loading state	Displays the number of neighbor routers that are in Loading state.
Exchange state	Displays the number of neighbor routers that are in Exchange state.
Exstart state	Displays the number of neighbor routers that are in Exstart state.
2way state	Displays the number of neighbor routers that are in 2way state.
Init state	Displays the number of neighbor routers that are in Init state.
Attempt state	Displays the number of neighbor routers that are in Attempt state.
Down state	Displays the number of neighbor routers that are in Down state.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 ospf admin-state	Enables or disables the administration of OSPFv3 on the router.
ipv6 ospf mtu-checking	Enables or disables the use of Maximum Transfer Unit (MTU) checking.
ipv6 ospf spf-timer	Configures timers for SPF calculation.
ipv6 ospf route-tag	Configures a tag value for Autonomous System External (ASE) routes created.
ip router router-id	Configures the router ID for the router.

MIB Objects

```
ospfv3GeneralGroup
   ospfv3RouterId

```

show ipv6 ospf border-routers

Displays information regarding all or specified border routers.

show ipv6 ospf border-routers [area *area_id***] [router** *router_id***]**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
router_id	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used to display a list of border routers known by this OSPFv3 router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.
- See the Related Commands sections below to modify the list.

Examples

```
-> show ipv6 ospf border-routers

Router ID          Area           Metric   Type
---------------+---------------+--------+---------
6.6.6.6            0.0.0.0          2      INTRA
6.6.6.6            0.0.0.1          2      INTRA
        fe80::2d0:95ff:fee2:6bda -> pseudo1
        fe80::2d0:95ff:fee2:6bda -> pseudo2
```

output definitions

Router ID	The unique identification for the router.
Area	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
Metric	The metric used by the routes.
Type	The type of routes specified (intra or inter).

Release History

Release 8.1.1; command introduced.

Related Commands

MIB Objects

N/A

show ipv6 ospf host

Displays information on the configured OSPFv3 hosts.

show ipv6 ospf host [*ipv6_address***]**

Syntax Definitions

ipv6_address	A 128-bit IP address for a directly attached host.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used to display general information for OSPFv3 hosts directly attached to this router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ipv6 ospf host

Area             Metric   Address
---------------+-------+-----------
0.0.0.1            1      2001::1/64
```

output definitions

Area	A 32-bit IP address for a directly attached host. This can be set using the **ipv6 ospf host** command.
Metric	The metric assigned to the host. Metric is set using the **ipv6 ospf host** command.
Address	IPV6 address of the host.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 ospf host	Creates or deletes an OSPFv3 entry for directly attached hosts.

MIB Objects

```
ospfv3HostTable
   ospfv3HostIpAddress
   ospfv3HostMetric
   ospfHostStatus
   ospfv3HostAreaID
```

show ipv6 ospf lsdb

Displays Link State Advertisements (LSAs) in the Link State Database (LSDB) associated with each area.

show ipv6 ospf lsdb [area *area_id***] [rtr | net | netsum | asbrsum] [linkstate-id** *ls_id***] [router-id** *router_id***]**

Syntax Definitions

area_id	A unique 32-bit value in IP address format.
rtr	Specifies router LSAs.
net	Specifies network LSAs.
netsum	Specifies network summary LSAs.
asbrsum	Specifies Autonomous System Border Router summary LSAs.
ls_id	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
router_id	The Router ID. The ID is a unique 32-bit value such as an IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used to display the LSDB of the OSPF router. It can be used for OSPF debugging, specifically to narrow down sections of an area to determine which sections are receiving the specified LSAs. You can specify the parameters of only the area LSDB using the optional command parameters.
- You can view LSAs by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you also need to supply a valid link state ID.

Examples

```
-> show ipv6 ospf lsdb

Area             Type       Link ID      Advertising Rtr  Sequence #   Age

-----------------+----------+------------+-----------------+----------+----------
0.0.0.0          Router     0            1.1.1.1           8000020f     1117
0.0.0.0          Router     0            3.3.3.3           80000208     1121
0.0.0.0          Router     0            5.5.5.5           800001f1     1117
0.0.0.0          Router     0            30.30.30.30       800000da     1115
```

output definitions

Area	The identification of the area to which the router belongs.
Type	The protocol type from where the route was learned.

output definitions (continued)

Link Id	The Link state ID. The ID is a unique 32-bit value expressed as an IPv6 address. This number is used as a record in the link state database.
Advertising Rtr	The ID of the router that advertises the routes.
Sequence #	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
Age	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 ospf admin-state	Displays the OSPFv3 status and general configuration parameters.

MIB Objects

```
ospfv3AsLsdbTable
   ospfv3AsLsdbAreaId
   ospfv3AsLsdbType

   ospfv3AsLsdbAge
```

show ipv6 ospf neighbor

Displays information on OSPFv3 non-virtual neighbors.

show ipv6 ospf neighbor [router *ipv4_address***][interface** *interface_name***]**

Syntax Definitions

ipv4_address	A 32-bit router ID of the neighboring router.
interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used to display all non-virtual neighbors of the OSPF router.
- See the Related Commands section below to modify the list.

Examples

```
-> show ipv6 ospf neighbor
Router ID        Area/Transit Area   State  Interface
----------------+-------------------+-----+---------------------------------
1.1.1.1          0.0.0.0              FULL  vlan-2071
3.3.3.3          0.0.0.0              FULL  vlan-2071
5.5.5.5          0.0.0.0              FULL  vlan-2071
23.23.23.23      0.0.0.1              FULL  vlan-2055
23.23.23.23      0.0.0.1              FULL  vlan-2056
24.24.24.24      0.0.0.1              FULL  vlan-2065
24.24.24.24      0.0.0.1              FULL  vlan-2066
```

output definitions

Router ID	The unique identification for the router.
Area/Transit Area	The area identifier.
State	The state of the OSPF neighbor adjacency.
Interface	The name of the interface.

```
-> show ipv6 ospf neighbor router 24.24.24.24
Router ID        Area/Transit Area   State  Interface
----------------+-------------------+-----+--------------
24.24.24.24      0.0.0.1              FULL  vlan-2070
24.24.24.24      0.0.0.1              FULL  vlan-2073
```

output definitions

Router ID	The unique identification for the router.
Area/Transit Area	The area identifier.
State	The state of the OSPF neighbor adjacency.
Interface	The name of the interface.

```
-> show ipv6 ospf neighbor router 10.135.37.23 interface ospf
Details for Neighbor 10.135.37.23

State                            = FULL,

                                 R bit is set
                                 DC bit is not set
```

output definitions

State	The state of the OSPF neighbor adjacency.
Interface	The name of the interface.
Neighbor i/f index	The unique value assigned to the neighbor.
Priority	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
Address	The IPV6 address of the host.
Neighbor’s type	Specifies the type of neighbor.
Neighbor is reporting DR as	The address of the neighbors designated router.
Neighbor is reporting BDR as	The address of the neighbors Backup Designated Router.
Neighbor is Master/Slave	The role the neighbor has with the local router during DD Exchange, which can be Master or Slave.
Seconds since last Hello seen	The amount of time (in seconds) since the last HELLO messages was received from this neighbor.
# of LSAs on retransmit list	The number of Link State updates to the neighbor that need to be retransmitted by the OSPF router.
# of LSAs on request list	The number of Link State requests to this neighbor that have not received a response from this neighbor.

output definitions (continued)

# of State Changes	The number of times this OSPF interface has changed its state.
Neighbor options	If set: EA - External attribute LSA support DC - Demand circuit support R - If clear, a node can participate in OSPF topology distribution without being used to forward transit traffic N - Type 7 LSA support MC - Multicast support E - External routes support V6 - V6 support

```

show ipv6 ospf routes

Displays the OSPFv3 routes known to the router.

show ipv6 ospf routes [prefix *ipv6_address_prefix***][gateway** *gateway***]**

Syntax Definitions

ipv6_address_prefix	The 128-bit IPv6 address of the route destination in hexadecimal format.
gateway	The next hop IPv6 address for this router.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If no variables are entered, all routes are displayed.
- If the variables are entered, then only routes matching the specified criteria are shown.
- All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

Examples

```
-> show ipv6 ospf routes
                                                          Metric
Prefix                                    Path Type       1 : 2

         fe80::2d0:95ff:feac:a59f -> vlan-2056
         fe80::2d0:95ff:fed7:747e -> vlan-2065
         fe80::2d0:95ff:fed7:747e -> vlan-2066
```

output definitions

Prefix	The destination address of the IPv6 route in the hexadecimal format.
Path Type	The type of routes specified (intra or inter).
Metric	The cost of the route.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 ospf admin-state	Displays the OSPFv3 status and general configuration parameters.

MIB Objects

N/A

show ipv6 ospf virtual-link

Displays virtual link information. A virtual link is used to connect OSPFv3 backbone routers that are not physically contiguous.

show ipv6 ospf virtual-link [*router_id***]**

Syntax Definitions

router_id	The router ID of the remote end of the virtual link.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 ospf virtual-link
                                      Intf   Nbr
Transit Area     Peer Router ID    State  State   Cost
----------------+----------------+------+-------+------+
0.0.0.1          6.6.6.6           P2P     FULL    2
```

output definitions

Transit Area	The area identification for the area assigned to the virtual link.
Peer Router ID	The destination router identification for the virtual link.
Intf State	The state of the virtual link with regards to the local router.
Nbr State	The state of the virtual link adjacency.
Cost	The cost metric of the route.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 ospf virtual-link	Creates or deletes a virtual link.

MIB Objects

```
ospfv3VirtIfTable
   ospfv3VirtIfAreaId
   ospfv3VirtIfNeighbor
   ospfv3VirtIfState
```

show ipv6 ospf area

Displays either all OSPFv3 areas, or a specified OSPFv3 area.

show ipv6 ospf area [*area_id*]

Syntax Definitions

area_id	A unique 32-bit value in IP address format.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Allows you to view the details of a specified OSPFv3 area.
- If an OSPF area is not specified, all known areas for the OSPFv3 router will be displayed.
- See the Related Commands section below for information on modifying an area.

Examples

```
-> show ipv6 ospf area

                          Stub   Number of
Area ID           Type    Metric  Interfaces
----------------+-------+-------+------------
0.0.0.0           Normal   NA      2
0.0.0.1           Normal   NA      2

-> show ipv6 ospf area 0.0.0.0
Area Type                                = Normal,
Area Stub Metric                         = 0,
# of SPF calculations                    = 52,
# Interfaces                             = 3,
# Router LSAs                            = 2,
# Network LSAs                           = 3,
# Intra-area-prefix LSAs                 = 4,
# Inter-area-prefix LSAs                 = 15,
# Inter-area-router LSAs                 = 0,
# hosts                                  = 0,
```

output definitions

Area Type	The area type. This field will be **normal** or **stub**.
Area Stub Metric	Indicates whether the area is enabled or disabled.
# Router LSAs	The total number of Link State Advertisements for the Area.
# Network LSAs	The total number of inter-area Link State Advertisements.

output definitions (continued)

# of SPF calculations	The number of times the area has calculated the Shortest Path.
# Interfaces	The number of OSPF interfaces.
# Intra-area-prefix LSAs	The number of intra-area-prefix LSAs, which associates a list of IPv6 address prefixes with a router by referencing a router-LSA.
# Inter-area-prefix LSAs	The number of inter-area-prefix LSAs.Corresponds to Type 3 summary-LSA of OSPF.
# Inter-area-router LSAs	The number of inter-area-router LSAs. Corresponds to Type 4 summary-LSA of OSPF.
# hosts	The number of directly attached hosts.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 ospf area	Creates or deletes an OSPFv3 area, assigning default metric, cost, and type.
show ipv6 ospf interface	Displays OSPFv3 interface information.

MIB Objects

```
ospfv3AreaTable
   ospfv3AreaId
   ospfv3ImportAsExtern
   ospfv3SpfRuns
   ospfv3AreaBdrRtrCount
   ospfv3AreaSummary
   ospfv3AreaStatus
```

show ipv6 ospf interface

Displays OSPFv3 interface information.

show ipv6 ospf interface [*interface_name***]**

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Not specifying the interface name displays all known interfaces for the OSPFv3 router.

Examples

```
-> show ipv6 ospf interface
                                                    IPv6
                                          Admin     Intf     Intf    Intf
 Name      DR Router ID     BDR Router ID  Status    Status   Type    State
---------+----------------+----------------+-------+------+-------+------
 ospf      10.135.38.37     10.135.37.23   Enabled   Up       DR      NBMA
```

output definitions

Name	The name of the interface.
DR Router ID	The designated router address on this network segment. Make sure you configure a VLAN for the router IP. (See Chapter 5, "VLAN Management Commands," for more information.)
BDR Router ID	The IP address of the backup designated router.
Vlan	The VLAN to which the interface is assigned.
Admin Status	The current administration status of the interface, either **enabled** or **disabled**.
Oper Status	Indicates whether the interface is an active OSPF interface.
State	The current state of the OSPF interface. It will be **DR, BDR, other.**
Type	Displays the OSPFv3 interface type.

```
-> show ipv6 ospf interface vlan-2071
Type                            = BROADCAST,
Admin Status                    = Enabled,
IPv6 Interface Status           = Up,
Oper Status                     = Up,
State                           = DR,
Area                            = 0.0.0.0,
Priority                        = 100,
Cost                            = 1,
Interface Type                  = Point-To-Point,
Designated Router               = 3.3.3.3,
Backup Designated Router        = 0.0.0.0,
Hello Interval                  = 1,
Router Dead Interval            = 4,
Retransmit Interval             = 5,
Transit Delay                   = 1,
Ifindex                         = 17,
IPv6 'ifindex'                  = 2071,
MTU                             = 1500,
# of attached neighbors         = 0,
Globally reachable prefix #0    = 2071::2/64
```

Output fields when an IP address or interface name is specified are described below:

output definitions

Type	The OSPF interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint.
Admin Status	The current administrative status of the interface, either **enabled** or **disabled**.
IPv6 Interface Status	The current administrative status of the IPv6 interface, either **up** or **down**.
Oper Status	Indicates whether the interface is an active OSPF interface.
State	The current state of the OSPF interface. It will be **down**, **up**, **dp**, **dr**, or **other**.
Area	The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area.
Priority	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
Cost	The cost added to routes learned on this interface.
Interface Type	Displays the OSPFv3 interface type.
Designated Router	The identification number of the designated router.
Backup Designated Router	The identification number of the backup designated router.
Hello Interval	The number of seconds between hello messages sent out on the interface.
Router Dead Interval	The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead.
Retransmit Interval	The number of seconds the interface waits before resending hello messages.

output definitions (continued)

Transit Delay	The estimated number of seconds required to transmit a link state update over this interface.
Ifindex	The unique value assigned to an interface.
IPv6 'ifindex'	The unique value assigned to an IPv6 interface.
MTU	The Maximum Transfer Unit (in bytes) for the interface.
# of attached neighbors	The number of OSPFv3 neighbors in the initialization state.
Globally reachable prefix #0	A globally unique IPv6 address.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 ospf interface	Creates and deletes an OSPFv3 interface.
ipv6 ospf interface dead-interval	Configures the OSPFv3 interface dead interval.
ipv6 ospf interface hello-interval	Configures the OSPFv3 interface hello interval.
ipv6 ospf interface cost	Configures the OSPFv3 interface cost.
ipv6 ospf interface priority	Configures the OSPFv3 interface priority.
ipv6 ospf interface retrans-interval	Configures the OSPFv3 interface retransmit interval.
ipv6 ospf interface transit-delay	Configures the OSPFv3 interface transit delay.
ipv6 ospf interface area	Configures an OSPFv3 interface area.
ipv6 ospf interface suppress-link-lsa	Enables or disables the administration status on an OSPFv3 interface.

MIB Objects

   ospfv3IfStatus
```

25 IS-IS Commands

Intermediate System-Intermediate System (IS-IS) is a shortest path first (SPF) or link-state protocol. IS-IS is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS) for IP (IPv4 and IPv6) as well as OSI environments. This feature allows a single routing protocol to support pure IP and OSI environments, and dual environments. Integrated IS-IS is also deployed extensively in an IP-only environment.

Each participating router distributes its local state (that is, the usable interfaces of the router and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. IS-IS routers have adjacencies with other routers on point-to-point links. In a multi-access network, routers report their adjacencies to a Designated Intermediate System (DIS), which generates an additional Link State PDU (LSP), commonly known as the pseudo-node LSP. The DIS is responsible for flooding the LAN with LSP and also for synchronizing the entire AS topology. This database is built from the collected link state advertisements of all routers.

IS-IS is a hierarchical protocol where the autonomous system is divided into multiple areas to reduce the size of the Routing table. Routing within an area is referred to as Level-1 routing and that between two or more areas is referred to as Level 2 routing. Each area runs a separate copy of the basic link-state routing algorithm.

Alcatel-Lucent's version of IS-IS complies with RFC 1142.

MIB information for the IP commands is as follows:

Filename: AlcatelIND1Isis.mib
Module: ALCATEL-IND1-ISIS-MIB

Filename: IETF_ISIS.MIB
Module: ISIS-MIB

A summary of the available commands is listed here:

Global IS-IS Commands	**ip load isis** **ip isis admin-state** **ip isis area-id** **ip isis level-capability** **ip isis auth-check** **ip isis auth-type** **ip isis csnp-auth** **ip isis hello-auth** **ip isis psnp-auth** **ip isis lsp-lifetime** **ip isis lsp-wait** **ip isis spf-wait** **ip isis summary-address** **ip isis overload** **ip isis overload-on-boot** **ip isis graceful-restart** **ip isis graceful-restart helper** **ip isis strict-adjacency-check** **ip isis level auth-type** **ip isis level hello-auth** **ip isis level csnp-auth** **ip isis level psnp-auth** **ip isis level wide-metrics-only**
IPv4 and IPv6 Commands	**ip isis activate-ipv6|ipv4** **ip isis vlan** **ip isis vlan admin-state** **ip isis vlan interface-type** **ip isis vlan csnp-interval** **ip isis vlan hello-auth-type** **ip isis vlan level-capability** **ip isis vlan lsp-pacing-interval** **ip isis vlan passive** **ip isis vlan retransmit-interval** **ip isis vlan default-type** **ip isis vlan level hello-auth-type** **ip isis vlan level hello-interval** **ip isis vlan level hello-multiplier** **ip isis vlan level metric** **ip isis vlan level passive** **ip isis vlan level priority** **ip isis summary-address6**

Show Commands	**show ip isis adjacency** **show ip isis database** **show ip isis hostname** **show ip isis routes** **show ip isis routes6** **show ip isis spf** **show ip isis spf-log** **show ip isis statistics** **show ip isis status** **show ip isis summary-address** **show ip isis vlan** **show ip isis summary-address6**
Clear Commands	**clear ip isis adjacency** **clear ip isis lsp-database** **clear ip isis spf-log** **clear ip isis statistics**
M-ISIS (Multi Topology) Commands	**ip isis multi-topology**

ip load isis

Loads the IS-IS software on the router.

ip load isis

Syntax Definitions

N/A

Defaults

By default, IS-IS is not loaded on the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You need to load IS-IS on the switch before executing any IS-IS configuration command.
- To unload IS-IS, remove all the IS-IS configuration from “vcboot.cfg”.

Examples

```
-> ip load isis
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip protocols	Displays switch routing protocol information and status.

MIB Objects

```
alaDrcTmIPIsisStatus
```

ip isis admin-state

Enables or disables the administrative status of IS-IS on the switch.

ip isis admin-state {enable | disable}

Syntax Definitions

enable	Enables IS-IS.
disable	Disables IS-IS.

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When IS-IS status is disabled, the configuration settings and related statistics of the protocol remain unaffected.

Examples

```
-> ip isis admin-state enable
-> ip isis admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```
isisSysTable
   isisSysAdminState
```

ip isis area-id

Configures the area ID for the switch.

ip isis area-id *area address*

no ip isis area-id *area address*

Syntax Definitions

area address	1–13 byte variable length integer, which specifies the area address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the area ID.
- The area ID is part of the Network Service Access Point (NSAP) address.
- Other parts of NSAP address (system ID and selector ID) are not configurable. System ID is derived from router ID and selector ID remains always as 00.
- You can configure a maximum of three area addresses.

Examples

```
-> ip isis area-id 49.0001
-> no ip isis area-id 49.0001
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```
isisManAreaAddrTable
   isisManAreaAddrExistState
```

ip isis level-capability

Configures the router level of the IS-IS protocol globally.

ip isis level-capability {level-1 | level-2 | level-1/2}

Syntax Definitions

level-1	Specifies that the router can operate at Level-1 only.
level-2	Specifies that the router can operate at Level-2 only.
level-1/2	Specifies that the router can operate at both Level-1 and Level-2.

Defaults

parameter	default
level-1 | level-2 | level-1/2	**level-1/2**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Changing the level capability restarts the IS-IS protocol.
- You can also configure the level capability at the IS-IS circuit level.

Examples

```
-> ip isis level-capability level-1
-> ip isis level-capability level-2
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis vlan level-capability	Configures the IS-IS level on the specified circuit.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
isisSysTable
   isisSysType
```

ip isis auth-check

Enables or disables authentication check for IS-IS PDUs.

ip isis auth-check {enable | disable}

Syntax Definitions

enable	Enables authentication check for IS-IS PDUs.
disable	Disables authentication check for IS-IS PDUs.

Defaults

By default, authentication check is enabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If enabled, IS-IS PDUs that fail to match either of the authentication type and key requirements are rejected.
- If disabled, the authentication PDUs are generated and the IS-IS PDUs are authenticated on receipt. An error message will be generated in case of a mismatch; but PDUs will not be rejected.

Examples

```
-> ip isis auth-check enable
-> ip isis auth-check disable
```

Release History

Release 8.1.1; command introduced;

Related Commands

ip isis auth-type	Enables authentication and configures the authentication type of IS-IS protocol globally.
ip isis level auth-type	Enables authentication and configures the authentication types for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisAuthCheck
```

ip isis auth-type

Enables authentication and configures the authentication type of IS-IS protocol globally.

ip isis auth-type {simple {key *key* **| encrypt-key** *encrypt-key***} | md5 {key** *key* | **encrypt-key** *encrypt-key***} | none}**

Syntax Definitions

simple	Simple authentication will be used.
md5	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
key	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
encrypt-key	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
none	No authentication will be used.

Defaults

parameter	default
simple | **md5** | **none**	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the encrypt-key parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this key parameter during the CLI configuration.
- If the encrypt-key parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.
- This command configures the authentication type of IS-IS protocol globally. These settings can be overridden at each level.

- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis auth-type simple key rachel
-> ip isis auth-type md5 encrypt-key 7a1e441a014b4030
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis level auth-type	Enables authentication and configures the authentication types for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisAuthType
   vRtrIsisAuthKey
```

ip isis csnp-auth

Enables or disables the authentication of Complete Sequence Number PDUs (CSNPs).

ip isis csnp-auth

no ip isis csnp-auth

Syntax Definitions

N/A

Defaults

CSNP authentication check is enabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to prevent the CSNP authentication.

Examples

```
-> ip isis csnp-auth
-> no ip isis csnp-auth
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis level csnp-auth	Configures CSNP authentication for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisCsnpAuthentication
```

ip isis hello-auth

Enables or disables the authentication of Hello PDUs globally.

ip isis hello-auth

no ip isis hello-auth

Syntax Definitions

N/A

Defaults

Authentication check of Hello PDUs is enabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to prevent the authentication of Hello packets.

Examples

```
-> ip isis hello-auth
-> no ip isis hello-auth
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis level hello-auth	Enables or disables the authentication of Hello PDUs for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisHelloAuthentication
```

ip isis psnp-auth

Enables or disables the authentication of Partial Sequence Number PDUs (PSNPs).

ip isis psnp-auth

no ip isis psnp-auth

Syntax Definitions

N/A

Defaults

PSNP authentication check is enabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to prevent the authentication of PSNP packets.

Examples

```
-> ip isis psnp-auth
-> no ip isis psnp-auth
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis level psnp-auth	Configures the PSNP authentication for specific IS-IS levels.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisPsnpAuthentication
```

ip isis lsp-lifetime

Configures the time interval for which Link State PDUs generated by a router are considered valid by other routers in the same domain.

ip isis lsp-lifetime *seconds*

no ip isis lsp-lifetime

Syntax Definitions

seconds	Validity interval in seconds.The valid range is 350–65535.

Defaults

parameter	default
seconds	1200

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to restore the default value.

Examples

```
-> ip isis lsp-lifetime 760
-> no ip isis lsp-lifetime
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis vlan lsp-pacing-interval	Configures the interval between IS-IS LSP PDUs sent from the specified circuit.
show ip isis status	Displays the IS-IS status.
show ip isis database	Displays IS-IS LSP database information of the adjacent routers.

MIB Objects

```
vRtrIsisTable
  vRtrIsisLspLifetime
```

ip isis lsp-wait

Configures the intervals between the first, second and subsequently generated LSPs.

ip isis lsp-wait {max-wait | initial-wait | second-wait} *seconds*

no ip isis lsp-wait {max-wait | initial-wait | second-wait}

Syntax Definitions

max-wait	Specifies the maximum interval between two successive LSPs, in seconds. The valid range is 1–120.
initial-wait	Specifies the initial LSP generation delay, in seconds. The valid range is 0–100.
second-wait	Specifies the time interval between the first and second generated LSPs, in seconds. The valid range is 1–100.
seconds	Specifies the time interval.

Defaults

parameter	default
max-wait *seconds*	5
initial-wait *seconds*	0
second-wait *seconds*	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Successive LSPs are generated at increasing **second-wait** interval until a maximum value is reached.

Examples

```
-> ip isis lsp-wait max-wait 25
-> no ip isis lsp-wait initial-wait
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis vlan lsp-pacing-interval	Configures the interval between IS-IS LSP PDUs sent from the specified circuit.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisLspInitialWait
   vRtrIsisLspSecondWait
   vRtrIsisLspMaxWait
```

ip isis spf-wait

Configures the intervals between the first, second, and subsequent SPF calculations.

ip isis spf-wait {max-wait *seconds* **| initial-wait** *milliseconds***| second-wait** *milliseconds***}**

no ip isis spf-wait {max-wait | initial-wait | second-wait}

Syntax Definitions

max-wait *seconds*	Specifies the maximum interval between two successive SPF calculations, in seconds. The valid range is 1000-120000 milliseconds.
initial-wait *milliseconds*	Specifies the initial SPF calculation delay, in milliseconds. The valid range is 10–100000 milliseconds.
second-wait *milliseconds*	Specifies the interval between first and second generated SPFs, in milliseconds. The valid range is 1–100000 milliseconds.

Defaults

parameter	default
max-wait *milliseconds*	10000
initial-wait *milliseconds*	1000
second-wait *milliseconds*	1000

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Successive SPF calculations are generated at exponentially increasing **second-wait** interval until a maximum value is reached.

Examples

```
-> ip isis spf-wait max-wait 1000
-> no ip isis spf-wait max-wait
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisSpfWait
   vRtrIsisSpfInitialWait
   vRtrIsisSpfSecondWait
```

ip isis summary-address

Adds or deletes the summary address.

ip isis summary-address {*ip-prefix/mask* **|** *ip-prefix* **[**/*netmask***]} {level-1 | level-2 | level-1/2}**

no ip isis summary-address {*ip-prefix/mask* **|** *ip-prefix* **[**/*netmask***]}**

Syntax Definitions

ip-prefix/mask	Specifies the IP prefix in dotted decimal notation and the mask length.
ip-prefix	Specifies the IP prefix in dotted decimal notation.
/netmask	Specifies the subnet mask in dotted decimal notation.
level-1	Specifies the IS-IS level as Level-1.
level-2	Specifies the IS-IS level as Level-2.
level-1/2	Specifies the IS-IS level as Level-1/2.

Defaults

parameter	default
level-1 | level-2 | level-1/2	**level-1/2**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an already configured summary address.
- Native IS-IS routes can only be summarized into Level-2 from the Level-1 database.
- It is not possible to summarize IS-IS internal routes at Level-1, although it is possible to summarize external (redistributed) routes at Level-1.
- IS-IS routes are not summarized by default.

Examples

```
-> ip isis summary-address 10.0.0.0/8 level-2
-> no ip isis summary-address 10.0.0.0/8
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis summary-address Displays the IS-IS summary address database.

MIB Objects

```
vRtrIsisSummaryTable
   vRtrIsisSummRowStatus
```

ip isis overload

Enables and configures the IS-IS router to operate in the overload state for a specified time period.

ip isis overload [timeout *seconds***]**

no ip isis overload [timeout]

Syntax Definitions

timeout *seconds*	Specifies the timeout interval, in seconds. The valid range is 60–1800.

Defaults

By default, the IS-IS overload state is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to make the router exit the overload state.
- If the time period is not specified, the router remains in the overload state for an infinite period.
- During normal operation, the router may be forced to enter an overload state due to a lack of resources. When in the overload state, the router is used only if the destination route is directly reachable by the router i.e., it will not be used for other transit traffic.
- This command can be used when the router is overloaded or before executing a shutdown command to divert traffic around the router.

Examples

```
-> ip isis overload timeout 70
-> no ip isis overload timeout
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis overload-on-boot	Configures the IS-IS router to be in the overload state during bootup for a specified time period.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
isisSysTable
   isisSysSetOverload
vRtrIsisTable
   vRtrIsisOverloadTimeout
```

ip isis overload-on-boot

Configures the IS-IS router to be in the overload state after bootup for a specified time period.

ip isis overload-on-boot [timeout *seconds***]**

no ip isis overload-on-boot [timeout *seconds***]**

Syntax Definitions

timeout *seconds*	Specifies the timeout interval, in seconds. The valid range is 60–1800.

Defaults

By default, the IS-IS router will not be in the overload state.

parameter	default
timeout *seconds*	60

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to prevent the router from entering the overload state after bootup.
- The router in the overload state is used only if there is no alternate path to reach the destination.
- This command configures the router after bootup in the overload state until the timeout timer expires or a timeout value is specified in the **no** form of this command.
- The **no overload** command does not influence the overload-on-boot function.

Examples

```
-> ip isis overload-on-boot timeout 80
-> no ip isis overload-on-boot timeout
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis overload	Sets the IS-IS router to operate in the overload state.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisOverloadOnBoot
   vRtrIsisOverloadOnBootTimeout
```

ip isis graceful-restart

Configures graceful restart of the router. It allows routing protocols to re-converge faster, minimizing service interruption.

ip isis graceful-restart

no ip isis graceful-restart

Syntax Definitions

N/A

Defaults

Graceful restart is disabled on the router by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable graceful restart and remove the graceful restart configuration from the IS-IS router.
- When graceful restart is enabled, the router can either be a helper (which helps a neighbor router to restart) or a restarting router, or both. In the current release, only the helper mode of a router is supported.

Examples

```
-> ip isis graceful-restart
-> no ip isis graceful-restart
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis graceful-restart helper	Configures the helper mode of routers for graceful restart.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisGracefulRestart
```

ip isis graceful-restart helper

Administratively enables and disables the IS-IS router to operate in the helper mode in response to a router performing a graceful restart.

ip isis graceful-restart helper {enable | disable}

Syntax Definitions

enable	Enables the helper mode on the router.
disable	Disables the helper mode on the router.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When graceful restart is enabled, the helper mode is enabled by default.
- When graceful restart helper is enabled on a router, it can help other restarting routers.

Examples

```
-> ip isis graceful-restart helper disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis graceful-restart	Configures graceful restart on the router.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisGRHelperMode
```

ip isis strict-adjacency-check

Enables or disables the adjacency check configuration on the router.

ip isis strict-adjacency-check {enable | disable}

Syntax Definitions

enable	Enables the adjacency check configuration on the router.
disable	Disables the adjacency check configuration on the router.

Defaults

By default, the adjacency check configuration is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the adjacency check configuration is enabled, both routers have to run the same IP version only in the IS-IS protocol to form an adjacency.
- When the adjacency check configuration is disabled, one common IP version running between two routers is enough to form an adjacency in the IS-IS protocol.

Examples

```
-> ip isis strict-adjacency-check enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisTable
   vRtrIsisStrictAdjacencyCheck
```

ip isis level auth-type

Enables authentication and configures the authentication types for specific IS-IS levels.

ip isis level {1 | 2} auth-type {simple {key *key* | **encrypt-key** *encrypt-key***} | md5 {key** *key* | **encrypt-key** *encrypt-key***} | none}**

Syntax Definitions

1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
simple	Simple authentication will be used.
md5	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
key	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
encrypt-key	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
none	No authentication will be used.

Defaults

parameter	default
simple | **md5** | **none**	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the encrypt-key parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this key parameter during the CLI configuration.
- If the encrypt-key parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.

- This command overrides the global configuration of IS-IS authentication type.
- This command also sets the password or hash-key according to the type of authentication.
- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis level 2 auth-type simple key rachel
-> ip isis level 2 auth-type md5 encrypt-key 7a1e441a014b4030
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis auth-type	Enables authentication and configures the authentication type of IS-IS protocol globally.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisLevelTable
   vRtrIsisLevelAuthType

```

ip isis level hello-auth

Enables or disables the authentication of Hello PDUs for specific IS-IS levels.

ip isis level {1 | 2} hello-auth

no ip isis level {1 | 2} hello-auth

Syntax Definitions

1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.

Defaults

Authentication check of Level Hello PDUs is enabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to prevent the authentication of Hello packets at the specified IS-IS level.
- This command overrides the global configuration of IS-IS Hello authentication.

Examples

```
-> ip isis level 1 hello-auth
-> no ip isis level 1 hello-auth
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis hello-auth	Enables or disables the authentication of Hello PDUs globally.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisLevelTable
   vRtrIsisLevelHelloAuthentication
```

ip isis level csnp-auth

Enables or disables the CSNP authentication for specific IS-IS levels.

ip isis level {1 | 2} csnp-auth

no ip isis level {1 | 2} csnp-auth

Syntax Definitions

1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.

Defaults

CSNP authentication check for specific IS-IS levels is enabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to prevent the authentication of CSNPs at the specified IS-IS level.
- This command overrides the global configuration of IS-IS CSNP authentication.

Examples

```
-> ip isis level 1 csnp-auth
-> no ip isis level 1 csnp-auth
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis csnp-auth	Enables or disables the authentication of CSNPs.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisLevelTable
   vRtrIsisLevelCsnpAuthentication
```

ip isis level psnp-auth

Enables or disables PSNP authentication for specific IS-IS levels.

ip isis level {1 | 2} psnp-auth

no ip isis level {1 | 2} psnp-auth

Syntax Definitions

1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.

Defaults

PSNP authentication check for specific IS-IS levels is enabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to prevent the authentication of PSNPs at the specified IS-IS level.
- This command overrides the global configuration of IS-IS PSNP authentication.

Examples

```
-> ip isis level 1 psnp-auth
-> no ip isis level 1 psnp-auth
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis psnp-auth	Enables or disables the authentication of PSNPs.
show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisLevelTable
   vRtrIsisLevelPsnpAuthentication
```

ip isis level wide-metrics-only

Enables the wide metrics in LSPs for specific IS-IS levels.

ip isis level {1 | 2} wide-metrics-only

no ip isis level {1 | 2} wide-metrics-only

Syntax Definitions

1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.

Defaults

By default, wide metrics is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to restore the narrow metric (1–63).
- Wide metrics are used for improved granularity of metrics.
- Numeric values above 63 indicate wide metrics.

Examples

```
-> ip isis level 1 wide-metrics-only
-> no ip isis level 1 wide-metrics-only
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```

ip isis activate-ipv6|ipv4

Configures the IPv6 or IPv4 routing in IS-IS.

ip isis {activate-ipv6 | activate-ipv4}

Syntax Definitions

N/A

Defaults

By default, both IPv4 and IPv6 routing is enabled in IS-IS.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The **no** form of this command disables the IPv4/IPv6 routing in IS-IS.

Examples

```
-> ip isis activate-ipv6
-> ip isis activate-ipv4
-> no ip isis activate-ipv4
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisActivateIPV4
vRtrIsisActivateIPV6
```

ip isis vlan

Configures IPv4 or IPv6 IS-IS circuit on a particular VLAN. This command enables IS-IS routing on a particular VLAN. This is used to add both the IPv4 and IPv6 interfaces on a particular VLAN to the IS-IS circuit.

ip isis vlan *vlan-id* **[address-family {v4 | v6 | v4v6}]**

Syntax Definitions

vlan-id	The VLAN ID of a given VLAN on which IS-IS is to be enabled.
v4 | v6 | v4v6	The address family extension. The type of interface (IPv4 or IPv6) is controlled by the address-family extension.

Defaults

By default, both address families (IPv4 and IPv6) are disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The **no** form of this command disables IPv4/IPv6 IS-IS circuit on a particular VLAN.

Examples

```
-> ip isis vlan 10
-> ip isis vlan 10 address-family v6
-> no ip isis vlan 10 address-family v6
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfTable
   vRtrIsisIfRowStatus
```

ip isis vlan admin-state

Enables or disables IS-IS on an circuit.

ip isis vlan *vlan-id* **admin-state {enable | disable}**

Syntax Definitions

vlan-id	The VLAN ID of a given VLAN on which IS-IS routing is to be enabled.
enable	Administratively enables IS-IS on the VLAN.
disable	Administratively disables IS-IS on the VLAN.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When the status is manually disabled, the configuration settings and related statistics of the protocol remain unaffected.

Examples

```
-> ip isis vlan 10 admin-state enable
-> ip isis vlan 10 admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
isisCircTable
isisCircAdminState
```

ip isis vlan interface-type

Configures the IS-IS interface (circuit) type as broadcast or point-to-point.

ip isis vlan *vlan-id* **interface-type {broadcast | point-to-point}**

Syntax Definitions

vlan-id	The VLAN ID of a given VLAN.
broadcast	Sets the interface (circuit) type as a broadcast IS-IS interface.
point-to-point	Sets the interface (circuit) type as a point-to-point IS-IS interface.

Defaults

parameter	default
broadcast | point-to-point	**broadcast**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip isis vlan 10 interface-type broadcast
-> ip isis vlan 10 interface-type point-to-point
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis vlan default-type	Sets the interface type to default, that is, broadcast.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
isisCircTable
   isisCircType
```

ip isis vlan csnp-interval

Configures the time interval in seconds to send Complete Sequence Number PDUs (CSNP) PDUs from the specified VLAN circuit.

ip isis vlan *vlan-id* **csnp-interval** *seconds*

Syntax Definitions

vlan-id	The VLAN ID of a given VLAN on which IS-IS routing is to be enabled.
seconds	The time interval in seconds between successive CSNP PDUs sent on an interface after which IS-IS must generate a CSNP PDU on the specified circuit. The valid range is 1–65535.

Defaults

parameter	default
seconds	Broadcast interface: 10 seconds Point-to-Point interface: 5 seconds

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The **no** form of this command reverts the time interval to the default value.

Examples

```
-> ip isis vlan 10 csnp-interval 10
-> no ip isis vlan 10 csnp-interval
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis status	Displays the IS-IS status.

MIB Objects

```
vRtrIsisIfCsnpInterval
```

ip isis vlan hello-auth-type

Configures the authentication settings for the hello protocol at a circuit level.

ip isis vlan *vlan-id* **hello-auth-type {simple {key** *key* **| encrypt-key** *encrypt-key***} | md5 {key** *key* **| encrypt-key** *encrypt-key***} | none}**

Syntax Definitions

vlan-id	The VLAN ID of a given VLAN.
simple	Simple authentication will be used.
md5	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
key	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
encrypt-key	The key in hexadecimal format to provide security considerations on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
none	No authentication will be used.

Defaults

parameter	default
simple | **md5** | **none**	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the encrypt-key parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You must use only this key parameter during the CLI configuration.
- If the encrypt-key parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.
- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis vlan 10 hello-auth-type md5 key asddfgfhno
-> ip isis vlan 10 hello-auth-type simple key sdsdff
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis vlan level hello-auth-type	Configures the authentication of Hello PDUs for the specified IS-IS level of an IS-IS Circuit.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfHelloAuthKey
vRtrIsisIfHelloAuthType
```

ip isis vlan level-capability

Configures the IS-IS level on the specified circuit.

ip isis vlan *vlan-id* **level-capability [level-1 | level-2 | level-1/2]**

Syntax Definitions

vlan-id	The VLAN ID of a given VLAN.
level-1	Specifies that the interface can operate at Level-1 only.
level-2	Specifies that the interface can operate at Level-2 only.
level-1/2	Specifies that the interface can operate at both Level-1 and Level-2.

Defaults

parameter	default
level-1 | **level-2** | **level-1/2**	**level-1/2**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Changing the level capability restarts the IS-IS protocol on the interface.
- If the level capability is configured globally and on a specific interface, the combination of the two settings will decide the potential adjacency.

Examples

```
-> ip isis vlan 10 level-capability level-1
-> ip isis vlan 10 level-capability level-1/2
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis level-capability	Configures the router level of the IS-IS protocol globally.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
isisCircTable
   isisCircLevel
```

ip isis vlan lsp-pacing-interval

Configures the interval between IS-IS LSP PDUs sent from the specified circuit.

ip isis vlan *vlan-id* **lsp-pacing-interval** *milliseconds*

no ip isis vlan *vlan-id* **lsp-pacing-interval**

Syntax Definitions

vlan-id	The VLAN ID of a given VLAN.
milliseconds	The time interval in milliseconds (from 0 to 65535) between IS-IS LSPs.

Defaults

parameter	default
milliseconds	100

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to restore the default settings.
- No LSPs are sent from the specified interface if the time interval is set to 0.

Examples

```
-> ip isis vlan 10 lsp-pacing-interval 1000
-> no ip isis vlan 10 lsp-pacing-interval
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis lsp-lifetime	Configures the time interval for which LSPs generated by a router is considered valid by other routers in the same domain.
ip isis lsp-wait	Configures the time interval between successively generated LSPs.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfTable
   vRtrIsisIfLspPacingInterval
```

ip isis vlan passive

Configures the IS-IS circuit as passive.

ip isis vlan *vlan-id* **passive**

no ip isis vlan *vlan-id* **passive**

Syntax Definitions

vlan-id	The VLAN ID of a given VLAN.

Defaults

By default, the interface is not passive.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the passive attribute.
- This command adds the passive attribute that causes the IS-IS circuit to be advertised as an IS-IS circuit without running the IS-IS protocol. Normally, only interface addresses that are configured for IS-IS are advertised as IS-IS interface at the level that they are configured. When the passive mode is enabled, the interface or the interface at the level ignores ingress IS-IS PDUs (Protocol Data Unit) and will not transmit IS-IS protocol PDUs.

Examples

```
-> ip isis vlan 10 passive
-> no ip isis vlan 10 passive
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis vlan level passive	Configures the IS-IS circuit as passive at the specified IS-IS level.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
isisCircTable
   isisCircPassiveCircuit
```

ip isis vlan retransmit-interval

Configures the minimum time interval between LSP (Link State Packet) retransmissions on a point-to-point interface.

ip isis vlan *vlan-id* **retransmit-interval** *seconds*

no ip isis vlan *vlan-id* **retransmit-interval**

Syntax Definitions

vlan-id	The VLAN ID of a given VLAN.
seconds	The minimum time interval (1–65535) in seconds between LSP transmissions on a point-to-point interface.

Defaults

parameter	default
seconds	5

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to restore the default settings.
- The retransmit interval should be greater than the expected round-trip delay between two devices to avoid any needless retransmission of PDUs.

Examples

```
-> ip isis vlan 10 retransmit-interval 130
-> no ip isis vlan 10 retransmit-interval
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfTbale
   vRtrIsisIfRetransmitInterval
```

ip isis vlan default-type

Sets the interface type to default, that is, broadcast.

ip isis vlan *vlan-id* **default-type**

Syntax Definitions

vlan-id	The VLAN ID of a given VLAN.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip isis vlan 10 default-type
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis vlan interface-type	Configures the IS-IS interface (circuit) type as broadcast or point-to-point.

MIB Objects

```
vRtrIsisIfTable
   vRtrIsisIfTypeDefault
```

ip isis vlan level hello-auth-type

Configures the authentication of Hello PDUs for the specified IS-IS level of an IS-IS Circuit.

ip isis vlan *vlan-id* **level {1 | 2} hello-auth-type {simple {key** *key* | **encrypt-key** *encrypt-key***} | md5 {key** *key* **| encrypt-key** *encrypt-key***} | none}**

Syntax Definitions

vlan-id	The VLAN ID of a given VLAN.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
simple	Simple authentication will be used.
md5	Specifies that MD5 authentication algorithm will be used. Hash-key will be used in MD5 authentication.
key	Key will be plain text ASCII up to 118 characters. Use quotes around string if the key contains multiple words with spaces between them.
encrypt-key	The key in hexadecimal format to provide security consideration on the authentication key. Configuration snapshot always displays authentication key in the encrypted form.
none	No authentication will be used.

Defaults

parameter	default
simple | **md5** | **none**	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Simple authentication uses only a text string as the password in the packet. This helps to protect the routers from a configuration mishap. MD5 authentication is used to protect the system from malicious actions.
- MD5 authentication is used to encrypt the information that is sent over the network. MD5 authentication uses shared secret key. The Key is used to sign the packets with an MD5 checksum to sign the packet, so that the packets cannot be tampered. As the key is not included in the packet, snooping the key is not possible.
- Use the Key parameter to configure the password for Simple or MD5 authentication. Alternatively, use the *encrypt-key* parameter to configure the password by supplying the encrypted form of the password as the encrypt-key. The Configuration snapshot always displays the password in the encrypted form. You should use only this *key* parameter during the CLI configuration.

- If the *encrypt-key* parameter is used to configure the password through the CLI, then its value should be the same as the one that appears in the configuration snapshot. Only valid system generated values are accepted as encrypt-key.
- This command also configures the authentication type and the corresponding key. These settings override the configuration done at an interface level.
- By default, the authentication is disabled and no authentication type is configured.

Examples

```
-> ip isis vlan 10 level 1 hello-auth-type md5 key xyz123
-> ip isis vlan 10 level 2 hello-auth-type none
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis vlan hello-auth-type	Configures the authentication settings for the hello protocol at a circuit level.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfLevelTable
   vRtrIsisIfLevelHelloAuthType
   vRtrIsisIfLevelHelloAuthKey
```

ip isis vlan level hello-interval

Configures the time interval between the successive Hello PDUs for the specified IS-IS level on a circuit.

ip isis vlan *vlan-id* **level {1 | 2} hello-interval** *seconds*

no ip isis vlan *vlan-id* **level {1 | 2} hello-interval**

Syntax Definitions

vlan-id	The VLAN ID of a given VLAN.
seconds	The hello interval, in seconds. The valid range is 1–20000.

Defaults

parameter	default
seconds (designated routers)	3
seconds (non-designated routers)	9

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to restore the default settings.

Examples

```
-> ip isis vlan 10 level 1 hello-interval 50
-> no isis vlan 10 level 2 hello-interval
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfLevelTable
   vRtrIsisIfLevelHelloTimer
```

ip isis vlan level hello-multiplier

Configures the number of missing Hello PDUs from a neighbor, after which the adjacency is declared as down.

ip isis vlan *vlan-id* **level {1 | 2} hello-multiplier** *number*

no ip isis vlan *vlan-id* **level {1 | 2} hello-multiplier**

Syntax Definitions

vlan-id	The VLAN ID of a given VLAN.
number	The multiplier (2–100) of the hello interval.

Defaults

parameter	default
number	3

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to restore the default settings.

Examples

```
-> ip isis vlan 10 level 1 hello-multiplier 10
-> no ip isis vlan 10 level 2 hello-multiplier
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
isisCircLevelTable
   isisCircLevelHelloMultiplier
```

ip isis vlan level metric

Configures the metric value of the specified IS-IS level of the circuit.

ip isis vlan *vlan-id* **level {1 | 2} metric** *number*

no ip isis vlan *vlan-id* **level {1 | 2} metric**

Syntax Definitions

vlan-id	The VLAN ID of a given VLAN.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
number	The metric value (0–16777215) assigned for the specified level of the circuit. If metric value is set to 0, metric will be set to the default value.

Defaults

parameter	default
number	10

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- To calculate the lowest cost to reach a destination, each configured level on each circuit must have a cost. The costs for each level on a circuit may be different. If the metric is not configured, the default of 10 is used.

Examples

```
-> ip isis vlan 10 level 1 metric 25
-> no ip isis vlan 10 level 2 metric
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfLevelTable
   vRtrIsisIfLevelAdminMetric
```

ip isis vlan level passive

Configures the IS-IS circuit as passive at the specified IS-IS level.

ip isis vlan *vlan-id* **level {1 | 2} passive**

no ip isis vlan *vlan-id* **level {1 | 2} passive**

Syntax Definitions

vlan-id	The VLAN ID of a given VLAN.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.

Defaults

By default, the interface level passive configuration is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the passive attribute.
- This command adds the passive attribute that causes the IS-IS circuit at the given level to be advertised as an IS-IS circuit without running the IS-IS protocol. Normally, only interface addresses that are configured for IS-IS are advertised as IS-IS interface at the level that they are configured. When the passive mode is enabled, the interface or the interface at the level ignores ingress IS-IS protocol PDUs and will not transmit IS-IS protocol PDUs.

Examples

```
-> ip isis vlan 10 level 1 passive
-> no ip isis vlan 10 level 1 passive
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis vlan passive	Configures the IS-IS circuit as passive.
show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfLevelTable
   vRtrIsisIfLevelPassive
```

ip isis vlan level priority

Configures the priority of the IS-IS circuit for the designated router election on a multi-access network.

ip isis vlan *vlan-id* **level [1 | 2] priority** *number*

no ip isis vlan *vlan-id* **level [1 | 2] priority**

Syntax Definitions

vlan-id	The VLAN ID of a given VLAN.
1	Specifies the IS-IS level as Level-1.
2	Specifies the IS-IS level as Level-2.
number	The priority value of the IS-IS circuit at this level. The valid range is 0–127.

Defaults

parameter	default
number	64

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- This priority is included in hello PDUs transmitted by the circuit on a multi-access network.
- The router with the highest priority is the preferred designated router.
- The designated router sends LSPs to this network and also to the routers that are attached to it.

Examples

```
-> ip isis vlan 10 level 1 priority 4
-> ip isis vlan 10 level 2 priority 4
-> no ip isis vlan 10 level 1 priority
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis vlan	Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

MIB Objects

```
vRtrIsisIfLevelTable
   vRtrIsisIfLevelISPriority
```

ip isis summary-address6

Configures the IPv6 summary address.

ip isis summary-address6 {*ipv6-prefix/prefix-length* **|** *ipv6-address***} {level-1 | level-2 | level-1/2}**

no ip isis summary-address6 {*ipv6-prefix/prefix-length* **|** *ipv6-address***} {level-1 | level-2 | level-1/2}**

Syntax Definitions

ipv6-prefix/prefix-length	IPv6 prefix and prefix length.
ipv6-address	IPv6 address.
level-1	Specifies that the routes can be summarized at Level-1 only.
level-2	Specifies that the routes can be summarized at Level-2 only.
level-1/2	Specifies that the routes can be summarized at Level-1 and at Level-2.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to remove an already configured summary address.

Examples

```
-> ip isis summary-address6 4001::/16 level-1
-> no ip isis summary-address6 4001::/16
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis summary-address6 Displays the IS-IS IPv6 summary address database.

MIB Objects

```
vRtrIsisInetSummLevel
vRtrIsisInetSummRowStatus
```

show ip isis adjacency

Displays information about IS-IS adjacent routers.

show ip isis adjacency [system-id *nbr_sys_id* | **vlan** *vlan-id***] [detail]**

Syntax Definitions

nbr_sys_id	The system ID of the neighbor router.
vlan-id	The VLAN ID of a given VLAN.
detail	Indicates that the output is displayed in a detailed manner.

Defaults

By default adjacency information for all the neighbor routers are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use *the nbr_sys_id* or *vlan-id* parameter with this command to view the adjacency information for a specific neighbor.

Examples

```
-> show ip isis adjacency
================================================================================
ISIS Adjacency
================================================================================
System ID          Type     State    Hold       VlanID    MT IDs    Hostname
--------------------------------------------------------------------------------
0000.0000.0001     L1        UP        25        20       0, 2      Router-A
0000.0000.0002     L2        UP        21        30       None      Router-B
--------------------------------------------------------------------------------
Adjacency : 2
================================================================================
```

output definitions

System ID	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
Type	The level (**LI, L2,** or **L1/L2**) of the adjacent router.
State	The state of the adjacent router (**Up** or **Down**).
Hold	The Hold time of the adjacent router.
VlanID	The VLAN ID of the adjacent router.
MT IDs	MT IDs sent by MT enabled ISIS neighbour. '0' signifies the IPv4 support, '2' signifies IPv6 support, 'none' signifies MT disabled neighbour.

output definitions

Hostname	The host name of the adjacent router.
Adjacencies	The total number of adjacent routers.

```
-> show ip isis adjacency detail

output definitions

SystemID	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
VLAN	The Vlan ID in which the adjacency is present.
MT IDs	MT IDs sent by MT enabled ISIS neighbour. '0' signifies the IPv4 support, '2' signifies IPv6 support, 'none' signifies MT disabled neighbour.
NLPIDs	The IP address families supported by IS-IS neighbor: IPv4 or IPv6
State	The state of the adjacent router (**Up** or **Down**).
Adj Level	The adjacency level (**L1** or **L2**) of the router.
Nbr Sys Type	The type of the neighboring router(**L1, L2** or **L1L2**)
Hold Time	The Hold time of the adjacent router.

output definitions

IPv4 Neighbor	The 32-bit IP address of the neighbor.
IPv6 Neighbor	The 32-bit IPv6 address of the neighbor
Restart Support	Indicates if graceful restart is **enabled** or **disabled**.
Restart Status	Indicates whether the router is currently helping an adjacent router to restart.
Restart Suppressed	Indicates whether the advertisement of LSPs are suppressed (**enabled**) or not (**disabled**) as per the request of adjacent router.
SNPA	The SNPA address of the adjacent router.
Up Time	Indicates the time period in seconds, during which the router was in the adjacency.
Priority	The priority of the adjacent router.
Host-name	The host name of the adjacent router.
L. CircType	Indicates the level circuit type (**L1, L2** or **L1L2**) of the adjacent router.
Max Hold	Indicates the maximum Hold time of the adjacent router.

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis database

Displays IS-IS LSP database information of the adjacent routers.

show ip isis database [system_id *system_id* **| lsp_id** *lsp_id***] [detail] [level {1 | 2}]**

Syntax Definitions

system_id	The system ID of the router.
lsp_id	The LSP ID.
detail	Indicates that the output is displayed in a detailed manner.
level	Indicates the IS-IS level, either **1** or **2**.

Defaults

By default the entire LSP database is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use *system-id* or *lsp-id* parameter with this command to view specific LSP database information.
- Use the **level** parameter with this command to view the LSP database information of a particular level.

Examples

```
-> show ip isis database
Legends : P            =  The Partition repair bit is set
OV    = The overload bit is set
ATT   = The Attach bit is set

================================================================
```

output definitions

LSP ID	The LSP ID. Indicates the system ID and the pseudo-node ID of the originating router.
Sequence	The sequence number of the LSP. The Sequence number is a value used to identify old and duplicate LSPs.
Checksum	The checksum value of the LSP.
Lifetime	The number of seconds the LSP remains valid. The LSP lifetime value of zero indicates that this LSP is being removed from the Link State Database of all the routers.
Version	The version of the IS-IS protocol that has generated the LSP.
Pkt Type	The IS-IS PDU type number derived from the PDU header, which can be **18** or **20**. The number 18 represents L1 LSP PDU type and 20 represents L2 LSP PDU type.
Pkt Ver	The version of the IS-IS protocol that has generated the packet.
Attributes	The level capability of the router.
Max Area	The Maximum number of areas supported by the originating router of the LSP.
SysID Len	The length of the system-id as used by the originating router.
Used Len	The length used by the LSP.
Alloc Len	The length allocated for the LSP to be stored.
Area Address	The area ID of the router.
Supp protocols	The network layer protocols that are supported.
IS-Host Name	The host name of the router.
System ID	The system ID of the adjacent router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
IS Neighbors	The list of reachable IS-IS neighbors.
IPv4 Internal Reach	The list of IS-IS internal routes.
IPv6 Reach	The list of IS-IS IPv6 internal routes.
IP Prefix	The IP address and subnet mask of the destination.
Metrics	The metric value to reach the destination.
IPv4 External Reach	The list of external IS-IS routes.
IPv6 Reach	The list of external IS-IS IPv6 routes.
level-1 LSP Count	The number of Level-1 LSPs.
level-2 LSP Count	The number of Level-2 LSPs.

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis hostname	Displays the database of IS-IS host name and its corresponding system ID.
clear ip isis lsp-database	Clears and resets the IS-IS LSP database information.

show ip isis spf

Displays the IS-IS SPF calculation information.

show ip isis spf [detail]

Syntax Definitions

detail	Indicates that the output is displayed in a detailed manner.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The SPF path table is common for both IPv4 and IPv6.

Examples

```
-> show ip isis spf
============================================================
ISIS Path Table
============================================================
Node                   VlanId         Nexthop
------------------------------------------------------------
0000.0000.0001.00      6             0000.0000.0001
------------------------------------------------------------
SPF count: 1
============================================================================
```

output definitions

Node	The system ID of the routers.
VlanId	The VLAN ID.
Nexthop	The system ID of the Next Hop router.

```
-> show ip isis spf detail
============================================================================
ISIS Path Table
============================================================================
----------------------------------------------------------------------
Node       : 0000.0000.0001.00      Metric   : 10

show ip isis spf-log

Displays the IS-IS SPF log.

show ip isis spf-log [detail]

Syntax Definitions

detail	Indicates that the output is displayed in a detailed manner.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays the last 20 IS-IS SPF events.

Examples

```
-> show ip isis spf-log
ISIS SPFLog
================================================================================
When       Duration       L1-Nodes      L2-Nodes      Event-Count
--------------------------------------------------------------------------------
01/30/2005 11:01:54 <0.01s 1              1               3
--------------------------------------------------------------------------------
Log Entries : 1
```

output definitions

When	The date on which the SPF calculation was completed.
Duration	The time duration of the event.
L1-Nodes	The number of Level-1 nodes.
L2-Nodes	The number of Level-2 nodes.
Event-Count	The number of SPF calculations.
Log Entries	The total number of log entries.

```
-> show ip isis spf-log detail

================================================================================

Spf Trigger Reason    :  newAdjacency(0) ,lspExpired(8) ,lspChanged(10)
--------------------------------------------------------------------------------
Log Entries : 2
================================================================================
```

output definitions

SpfTimeStamp	The timestamp when the SPF run started on the system.
spfRunTime	The time (in hundredths of a second) required to complete the SPF run.
Spf Involved L1 Nodes	The number of Level-1 nodes involved in the SPF calculation.
Spf Involved L1 Nodes	The number of Level-2 nodes involved in the SPF calculation.
Spf Event-count	The number of SPF events that triggered the SPF calculation.
Last TriggeredLspId	The LSP ID of the last LSP processed before the SPF run.
Spf trigger Reason	Indicates the reasons (**newAdjacency**, **lspExpired**, or **lspChanged**) for SPF calculations.
Log Entries	The number of SPF logs.

Release History

Release 8.1.1; command introduced.

Unknown   0           0         0       0          0
```

output definitions

ISIS Instance	The number of IS-IS instances.
SPF Runs	The number of SPF calculations that have been performed.
Purge Initiated	The number of purges that the system initiated. A purge is initiated if the router decides that a link-state PDU must be removed from the database.
LSP Regens	The number of LSPs that have been regenerated. An LSP is regenerated when it nears the end of its lifetime and has not changed.
Requests	The number of CSNP requests received.

output definitions (continued)

Request Drops	The number of CSNP requests that are dropped.
Paths Found	The number of paths found.
Paths Not Found	The number of paths not found.
PDU Type	The type of PDU.
Received	The number of PDUs received since IS-IS started or since the statistics were set to zero.
Processed	The number of PDUs that are processed (number of PDUs received less the number dropped).
Dropped	The number of PDUs that are dropped.
Sent	The number of PDUs transmitted since IS-IS started or since the statistics were set to zero.
Retransmitted	The number of PDUs that are retransmitted.

Release History

Release 8.1.1; command introduced.

output definitions

System Id	The system ID of the router. The system ID is a fixed size, six octet field in the NSAP. In an IS-IS routing domain, each router is identified by a 6-octet hexadecimal system ID.
Admin State	The state of the router (**Up** or **Down**).
Protocols Enabled	The protocol enabled on the router: IPv4 or IPv6
Last Enabled	The date and time when the router is enabled.
Level Capability	The level capability of the router **(L1, L2,** or **L1L2**).
Authentication Check	Indicates the status of the authentication (**true** or **false**).
Authentication Type	The type of authentication (**password** or **md5**).
Graceful Restart	Indicates if graceful restart is **Enabled** or **Disabled**.
GR helper-mode	Indicates if the helper mode of graceful restart is **Enabled** or **Disabled**.
LSP Lifetime	The Lifetime of the LSP (in seconds).
LSP Wait	The Wait time of the LSP (in seconds).
Adjacency Check	The adjacency check configuration on the router
L1 Auth Type	The authentication type (**password** or **md5**) for Level-1 adjacency.
L2 Auth Type	The authentication type (**password** or **md5**) for Level-2 adjacency.
L1 Wide Metrics-only	Indicates whether wide metrics is **Enabled** or **Disabled** for Level-1 adjacency.
L2 Wide Metrics-only	Indicates whether wide metrics is **Enabled** or **Disabled** for Level-2 adjacency.
L1 LSDB Overload	Indicates whether LSDB Overload is **Enabled** or **Disabled** for Level-1 adjacency.
L2 LSDB Overload	Indicates whether LSDB Overload is **Enabled** or **Disabled** for Level-2 adjacency.
L1 LSPs	The number of LSPs for Level-1 adjacency.
L2 LSPs	The number of LSPs for Level-2 adjacency.
Last SPF	The date and duration of the last SPF calculation.
SPF Wait	The Wait time for the SPF calculation.
Hello-Auth Check	Indicates the status of global Hello authentication check (**Enabled** or **Disabled**).
Csnp-Auth Check	Indicates the status of global CSNP authentication check (**Enabled** or **Disabled**).
Psnp-Auth Check	Indicates the status of global PSNP authentication check (**Enabled** or **Disabled**).

output definitions (continued)

L1 Hello-Auth Check	Indicates the status of L1 Hello authentication check (**Enabled** or **Disabled**).
L1 Csnp-Auth Check	Indicates the status of L1 CSNP authentication check (**Enabled** or **Disabled**).
L1 Psnp-Auth Check	Indicates the status of L1 PSNP authentication check (**Enabled** or **Disabled**).
L2 Hello-Auth Check	Indicates the status of L2 Hello authentication check (**Enabled** or **Disabled**).
L2 Csnp-Auth Check	Indicates the status of L2 CSNP authentication check (**Enabled** or **Disabled**).
L2 Psnp-Auth Check	Indicates the status of L2 PSNP authentication check (**Enabled** or **Disabled**).
Multi-Topology	Indicates the status of multi-topology capability support for IS-IS (**Enabled** or **Disabled**).
Auto-Configuration	Indicates if IS-IS instance is enabled or disabled through auto configuration.
Area Address	The area address of the router.

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis statistics	Displays IS-IS statistics information.

show ip isis summary-address

Displays the IS-IS summary address database.

show ip isis summary-address [*ip-addr* **[***/mask***]]**

Syntax Definitions

ip-addr	The 32-bit IP address.
/mask	The netmask value. The valid range is 1–32.

Defaults

By default summary address information for all the IP addresses is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the *ip-addr* parameter with this command to view the summary address information for a specific IP address.

Examples

```
-> show ip isis summary-address
=============================================================================
ISIS Summary Address
=====================================================
Address                     Level
-----------------------------------------------------------------------------
1.0.0.0/8                   L1
2.1.0.0/24                  L1L2
3.1.2.3/32                  L2
-----------------------------------------------------------------------------

Summary Address : 3
```

output definitions

Address	The summary address for a range of IPv4 addresses.
Level	The capability level of the router.
Summary Address	The number of summarized addresses.

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis summary-address	Adds or deletes the summary address.

MIB Objects

```
vRtrIsissummaryTable
   vRtrIsisSummPefix
   vRtrIsisSummMask
   vRtrIsisSummLevel
```

show ip isis vlan

Displays the IS-IS IPv4 and IPv6 interface information on a VLAN in the IS-IS database.

show ip isis vlan [*vlan-id***] [detail]**

Syntax Definitions

vlan-id	The VLAN ID.
detail	Indicates that the output is displayed in a detailed manner.

Defaults

By default, the interface information for all the interfaces is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the *vlan-id* parameter with this command to view information for a specific VLAN.

Examples

```
-> show ip isis vlan
================================================================================
ISIS VLan
================================================================================
Interface   Address-family  Level  VlanID  Oper-state   Admin-state  L1/L2-Metric
--------------------------------------------------------------------------------
ospf       ipv4           L1L2   11      DOWN       UP          10/10
vlan11      ipv6            L1L2    11      DOWN        UP           10/10
--------------------------------------------------------------------------------
Vlans : 2
================================================================================
```

output definitions

Interface	The name of the IS-IS interface.
Address-family	The address family extension: **IPv4** or **IPv6**
Level	The level capability of the interface.
VlanID	The VLAN ID of the interface.
Oper-state	The operational state of the interface (**up** or **down**).
Admin-state	The administrative state of the interface (**up** or **down**).
L1/L2 -Metric	The metric value of the router for the corresponding capability level.
Vlans	The total number of VLANs.

```
-> show ip isis vlan detail

output definitions

VlanId	The VLAN ID.
Level Capability	The level capability of the interface.
Oper State	The operational state of the interface (**up** or **down**).
Admin State	The administrative state of the interface (**up** or **down**).
Auth Type	Indicates the authentication type (**simple**, **MD5**, or **none**) of the interface.
Address Families	The address family extension: IPv4 or IPv6
Circuit Id	The circuit ID of the interface.
RetransmitInt	Specifies the minimal interval of time, in seconds between retransmission of an LSP on the point-to-point interface.
Type	The type of interface: **Broadcast** or **Pt-to-Pt** (point to point).
LSP Pacing Int	The LSP Pacing interval.
Mesh Group	The status of the mesh group (**Active** or **Inactive**).
CSNP Int	The CSNP interval.

output definitions (continued)

Level	Indicates the IS-IS level of the neighbor (**L1, L2**, or **L1L2**).
Adjacencies	The number of adjacencies formed.
Desg IS	The ID of the LAN Designated Intermediate System on this circuit at this level.
Auth Type	Indicates the authentication type (**simple**, **MD5**, or **none**) for the specified level.
Metric	The metric value of this circuit for a specific level.
Hello Timer	Indicates the Hello timer value.
Hello Mult	Indicates the Hello multiplier value.
Priority	The priority value of the interface.
Passive	Indicates whether the interface is configured as a passive interface (**Yes** or **No**).
Vlans	The total number of VLANs.

Release History

Release 8.1.1; command introduced.

Related Commands

show ip isis summary-address6

Displays the IS-IS IPv6 summary address database.

show ip isis summary-address6 [*ip-addr* **[***/mask***]]**

Syntax Definitions

ip-addr	The 32-bit IP address.
/mask	The netmask value. The valid range is 1–32.

Defaults

By default, summary address information for all the IP addresses is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the *ip-addr* parameter with this command to view the summary address information for a specific IP address.

Examples

```
-> show ip isis summary-address6
============================================================
ISISv6 Summary Address
============================================================

============================================================
```

output definitions

Address	The summary address for a range of IPv6 addresses.
Level	The capability level of the router.
Summary Address	The number of summarized addresses.

Release History

Release 8.1.1; command introduced.

Related Commands

ip isis summary-address6	Configures the IPv6 summary address.

MIB Objects

N/A

clear ip isis adjacency

Clears and resets the IS-IS adjacency database information.

clear ip isis adjacency [system-id *nbr-sys-id***]**

Syntax Definitions

nbr-sys-id	The system ID of the neighbor router.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If the *nbr-sys-id* parameter is specified, only the entries specific to that system ID are removed from the database.

Examples

```
-> clear ip isis adjacency system-id 1122.3344.5566
```

Release History

Release 8.1.1; command introduced.

Related Commands

```

ip isis multi-topology

Enables M-ISIS (multi-topology) capability support for IS-IS. If enabled, IPv6 SPF computation is performed separate from the IPv4 SPF computation.

ip isis multi-topology

no ip isis multi-topology

Syntax Definitions

N/A

Defaults

By default, multi-topology is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Changing the multi-topology mode with this command results in internal disabling and re-enabling of IS-IS protocol with the new mode of operation. This will cause IS-IS adjacencies to be reset.

Examples

```
-> ip isis multi-topology
-> no ip isis multi-topology
```

Release History

Release 8.2.1; command introduced.

Related Commands

show ip isis status	Displays the IS-IS status.
show ip isis adjacency	Displays information about IS-IS adjacent routers.

MIB Objects

```
vRtrIsisEntry
   vRtrIsisMTEnabled
```

26 BGP Commands

This chapter describes the CLI commands used to configure the BGP (Border Gateway Protocol) and Multiprotocol extensions to BGP. BGP is a protocol for exchanging routing information between gateway hosts in a network of ASs (autonomous systems). BGP is the most common protocol used between gateway hosts on the Internet. The routing table exchanged contains a list of known routers, the addresses they can reach, and a preference metrics associated with the path to each router so that the best available route is chosen.

Multiprotocol Extensions to BGP-4 supports the exchange of IPv6 unicast prefixes, as well as the establishment of BGP peering sessions with BGP speakers identified by their IPv6 addresses.

The Alcatel-Lucent implementation of BGP-4 and Multiprotocol Extensions to BGP-4 complies with the following RFCs: 4271, 2439, 3392, 2385, 1997, 4456, 3065, 4273, 4760, 2545

Note. In the following document, the BGP terms “peer” and “neighbor” are used interchangeably to mean any BGP speaker known to the local router.

MIB information for BGP is as follows:

Filename: AlcatelIND1Bgp.MIB
Module: ALCATEL-IND1-BGP-MIB

Filename: IETF_BGP4.MIB
Module: BGP4-MIB

The following table summarizes the available commands:

Global BGP Commands	**ip load bgp** **ip bgp admin-state** **ip bgp autonomous-system** **ip bgp bestpath as-path ignore** **ip bgp cluster-id** **ip bgp default local-preference** **ip bgp fast-external-failover** **ip bgp always-compare-med** **ip bgp bestpath med missing-as-worst** **ip bgp client-to-client reflection** **ip bgp as-origin-interval** **ip bgp synchronization** **ip bgp confederation identifier** **ip bgp maximum-paths** **ip bgp log-neighbor-changes** **ip bgp dampening** **ip bgp dampening clear** **ip bgp asn-format** **show ip bgp** **show ip bgp statistics** **show ip bgp dampening** **show ip bgp dampening-stats** **show ip bgp path** **show ip bgp routes**
Aggregate Configuration	**ip bgp aggregate-address** **ip bgp aggregate-address admin-state** **ip bgp aggregate-address as-set** **ip bgp aggregate-address community** **ip bgp aggregate-address local-preference** **ip bgp aggregate-address metric** **ip bgp aggregate-address summary-only** **show ip bgp aggregate-address**
Network (local route) Configurations	**ip bgp network** **ip bgp network admin-state** **ip bgp network community** **ip bgp network local-preference** **ip bgp network metric** **show ip bgp network**

Neighbor (Peer) Configuration	**ip bgp neighbor** **ip bgp neighbor admin-state** **ip bgp neighbor advertisement-interval** **ip bgp neighbor clear** **ip bgp neighbor route-reflector-client** **ip bgp neighbor default-originate** **ip bgp neighbor timers** **ip bgp neighbor conn-retry-interval** **ip bgp neighbor auto-restart** **ip bgp neighbor maximum-prefix** **ip bgp neighbor md5 key** **ip bgp neighbor ebgp-multihop** **ip bgp neighbor description** **ip bgp neighbor next-hop-self** **ip bgp neighbor passive** **ip bgp neighbor remote-as** **ip bgp neighbor remove-private-as** **ip bgp neighbor soft-reconfiguration** **ip bgp neighbor stats-clear** **ip bgp confederation neighbor** **ip bgp neighbor update-source** **ip bgp neighbor in-aspathlist** **ip bgp neighbor in-communitylist** **ip bgp neighbor in-prefixlist** **ip bgp neighbor out-aspathlist** **ip bgp neighbor out-communitylist** **ip bgp neighbor out-prefixlist** **ip bgp neighbor route-map** **ip bgp neighbor clear soft** **show ip bgp neighbors** **show ip bgp neighbors policy** **show ip bgp neighbors timer** **show ip bgp neighbors statistics**

Policy Commands	**ip bgp policy aspath-list** **ip bgp policy aspath-list action** **ip bgp policy aspath-list priority** **ip bgp policy community-list** **ip bgp policy community-list action** **ip bgp policy community-list match-type** **ip bgp policy community-list priority** **ip bgp policy prefix-list** **ip bgp policy prefix-list action** **ip bgp policy prefix-list ge** **ip bgp policy prefix-list le** **ip bgp policy prefix6-list** **ip bgp policy route-map action** **ip bgp policy route-map aspath-list** **ip bgp policy route-map asprepend** **ip bgp policy route-map community** **ip bgp policy route-map community-list** **ip bgp policy route-map community-mode** **ip bgp policy route-map lpref** **ip bgp policy route-map lpref-mode** **ip bgp policy route-map match-community** **ip bgp policy route-map match-mask** **ip bgp policy route-map match-prefix** **ip bgp policy route-map match-regexp** **ip bgp policy route-map med** **ip bgp policy route-map med-mode** **ip bgp policy route-map origin** **ip bgp policy route-map prefix-list** **ip bgp policy route-map weight** **ip bgp policy route-map community-strip** **show ip bgp policy aspath-list** **show ip bgp policy community-list** **show ip bgp policy prefix-list** **show ip bgp policy route-map**
BGP Graceful Restart Commands	**ip bgp graceful-restart** **ip bgp graceful-restart restart-interval**
IPv6 Global BGP Commands	**ip bgp unicast** **ipv6 bgp unicast** **ip bgp neighbor activate-ipv6** **ip bgp neighbor ipv6-nexthop** **show ipv6 bgp path** **show ipv6 bgp routes**
IPv6 BGP Network Configuration Commands	**ipv6 bgp network** **ipv6 bgp network community** **ipv6 bgp network local-preference** **ipv6 bgp network metric** **ipv6 bgp network admin-state** **show ipv6 bgp network**

IPv6 BGP Neighbor (Peer) Configuration Commands	**ipv6 bgp neighbor** **ipv6 bgp neighbor activate-ipv6** **ipv6 bgp neighbor ipv6-nexthop** **ipv6 bgp neighbor admin-state** **ipv6 bgp neighbor remote-as** **ipv6 bgp neighbor timers** **ipv6 bgp neighbor maximum-prefix** **ipv6 bgp neighbor next-hop-self** **ipv6 bgp neighbor conn-retry-interval** **ipv6 bgp neighbor default-originate** **ipv6 bgp neighbor update-source** **ipv6 bgp neighbor ipv4-nexthop** **show ipv6 bgp neighbors** **show ipv6 bgp neighbors statistics** **show ipv6 bgp neighbors policy** **show ipv6 bgp neighbors policy**

ip load bgp

Loads the BGP protocol software into running memory on the router. The image file containing BGP should already be resident in flash memory before issuing this command.

ip load bgp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command requires that the BGP software be resident in flash memory in the active directory.
- Enter this command in the router's configuration file (vcboot.cfg) to ensure BGP software is running after a reboot.
- The command does not administratively enable BGP on the router; BGP will be disabled after issuing this command. You must issue the **ip bgp admin-state** to start the BGP protocol.

Examples

```
-> ip load bgp
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp autonomous-system	Configures the Autonomous system number for this BGP router.
ip bgp admin-state	Administratively enables or disables BGP.

MIB Objects

```
alaDrcTmIPBgpStatus
```

ip bgp admin-state

Administratively enables or disables BGP. The BGP protocol will not be active until you enable it using this command.

ip bgp admin-state {enable | disable}

Syntax Definitions

enable	Enables BGP.
disable	Disables BGP.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You must first load the BGP software into running memory using the **ip load bgp** command before initiating this command.
- Many BGP commands require that the protocol be disabled (**ip bgp admin-state**) before issuing them.

Examples

```
-> ip bgp admin-state enable
-> ip bgp admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip load bgp	Loads the BGP software.

MIB Objects

```
alaBgpGlobal
   alaBgpProtoStatus
```

ip bgp autonomous-system

Configures the Autonomous System (AS) number for this router. This number identifies this BGP speaker (this router) instance to other BGP routers. The AS number for a BGP speaker determines whether it is an internal or an external peer in relation to other BGP speakers. BGP routers in the same AS are internal peers while BGP routers in different ASs are external peers. BGP routers in the same AS exchange different routing information with each other than they exchange with BGP routers in external ASs. BGP speakers append their AS number to routes passing through them; this sequence of AS numbers is known as a route's AS path.

ip bgp autonomous-system *value*

Syntax Definitions

value	The AS number in the asplain, asdot+, or asdot formats.

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A router can belong to only one AS. Do not specify more than one AS value for each router.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.
- The 4-octet ASN is represented in one of three ways:
  - asplain (simple decimal notation)
  - asdot+ (two 16-bit values as low-order and high-order)
  - asdot (a mixture of asplain and asdot+).

Examples

```
-> ip bgp autonomous-system 64724
The following examples show how to configure the local BGP ASN as 65535 in the
three different formats:
-> ip bgp autonomous-system 65535        (asplain format)
-> ip bgp autonomous-system 0.65535      (asdot+ format)
-> ip bgp autonomous-system 65535        (asdot format)
```

```
The following examples show how to configure the local BGP ASN as 65538 in the
three different formats:
-> ip bgp autonomous-system 65538              (asplain format
-> ip bgp autonomous-system 1.2                (asdot+ format)
-> ip bgp autonomous-system 1.2                (asdot format)
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp admin-state	Enables and disables the BGP protocol.

MIB Objects

```
alaBgpGlobal
   alaBgpAutonomousSystemNumber
```

ip bgp bestpath as-path ignore

Indicates whether AS path comparison will be used in route selection. The AS path is the sequence of ASs through which a route has traveled. A shorter AS path is preferred over a longer AS path. The AS path is always advertised in BGP route updates. This command informs BGP to use the length of the AS path as a criteria for determining the best route.

ip bgp bestpath as-path ignore

no ip bgp bestpath as-path ignore

Syntax Definitions

N/A

Defaults

This command is enabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable this feature after it has been enabled.
- AS path comparison does not consider the type of links connecting the ASs along the path. In some cases a longer path over very fast connections may be a better route than a shorter path over slower connections. For this reason the AS path should not be the only criteria used for route selection. BGP considers local preference before AS path when making path selections.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp bestpath as-path ignore
-> no ip bgp bestpath as-path ignore
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp aggregate-address as-set	Specifies whether AS path aggregation is to be performed or not.
ip bgp policy aspath-list	Creates or removes an AS path list.
ip bgp default local-preference	Configures the default local preference (lpref) value to be used when advertising routes.

MIB Objects

```
alaBgpGlobal
   alaBgpAsPathCompare
```

ip bgp cluster-id

Configures a BGP cluster ID when there are multiple, redundant, route reflectors in a cluster. This command is not necessary for configurations containing only one route reflector.

ip bgp cluster-id *ip_address*

Syntax Definitions

ip_address	32-bit IP address that is the Cluster ID of the router acting as a route reflector.

Defaults

parameter	default
ip_address	0.0.0.0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- In a route-reflection configuration where there are multiple route-reflectors in a cluster, use this command to configure this cluster ID. Configuring multiple route-reflectors enhances redundancy and avoids a single point of failure. When there is only one reflector in a cluster, the router ID of the reflector is used as the cluster-ID.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.
- Using many redundant reflectors in a single cluster places demands on the memory required to store routes for all redundant reflectors' peers.

Examples

```
-> ip bgp cluster-id 1.2.3.4
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp admin-state	Enables and disables BGP.
ip bgp client-to-client reflection	Enables route reflection and sets this speaker as the route reflector.

MIB Objects

```
alaBgpGlobal
   alaBgpClusterId
```

ip bgp default local-preference

Configures the default local preference (lpref) value to be used when advertising routes. A higher local preference value is preferred over a lower value. The local preference value is sent to all BGP peers in the local autonomous system; it is not advertised to external peers.

ip bgp default local-preference *value*

Syntax Definitions

value	The default local preference value for this router. The valid range is 0–4294967295.

Defaults

parameter	default
value	100

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Unless a route is specifically configured for a different local preference value it will default to value you specify in this command. This value is used for routes learned from external autonomous systems (the local preference value is not advertised in routes received from external peers) and for aggregates and networks that do not already contain local preference values.
- This value is specific to the router so it can compare its own local preference to those received in advertised paths. If other routers belong to the same AS, then they should use the same default local preference value.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp default local-preference 200
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp aggregate-address local-preference	Sets the local preference for a BGP aggregate.
ip bgp network local-preference	Sets the local preference for a BGP network.

MIB Objects

```
alaBgpGlobal
   alaBgpDefaultLocalPref
```

ip bgp fast-external-failover

Enables fast external failover (FEFO). When enabled, FEFO resets a session when a link to a directly connected external peer is operationally down. The BGP speaker will fall back to Idle and then wait for a connection retry by the external peer that went down.

ip bgp fast-external-failover

no ip bgp fast-external-failover

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable Fast External Failover.
- When enabled, this command allows BGP to take immediate action when a directly connected interface, on which an external BGP session is established, goes down. Normally BGP relies on TCP to manage peer connections. Fast External failover improves upon TCP by resetting connections as soon as they go down.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp fast-external-failover
-> no ip bgp fast-external-failover
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor clear	Restarts a BGP peer.
ip bgp neighbor auto-restart	Enables or disables BGP peer automatic restart.
ip bgp neighbor timers	Configures the time interval between KEEPALIVE messages sent by this peer and the tolerated hold time interval, in seconds, for messages to this peer from other peers.

MIB Objects

```
alaBgpFastExternalFailOver
```

ip bgp always-compare-med

Enables or disables Multi-Exit Discriminator (MED) comparison between peers in different autonomous systems. The MED value is considered when selecting the best path among alternatives; it indicates the weight for a particular exit point from the AS. A path with a lower MED value is preferred over a path with a higher MED value.

ip bgp always-compare-med

no ip bgp always-compare-med

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable MED comparison for external peers.
- By default, BGP only compares MEDs from the same autonomous system when selecting routes. Enabling this command forces BGP to also compare MEDs values received from external peers, or other autonomous systems.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp always-compare-med
-> no ip bgp always-compare-med
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp bestpath med missing-as-worst	Configures the MED parameter when it is missing in a BGP path.

MIB Objects

```
alaBgpGlobal
   alaBgpMedAlways
```

ip bgp bestpath med missing-as-worst

Configures the MED parameter when it is missing in a BGP path.

ip bgp bestpath med missing-as-worst

no ip bgp bestpath med missing-as-worst

Syntax Definitions

N/A

Defaults

By default this command is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable missing MEDs as worst.
- This command is used to specify how a missing MED in an external BGP path is to be treated for route selection purposes. The default behavior is to treat missing MEDs as zero (best). This command allows you to treat missing MEDs as worst (2^{32}-1) for compatibility reasons.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp bestpath med missing-as-worst
-> no ip bgp bestpath med missing-as-worst
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp always-compare-med	Forces BGP to consider MED values from external routes.

MIB Objects

```
alaBgpGlobal
   alaBgpMissingMed
```

ip bgp client-to-client reflection

Enables or disables this BGP speaker (router) to be a route reflector. Route reflectors advertise routing information to internal BGP peers, referred to as *clients*. BGP requires all internal routers to know all routes in an AS. This requirement demands a fully meshed (each router has a direct connection to all other routers in the AS) topology. Route reflection loosens the fully meshed restriction by assigning certain BGP routers as route reflectors, which take on the responsibility of advertising routing information to local BGP peers.

ip bgp client-to-client reflection

no ip bgp client-to-client reflection

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable the speaker as a route reflector.
- In addition to defining this router as the route reflector, this command also enable route reflection for this cluster. After setting this command this reflector will begin using route reflection behavior when communicating to client and non-client peers.
- Once route reflectors are configured, you need to indicate the clients (those routers receiving routing updates from the reflectors) for each route reflector. Use the **ip bgp neighbor route-reflector-client** command to configure clients.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp client-to-client reflection
-> no ip bgp client-to-client reflection
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp admin-state	Administratively disables BGP in this router.
ip bgp neighbor route-reflector-client	Configures a BGP peer to be a client to the this route reflector.

MIB Objects

```
alaBgpGlobal
   alaBgpRouteReflection
```

ip bgp as-origin-interval

Specifies the frequency at which routes local to the autonomous system are advertised. These advertisements are also referred to as UPDATE messages. This interval applies to advertisements to internal peers.

ip bgp as-origin-interval *seconds*

no ip bgp as-origin-interval

Syntax Definitions

seconds	The update interval in seconds. The valid range is 1–65535.

Defaults

parameter	default
seconds	15

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to reset the feature to the default value.
- A lower value may increase the likelihood of route flapping as route status is updated more frequently.

Examples

```
-> ip bgp as-origin-interval 15
-> no ip bgp as-origin-interval
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor advertisement-interval Set the route advertisement interval for external peers.

MIB Objects

```
alaBgpGlobal
   alaBgpAsOriginInterval
```

ip bgp synchronization

Enables or disables synchronization of BGP prefixes with AS-internal routing information. Enabling this command will force the BGP speaker to advertise prefixes only if the prefixes are reachable through AS-internal routing protocols (IGPs like RIP and OSPF).

ip bgp synchronization

no ip bgp synchronization

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable IGP synchronization.
- A BGP router is not supposed to advertise routes learned through internal BGP updates unless those routes are also known by the primary internal routing protocol (e.g, RIP or OSPF). However, requiring all routers in an AS to know all external routes places a heavy burden on routers focusing mainly on Intra-AS routing. Therefore, disabling synchronization avoids this extra burden on internal routers. As long as all BGP routers in an AS are fully meshed (each has a direct connection to all other BGP routers in the AS) then the problem of unknown external router should not be a problem and synchronization can be disabled.
- By default, synchronization is disabled and the BGP speaker can advertise a route without waiting for the IGP to learn it. When the autonomous system is providing transit service, BGP should not propagate IGP paths until the IGP prefixes themselves are known to be reachable through IGP. If BGP advertises such routes before the IGP routers have learned the path, they will drop the packets causing a blackhole.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp synchronization
-> no ip bgp synchronization
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal
   alaBgpIgpSynchStatus
```

ip bgp confederation identifier

Sets a confederation identification value for the local BGP speaker (this router). A confederation is a grouping of sub-ASs into a single AS. To peers outside a confederation, the confederation appears to be a single AS. Within the confederation multiple ASs may exist and even exchange information with each other as using external BGP (EBGP).

ip bgp confederation identifier *value*

Syntax Definitions

value	The confederation identification value. The valid range is 0–65535.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to restore the default value.
- A value of 0 means this local speaker is not a member of any confederation.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.
- Use this command in conjunction with the **ip bgp confederation neighbor** command to specify those peers that are a members of the same confederation as the local BGP speaker.

Examples

```
-> ip bgp confederation identifier 3
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp autonomous-system	Sets the AS number for this router.
ip bgp confederation neighbor	Specifies peers that are members of a confederation.

MIB Objects

```
alaBgpGlobal
   alaBgpConfedId
```

ip bgp maximum-paths

Enables or disables support for multiple equal paths. When multipath support is enabled and the path selection process determines that multiple paths are equal when the router-id is disregarded, then all equal paths are installed in the hardware forwarding table. When multipath support is disabled, only the best route entry is installed in the hardware forwarding table.

ip bgp maximum-paths

no ip bgp maximum-paths

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable support for multiple equal cost paths.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp maximum-paths
-> no ip bgp maximum-paths
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal
   alaBgpMultiPath
```

ip bgp log-neighbor-changes

Enables or disables the logging of peer state changes. If enabled, this logging tracks changes in the state of BGP peers from ESTABLISHED to IDLE and from IDLE to ESTABLISHED. Viewing peer state logging requires that certain debug parameters be set.

ip bgp log-neighbor-changes

no ip bgp log-neighbor-changes

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

Examples

```
-> ip bgp log-neighbor-changes
-> no ip bgp log-neighbor-changes
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp admin-state	Disables BGP within the router.

MIB Objects

```
alaBgpGlobal
   alaBgpPeerChanges
```

ip bgp dampening

Enables or disables BGP route dampening or the suppression of unstable routes. Route dampening helps to control the advertisement of routes that are going up and then down at an abnormally high rate. Routes that are changing states (available then unavailable) are said to be *flapping*.

ip bgp dampening [half-life *half_life* **reuse** *reuse* **suppress** *suppress* **max-suppress-time** *max_suppress_time***]**

no ip bgp dampening

Syntax Definitions

half_life	The half-life duration, in seconds. The valid range is 0–65535.
reuse	The number of route withdrawals set for the re-use value. The valid range is 1–9999.
suppress	The dampening cutoff value. The valid range is 1–9999.
max_suppress_time	The maximum number of seconds a route can be suppressed. The valid range is 0–65535.

Defaults

parameter	value
half_life	300
reuse	200
suppress	300
max_suppress_time	1800

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable dampening.
- BGP dampening is disabled by default. When enabled, route dampening suppresses routes that are unstable, or “flapping,” and disrupting the network.
- BGP dampening of IPv6 route flaps is currently not supported.
- This command enables dampening and can also be used to change the default times for the dampening variables.
- Use the dampening variables to set penalties, suppression limits, and reuse values for flapping routes.

- The half-life value configures the half-life duration for a reachable route. After the time interval specified in this command, the penalty value for the route will be reduced by half. This command sets the duration in seconds during which the accumulated stability value is reduced by half if the route is considered reachable, whether suppressed or not. A larger value may be desirable for routes that are known for their instability. A larger value will also result in a longer suppression time if the route exceeds the flapping rate.
- The reuse value configures the number of route withdrawals necessary to begin readvertising a previously suppressed route. If the penalty value for a suppressed route fall below this value, then it will be advertised again. This command sets the reuse value, expressed as a number of route withdrawals. When the stability value for a route reaches or falls below this value, a previously suppressed route will be advertised again. The instability metric for a route is decreased by becoming more stable and by passing half-life time intervals.
- The suppress value configures the cutoff value, or number of route withdrawals, at which a flapping route is suppressed and no longer advertised to BGP peers. This value is expressed as a number of route withdrawals. When the stability value for a route exceeds this cutoff value, the route advertisement is suppressed.
- The max-suppress-time value configures the maximum time (in seconds) a route can be suppressed. This time is also known as the maximum holdtime or the maximum instability value. Once this time is reached the route flap history for a route will be deleted and the route will be advertised again (assuming it is still reachable). This maximum holdtime as applied on an individual route basis. Each suppressed route will be held for the amount of time specified in this command unless the route is re-advertised by falling below the reuse value.
- Entering the command with no variables returns the variables back to their defaults.

Examples

```
-> ip bgp dampening
-> ip bgp dampening half-life 20 reuse 800 suppress 60 max-suppress-time 40
-> no ip bgp dampening
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp dampening clear	Clears the dampening history data for all routes on the router, resetting route flap counters and unsuppressing any routes that had been suppressed due to route flapping violations.
show ip bgp dampening	Displays the BGP route dampening settings.
show ip bgp dampening-stats	Displays BGP dampening statistics.

MIB Objects

```
alaBgpGlobal
   alaBgpDampening
   alaBgpDampMaxFlapHistory
   alaBgpDampHalfLifeReach
   alaBgpDampReuse
   alaBgpDampCutOff
```

ip bgp dampening clear

Clears the dampening history data for all routes on the router, resetting route flap counters and unsuppressing any routes that had been suppressed due to route flapping violations.

ip bgp dampening clear

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to clear all of the currently stored information on routes for dampening purposes. When this command is entered, all route information in regards to dampening is cleared.
- BGP dampening of IPv6 route flaps is currently not supported.

Examples

```
-> ip bgp dampening clear
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp dampening	Enables or disables route dampening.

MIB Objects

```
alaBgpGlobal
   alaBgpDampeningClear
```

ip bgp asn-format

Configures the display format to be used when displaying 4-octet ASNs.

ip bgp asn-format {asdot | asplain}

Syntax Definitions

asdot	A mixture of asplain and asdot+.
asplain	Simple decimal notation.

Defaults

The default is asplain.

Platforms Supported

OmniSwitch 6900.

Usage Guidelines

This command configures the display format to be used when displaying 4-octet ASNs. This configuration changes only the output format. The input format can be in any mode.

Examples

```
-> ip bgp asn-format asdot
```

Release History

Release 7.3.3; command was introduced.

Related Commands

ip bgp autonomous-system	Configures the Autonomous System (AS) number for this router.

MIB Objects

N/A

ip bgp aggregate-address

Creates and deletes a BGP aggregate route. Aggregate routes are used to reduce the size of routing tables by combining the attributes of several different routes and allowing a single aggregate route to be advertised to peers.

The base command (**ip bgp aggregate-address**) may be used with other keywords to set up aggregate address configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

Note that only one of the following optional keywords is specified with each use of the base command. Keywords are not combined together in a single command.

ip bgp aggregate-address *ip_address ip_mask*
[admin-state {enable | disable}]
[as-set]
[community *string***]**
[local-preference *value***]**
[metric *metric***]**
[summary-only]

no ip bgp aggregate-address *ip_address ip_mask*

Syntax Definitions

ip_address	32-bit IP address to be used as the aggregate address.
ip_mask	32-bit subnet mask that determines how many bits of the IP address denote the network number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete an aggregate route.
- This command allows administrative operations on a BGP aggregate. You must still enable the aggregate route through the **ip bgp aggregate-address admin-state** command.
- You cannot aggregate an address (for example, 100.10.0.0) if you do not have at least one more specific route of the address (for example, 100.10.20.0) in the BGP routing table.
- Only the aggregate is advertised unless aggregate summarization is disabled using the **ip bgp aggregate-address summary-only** command.

Examples

```
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0
-> no ip bgp aggregate-address 172.22.2.0 255.255.255.0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp aggregate-address summary-only	Enables or disables aggregate summarization, which suppresses more-specific routes.

MIB Objects

```
alaBgpAggrAddr
alaBgpAggrSet
alaBgpAggrCommunity
alaBgpAggrLocalPref
alaBgpAggrMetric
alaBgpAggrSummarize
alaBgpAggrMask
```

ip bgp aggregate-address admin-state

Enables or disables a BGP aggregate route.

ip bgp aggregate-address *ip_address ip_mask* **admin-state {enable | disable}**

Syntax Definitions

ip_address	32-bit IP address for this aggregate route.
ip_mask	32-bit subnet mask that determines how many bits of the network address denote the network number.
enable	Enables this aggregate route.
disable	Disables this aggregate route.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Configure all aggregate route parameters before enabling the aggregate with this command. Use the **ip bgp aggregate-address** command to configure individual aggregate parameters.
- The **show ip bgp path** command displays every aggregate currently defined.

Examples

```
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0 admin-state enable
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0 admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp aggregate-address	Creates an aggregate route.
show ip bgp path	Displays aggregate routes.

MIB Objects

```
alaBgpAggrTable
   alaBgpAggrAddr
   alaBgpAggrMask
```

ip bgp aggregate-address as-set

Specifies whether AS path aggregation is to be performed or not. AS path aggregation takes the AS path for all routes in this aggregate and creates a new AS path for the entire aggregate. This aggregated AS path includes all the ASs from the routes in the aggregate, but it does not repeat AS numbers if some routes in the aggregate include the same AS in their path.

ip bgp aggregate-address *ip_address ip_mask* **as-set**

no ip bgp aggregate-address *ip_address ip_mask* **as-set**

Syntax Definitions

ip_address	32-bit IP address.
ip_mask	32-bit subnet mask that determines how many bits of the IP address denote the network number.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable the **as-set** option.
- When AS path aggregation is disabled (the default), the AS path for the aggregate defaults to the AS number of the local BGP speaker (configured in the **ip bgp autonomous-system** command).
- If AS path aggregation is enabled, a flap in a more specific path's AS path will cause a flap in the aggregate as well.
- Do not use this command when aggregating many paths because of the numerous withdrawals and updates that must occur as path reachability information for the summarized routes changes.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 as-set
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 as-set
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp aggregate-address	Creates and deletes a BGP aggregate route.

MIB Objects

```
alaBgpAggrTable
   alaBgpAggrAddr
   alaBgpAggrMask
   alaBgpAggrSet
```

ip bgp aggregate-address community

Defines a community for an aggregate route created by the **ip bgp aggregate-address** command. Communities are a way of grouping BGP peers that do not share an IP subnet or an AS number.

ip bgp aggregate-address *ip_address ip_mask* **community {none | no-export | no-advertise | no-export-subconfed |** *num:num***}**

Syntax Definitions

ip_address	32-bit IP address of the aggregate route.
ip_mask	32-bit subnet mask that determines how many bits of the IP address denote the network number.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
num:num	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.

Defaults

parameter	default
none | no-export | no-advertise | no-export-subconfed | *num:num*	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

To revert the aggregate community string to the default value, set the community string to **none**.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 community no-export
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 community none
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp aggregate-address	Creates and deletes a BGP aggregate route.

MIB Objects

```
alaBgpAggrTable
   alaBgpAggrAddr
   alaBgpAggrMask
   alaBgpAggrCommunity
```

ip bgp aggregate-address local-preference

Configures the local preference attribute value for this BGP aggregate. This value will override the default local preference value; it is used when announcing this aggregate to internal peers.

ip bgp aggregate-address *ip_address ip_mask* **local-preference** *value*

no ip bgp aggregate-address *ip_address ip_mask* **local-preference** *value*

Syntax Definitions

ip_address	An IP address for the aggregate route.
ip_mask	A 32-bit subnet mask that determines how many bits of the IP address denote the network number.
value	The local preference attribute. The valid range is 0–4294967295

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to set the local preference back to the default value.
- You can specify that this route use the default local preference value for the AS by specifying zero (0). In this case the local preference for this route will take the default local preference value set for this AS (defined in the **ip bgp default local-preference** command).

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 local-preference 200
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 local-preference 200
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp default local-preference Sets the default local preference value for this AS.

MIB Objects

```
alaBgpAggrTable
   alaBgpAggrAddr
   alaBgpAggrMask
   alaBgpAggrLocalPref
```

ip bgp aggregate-address metric

Configures the MED attribute value for a BGP aggregate. This value is used when announcing this aggregate to internal peers; it indicates the best exit point from the AS.

ip bgp aggregate-address *ip_address ip_mask* **metric** *value*

no ip bgp aggregate-address *ip_address ip_mask* **metric** *value*

Syntax Definitions

ip_address	A 32-bit IP address.
ip_mask	A 32-bit subnet mask that determines how many bits of the IP address denote the network number.
value	The MED attribute. The valid range is 0–4294967295.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to reset the aggregate metric back to its default value.
- The default value of zero indicates that a MED will not be sent for this aggregate. When a MED value is missing for a route, BGP will determine a MED value based upon the settings specified in the **ip bgp bestpath med missing-as-worst** command.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 metric 0
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 metric 0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp bestpath med missing-as-worst	Configures the MED for paths that do not contain a MED value.
ip bgp always-compare-med	Forces BGP to use the MED for comparison of external routes.

MIB Objects

```
alaBgpAggrTable
   alaBgpAggrAddr
   alaBgpAggrMask
   alaBgpAggrMetric
```

ip bgp aggregate-address summary-only

Enables or disables aggregate summarization, which supresses more-specific routes. Disabling aggregate summarization means that more-specific routes will be announced to BGP peers (internal and external peers).

ip bgp aggregate-address *ip_address ip_mask* **summary-only**

no ip bgp aggregate-address *ip_address ip_mask* **summary-only**

Syntax Definitions

ip_address	IP address for the aggreagte route.
ip_mask	32-bit subnet mask that determines how many bits of the IP address denote the network number.

Defaults

This command is enabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This command specifies whether more-specific routes should be announced or suppressed.
- By default, aggregate summarization is enabled, which means that only the aggregate entry (for example, 100.10.0.0) is advertised. Advertisements of more-specific routes (for example, 100.10.20.0) are suppressed.

Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 summary-only
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 summary-only
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp aggregate-address	Creates and deletes a BGP aggregate route.

MIB Objects

```
alaBgpAggrTable
   alaBgpAggrAddr
   alaBgpAggrMask
   alaBgpAggrSummarize
```

ip bgp network

Creates or deletes a BGP network. A network must be known to the local BGP speaker; it also must originate from the local BGP speaker. The network may be directly connected, dynamically learned, or static.

In lieu of these options, the base command (**ip bgp network**) may be used with other keywords to set up network configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

ip bgp network *network_address ip_mask*
[community *string***]**
[local-preference *value***]**
[metric *metric***]**
[admin-state {enable | disable}]

no ip bgp network *network_address ip_mask*

Syntax Definitions

network_address	32-bit IP address.
ip_mask	32-bit subnet mask that determines how many bits of the network address denote the network number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a local network.
- Creating and enabling a network entry indicates to BGP that this network should originate from this router. The network specified must be known to the router, whether it is connected, static, or dynamically learned.
- You can create up to 200 network entries. The basic **show ip bgp path** command will display every network currently defined.
- This command allows administrative operations on a BGP network. You must still enable the network through the **ip bgp network admin-state** command.

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0
-> no ip bgp network 172.22.2.115 255.255.255.0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp network admin-state	Enables a BGP network.

MIB Objects

```
alaBgpNetworkTable
   alaBgpNetworkAddr
   alaBgpNetwrokMetric
   alaBgpNetworkLocalPref
   alaBgpNetworkCommunity
   alaBgpNetworkMask
```

ip bgp network admin-state

Enables or disables a BGP network.

ip bgp network *network_address ip_mask* **admin-state {enable | disable}**

Syntax Definitions

network_address	32-bit IP address.
ip_mask	32-bit subnet mask that determines how many bits of the network address denote the network number.
enable	Enables this network.
disable	Disables this network.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Configure all network parameters before enabling this BGP network with this command. Use the **ip bgp network** command to configure individual aggregate parameters.
- You can create up 200 network entries. The **show ip bgp path** command displays every network currently defined.

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 admin-state enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp network	Create a BGP network.
show ip bgp path	Display currently defined BGP networks.

MIB Objects

```
alaBgpNetworkTable
   alaBgpNetworkAddr
   alaBgpNetworkMask
```

ip bgp network community

Defines a community for a route created by the **ip bgp network** command. Communities are a way of grouping BGP peers that do not share an IP subnet or an AS.

ip bgp network *network_address ip_mask* **community {none | no-export | no-advertise | no-export-subconfed |** *num:num***}**

Syntax Definitions

network_address	32-bit IP address of the network.
ip_mask	32-bit subnet mask that determines how many bits of the network address denote the network number.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
num:num	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.

Defaults

parameter	default
none | no-export | no-advertise | no-export-subconfed | *num:num*	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

To revert the network community string to the default value, set the community string to **none**.

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 community export
-> ip bgp network 172.22.2.115 255.255.255.0 community none
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp network	Creates or deletes a BGP network

MIB Objects

```
alaBgpNetworkTable
   alaBgpNetworkAddr
   alaBgpNetworkMask
   alaBgpNetworkCommunity
```

ip bgp network local-preference

Defines the local preference value for a route generated by the **ip bgp network** command. This value will override the default local preference value; it is used when announcing this network to internal peers.

ip bgp network *network_address ip_mask* **local-preference** *value*

no ip bgp network *network_address ip_mask* **local-preference** *value*

Syntax Definitions

network_address	A 32-bit IP address.
ip_mask	A 32-bit subnet mask that determines how many bits of the network address denote the network number.
value	The local preference attribute value. The valid range is 0–4294967295.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to return the local preference of the specified network to its default setting.
- You can specify that this route use the default local preference value for the AS by specifying zero (0). In this case the local preference for this route will take the default local preference value set for this AS (defined in the **ip bgp default local-preference** command).

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 local-preference 600
-> no ip bgp network 172.22.2.115 255.255.255.0 local-preference 600
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp network	Creates or deletes a BGP network.
ip bgp default local-preference	Sets the default local preference for this AS.

MIB Objects

```
alaBgpNetworkTable
   alaBgpNetworkAddr
   alaBgpNetworkMask
   alaBgpNetworkLocalPref
```

ip bgp network metric

Configures the Multi-Exit Discriminator (MED) attribute value for an network generated by the **ip bgp network** command. This value is used when announcing this network to internal peers; it indicates the best exit point from the AS.

ip bgp network *network_address ip_mask* **metric** *value*

no ip bgp network *network_address ip_mask* **metric** *value*

Syntax Definitions

network_address	A 32-bit IP address.
ip_mask	A 32-bit subnet mask that determines how many bits of the network address denote the network number.
value	A MED attribute value. The valid range is 0–4294967295.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to return the metric for this network to its default value.
- The default value of zero indicates that a MED will not be sent for this network. When a MED value is missing for a route, BGP will determine a MED value based upon the settings specified in the **ip bgp bestpath med missing-as-worst** command.

Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 metric 100
-> no ip bgp network 172.22.2.115 255.255.255.0 metric 100
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp network	Creates or deletes a BGP network.
ip bgp bestpath med missing-as-worst	Specifies the MED value when it is missing.

MIB Objects

```
alaBgpNetworkTable
   alaBgpNetworkAddr
   alaBgpNetworkMask
   alaBgpNetwrokMetric
```

ip bgp neighbor

Creates or deletes a BGP peer.

ip bgp neighbor *ip_address*

no ip bgp neighbor *ip_address*

Syntax Definitions

ip_address	32-bit IP address of the new BGP peer.

Defaults

No peers configured.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a BGP peer.
- You must still enable a BGP peer after creating it. A BGP peer is enabled using the **ip bgp neighbor admin-state** command.
- Once created, a BGP peer cannot be enabled until it is assigned an autonomous system number using the **ip bgp neighbor remote-as** command.

Examples

```
-> ip bgp neighbor 172.22.2.115
-> no ip bgp neighbor 172.22.2.115
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor admin-state	Enable or disable a BGP peer.
ip bgp neighbor remote-as	Configure the AS number for the peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
```

ip bgp neighbor admin-state

Enables or disables a BGP peer.

ip bgp neighbor *ip_address* **admin-state {enable | disable}**

Syntax Definitions

ip_address	32-bit IP address of the new BGP peer.
enable	Enables this peer.
disable	Disables this peer.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You must first create a peer and assign it an IP address using the **ip bgp neighbor** command before enabling the peer.
- Configure all BGP peer related commands before enabling a peer using this command. Once you enable the peer it will begin sending BGP connection and route advertisement messages.

Examples

```
-> ip bgp neighbor 172.22.2.115 admin-state enable
-> ip bgp neighbor 172.22.2.115 admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor	Creates a BGP peer.
show ip bgp neighbors	Displays peer parameters.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
```

ip bgp neighbor advertisement-interval

Configures the time interval for updates between external BGP peers.

ip bgp neighbor *ip_address* **advertisement-interval** *value*

Syntax Definitions

ip_address	32-bit IP address of the neighbor.
value	An advertisement time interval in seconds. The valid range is 0–65535.

Defaults

parameter	default
value	30

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Internal peers sharing the same AS as the local BGP speaker (configured in the **ip bgp autonomous-system** command) use the global route advertisement update interval. This command sets the interval this peer uses to send BGP UPDATE messages to external peers.

Examples

```
-> ip bgp neighbor 172.22.2.115 255.255.255.0 advertisement-interval 60
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip bgp neighbors	Displays BGP peer main status.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   bgpPeerMinRouteAdvertisementTinterval
```

ip bgp neighbor clear

Restarts a BGP peer. The peer will be unavailable during this restart.

ip bgp neighbor *ip_address* **clear**

Syntax Definitions

ip_address	32-bit IP address of the neighbor.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command whenever changes occur to BGP-related access lists, weights, distribution lists, timer specifications, or administrative distance.
- Many peer commands restart the peer as soon as they are configured. The following commands restart the BGP peer for which they are configured:

  ip bgp neighbor remote-as
  ip bgp neighbor md5 key
  ip bgp neighbor passive
  ip bgp neighbor ebgp-multihop
  ip bgp neighbor maximum-prefix
  ip bgp neighbor update-source
  ip bgp neighbor next-hop-self
  ip bgp neighbor soft-reconfiguration
  ip bgp neighbor route-reflector-client
  ip bgp confederation neighbor
  ip bgp neighbor remove-private-as
  ip bgp neighbor update-source.

- You do not need to issue the **ip bgp neighbor clear** command after issuing any of the above commands.

Examples

```
-> ip bgp neighbor 172.22.2.115 clear
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor auto-restart	Automatically attempts to restart a BGP peer session after a session terminates.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerRestart
```

ip bgp neighbor route-reflector-client

Configures this peer as a client to the local route reflector.

ip bgp neighbor *ip_address* **route-reflector-client**

no ip bgp neighbor *ip_address* **route-reflector-client**

Syntax Definitions

ip_address	32-bit IP address of the neighbor.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove this peer as a client to the local route reflector.
- This command configures this peer as one of the clients to the local route reflector.
- All of the peers configured using this command become part of the client group. The remaining peers are members of the non-client group for the local route reflector.
- When route reflection is configured all of the internal BGP speakers in an autonomous system need not be fully meshed. The route reflector take responsibility for passing internal BGP-learned routes to its peers.

Examples

```
-> ip bgp neighbor 172.22.2.115 route-reflector-client
-> no ip bgp neighbor 172.22.2.115 route-reflector-client
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp client-to-client reflection	Configures the local BGP speaker as a route reflector

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerClientStatus
```

ip bgp neighbor default-originate

Enables or disables BGP peer default origination.

ip bgp neighbor *ip_address* **default-originate**

no ip bgp neighbor *ip_address* **default-originate**

Syntax Definitions

ip_address	32-bit IP address of the neighbor.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- When this command is enabled, the local BGP speaker advertises itself as a default to the peer. Such a default route overrides any learned default (propagation) and outbound policy. The default route 0.0.0.0 does not need to exist on the local router.

Examples

```
-> ip bgp neighbor 172.22.2.115 default-originate
-> no ip bgp neighbor 172.22.2.115 default-originate
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor	Creates or deletes a BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerDefaultOriginate
```

ip bgp neighbor timers

Configures the KEEPALIVE message interval and hold time interval (in seconds) with regards to the specified peer.

ip bgp neighbor *ip_address* **timers** *keepalive holdtime*

Syntax Definitions

ip_address	A 32-bit IP address for the BGP peer.
keepalive	The interval (in seconds) between KEEPALIVE messages. The valid values are zero (0) or the range 1–21845.
holdtime	The hold time interval between updates to peers, in seconds. The valid range is 0, 3–65535.

Defaults

parameter	default
keepalive	30
holdtime	90

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Configures the time interval between KEEPALIVE messages sent by this peer. KEEPALIVE messages do not contain route updates or indicate a change in the status of the BGP peer; they serve only to tell the receiving BGP peer that the connection is still live and the peer is reachable.
- By default, the keep alive interval of 30 seconds is one-third the default hold-time interval of 90 seconds. The keep alive interval can never be more than one-third the value of the hold-time interval. When the hold interval is reached without receiving keep alive or other updates messages, the peer is considered dead.
- Setting the keep alive value to zero means no keep alive messages will be sent.
- Once a connection is established with a peer and a time period of the length specified in this command transpires with no messages from the remote peer, then the connection with that remote peer will be considered dead.
- Configures the tolerated hold time interval, in seconds, for messages to this peer from other peers. The hold timer is used during the connection setup process and in on-going connection maintenance with BGP peers. If this peer does not receive a KEEPALIVE, UPDATE, or NOTIFICATION message within this time period, then the BGP connection will be closed.
- By default, the hold-interval of 180 seconds is three times the default keep-alive interval of 60 seconds. The hold-interval can never be less than three times the keep-alive value.

- You must restart the peer (using the **ip bgp neighbor clear** command) after issuing this command before the new hold time interval takes effect.
- Both values must be set at the same time.
- Entering this command without the variables resets the variables to their default value.

Examples

```
-> ip bgp neighbor 172.22.2.115 timers 80 240
-> ip bgp neighbor 172.22.2.115 timers
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor conn-retry-interval	The interval, in seconds, between BGP retries to set up a connection through the transport protocol with another peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   bgpPeerHoldTimeConfigured
   bgpPeerKeepAliveConfigured
```

ip bgp neighbor conn-retry-interval

The interval, in seconds, between BGP retries to set up a connection through the transport protocol with another peer. In the connect state, BGP tries to set up a connection with a remote peer. If the connection fails, then the connect retry interval is started. Once this interval elapses, BGP retries setting up the connection.

ip bgp neighbor *ip_address* **conn-retry-interval** *seconds*

Syntax Definitions

ip_address	A 32-bit IP address for the neighbor.
seconds	The time interval (in seconds) between retries. The valid range is 0–65535.

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The time interval is started when a connection to a peer is lost.
- Other BGP peers may automatically attempt to restart a connection with this peer if they have configured automatic peer session restart (using the **ip bgp neighbor auto-restart** command).
- You must restart the peer (using the **ip bgp neighbor clear** command) after issuing this command before the new connection retry interval takes effect.
- Entering this command without the *seconds* variable resets the variable to its default value.

Examples

```
-> ip bgp neighbor 172.22.2.115 connect-interval 60
-> ip bgp neighbor 172.22.2.115 connect-interval
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor auto-restart	Enable automatic session restart after a session termination.
ip bgp neighbor clear	Restarts the peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   bgpPeerConnectRetryInterval
```

ip bgp neighbor auto-restart

Enables or disables BGP peer automatic restart. When enabled, this peer will automatically attempt to restart a session with another peer after a session with that peer terminates. When disabled, this peer will not try to re-establish a session with another peer after the session terminates; in such a case, the other peer will have to restart the session for the two peers to resume communication.

ip bgp neighbor *ip_address* **auto-restart**

Syntax Definitions

ip_address	32-bit IP address for the neighbor.

Defaults

This command is enabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable automatic peer restart.
- After a session with another peer terminates, the local BGP speaker will wait 60 seconds before attempting to restart the session. If the session does not start on the first attempt a second attempt will be made after another 120 seconds (60x2). On each unsuccessful session attempt, the previous delay between restarts is multiplied by 2, up to a maximum delay of 240 seconds. An exception to this rule occurs when the peer session terminates on receipt of a NOTIFY message with 'unsupported option' code or 'unsupported capability' code; in these cases the delay between restart attempts will begin at 1 second and multiply by 2 after each unsuccessful restart attempt (up to a maximum of 240 second delay).
- Disabling this option can be helpful in cases where other peers are prone to frequent flapping or sending many NOTIFY messages. By not restarting sessions with unstable neighbors, the local BGP speaker forces those unstable neighbors to re-initialize the connection.

Examples

```
-> ip bgp neighbor 172.22.2.115 auto-restart
-> no ip bgp neighbor 172.22.2.115 auto-restart
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor	Creates a BGP peer.
ip bgp neighbor admin-state	Enables a BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerAutoRestart
```

ip bgp neighbor maximum-prefix

Configures the maximum number of prefixes, or paths, the local router can receive from this peer in UPDATE messages.

ip bgp neighbor *ip_address* **maximum-prefix** *maximum* **[warning-only]**

Syntax Definitions

ip_address	A 32-bit IP address of the BGP peer.
maximum	The maximum number of prefixes. The valid range is 0–4294967295.

Defaults

parameter	default
threshold	5000

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the number of prefixes sent by this peer reaches this limit, the peer is restarted.
- You can use BGP logging to receive a warning when the number of prefixes received from this peer reaches 80 percent of the value you configure in this command.
- If the **warning-only** prefix is used, the operator will be warned when the peer exceeds 80 percent of the configured number of maximum prefixes.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 maximum-prefix 1000
-> ip bgp neighbor 172.22.2.115 maximum-prefix 1000 warning only
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor clear	Restarts the BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerMaxPrefixWarnOnly
   alaBgpPeerMaxPrefix
```

ip bgp neighbor md5 key

Sets an encrypted MD5 signature for TCP sessions with this peer in compliance with RFC 2385.

ip bgp neighbor *ip_address* **md5 key {***string* **| none}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	The MD5 public key. Maximum character length is 200.
none	Removes the MD5 public key.

Defaults

parameter	default
string	no password

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Entering the keyword **none** in place of a key removes the password and disables authentication.
- Due to security concerns the actual password that you specify in this command is encrypted using a 3DES algorithm before it appears in a saved snapshot file. Also, if you were to view this command in a snapshot file, or **vcboot.cfg** file, it would appear in a different syntax. The syntax for this command used in snapshot files is as follows:

  ip bgp neighbor *ip_address* **md5 key-encrypt** *encrypted_string*

  However, you should not use this syntax to actually set an MD5 password; it will not work.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 md5 key openpeer5
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor clear	Restarts the BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerMD5Key
```

ip bgp neighbor ebgp-multihop

Allows external peers to communicate with each other even when they are not directly connected. The absence of communication between disconnected peers can occur when a router that is not running BGP sits between two BGP speakers; in such a scenario the BGP speakers are multiple hops from each other. By enabling this command, you allow the BGP peers to speak to each other despite the non-BGP router that sits between them.

ip bgp neighbor *ip_address* **ebgp-multihop [***ttl***]**

no ip bgp neighbor *ip_address* **ebgp-multihop**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
ttl	The Time to Live for the multi-hop connection, in seconds. The range is 1 to 255.

Defaults

parameter	default
ttl	255

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable multi-hop connections.
- By default an external BGP peer is on a directly connected subnet. This command allows you to configure an external BGP peer that is not directly connected and may be multiple hops away. It should be used with caution and only with the guidance of qualified technical support.
- As a safeguard against loops, the multi-hop connection will not be made if the only route to a multi-hop peer is the default route (0.0.0.0).
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 ebgp-multihop 250
-> no ip bgp neighbor 172.22.2.115 ebgp-multihop 50
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor	Creates or deletes a BGP peer.
ip bgp neighbor next-hop-self	Sets the BGP peer to use next hop processing behavior.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerMultiHop
```

ip bgp neighbor description

Configures the BGP peer name.

ip bgp neighbor *ip_address* **description** *string*

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	Peer name (1 - 20 characters).

Defaults

parameter	default
string	peer(ip_address)

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The peer name is a text identifier that, by default, follows the format “peer(x.x.x.x)” where x.x.x.x is the IP address of the BGP peer. For example, the default name of a peer at address 198.216.14.23 would be “peer(198.216.14.23)”.
- A peer name with embedded spaces must be enclosed in quotation marks.

Examples

```
-> ip bgp neighbor 172.22.2.115 description “peer for building 3”
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor	Sets the IP address for the peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerName
```

ip bgp neighbor next-hop-self

Sets the BGP peer to use next hop processing behavior. By default, the next-hop processing of BGP updates is disabled. Using this command to enable next-hop behavior may be useful in non-meshed networks where BGP peers do not have direct access to other peers.

ip bgp neighbor *ip_address* **next-hop-self**

no ip bgp neighbor *ip_address* **next-hop-self**

Syntax Definitions

N/A

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable next hop processing behavior.
- In partially meshed networks a BGP peer may not have direct connections to other peers. When such a peer receives route updates from these distant peers (through other peers), it may treat the remote peer as if it were the next hop in the routing path. Packet forwarding will not work in such a case because no direct connection exists. This command allows this peer to deem itself the next hop on the routing path so that the two non-connected peers can route packets. This peer would have a direct connection to both peers that want to exchange packets.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 next-hop-self
-> no ip bgp neighbor 172.22.2.115 next-hop-self
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor	Creates or deletes a BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerNextHopSelf
```

ip bgp neighbor passive

Configures the local BGP speaker to wait for this peer to establish a connection. When enabled, the local BGP speaker will not initiate a peer session with this peer; in this sense, the BGP speaker is “passive.” When disabled, the local BGP speaker will attempt to set up a session with this peer.

ip bgp neighbor *ip_address* **passive**

no ip bgp neighbor *ip_address* **passive**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable passive peer behavior.
- By default BGP will initiate a session to a peer once the peer is configured, has an AS number, and is enabled. You can use this command to configure the local BGP speaker as passive and an outbound session will not be initiated to this peer. For such peers, BGP will always wait passively for the inbound session attempt.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 passive
-> no ip bgp neighbor 172.22.2.115 passive
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor	Creates or deletes a BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerPassive
```

ip bgp neighbor remote-as

Assigns an AS number to this BGP peer.

ip bgp neighbor *ip_address* **remote-as** *value*

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
value	Autonomous system number in the asplain, asdot+, or asdot formats.

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A BGP peer created with the **ip bgp neighbor** command cannot be enabled (**ip bgp neighbor admin-state enable**) until it is assigned an autonomous system number. If the AS number matches the AS number assigned to the local BGP speaker (assigned using the **ip bgp autonomous-system** command), the peer is considered internal to the local autonomous system. Otherwise, the peer is consider external to the local BGP speaker's AS.
- This BGP peer may not be operational within this router and it may be in an external AS, but it must still be configured on this router before the local BGP speaker can establish a connection to the peer. The local BGP speaker does not auto-discover peers in other routers; it initially learns about peers through the peer commands.
- The BGP peer is restarted after issuing this command.
- The 4-octet ASN is represented in one of three ways:
  - asplain (simple decimal notation)
  - asdot+ (two 16-bit values as low-order and high-order)
  - asdot (a mixture of asplain and asdot+).

Examples

```
-> ip bgp neighbor 172.22.2.115 remote-as 100

The following examples show how to configure the BGP neighbor ASN as 65535 in the
three different formats:
-> ip bgp neighbor 2.2.2.2 remote-as 65535        (asplain format)
-> ip bgp neighbor 2.2.2.2 remote-as 0.65535      (asdot+ format)
-> ip bgp neighbor 2.2.2.2 remote-as 65535        (asdot format)
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp autonomous-system	Set the AS for the local BGP speaker.
ip bgp neighbor	Create a BGP peer.
ip bgp neighbor admin-state enable	Enables a BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerAS
```

ip bgp neighbor remove-private-as

Enables or disables the stripping of private autonomous system numbers from the AS path of routes destined to this peer.

ip bgp neighbor *ip_address* **remove-private-as**

no ip bgp neighbor *ip_address* **remove-private-as**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable stripping of private AS numbers.
- By default all AS numbers in the AS path are passed to peers. Enabling his command strips any private AS numbers in the AS path before sending updates to this peer. AS numbers in the range 64512 to 65535 are considered private ASs; they intended for internal use within an organization (such as an enterprise network), but they are not intended for use on public networks (such as the Internet).
- This command has no effect if you are not using ASs in the range 64512 to 65535.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 remove-private-as
-> no ip bgp neighbor 172.22.2.115 remove-private-as
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor remote-as	Configures the AS number for this peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerRemovePrivateAs
```

ip bgp neighbor soft-reconfiguration

Enables or disables BGP peer soft reconfiguration. Soft reconfiguration increases the stability of the peer by allowing you to reconfigure attributes that require peer resets without halting the TCP connection with other peers.

ip bgp neighbor *ip_address* **soft-reconfiguration**

no ip bgp neighbor *ip_address* **soft-reconfiguration**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.

Default

This command is enabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This feature stores routes and other configuration information in local memory. When you make configuration changes that require a peer reset, the routing cache is not cleared and connections with other peers are not interrupted.
- By default BGP stores all paths from peers, even those that are policy rejected, in anticipation of policy changes in the future. Storing these paths consumes memory. You can use this command to disable the storing of these paths, or soft reconfiguration. However, if soft reconfiguration is disabled and the inbound policy changes, the peer will have to be restarted using the **ip bgp neighbor out-aspathlist** command.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp neighbor 172.22.2.115 soft-reconfiguration
-> no ip bgp neighbor 172.22.2.115 soft-reconfiguration
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor clear	Restarts this BGP peer.
ip bgp neighbor out-aspathlist	Resets inbound policies to this peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerSoftReconfig
```

ip bgp neighbor stats-clear

Clears the statistics for a peer.

ip bgp neighbor *ip_address* **stats-clear**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command clears the statistical variables for a peer so they can accumulate from a known point.
- The cleared statistics include the total messages sent and received from this peer, the total UPDATE messages sent and received from this peer, the total NOTIFY messages sent and received from this peer, and the total peer state transition messages sent and received from this peer. These statistics can be displayed through **show ip bgp neighbors statistics**.

Examples

```
-> ip bgp neighbor 172.22.2.115 stats-clear
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip bgp neighbors statistics	Displays peer statistics.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerClearCounter
```

ip bgp confederation neighbor

Configures this peer as a member of the same confederation as the local BGP speaker.

ip bgp confederation neighbor *ip_address*

no ip bgp confederation neighbor *ip_address*

Syntax Definitions

ip_address	32-bit IP address of the peer.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- You must first assign a confederation number to the local BGP speaker before assigning peers to the confederation. Use the **ip bgp confederation identifier** command to assign a confederation number to the local BGP speaker.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ip bgp confederation neighbor 172.22.2.115
-> no ip bgp confederation neighbor 172.22.2.115
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp confederation identifier	Sets a confederation identification value for the local BGP speaker (this router).

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerConfedStatus
```

ip bgp neighbor update-source

Configures the local address from which this peer will be contacted. This local address can be configured for internal and external BGP peers.

ip bgp neighbor *ip_address* **update-source [***interface_name***]**

Syntax Definitions

ip_address	The 32-bit IP address for this peer.
interface_name	The name of the interface.

Defaults

parameter	default
interface_address	0.0.0.0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This address does not override the router identification for this BGP peer (configured in the **ip bgp neighbor** command). It is the address through which this peer can be contacted within this router. The router identification for a peer, especially an external peer, may not exist in the local router, but that distant peer can still be contacted through this router. This command sets the local address through which this distant peer can be contacted.
- The default is restored by entering the command without a IP address.
- The BGP peer is restarted after issuing this command.
- The update-source is not related to the router-id, it specifies the interface to be used for the TCP connection endpoint. By default, the nearest interface is selected.

Examples

```
-> ip bgp neighbor 172.22.5.115 update-source 172.22.2.117
-> ip bgp neighbor 172.22.5.115 update-source vlan-22
-> ip bgp neighbor 172.22.5.115 update-source
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor	Sets the router identification for a BGP peer.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerLocalAddr
   alaBgpPeerLocalIntfName
```

ip bgp neighbor in-aspathlist

Assigns an inbound AS path list filter to a BGP peer.

ip bgp neighbor *ip_address* **in-aspathlist {***string* | **none}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	Inbound AS path list (0 to 70 characters). This name is case sensitive.
none	Removes this AS path list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The AS path list name *(***InboundASpath** in the example below) is created using the **ip bgp policy aspath-list** command. Any inbound routes from the BGP peer must match this AS path filter before being accepted or passed to inbound policy.
- To deassign an input AS path filter list, use this command to assign a value of **none**.

Examples

```
-> ip bgp neighbor 172.22.2.115 in-aspathlist InboundASpath
-> ip bgp neighbor 172.22.2.115 in-aspathlist none
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy aspath-list	Creates or removes an AS path list.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAspathListIn
```

ip bgp neighbor in-communitylist

Assigns an inbound community list filter to a BGP peer.

ip bgp neighbor *ip_address* **in-communitylist {***string* | **none}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	Input community list (0 to 70 characters. This name is case sensitive.
none	Removes this community list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The community filter list name (**InboundCommlist** in the example below) is created using the **ip bgp policy community-list** command. Any inbound routes from the BGP peer must match this community filter before being accepted or passed to inbound policy.
- To deassign an input community filter list, use this command to assign a value of "**none**."

Examples

```
-> ip bgp neighbor 172.22.2.115 in-communitylist InboundCommlist
-> ip bgp neighbor 172.22.2.115 in-communitylist none
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy community-list	Creates or deletes a community list.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerCommunityListIn
```

ip bgp neighbor in-prefixlist

Assigns an inbound prefix filter list to a BGP peer.

ip bgp neighbor *ip_address* **in-prefixlist {***string* | **none}**

Syntax Definitions

ip_address	32-bit IP address.
string	Input prefix filter list (0 to 70 characters). This name is case sensitive.
none	Removes the prefix list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The prefix list name (**InboundPrefix** in the example below) is created using the **ip bgp policy prefix-list** command. Any inbound routes from the BGP peer must match this prefix filter before being accepted or passed to inbound policy.
- To deassign an input prefix filter list, use this command to assign a value of "**none.**"

Examples

```
-> ip bgp neighbor 172.22.2.115 in-prefixlist InboundPrefix
-> ip bgp neighbor 172.22.2.115 in-prefixlist none
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list	Creates or deletes a prefix match list.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerPrefixListIn
```

ip bgp neighbor out-aspathlist

Assigns an outbound AS path filter list to a BGP peer.

ip bgp neighbor *ip_address* **out-aspathlist {***string* | **none}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	Outbound AS path list (0 - 70 characters).
none	Removes the AS path list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The AS path list name (**OutboundASpath** in the example below) is created using the **ip bgp policy aspath-list** command. Any outbound routes from the BGP peer must match this AS path filter, or policy, before being advertised or passed to outbound policy.
- To deassign an output AS path filter list, use this command to assign a value of "**none**".

Examples

```
-> ip bgp neighbor 172.22.2.115 out-aspathlist OutboundASpath
-> ip bgp neighbor 172.22.2.115 out-aspathlist none
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy aspath-list	Creates or removes an AS path list.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAspathListOut
```

ip bgp neighbor out-communitylist

Assigns an outbound community filter list to a BGP peer.

ip bgp neighbor *ip_address* **out-communitylist {***string* **| none}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	Outbound community list (0 - 70 characters).
none	Removes the community list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The community filter list name (**OutboundCommlist** in the example below) is created using the **ip bgp policy community-list** command. Any outbound routes from the BGP peer must match this community filter before being advertised or passed to outbound policy.
- To deassign an output community filter list, use this command to assign a value of "**none**".

Examples

```
-> ip bgp neighbor 172.22.2.115 out-communitylist OutboundCommlist
-> ip bgp neighbor 172.22.2.115 out-communitylist none
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy community-list	Creates or deletes a community list.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerCommunityListOut
```

ip bgp neighbor out-prefixlist

Assigns an outbound prefix filter list to a BGP peer.

ip bgp neighbor *ip_address* **out-prefixlist {***string* | **none}**

Syntax Definitions

ip_address	32-bit IP address of the BGP peer.
string	Output prefix filter list (0 - 70 characters).
none	Removes the prefix list from the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The prefix list name (**OutboundPrefix** in the example below) is created using the **ip bgp policy prefix-list** command. Any outbound routes from the BGP peer must match this prefix filter before being advertised or passed to outbound policy.
- To deassign an output prefix filter list, use this command to assign a value of "**none**".

Examples

```
-> ip bgp neighbor 172.22.2.115 out-prefixlist OutboundPrefix
-> ip bgp neighbor 172.22.2.115 out-prefixlist none
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list	Creates or deletes a prefix match list.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerPrefixListOut
```

ip bgp neighbor route-map

Assigns an inbound policy map to a BGP peer.

ip bgp neighbor *ip_address* **route-map {***string* **| none} {in | out}**

no ip bgp neighbor *ip_address* **route-map {in | out}**

Syntax Definitions

ip_address	32-bit IP address of the peer.
string	Inbound policy map name (0 to 70 characters). This name is case sensitive.
none	Deletes the route map if entered rather than a text string.
in	Designates this route map policy as an inbound policy.
out	Designates this route map policy as an outbound policy.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to deassign an inbound map.
- The policy route map name (**peeringPointAMap** in the example below) is created using the **ip bgp policy prefix6-list** command. Any inbound routes from the BGP peer must match this route map filter before being accepted or passed to inbound policy.
- It is also possible to deassign a route map by entering **none** in place of a route map name.

Examples

```
-> ip bgp neighbor 172.22.2.115 route-map InboundRoute in
-> ip bgp neighbor 172.22.2.115 route-map OutboundRoute out
-> ip bgp neighbor 172.22.2.115 route-map none in
-> no ip bgp neighbor 172.22.2.115 route-map in
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Creates or deletes a policy route map.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerRouteMapOut
   alaBgpPeerRouteMapIn
```

ip bgp neighbor clear soft

Invokes an inbound or outbound policy reconfiguration for a BGP peer.

ip bgp neighbor *ip_address* **clear soft {in | out}**

Syntax Definitions

ip_address	32-bit IP address for the BGP peer.
in	Applies reconfiguration to the inbound policies.
out	Applies reconfiguration to the outbound policies.

Default

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command reconfigures (or reapplies) all inbound or outbound policies to existing routes without restarting the peer session.
- This command is useful if policies have been changed.

Examples

```
-> ip bgp neighbor 172.22.2.115 clear soft in
-> ip bgp neighbor 172.22.2.115 clear soft out
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor soft-reconfiguration	Enables or disables BGP peer soft reconfiguration.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerReconfigureInBound
   alaBgpPeerReconfigureOutBound
```

ip bgp policy aspath-list

Creates or removes an AS path list.

ip bgp policy aspath-list *name* **"***regular_expression***"**

no ip bgp policy aspath-list *name* **"***regular_expression***"**

Syntax Definitions

name	AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
regular_expression	Regular expression, e.g., "^100 200$" where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.

Defaults

No IP BGP peer policy AS path-list exists.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an AS path list.
- To create an AS path list, use the **ip bgp policy aspath-list** command.
- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200$. Valid regular expression characters (metacharacters) are shown in the table below. See also "Configuring BGP" in your Advanced Routing Guide for more information on using regular expressions in BGP commands.
-

Symbol	Description
^	Matches the beginning of the AS path list.
123	Matches the AS number 123.
.	Matches any single AS number.
?	Matches zero or one occurrence of the previous token, which must be an AS number, a dot, an alternation or a range.
+	Matches one or more occurrences of the previous token, which must be an AS number, a dot, an alternation or a range.
*	Matches zero or more occurrences of the previous token, which must be an AS number, a dot, an alternation or a range.
(	Begins an alternation sequence of AS numbers. It matches any AS number listed in the alternation sequence.

Symbol	Description
|	Separates AS numbers in an alternation sequence.
)	Ends an alternation sequence of AS numbers
[	Begins a range pair consisting of two AS numbers separated by a dash. It matches any AS number within that inclusive range.
-	Separates the endpoints of a range.
]	Ends a range pair.
$	Matches the end of the AS path list.
,_	Commas, underscores and spaces are ignored.

- When using a regular expression in the CLI, the regular expression must be enclosed in quotation marks.
- This command creates AS path lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-aspathlist** and **ip bgp neighbor out-aspathlist** commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies.
- If a BGP AS path list is configured to deny routes from a particular string of regular expression, then by default all of the routes coming from any AS would be denied. You must configure the policy instance in the same policy to allow other routes to come in, to be permitted from other ASs.
- General or more specific AS path list information can be displayed by varying the use of the **show ip bgp** command.

Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$"
-> ip bgp policy aspath-list OutboundAspath "^300 400$"
-> no ip bgp policy aspath-list InboundAspath "^100 200$"
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor in-aspathlist	Assigns an inbound AS path list filter to a BGP peer.
ip bgp neighbor out-aspathlist	Assigns an outbound AS path list filter to a BGP peer.
ip bgp policy aspath-list action	Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found.
ip bgp policy aspath-list priority	Configures priority for processing regular expressions in an AS path list.

MIB Objects

```
alaBgpAspathMatchListTable
   alaBgpAspathMatchListRowStatus
```

ip bgp policy aspath-list action

Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found. Matching criteria are specified in the regular expression.

ip bgp policy aspath-list *name* **“***regular_expression***” action {permit | deny}**

Syntax Definitions

name	AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
regular_expression	Regular expression, e.g., “^100 200$” where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.
permit	Allows matching routes to pass.
deny	Stops matching routes from passing.

Defaults

parameter	default
permit | deny	permit

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200$. Refer to **ip bgp policy aspath-list** on page 26-99 for a table of valid regular expression characters (metacharacters). See also “Configuring BGP” in your Advanced Routing Guide for more information on using regular expressions in BGP commands.
- This command allows or stops AS path lists from being applied to a peer’s inbound and outbound routes configured through the **ip bgp neighbor in-aspathlist** and **ip bgp neighbor out-aspathlist** commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies.
- General or more specific AS path list information can be displayed by varying the use of the **show ip bgp** command.

Examples

```
-> ip bgp policy aspath-list InboundAspath “^100 200$” action permit
-> ip bgp policy aspath-list OutboundAspath “^300 400$” action deny
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor in-aspathlist	Assigns an inbound AS path list filter to a BGP peer.
ip bgp neighbor out-aspathlist	Assigns an outbound AS path list filter to a BGP peer.
ip bgp policy aspath-list	Creates or removes an AS path list.
ip bgp policy aspath-list priority	Configures priority for processing regular expressions in an AS path list.

MIB Objects

```
alaBgpAspathMatchListTable
   alaBgpAspathMatchListAction
```

ip bgp policy aspath-list priority

Configures the priority for processing regular expressions in an AS path list.

ip bgp policy aspath-list *name* **"***regular_expression***" priority** *value*

Syntax Definitions

name	The AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
regular_expression	A regular expression, e.g., "^100 200$" where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.
value	A priority value, e.g., 1, assigned to the policy action. Valid priority range is from 1 - 255.

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200$. Refer to **ip bgp policy aspath-list** on page 26-99 for a table of valid regular expression characters (metacharacters). See also "Configuring BGP" in your Advanced Routing Guide for more information on using regular expressions in BGP commands.
- This command specifies the priority of an AS path list filter being applied to a peer's inbound and outbound routes configured through the **ip bgp neighbor in-aspathlist** and **ip bgp neighbor out-aspathlist** commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies, but only in the order designated by the priority value.
- The higher the priority value specified in the command, the later the matching is processed. For example, regular expressions with a priority of 1 (the default) are processed before an expression assigned a priority of 3. When regular expressions have an equal priority, the processing order is indeterminate.
- General or more specific AS path list information can be displayed by varying the use of the **show ip bgp** command.

Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$" priority 1
-> ip bgp policy aspath-list OutboundAspath "^300 400$" priority 5
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor in-aspathlist	Assigns an inbound AS path list filter to a BGP peer.
ip bgp neighbor out-aspathlist	Assigns an outbound AS path list filter to a BGP peer.
ip bgp policy aspath-list	Creates or removes an AS path list.
ip bgp policy aspath-list action	Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found.

MIB Objects

```
alaBgpAspathMatchListTable
   alaBgpAspathMatchListPriority
```

ip bgp policy community-list

Creates or deletes a community list.

ip bgp policy community-list *name* **{none | no-export | no-advertise | no-export-subconfed |** *num:num***}**

no ip bgp policy community-list *name* **{none | no-export | no-advertise | no-export-subconfed |** *num:num***}**

Syntax Definitions

name	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
num:num	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.

Defaults

No IP BGP peer policy community-list exists.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a community-list.
- This command creates community lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-communitylist** and **ip bgp neighbor out-communitylist** commands. The community list filters routes based on one or more community match list strings, as shown in the example below. If the route matches the community list filter, according to the matching type *exact* or *occur*, then the *permit* or *deny* policy action associated with the match list string applies.
- General or more specific community list information can be displayed by varying the use of the **show ip bgp** command.

Examples

```
-> ip bgp policy community-list CommListAIn 40:40
-> ip bgp policy community-list CommListAOut 400:20
-> ip bgp policy community-list none
-> no ip bgp policy community-list CommListAIn 400:20
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor in-communitylist	Assigns an inbound AS community list filter to a BGP peer.
ip bgp neighbor out-communitylist	Assigns an outbound AS community list filter to a BGP peer.
ip bgp policy community-list action	Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
ip bgp policy community-list match-type	Configures type of matching to be performed with a community string list.
ip bgp policy community-list priority	Configures priority for processing multiple items in a community list filter.

MIB Objects

```
alaBgpCommunityMatchListTable
   alaBgpCommunityMatchListRowStatus
```

ip bgp policy community-list action

Configures the action to be taken for a community list when a match is found.

ip bgp policy community-list *name* **{none | no-export | no-advertise | no-export-subconfed |** *num:num***} action {permit | deny}**

Syntax Definitions

name	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
num:num	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
permit	Allows matching routes to pass.
deny	Stops matching routes from passing.

Defaults

parameter	default
permit | deny	**permit**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

By default, this command allows routes that match the criteria specified in the community list to pass.

Examples

```
-> ip bgp policy community-list commListAIn 600:1 action permit
-> ip bgp policy community-list commListAIn 600:1 action deny
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor in-communitylist	Assigns an inbound AS community list filter to a BGP peer.
ip bgp neighbor out-communitylist	Assigns an outbound AS community list filter to a BGP peer.
ip bgp policy community-list match-type	Configures type of matching to be performed with a community string list.
ip bgp policy community-list priority	Configures priority for processing multiple items in a community list filter.

MIB Objects

```
alaBgpCommunityMatchListTable
   alaBgpCommunityMatchListAction
```

ip bgp policy community-list match-type

Configures the type of matching to be performed with a community string list.

ip bgp policy community-list *name* **{none | no-export | no-advertise | no-export-subconfed |** *num:num***} match-type {exact | occur}**

Syntax Definitions

name	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
num:num	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
exact	Checks for an exact match of the community string and the community attribute.
occur	Checks for an occurrence of the community string anywhere in the community attribute.

Defaults

parameter	default
exact | occur	exact

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

By default, this command only allows routes to pass if the community string exactly matches the community attribute of the route.

Examples

```
-> ip bgp policy community-list commListC 600:1 match-type exact
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor in-communitylist	Assigns an inbound AS community list filter to a BGP peer.
ip bgp neighbor out-communitylist	Assigns an outbound AS community list filter to a BGP peer.
ip bgp policy community-list action	Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
ip bgp policy community-list priority	Configures priority for processing multiple items in a community list filter.

MIB Objects

```
alaBgpCommunityMatchListTable
   alaBgpCommunityMatchListType
```

ip bgp policy community-list priority

Configures the priority for processing multiple items in a community list filter.

ip bgp policy community-list *name* **{none | no-export | no-advertise | no-export-subconfed |** *num:num***} priority** *value*

Syntax Definitions

name	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
num:num	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
value	Priority value in the range 0 - 255.

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The higher the priority value specified in the command, the later the matching is processed. For example, items with a priority of 1 (the default) are processed before items assigned a priority of 3. When items have an equal priority, the processing order is indeterminate.

Examples

```
-> ip bgp policy community-list commListB 500:1 priority 3
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy community-list	Creates or deletes a community list.
ip bgp policy community-list action	Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
ip bgp policy community-list match-type	Configures type of matching to be performed with community string list.

MIB Objects

```
alaBgpCommunityMatchListTable
   alaBgpCommunityMatchListPriority
```

ip bgp policy prefix-list

Creates or deletes a prefix match list.

ip bgp policy prefix-list *name ip_address ip_mask*

no ip bgp policy prefix-list *name ip_address ip_mask*

Syntax Definitions

name	Prefix list name.
ip_address	IP address for the prefix list.
ip_mask	Mask for the prefix list.

Defaults

No IP BGP policy prefix-list exists.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command creates prefix lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-prefixlist** and **ip bgp neighbor out-prefixlist** commands. The prefix list filters routes based on one or more prefixes, as shown in the example below. If the route matches the prefix list filter, according to the **ge** (lower) and **le** (upper) limits defined, then the **permit** or **deny** action associated with the prefix applies.
- General or more specific prefix list information can be displayed by varying the use of the **show ip bgp** command.

Examples

```
-> ip bgp policy prefix-list prefixListA 12.0.0.0 255.0.0.0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list action	Configures action to be taken for a prefix list when a match is found.
ip bgp policy prefix-list ge	Configures lower limit on length of prefix to be matched.
ip bgp policy prefix-list le	Configures upper limit on length of prefix to be matched.

MIB Objects

```
alaBgpPrefixMatchListTable
   alaBgpPrefixMatchListRowStatus
```

ip bgp policy prefix-list action

Configures the action to be taken for a prefix list when a match is found.

ip bgp policy prefix-list *name ip_address ip_mask* **action {permit | deny}**

Syntax Definitions

name	Prefix list name.
ip_address	IP address of the prefix list.
ip_mask	Mask for the prefix list.
permit	Allows matching routes to pass.
deny	Stops matching routes from passing.

Defaults

parameter	default
permit | deny	permit

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Configures the action to be taken for a prefix list when a match is found.

Examples

```
-> ip bgp policy prefix-list prefixListA 12.0.0.0 255.0.0.0 action deny
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list	Creates or deletes a prefix match list.
ip bgp policy prefix-list ge	Configures lower limit on length of prefix to be matched.
ip bgp policy prefix-list le	Configures upper limit on length of prefix to be matched.

MIB Objects

```
alaBgpPrefixMatchListTable
   alaBgpPrefixMatchListAction
```

ip bgp policy prefix-list ge

Configures the lower limit on the length of the prefix to be matched.

ip bgp policy prefix-list *name ip_address ip_mask* **ge** *value*

Syntax Definitions

name	Prefix list name.
ip_address	IP address of the prefix list.
ip_mask	Mask of the prefix list.
value	The lower limit value in the range 0 to 32.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The default value of zero indicates there is no lower limit on the length of the prefix to be matched.
- This command is used in conjunction with the **ip bgp policy prefix-list le** command to set the prefix matching range. The two commands can be combined, as show in the Example section below.
- The **ge** (lower limit) value must be greater than or equal to the prefix length (8 in the example below) and less than or equal to the **le** (upper limit) value.

Examples

```
-> ip bgp policy prefix-list prefixListA 14.0.0.0 255.0.0.0 ge 8 le 16
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list	Creates or deletes a prefix match list.
ip bgp policy prefix-list action	Configures action to be taken for a prefix list when a match is found.
ip bgp policy prefix-list le	Configures upper limit on length of prefix to be matched.

MIB Objects

```
alaBgpPrefixMatchListTable
   alaBgpPrefixMatchListGE
```

ip bgp policy prefix-list le

Configures the upper limit on the length of the prefix to be matched.

ip bgp policy prefix-list *name ip_address ip_mask* **le** *value*

Syntax Definitions

name	Prefix list name.
ip_address	Prefix list IP address for the prefix list.
ip_mask	Prefix list mask for the prefix list.
value	The upper limit value in the range of 0 to 32.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The default value of zero indicates there is no upper limit on the length of the prefix to be matched. This command is used in conjunction with **ip bgp policy prefix-list ge** to set the prefix matching range. The two commands can be combined, as show in the Example section below.
- The **ge** (lower limit) value must be greater than or equal to the prefix length (8 in the example below) and less than or equal to the **le** (upper limit) value.

Examples

```
-> ip bgp policy prefix-list prefixListA 14.0.0.0 255.0.0.0 ge 8 le 16
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list	Creates or deletes a prefix match list.
ip bgp policy prefix-list action	Configures action to be taken for a prefix list when a match is found.
ip bgp policy prefix-list ge	Configures lower limit on length of prefix to be matched.

MIB Objects

```
alaBgpPrefixMatchListTable
   alaBgpPrefixMatchListLE
```

ip bgp policy prefix6-list

Configures a BGP prefix6-list policy for filtering IPv6 prefixes. This policy can be applied to filter unique local IPv6 addresses.

ip bgp policy prefix6-list *pfx_list_name prefix6/pfx_length* **[action {permit | deny}] [admin-state {enable | disable}] [ge [***masklength***]] [le [***masklength***]]**

no ip bgp policy prefix6-list *pfx_list_name prefix6/pfx_length* **[action {permit | deny}] [admin-state {enable | disable}] [ge [***masklength***]] [le [***masklength***]]**

Syntax Definitions

pfx_list_name	Prefix list name.
prefix6	Prefix list IPv6 address for the prefix list.
pfx_length	Prefix length. Prefix length should be in the range of 0 to 128.
permit | deny	Action to be taken which can be either permit or deny.
enable | disable	Row Status can be either enabled or disabled.
masklength	Minimum length of the prefix to be matched. It should be in the range of 0 - 32.

Defaults

NA

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable this feature.
- BGP must be configured on the system.
- The **ge** (lower limit) value must be greater than or equal to the prefix length and less than or equal to the **le** (upper limit) value.

Examples

```
-> ip bgp policy prefix6-list uniqLocal FC00::/48
-> ip bgp policy prefix6-list uniqLocal FC00::/48 action permit
-> ip bgp policy prefix6-list uniqLocal FC00::/48 admin-state enable
-> no ip bgp policy prefix6-list uniqLocal FC00::/48
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip bgp policy route-map	Displays configured prefix6-list policies on the system.
show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPrefix6MatchListTable
   alaBgpPrefix6MatchListId
   alaBgpPrefix6MatchListAddr
   alaBgpPrefix6MatchListAddrLength
   alaBgpPrefix6MatchListAction
   alaBgpPrefix6MatchListRowStatus
   alaBgpPrefix6MatchListGE
   alaBgpPrefix6MatchListLE
```

ip bgp policy route-map

Creates or deletes a policy route map.

ip bgp policy route-map *name sequence_number*

Syntax Definitions

name	Route map name. Case-sensitive.
sequence_number	Route map sequence number in the range of 1 to 255. The sequence number allows for multiple instances of the same route map name.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command creates policy route maps. Each route map can be configured using the following match commands to specify the match criteria by which routes are allowed to pass. Match criteria is examined in the order the commands are listed below.
  1. **ip bgp policy route-map aspath-list**
  2. **ip bgp policy route-map prefix-list**
  3. **ip bgp policy route-map community-list**
  4. **ip bgp policy route-map match-regexp**
  5. **ip bgp policy route-map match-prefix**
  6. **ip bgp policy route-map match-mask**
  7. **ip bgp policy route-map match-community**
- Each route map can also be configured using the following set commands to sequentially specify the actions to be taken when a match is found.
  - **ip bgp policy route-map community**
  - **ip bgp policy route-map community-mode**
  - **ip bgp policy route-map lpref**
  - **ip bgp policy route-map lpref-mode**
  - **ip bgp policy route-map med**
  - **ip bgp policy route-map med-mode**
  - **ip bgp policy route-map origin**
  - **ip bgp policy route-map weight**

- Route maps can be referenced as a filtering mechanism for displaying paths using the **show ip bgp path** command. They are also referenced in filtering inbound and outbound routes for BGP peers using the **ip bgp neighbor route-map** commands.

Examples

```
-> ip bgp policy route-map routemap1 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy route-map action Configures action to be taken for a route when a match is found.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapRowStatus
```

ip bgp policy route-map action

Configures the action to be taken for a route when a match is found.

ip bgp policy route-map *name sequence_number* **action {permit | deny}**

Syntax Definitions

name	A route map name.
sequence_number	A route map sequence number. The valid range is 1–255.
permit	Allows matching routes to pass.
deny	Stops matching routes from passing. In addition, no further instances (sequence numbers) of the route map are examined.

Defaults

parameter	default
permit | deny	**permit**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

By default, this command allows routes that match the criteria specified in the route map to pass. If no matching routes are found, any additional instances (sequence numbers) of the route map name are examined. When all instances have been examined with no match, the route is dropped.

Examples

```
-> ip bgp policy route-map routemap1 1 action deny
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapAction
```

ip bgp policy route-map aspath-list

Assigns an AS path matching list to the route map.

ip bgp policy route-map *name sequence_number* **aspath-list** *as_name*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
as_name	The AS path list name or “none”.

Defaults

parameter	default
as_name	none

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- By default, no AS path list is assigned to a route map.
- This default behavior can be reset by changing the value of the AS path list name to “**none**”.
- The **ip bgp policy aspath-list** and **ip bgp policy aspath-list action** commands are used to create and set permit/deny actions for an AS path list.

Examples

```
-> ip bgp policy route-map routemap1 1 aspath-list aspathlist1
-> ip bgp policy route-map routemap1 1 aspath-list none
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapAsPathMatchListId
```

ip bgp policy route-map asprepend

Configures the AS path prepend action to be taken when a match is found.

ip bgp policy route-map *name sequence_number* **asprepend** *path*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
path	The AS path to prepend or “none**”**. Note that multiple AS path entries must be enclosed in quotes (e.g., “500 600 700”).

Defaults

parameter	default
path	none

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

By default, no AS path is prepended. This command allows AS path numbers to be prepended (added to the beginning of the AS path list) to the AS path attribute of a matching route. The default behavior can be reset by changing the value to “none**”**.

Examples

```
-> ip bgp policy route-map routemap1 1 asprepend “700 800 900”
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapAsPrepend
```

ip bgp policy route-map community

Configures the action to be taken on the community attribute when a match is found.

ip bgp policy route-map *name sequence_number* **community [none | no-export | no-advertise | no-export-subconfed |** *num***:***num***]**

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
none	Removes the community restrictions on the community section of the route map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
num:num	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.

Defaults

parameter	default
none | no-export | no-advertise | no-export-subconfed | *num:num*	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- By default, no action is taken on a community attribute when a match on a route is found.
- The default behavior can be reset by setting the value to "**none**".
- The **ip bgp policy community-list** and **ip bgp policy community-list action** commands are used to create and set permit/deny actions for a community path list. This command is used in conjunction with **ip bgp policy route-map community-mode**.

Examples

```
-> ip bgp policy route-map routemap1 1 community 400:1 500:1
-> ip bgp policy route-map routemap1 1 community 400:1 500:1 community-mode replace
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Creates or deletes a policy route map.
ip bgp policy route-map community-mode	Configures the action to be taken for a community string when a match is found.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapCommunity
```

ip bgp policy route-map community-list

Assigns a community matching list to the route map.

ip bgp policy route-map *name sequence_number* **community-list [***name* | **none]**

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
name	The community list name.
none	No community list name is specified.

Defaults

parameter	default
name | **none**	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

By default, no community list is assigned to the route map. The default behavior can be reset by changing the value to **none**.

Examples

```
-> ip bgp policy route-map routemap1 1 community-list listB
-> ip bgp policy route-map routemap1 1 community-list none
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapCommunityMatchListId
```

ip bgp policy route-map community-mode

Configures the action to be taken for a community string when a match is found.

ip bgp policy route-map *name sequence_number* **community-mode {add | replace}**

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
add	Adds the community string specified in the command **ip bgp policy route-map community**.
replace	Replaces the community string specified in the command **ip bgp policy route-map community**.

Defaults

parameter	default
add | replace	**add**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command is used in conjunction with **ip bgp policy route-map community**. The example on the next line shows the combined usage.

Examples

```
-> ip bgp policy route-map routemap1 1 community-mode replace
-> ip bgp policy route-map routemap1 1 community 400:1 500:1 community-mode replace
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Creates or deletes a policy route map.
ip bgp policy route-map community	Configures the action to be taken on the community attribute when a match is found.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapSetComunityMode
```

ip bgp policy route-map lpref

Configures the local preference value for the route map.

ip bgp policy route-map *name sequence_number* **lpref** *value*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
value	The local preference value. The valid range is 0–4294967295

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used in conjunction with **ip bgp policy route-map lpref-mode**. The example on the next line shows the combined usage.
- In this example, the local preference value will be incremented for a matching route by 555.

Examples

```
-> ip bgp policy route-map routemap1 1 lpref 555
-> ip bgp policy route-map routemap1 1 lpref 555 lpref-mode inc
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Creates or deletes a policy route map.
ip bgp policy route-map lpref-mode	Configures the action to be taken when setting local preference attribute for a local matching route.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapLocalPref
```

ip bgp policy route-map lpref-mode

Configures the action to be taken when setting local preference attribute for a local matching route.

ip bgp policy route-map *name sequence_number* **lpref-mode {none | inc | dec | rep}**

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
none	Do not set the local preference attribute.
inc	Increment the local preference attribute in the matching route by the value specified in the **ip bgp policy route-map med** command. No action is taken if no local preference attribute is found in the matching route.
dec	Decrement the local preference attribute in the matching route by the value specified in the **ip bgp policy route-map med** command. No action is taken if no local preference attribute is found in the matching route.
rep	Replace the local preference attribute in the matching route by the value specified in the **ip bgp policy route-map med** command even if no local preference attribute is found in the matching route.

Defaults

parameter	default
none | inc | dec | rep	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used in conjunction with **ip bgp policy route-map lpref**. The example below shows the combined usage.
- In this example, the local preference value is incremented for a matching route by 555.

Examples

```
-> ip bgp policy route-map routemap1 1 lpref-mode none
-> ip bgp policy route-map routemap1 1 lpref 555 lpref-mode inc
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Creates or deletes a policy route map.
ip bgp policy route-map lpref	Configures the local preference value for the route map.
ip bgp policy route-map med	Configures the Multi-Exit Discriminator (MED) value for a route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapLocalPrefMode
```

ip bgp policy route-map match-community

Configures a matching community primitive for the route map.

ip bgp policy route-map *name sequence_number* **match-community [none | no-export | no-advertise | no-export-subconfed |** *num:num***]**

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
none	Removes the community match from the route-map.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes matching the community restricting advertisement to any peer.
no-export-subconfed	Routes matching the community restricting advertisement to any external BGP peer.
num:num	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.

Defaults

parameter	default
none | no-export | no-advertise | no-export-subconfed | *num:num*	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command allows a matching community string primitive to be placed directly in the route map. By default, no community string is specified. The default behavior can be reset by changing the value to **none**.

Examples

```
-> ip bgp policy route-map routemap1 1 match-community 400:1 500 700:1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Creates or deletes a policy route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapMatchCommunity
```

ip bgp policy route-map match-mask

Configures a matching mask primitive in the route map.

ip bgp policy route-map *name sequence_number* **match-mask** *ip_address*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
ip_address	The 32-bit IP address of the matching mask.

Defaults

parameter	default
ip_address	0.0.0.0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command allows a matching mask primitive to be placed directly in the route map. By default, no mask primitive is specified.
- The example on the next line shows usage combined with the **ip bgp policy route-map match-prefix** command.

Examples

```
-> ip bgp policy route-map routemap1 1 match-mask 255.255.0.0
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0 match-mask 255.255.0.0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Creates or deletes a policy route map.
ip bgp policy route-map match-prefix	Configures a matching prefix primitive in the route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapMatchMask
```

ip bgp policy route-map match-prefix

Configures a matching prefix primitive in the route map.

ip bgp policy route-map *name sequence_number* **match-prefix** *ip_address*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
ip_address	The 32-bit IP address of the matching prefix.

Defaults

parameter	default
ip_address	0.0.0.0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command allows a matching prefix primitive to be placed directly in the route map. By default, no prefix primitive is specified.
- The example on the next line shows usage combined with the **ip bgp policy route-map match-mask** command.

Examples

```
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0 match-mask 255.255.0.0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy route-map match-mask	Configures a matching prefix primitive in the route map.
ip bgp policy prefix6-list	Configures an AS path matching regular expression primitive in the route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapMatchPrefix
```

ip bgp policy route-map match-regexp

Configures an AS path matching regular expression primitive in the route map.

ip bgp policy route-map *name sequence_number* **match-regexp {“***regular_expression***” | none}**

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
regular_expression	Regular expression. The regular expression must be enclosed by quotation marks.
none	No regular expression primitive.

Defaults

parameter	default
regular_expression | **none**	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command allows a regular expression matching directive to be placed directly in the route map. By default, no matching regular expression is specified. Regular expressions are defined in **ip bgp policy aspath-list** on page 26-99.
- When using regular expressions in the CLI, the regular expression must be enclosed by quotation marks.
- The default behavior can be reset by changing the value to **none**.
- See the *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* for more information on the use of regular expressions in BGP commands.

Examples

```
-> ip bgp policy route-map routemap1 1 match-regexp “500 .* 400$”
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Configures an AS path matching regular expression primitive in the route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapMatchAsRegExp
```

ip bgp policy route-map med

Configures the Multi-Exit Discriminator (MED) value for a route map.

ip bgp policy route-map *name sequence_number* **med** *value*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
value	The MED value. The valid range is 0–4294967295.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command is used in conjunction with **ip bgp policy route-map med-mode** command. The first example below shows the combined usage. In the second example, the MED value is incremented for a matching route by 5.

Examples

```
-> ip bgp policy route-map routemap1 1 med 555
-> ip bgp policy route-map routemap1 1 med 555 med-mode inc
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy route-map med-mode	Configures Multi-Exit Discriminator (MED) value for a route map.
ip bgp policy prefix6-list	Configures an AS path matching regular expression primitive in the route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapMed
```

ip bgp policy route-map med-mode

Configures the action to be taken when setting the Multi-Exit Discriminator (MED) attribute for a matching route.

ip bgp policy route-map *name sequence_number* **med-mode {none | inc | dec | rep}**

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
none	Do not set the MED.
inc	Increment the MED in the matching route by the value specified in the **ip bgp policy route-map med** command. No action is taken if no MED is found in the matching route.
dec	Decrement the MED in the matching route by the value specified in the **ip bgp policy route-map med** command. No action is taken if no MED is found in the matching route.
rep	Replace the MED in the matching route by the value specified in the **ip bgp policy route-map med** command even if no MED is found in the matching route.

Defaults

parameter	default
none | inc | dec | rep	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command is used in conjunction with **ip bgp policy route-map med**. The first example below shows the combined usage. In the second example, the MED value is incremented for a matching route by 5.

Examples

```
-> ip bgp policy route-map routemap1 1 med-mode inc
-> ip bgp policy route-map routemap1 1 med 5 med-mode inc
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy route-map med	Configures action to take when setting Multi-Exit Discriminator (MED) attribute for a matching route.
ip bgp policy prefix6-list	Configures an AS path matching regular expression primitive in the route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapMedMode
```

ip bgp policy route-map origin

Configures the action to be taken on the origin attribute when a match is found.

ip bgp policy route-map *name sequence_number* **origin {igp | egp | incomplete | none}**

Syntax Definitions

name	Route map name.
sequence_number	Route map sequence number. Valid range 1–255.
igp	Sets the origin attribute to remote internal BGP (IGP).
egp	Sets the origin attribute to local external BGP (EGP).
incomplete	Sets the origin attribute to incomplete, meaning the origin is unknown.
none	Sets the origin attribute to “none”.

Defaults

parameter	default
igp | egp | incomplete | none	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

By default, no action is taken on the origin attribute when a match is found. The default behavior can be reset by changing the value to **none**.

Examples

```
-> ip bgp policy route-map routemap1 1 origin egp
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy route-map origin	Configures action to take on origin attribute when a match is found.
ip bgp policy prefix6-list	Configures an AS path matching regular expression primitive in the route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapOrgin
```

ip bgp policy route-map prefix-list

Assigns a prefix matching list to the route map.

ip bgp policy route-map *name sequence_number* **prefix-list {***prefix_name* | **none}**

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
prefix_name	The prefix list name.
none	No prefix list name

Defaults

parameter	default
prefix_name | **none**	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- By default, no prefix list is assigned to the route map. The default behavior can be reset by changing the value to **none**.
- The **ip bgp policy prefix-list**, **ip bgp policy prefix-list action**, **ip bgp policy prefix-list ge**, and **ip bgp policy prefix-list le** commands are used to create and set permit/deny actions for a prefix path list.

Examples

```
-> ip bgp policy route-map routemap1 1 prefix-list listC
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list	Assigns a prefix matching list to the route map.
ip bgp policy prefix-list action	Configures action to be taken for a prefix list when a match is found.
ip bgp policy prefix6-list	Configures an AS path matching regular expression primitive in the route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapPrefixMatchListId
```

ip bgp policy route-map weight

Configures a BGP weight value to be assigned to inbound routes when a match is found.

ip bgp policy route-map *name sequence_number* **weight** *value*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
value	The weight value. The valid range is 0–65535.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command sets the weight value for routes that pass the route map match criteria. It is only applicable for the inbound policy. The default value of zero means that the weight is not changed by the route map.

Examples

```
-> ip bgp policy route-map routemap1 1 weight 500
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Configures an AS path matching regular expression primitive in the route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapWeight
```

ip bgp policy route-map community-strip

Configures the value to strip from the community attribute of the routes matched by this route map instance (sequence number).

ip bgp policy route-map *name sequence_number* **community-strip** *community_list*

Syntax Definitions

name	The route map name.
sequence_number	The route map sequence number. The valid range is 1–255.
community_list	The community list name.

Defaults

No IP BGP policy route-map community list exists.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Configures the value to strip from the community attribute of the routes matched by this route map instance (sequence number).

Examples

```
-> ip bgp policy route-map routemap1 1 commmunity_strip communitylist
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix6-list	Configures an AS path matching regular expression primitive in the route map.

MIB Objects

```
alaBgpRouteMapTable
   alaBgpRouteMapCommunityStrip
```

show ip bgp

Displays the current global settings for the local BGP speaker.

show ip bgp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Most of the parameters in this display can be altered through BGP global commands. See the output definitions below for references to the CLI commands used to configure individual parameters.

Examples

```
-> show ip bgp
Admin Status                          = disabled,
Operational Status                    = down,
Autonomous system Number              = 1,
BGP Router Id                         = 128.0.1.4,
Confederation Id                      = 0,
IGP Synchronization Status            = disabled,
Minimum AS origin interval (seconds) = 15,
Default Local Preference              = 100,
Route Reflection                      = disabled,
Cluster Id                            = 0.0.0.0,
Missing MED Status                    = Best,
Aspath Comparison                     = enabled,
Always Compare MED                   = disabled,
Fast External Fail Over               = disabled,
Log Neighbor Changes                 = disabled,
Multi path                            = disabled,
Graceful Restart                      = enabled,
Graceful Restart Status               = Not Restarting,
Configured Graceful Restart Interval = 90s,
IPv4 Unicast                          = enabled,
IPv6 Unicast                          = disabled
```

output definitions

Admin Status	Indicates whether the BGP protocol has been enabled or disabled through the **ip bgp admin-state** command.
Operational Status	Indicates if the local BGP speaker is actively participating in BGP messages, update, routing advertisements.
Autonomous system Number	The AS assigned to the local BGP speaker through the **ip bgp autonomous-system** command.
BGP Router Id	The IP address for the local BGP speaker.
Confederation Id	Shows the confederation number assigned to the local BGP speaker. If the BGP speaker does not belong to a confederation, then this value will be zero (0). Confederation numbers are assigned through the **ip bgp confederation identifier** command.
IGP Synchronization Status	Indicates whether BGP is synchronizing its routing tables with those on non-BGP routers handling IGP traffic (such as a RIP or OSPF router). This value is configured through the **ip bgp synchronization** command.
Minimum AS origin interval	The frequency, in seconds, at which routes local to the autonomous system are advertised. This value is configured through the **ip bgp as-origin-interval** command.
Default Local Preference	The local preference that will be assigned to routes that do not already contain a local preference value. This default value is configured through the **ip bgp default local-preference** command.
Route Reflection	Indicates whether the local BGP speaker is acting as a route reflector for its AS. This value is configured through the **ip bgp client-to-client reflection** command.
Cluster Id	The IP address for cluster in route reflector configurations using multiple, redundant route reflectors. A value of 0.0.0.0 indicates that a cluster is not set up. This value is configured through the **ip bgp cluster-id** command.
Missing MED Status	Indicates the MED value that will be assigned to paths that do not contain MED values. Missing MED values will either be assigned to the worst possible value (2^{32}-1) or the best possible value (0). This value is set using the **ip bgp bestpath med missing-as-worst** command. By default, missing MED values are treated as **best**.
Aspath Comparison	Indicates whether the AS path will be in used in determining the best route. This value is configured through the **ip bgp bestpath as-path ignore** command.
Always Compare MED	Indicates whether multi-exit discriminator (MED) values are being compared only for internal peers or also for external peers. This value is configured through the **ip bgp always-compare-med** command.
Fast External Fail Over	Indicates whether Fast External Failover has been enabled or disabled. When enabled a BGP sessions will be reset immediately after a connection to a directly connected external peer goes down. This value is configured through the **ip bgp fast-external-failover** command.

output definitions (continued)

Log Neighbor Changes	Indicates whether logging of peer state changes is enabled or disabled. This value is configured through the **ip bgp log-neighbor-changes** command.
Multi path	Indicates whether support for multiple equal cost paths is enabled or disabled. This value is configured through the **ip bgp maximum-paths** command.
Graceful Restart	Indicates whether graceful restart is enabled or disabled.
Graceful Restart Status	Indicates the graceful restart state. This feature is not supported in Multiprotocol BGP.
Configured Graceful Restart Interval	Indicates the timer for achieving a graceful restart.
IPv4 Unicast	Indicates whether IPv4 unicast is enabled or disabled.
IPv6 Unicast	Indicates whether IPv6 unicast is enabled or disabled.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp unicast	Enables or disables unicast IPv4 updates for the BGP routing process.
ipv6 bgp unicast	Enables or disables unicast IPv6 updates for the BGP routing process
show ip bgp statistics	Displays BGP global statistics.

show ip bgp statistics

Displays BGP global statistics.

show ip bgp statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command show various BGP statistics for the router, such as number of neighbors, active prefixes, number of paths, etc.

Examples

```
-> show ip bgp statistics
# of Active Prefixes Known                = 0,
# of EBGP Neighbors in Established State  = 0,
# of IBGP Neighbors in Established State  = 0,
# of Feasible Paths                       = 0,
# of Dampened Paths                       = 0,
# of Unsynchronized Paths                 = 0,
# of Policy unfeasible paths              = 0,
Total Number of Paths                     = 0
```

output definitions

# of Active Prefixes Known	The number of prefixes, or route paths, currently known to the local BGP speaker, that are currently up and active.
# of EBGP Neighbors in Established State	The number of peers outside the AS of the local BGP speaker that the local BGP speaker can route to.
# of IBGP Neighbors in Established State	The number of peers in the same AS as the local BGP speaker that the local BGP speaker can route to.
# of Feasible Paths	The number of route paths that are not active due to one of the following reasons: the route is dampened, the route is not permitted based on BGP policies, or the route is waiting to be synchronized with the IGP protocol.
# of Dampened Paths	The number of route paths that are not active because they have violated dampening parameters.
# of Unsynchronized Paths	The number of route paths that are not active because they are waiting to be synchronized with the IGP routing protocol.

output definitions (continued)

# of Unfeasible Paths	The number of route paths that are not active because they are not permitted based on a configured BGP policy.
Total Number of Paths	The total number of paths known to the speaker, active or not.

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpStatsTable
```

show ip bgp dampening

Displays the BGP route dampening settings.

show ip bgp dampening

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command shows the setting for dampening on the router, assuming it is enabled.

Examples

```
-> show ip bgp dampening
Admin Status                    = disabled,
Half life value (seconds)       = 300,
Reuse value                     = 200
Suppress value                  = 300,
Max suppress time (seconds)     = 1800,
```

output definitions

Admin Status	Indicates whether route dampening is enabled or disabled. This value is configured through the **ip bgp dampening** command.
Half life value	The half-life interval, in seconds, after which the penalty value for a reachable route will be reduced by half. This value is configured through the **ip bgp dampening** command.
Reuse value	The value that the route flapping metric must reach before this route is re-advertised. This value is configured through the **ip bgp dampening** command.
Suppress value	The number of route withdrawals necessary to begin readvertising a previously suppressed route. This value is configured through the **ip bgp dampening** command.
Max Suppress time	The maximum time (in seconds) that a route will be suppressed. This value is configured through the **ip bgp dampening** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp dampening	Enables or disables BGP route dampening or the suppression of unstable routes.

```

show ip bgp dampening-stats

Displays BGP dampening statistics.

show ip bgp dampening-stats [*ip_address ip_mask*] [*peer_address*]

Syntax Definitions

ip_address	A 32-bit IP address.
ip_mask	A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.
peer_address	A 32-bit IP address of peer (neighbor).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays various statistics on routes that have flapped, and are thus subject to the settings of the dampening feature.

Examples

```
-> show ip bgp dampening-stats
Network         Mask            From            Flaps Duration    FOM
--------------+---------------+---------------+-----+-----------+-----
155.132.44.73   255.255.255.255 192.40.4.121    8     00h:00m:35s 175
```

output definitions

Network	The IP address for the local BGP speaker that is responsible for route dampening in this router.
Mask	The mask for the local BGP speaker that is responsible for route dampening in this router.
From	The IP address for the route that is flapping.
Flaps	The number of times this route has moved from an UP state to a DOWN state or from a DOWN state to an UP state. If the route goes down and then comes back up, then this statistics would count 2 flaps.
Duration	The time since the first route flap occurred. In the above example, this route has flapped 8 times in a 35 second period.
FOM	The Figure Of Merit, or instability metric, for this route. This value increases with each unreachable event. If it reaches the cutoff value (configured in **ip bgp dampening**), then this route will no longer be advertised.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp dampening	Enables and disables route dampening.

MIB Objects

N/A

show ip bgp path

Displays BGP paths.

show ip bgp path
[ip-addr *ip_address ip_mask***]**
[aspath-list *aspathlist_name***]**
[community-list *community_list_name***]**
[prefix-list *prefix_name***]**
[route-map *routemap_name***]**
[cidr-only]
[community *community_number***]**
[neighbor-rcv *recv_peer_address***]**
[neighbor-adv *adv_peer_addr***]**
[regexp "*regular_expression***"]**
[best]

Syntax Definitions

ip_address	A 32-bit IP address of the path.
ip_mask	A 32-bit subnet mask of the path.
aspathlist_name	AS path on which to filter.
community_list_name	Community name on which to filter.
prefix_name	Prefix on which to filter.
routemap_name	Route map on which to filter.
cidr-only	Filter out everything except CIDR routes.
community_number	Community number on which to filter.
recv_peer_address	Filter all except paths received from this path.
adv_peer_addr	Filter all except paths sent to this path.
regular_expression	Regular expression on which to filter. Regular expressions must be enclosed by quotes. For example, "$100".
best	Show only the best path.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The basic command displays every path currently in the table. Since the number of paths may run into the thousands, this command provides a number of parameters for displaying a specific path or matching entries for a portion of a path or peer address.

Examples

```
-> show ip bgp path
Legends: Sta     = Path state
         >       = best, F = feasible
         P       = policy changing, U = un-synchronized
         D       = dampened, N = none
         Nbr     = Neighbor
         (O)     = Path Origin (? = incomplete, i = igp, e = egp)
         degPref = degree of preference
Sta Network         Mask            Nbr address     Next Hop       (O)  degPref
---+---------------+---------------+---------------+---------------+---+--------

```

output definitions

Sta	Status flag. A greater-than sign (>) indicates this is the best route to the destination.
Network	The IP address for this route path. This is the destination of the route.
Mask	The mask for this route path.
Nbr address	The IP or IPv6 address of the BGP peer that is advertising this path.
Next Hop	The next hop along the route path.
(0)	The origin attribute of this route path. A question mark (**?**) indicates incomplete, and **i** indicates IGP, and an **e** indicates EGP.
degPref	The local preference value assigned to this route path.

```
-> show ip bgp path ip-addr 192.40.6.72 255.255.255.248
BGP Path parameters
Path address  = 192.40.6.72
Path mask     = 255.255.255.248
Path protocol = ebgp
Path peer     = 192.40.4.29
  Path nextHop            = 192.40.4.29,
  Path origin             = igp,
  Path local preference   = -1,
  Path state              = active,
  Path weight             = 0,
  Path preference degree  = 100,
  Path autonomous systems = [nAs=2] : 3 2 ,
  Path MED                = -1,
  Path atomic             = no,
  Path AS aggregator      = <none>,
  Path IPaddr aggregator  = <none>,
  Path community          = <none>,
  Path unknown attribute  = <none>
```

output definitions

Path address	The IP address for route path.
Path mask	The mask for this route path.
Path protocol	The protocol from which this route path was learned. Possible values for this field are as follows: **local**, **static**, **directhost**, **rip**, **ospf**, **isis**, **ibgp**, **ebgp**, and **other**.
Path peer	The IP address of the peer that is advertising this route path.
Path nextHop	The next hop along the route path.
Path origin	The BGP origin attribute. Possible values will be **igp**, **egp**, **incomplete**, and **none**. The origin attribute is considered during the route decision process.
Path local preference	The local preference value for this route as received in an UPDATE message. A negative value (for example, the **-1** in the above display) indicates that the local preference value is missing for this route path.
Path state	Path state indicates the state of the path.The possible states are **best**, **feasible**, **policy-wait**, **un-synchronized**, **dampened**, or **none**. When path state is **none**, it indicates that there are no paths to this prefix and the route is being purged from the system.
Path weight	The path weight as assigned through inbound and outbound policies.
Path preference degree	The local preference assigned to this route through an inbound or outbound policy, or, if the local preference value is missing, the default local preference (which is assigned through the **ip bgp default local-preference**).
Path autonomous systems	The AS path for this route. These numbers show the ASs through which the route has traversed with the most recent AS listed first. In the above example, this route began its path in AS 2 and then traveled through AS 3.
Path MED	The multi-exit discriminator (MED) value for this route path. A negative value (for example, the **-1** in the above display) indicates that the MED value is missing for this route path.
Path atomic	Indicates whether the ATOMIC-AGGREGATE attribute has been set for this route. When set (this field would read **yes**), this attribute indicates that an aggregate has caused a loss of information for this route (a less specific route was chosen over a more specific route included in the aggregate).
Path AS aggregator	Part of the AGGREGATOR attribute. This field indicates the AS for the BGP speaker that created the aggregate. A value of **<none>** indicates this is not an aggregate route.
Path IPaddr aggregator	Part of the AGGREGATOR attribute. This field indicates the IP address for the BGP speaker that created the aggregate. A value of **<none>** indicates that this is not an aggregate route.

output definitions (continued)

Path community	Indicates the community to which this route path belongs, if applicable. A value of **<none>** indicates that this route does not belong to a community.
Path unknown attribute	Indicates BGP attributes found in UPDATE messages which the router does not support. For example, multi-protocol attributes are not supported by the router in this release, but it is possible for these attributes to appear in a BGP route.

Release History

Release 8.1.1; command was introduced.

Related Commands

192.40.6.144    255.255.255.248 No  No  No  No  No  No  No  No  No  No  No  Yes
```

output definitions

Address	The route destination network address.
Mask	The route destination network mask.
ECL	External BGP change list. When Yes, this route will be advertised as soon as the route advertisement timer expires.
ICC	Internal BGP client change list. When Yes, this route will be advertised to internal non-clients.

output definitions (continued)

ICL	Internal BGP change list. When Yes, this route has changes that need to be advertised.
LCL	Local change list. When Yes, this route is local.
AGG	Aggregation. When Yes, this route is an aggregate route.
AGC	Aggregation contribution. When Yes, this route is part of an aggregate route.
AGL	Aggregation list. When Yes, this route is placed on an aggregate list.
AGW	Aggregation waiting. When Yes, this route is waiting for an aggregate contributor.
AGH	Aggregation hidden. When Yes, this route is hidden as part of an aggregate route.
GDL	Deletion list. When Yes, this route will be deleted.
DMP	Dampening. Indicate whether this route has been dampened. If 'Yes', then this route has been dampened and a dampening history exists.
ACT	Active route. When Yes, the route is active.

Release History

Release 8.1.1; command was introduced.

   alaBgpRouteEntry
```

show ip bgp aggregate-address

Displays aggregate route status.

show ip bgp aggregate-address [*ip_address ip mask*]

Syntax Definitions

ip_address	The 32-bit IP address of the aggregate address.
ip_mask	The 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays a specific aggregate address, or all aggregate addresses on the router.

Examples

```
-> show ip bgp aggregate-address
Network         Mask            Summarize As-Set   Admin state Oper state
--------------+---------------+---------+--------+-----------+----------
155.132.44.73   255.255.255.255 disabled  disabled disabled    not_active
192.40.6.0      255.255.255.255 disabled  disabled disabled    not_active

-> show ip bgp aggregate-address 192.40.6.0 255.255.255.255
Aggregate address          = 192.40.6.0,
Aggregate mask             = 255.255.255.255,
Aggregate admin state      = disabled,
Aggregate oper state       = not_active,
Aggregate as-set           = disabled,
Aggregate summarize        = disabled,
Aggregate metric           = 0,
Aggregate local preference = 0,
Aggregate community string = 0:500 400:1 300:2
```

output definitions

Network or **Aggregate address**	The IP address for this aggregate route. This value is configured through the **ip bgp aggregate-address** command.
Mask or **Aggregate mask**	The mask for this aggregate route. This value is configured through the **ip bgp aggregate-address** command.
Summarize or **Aggregate summarize**	Indicates whether aggregate summarization is enabled or disabled for this aggregate route. This value is configured through the **ip bgp aggregate-address summary-only** command.

output definitions (continued)

As-Set or **Aggregate as-set**	Indicates whether AS path aggregate is enabled or disabled. This value is configured through the **ip bgp aggregate-address as-set** command.
Admin State or **Aggregate admin state**	Indicates whether this aggregate route is administratively enabled or disabled. This value is configured through the **ip bgp aggregate-address admin-state** command.
Oper State or **Aggregate oper state**	Indicates whether this aggregate route is operational and participating in BGP message exchanges.
Aggregate metric	The multi-exit discriminator (MED) value configured for this aggregate route. This value is configured through the **ip bgp aggregate-address metric** command.
Aggregate local preference	The local preference value for this aggregate route. This value is configured through the **ip bgp aggregate-address local-preference** command.
Aggregate community string	The community string value for this aggregate route. This value is configured through the **ip bgp aggregate-address community** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp aggregate-address	Creates and deletes a BGP aggregate route.

MIB Objects

   alaBgpAggrSummarize
   alaBgpAggrCommunity
```

show ip bgp network

Displays currently defined network configurations.

show ip bgp network [*network_address ip_mask*]

Syntax Definitions

network_address	A 32-bit IP address.
ip_mask	A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays all the configured networks, or a single network.

Examples

```
-> show ip bgp network
Network         Mask            Admin state Oper state
--------------+---------------+-----------+----------
155.132.1.2     255.255.255.255 disabled    not_active
155.132.1.3     255.255.255.255 disabled    not_active

-> show ip bgp network 155.132.1.2 255.255.255.255
Network address          = 155.132.1.2,
Network mask             = 255.255.255.255,
Network admin state      = disabled,
Network oper state       = not_active,
Network metric           = 0,
Network local preference = 0,
Network community string = 0:500 400:1 300:2
```

output definitions

Network or **Network address**	The IP address configured for this local BGP network. This value is configured through the **ip bgp network** command.
Mask or **Network mask**	The mask configured for this local BGP network. This value is configured through the **ip bgp network** command.
Admin state or **Network admin state**	Indicates whether this local BGP network is administratively enabled or disabled. This value is configured through the **ip bgp network admin-state** command.

output definitions (continued)

Oper state or **Network oper state**	Indicates whether this BGP local network is operationally active or inactive.
Network metric	The multi-exit discriminator (MED) value configured for this local BGP network. This value is configured through the **ip bgp network metric** command.
Network local preference	The local preference value for this local BGP network. This value is configured through the **ip bgp network local-preference** command.
Network community string	The community string value for this local BGP network. This value is configured through the **ip bgp network community** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp network	Configures a local BGP network.

MIB Objects

```
alabgpMIBNetworkGroup
   alaBgpNetworkEntry
```

show ip bgp neighbors

Displays the configured IPv4 BGP peers.

show ip bgp neighbors [*ip_address*]

Syntax Definitions

ip_address	A 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

There are two output options for this command. If you specify show ip bgp peer without a peer IP address, then you see summary information for all peers known to the local BGP speaker. If you enter a specific peer IP address with the command, then you see detailed parameter information for that peer only.

Examples

```
-> show ip bgp neighbors
Legends:Nbr = Neighbor
         As = Autonomous System
Nbr address     As    Admin state Oper state   BgpId           Up/Down
---------------+-----+-----------+------------+---------------+-----------
192.40.4.29     3     enabled     estab        192.40.4.29     00h:14m:48s
192.40.4.121    5     disabled    idle         0.0.0.0         00h:00m:00s
```

output definitions

Nbr address	The IP address for this BGP peer. Assign this address through the **ip bgp neighbor** command.
As	The autonomous system to which this peer belongs. A peer's AS number is assigned through the **ip bgp neighbor remote-as** command.
Admin state	Indicates whether this peer has been enabled or disabled through the **ip bgp neighbor admin-state** command.
Oper state	The current BGP state for this peer. Possible states are **idle**, **connect**, **active**, **opensent**, **openconfirm**, and **established**.
BgpId	The unique BGP identifier of the peer. This value is configured through the **ip bgp neighbor update-source** command.
Up/Down	The time since this peer has transitioned to its current UP or DOWN state. If the peer is currently Established, then this is the time that the peer has been UP. If the peer is currently Idle, then this is the time the peer has been DOWN.

```
-> show ip bgp neighbors 0.0.0.1
Neighbor address                  = 0.0.0.1,
Neighbor autonomous system        = 1,
Neighbor Admin state              = enabled,
Neighbor Oper state               = connect,
Neighbor passive status           = disabled,
Neighbor name                     = peer(0.0.0.1),
Neighbor local address            = vlan-215,
Neighbor EBGP multiHop            = enabled,
Neighbor next hop self            = disabled,
Neighbor Route Refresh            = enabled,
Neighbor Ipv4 unicast             = enabled,
Neighbor Ipv4 multicast           = disabled,
Neighbor type                     = internal,
Neighbor auto-restart             = enabled,
Neighbor route-reflector-client   = disabled,
Neighbor confederation status     = disabled,
Neighbor remove private AS        = disabled,
Neighbor default originate        = disabled,
Neighbor maximum prefixes         = 5000,
Neighbor max prefixes warning     = enabled,
# of prefixes received            = 0,
Neighbor MD5 key                  = <none>,
Neighbor local port               = 0,
Neighbor TCP window size          = 32768
Graceful Restart State            = None,
Advertised Restart Interval       = 0s,
Forwarding State during restart   = NotPreserved,
Activate IPv6 unicast             = enabled,
Configured IPv6 NextHop Address   = ::,
Neighbor Ipv6 unicast             = advertised
```

output definitions

Neighbor address	The IP address for this BGP peer. Assign this address through the **ip bgp neighbor** command.
Neighbor autonomous system	The autonomous system to which this peer belongs. A peer's AS number is assigned through the **ip bgp neighbor remote-as** command.
Neighbor Admin state	Indicates whether this peer has been enabled or disabled through the **ip bgp neighbor admin-state** command.
Neighbor Oper state	The current BGP state for this peer. Possible states are **idle**, **connect**, **active**, **opensent**, **openconfirm**, and **established**.
Neighbor passive status	Indicates whether the local BGP speaker is "passive" (i.e., waiting for this peer to initiate a session). This value is configured through the **ip bgp neighbor passive** command.
Neighbor name	The name assigned to this peer through the **ip bgp neighbor description** command.
Neighbor local address	The interface assigned to this peer. This value is configured through the **ip bgp neighbor update-source** command.
Neighbor EBGP multihop	Indicates whether BGP multi-hop support is enabled or disabled. This supports allows external BGP peers to communicate with each other even when they are not directly connected. This value is configured through the **ip bgp neighbor ebgp-multihop** command.

output definitions (continued)

Neighbor next hop self	Indicates whether this peer is using next hop processing. This value is configured through the **ip bgp neighbor next-hop-self** command.
Neighbor Route Refresh	Indicates whether this peer supports Route Refresh capability as defined in RFC 2918. This capability is an alternative to soft-reconfiguration that can save CPU and memory resources. It allows peers to dynamically request the re-advertisement of BGP routing tables. Since this router supports route refresh all BGP peers are automatically enabled for this capability.
Neighbor Ipv4 unicast	Indicates whether this peer is multi-protocol IP version 4 unicast capable. This router is IPv4 unicasts capable so all peers will be enabled for this capability.
Neighbor Ipv4 multicast	Indicates whether this peer is multi-protocol IP version 4 multicast capable. This router is not IPv4 multicasts capable so all peers will be disabled for this capability.
Neighbor type	Indicates whether this peer is internal or external to the router.
Neighbor auto-restart	Indicates whether peer auto-restart is enabled or disabled. This value is configured through the **ip bgp neighbor auto-restart** command.
Neighbor route-reflector- client	Indicates whether this peer is a client to the local route reflector, if configured. This value is configured through the **ip bgp neighbor route-reflector-client** command.
Neighbor confederation status	Indicates whether this peer is a member of a BGP confederation. This value is configured through the **ip bgp confederation neighbor** command.
Neighbor remove private AS	Indicates whether the stripping of private AS numbers (64512 to 65535) from AS paths is enabled or disabled. This value is configured through the **ip bgp neighbor remove-private-as** command.
Neighbor default originate	Indicates whether peer default origination is enabled or disabled. When enabled, the local BGP speaker advertises itself as a default to the peer. This value is configured through the **ip bgp neighbor default-originate** command.
Neighbor maximum prefixes	The maximum number of prefixes the local router can receive in UPDATE from this peer. This value is configured through the **ip bgp neighbor maximum-prefix** command.
Neighbor max prefixes warning	Indicates whether a warning will be issued when this peer exceeds 80 percent of the maximum prefix value. This value is configured through the **ip bgp neighbor update-source** command.
# of prefixes received	Displays the total number of prefixes received by this neighbor.
Neighbor MD5 key [32- 47]	When present, shows an encrypted version of the MD5 password. When not present, and MD5 password has not been configured. This value is configured through the **ip bgp neighbor md5 key** command.
Neighbor local port	The TCP port used for the session with this peer.
Neighbor TCP window size	The size of the TCP window for this BGP session. This value will always be 32768 as that is the maximum size of a BGP message.
Graceful Restart State	Indicates the graceful restart state. This feature is not supported in Multiprotocol BGP.
Advertised Restart Interval	Indicates the restart interval in seconds.

output definitions (continued)

Forwarding State during restart	Indicates whether the peer has preserved the forwarding state during the graceful restart.
Activate IPv6 unicast	Indicates if the IPv6 unicast updates are enabled or not. Options include **enabled** or **disabled**.
Configured IPv6 NextHop Address	Specifies the IPv6 nexthop address. This is specified using the **ipv6 bgp neighbor ipv6-nexthop** command.
Neighbor Ipv6 unicast	Indicates whether Multiprotocol IPv6 Unicast capability is enabled or disabled between the peers.

show ip bgp neighbors policy

Displays BGP peer policy information.

show ip bgp neighbors policy [*ip_address*]

Syntax Definitions

ip_address	A 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays all of the configured policies for the router, or the polices configured for a specific peer.

Examples

```
-> show ip bgp neighbors policy
Neighbor address  =  0.0.0.0,
  Neighbor autonomous system          = 1,
  Neighbor output policy map name     = <none>,
  Neighbor input policy map name      = <none>,
  Neighbor output aspath-list name    = <none>,
  Neighbor input aspath-list name     = <none>,
  Neighbor output prefix-list name    = <none>,
  Neighbor input prefix-list name     = <none>,
  Neighbor output community-list name = <none>,
  Neighbor input community-list name  = <none>,
  Neighbor soft reconfiguration       = enabled
Neighbor address  =  0.0.0.1,
  Neighbor autonomous system          = 1,
  Neighbor output policy map name     = <none>,
  Neighbor input policy map name      = <none>,
  Neighbor output aspath-list name    = <none>,
  Neighbor input aspath-list name     = <none>,
  Neighbor output prefix-list name    = <none>,
  Neighbor input prefix-list name     = <none>,
  Neighbor output community-list name = <none>,
  Neighbor input community-list name  = <none>,
  Neighbor soft reconfiguration       = enabled
```

output definitions

Neighbor autonomous system	The AS to which the peer is assigned. This can be assigned by using the **ip bgp neighbor remote-as** command.
Neighbor output policy map name	The outbound route map policy for the peer. This can be assigned by using the **ip bgp neighbor route-map** command.
Neighbor input policy map name	The inbound route map policy for the peer. This can be assigned by using the **ip bgp neighbor route-map** command.
Neighbor output aspath-list name	The outbound AS path list policy for the peer. This can be assigned by using the **ip bgp neighbor out-aspathlist** command.
Neighbor input aspath-list name	The inbound AS path list policy for the peer. This can be assigned by using the **ip bgp neighbor in-aspathlist** command.
Neighbor output prefix-list name	The outbound prefix list policy for the peer. This can be assigned by using the **ip bgp neighbor out-prefixlist** command.
Neighbor input prefix-list name	The inbound prefix list policy for the peer. This can be assigned by using the **ip bgp neighbor in-prefixlist** command.
Neighbor output community-list name	The outbound community list policy for the peer. This can be assigned by using the **ip bgp neighbor out-communitylist** command.
Neighbor input community-list name	The inbound community list policy for the peer. This can be assigned by using the **ip bgp neighbor in-communitylist** command.
Neighbor soft reconfiguration	Lists whether soft reconfigurations are enabled or disabled for this peer. This is configured using the **ip bgp neighbor soft-reconfiguration** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip bgp neighbors	Displays BGP peer main status.

MIB Objects

N/A

show ip bgp neighbors timer

Displays BGP peer timer statistics.

show ip bgp neighbors timer [*ip_address*]

Syntax Definitions

ip_address	A 32-bit IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays the timer values for all peer associated with this speaker, or for a specific peer.

Examples

```
-> show ip bgp neighbors timer
Legends: Nbr     = Neighbor
         As      = Autonomous System
         RtAdv   = Route Advertisement
         Kalive  = Keep Alive (actual)
         Ka(C)   = Configured Keep Alive
Nbr address     As    Hold  Hold(C) RtAdv Retry Kalive Ka(C)
---------------+-----+-----+-------+-----+-----+------+-----
192.40.4.29     3     90    90      30    120   30     30
192.40.4.121    5     0     90      30    120   0      30
```

output definitions

Nbr address	The IP address for this BGP peer. Assign this address through the **ip bgp neighbor** command.
As	The autonomous system to which this peer belongs. A peer's AS number is assigned through the **ip bgp neighbor remote-as** command.
Hold	The current count for the holdtime value.
Hold(C)	The holdtime value configured through the **ip bgp neighbor timers** command.
RtAdv	The route advertisement interval, in seconds, for updates between external BGP peers. This value is configured through the **ip bgp neighbor advertisement-interval** command.
Retry	The interval, in seconds, between retries by this peer to set up a connection through TCP with another peer. This value is configured through the **ip bgp neighbor timers** command.

output definitions (continued)

Kalive	The current count, in seconds, between keepalive messages. Keepalive messages do not contain route or status updates; they serve only to tell other peers that the connection is still live and this peer is reachable.
Ka(C)	The keepalive interval as configured through the **ip bgp neighbor timers** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip bgp neighbors	Displays BGP peer main status.

MIB Objects

show ip bgp neighbors statistics

Displays BGP peer message statistics.

show ip bgp neighbors statistics [*ip_address*]

Syntax Definitions

ip_address	A 32-bit IP address of the peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays message statistics for all peers associated with this speaker, or with a specific peer.

Examples

```
-> show ip bgp neighbors statistics
Legends: RMSGS = number of received messages, SMSGS = number of sent messages
         RUPDS = number of Update messages received,
         SUPDS = number of Update messages sent,
         RNOFY = number of Notify messages received,
         SNOFY = number of Notify messages sent
         RPFXS = number of prefixes received
         UPTNS = number of UP transitions
         DNTNS = number of DOWN transitions

 Nbr address    As    RMSGS SMSGS RUPDS SUPDS RNOFY SNOFY RPFXS UPTNS DNTNS
---------------+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
192.40.4.29     3     110   123   5     0     0     1     8     2     2
192.40.4.121    5     0     0     0     0     0     0     0     0     0
```

output definitions

Nbr address	The IP address for this peer. This value is configured through the **ip bgp neighbor** command.
As	The autonomous system to which this peer belongs. This value is configured through the **ip bgp neighbor remote-as** command.
RMSGS	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
SMSGS	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent by this peer.

output definitions (continued)

RUPDS	The number of route UPDATE messages received by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
SUPDS	The number of route UPDATE messages sent by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
RNOFY	The number of NOTIFY messages received by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
SNOFY	The number of NOTIFY messages sent by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
RPFXS	The number of unique route prefixes received by this peer.
UPTNS	The number of times this peer has come up, operationally.
DNTNS	Number of times this peer has gone down, operationally.

```
-> show ip bgp neighbors statistics 0.0.0.1
Neighbor address                  = 0.0.0.1,
# of UP transitions               = 0,
Time of last UP transition        = 00h:00m:00s,
# of DOWN transitions             = 0,
Time of last DOWN transition      = 00h:00m:00s,
Last DOWN reason                  = none,
# of msgs rcvd                    = 0,
# of Update msgs rcvd             = 0,
# of prefixes rcvd                = 0,
# of Route Refresh msgs rcvd      = 0,
# of Notification msgs rcvd       = 0,
Last rcvd Notification reason     = none [none]
Time last msg was rcvd            = 00h:00m:00s,
# of msgs sent                    = 0,
# of Update msgs sent             = 0,
# of Route Refresh msgs sent      = 0
# of Notification msgs sent       = 0,
Last sent Notification reason     = none [none]
Time last msg was sent            = 00h:00m:00s,
```

output definitions

Neighbor address	The IP address for this peer. This value is configured through the **ip bgp neighbor** command.
# of UP transitions	The number of times this peer has come up, operationally.
Time of last UP transition	The duration that this peer has been up.
# of DOWN transitions	Number of times this peer has gone down, operationally.
Time of last DOWN transition	The duration since this peer last went down.

output definitions (continued)

Last DOWN reason	Provides a message as the last reason why a peer went down. The possible reasons for going down are: user_request - user initiated conn_timeout - connection timer expired hold_timeout - hold timer expired bad_msg - received a bad message from neighbor fsm_blink - BGP FSM error peer_closed - neighbor closed connection peer_notify - neighbor sent fatal notification tcp_error - Fatal TCP error none - None
# of msgs rcvd	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received from this peer.
# of Update msgs rcvd	The number of route UPDATE messages received from this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
# of prefixes rcvd	The number of unique route prefixes received by this peer.
# of Route Refresh msgs rcvd	The number of route refresh requests this peer has received. Route refresh requests all routes learned be a peer.
# of Notification msgs rcvd	The number of NOTIFY messages received from this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

output definitions (continued)

Last rcvd Notification reason	NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message received from this peer. The notification reasons are listed in two parts separated by a dash (-). The following are possible notification reasons: message header error - synchronization loss message header error - bad length message header error - bad type open message error - unsupported version open message error - bad peer autonomous system open message error - bad peer bgp id open message error - unsupported option open message error - authentication failure open message error - unacceptable hold time open message error - unsupported capability update message error - malformed attribute update message error - unknown attribute update message error - missing wellknown attribute update message error - attribute flags error update message error - attribute length error update message error - invalid origin update message error - as loop update message error - invalid nexthop update message error - optional attribute error update message error - invalid network update message error - malformed aspath cease - maximum number of prefixes reached cease - administrative shutdown cease - peer de-configured cease- administrative reset cease- connection rejected cease - other configuration change cease - connection collision resolution cease - out of resources hold time out - none fsm error - none none - none
Time last msg was rcvd	The duration since a message was received from this peer.
# of msgs sent	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent to this peer.
# of Update msgs sent	The number of route UPDATE messages sent to this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
# of Route Refresh msgs sent	The number of route refresh requests this peer has sent. Route refresh requests request all routes learned be a peer.
# of Notification msgs sent	The number of NOTIFY messages sent to this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

output definitions (continued)

Last sent Notification reason	NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message sent by this peer. The notification reasons are listed in two parts separated by a dash (-). See the list of possible notification reasons under the description for the **Peer last received notification reason** field above.
Time last msg was sent	The duration since a message was sent to this peer.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp neighbor	Creates or deletes a BGP peer.

MIB Objects

N/A

show ip bgp policy aspath-list

Displays AS path list parameters.

show ip bgp policy aspath-list [*name***] [***"regular_expression"***]**

Syntax Definitions

name	An AS path name.
regular_expression	A regular expression. The regular expression must be enclosed by quotation marks.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command displays a list of all of the AS path policies for the router, or a single policy selected by the list name or regular expression.
- Regular expressions are defined in the **ip bgp policy aspath-list** command on page 26-99.
- When using regular expressions in the CLI, the regular expression must be enclosed by quotation marks.

Examples

```
-> show ip bgp policy aspath-list
Aspath List Name          Aspath regular expression
------------------------+-------------------------------------------------
aspl1                     (500 | 400) ? 300$
aspl2                     (500 | 400)

-> show ip bgp policy aspath-list aspl1
Aspath List name = aspl1
Aspath Regexp    = (500 | 400) ? 300$
  Admin state      = disabled,
  Priority         = 1,
  Action           = deny,
  Primary index    = 0,
```

output definitions

Aspath List name	The name of the AS path list. This is defined using the **ip bgp policy aspath-list** command.
Aspath regular expression	The regular expression that defines the AS path list. This is defined using the **ip bgp policy aspath-list** command.

output definitions (continued)

Admin state	The administration state of the AS path policy. It is either enable or disable.
Priority	The AS path list priority. This is defined using the **ip bgp policy aspath-list priority** command.
Action	The AS path list action, either permit or deny. This is defined using the **ip bgp policy aspath-list action** command.
Primary index	The instance identifier for the AS path list. This value is not configurable.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy aspath-list	Creates or removes an AS path list.

show ip bgp policy community-list

Displays community list parameters.

show ip bgp policy community-list [*name***] [***string***]**

Syntax Definitions

name	Community name.
string	Community match list string

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays a list of the community policies for the speaker, or a specific policy defined by its name or community match string.

Examples

```
-> show ip bgp policy community-list
Community list name       Community string
-------------------------+--------------------------------------------------
adfasdf                   0:0

-> show ip bgp policy community-list coml1
Community List name = coml1
Community string    = 600:1
  Admin state               = disabled,
  Match type                = exact,
  Priority                  = 1,
  Action                    = deny,
  Primary index             = 0
```

output definitions

Community List name	The community list name. This is defined using the **ip bgp policy community-list** command.
Community string	The community list definition. This is defined using the **ip bgp policy community-list** command.
Admin state	The administration state of the community list policy, either enabled or disabled.
Match type	The match type of the community list. This is defined using the **ip bgp policy community-list match-type** command.

output definitions (continued)

Priority	The community list priority. This is defined using the **ip bgp policy community-list priority** command.
Action	The community list action. This is defined using the **ip bgp policy community-list action** command.
Primary index	The instance indentifier for the community list. This value is not configurable.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy community-list	Creates or deletes a community list.

MIB Objects

```

show ip bgp policy prefix-list

Displays prefix list parameters.

show ip bgp policy prefix-list [*name***] [***ip_address ip_mask***]**

Syntax Definitions

name	A prefix list name.
ip_address	A prefix list IP address.
ip_mask	An IP address mask.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays the list of prefix-list policies configured for the speaker, or a specific list determined by the list name or IP address and mask.

Examples

```
-> show ip bgp policy prefix-list
Prefix List name          Prefix address  Prefix mask
-------------------------+---------------+--------------
pfxl1                     155.132.33.0    255.255.255.0
pfxl2                     155.148.32.0    255.255.255.0

-> show ip bgp policy prefix-list pfxl1
Prefix List name = pfxl1
Address          = 155.132.33.0
Mask             = 255.255.255.0
  Admin state        = disabled,
  Match Mask >= (GE) = 0,
  Match Mask <= (LE) = 0,
  Action             = deny
```

output definitions

Prefix List name	The name of the prefix list. This is defined using the **ip bgp policy prefix-list** command.
Address	The IP address of the prefix list. This is defined using the **ip bgp policy prefix-list** command.
Mask	The mask of the prefix list. This is defined using the **ip bgp policy prefix-list** command.
Admin state	The administrative state of the prefix list, either enabled or disabled.

output definitions (continued)

Match Mask >= (GE)	The GE match mask of the prefix list. This is defined using the **ip bgp policy prefix-list ge** command.
Match Mask <= (LE)	The GE match mask of the prefix list. This is defined using the **ip bgp policy prefix-list le** command.
Action	The action of the prefix list. This is defined using the **ip bgp policy prefix-list action** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp policy prefix-list	Creates or deletes a prefix match list.

MIB Objects

```
alabgpMIBPrefixListGroup
   alaBgpPrefixMatchListId
   alaBgpPrefixMatchListAddr

   alaBgpPrefixMatchListGE
   alaBgpPrefixMatchListLE
   alaBgpPrefixMatchListAction
   alaBgpPrefixMatchListRowStatus
```

show ip bgp policy route-map

Displays policy route map parameters.

show ip bgp policy route-map [*name***] [***sequence_number***]**

Syntax Definitions

name	Route map name.
sequence_number	A sequence number. The valid range is 1–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The route map is displayed as a summary table by entering only the route map name, or as a detailed list by specifying the sequence number.

Examples

```
-> show ip bgp policy route-map
RouteMap name             Instance
--------------------------+--------
rmap1                     1
rmap1                     2
rmap2                     1

-> show ip bgp policy route-map rmap1
RouteMap name     = rmap1
RouteMap instance = 1
  Admin state               = disabled,
  Local pref (mode/value)   = <none> / 0,
  Route map action          = permit,
  Origin                    = <none>,
  MED (mode/value)          = <none> / 0,
  Weight                    = 0,
  Aspath-List name          = aspl1,
  Aspath prepend            = <none>,
  Aspath match primitive    = 500 .* 400$,
  Prefix-List name          = <none>,
  Prefix match primitive    = 0.0.0.0 0.0.0.0,
  Community-List name       = coml2,
  Community match primitive = <none>,
  Community string [mode]   =  [Additive]
```

output definitions

RouteMap name	The name of the route map policy. This is determined using the **ip bgp policy prefix6-list** command.
RouteMap instance	The instance of the route map policy. This is determined using the **ip bgp policy prefix6-list** command.
Admin state	The administrative state of the route map policy, either enabled or disabled.
Local pref (mode/value)	The local preference of the route map policy. This is determined using the **ip bgp policy route-map lpref** command.
Route map action	The action of the route map policy. This is determined using the **ip bgp policy route-map action** command.
Origin	The origin of the route map policy. This is determined using the **ip bgp policy route-map origin** command.
MED (mode/value)	The MED of the route map policy. This is determined using the **ip bgp policy route-map med** command.
Weight	The weight of the route map policy. This is determined using the **ip bgp policy route-map weight** command.
Aspath-List name	The name of the AS path list attached to this route map.This is set using the **show ip bgp policy aspath-list** command.
Aspath prepend	The value to prepend to the AS_PATH attribute of the routes matched by this RouteMap instance (Empty quotes indicates no AS_PATH prepending is to be done).
Aspath match primitive	The regular expression used to match AS Path for this route map.
Prefix-List name	The name of the prefix list attached to this route map. This is set using the **show ip bgp policy prefix-list** command.
Prefix match primitive	The prefix to match for this route map.
Community-List name	The name of the community list attached to this route map. This is set using the **show ip bgp policy community-list** command.
Community match primitive	The community string to match for this route map.
Community string [mode]	The name of the community mode attached to this route map. This is set using the **ip bgp policy route-map community-mode** command.

Release History

Release 8.1.1; command was introduced.

ip bgp graceful-restart

Configures support for the graceful restart feature on a BGP router.

ip bgp graceful-restart

no ip bgp graceful-restart

Syntax Definitions

N/A

Defaults

Graceful restart is enabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable support for the graceful restart feature on a BGP router. It has only unplanned graceful restart.
- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on an OmniSwitch 10K with a single CMM.
- Note that graceful restart does not support IPv6 prefixes at this time.

Examples

```
-> ip bgp graceful restart
-> no ip bgp graceful restart
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal
   alaBgpGracefulRestart
   alaBgpRestartInterval
```

ip bgp graceful-restart restart-interval

Configures the grace period for achieving a graceful BGP restart.

ip bgp graceful-restart restart-interval [*seconds***]**

Syntax Definitions

seconds	The hitless restart timeout interval, in seconds. The valid range is 1–3600.

Defaults

parameter	default
seconds	90

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on an OmniSwitch 10K with a single CMM.
- Note that graceful restart does not support IPv6 prefixes at this time.

Examples

```
-> ip bgp graceful-restart restart-interval 600
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal
   alaBgpGracefulRestart
   alaBgpRestartInterval
```

ip bgp unicast

Enables or disables unicast IPv4 advertisements for the BGP routing process.

ip bgp unicast

no ip bgp unicast

Syntax Definitions

N/A

Defaults

By default, BGP IPv4 advertisements are enabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to turn off IPv4 unicast advertisements.
- BGP should be disabled before enabling or disabling IPv4 unicast advertisements.
- IPv4 unicast advertisements may be turned off on homogeneous IPv6 networks that are not aware of IPv4 routing. In such cases, the command, **ip router router-id**, must be used to explicitly configure the 32-bit unique router identifier.

Examples

```
-> ip bgp unicast
-> no ip bgp unicast
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ipv6 bgp unicast	Enables or disables unicast IPv6 updates for the BGP routing process.
show ip bgp	Displays the current global settings for the local BGP speaker.
ip router router-id	Configures the router ID for the router.

MIB Objects

```
alaBgpGlobal
   alaBgpMultiProtocolIpv4
```

ipv6 bgp unicast

Enables or disables unicast IPv6 advertisements for the BGP routing process.

ipv6 bgp unicast

no ipv6 bgp unicast

Syntax Definitions

N/A

Defaults

By default, IPv6 BGP advertisements are disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to turn off IPv6 unicast advertisements.
- BGP should be disabled before enabling or disabling IPv6 unicast advertisements.

Examples

```
-> ipv6 bgp unicast
-> no ipv6 bgp unicast
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp unicast	Enables or disables unicast IPv4 updates for the BGP routing process.
show ip bgp	Displays the current global settings for the local BGP speaker.

MIB Objects

```
alaBgpGlobal
   alaBgpMultiProtocolIpv6
```

ip bgp neighbor activate-ipv6

Enables or disables the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv4 addresses.

ip bgp neighbor *ip_address* **activate-ipv6**

no ip bgp neighbor i*p_address* **activate-ipv6**

Syntax Definitions

ip_address	The 32-bit IPv4 address of the neighbor.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to disable the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv4 addresses.

Examples

```
-> ip bgp neighbor 1.0.0.1 activate-ipv6
-> no ip bgp neighbor 1.0.0.1 activate-ipv6
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip bgp neighbors	Displays BGP peer main status.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerIpv6Unicast
```

ip bgp neighbor ipv6-nexthop

Configures the IPv6 next hop addresses for the IPv6 prefixes advertised between BGP peers. These BGP peers are identified by their IPv4 addresses.

ip bgp neighbor *ip_address* **ipv6-nexthop** *ipv6_address*

Syntax Definitions

ip_address	The 32-bit IPv4 address of the neighbor.
ipv6_address	A 128-bit global IPv6 address to be used as the next hop for IPv6 routes being advertised to this BGP speaker.

Defaults

By default, the IPv6 next hop value is set to all zeros.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- To reset the IPv6 next hop value, enter an all-zero address.
- For internal BGP (IBGP) peers, the IPv6 next hop is used only if the peer **next-hop-self** option is configured.
- For external BGP (EBGP) peers, the IPv6 next hop is used for all the advertised IPv6 routes.

Examples

```
-> ip bgp neighbor 1.0.0.1 ipv6-nexthop 2001:100:3:4::1
-> ip bgp neighbor 1.0.0.1 ipv6-nexthop ::
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeerTable
   alaBgpPeerAddr
   alaBgpPeerIpv6NextHop
```

show ipv6 bgp path

Displays the known IPv6 BGP paths for all the routes or a specific route.

show ipv6 bgp path [ipv6-addr *ipv6_address/prefix_length***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.
/prefix_length	The number of bits that are significant in the IPv6 address (mask) (3–128)

Defaults

By default, IPv6 BGP paths for all the routes will be displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the *ipv6_address/prefix_length* parameter to display the IPv6 BGP paths for a specified route.

Examples

```
-> show ipv6 bgp path
Legends: Sta     = Path state
         >       = best, F = feasible, S = stale
         U       = un-synchronized
         Nbr     = Neighbor
         (O)     = Path Origin (? = incomplete, i = igp, e = egp)
         degPref = degree of preference
Sta  Prefix                       Nbr Address                        (O) degPref

 >  2525:2525:5::/48             100.3.4.1                           i   100
```

output definitions

Sta	Status flag. A greater-than sign (>) indicates this is the best route to the destination.
Prefix	The destination address of the IPv6 route in the hexadecimal format.
Nbr Address	The IP or IPv6 address of the BGP peer that advertises this path.

output definitions (continued)

(0)	The origin attribute of this route path. A question mark (**?**) indicates incomplete, and **i** indicates IGP, and an **e** indicates EGP.
degPref	The local preference value assigned to this route path.

```
-> show ipv6 bgp path ipv6-addr 2020:100:200:1::/64
BGP Path parameters
Path address   = 2020:100:200:1::
Path Length    = 64
Path protocol  = ibgp
Path neighbor  = peer(2001:100:3:4::1)
  Path nextHop            = 2001:100:3:4::1,
  Path origin             = igp,
  Path local preference   = 100,
  Path state              = active,
  Path weight             = 0,
  Path preference degree  = 100,
  Path autonomous systems = [nAs=0] : <none>,
  Path MED                = <none>,
  Path atomic             = no,
  Path AS aggregator      = <none>,
  Path IPaddr aggregator  = <none>,
  Path community          = <none>,
  Path Originator Id      = <none>,
  Path Cluster List       = <none>,
  Path unknown attribute  = <none>
```

output definitions

Path address	The IPv6 address for route path.
Path Length	The prefix length of the IPv6 path.
Path protocol	The protocol from which this route path was learned. Possible values for this field are as follows: **local**, **static**, **directhost**, **rip**, **ospf**, **isis**, **ibgp**, **ebgp**, and **other**.
Path neighbor	The IPv6 address of the BGP peer.
Path nextHop	The next hop along the route path.
Path origin	The BGP origin attribute. Possible values will be **igp**, **egp**, **incomplete**, and **none**. The origin attribute is considered during the route decision process.
Path local preference	The local preference value for this route as received in an UPDATE message. A negative value (for example, the **-1** in the above display) indicates that the local preference value is missing for this route path.
Path state	Indicates the state of the path.The possible states are **best**, **feasible**, **policy-wait**, **un-synchronized**, **dampened**, or **none**. When path state is **none**, it indicates that there are no paths to this prefix and the route is being purged from the system.
Path weight	The path weight as assigned through inbound and outbound policies.

output definitions (continued)

Path preference degree	The local preference assigned to this route through an inbound or outbound policy, or, if the local preference value is missing, the default local preference (which is assigned through the **ip bgp default local-preference**).
Path autonomous systems	The AS path for this route. These numbers show the ASs through which the route has traversed with the most recent AS listed first. In the above example, this route began its path in AS 2 and then traveled through AS 3.
Path MED	The multi-exit discriminator (MED) value for this route path. A negative value (for example, the **-1** in the above display) indicates that the MED value is missing for this route path.
Path atomic	Indicates whether the ATOMIC-AGGREGATE attribute has been set for this route. When set (this field would read **yes**), this attribute indicates that an aggregate has caused a loss of information for this route (a less specific route was chosen over a more specific route included in the aggregate).
Path AS aggregator	Part of the AGGREGATOR attribute. This field indicates the AS for the BGP speaker that created the aggregate. A value of **<none>** indicates this is not an aggregate route.
Path IPaddr aggregator	Part of the AGGREGATOR attribute. This field indicates the IP address for the BGP speaker that created the aggregate. A value of **<none>** indicates that this is not an aggregate route.
Path community	Indicates the community to which this route path belongs, if applicable. A value of **<none>** indicates that this route does not belong to a community.
Path Originator Id	The Router Id of the BGP4 speaker that performed route reflection
Path Cluster List	Sequence of Cluster Id values representing the reflection path that the route has passed, if this is a reflected route in the local AS.
Path unknown attribute	Indicates BGP attributes found in UPDATE messages which the router does not support. For example, multi-protocol attributes are not supported by the router in this release, but it is possible for these attributes to appear in a BGP route.

Release History

Release 8.1.1; command was introduced.

Related Commands

 2525:2525:5::/48                No  No  No  No  No  No  No  No  No  No  No  Yes
```

output definitions

Prefix	The destination address of the IPv6 route in the hexadecimal format.
ECL	External BGP change list. When Yes, this route will be advertised as soon as the route advertisement timer expires.
ICC	Internal BGP client change list. When Yes, this route will be advertised to internal non-clients.

output definitions (continued)

ICL	Internal BGP change list. When Yes, this route has changes that need to be advertised.
LCL	Local change list. When Yes, this route is local.
AGG	Aggregation. When Yes, this route is an aggregate route.
AGC	Aggregation contribution. When Yes, this route is part of an aggregate route.
AGL	Aggregation list. When Yes, this route is placed on an aggregate list.
AGW	Aggregation waiting. When Yes, this route is waiting for an aggregate contributor.
AGH	Aggregation hidden. When Yes, this route is hidden as part of an aggregate route.
GDL	Deletion list. When Yes, this route will be deleted.
DMP	Dampening. Indicate whether this route has been dampened. If 'Yes', then this route has been dampened and a dampening history exists.
ACT	Active route. When Yes, the route is active.

Release History

Release 8.1.1; command was introduced.

ipv6 bgp network

Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.

ipv6 bgp network *ipv6_address/prefix_length*

no ipv6 bgp network *ipv6_address/prefix_length*

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.
/prefix_length	The number of bits that are significant in the IPv6 address (mask). The valid range is 3–128)

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to turn off the advertisement of locally reachable IPv6 networks.

Examples

```
-> ipv6 bgp network 2001::1/64
-> no ipv6 bgp network 2001::1/64
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ipv6 bgp network admin-state	Enables or disables a BGP network.
show ipv6 bgp network	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

MIB Objects

```
alaBgpNetwork6Table
   alaBgpNetwork6Addr
   alaBgpNetwork6MaskLen
```

ipv6 bgp network community

Defines a community for a route created by the **ipv6 bgp network** command. Communities are a way of grouping BGP peers that do not share an IPv6 subnet or an AS.

ipv6 bgp network *ipv6_address/prefix_length* **[community {none | no-export | no-advertise | no-export-subconfed |** *num* **|** *num:num***}]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.
/prefix_length	The number of bits that are significant in the IPv6 address (mask). The valid range is 3–128
none	Removes a prefix from a community.
no-export	Routes in this community are advertised within the AS but not beyond the local AS.
no-advertise	Routes in this community are not advertised to any peer.
no-export-subconfed	Routes in this community are not advertised to any external BGP peer.
num	The community attribute number.
num:num	Community attribute in the AA : NN format. AA indicates the autonomous system and NN indicates the community number.

Defaults

By default, a route is not assigned to a community.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **community** attribute is defined.

Examples

```
-> ipv6 bgp network 2004::2/64 community 23:20
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ipv6 bgp network	Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.
show ipv6 bgp network	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

MIB Objects

```
alaBgpNetwork6Table
   alaBgpNetwork6Addr
   alaBgpNetwork6MaskLen
   alaBgpNetwork6Community
```

ipv6 bgp network local-preference

Defines the local preference value for a route generated by the **ipv6 bgp network** command. This value will override the default local preference value; it is used when announcing this network to internal peers.

ipv6 bgp network *ipv6_address/prefix_length* **[local-preference** *num***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.
/prefix_length	The number of bits that are significant in the IPv6 address (mask). The valid range is 3–128.
num	The local preference attribute value. The valid range is 0–4294967295.

Defaults

parameter	default
num	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **local-preference** attribute is defined.

Examples

```
-> ipv6 bgp network 2004::1/24 local-preference 6
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ipv6 bgp network	Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers
show ipv6 bgp network	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

MIB Objects

alaBgpNetwork6Table
   alaBgpNetwork6Addr
   alaBgpNetwork6MaskLen
   alaBgpNetwork6LocalPref
```

ipv6 bgp network metric

Configures the Multi-Exit Discriminator (MED) attribute value for an network generated by the **ipv6 bgp network** command. This value is sent from routers of one AS to another to indicate the path that the remote AS can use to send data to the local AS.

ipv6 bgp network *ipv6_address/prefix_length* **[metric** *num***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.
/prefix_length	The number of bits that are significant in the IPv6 address (mask). The valid range is 3–128.
num	The MED attribute value. The valid range is 0–4294967295.

Defaults

parameter	default
num	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **metric** attribute is defined for the same route.

Examples

```
-> ipv6 bgp network 2001::1/64 metric 20
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ipv6 bgp network	Advertises a locally reachable IPv6 address as a IPv6 BGP network to other BGP peers.
show ipv6 bgp network	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

MIB Objects

```
alaBgpNetwork6Table
   alaBgpNetwork6Addr
   alaBgpNetwork6MaskLen
   alaBgpNetwork6Metric
```

ipv6 bgp network admin-state

Enables or disables a BGP network. The BGP status must be manually enabled after configuring all the BGP neighbor and network parameters.

ipv6 bgp network *ipv6_address/prefix_length* **[admin-state {enable | disable}]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.
/prefix_length	The number of bits that are significant in the IPv6 address (mask). The valid range is 3–128.
enable	Enables the BGP network.
disable	Disables the BGP network.

Defaults

By default, the BGP network is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **status** attribute is defined.

Examples

```
-> ipv6 bgp network 2001::1/64 admin-state enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ipv6 bgp network	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

MIB Objects

```
alaBgpNetwork6Table
   alaBgpNetwork6Addr
   alaBgpNetwork6MaskLen
   alaBgpNetwork6RowStatus
```

show ipv6 bgp network

Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

show ipv6 bgp network [*ipv6_address/prefix_length***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.
/prefix_length	The number of bits that are significant in the IPv6 address (mask). The valid range is 3–128.

Defaults

By default, all IPv6 BGP networks and their status will be displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the *ipv6_address/prefix_length* parameter to display the status of a specific IPv6 BGP nework.

Examples

```
show ipv6 bgp network
 Network                              Admin state Oper state
-------------------------------------+-----------+----------
2525:500:600::/64                     enabled     active

show ipv6 bgp network 2525:500:600::/64
Network address          = 2525:500:600::/64,
Network admin state      = enabled,
Network oper state       = active,
Network metric           = 0,
Network local preference = 0,
Network community string = <none>
```

output definitions

Network or **Network address**	The IPv6 address configured for this local BGP network. This value is configured through the **ipv6 bgp network** command.
Admin state or **Network admin state**	Indicates whether this local BGP network is administratively enabled or disabled. This value is configured through the **ipv6 bgp network admin-state** command.
Oper state or **Network oper state**	Indicates whether this BGP local network is operationally active or inactive.

output definitions (continued)

Network metric	The multi-exit discriminator (MED) value configured for this local BGP network. This value is configured through the **ipv6 bgp network metric** command.
Network local preference	The local preference value for this local BGP network. This value is configured through the **ipv6 bgp network local-preference** command.
Network community string	The community string value for this local BGP network. This value is configured through the **ipv6 bgp network community** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

ipv6 bgp network	Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.

```

ipv6 bgp neighbor

Creates or deletes a BGP peer relationship using IPv6 addresses.

ipv6 bgp neighbor *ipv6_address*

no ipv6 bgp neighbor *ipv6_address*

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the new BGP peer.

Defaults

By default, no BGP peers are configured in the BGP network.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a BGP peer.
- To establish a BGP session, the BGP peer should be reachable.
- You must manually enable a BGP peer after creating it. A BGP peer is enabled using the **ipv6 bgp neighbor admin-state** command.
- Once created, a BGP peer must be assigned an autonomous system number using the **ipv6 bgp neighbor remote-as** command.
- Use **update-source** keyword to configure the IPv6 interface when link-local address is used as neighbor address.

Examples

```
-> ipv6 bgp neighbor 2001::1
-> no ipv6 bgp neighbor 2001::1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ipv6 bgp neighbor admin-state	Enables or disables the BGP peer status.
ipv6 bgp neighbor remote-as	Assigns an AS number to the BGP peer.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
```

ipv6 bgp neighbor activate-ipv6

Enables the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv6 addresses.

ipv6 bgp neighbor *ipv6_address* **[activate-ipv6]**

no ipv6 bgp neighbor i*pv6_address* **[activate-ipv6]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.

Defaults

This command is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to disable the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv6 addresses.

Examples

```
-> ipv6 bgp neighbor 1.0.0.1 activate-ipv6
-> no ipv6 bgp neighbor 1.0.0.1 activate-ipv6
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6ActivateIpv6
```

ipv6 bgp neighbor ipv6-nexthop

Configures the IPv6 next hop addresses for IPv6 prefixes advertised between BGP peers. These BGP peers are identified by their IPv6 addresses.

ipv6 bgp neighbor *ipv6_address* **[ipv6-nexthop** *ipv6_address***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the next hop router.

Defaults

By default, the IPv6 next hop address is set to all zeros.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- To reset the IPv6 next hop value, enter an all-zero address.
- For internal BGP (IBGP) peers, the IPv6 next hop is used only if the peer **next-hop-self** option is configured.
- For external BGP (EBGP) peers, the IPv6 next hop is used for all the advertised IPv6 routes.
- For BGP peers configured with their link-local addresses, the configured IPv6 next hop is used while advertising IPv6 prefixes.

Examples

```
-> ipv6 bgp neighbor 2001::1 ipv6-nexthop fe80::/24
-> no ipv6 bgp neighbor 2001::1 ipv6-nexthop fe80::/24
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeerIpv6NextHop
```

ipv6 bgp neighbor admin-state

Enables or disables the BGP peer status. These peers are identified by their IPv6 addresses.

ipv6 bgp neighbor *ipv6_address* **[admin-state {enable | disable}]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the new BGP peer.
enable	Enables the BGP peer.
disable	Disables the BGP peer.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You should first create a BGP peer and assign it an IPv6 address using the **ipv6 bgp neighbor** command before enabling the peer.
- You should configure all the BGP peer related commands before enabling a BGP peer. Once you have enabled the peer, it will begin sending BGP connection and route advertisement messages.

Examples

```
-> ipv6 bgp neighbor 2001::1 admin-state enable
-> ipv6 bgp neighbor 2001::1 admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6RowStatus
```

ipv6 bgp neighbor remote-as

Assigns an AS number to the BGP peer.

ipv6 bgp neighbor *ipv6_address* **[remote-as** *num***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address of the BGP peer.
num	Autonomous system number in the range 1–65535.

Defaults

parameter	default
num	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A BGP peer created with the **ipv6 bgp neighbor** command cannot be enabled until it is assigned an autonomous system number. If the AS number assigned to the peer matches the AS number of the local BGP speaker (assigned using the **ip bgp autonomous-system** command), the peer is considered internal to the local autonomous system. Otherwise, the peer is considered external to the local BGP speaker's AS.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::1 remote-as 100
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip bgp autonomous-system	Sets the AS for the local BGP speaker.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6AS
```

ipv6 bgp neighbor timers

Configures the KEEPALIVE message interval and hold time interval (in seconds) with regards to the specified BGP peer.

ipv6 bgp neighbor *ipv6_address* **[timers** *num num***]**

Syntax Definitions

ipv6_address	A 128-bit IPv6 address for the BGP peer.
num	The KEEPALIVE message interval in seconds.
num	The hold time interval in seconds.

Defaults

parameter	default
num (keepalive)	30 seconds
num (holdtime)	90 seconds

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- KEEPALIVE messages do not contain route updates or indicate a change in the status of the BGP peer; they indicate to the receiving BGP peer that the connection is still live and the peer is reachable.
- By default, the KEEPALIVE interval of 30 seconds is one-third the default hold time interval of 90 seconds. The KEEPALIVE interval can never be more than one-third the value of the hold time interval. When the hold time interval is reached without receiving KEEPALIVE or other updates messages, the peer is considered dead.
- Setting the KEEPALIVE value to zero means no KEEPALIVE messages will be sent.
- Once a connection is established with a peer and a time period of the length specified in this command transpires with no messages from the remote peer, then the connection with that remote peer will be considered dead.
- The hold timer is used during the connection setup process and for on-going connection maintenance with BGP peers. If the peer does not receive a KEEPALIVE, UPDATE, or NOTIFICATION message within this time period, then the BGP connection will be closed.
- Both the KEEPALIVE and hold time interval should be set at the same time.
- Using this command without the variables resets the variables to their default value.

Examples

```
-> ipv6 bgp neighbor 2001::1 timers 80 240
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ipv6 bgp neighbor conn-retry-interval	The interval, in seconds, between BGP retries to set up a connection with another peer through the transport protocol.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6HoldTime
   alaBgpPeer6KeepAlive
```

ipv6 bgp neighbor maximum-prefix

Configures the maximum number of prefixes, or paths, the local router can receive from a BGP peer in UPDATE messages.

ipv6 bgp neighbor *ipv6_address* **[maximum-prefix** *num* **[warning-only]]**

no ipv6 bgp neighbor *ipv6_address* **[maximum-prefix** *num* **[warning-only]]**

Syntax Definitions

ipv6_address	A 128-bit IPv6 address for the BGP peer.
num	The number of prefixes. The valid range is 0–4294967295.

Defaults

parameter	default
num	5000

By default, **warning-only** is enabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the number of prefixes sent by the BGP peer reaches the maximum limit, the peer is restarted.
- You can use BGP logging to receive a warning when the number of prefixes received from the peer reaches 80 percent of the value you configure in this command.
- If the **warning-only** prefix is used, the operator will be warned when the peer exceeds 80 percent of the configured number of maximum prefixes.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::2 maximum-prefix 1000 warning-only
-> no ipv6 bgp neighbor 2001::2 maximum-prefix 1000
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6MaxPrefix
   alaBgpPeer6MaxPrefixWarnOnly
```

ipv6 bgp neighbor next-hop-self

Configures router to advertise its peering address as the next hop address for the specified neighbor.

ipv6 bgp neighbor *ipv6_address* **[next-hop-self]**

no ipv6 bgp neighbor *ipv6_address* **[next-hop-self]**

Syntax Definitions

ipv6_address	A 128-bit IPv6 address for the BGP peer.

Defaults

By default, the **next-hop-self** parameter of BGP updates is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable the **next-hop-self** parameter.
- In meshed networks, the BGP peer may not have direct connections to other peers. When such a peer receives route updates from these distant peers (through other peers), it may treat the remote peer as if it were the next hop in the routing path. Packet forwarding will not work in such a case because no direct connection exists. This command allows the peer to deem itself the next hop on the routing path so that the two non-connected peers can route packets. This peer would have a direct connection to both peers that want to exchange packets.
- The BGP peer is restarted after issuing this command.

Examples

```
-> ipv6 bgp neighbor 2001::2 next-hop-self
-> no ipv6 bgp neighbor 2001::2 next-hop-self
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6NextHopSelf
```

ipv6 bgp neighbor conn-retry-interval

The interval, in seconds, between BGP retries to set up a connection with another peer through the transport protocol. In the connect state, BGP tries to set up a connection with a remote peer. If the connection fails, then the connection retry interval starts. Once this interval elapses, BGP retries setting up the connection.

ipv6 bgp neighbor *ipv6_address* **[conn-retry-interval** *num***]**

Syntax Definitions

ipv6_address	A 128-bit IPv6 address for the BGP neighbor.
num	The time interval (in seconds) between retries. The valid range is 0–65535.

Defaults

parameter	default
num	120

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The connection retry time interval starts when a connection to a peer is lost.
- Using this command without the *num* variable resets the variable to its default value.

Examples

```
-> ipv6 bgp neighbor 2001::2 conn-retry-interval 60
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6ConnRetryInterval
```

ipv6 bgp neighbor default-originate

Enables or disables the BGP local speaker to advertise a default route to the peer.

ipv6 bgp neighbor *ipv6_address* **[default-originate]**

no ipv6 bgp neighbor *ipv6_address* **[default-originate]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address for the neighbor.

Defaults

This **default-originate** parameter is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable the BGP peer default origination.
- When this command is enabled, the local BGP speaker advertises the default route to the peer. Such a default route overrides any learned default (propagation) and outbound policy. The default route `::/0` does not need to exist on the local router.
- If the peer is capable of exchanging IP as well as IPv6 prefixes, the default route for both IP and IPv6 is advertised.

Examples

```
-> ipv6 bgp neighbor 2001::1 default-originate
-> no ipv6 bgp neighbor 2001::1 default-originate
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6DefaultOriginate
```

ipv6 bgp neighbor update-source

Configures the local IPv6 interface from which a BGP peer will be connected. This local IPv6 interface can be configured for internal and external BGP peers.

ipv6 bgp neighbor *ipv6_address* **[update-source** *interface_name***]**

no ipv6 bgp neighbor *ipv6_address* **[update-source** *interface_name***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address for the BGP peer.
interface_name	The name of the local IPv6 interface that provides the TCP connection for this BGP peer.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The BGP peer is restarted after issuing this command.
- If a BGP peer is configured with its link-local address, use the **update-source** parameter to specify the name of the IPv6 interface from which this peer is reachable. This is required to establish a BGP peering session.

Examples

```
-> ipv6 bgp neighbor 2004::1 update-source bgp_ipv6
-> no ipv6 bgp neighbor 2004::1 update-source bgp_ipv6
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.
ipv6 interface	Configures an IPv6 interface on a VLAN or IPv6 tunnel.

MIB Objects

```
alaBgpPeer6Table
   alaBgpPeer6Addr
   alaBgpPeer6LocalIntfName
```

ipv6 bgp neighbor ipv4-nexthop

Configures the IPv4 next hop addresses for IPv4 prefixes advertised between BGP peers. These BGP peers are identified by their IPv6 addresses.

ipv6 bgp neighbor *ipv6_address* **[ipv4-nexthop** *ip_address***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address for the BGP peer.
ip_address	The 32-bit IP address of the next hop.

Defaults

By default, the IPv4 next hop value is set to all zeros.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

To reset the IPv4 next hop value, enter an all-zero address.

Examples

```
-> ipv6 bgp neighbor 2004::1 ipv4-nexthop 172.22.2.115
-> ipv6 bgp neighbor 2004::1 ipv4-nexthop 0.0.0.0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors .Displays the configured IPv6 BGP peers.

MIB Objects

Neighbor Ipv6 unicast             = advertised
```

output definitions

Nbr address or **Neighbor address**	The IPv6 address for this BGP peer. Assign this address through the **ipv6 bgp neighbor** command.
As or **Neighbor autonomous system**	The autonomous system to which this peer belongs. A peer's AS number is assigned through the **ipv6 bgp neighbor remote-as** command.
Admin state or **Neighbor Admin state**	Indicates whether this peer has been enabled or disabled through the **ipv6 bgp neighbor admin-state** command.
Oper state or **Neighbor Oper state**	The current BGP state for this peer. Possible states are **idle**, **connect**, **active**, **opensent**, **openconfirm**, and **established**.
BGP Id	The unique BGP identifier of the peer.
Up/Down	The time since this peer has transitioned to its current UP or DOWN state. If the peer is currently Established, then this is the time that the peer has been UP. If the peer is currently Idle, then this is the time the peer has been DOWN.
Neighbor passive status	Indicates whether the local BGP speaker is "passive" (i.e., waiting for this peer to initiate a session).
Neighbor name	The name assigned to this peer.
Neighbor local address	The interface assigned to this peer. This value is configured through the **ipv6 bgp neighbor update-source** command.
Neighbor EBGP multiHop	Indicates whether BGP multi-hop support is enabled or disabled. This supports allows external BGP peers to communicate with each other even when they are not directly connected.
Neighbor next hop self	Indicates whether this peer is using next hop processing. This value is configured through the **ipv6 bgp neighbor next-hop-self** command.
Neighbor Route Refresh	Indicates whether this peer supports Route Refresh capability as defined in RFC 2918. This capability is an alternative to soft-reconfiguration that can save CPU and memory resources. It allows peers to dynamically request the re-advertisement of BGP routing tables. Since this router supports route refresh all BGP peers are automatically enabled for this capability.
Neighbor Ipv4 unicast	Indicates whether this peer is multiprotocol IPv4 unicast capable.
Neighbor Ipv4 multicast	Indicates whether this peer is multiprotocol IPv4 multicast capable.
Neighbor type	Indicates whether this peer is internal or external to the AS.
Neighbor auto-restart	Indicates whether peer auto-restart is enabled or disabled.

output definitions (continued)

Neighbor route-reflector-client	Indicates whether this peer is a client to the local route reflector, if configured.
Neighbor confederation status	Indicates whether this peer is a member of a BGP confederation.
Neighbor remove private AS	Indicates whether the stripping of private AS numbers (64512 to 65535) from AS paths is enabled or disabled.
Neighbor default originate	Indicates whether peer default origination is enabled or disabled. When enabled, the local BGP speaker advertises the default route to the peer. This value is configured through the **ipv6 bgp neighbor default-originate** command.
Neighbor maximum prefixes	The maximum number of prefixes the local router can receive in UPDATE from this peer. This value is configured through the **ipv6 bgp neighbor maximum-prefix** command.
Neighbor max prefixes warning	Indicates whether a warning will be issued when this peer exceeds 80 percent of the maximum prefix value. This value is configured through the **ipv6 bgp neighbor update-source** command.
# of prefixes received	Displays the total number of prefixes received by this neighbor.
Neighbor MD5 key	When present, shows an encrypted version of the MD5 password. When not present, and MD5 password has not been configured.
Neighbor local port	The TCP port used for the session with this peer.
Neighbor TCP window size	The size of the TCP window for this BGP session. This value will always be 32768 as that is the maximum size of a BGP message.
Graceful Restart State	Indicates the graceful restart state. This feature does not support IPv6 prefixes.
Advertised Restart Interval	Indicates the restart interval in seconds.
Forwarding State during restart	Indicates whether the peer has preserved the forwarding state during the graceful restart.
Activate IPv6 unicast	Indicates whether or not IPv6 unicast advertisements are enabled. Options include **enabled** or **disabled**.
Configured IPv4 NextHop Address	Specifies the IPv4 nexthop address. This is specified using the **ipv6 bgp neighbor ipv4-nexthop** command.
Configured IPv6 NextHop Address	Specifies the IPv6 nexthop address. This is specified using the **ipv6 bgp neighbor ipv6-nexthop** command.
Neighbor Ipv6 unicast	Indicates whether or not IPv6 unicast capability is advertised between the peers. Options include **enabled** or **disabled**.

Release History

Release 8.1.1; command was introduced.

show ipv6 bgp neighbors statistics [*ipv6_address***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.

Defaults

By default, the neighbor statistics for all the IPv6 BGP peers will be displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the *ipv6_address* parameter to display the neighbor statistics of a specified IPv6 BGP peer.

Examples

```
-> show ipv6 bgp neighbors statistics
Legends: Nbr   = Neighbor
         As    = Autonomous System
         RMSGS = # of received messages
         SMSGS = # of sent messages
         RUPDS = # of Update messages received
         SUPDS = # of Update messages sent
         RNOFY = # of Notify messages received
         SNOFY = # of Notify messages sent
         RPFXS = # of prefixes received
         UPTNS = # of UP transitions
         DNTNS = # of DOWN transitions

Nbr address             As    RMSGS SMSGS RUPDS SUPDS RNOFY SNOFY RPFXS UPTNS DNTNS
------------------------+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
2001:100:3:4::1         30    225   260   2     3     0     0     10    1     1
```

output definitions

Nbr address	The IPv6 address for this peer. This value is configured using the **ipv6 bgp neighbor** command.
As	The autonomous system to which this peer belongs. This value is configured using the **ipv6 bgp neighbor remote-as** command.
RMSGS	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
SMSGS	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent by this peer.

output definitions (continued)

RUPDS	The number of route UPDATE messages received by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
SUPDS	The number of route UPDATE messages sent by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
RNOFY	The number of NOTIFY messages received by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
SNOFY	The number of NOTIFY messages sent by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
RPFXS	Number of unique route prefixes received by this peer.
UPTNS	Number of times this peer has come up, operationally.
DNTNS	Number of times this peer has gone down, operationally.

```
-> show ipv6 bgp neighbors statistics 2001:100:3:4::1
Neighbor address                  = 2001:100:3:4::1,
# of UP transitions               = 1,
Time of last UP transition        = 01h:50m:36s,
# of DOWN transitions             = 1,
Time of last DOWN transition      = 00h:00m:00s,
Last DOWN reason                  = none,
# of msgs rcvd                    = 226,
# of Update msgs rcvd             = 2,
# of prefixes rcvd                = 10,
# of Route Refresh msgs rcvd      = 0,
# of Notification msgs rcvd       = 0,
Last rcvd Notification reason     = none [none]
Time last msg was rcvd            = 00h:00m:04s,
# of msgs sent                    = 260,
# of Update msgs sent             = 3,
# of Route Refresh msgs sent      = 0
# of Notification msgs sent       = 0,
Last sent Notification reason     = none [none]
Time last msg was sent            = 00h:00m:18s,
```

output definitions

Neighbor address	The IPv6 address for this peer. This value is configured using the **ipv6 bgp neighbor** command.
# of UP transitions	Number of times this peer has come up, operationally.
Time of last UP transition	The duration that this peer has been up.
# of DOWN transitions	Number of times this peer has gone down, operationally.
Time of last DOWN transition	The duration since this peer last went down.

output definitions (continued)

Last DOWN reason	Provides a message as the last reason why a peer went down. The possible reasons for going down are: user_request - user initiated conn_timeout - connection timer expired hold_timeout - hold timer expired bad_msg - received a bad message from neighbor fsm_blink - BGP FSM error peer_closed - neighbor closed connection peer_notify - neighbor sent fatal notification tcp_error - Fatal TCP error none - None
# of msgs rcvd	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
# of Update msgs rcvd	The number of route UPDATE messages received from this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
# **of prefixes rcvd**	Number of unique route prefixes received by this peer.
# of Route Refresh msgs rcvd	Number of route refresh requests this peer has received. Route refresh requests all routes learned be a peer.
# **of Notification msgs rcvd**	Number of NOTIFY messages received from this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

output definitions (continued)

Last rcvd Notification reason	NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message received from this peer. The notification reasons are listed in two parts separated by a dash (-). The following are possible notification reasons: message header error - synchronization loss message header error - bad length message header error - bad type open message error - unsupported version open message error - bad peer autonomous system open message error - bad peer bgp id open message error - unsupported option open message error - authentication failure open message error - unacceptable hold time open message error - unsupported capability update message error - malformed attribute update message error - unknown attribute update message error - missing wellknown attribute update message error - attribute flags error update message error - attribute length error update message error - invalid origin update message error - as loop update message error - invalid nexthop update message error - optional attribute error update message error - invalid network update message error - malformed aspath cease - maximum number of prefixes reached cease - administrative shutdown cease - peer de-configured cease- administrative reset cease- connection rejected cease - other configuration change cease - connection collision resolution cease - out of resources hold time out - none fsm error - none none - none
Time last msg was rcvd	The duration since a message was received from this peer.
# of msgs sent	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent to this peer.
# of Update msgs sent	Number of route UPDATE messages sent to this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
# of Route Refresh msgs sent	Number of route refresh requests this peer has sent. Route refresh requests request all routes learned be a peer.
# of Notification msgs sent	Number of NOTIFY messages sent to this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

output definitions (continued)

Last sent Notification reason	NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message sent by this peer. The notification reasons are listed in two parts separated by a dash (-). See the list of possible notification reasons under the description for the **Peer last received notification reason** field above.
Time last msg was sent	The duration since a message was sent to this peer.

Release History

Release 8.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors	Displays the configured IPv6 BGP peers.

show ipv6 bgp neighbors policy

Displays the incoming and outgoing prefix6 list policy identifiers configured for BGP IPv6 peer.

show ipv6 bgp neighbors policy *ipv6_address*

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays all of the configured policies for the router, or the polices configured for a specific BGP IPv6 peer.

Examples

```
OS6860::> show ipv6 bgp neighbors policy
Neighbor address  =  2001::1,
  Neighbor autonomous system          = 1,
  Neighbor output policy map name     = <none>,
  Neighbor input policy map name      = <none>,
  Neighbor output aspath-list name    = <none>,
  Neighbor input aspath-list name     = <none>,
  Neighbor output prefix-list name    = <none>,
  Neighbor input prefix-list name     = <none>,
  Neighbor output community-list name = <none>,
  Neighbor input community-list name  = <none>,
  Neighbor soft reconfiguration       = enabled
  Neighbor output prefix6-list name   = <none>,
  Neighbor input prefix6-list name    = <none>
```

output definitions

Neighbor autonomous system	The AS to which the peer is assigned. This can be assigned by using the **ip bgp neighbor remote-as** command.
Neighbor output policy map name	The outbound route map policy for the peer. This can be assigned by using the **ip bgp neighbor route-map** command.
Neighbor input policy map name	The inbound route map policy for the peer. This can be assigned by using the **ip bgp neighbor route-map** command.
Neighbor output aspath-list name	The outbound AS path list policy for the peer. This can be assigned by using the **ip bgp neighbor out-aspathlist** command.

output definitions (continued)

Neighbor input aspath-list name	The inbound AS path list policy for the peer. This can be assigned by using the **ip bgp neighbor in-aspathlist** command.
Neighbor output prefix-list name	The outbound prefix list policy for the peer. This can be assigned by using the **ip bgp neighbor out-prefixlist** command.
Neighbor input prefix-list name	The inbound prefix list policy for the peer. This can be assigned by using the **ip bgp neighbor in-prefixlist** command.
Neighbor output community-list name	The outbound community list policy for the peer. This can be assigned by using the **ip bgp neighbor out-communitylist** command.
Neighbor input community-list name	The inbound community list policy for the peer. This can be assigned by using the **ip bgp neighbor in-communitylist** command.
Neighbor soft reconfiguration	Lists whether soft reconfigurations are enabled or disabled for this peer. This is configured using the **ip bgp neighbor soft-reconfiguration** command.
Neighbor output prefix6-list name	The outbound prefix6-list policy for the peer.
Neighbor input prefix6-list name	The inbound prefix6-list policy for the peer.

Release History

Release 8.1.1; command was introduced.

Related Commands

show ipv6 bgp neighbors timers

Displays the timers for configured IPv6 BGP peers.

show ipv6 bgp neighbors timers [*ipv6_address***]**

Syntax Definitions

ipv6_address	The 128-bit IPv6 address.

Defaults

By default, the timer values for all the IPv6 BGP peers will be displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the *ipv6_address* parameter to display the timer value for a specified IPv6 BGP peer.

Examples

```
-> show ipv6 bgp neighbors timers
Legends: Nbr     = Neighbor
         As      = Autonomous System
         RtAdv   = Route Advertisement
         Kalive  = Keep Alive (actual)
         Ka(C)   = Configured Keep Alive
Nbr address                        As    Hold  Hold(C) RtAdv Retry Kalive Ka(C)
-----------------------------------+-----+-----+-------+-----+-----+------+-----
2001:100:3:4::1                     30    90    90      30    120   30     30
```

output definitions

Nbr address	The IPv6 address for this BGP peer. Assign this address using the **ipv6 bgp neighbor** command.
As	The autonomous system to which this peer belongs. A peer's AS number is assigned using the **ipv6 bgp neighbor remote-as** command.
Hold	The actual negotiated hold time value.
Hold (C)	The hold time value. This value is configured using the **ipv6 bgp neighbor timers** command.
RtAdv	The route advertisement interval, in seconds, for updates between external BGP peers.
Retry	The interval, in seconds, between retries by this peer to set up a connection through TCP with another peer. This value is configured using the **ipv6 bgp neighbor timers** command.

output definitions (continued)

Kalive	The actual negotiated value, in seconds, between KEEPALIVE messages. KEEPALIVE messages do not contain route or status updates; they serve only to tell other peers that the connection is still live and this peer is reachable.
Ka (C)	The KEEPALIVE interval as configured using the **ipv6 bgp neighbor timers** command.

Release History

Release 8.1.1; command was introduced.

   alaBgpPeer6MinRouteAdvertisementInterval
   alaBgpPeer6HoldTime
```

27 Server Load Balancing Commands

Server Load Balancing (SLB) allows clients to send requests to servers logically grouped together in clusters. Each cluster logically aggregates a set of servers running identical applications with access to the same content (for example, web servers). Clients access clusters through the use of a Virtual IP (VIP) address.

MIB information for the SLB commands is as follows:

Filename AlcatellIND1Slb.mib
Module: ALCATEL-IND1-SLB-MIB

A summary of available commands is listed here:

Global SLB Commands	**ip slb admin-state** **ip slb reset statistics** **show ip slb**
SLB Cluster Commands	**ip slb cluster** **ip slb cluster admin-state** **ip slb cluster ping period** **ip slb cluster ping timeout** **ip slb cluster ping retries** **ip slb cluster probe** **show ip slb clusters** **show ip slb cluster**
SLB Server Commands	**ip slb server ip cluster** **ip slb server ip cluster probe** **show ip slb cluster server** **show ip slb servers**
SLB Probe Commands	**ip slb probe** **ip slb probe timeout** **ip slb probe period** **ip slb probe port** **ip slb probe retries** **ip slb probe username** **ip slb probe password** **ip slb probe url** **ip slb probe status** **ip slb probe send** **ip slb probe expect** **show ip slb probes**

ip slb admin-state

Enables or disables the administrative status for Server Load Balancing (SLB) on a switch.

ip slb admin-state {enable | disable}

Syntax Definitions

enable	Enables the administrative status for Server Load Balancing on a switch.
disable	Disables the administrative status for Server Load Balancing on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Disabling the administrative status for the SLB feature does not delete the SLB configuration from the switch. The next time the feature is enabled, the existing configuration becomes active.

Examples

```
-> ip slb admin-state enable
-> ip slb admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip slb	Displays the status of Server Load Balancing on a switch.
ip slb cluster	Configures a Server Load Balancing cluster on a switch.
ip slb server ip cluster	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

MIB Objects

```
slbFeatureGroup
   slbAdminStatus
```

ip slb reset statistics

Resets SLB statistics for all clusters configured on the switch.

ip slb reset statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Note that the **qos apply** command resets both QoS statistics *and* SLB cluster statistics. The **ip slb reset statistics** command only resets SLB statistics.

Examples

```
-> ip slb reset statistics
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.

MIB Objects

```
slbFeatureGroup
   slbResetStatistics
```

ip slb cluster

Configures a Server Load Balancing (SLB) cluster on a switch.

ip slb cluster *name* **{vip** *ip_address* **| condition** *string***} [l3 | l2]**

no ip slb cluster *name*

Syntax Definitions

name	The name of the Server Load Balancing (SLB) cluster. The name can consist a maximum of 23 characters. Names with spaces must be enclosed within quotation marks (for example, “mail server”).
ip_address	The Virtual IP (VIP) address for the Server Load Balancing cluster. This IP address must be in dotted decimal format.
string	The name of an existing QoS policy condition that identifies the Server Load Balancing cluster.
l3	Specifies Layer 3 Server Load Balancing mode. The source and destination MAC and TTL of each packet is modified before the packet is bridged or routed to the server.
l2	Specifies Layer 2 Server Load Balancing mode. Packets are not modified before they are bridged to the server. This parameter is only available when using the **condition** parameter.

Defaults

parameter	default
l3 | l2	**l3**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a Server Load Balancing cluster.
- Once a cluster is created, the Virtual IP or condition cannot be modified. To modify these values, delete the cluster and re-create the cluster with the different VIP and conditions.
- The VIP address of the SLB cluster *must* be an address that is in the same subnet as the servers.
- Specifying the **l3** parameter when configuring a VIP cluster is not required. VIP clusters only use the Layer-3 mode to route traffic to the servers. Layer-2 mode is not supported with this type of cluster.
- The QoS policy condition must exist before it is assigned to an SLB cluster. Use the **policy condition** command to create the QoS policy condition. See the “QoS Policy Commands” chapter for more information.

- SLB clusters are not active if the Server Load Balancing feature is disabled for the switch. Use the **ip slb admin-state** command to enable this feature.

Note. It is possible to configure clusters and add or remove servers from a cluster even when SLB is disabled for the switch

Examples

```
-> ip slb cluster corporate_servers vip 1.2.3.4
-> ip slb cluster "mail servers" vip 1.2.3.6
-> ip slb cluster cluster_1 condition intranet_cond l2
-> ip slb cluster cluster_2 condition slb_cond l3
-> no ip slb cluster hr_servers
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb admin-state	Enables or disables Server Load Balancing on a switch.
ip slb server ip cluster	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

MIB Objects

```
slbClusterTable
   slbClusterName
   slbClusterVIP
   slbClusterRowStatus
   slbClusterPackets
   slbClusterCondition
   slbClusterType
```

ip slb cluster admin-state

Administratively enables or disables a Server Load Balancing (SLB) cluster on a switch.

ip slb cluster *cluster_name* **admin-state {enable | disable}**

Syntax Definitions

cluster_name	The name of an existing Server Load Balancing cluster.
enable	Administratively enables a Server Load Balancing cluster on a switch.
disable	Administratively disables a Server Load Balancing cluster on a switch.

Defaults

By default, a cluster is administratively enabled when the cluster is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The SLB cluster name specified with this command must already exist in the switch configuration.

Examples

```
-> ip slb cluster hr_servers admin-state enable
-> ip slb cluster "mail servers" admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb cluster	Configures Server Load Balancing clusters.
ip slb server ip cluster	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

MIB Objects

```
slbClusterTable
   slbClusterAdminStatus
```

ip slb cluster ping period

Modifies the number of seconds to check the health of the servers in a Server Load Balancing cluster.

ip slb cluster *cluster_name* **ping period** *seconds*

Syntax Definitions

cluster_name	The name of the Server Load Balancing (SLB) cluster.
seconds	The number of seconds for the ping period. Specifying 0 (zero) disables the ping.

Defaults

parameter	default
seconds	60

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If you do not set the ping period to zero, then the ping period *must* be greater than or equal to the ping timeout value divided by 1000. Use the **ip slb cluster ping timeout** command to modify the ping timeout value.

Examples

```
-> ip slb cluster hr_servers ping period 120
-> ip slb cluster "mail servers" ping period 0
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb cluster ping timeout	Modifies the ping timeout value.
ip slb cluster ping retries	Modifies the number of ping retries.

MIB Objects

```
slbClusterTable
   slbClusterPingPeriod
```

ip slb cluster ping timeout

Configures the ping timeout value for a Server Load Balancing (SLB) cluster before it retries.

ip slb cluster *cluster_name* **ping timeout** *milliseconds*

Syntax Definitions

cluster_name	The name of the Server Load Balancing (SLB) cluster.
milliseconds	The number of milliseconds for the ping timeout. The valid range for the ping timeout value is 0 to 1000 times the ping period. For example, if the ping period is 10 seconds, then maximum value for the ping timeout is 10000.

Defaults

parameter	default
milliseconds	3000

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **ip slb cluster ping period** command to modify the ping period value.

Examples

```
-> ip slb cluster "mail servers" ping timeout 1000
-> ip slb cluster hr_servers ping timeout 6000
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb cluster ping period	Modifies the ping period value.
ip slb cluster ping retries	Modifies the number of ping retries.

MIB Objects

```
slbClusterTable
   slbClusterPingTimeout
```

ip slb cluster ping retries

Configures the number of ping attempts for a Server Load Balancing (SLB) cluster.

ip slb cluster *cluster_name* **ping retries** *count*

Syntax Definitions

cluster_name	The name of the Server Load Balancing (SLB) cluster.
count	The number of ping retries.

Defaults

parameter	default
count	3

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip slb cluster "mail servers" ping retries 5
-> ip slb cluster hr_servers ping retries 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb cluster ping period	Modifies the ping period value.
ip slb cluster ping timeout	Modifies the ping timeout value.

MIB Objects

```
slbClusterTable
   slbClusterPingRetries
```

ip slb cluster probe

Configures a probe for a Server Load Balancing (SLB) cluster.

ip slb cluster *cluster_name* **probe** *probe_name*

Syntax Definitions

cluster_name	The name of the Server Load Balancing (SLB) cluster.
probe_name	The name of the Server Load Balancing (SLB) probe.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

You must create the probe with the **ip slb probe** before you can use this command.

Examples

```
-> ip slb cluster mail_servers probe mail_server_probe
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
ip slb probe	Configures and deletes SLB probes.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb server ip cluster	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

MIB Objects

```
slbClusterTable
   slbClusterProbeName
```

ip slb server ip cluster

Adds a physical server to a Server Load Balancing (SLB) cluster, deletes a physical server from an SLB cluster, or modifies the administrative status of a physical server in an SLB cluster.

ip slb server ip *ip_address* **cluster** *cluster_name* **[admin-state {enable | disable}] [weight** *weight***]**

no ip slb server ip *ip_address* **cluster** *cluster_name*

Syntax Definitions

ip_address	The IP address for the physical server.
cluster_name	The name of an existing Server Load Balancing cluster.
enable	Enables a server.
disable	Disables a server.
weight	Specifies the weight of the server.

Defaults

parameter	default
enable | disable	**enable**
weight	**1**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a physical server from a Server Load Balancing cluster.
- Use the weight parameter to assign the server preference value. Each server or server cluster can be assigned a weight to set their preference value for distribution of incoming network traffic. The weights assigned are relative. For example, if Servers A and B have respective weights of 10 and 20 within a cluster, Server A would get half the traffic of Server B.
- Assigning a weight of 0 (zero) to a server prevents the server from being assigned any new connections. This server is a backup server.
- A higher weight value indicates that the server can accept more network traffic.

Examples

```
-> ip slb server ip 10.255.11.127 cluster corporate_servers
-> ip slb server ip 10.255.11.109 cluster "mail servers" admin-state enable
weight 5
-> no ip slb server ip 10.255.11.105 cluster hr_servers
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb admin-state	Enables or disables Server Load Balancing on a switch.
ip slb cluster	Configures Server Load Balancing clusters.

MIB Objects

```
slbServerTable
   slbServerRowStatus
   slbServerAdminStatus
   slbServerAdminWeight
```

ip slb server ip cluster probe

Configures a probe for a Server Load Balancing (SLB) server.

ip slb server ip *ip_address* **cluster** *cluster_name* **probe** *probe_name*

Syntax Definitions

ip_address	The IP address for the physical server.
cluster_name	The name of the Server Load Balancing (SLB) cluster.
probe_name	The name of the Server Load Balancing (SLB) probe.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

You must create the probe with the **ip slb probe** before you can use this command.

Examples

```
-> ip slb server ip 10.255.11.127 cluster corporate_servers probe p_http
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
ip slb probe	Configures and deletes SLB probes.
ip slb admin-state	Enables or disables Server Load Balancing on a switch.
ip slb cluster	Configures Server Load Balancing clusters.

MIB Objects

```
slbServerTable
   slbServerProbeName
```

ip slb probe

Configures a Server Load Balancing (SLB) probe used to check the health of servers or clusters.

ip slb probe *probe_name* **{ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp}**

no ip slb probe *probe_name*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing (SLB) probe.
ftp	Specifies an FTP probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
imap	Specifies an IMAP probe.
imaps	Specifies an IMAPS probe.
nntp	Specifies an NNTP probe.
ping	Specifies a ping probe.
pop	Specifies a POP probe.
pops	Specifies a POPS probe.
smtp	Specifies an SMTP probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to delete an SLB probe.

Examples

```
-> ip slb probe mail_server_probe smtp
-> no ip slb probe mail_server_probe
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
```

ip slb probe timeout

Configures the amount of time to wait for Server Load Balancing (SLB) probe answers.

ip slb probe *probe_name* **{ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp} timeout** *seconds*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing (SLB) probe.
ftp	Specifies an FTP probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
imap	Specifies an IMAP probe.
imaps	Specifies an IMAPS probe.
nntp	Specifies an NNTP probe.
ping	Specifies a ping probe.
pop	Specifies a POP probe.
pops	Specifies a POPS probe.
smtp	Specifies an SMTP probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.
seconds	Specifies the timeout in seconds.

Defaults

parameter	default
seconds	3000

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip slb probe mail_server smtp timeout 12000
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbeTimeout
```

ip slb probe period

Configures the length of time between each SLB probe to check the health of the servers.

ip slb probe *probe_name* **{ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp} period** *seconds*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing (SLB) probe.
ftp	Specifies an FTP probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
imap	Specifies an IMAP probe.
imaps	Specifies an IMAPS probe.
nntp	Specifies an NNTP probe.
ping	Specifies a ping probe.
pop	Specifies a POP probe.
pops	Specifies a POPS probe.
smtp	Specifies an SMTP probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.
seconds	Specifies the length of time for the SLB probe period.

Defaults

parameter	default
seconds	60

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip slb probe web_server http period 120
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbePeriod
```

ip slb probe port

Configures the TCP/UDP port on which the Server Load Balancing (SLB) probe is sent.

ip slb probe *probe_name* **{ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp} port** *port_number*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing (SLB) probe.
ftp	Specifies an FTP probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
imap	Specifies an IMAP probe.
imaps	Specifies an IMAPS probe.
nntp	Specifies an NNTP probe.
ping	Specifies a ping probe.
pop	Specifies a POP probe.
pops	Specifies a POPS probe.
smtp	Specifies an SMTP probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.
port_number	Specifies the TDP/UDP port number.

Defaults

parameter	default
port_number	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip slb probe mis_server udp port 200
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbePort
```

ip slb probe retries

Configures the number of Server Load Balancing (SLB) probe retries that are performed before deciding that a server is out of service.

ip slb probe *probe_name* **{ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp} retries** *retries*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing (SLB) probe.
ftp	Specifies an FTP probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
imap	Specifies an IMAP probe.
imaps	Specifies an IMAPS probe.
nntp	Specifies an NNTP probe.
ping	Specifies a ping probe.
pop	Specifies a POP probe.
pops	Specifies a POPS probe.
smtp	Specifies an SMTP probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.
retries	Specifies the number of retries.

Defaults

parameter	default
retries	3

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip slb probe mail_server smtp retries 5
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbeRetries
```

ip slb probe username

Configures a user name that is sent to a server as credentials for an HTTP GET operation to verify the health of the server.

ip slb probe *probe_name* **{http | https} username** *user_name*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing (SLB) probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
user_name	Specifies user name.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip slb probe web_server http username subnet1
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbeHttpUsername
```

ip slb probe password

Configures a password that is sent to a server as credentials for an HTTP GET to verify the health of the server.

ip slb probe *probe_name* **{http | https} password** *password*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing (SLB) probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
password	Specifies the password.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The password is encrypted in the configuration file so that it is not readable.

Examples

```
-> ip slb probe web_server http password h1f45xc
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbeHttpPassword
```

ip slb probe url

Configures a URL that is sent to a server for an HTTP GET to verify the health of the server.

ip slb probe *probe_name* **{http | https} url** *url*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing (SLB) probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
url	Specifies the URL of the server.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip slb probe web_server http url pub/index.html
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod
   slbProbeHttpUrl
```

ip slb probe status

Configures the expected status returned from an HTTP GET to verify the health of a server.

ip slb probe *probe_name* **{http | https} status** *status_value*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
status_value	Specifies the expected status returned.

Defaults

parameter	default
status_value	200

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip slb probe web_server http status 404
```

Release History

Release 8.1.1; command introduced.

Related Commands

   slbProbeName
   slbProbeMethod
   slbProbePeriod
   slbProbeHttpStatus
```

ip slb probe send

Configures an ASCII string that is sent to a server to invoke a server response and verify the health of the server.

ip slb probe *probe_name* **{tcp | udp} send** *send_string*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing (SLB) probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.
send_string	Specifies the ASCII string sent to a server to invoke a response.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

NA

Examples

```
-> ip slb probe web_server tcp send test
```

Release History

Release 8.1.1; command introduced.

Related Commands

   slbProbeName
   slbProbeMethod
   slbProbeSend
```

ip slb probe expect

Configures an ASCII string used to compare a response from a server to verify the health of the server.

ip slb probe *probe_name* **{http | https | tcp | udp} expect** *expect_string*

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing (SLB) probe.
http	Specifies an HTTP probe.
https	Specifies an HTTPS probe.
tcp	Specifies a TCP probe.
udp	Specifies a UDP probe.
expect_string	Specifies the ASCII string used to compare a response from a server.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip slb probe web_server http expect test
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip slb probe	Configures and deletes SLB probes.
show ip slb probes	Displays the configuration of SLB probes.

MIB Objects

```
slbProbeTable
   slbProbeName
   slbProbeMethod

```

show ip slb

Displays the status of Server Load Balancing on a switch.

show ip slb

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip slb

Admin status                    : Enabled,
Operational status              : In Service,
Number of clusters              = 3
```

Output fields are described here:

output definitions

Admin status	The current administrative status of Server Load Balancing (SLB) on this switch (**Enabled** or **Disabled**).
Operational status	The current operational status of Server Load Balancing (SLB) on this switch, which is either **In service** (at least one SLB cluster is in service) or **Out of service** (all SLB clusters are out of service).
Number of clusters	The total number of Server Load Balancing (SLB) clusters on this switch.

Release History

Release 8.1.1; command introduced.

Related Commands

show ip slb servers	Displays the status of all physical servers belonging to Server Load Balancing clusters on a switch.
show ip slb clusters	Displays the status and configuration of all Server Load Balancing clusters on a switch.
show ip slb cluster	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
show ip slb cluster server	Displays detailed status and configuration information for a single physical server in a Server Load Balancing cluster.

MIB Objects

```
slbFeature
   slbAdminStatus
   slbOperStatus
   slbClustersCount
```

show ip slb clusters

Displays the status and basic configuration for all Server Load Balancing (SLB) clusters on a switch. This command also displays traffic statistics for QoS policy condition clusters.

show ip slb clusters [statistics]

Syntax Definitions

statistics	Displays SLB statistics for QoS policy condition clusters.

Defaults

By default, the status and basic configuration for all clusters is displayed; statistics are not shown.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **statistics** parameter to display the total number of packets that were passed to clusters because they met the QoS condition criteria configured for that cluster. The polling interval used to obtain such statistics is every 15 minutes. See the second example below.

Examples

```
-> show ip slb clusters
                                Admin    Operational         #     %
Cluster Name     VIP/COND       Status   Status              Srv   Avail
-----------------+--------------+--------+-------------------+-----+---------
WorldWideWeb     128.241.130.204  Enabled  In Service          3     95
Intranet         128.241.130.205  Enabled  In Service          2     100
FileTransfer     128.241.130.206  Enabled  Out of Service      2     50
```

Output fields are described here:

output definitions

Cluster Name	The name of the SLB cluster.
VIP/COND	The virtual IP (VIP) address or the policy condition name for the SLB cluster.
Admin Status	The administrative status of the SLB cluster (**Enabled** or **Disabled**).
Operational Status	The operational status of the SLB cluster; **In Service** (at least one physical server is operational in the cluster) or **Out of Service**.
# Srv	The total number of physical servers that belong to the SLB cluster.
% Avail	The percentage of time that the physical server has been available for processing client requests. In other words, the actual ratio of up time (**In Service** plus **Retrying**) versus down time (**No Answer** plus **Link Down**). Please note that the **Disabled** and the initial **Discovery** states are not counted as down time.

```
-> show ip slb clusters statistics

                         Admin    Operational
Cluster Name             Status   Status               Count
-----------------------+--------+-------------------+--------
Cluster1                Enabled  In Service           4 Servers
Cluster2                Enabled  In Service           4 Servers

Dst IP 101.113.113.1/255.255.255.255             4503911
Src IP 202.202.1.0/255.255.255.0                 6527831
      Src Port 2/49
```

output definitions

Cluster Name	The name of the SLB cluster. This field also contains the administrative and operational status for the cluster and either the VIP address or QoS policy condition value that identifies the cluster.
Admin Status	The administrative state of this physical server (**Enabled** or **Disabled)**.
Operational Status	The operational state of this server. The possible states are described as follows: • **Disabled** (this server is administratively disabled). • **No Answer** (this server has not responded to ping requests). • **Link Down** (there is a bad connection to this server). • **In Service** (this server is used for SLB cluster client connections). • **Discovery** (the SLB cluster is pinging this physical server). • **Retrying** (the SLB cluster is making another attempt to bring up this server).
Count	The total number of physical servers that belong to the cluster, and the total number of packets serviced by the cluster.
Dst	The destination Virtual IP address assigned to the cluster.
Src	Source IP address assigned to the cluster.
Src Port	Source slot and port number of the SLB cluster.

Release History

Release 8.1.1; command introduced.

Related Commands

ip slb reset statistics	Resets SLB statistics for all clusters.
show ip slb cluster	Displays detailed status and configuration information for a single SLB cluster.
show ip slb servers	Displays the status of all physical servers belonging to each SLB cluster on a switch.
show ip slb cluster server	Displays detailed status and configuration information for a single physical server in an SLB cluster.

MIB Objects

```
slbClusterTable
   slbClusterName
   slbClusterVIP

   slbStatsCounter
slbStatsQualTable
   slbStatsQualType
   slbStatsQualData
```

show ip slb cluster

Displays detailed statistics and configuration information and operational status for a single Server Load Balancing (SLB) cluster. This command also displays traffic statistics for single QoS policy condition cluster.

show ip slb cluster *name* **[statistics]**

Syntax Definitions

name	Specifies the name of the SLB cluster.
statistics	Displays SLB statistics for the specified cluster.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **statistics** parameter to display the total number of packets that were passed to the cluster because they met the QoS condition criteria configured for that cluster. The polling interval used to obtain such statistics is every 15 minutes. See the second example below:

Examples

```
-> show ip slb cluster Intranet

Cluster Intranet
  VIP                           : 128.241.130.204,
  Type                          : L3
  Admin status                  : Enabled,
  Operational status            : In Service,
  Ping period (seconds)         = 60,
  Ping timeout (milliseconds)   = 3000,
  Ping retries                  = 3,
  Probe                         = None,
  Number of packets             = 25346,
  Number of servers             = 3
    Server 128.241.130.107
      Admin status = Enabled, Operational status = In Service,
      Weight = 4, Availability (%) =   0
    Server 128.241.130.117
      Admin status = Enabled, Operational status = Discovery,
      Weight = 6, Availability (%) =   0
    Server 128.241.130.127
      Admin status = Enabled, Operational status = Discovery,
      Weight = 1, Availability (%) =   0
```

output definitions

Cluster	The name of this Server Load Balancing (SLB) cluster.
VIP	The virtual IP (VIP) address for this Server Load Balancing (SLB) cluster.
Type	The classifier for the hypothetical packet, which can be **L2** or **L3**.
Admin status	The current administrative status of this Server Load Balancing (SLB) cluster (**Enabled** or **Disabled**).
Operational status	The current operational status of this Server Load Balancing (SLB) cluster, which is **In Service** (at least one physical server is operational in the cluster) or **Out of Service**.
Ping period (seconds)	The ping period (in seconds) used by this Server Load Balancing (SLB) cluster to check the health of physical servers.
Ping timeout (milliseconds)	The timeout (in milliseconds) used by this Server Load Balancing (SLB) cluster to wait for ping answers from physical servers.
Ping retries	The number of ping retries that this Server Load Balancing (SLB) cluster executes before switching the status to **No answer**.
Probe	The probe configured for this cluster.
Number of packets	The number of packets balanced for this Server Load Balancing (SLB) cluster.
Number of servers	The total number of physical servers that belong to this Server Load Balancing (SLB) cluster.
Server	The IP address for this physical server.
Admin Status	The administrative state of this physical server (**Enabled** or **Disabled)**.
Operational Status	The operational state of this server. The possible states are described as follows: • **Disabled** (this server is administratively disabled). • **No Answer** (this server has not responded to ping requests). • **Link Down** (there is a bad connection to this server). • **In Service** (this server is used for SLB cluster client connections). • **Discovery** (the SLB cluster is pinging this physical server). • **Retrying** (the SLB cluster is making another attempt to bring up this server).
Availability (%)	The percentage of time that this physical server has been available for processing client requests. In other words, the actual ratio of up time (**In Service** plus **Retrying**) versus down time (**No Answer** plus **Link Down**). Please note that the **Disabled** and the initial **Discovery** states are not counted as down time.

show ip slb cluster server

Displays detailed statistics and configuration information for a single physical server in a Server Load Balancing (SLB) cluster.

show ip slb cluster *name* **server** *ip_address*

Syntax Definitions

name	Specifies the name of the Server Load Balancing (SLB) cluster.
ip_address	Specifies the IP address for the physical server.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Specifying a value for the *name* and *ip_address* parameters is required.

Examples

```
-> show ip slb cluster Intranet server 128.220.40.4
Cluster cl1
  VIP 128.220.40.205
    Server 128.220.40.4
      Admin status                              : Enabled,
      Oper status                               : In Service,
      Probe                                     = phttp,
      Availability time (%)                     = 95,
      Ping failures                             = 0,
      Last ping round trip time (milliseconds) = 20,
      Probe status                              = ,
```

Output fields are described here:

output definitions

Cluster	The name of the Server Load Balancing (SLB) cluster.
VIP	The virtual IP (VIP) address for this Server Load Balancing (SLB) cluster.
Server	The IP address for this physical server.
Admin status	The current administrative status of this physical server (**Enabled** or **Disabled**).

output definitions (continued)

Oper status	The operational state of this server. The possible states are described as follows: • **Disabled** (this server is administratively disabled). • **No Answer** (this server has not responded to ping requests). • **Link Down** (there is a bad connection to this server). • **In Service** (this server is used for SLB cluster client connections). • **Discovery** (the SLB cluster is pinging this physical server). • **Retrying** (the SLB cluster is making another attempt to bring up this server).
Probe	The name of the probe configured for this server.
Availability time (%)	The percentage of time that this physical server has been available for processing client requests. In other words, the actual ratio of up time (**In Service** plus **Retrying**) versus down time (**No Answer** plus **Link Down**). Please note that the **Disabled** and the initial **Discovery** states are not counted as down time.
Ping failures	The total number of pings that have failed on this physical server.
Last ping round trip time (milliseconds)	The total amount of time (in milliseconds) measured for the last valid ping to this physical server to make a round trip.
Probe status	The status of the probe configured for this server.

   slbServerFlows
```

show ip slb probes

Displays the configuration of Server Load Balancing (SLB) probes.

show ip slb probes [*probe_name***]**

Syntax Definitions

probe_name	Specifies the name of the Server Load Balancing (SLB) probe.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If you do not specify the name of an SLB probe then all SLB probes are displayed.

Examples

No probe name is specified:

```
-> show ip slb probes

Probe Name              Period  Retries Timeout Method
------------------------+-------+-------+--------+------
web_server                60000       3   12000   HTTP
mail_server               60000       3    3000   SMTP
mis_servers             3600000       5   24000   Ping
```

Output fields are described here:

output definitions

Probe Name	The user-specified name of the probe.
Period	The period (in seconds) to check the health of servers.
Retries	The number of probe retries before deciding that a server is out of service.
Timeout	The timeout (in seconds) used to wait for probe answers.
Method	The type of probe.

The name of a probe that is not an HTTP/HTTPS probe is specified:

```
-> show ip slb probes mail_server

Probe mail_server
  Type                          = SMTP,
  Period (seconds)              = 60,
  Timeout (milliseconds)        = 3000,
  Retries                       = 3,
  Port                          = 0,
```

The name of an HTTP/HTTPS probe is specified:

```
-> show ip slb probes phttp

Probe phttp
  Type                          = HTTP,
  Period (seconds)              = 60,
  Timeout (milliseconds)        = 3000,
  Retries                       = 3,
  Port                          = 0,
  Username                      = ,
  Password                      = ,
  Expect                        = ,
  Status                        = 200,
  URL                           = /,
```

Output fields are described here:

output definitions

Probe	The user-specified name of the probe.
Type	The type of probe.
Period	The period (in seconds) to check the health of servers.
Timeout	The timeout (in seconds) used to wait for probe answers.
Retries	The number of probe retries before deciding that a server is out of service.
Port	The TCP/UDP port on which the probe is sent.
Username	The configured user name sent to a server as credentials for an HTTP GET operation for the probe.
Password	The configured password for the probe.
Expect	The configured ASCII string used to compare a response from a server to verify the health of the server.
Status	The expected status returned from an HTTP GET to verify the health of a server.
URL	The configured URL sent to a server for an HTTP GET to verify the health of the server.

Release History

Release 8.1.1; command introduced.

Related Commands

28 IP Multicast Switching Commands

IP Multicast Switching (IPMS) is a one-to-many communication technique employed by emerging applications such as video distribution, news feeds, conferencing, netcasting, and resource discovery (OSPF, RIP2, and BOOTP). Unlike unicast, which sends one packet per destination, multicast sends one packet to all devices in any subnetwork that has at least one device requesting the multicast traffic.

Alcatel-Lucent's IPMS software is compatible with the following RFCs:

RFC 1112 — Host Extensions for IP Multicasting
RFC 2236 — Internet Group Management Protocol, Version 2
RFC 2933 — Internet Group Management Protocol MIB
RFC 3376 — Internet Group Management Protocol, Version 3

Alcatel-Lucent's IPv6MS software is compatible with the following RFCs:

RFC 2710 — Multicast Listener Discovery for IPv6
RFC 3019 — IPv6 MIB for Multicast Listener Discovery Protocol
RFC 3810 — Multicast Listener Discovery Version 2 for IPv6

MIB information for the IPMS commands is as follows:

Filename: AlcatelIND1Igmp.mib
Module: ALCATEL-IGMP-IND1-MIB

MIB information for the IPv6MS commands is as follows:

Filename: AlcatelIND1Mld.mib
Module: ALCATEL-MLD-IND1-MIB

The following table summarizes the available IP and IPv6 multicast commands:

ip multicast admin-state
ip multicast querier-forwarding
ip multicast flood-unknown
ip multicast version
ip multicast max-group
ip multicast vlan max-group
ip multicast port max-group

ip multicast admin-state

Enables or disables IP Multicast Switching and Routing on the specified VLAN, or on the system if no VLAN is specified.

ip multicast [vlan *vid***] admin-state [{enable | disable}]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
enable	Enable IP Multicast Switching and Routing.
disable	Disable IP Multicast Switching and Routing.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If an IP Multicast Routing protocol is already running on the system, the **ip multicast admin-state** command will override the existing configuration and always enable IP Multicast Switching and Routing.
- If the IP Multicast Switching and Routing is already enabled on the system, then the VLAN configuration will override the system's configuration.
- You can also restore the IP Multicast Switching and Routing to its default (i.e., disabled) status on the system if no VLAN is specified, by using only **ip multicast admin-state**.
- You can also restore the IP Multicast Switching and Routing to its default (i.e., disabled) status on the specified VLAN, by using only **ip multicast vlan** *vid* **admin-state**.

Examples

```
-> ip multicast admin-state enable
-> ip multicast admin-state disable
-> ip multicast vlan 2 admin-state enable
-> ip multicast vlan 2 admin-state disable
-> ip multicast vlan 2 admin-state
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 multicast initial-packet-buffer min-delay	Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaIgmp
   alaIgmpStatus
alaIgmpVlan
   alaIgmpVlanStatus
```

ip multicast querier-forwarding

Enables or disables IGMP querier forwarding on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vid***] querier-forwarding [{enable | disable}]**

no ip multicast [vlan *vid***] querier-forwarding**

Syntax Definitions

vid	The VLAN on which configuration is applied.
enable	Enable IGMP querier forwarding.
disable	Disable IGMP querier forwarding.

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an IGMP querier forwarding entry on the specified VLAN or on the system and return to its default behavior.
- If the IGMP querier forwarding is already enabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP querier forwarding refers to promoting detected IGMP queriers to receive all IP multicast data traffic.

Examples

```
-> ip multicast querier-forwarding enable
-> ip multicast querier-forwarding disable
-> ip multicast querier-forwarding
-> ip multicast vlan 2 querier-forwarding enable
-> ip multicast vlan 2 querier-forwarding disable
-> ip multicast vlan 2 querier-forwarding
-> no ip multicast vlan 2 querier-forwarding
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 multicast initial-packet-buffer min-delay	Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaIgmp
   alaIgmpQuerierForwarding
alaIgmpVlan
   alaIgmpVlanQuerierForwarding
```

ip multicast flood-unknown

Enables or disables the flooding of new multicast packets until the multicast group membership table is updated.

ip multicast flood-unknown {enable | disable}

Syntax Definitions

enable	Enable the flooding of multicast packets until membership table is updated.
disable	Disable the flooding of multicast packets.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When flood-unknown and IP multicast switching are enabled, multicast packets are flooded on the VLAN until the multicast group membership table is updated. They are then forwarded based on the multicast group membership table.
- When flood-unknown is enabled and IP multicast switching is disabled, all multicast traffic will be flooded on the VLAN.
- When flood-unknown is disabled and IP multicast switching is enabled, multicast packets are not flooded on the VLAN, but, will be forwarded once the multicast group membership table is updated.
- If IP multicast switching and flood-unknown are disabled, all multicast packets are flooded on the VLAN.

Examples

```
-> ip multicast flood-unknown enable
-> ip multicast flood-unknown disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip multicast admin-state	Enables or disables IP Multicast Switching and Routing on the specified VLAN, or on the system if no VLAN is specified.
show ip multicast	Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaIgmp
   alaIgmpStatus
alaIgmpVlan
   alaIgmpVlanStatus
```

ip multicast version

Sets the default version of the IGMP protocol on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vid***] version [***version***]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
version	Default IGMP protocol version to run. Valid range is 1 to 3.

Defaults

parameter	default
version	2

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the default IGMP protocol version on the system and/or the specified VLANs.
- If the default IGMP protocol version is already configured on the system, then the VLAN configuration will override the system's configuration.
- Due to protocol inter-operation requirements, this command specifies only a default version of the IGMP protocol to run.
- To restore the IGMP multicast version to the default (i.e., 2) version on the system if no VLAN is specified, use **ip multicast version** followed by the value 0 (e.g., ip multicast version 0) or use only **ip multicast version** (e.g., ip multicast version).
- To restore the IGMP multicast version to the default (i.e., 2) version on the specified VLAN, use **ip multicast vlan** *vid* **version**, followed by the value 0 (e.g., ip multicast vlan 2 version 0) or use only **ip multicast vlan** *vid* **version** (e.g., ip multicast vlan 2 version).

Examples

```
-> ip multicast version 3
-> ip multicast version 0
-> ip multicast version
-> ip multicast vlan 2 version 3
-> ip multicast vlan 2 version 0
-> ip multicast vlan 2 version
```

Release History

Release 8.1.1; command introduced.

alaIgmpVlan
   alaIgmpVlanVersion
```

ip multicast max-group

Configures the global maximum group limit that can be learned per port/VLAN instance.The limit is applied to each port/VLAN instance and an action is taken when it exceeds the limit.

ip multicast max-group [*num***] [action {none | drop | replace}]**

Syntax Definitions

num	Specifies the maximum IGMP group count. Valid range is 0 to 4294967295.
none	Disables the maximum group limit configuration
drop	Drops the incoming membership request.
replace	Replaces an existing membership with the incoming membership request.

Defaults

By default, the max-group limit is set to zero.

parameter	defaults
action	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance.
- The configuration is allowed even when the ip multicast status is disabled.
- If the num and action parameters are not specified, then the limit is removed.
- The max-group configuration on a specific VLAN or port will override the global configuration.
- IGMP zapping must be enabled when the max-group limit is enabled and the action is dropped.

Examples

```
-> ip multicast max-group 10 action drop
-> ip multicast max-group 20 action replace
-> ip multicast max-group
```

Release History

Release 8.1.1; command introduced.

Related Commands

MIB Objects

```
alaIgmpMaxGroupLimit
   alaIgmpMaxGroupExceedAction
```

ip multicast vlan max-group

Configures the maximum group limit learned per port on a VLAN. The limit is applied to each port that is a member of the given VLAN.

ip multicast vlan *vid* **max-group [***num***] [action {none | drop | replace}]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
num	The maximum IGMP group count. Valid range is 0 to 4294967295.
none	Disables the maximum group limit configuration.
drop	Drops the incoming membership request.
replace	Replaces an existing membership with the incoming membership request.

Defaults

By default, the max-group limit is set to zero.

parameter	defaults
action	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance
- The configuration is allowed even when the ip multicast status is disabled.
- If the *num* and **action** parameters are not specified, then the limit is removed.
- The max group configuration on a VLAN will override the global configuration.
- IGMP zapping must be enabled when the max-group limit is enabled and the action is dropped.

Examples

```
-> ip multicast vlan 10 max-group 10 action drop
-> ip multicast vlan 10 max-group
```

Release History

Release 8.1.1; command introduced.

Related Commands

   alaIgmpVlanMaxGroupExceedAction
```

ip multicast port max-group

Configures the maximum group limit learned per port. The limit is applicable on the given port for all VLAN instances of the port.

ip multicast port *chassis/slot/port* **max-group [***num***] [action {none | drop | replace}]**

Syntax Definitions

chassis/slot/port	The port number.
num	The maximum IGMP group count. Valid range is 0 to 4294967295.
none	Disables the maximum group limit configuration.
drop	Drops the incoming membership request.
replace	Replaces an existing membership with the incoming membership request.

Defaults

By default, the max-group limit is set to zero.

parameter	defaults
action	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance
- The configuration is allowed even when the ip multicast status is disabled.
- If the *num* and **action** parameters are not specified, then the limit is removed.
- The max-group configuration on a port will override the VLAN or global configuration.
- IGMP zapping must be enabled when the max-group limit is enabled and the action is dropped.

Examples

```
-> ip multicast port 1/1/1 max-group 10 action drop
-> ip multicast port 6/1/14 max-group 20 action replace
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 multicast initial-packet-buffer min-delay	Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaIgmpPortTable
   alaIgmpPortMaxGroupLimit
   alaIgmpPortMaxGroupExceedAction
```

ip multicast static-neighbor

Creates a static IGMP neighbor entry on a specified port on a specified VLAN.

ip multicast static-neighbor vlan *vid* **{port** *chassis/slot/port* | **linkagg** *linkagg***}**

no ip multicast static-neighbor vlan *vid* **{port** *chassis/slot/port* | **linkagg** *linkagg***}**

Syntax Definitions

chassis	The chassis identifier.*vid* VLAN to include as a static IGMP neighbor.
slot/port	The slot/port number you want to configure as a static IGMP neighbor.
linkagg	The link aggregate identifier you want to configure as a static IGMP neighbor.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an IGMP static neighbor entry on a specified port on a specified VLAN.
- The **ip multicast static-neighbor** command allows you to create an IGMP static neighbor entry on a specified port on a specified VLAN. This, in turn, enables that network segment to receive all the IGMP traffic.
- You can also create an IGMP static neighbor entry on a link aggregate port by entering **ip multicast static-neighbor vlan** *vid* **linkagg**, followed by the link aggregation group number (e.g., ip multicast static-neighbor vlan 2 linkagg 7).

Examples

```
-> ip multicast static-neighbor vlan 4 port 1/1/1
-> no ip multicast static-neighbor vlan 4 port 1/1/1
-> ip multicast static-neighbor vlan 4 linkagg 7
-> no ip multicast static-neighbor vlan 4 linkagg 7
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip multicast neighbor	Displays the IGMP neighbor table entries of IP Multicast Switching and Routing.

MIB Objects

```
alaIgmpStaticNeighborTable
   alaIgmpStaticNeighborVlan
   alaIgmpStaticNeighborIfIndex
   alaIgmpStaticNeighborRowStatus
```

ip multicast static-querier

Creates a static IGMP querier entry on a specified port on a specified VLAN.

ip multicast static-querier vlan *vid* **{port** *chassis/slot/port* | **linkagg** *linkagg***}**

no ip multicast static-querier vlan *vid* **{port** *chassis/slot/port* | **linkagg** *linkagg***}**

Syntax Definitions

vid	VLAN to include as a static IGMP querier.
chassis	The chassis identifier.
slot/port	The slot/port number you want to configure as a static IGMP querier.
linkagg	The link aggregate id number to configure as a static IGMP querier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an IGMP static querier entry on a specified port on a specified VLAN.
- The **ip multicast static-querier** command allows you to create an IGMP static querier entry on a specified port on a specified VLAN. This, in-turn, enables that network segment to receive all the IGMP traffic.
- You can also create an IGMP static querier entry on a link aggregate port by entering **ip multicast static-querier vlan** *vid* **linkagg**, followed by the link aggregation group number (e.g., ip multicast static-querier vlan 2 linkagg 7).

Examples

```
-> ip multicast static-querier vlan 4 port 1/1/1
-> no ip multicast static-querier vlan 4 port 1/1/1
-> ip multicast static-querier vlan 4 linkagg 7
-> no ip multicast static-querier vlan 4 linkagg 7
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip multicast querier	Displays the IGMP querier table entries of IP Multicast Switching and Routing.

MIB Objects

```
alaIgmpStaticQuerierTable
   alaIgmpStaticQuerierVlan
   alaIgmpStaticQuerierIfIndex
   alaIgmpStaticQuerierRowStatus
```

ip multicast static-group

Creates a static IGMP group entry on a specified port on a specified VLAN.

ip multicast static-group *ip_address* **vlan** *vid* **{port** *chassis/slot/port* | **linkagg** *linkagg***}**

no ip multicast static-group *ip_address* **vlan** *vid* **{port** *chassis/slot/port* | **linkagg** *linkagg***}**

Syntax Definitions

ip_address	The IP address of the multicast group.
vid	VLAN to include as a static IGMP group.
chassis	The chassis identifier.
slot/port	The slot/port number you want to configure as a static IGMP group.
linkagg	The link aggregate identifier you want to configure as a static IGMP group.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an IGMP static group entry on a specified port on a specified VLAN.
- The **ip multicast static-group** command allows you to create an IGMP static group entry on a specified port on a specified VLAN. This, in-turn, enables that network segment to receive IGMP traffic addressed to the specified IP multicast group address.
- You can also create an IGMP static group entry on a link aggregate port by entering **ip multicast static-group** *ip_address* **vlan** *vid* **linkagg**, followed by the link aggregation group number (e.g., ip multicast static-group 225.0.0.1 vlan 2 linkagg 7).

Examples

```
-> ip multicast static-group 229.10.10.10 vlan 4 port 1/1/1
-> no ip multicast static-group 229.10.10.10 vlan 4 port 1/1/1
-> ip multicast static-group 225.11.11.11 vlan 4 linkagg 7
-> no ip multicast static-group 225.11.11.11 vlan 4 linkagg 7
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip multicast group	Displays the IGMP group membership table entries of IP Multicast Switching and Routing for the specified IP multicast group address or all entries if no IP multicast group address is specified.

ip multicast query-interval

Sets the IGMP query interval on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vid***] query-interval [***seconds***]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
seconds	IGMP query interval in seconds. Valid range is 1 to 65535.

Defaults

parameter	default
seconds	125

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP query interval on the system and/or the specified VLANs.
- If the IGMP query interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The IGMP query interval refers to the time period between IGMP query messages.
- To restore the IGMP query interval to its default (i.e., 125 seconds) value on the system if no VLAN is specified, use **ip multicast query-interval** followed by the value 0 (e.g., ip multicast query-interval 0) or use only **ip multicast query-interval** (e.g., ip multicast query-interval).
- To restore the IGMP query interval to its default (i.e., 125 seconds) value on the specified VLAN, use **ip multicast vlan** *vid* **query-interval**, followed by the value 0 (e.g., ip multicast vlan 2 query-interval 0) or use only **ip multicast vlan** *vid* **query-interval** (e.g., ip multicast vlan 2 query-interval).

Examples

```
-> ip multicast query-interval 100
-> ip multicast query-interval 0
-> ip multicast query-interval
-> ip multicast vlan 2 query-interval 100
-> ip multicast vlan 2 query-interval 0
-> ip multicast vlan 2 query-interval
```

Release History

Release 8.1.1; command introduced.

Related Commands

   alaIgmpVlanQueryInterval
```

ip multicast last-member-query-interval

Sets the IGMP last member query interval value on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vid***] last-member-query-interval [***tenths-of-seconds***]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
tenths-of-seconds	IGMP last member query interval in tenths of seconds. Valid range is 1 to 65535.

Defaults

parameter	default
tenths-of-seconds	10

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP last member query interval on the system and/or the specified VLANs.
- If the IGMP last member query interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The IGMP last member query interval refers to the time period to reply to an IGMP query message sent in response to a leave group message.
- To restore the IGMP last member query interval to its default (i.e., 10 tenths-of-seconds) value on the system if no VLAN is specified, use **ip multicast last-member-query-interval** followed by the value 0 (e.g., ip multicast last-member-query-interval 0) or use only **ip multicast last-member-query-interval** (e.g., ip multicast last-member-query-interval).
- To restore the IGMP last member query interval to its default value (10 tenths-of-seconds) on the specified VLAN, use **ip multicast vlan** *vid* **last-member-query interval** followed by the value 0 (e.g., ip multicast vlan 2 last-member-query-interval 0) or use only **ip multicast vlan** *vid* **last-member-query-interval** (e.g., ip multicast vlan 2 last-member-query-interval).

Examples

```
-> ip multicast last-member-query-interval 22
-> ip multicast last-member-query-interval 0
-> ip multicast last-member-query-interval
-> ip multicast vlan 2 last-member-query-interval 22
-> ip multicast vlan 2 last-member-query-interval 0
-> ip multicast vlan 2 last-member-query-interval
```

ip multicast query-response-interval

Sets the IGMP query response interval on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vid***] query-response-interval [***tenths-of-seconds***]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
tenths-of-seconds	IGMP query response interval in tenths of seconds. Valid range is 1 to 65535.

Defaults

parameter	default
tenths-of-seconds	100

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP query response interval on the system and/or the specified VLANs.
- If the IGMP query response interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The query response interval refers to the time period to reply to an IGMP query message.
- To restore the IGMP query response interval to its default (i.e., 100 tenths-of-seconds) value on the system if no VLAN is specified, use **ip multicast query-response-interval** followed by the value 0 (e.g., ip multicast query-response-interval 0) or use only **ip multicast query-response-interval** (e.g., ip multicast query-response-interval).
- To restore the IGMP last member query interval to its default (i.e., 100 tenths-of-seconds) value on the specified VLAN, use **ip multicast vlan** *vid* **query-response-interval** followed by the value 0 (e.g., ip multicast vlan 2 query-response-interval 0) or use only **ip multicast vlan** *vid* **query-response-interval** (e.g., ip multicast vlan 2 query-response-interval).

Examples

```
-> ip multicast query-response-interval 200
-> ip multicast query-response-interval 0
-> ip multicast query-response-interval
-> ip multicast vlan 2 query-response-interval 300
-> ip multicast vlan 2 query-response-interval 0
-> ip multicast vlan 2 query-response-interval
```

ip multicast unsolicited-report-interval

Sets the value of the IGMP unsolicited report interval on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vid***] unsolicited-report-interval [***seconds***]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
seconds	IGMP query response interval in seconds. Valid range is 1 to 65535, where 0 represents the default setting.

Defaults

parameter	default
seconds	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP unsolicited report interval on the system and/or the specified VLANs.
- If the IGMP query response interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The unsolicited report interval refers to the time period to proxy any changed IGMP membership state.
- To restore the IGMP unsolicited report interval to its default (i.e., 1 second) value on the system if no VLAN is specified, use **ip multicast unsolicited-report-interval** followed by the value 0 (e.g., ip multicast unsolicited-report-interval 0) or use only **ip multicast unsolicited-report-interval** (e.g., ip multicast unsolicited-report-interval).
- To restore the IGMP unsolicited report interval to its default (i.e., 1 second) value on the specified VLAN, use **ip multicast vlan** *vid* **unsolicited-report-interval** followed by the value 0 (e.g., ip multicast vlan 2 unsolicited-report-interval 0) or use only **ip multicast vlan** *vid* **unsolicited-report-interval** (e.g., ip multicast vlan 2 unsolicited-report-interval).

Examples

```
-> ip multicast unsolicited-report-interval 200
-> ip multicast unsolicited-report-interval 0
-> ip multicast unsolicited-report-interval
-> ip multicast vlan 2 unsolicited-report-interval 300
-> ip multicast vlan 2 unsolicited-report-interval 0
-> ip multicast vlan 2 unsolicited-report-interval
```

ip multicast router-timeout

Configures the expiry time of IP multicast routers on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vid***] router-timeout [***seconds***]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
seconds	IGMP router timeout in seconds. Valid range is 1 to 65535.

Defaults

parameter	default
seconds	90

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP router timeout on the system and/or the specified VLANs.
- If the IGMP router timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- To restore the IGMP router timeout to its default (i.e., 90 seconds) value on the system if no VLAN is specified, use **ip multicast router-timeout** followed by the value 0 (e.g., ip multicast router-timeout 0) or use only **ip multicast router-timeout** (e.g., ip multicast router-timeout).
- To restore the IGMP router timeout to its default (i.e., 90 seconds) value on the specified VLAN, use **ip multicast vlan** *vid* **router-timeout** followed by the value 0 (e.g., ip multicast vlan 2 router-timeout 0) or use only **ip multicast vlan** *vid* **router-timeout** (e.g., ip multicast vlan 2 router-timeout).

Examples

```
-> ip multicast router-timeout 100
-> ip multicast router-timeout 0
-> ip multicast router-timeout
-> ip multicast vlan 2 router-timeout 100
-> ip multicast vlan 2 router-timeout 0
-> ip multicast vlan 2 router-timeout
```

ip multicast source-timeout

Configures the expiry time of IP multicast sources on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vid***] source-timeout [***seconds***]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
seconds	IGMP source timeout in seconds. Valid range is 1 to 65535.

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP source timeout on the system and/or the specified VLANs.
- If the IGMP source timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- To restore the IGMP source timeout to its default (i.e., 30 seconds) value on the system if no VLAN is specified, use **ip multicast source-timeout** followed by the value 0 (e.g., ip multicast source-timeout 0) or use only **ip multicast source-timeout** (e.g., ip multicast source-timeout).
- To restore the IGMP source timeout to its default (i.e., 30 seconds) value on the specified VLAN, use **ip multicast vlan** *vid* **source-timeout** followed by the value 0 (e.g., ip multicast vlan 2 source-timeout 0) or use only **ip multicast vlan** *vid* **source-timeout** (e.g., ip multicast vlan 2 source-timeout).

Examples

```
-> ip multicast source-timeout 100
-> ip multicast source-timeout 0
-> ip multicast source-timeout
-> ip multicast vlan 2 source-timeout 100
-> ip multicast vlan 2 source-timeout 0
-> ip multicast vlan 2 source-timeout
```

ip multicast querying

Enables or disables IGMP querying on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vid***] querying [{enable | disable}]**

no ip multicast [vlan *vid***] querying**

Syntax Definitions

vid	VLAN on which configuration is applied.
enable	Enable IGMP querying.
disable	Disable IGMP querying.

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an IGMP querying entry on the specified VLAN or on the system and return to its default behavior.
- IP Multicast Switching and Routing must be enabled to enable IGMP querying on the system and/or specified VLANs.
- If the IGMP querying is already enabled/disabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP querying refers to requesting the network's IGMP group membership information by sending out IGMP queries. IGMP querying also involves participating in IGMP querier election.
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ip multicast querying** (e.g., ip multicast querying).
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the specified VLAN, by using only **ip multicast vlan** *vid* **querying** (e.g., ip multicast vlan 2 querying).

Examples

```
-> ip multicast querying enable
-> ip multicast querying disable
-> ip multicast querying
-> ip multicast vlan 2 querying enable
-> ip multicast vlan 2 querying disable
-> ip multicast vlan 2 querying
-> no ip multicast vlan 2 querying
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip multicast robustness

Sets the IGMP robustness variable on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vid***] robustness [***robustness***]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
robustness	IGMP robustness variable. Valid range is 1 to 7.

Defaults

parameter	default
robustness	2

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP robustness variable on the system and/or the specified VLANs.
- If the IGMP robustness variable is already configured on the system, then the VLAN configuration will override the system's configuration.
- Robustness variable allows fine-tuning on the network, where the expected packet loss would be greater.
- To restore the IGMP robustness variable to its default (i.e., 2) value on the system if no VLAN is specified, use **ip multicast robustness** followed by the value 0 (e.g., ip multicast robustness 0) or use only **ip multicast robustness** (e.g., ip multicast robustness).
- To restore the IGMP robustness variable to its default (i.e., 2) value on the specified VLAN, use **ip multicast vlan** *vid* **robustness** followed by the value 0 (e.g., ip multicast vlan 2 robustness 0) or use only **ip multicast vlan** *vid* **robustness** (e.g., ip multicast vlan 2 robustness).

Examples

```
-> ip multicast robustness 3
-> ip multicast robustness 0
-> ip multicast robustness
-> ip multicast vlan 2 robustness 3
-> ip multicast vlan 2 robustness 0
-> ip multicast vlan 2 robustness
```

Release History

Release 8.1.1; command introduced.

alaIgmpVlan
   alaIgmpVlanRobustness
```

ip multicast spoofing

Enables or disables IGMP spoofing on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vid***] spoofing [{enable | disable}]**

no ip multicast [vlan *vid***] spoofing**

Syntax Definitions

vid	VLAN on which to apply the configuration.
enable	Enable IGMP spoofing.
disable	Disable IGMP spoofing.

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an IGMP spoofing entry on the specified VLAN or on the system and return to its default behavior.
- If the IGMP spoofing is already enabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP spoofing refers to replacing a client's MAC and IP address with the system's MAC and IP address when proxying aggregated IGMP group membership information.
- You can also restore the IGMP spoofing to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ip multicast spoofing** (e.g., ip multicast spoofing).
- You can also restore the IGMP spoofing to its default (i.e., disabled) setting on the specified VLAN, by using only **ip multicast vlan** *vid* **spoofing** (e.g., ip multicast vlan 2 spoofing).

Examples

```
-> ip multicast spoofing enable
-> ip multicast spoofing disable
-> ip multicast spoofing
-> ip multicast vlan 2 spoofing enable
-> ip multicast vlan 2 spoofing disable
-> ip multicast vlan 2 spoofing
-> no ip multicast vlan 2 spoofing
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip multicast zapping

Enables or disables IGMP zapping on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vid***] zapping [{enable | disable}]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
enable	Enable IGMP zapping.
disable	Disable IGMP zapping.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the IGMP zapping is already enabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP zapping refers to processing membership, immediate source filter removals and will not wait for the protocol's specified time period. This mode facilitates IP TV applications looking for quick changes between IP multicast groups.
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ip multicast zapping** (e.g., ip multicast zapping).
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the specified VLAN, by using only **ip multicast vlan** *vid* **zapping** (e.g., ip multicast vlan 2 zapping).

Examples

```
-> ip multicast zapping enable
-> ip multicast zapping disable
-> ip multicast zapping
-> ip multicast vlan 2 zapping enable
-> ip multicast vlan 2 zapping disable
-> ip multicast vlan 2 zapping
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip multicast proxying

Enables or disables IGMP proxying on the specified VLAN or on the system if no VLAN is specified.

ip multicast [vlan *vid***] proxying [enable | disable]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
enable	Enable IGMP proxying.
disable	Disable IGMP proxying.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the IGMP proxying is already enabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP proxying refers to processing membership information on behalf of client systems and reporting membership on their behalf.
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ip multicast proxying** (e.g., ip multicast proxying).
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the specified VLAN, by using only **ip multicast vlan** *vid* **proxying** (e.g., ip multicast vlan 2 proxying).

Examples

```
-> ip multicast proxying enable
-> ip multicast proxying disable
-> ip multicast proxying
-> ip multicast vlan 2 proxying enable
-> ip multicast vlan 2 proxying disable
-> ip multicast vlan 2 proxying
```

Release History

Release 8.1.1; command introduced.

   alaIgmpProxying
alaIgmpVlan
   alaIgmpVlanProxying
```

ip multicast helper-address

Specifies the destination IP address of a relay host where IGMP host reports and Leave messages are to be sent.

ip multicast helper-address [*ip-address***]**

Syntax Definitions

ip-address	The IP address of the relay host

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- After the destination IP address is specified, the IPMS reporting feature is enabled.
- To disable the IPMS reporting feature, 0.0.0.0 is used as the IP address. It can also be disabled by omitting the IP address from the command.

Examples

```
-> ip multicast helper-address 10.1.1.198
-> ip multicast helper-address 0.0.0.0
```

Release History

Release 8.1.1; command introduced.

Related Commands

```

ip multicast initial-packet-buffer admin-state

Enables or disables the initial packet buffering feature globally for IPv4 multicast flows on the switch.

ip multicast initial-packet-buffer admin-state {enable | disable}

Syntax Definitions

enable	Enable the initial packet buffering globally on the switch.
disable	Disable the initial packet buffering globally on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You must enable or disable the command to administratively enable or disable the buffering of initial packets.

Examples

```
-> ip multicast initial-packet-buffer admin-state disable
-> ip multicast initial-packet-buffer admin-state enable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show ip multicast initial-packet-buffer	Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the system.

MIB Objects

```
alaIgmp
   alaIgmpInitialPacketBuffer
```

ip multicast initial-packet-buffer max-packet

Configures the maximum number of initial packets buffered per IPv4 multicast flow.

ip multicast initial-packet-buffer max-packet [*num***]**

Syntax Definitions

num	The maximum number of packets allowed to buffer per IPv4 multicast flow. Valid range is 1 to 10.

Defaults

parameter	default
num	4

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip multicast initial-packet-buffer max-packet 4
```

Release History

Release 8.2.1; command introduced.

Related Commands

ip multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch, for IPv4 multicast flows.

MIB Objects

```
alaIgmp
   alaIgmpInitialPacketBufferMaxPacket
```

ip multicast initial-packet-buffer max-flow

Configures the maximum number of IPv4 multicast flows buffered for initial packet.

ip multicast initial-packet-buffer max-flow [*num***]**

Syntax Definitions

num	The maximum number of IPv4 multicast flows allowed for initial packet buffering. Valid range is 1 to 32.

Defaults

parameter	default
num	32

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

NA

Examples

```
-> ip multicast initial-packet-buffer max-flow 32
```

Release History

Release 8.2.1; command introduced.

Related Commands

ip multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch, for IPv4 multicast flows.

MIB Objects

```
alaIgmp
   alaIgmpInitialPacketBufferMaxFlow

ip multicast initial-packet-buffer timeout

Configures the timeout value for the initial buffered IPv4 multicast packets.

ip multicast initial-packet-buffer timeout [*seconds***]**

Syntax Definitions

seconds	The timeout value for the initial buffered IPv4 multicast packets in seconds. Valid range is 1 to 10.

Defaults

parameter	default
seconds	10

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the buffered multicast packet is not sent out before the timeout, then the buffered packets will be removed from IPMS system.

Examples

```
-> ip multicast initial-packet-buffer timeout 2
```

Release History

Release 8.2.1; command introduced.

Related Commands

ip multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch, for IPv4 multicast flows.

MIB Objects

```
alaIgmp
   alaIgmpInitialPacketBufferTimeout
```

ip multicast initial-packet-buffer min-delay

Configures the minimum delay to program the multicast replication index for IPv4 multicast flows buffered for initial packet.

ip multicast initial-packet-buffer min-delay [*milliseconds***]**

Syntax Definitions

milliseconds	The minimum delay value to program the multicast replication index for IPv4 multicast flows buffered for initial packet. Valid range is 0 to 1000.

Defaults

parameter	default
milliseconds	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Note. This command configures a timer to delay the programming of multicast replication index in hardware which might increase the number of multicast packets lost during the learning phase.

Examples

```
-> ip multicast initial-packet-buffer min-delay 200
```

Release History

Release 8.2.1; command introduced.

Related Commands

ip multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch, for IPv4 multicast flows.

MIB Objects

ipv6 multicast admin-state

Enables or disables IPv6 Multicast Switching and Routing on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vid***] admin-state [{enable | disable}]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
enable	Enable IPv6 Multicast Switching and Routing.
disable	Disable IPv6 Multicast Switching and Routing.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If an IPv6 multicast routing protocol is already running on the system, this command will override this configuration and always enable IPv6 Multicast Switching and Routing.
- If the IPv6 Multicast Switching and Routing is already enabled on the system, then the VLAN configuration will override the system's configuration.
- You can also restore the MLD querying to its default (i.e., disabled) status on the system if no VLAN is specified by using this command.
- You can also restore the MLD querying to its default (i.e., disabled) status on the specified VLAN, by using this command.

Examples

```
-> ipv6 multicast admin-state enable
-> ipv6 multicast admin-state disable
-> ipv6 multicast admin-state
-> ipv6 multicast vlan 2 admin-state enable
-> ipv6 multicast vlan 2 admin-state disable
-> ipv6 multicast vlan 2 admin-state
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 multicast	Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaMld
   alaMldStatus
alaMldVlan
   alaMldVlanStatus
```

ipv6 multicast querier-forwarding

Enables or disables MLD querier forwarding on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vid***] querier-forwarding [{enable | disable}]**

no ipv6 multicast [vlan *vid***] querier-forwarding**

Syntax Definitions

vid	The VLAN on which configuration is applied.
enable	Enable MLD querier forwarding.
disable	Disable MLD querier forwarding.

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an MLD querier forwarding entry on the specified VLAN or on the system and return to its default behavior.
- If the MLD querier forwarding is already enabled on the system, then the VLAN configuration will override the system's configuration.
- MLD querier forwarding refers to promoting detected MLD queriers to receive all IP multicast data traffic.

Examples

```
-> ipv6 multicast querier-forwarding enable
-> ipv6 multicast querier-forwarding disable
-> ipv6 multicast querier-forwarding
-> ipv6 multicast vlan 2 querier-forwarding enable
-> ipv6 multicast vlan 2 querier-forwarding disable
-> ipv6 multicast vlan 2 querier-forwarding
-> no ipv6 multicast vlan 2 querier-forwarding
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 multicast	Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaMld
   alaMldQuerierForwarding
alaMldVlan
   alaMldVlanQuerierForwarding
```

ipv6 multicast flood-unknown

Enables or disables the flooding of new IPv6 multicast packets until the multicast group membership table is updated.

ipv6 multicast flood-unknown {enable | disable}

Syntax Definitions

enable	Enable the flooding of multicast packets until membership table is updated.
disable	Disable the flooding of multicast packets.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When flood-unknown and IP multicast switching are enabled, multicast packets are flooded on the VLAN until the multicast group membership table is updated. They are then forwarded based on the multicast group membership table.
- When flood-unknown is enabled and IP multicast switching is disabled, all multicast traffic will be flooded on the VLAN.
- When flood-unknown is disabled and IP multicast switching is enabled, multicast packets are not flooded on the VLAN but will be forwarded once the multicast group membership table is updated.
- If IP multicast switching and flood-unknown are disabled, all multicast packets are flooded on the VLAN.

Examples

```
-> ipv6 multicast flood-unknown enable
-> ipv6 multicast flood-unknown disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ipv6 multicast admin-state	Enables or disables IPv6 Multicast Switching and Routing on the specified VLAN or on the system if no VLAN is specified.
show ipv6 multicast	Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaMld
   alaMldFloodUnknown
```

ipv6 multicast version

Sets the default version of the MLD protocol on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vid***] version [***version***]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
version	Default MLD protocol version to run. Valid range is 1 to 2.

Defaults

parameter	default
version	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the default MLD protocol version on the system and/or the specified VLANs.
- If the default MLD protocol version is already configured on the system, then the VLAN configuration will override the system's configuration.
- Due to protocol inter-operation requirements, this command specifies only a default version of the MLD protocol to run.
- To restore the MLD multicast version to the default (i.e., 1) version on the system if no VLAN is specified, use **ipv6 multicast version** followed by the value 0 (e.g., ipv6 multicast version 0) or use only **ipv6 multicast version** (e.g., ipv6 multicast version).
- To restore the MLD multicast version to the default (i.e., 1) version on the specified VLAN, use **ipv6 multicast vlan** *vid* **version** followed by the value 0 (e.g., ipv6 multicast vlan 2 version 0) or use only **ipv6 multicast vlan** *vid* **version** (e.g., ipv6 multicast vlan 2 version).

Examples

```
-> ipv6 multicast version 2
-> ipv6 multicast version 0
-> ipv6 multicast version
-> ipv6 multicast vlan 2 version 2
-> ipv6 multicast vlan 2 version 0
-> ipv6 multicast vlan 2 version
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 multicast	Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaMld
   alaMldVersion
alaMldVlan
   alaMldVlanVersion
```

ipv6 multicast max-group

Configures the global maximum group limit that can be learned per port/VLAN instance.The limit is applied to each port/VLAN instance and an action is taken when it exceeds the limit.

ipv6 multicast max-group [*num***] [action {none | drop | replace}]**

Syntax Definitions

num	Specifies the maximum MLD group count. Valid range is 0 to 4294967295.
none	Disables the maximum group limit configuration
drop	Drops the incoming membership request.
replace	Replaces an existing membership with the incoming membership request.

Defaults

By default, the max-group limit is set to zero.

parameter	defaults
action	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance.
- The configuration is allowed even when the ip multicast status is disabled.
- If the *num* and **action** parameters are not specified, then the limit is removed.
- The maximum group configuration on a specific VLAN or port will override the global configuration.
- MLD zapping must be enabled when the max-group limit is enabled and the action is dropped.

Examples

```
-> ipv6 multicast max-group 10 action drop
-> ipv6 multicast max-group 20 action replace
-> ipv6 multicast max-group
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 multicast	Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```
alaIgmpMaxGroupLimit
   alaIgmpMaxGroupExceedAction
```

ipv6 multicast vlan max-group

Configures the maximum group limit learned per port on a VLAN. The limit is applied to each port that is a member of the given VLAN.

ipv6 multicast vlan *vid* **max-group [***num***] [action {none | drop | replace}]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
num	The maximum MLD group count. Valid range is 0 to 4294967295.
none	Disables the maximum group limit configuration.
drop	Drops the incoming membership request.
replace	Replaces an existing membership with the incoming membership request.

Defaults

By default, the max-group limit is set to zero.

parameter	defaults
Action	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance.
- The configuration is allowed even when the ip multicast status is disabled.
- If the num and action parameters are not specified, then the limit is removed.
- The max-group configuration on a VLAN will override the global configuration.
- MLD zapping must be enabled when the max-group limit is enabled and the action is dropped.

Examples

```
-> ipv6 multicast vlan 10 max-group 10 action drop
-> ipv6 multicast vlan 10 max-group 20 action replace
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 multicast	Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

alaIgmpVlanTable
   alaIgmpVlanMaxGroupLimit
   alaIgmpVlanMaxGroupExceedAction
```

ipv6 multicast port max-group

Configures the maximum group limit learned per port. The limit is applicable on the given port for all VLAN instances of the port.

ipv6 multicast port *chassis/slot/port* **max-group [***num***] [action {none | drop | replace}]**

Syntax Definitions

chassis/slot/port	The port identifier.
num	The maximum MLD group count. Valid range is 0 to 4294967295.
none	Disables the maximum group limit configuration.
drop	Drops the incoming membership request.
replace	Replaces an existing membership with the incoming membership request.

Defaults

By default, the max-group limit is set to zero.

parameter	defaults
action	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance.
- The configuration is allowed even when the ip multicast status is disabled.
- If the *num* and **action** parameters are not specified, then the limit is removed.
- The maximum group configuration on a port will override the VLAN or global configuration.
- MLD zapping must be enabled when the maximum group limit is enabled and the action is dropped.

Examples

```
-> ipv6 multicast port 1/1/1 max-group 10 action drop
-> ipv6 multicast port 1/1/1 max-group action replace
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 multicast	Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

MIB Objects

```

```

ipv6 multicast static-neighbor

Creates a static MLD neighbor entry on a specified port on a specified VLAN.

ipv6 multicast static-neighbor vlan *vid* **{port** *chassis/slot/port* | **linkagg** *linkagg***}**

no ipv6 multicast static-neighbor vlan *vid* **{port** *chassis/slot/port* | **linkagg** *linkagg***}**

Syntax Definitions

vid	VLAN to include as a static MLD neighbor.
chassis	The chassis identifier.
slot/port	The slot/port number you want to configure as a static MLD neighbor.
linkagg	The link aggregate you want to configure as a static MLD neighbor.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an MLD static neighbor entry on a specified port on a specified VLAN.
- The **ipv6 multicast static-neighbor** command allows you to create an MLD static neighbor entry on a specified port on a specified VLAN. This, in turn, enables that network segment to receive all MLD traffic.
- You can also create an MLD static neighbor entry on a link aggregate port by entering **ipv6 multicast static-neighbor vlan** *vid* **linkagg**, followed by the link aggregation group number (e.g., ipv6 multicast static-neighbor vlan 2 linkagg 7).

Examples

```
-> ipv6 multicast static-neighbor vlan 4 port 1/1/1
-> no ipv6 multicast static-neighbor vlan 4 port 1/1/1
-> ipv6 multicast static-neighbor vlan 4 linkagg 7
-> no ipv6 multicast static-neighbor vlan 4 linkagg 7
```

Release History

Release 8.1.1; command introduced.

Related Commands

```

ipv6 multicast static-querier

Creates a static MLD querier entry on a specified port on a specified VLAN.

ipv6 multicast static-querier vlan *vid* **{port** *chassis/slot/port* | **linkagg** *linkagg***}**

no ipv6 multicast static-querier vlan *vid* **{port** *chassis/slot/port* | **linkagg** *linkagg***}**

Syntax Definitions

vid	VLAN to include as a static MLD querier.
chassis	The chassis identifier.
slot/port	The slot/port number you want to configure as a static MLD querier.
linkagg	The link aggregate you want to configure as a static MLD querier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an MLD static querier entry on a specified port on a specified VLAN.
- The **ipv6 multicast static-querier** command allows you to create an MLD static querier entry on a specified port on a specified VLAN. This, in turn, enables that network segment to receive all MLD traffic.
- You can also create an MLD static querier entry on a link aggregate port by entering **ipv6 multicast static-querier vlan** *vid* **linkagg**, followed by the link aggregation group number (e.g., ipv6 multicast static-querier vlan 2 linkagg 7).

Examples

```
-> ipv6 multicast static-querier vlan 4 port 1/1/1
-> no ipv6 multicast static-querier vlan 4 port 1/1/1
-> ipv6 multicast static-querier vlan 4 linkagg 7
-> no ipv6 multicast static-querier vlan 4 linkagg 7
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 multicast querier	Displays the MLD querier table entries of IPv6 Multicast Switching and Routing.

MIB Objects

```

ipv6 multicast static-group

Creates a static MLD group entry on a specified port on a specified VLAN.

ipv6 multicast static-group *ip_address* **vlan** *vid* **{port** *chassis/slot/port* | **linkagg** *linkagg***}**

no ipv6 multicast static-group *ip_address* **vlan** *vid* **{port** *chassis/slot/port* | **linkagg** *linkagg***}**

Syntax Definitions

ip_address	IPv6 multicast group address.
vid	VLAN to include as a static MLD group.
chassis	The chassis identifier.
slot/port	The slot/port number you want to configure as a static MLD group.
linkagg	The link aggregate you want to configure as a static MLD group.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an MLD static group entry on a specified port on the specified VLAN.
- The **ipv6 multicast static-group** command allows you to create an MLD static group entry on a specified port on a specified VLAN. This, in turn, enables that network segment to receive MLD traffic addressed to the specified IPv6 multicast group address.
- You can also create an MLD static group entry on a link aggregate port by entering **ipv6 multicast static-group** *ip_address* **vlan** *vid* **linkagg**, followed by the link aggregation group number (e.g., ipv6 multicast static-group ff05::5 vlan 2 linkagg 7).

Examples

```
-> ipv6 multicast static-group ff05::4681 vlan 4 port 1/1/1
-> no ipv6 multicast static-group ff05::4681 vlan 4 port 1/1/1
-> ipv6 multicast static-group ff05::4681 vlan 4 linkagg 7
-> no ipv6 multicast static-group ff05::4681 vlan 4 linkagg 7
```

Release History

Release 8.1.1; command introduced.

ipv6 multicast query-interval

Sets the MLD query interval on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vid***] query-interval [***seconds***]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
seconds	MLD query interval in seconds. Valid range is 1 to 65535.

Defaults

parameter	default
seconds	125

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD query interval on the system and/or the specified VLANs.
- If the MLD query interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The MLD query interval refers to the time period between MLD query messages.
- To restore the MLD query interval to its default (i.e., 125 seconds) value on the system if no VLAN is specified, use **ipv6 multicast query-interval** followed by the value 0 (e.g., ipv6 multicast query-interval 0) or use only **ipv6 multicast query-interval (**e.g., ipv6 multicast query-interval).
- To restore the MLD query interval to its default (i.e., 125 seconds) value on the specified VLAN, use **ipv6 multicast vlan** *vid* **query-interval** followed by the value 0 (e.g., ipv6 multicast vlan 2 query-interval 0) or use only **ipv6 multicast vlan** *vid* **query-interval** (e.g., ipv6 multicast vlan 2 query-interval).

Examples

```
-> ipv6 multicast query-interval 100
-> ipv6 multicast query-interval 0
-> ipv6 multicast query-interval
-> ipv6 multicast vlan 2 query-interval 100
-> ipv6 multicast vlan 2 query-interval 0
-> ipv6 multicast vlan 2 query-interval
```

Release History

Release 8.1.1; command introduced.

ipv6 multicast last-member-query-interval

Sets the MLD last member query interval on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vid***] last-member-query-interval [***milliseconds***]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
milliseconds	MLD last member query interval in milliseconds. Valid range is 1 to 65535.

Defaults

parameter	default
milliseconds	1000

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD last member query interval to use on the system and/or the specified VLANs. apply this configuration.
- If the MLD last member query interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The MLD last member query interval refers to the time period to reply to an MLD query message sent in response to a leave group message.
- To restore the MLD last member query interval to its default (i.e., 1000 milliseconds) value on the system if no VLAN is specified, use **ipv6 multicast last-member-query-interval** followed by the value 0 (e.g., ipv6 multicast last-member-query-interval 0) or use only **ipv6 multicast last-member-query-interval** (e.g., ipv6 multicast last-member-query-interval).
- To restore the MLD last member query interval to its default (i.e., 1000 milliseconds) value on the specified VLAN, use **ipv6 multicast vlan** *vid* **last-member-query interval** followed by the value 0 (e.g., ipv6 multicast vlan 2 last-member-query-interval 0) or use only **ipv6 multicast vlan** *vid* **last-member-query-interval** (e.g., ipv6 multicast vlan 2 last-member-query-interval).

Examples

```
-> ipv6 multicast last-member-query-interval 2200
-> ipv6 multicast last-member-query-interval 0
-> ipv6 multicast last-member-query-interval
-> ipv6 multicast vlan 4 last-member-query-interval 2200

ipv6 multicast unsolicited-report-interval

Sets the MLD unsolicited report interval on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vid***] unsolicited-report-interval [***seconds***]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
seconds	MLD unsolicited report interval in seconds. Valid range is 1 to 65535, where 0 represents the default setting.

Defaults

parameter	default
seconds	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD unsolicited report interval to use on the system and/or the specified VLANs.
- If the MLD unsolicited report interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The unsolicited report interval refers to the time period to proxy any changed MLD membership state.
- To restore the MLD unsolicited interval to its default (i.e., 1 second) value on the system if no VLAN is specified, use **ipv6 multicast unsolicited-report-interval** followed by the value 0 (e.g., ipv6 multicast unsolicited-report-interval 0) or use only **ipv6 multicast unsolicited-report-interval** (e.g., ipv6 multicast unsolicited-report-interval).
- To restore the MLD unsolicited report interval to its default (i.e., 1 second) value on the specified VLAN, use **ipv6 multicast vlan** *vid* **unsolicited-report-interval** followed by the value 0 (e.g., ipv6 multicast vlan 2 unsolicited-report-interval 0) or use only **ipv6 multicast vlan** *vid* **unsolicited-report-interval** (e.g., ipv6 multicast vlan 2 unsolicited-report-interval).

Examples

```
-> ipv6 multicast unsolicited-report-interval 20000
-> ipv6 multicast unsolicited-report-interval 0
-> ipv6 multicast unsolicited-report-interval
-> ipv6 multicast vlan 2 unsolicited-report-interval 20000
-> ipv6 multicast vlan 2 unsolicited-report-interval 0
-> ipv6 multicast vlan 2 unsolicited-report-interval
```

ipv6 multicast router-timeout

Configures the expiry time of IPv6 multicast routers on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vid***] router-timeout [***seconds***]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
seconds	MLD router timeout in seconds. Valid range is 1 to 65535.

Defaults

parameter	default
seconds	90

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD router timeout on the system and/or the specified VLANs. apply this configuration.
- If the MLD router timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- To restore the MLD router timeout to its default (i.e., 90 seconds) value on the system if no VLAN is specified, use **ipv6 multicast router-timeout** followed by the value 0 (e.g., ipv6 multicast router-timeout 0) or use only **ipv6 multicast router-timeout** (e.g., ipv6 multicast router-timeout).
- To restore the MLD router timeout to its default (i.e., 90 seconds) value on the specified VLAN, use **ipv6 multicast vlan** *vid* **router-timeout** followed by the value 0 (e.g., ipv6 multicast vlan 2 router-timeout 0) or use only **ipv6 multicast vlan** *vid* **router-timeout** (e.g., ipv6 multicast vlan 2 router-timeout).

Examples

```
-> ipv6 multicast router-timeout 100
-> ipv6 multicast router-timeout 0
-> ipv6 multicast router-timeout
-> ipv6 multicast vlan 2 router-timeout 100
-> ipv6 multicast vlan 2 router-timeout 0
-> ipv6 multicast vlan 2 router-timeout
```

ipv6 multicast source-timeout

Configures the expiry time of IPv6 multicast sources on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vid***] source-timeout [***seconds***]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
seconds	MLD source timeout in seconds. Valid range is 1 to 65535.

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD source timeout on the system and/or the specified VLANs.
- If the MLD source timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- To restore the MLD router timeout to its default (i.e., 30 seconds) value on the system if no VLAN is specified, use **ipv6 multicast source-timeout** followed by the value 0 (e.g., ipv6 multicast source-timeout 0) or use only **ipv6 multicast source-timeout** (e.g., ipv6 multicast source-timeout).
- To restore the MLD router timeout to its default (i.e., 30 seconds) value on the specified VLAN, use **ipv6 multicast vlan** *vid* **source-timeout** followed by the value 0 (e.g., ipv6 multicast vlan 2 source-timeout 0) or use only **ipv6 multicast vlan** *vid* **source-timeout** (e.g., ipv6 multicast vlan 2 source-timeout).

Examples

```
-> ipv6 multicast source-timeout 100
-> ipv6 multicast source-timeout 0
-> ipv6 multicast source-timeout
-> ipv6 multicast vlan 2 source-timeout 100
-> ipv6 multicast vlan 2 source-timeout 0
-> ipv6 multicast vlan 2 source-timeout
```

Release History

Release 8.1.1; command introduced.

Related Commands

alaMld
   alaMldSourceTimeout
alaMldVlan
   alaMldVlanSourceTimeout
```

ipv6 multicast querying

Enables or disables MLD querying on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vid***] querying [{enable | disable}]**

no ipv6 multicast [vlan *vid***] querying**

Syntax Definitions

vid	VLAN on which to apply the configuration.
enable	Enable MLD querying.
disable	Disable MLD querying.

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an MLD querying entry on the specified VLAN or on the system and return to its default behavior.
- IPv6 Multicast Switching and Routing must be enabled to enable MLD querying on the system and/or specified VLANs.
- If the MLD querying is already enabled/disabled on the system, then the VLAN configuration will override the system's configuration.
- MLD querying refers to requesting the network's MLD group membership information by sending out MLD queries. MLD querying also involves participating in MLD querier election.
- You can also restore the MLD querying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ipv6 multicast querying** (e.g., ipv6 multicast querying).
- You can also restore the MLD querying to its default (i.e., disabled) setting on the specified VLAN, by using only **ipv6 multicast vlan** *vid* **querying** (e.g., ipv6 multicast vlan 2 querying).

Examples

```
-> ipv6 multicast querying enable
-> ipv6 multicast querying disable
-> ipv6 multicast querying
-> ipv6 multicast vlan 2 querying enable
-> ipv6 multicast vlan 2 querying disable
-> ipv6 multicast vlan 2 querying
-> no ipv6 multicast vlan 2 querying
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 multicast	Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast robustness

Sets the MLD robustness variable on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vid***] robustness [***robustness***]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
robustness	MLD robustness variable. Valid range is 1 to 7.

Defaults

parameter	default
robustness	2

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD robustness variable on the system and/or the specified VLANs.
- If the MLD robustness variable is already configured on the system, then the VLAN configuration will override the system's configuration.
- Robustness variable allows fine-tuning on the network, where the expected packet loss would be greater.
- To restore the MLD robustness variable to its default (i.e., 2) value on the system if no VLAN is specified, use **ipv6 multicast robustness** followed by the value 0 (e.g., ipv6 multicast robustness 0) or use only **ipv6 multicast robustness** (e.g., ipv6 multicast robustness).
- To restore the MLD robustness variable to its default (i.e., 2) value on the specified VLAN, use **ipv6 multicast vlan** *vid* **robustness** followed by the value 0 (e.g., ipv6 multicast vlan 2 robustness 0) or use only **ipv6 multicast vlan** *vid* **robustness** (e.g., ipv6 multicast vlan 2 robustness).

Examples

```
-> ipv6 multicast robustness 3
-> ipv6 multicast robustness 0
-> ipv6 multicast robustness
-> ipv6 multicast vlan 2 robustness 3
-> ipv6 multicast vlan 2 robustness 0
-> ipv6 multicast vlan 2 robustness
```

Release History

Release 8.1.1; command introduced.

Related Commands

MIB Objects

```
alaMld
   alaMldRobustness
alaMldVlan
   alaMldVlanRobustness
```

ipv6 multicast spoofing

Enables or disables MLD spoofing on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vid***] spoofing [{enable | disable}]**

no ipv6 multicast [vlan *vid***] spoofing**

Syntax Definitions

vid	VLAN on which to apply the configuration.
enable	Enable MLD spoofing.
disable	Disable MLD spoofing.

Defaults

parameter	defaults
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an MLD spoofing entry on the specified VLAN or on the system and return to its default behavior.
- If the MLD spoofing is already enabled on the system, then the VLAN configuration will override the system's configuration.
- MLD spoofing refers to replacing a client's MAC and IP address with the system's MAC and IP address when proxying aggregated MLD group membership information.
- You can also restore the MLD spoofing to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ipv6 multicast spoofing** (i.e., ipv6 multicast spoofing).
- You can also restore the MLD spoofing to its default (i.e., disabled) setting on the specified VLAN, by using only **ipv6 multicast vlan** *vid* **spoofing** (i.e., ipv6 multicast vlan 2 spoofing).

Examples

```
-> ipv6 multicast spoofing enable
-> ipv6 multicast spoofing disable
-> ipv6 multicast spoofing
-> ipv6 multicast vlan 2 spoofing enable
-> ipv6 multicast vlan 2 spoofing disable
-> ipv6 multicast vlan 2 spoofing
-> no ipv6 multicast vlan 2 spoofing
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 multicast zapping

Enables or disables MLD zapping on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vid***] zapping [{enable | disable}]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
enable	Enable MLD zapping.
disable	Disable MLD zapping.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the MLD zapping is already enabled on the system, then the VLAN configuration will override the system's configuration.
- MLD zapping refers to processing membership and source filter removals immediately and not waiting for the protocol's specified time period. This mode facilitates IP TV applications looking for quick changes between IP multicast groups.
- You can also restore the MLD zapping to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ipv6 multicast zapping** (e.g., ipv6 multicast zapping).
- You can also restore the MLD zapping to its default (i.e., disabled) setting on the specified VLAN, by using only **ipv6 multicast vlan** *vid* **zapping** (e.g., ipv6 multicast vlan 2 zapping).

Examples

```
-> ipv6 multicast zapping enable
-> ipv6 multicast zapping disable
-> ipv6 multicast zapping
-> ipv6 multicast vlan 2 zapping enable
-> ipv6 multicast vlan 2 zapping disable
-> ipv6 multicast vlan 2 zapping
```

Release History

Release 8.1.1; command introduced.

Related Commands

```

ipv6 multicast proxying

Enables or disables MLD proxying on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast [vlan *vid***] proxying [enable | disable]**

Syntax Definitions

vid	VLAN on which to apply the configuration.
enable	Enable MLD proxying.
disable	Disable MLD proxying.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the MLD proxying is already enabled on the system, then the VLAN configuration will override the system's configuration.
- MLD proxying refers to processing membership information on behalf of client systems and reporting membership on their behalf.
- You can also restore the MLD proxying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ipv6 multicast proxying** (e.g., ipv6 multicast proxying).
- You can also restore the MLD proxying to its default (i.e., disabled) setting on the specified VLAN, by using only **ipv6 multicast vlan** *vid* **proxying** (e.g., ipv6 multicast vlan 2 proxying).

Examples

```
-> ipv6 multicast proxying enable
-> ipv6 multicast proxying disable
-> ipv6 multicast proxying
-> ipv6 multicast vlan 2 proxying enable
-> ipv6 multicast vlan 2 proxying disable
-> ipv6 multicast vlan 2 proxying
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 multicast initial-packet-buffer admin-state

Enables or disables the initial packet buffering feature globally for IPv6 multicast flows on the switch.

ipv6 multicast initial-packet-buffer admin-state {enable | disable}

Syntax Definitions

enable	Enable the initial packet buffering globally on the switch for IPv6 multicast flow.
disable	Disable the initial packet buffering globally on the switch for IPv6 multicast flow.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

You must enable or disable the command to administratively enable or disable the buffering of initial multicast packets.

Examples

```
-> ipv6 multicast initial-packet-buffer admin-state disable
-> ipv6 multicast initial-packet-buffer admin-state enable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show ipv6 multicast initial-packet-buffer	Displays the status and configuration parameters of initial multicast packet buffer for IPv6 flows on the switch.

MIB Objects

```
alaMld
   alaMldInitialPacketBuffer
```

ipv6 multicast initial-packet-buffer max-packet

Configures the maximum number of initial packets buffered per IPv6 multicast flow.

ipv6 multicast initial-packet-buffer max-packet [*num***]**

Syntax Definitions

num	The maximum number of packets allowed to buffer per IPv6 multicast flow. Valid range is 1 to 10.

Defaults

parameter	default
num	4

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ipv6 multicast initial-packet-buffer max-packet 4
```

Release History

Release 8.2.1; command introduced.

Related Commands

ipv6 multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally for IPv6 multicast flows on the switch.

MIB Objects

```
alaMld
   alaMldInitialPacketBufferMaxPacket
```

ipv6 multicast initial-packet-buffer max-flow

Configures the maximum number of IPv6 multicast flows buffered for initial packet.

ipv6 multicast initial-packet-buffer max-flow [*num***]**

Syntax Definitions

num	The maximum number of IPv6 multicast flows allowed for initial packet buffering. Valid range is 1 to 32.

Defaults

parameter	default
num	32

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

NA

Examples

```
-> ipv6 multicast initial-packet-buffer max-flow 32
```

Release History

Release 8.2.1; command introduced.

Related Commands

ipv6 multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally for IPv6 multicast flows on the switch.

MIB Objects

```
alaMld
   alaMldInitialPacketBufferMaxFlow
```

ipv6 multicast initial-packet-buffer timeout

Configures the timeout value for the buffered IPv6 initial multicast packets.

ipv6 multicast initial-packet-buffer timeout [*seconds***]**

Syntax Definitions

seconds	The timeout value for the initial buffered IPv6 multicast packets in seconds. Valid range is 1 to 10.

Defaults

parameter	default
seconds	10

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If the buffered multicast packet is not sent out before the timeout, then the buffered packets will be removed from IPMS system.

Examples

```
-> ipv6 multicast initial-packet-buffer timeout 2
```

Release History

Release 8.2.1; command introduced.

Related Commands

ipv6 multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally for IPv6 multicast flows on the switch.

MIB Objects

```
alaMld
   alaMldInitialPacketBufferTimeout
```

ipv6 multicast initial-packet-buffer min-delay

Configures the minimum delay to program the multicast replication index for IPv6 multicast flows buffered for initial packet.

ipv6 multicast initial-packet-buffer min-delay [*milliseconds***]**

Syntax Definitions

milliseconds	The minimum delay value to program the multicast replication index for IPv6 multicast flows buffered for initial packet. Valid range is 0 to 1000.

Defaults

parameter	default
milliseconds	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Note. This command configures a timer to delay the programming of multicast replication index in hardware which might increase the number of multicast packets lost during the learning phase.

Examples

```
-> ipv6 multicast initial-packet-buffer min-delay 200
```

Release History

Release 8.2.1; command introduced.

Related Commands

ipv6 multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally on the switch, for IPv6 multicast flows.

MIB Objects

```
alaMld
   alaMldInitialPacketBufferMinDelay
```

show ip multicast

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

show ip multicast [vlan *vid***]**

Syntax Definitions

vid	VLAN ID number (1–4094).

Defaults

By default the status and general configuration parameters for the system.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Specify a VLAN ID to display the configuration information for an individual VLAN.

Examples

```
-> show ip multicast

Status:                                      Enabled
Querying:                                    Disabled
Proxying                                    Disabled
Spoofing:                                    Disabled

Output fields are described here:

output definitions

Status	Whether the IP Multicast Switching and Routing is **Enabled** or **Disabled** (the default status).You can enable or disable IP Multicast Switching and Routing with the **ip multicast admin-state** command, which is described on page 28-4.
Querying	The current state of IGMP querying, which can be **Enabled** or **Disabled** (the default status). You can enable or disable IGMP querying with the **ip multicast querying** command, which is described on page 28-36.
Proxying	The current state of IGMP proxying on the system, which can be **Enabled** or **Disabled** (the default status)**.** You can enable or disable IGMP spoofing with the **ip multicast proxying** command, which is described on page 28-44.
Spoofing	The current state of IGMP spoofing on the system, which can be **Enabled** or **Disabled** (the default status)**.** You can enable or disable IGMP spoofing with the **ip multicast spoofing** command, which is described on page 28-40.
Zapping	The current state of IGMP zapping on the system, which can be **Enabled** or **Disabled** (the default status)**.** You can enable or disable IGMP zapping with the **ip multicast zapping** command, which is described on page 28-42.
Querier Forwarding	The current state of IGMP querier forwarding on the system, which can be **Enabled** or **Disabled** (the default status)**.** You can enable or disable IGMP Querier forwarding with the **ip multicast querier-forwarding** command, which is described on page 28-6.
Version	Displays the default IGMP version, which can be **1, 2** or **3**. Use the **ip multicast version** command to modify this parameter.
Robustness	Displays the IGMP robustness value, ranging from **1** to **7.** (The default value is 2). Use the **ip multicast robustness** command to modify this parameter.
Query Interval (seconds)	Displays the time (in seconds) between IGMP queries. (The default value is 125 seconds). You can modify this parameter with the **ip multicast query-interval** command, which is described on page 28-24.
Query Response Interval (tenths of seconds)	Displays the time (in tenths of seconds) taken to reply to an IGMP query message. (The default value is 100 tenths-of-seconds). You can modify this parameter with the **ip multicast query-response-interval** command, which is described on page 28-28.
Last Member Query Interval (tenths of seconds)	Displays the time (in tenths of seconds) taken to reply to an IGMP query message sent in response to a leave group message. (The default value is 10 tenths-of-seconds.) You can modify this parameter with the **ip multicast last-member-query-interval** command, which is described on page 28-26.

output definitions

Unsolicited Report Interval (seconds)	Displays the time period (in seconds) to proxy any changed IGMP membership state. (The default value is 1 second). You can modify this parameter with the **ip multicast unsolicited-report-interval** command, which is described on page 28-30.
Router Timeout (seconds)	Displays the IGMP router timeout in seconds. (The default value is 90 seconds.) You can modify this parameter with the **ip multicast router-timeout** command, which is described on page 28-32.
Source Timeout (seconds)	Displays the IGMP source timeout in seconds. (The default value is 30 seconds.) You can modify this parameter with the **ip multicast source-timeout** command, which is described on page 28-34.

Release History

Release 8.1.1; command introduced.

Related Commands

show ip multicast port

Displays the max-group configuration applicable for all port or vlan instances of a given port or all ports. The current number of groups learnt on a given port or vlan instance will also be displayed.

show ip multicast port [*chassis/slot/port*]

Syntax Definitions

chassis	The chassis identifier.
slot | *port*	The slot number for the module and the physical port number on that module.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Specify a slot and port number to display the configuration information for a specific switch port.

Examples

```
-> show ip multicast port

Total 5 Port-Vlan Pairs

  Port    VLAN       Current Igmp   Max-group   Action
                     Groups

```

show ip multicast forward

Displays the IP Multicast Switching and Routing forwarding table entries for the specified IP multicast group address or all the entries if no IP multicast group address is specified.

show ip multicast forward [*ip_address***]**

Syntax Definitions

ip_address	IP multicast group address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip multicast forward

Total 1 Forwards
                                                 Ingress    Egress
Group Address   Host Address    Tunnel Address  VLAN   Port  VLAN  Port
---------------+---------------+---------------+-----+-----+-----+------
228.0.0.1       1.0.0.2         0.0.0.0          1     2/1/1    1    2/1/23

-> show ip multicast forward 228.0.0.1

                                                 Ingress     Egress
Group Address   Host Address    Tunnel Address  VLAN   Port  VLAN  Port
---------------+---------------+---------------+-----+-----+-----+------
228.0.0.1       1.0.0.2         0.0.0.0          1     2/1/1    1    2/1/23
```

Output fields are described here:

output definitions

Group Address	IP group address of the IP multicast forward.
Host Address	IP host address of the IP multicast forward.
Tunnel Address	IP source tunnel address of the IP multicast forward.
VLAN	VLAN associated with the IP multicast forward.
Port	The slot and port number of the IP multicast forward.

Release History

Release 8.1.1; command introduced.

Related Commands

ip multicast static-group	Creates a static IGMP group entry on a specified port on a specified VLAN.

MIB Objects

```
alaIgmpForwardTable
   alaIgmpForwardVlan
   alaIgmpForwardIfIndex
   alaIgmpForwardGroupAddress
   alaIgmpForwardHostAddress
   alaIgmpForwardDestAddress

   alaIgmpForwardNextTunnelAddress
   alaIgmpForwardNextType
   alaIgmpForwardTtl
```

show ip multicast neighbor

Displays the IGMP neighbor table entries of IP Multicast Switching and Routing.

show ip multicast neighbor

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip multicast neighbor

Total 2 Neighbors
Host Address    VLAN  Port  Static  Count  Life
---------------+-----+-----+-------+------+-----
1.0.0.2         1     2/1/1   no      1      86
0.0.0.0         1     2/1/13  yes     0      0
```

Output fields are described here:

output definitions

Host Address	The IP address of the IP multicast neighbor.
VLAN	The VLAN associated with the IP multicast neighbor.
Port	The slot and port number of the IP multicast neighbor.
Static	Whether it is a static IP multicast neighbor or not.
Count	Displays the count of IP multicast neighbor.
Life	The life time of the IP multicast neighbor.

Release History

Release 8.1.1; command introduced.

Related Commands

ip multicast max-group	Creates a static IGMP neighbor entry on a specified port on a specified VLAN.

MIB Objects

```
alaIgmpNeighborTable
   alaIgmpNeighborVlan
   alaIgmpNeighborIfIndex
   alaIgmpNeighborHostAddress
   alaIgmpNeighborCount

   alaIgmpStaticNeighborVlan
   alaIgmpStaticNeighborIfIndex
   alaIgmpStaticNeighborRowStatus
```

show ip multicast querier

Displays the IGMP querier table entries of IP Multicast Switching and Routing.

show ip multicast querier

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip multicast querier

Total 2 Queriers
Host Address    VLAN  Port  Static  Count  Life
---------------+-----+-----+-------+------+-----
1.0.0.2         1     2/1/1   no      1      250
0.0.0.0         1     2/1/13  yes     0      0
```

Output fields are described here:

output definitions

Host Address	The IP address of the IP multicast querier.
VLAN	The VLAN associated with the IP multicast querier.
Port	The slot and port number of the IP multicast querier.
Static	Whether it is a static multicast neighbor or not.
Count	Displays the count of the IP multicast querier.
Life	The life time of the IP multicast querier.

Release History

Release 8.1.1; command introduced.

Related Commands

ip multicast static-querier	Creates a static IGMP querier entry on a specified port on a specified VLAN.

MIB Objects

```
alaIgmpQuerierTable
   alaIgmpQuerierVlan
   alaIgmpQuerierIfIndex
   alaIgmpQuerierHostAddress
   alaIgmpQuerierCount
   alaIgmpQuerierTimeout
   alaIgmpQuerierUpTime
alaIgmpStaticQuerierTable
   alaIgmpStaticQuerierVlan
   alaIgmpStaticQuerierIfIndex
   alaIgmpStaticQuerierRowStatus
```

show ip multicast group

Displays the IGMP group membership table entries of IP Multicast Switching and Routing for the specified IP multicast group address or all entries if no IP multicast group address is specified.

show ip multicast group [*ip_address***]**

Syntax Definitions

ip_address	IP multicast group address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip multicast group

Total 3 Groups
Group Address   Source Address  VLAN  Port  Mode     Static  Count  Life
--------------+---------------+-----+-----+--------+-------+------+-----
231.0.0.3       1.0.0.5         1     2/1/1   exclude  no      1      257
234.0.0.4       0.0.0.0         1     2/1/1   exclude  no      1      218
229.0.0.1       0.0.0.0         1     2/1/13  exclude  yes     0      0

-> show ip multicast group 234.0.0.4

Group Address   Source Address  VLAN  Port  Mode     Static  Count  Life
--------------+---------------+-----+-----+--------+-------+------+-----
234.0.0.4       0.0.0.0         1     2/1/1   exclude  no      1      218
```

Output fields are described here:

output definitions

Group Address	IP address of the IP multicast group.
Source Address	IP address of the IP multicast source.
VLAN	The VLAN associated with the IP multicast group.
Port	The slot and port number of the IP multicast group.
Mode	IGMP source filter mode.
Static	Whether it is a static multicast group or not.

output definitions

Count	Number of IGMP membership requests made.
Life	Life time of the IGMP group membership.

Release History

Release 8.1.1; command introduced

Related Commands.

ip multicast static-group	Creates a static IGMP group entry on a specified port on a specified VLAN.

alaIgmpStaticMemberTable
   alaIgmpStaticMemberVlan
   alaIgmpStaticMemberIfIndex
   alaIgmpStaticMemberGroupAddress
   alaIgmpStaticMemberRowStatus
```

show ip multicast source

Displays the IP Multicast Switching and Routing source table entries matching the specified IP multicast group address or all entries if no IP multicast group address is specified.

show ip multicast source [*ip_address***]**

Syntax Definitions

ip_address	IP multicast group address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip multicast source

Total 1 Sources
Group Address   Host Address    Tunnel Address  VLAN  Port
---------------+---------------+---------------+-----+-----
228.0.0.1       1.0.0.2         0.0.0.0         1     2/1/1

-> show ip multicast source 228.0.0.1

Total 1 Sources
Group Address   Host Address    Tunnel Address  VLAN  Port
---------------+---------------+---------------+-----+-----
228.0.0.1       1.0.0.2         0.0.0.0         1     2/1/1
```

output definitions

Group Address	IP group address of the IP multicast source.
Host Address	IP host address of the IP multicast source.
Tunnel Address	IP destination tunnel address of the IP multicast source.
VLAN	VLAN associated with the IP multicast source.
Port	The slot and port number of the IP multicast source.

Release History

Release 8.1.1; command introduced.

Related Commands

show ip multicast tunnel	Display the IP Multicast Switching and Routing tunneling table entries matching the specified IP multicast group address or all entries if no IP multicast address is specified.

MIB Objects

   alaIgmpSourceType
   alaIgmpSourceUpTime
```

show ip multicast tunnel

Display the IP Multicast Switching and Routing tunneling table entries matching the specified IP multicast group address or all entries if no IP multicast address is specified.

show ip multicast tunnel [address]

Syntax Definitions

address	IP multicast group address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip multicast tunnel
Total 1 Tunnels
                                                Ingress
Group Address   Host Address    Tunnel Address  VLAN  Port
--------------+---------------+---------------+-----+-----
228.0.0.1       1.0.0.2         2.1.2.3         1     2/1/1
```

output definitions

Group Address	IP group address of the IP multicast tunnel.
Host Address	IP host address of the IP multicast tunnel.
Tunnel Address	IP source tunnel address of the IP multicast tunnel.
VLAN	VLAN associated with the IP multicast tunnel.
Port	The slot and port number of the IP multicast tunnel.

Release History

Release 8.1.1; command introduced.

Related Commands

show ip multicast source	Displays the IP Multicast Switching and Routing source table entries matching the specified IP multicast group address or all entries if no IP multicast group address is specified

    alaIgmpTunnelType
    alaIgmpTunnelNextDestAddress
    alaIgmpTunnelNextType
```

show ip multicast initial-packet-buffer

Displays the status and configuration parameters of initial multicast packet buffer for IPv4 flows on the Switch.

show ip multicast initial-packet-buffer

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip multicast initial-packet-buffer
Admin-status       = disabled,
Max Packet         = 4,
Max Flow           = 32,
Timeout(seconds)   = 10
```

output definitions

Admin-status	The status of IPv4 initial multicast packet buffer.
Max Packet	The maximum number of initial packets buffered per IPv4 multicast flow.
Max Flow	The maximum number of IPv4 multicast flows buffered for initial packet buffering.
Timeout (seconds)	The timeout value for the buffered IPv4 initial multicast packets.

Release History

Release 8.2.1; command introduced.

Related Commands

ip multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally for IPv4 multicast flows on the switch.
ip multicast initial-packet-buffer max-packet	Configures the maximum number of initial packets buffered per IPv4 multicast flow.
ip multicast initial-packet-buffer max-flow	Configures the maximum number of IPv4 multicast flows buffered for initial packet.
ip multicast initial-packet-buffer timeout	Configures the timeout value for the buffered IPv4 initial multicast packets.

MIB Objects

NA

show ipv6 multicast

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

show ipv6 multicast [vlan *vid***]**

Syntax Definitions

vid	VLAN for which to display the configuration.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 multicast

Status:                                          = Enabled

```

output definitions

Status	Whether the IPv6 Multicast Switching and Routing is **Enabled** or **Disabled** (the default status).You can enable or disable IPv6 Multicast Switching and Routing with the **ip multicast helper-address** command, which is described on page 28-46
Querying	The current state of MLD querying, which can be **Enabled** or **Disabled** (the default status). You can enable or disable MLD querying with the **ipv6 multicast querying** command, which is described on page 28-84
Proxying	The current state of MLD proxying on the system, which can be **Enabled** or **Disabled** (the default status)**.** You can enable or disable MLD spoofing with the **ipv6 multicast proxying** command, which is described on page 28-92
Spoofing	The current state of MLD spoofing on the system, which can be **Enabled** or **Disabled** (the default status)**.** You can enable or disable MLD spoofing with the **ipv6 multicast spoofing** command, which is described on page 28-40
Zapping	The current state of MLD zapping on the system, which can be **Enabled** or **Disabled** (the default status)**.** You can enable or disable MLD zapping with the **ipv6 multicast zapping** command, which is described on page 28-90
Querier Forwarding	The current state of MLD querier forwarding on the system, which can be **Enabled** or **Disabled** (the default status)**.** You can enable or disable MLD Querier forwarding with the **ipv6 multicast querier-forwarding** command, which is described on page 28-54.
Version	Displays the default MLD version, which can be **1, 2** or **3**. Use the **ipv6 multicast flood-unknown** command to modify this parameter.
Robustness	Displays the MLD robustness value, ranging from **1** to **7**. Use the **ipv6 multicast robustness** command to modify this parameter.
Query Interval (seconds)	Displays the time (in seconds) between MLD queries. (The default value is 125 seconds). You can modify this parameter with the **ipv6 multicast query-interval** command, which is described on page 28-72.

output definitions

Query Response Interval (milliseconds)	Displays the time (in milliseconds) to reply to an MLD query message. (The default value is 10000 milliseconds.) You can modify this parameter with the **ipv6 multicast query-response-interval** command, which is described on page 28-76.
Last Member Query Interval (milliseconds)	Displays the time (in milliseconds) to reply to an MLD query message sent in response to a leave group message. (The default value is 1000 milliseconds.) You can modify this parameter with the **ipv6 multicast last-member-query-interval** command, which is described on page 28-74.
Unsolicited Report Interval (seconds)	Displays the time period (in seconds) to proxy any changed MLD membership state. (The default value is 1 second). You can modify this parameter with the **ipv6 multicast unsolicited-report-interval** command, which is described on page 28-78.
Router Timeout (seconds)	Displays the MLD router timeout in seconds (The default value is 90 seconds.) You can modify this parameter with the **ipv6 multicast router-timeout** command, which is described on page 28-80
Source Timeout (seconds)	Displays the IGMP source timeout in seconds (The default is 30 seconds.) You can modify this parameter with the **ipv6 multicast source-timeout** command, which is described on page 28-82

Release History

Release 8.1.1; command introduced.

Related Commands

ip multicast helper-address	Enables or disables IPv6 Multicast Switching and Routing on the specified VLAN or on the system if no VLAN is specified.
ipv6 multicast flood-unknown	Sets the default version of the MLD protocol on the specified VLAN or on the system if no VLAN is specified.
ipv6 multicast query-interval	Sets the MLD query interval on the specified VLAN or on the system if no VLAN is specified.
ipv6 multicast last-member-query-interval	Sets the MLD last member query interval on the specified VLAN or on the system if no VLAN is specified.
ipv6 multicast query-response-interval	Sets the MLD query response interval on the specified VLAN or on the system if no VLAN is specified.
ipv6 multicast unsolicited-report-interval	Sets the MLD unsolicited report interval on the specified VLAN or on the system if no VLAN is specified.
ipv6 multicast router-timeout	Configures the expiry time of IPv6 multicast routers on the specified VLAN or on the system if no VLAN is specified.
ipv6 multicast source-timeout	Configures the expiry time of IPv6 multicast sources on the specified VLAN or on the system if no VLAN is specified.
ipv6 multicast querying	Enables or disables MLD querying on the specified VLAN or on the system if no VLAN is specified.
ipv6 multicast robustness	Sets the MLD robustness variable on the specified VLAN or on the system if no VLAN is specified.

ipv6 multicast spoofing	Enables or disables MLD spoofing on the specified VLAN or on the system if no VLAN is specified.
ipv6 multicast zapping	Enables or disables MLD zapping on the specified VLAN or on the system if no VLAN is specified.
ipv6 multicast proxying	Enables or disables MLD proxying on the specified VLAN or on the system if no VLAN is specified.

show ipv6 multicast port

Display the max-group configuration applicable for all port or vlan instances of a given port or all ports. The current number of groups learnt on a given port or vlan instance will also be displayed in this show output.

show ipv6 multicast port [*chassis/slot/port*]

Syntax Definitions

chassis	The chassis identifier.
slot | *port*	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3)).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Specify a VLAN ID to display the configuration information for an individual VLAN.

Examples

```
-> show ipv6 multicast port 1/1/6
Max-group 9 Action replace

Total 1 Port-Vlan Pairs
  Port   VLAN  Current Mld  Max-group   Action
                  Groups
---------+-----+-------------+----------+---------
    1/1/6    15             5           0     none
```

Output fields are described here:

output definitions

Port	The slot and port number of the IP multicast port.
VLAN	The VLAN associated with the IP multicast port.
Current Groups	The current group associated with the IP Current groups.
IGMP	The IGMP associated with the IP multicast port.
Max-group	The maximum group count allowed on the port.
Action	The action to be taken when the group membership limit is exceeded.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 multicast admin-state	Enables or disables IPv6 Multicast Switching and Routing on the specified VLAN or on the system if no VLAN is specified.

Release 8.1.1; command introduced.

Related Commands

ipv6 multicast static-group	Creates a static MLD group entry on a specified port on a specified VLAN.

MIB Objects

```
alaMldForwardTable
   alaMldForwardVlan
   alaMldForwardIfIndex
   alaMldForwardGroupAddress
   alaMldForwardHostAddress
   alaMldForwardDestAddress
   alaMldForwardOrigAddress
   alaMldForwardType
   alaMldForwardNextVlan
   alaMldForwardNextIfIndex
   alaMldForwardNextDestAddress
   alaMldForwardNextType
   alaMldForwardTtl
```

show ipv6 multicast neighbor

Displays the MLD neighbor table entries of IPv6 Multicast Switching and Routing.

show ipv6 multicast neighbor

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 multicast neighbor

Total 2 Neighbors
Host Address              VLAN  Port  Static  Count  Life
------------------------+-----+-----+-------+------+-----
fe80::2a0:ccff:fed3:2853  1     2/1/1   no      1      6
::                        1     2/1/13  yes     0      0
```

output definitions

Host Address	The IPv6 address of the IPv6 multicast neighbor.
VLAN	The VLAN associated with the IPv6 multicast neighbor.
Port	The slot and port number of the IPv6 multicast neighbor.
Static	Whether it is a static MLD neighbor or not.
Count	Displays the count of the IPv6 multicast neighbor.
Life	The life time of the IPv6 multicast neighbor.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 multicast max-group	Creates a static MLD neighbor entry on a specified port on a specified VLAN.

MIB Objects

```
alaMldNeighborTable
   alaMldNeighborVlan
   alaMldNeighborIfIndex
   alaMldNeighborHostAddress
   alaMldNeighborCount
   alaMldNeighborTimeout
   alaMldNeighborUpTime
alaMldStaticNeighborTable
   alaMldStaticNeighborVlan
   alaMldStaticNeighborIfIndex
   alaMldStaticNeighborRowStatus
```

show ipv6 multicast querier

Displays the MLD querier table entries of IPv6 Multicast Switching and Routing.

show ipv6 multicast querier

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 multicast querier

Total 2 Queriers
Host Address              VLAN  Port  Static  Count  Life
-------------------------+-----+-----+-------+------+-----
fe80::2a0:ccff:fed3:2853  1     2/1/1   no      1      6
::                        1     2/1/13  yes     0      0
```

output definitions

Host Address	The IPv6 address of the IPv6 multicast querier.
VLAN	The VLAN associated with the IPv6 multicast querier.
Port	The slot and port number of the IPv6 multicast querier.
Static	Whether it is a static MLD neighbor or not.
Count	Displays the count of the IPv6 multicast querier.
Life	The life time of the IPv6 multicast querier.

Release History

Release 8.1.1; command introduced

Related Commands

ipv6 multicast static-querier	Creates a static MLD querier entry on a specified port on a specified VLAN.

MIB Objects

```
alaMldQuerierTable
   alaMldQuerierVlan
   alaMldQuerierIfIndex
   alaMldQuerierHostAddress
   alaMldQuerierCount
   alaMldQuerierTimeout
   alaMldQuerierUpTime
alaMldStaticQuerierTable
   alaMldStaticQuerierVlan
   alaMldStaticQuerierIfIndex
   alaMldStaticQuerierRowStatus
```

show ipv6 multicast group

Displays the MLD group membership table entries of IPv6 Multicast Switching and Routing for the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified.

show ipv6 multicast group [*ip_address***]**

Syntax Definitions

ip_address	IPv6 multicast group address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 multicast group

Total 3 Groups
Group Address    Source Address  VLAN  Port  Mode     Static  Count  Life
----------------+---------------+-----+-----+--------+-------+------+-----
ff05::5          ::              1     2/1/1   exclude  no      1      145
ff05::6          3333::1         1     2/1/1   exclude  no      1      242
ff05::9          ::              1     2/1/13  exclude  yes     0      0

-> show ipv6 multicast group ff05::5

Group Address    Source Address  VLAN  Port  Mode     Static  Count  Life
----------------+---------------+-----+-----+--------+-------+------+-----
ff05::5          ::              1     2/1/1   exclude  no      1      145
```

output definitions

Group Address	IPv6 address of the IPv6 multicast group.
Source Address	IPv6 address of the IPv6 multicast source.
VLAN	The VLAN associated with the IPv6 multicast group.
Port	The slot and port number of the IPv6 multicast group.
Mode	MLD source filter mode.
Static	Whether it is a static MLD group or not.
Count	Number of MLD membership requests made.
Life	Life time of the MLD group membership.

Release History

Release 8.1.1; command introduced

Related Commands

ipv6 multicast static-group	Creates a static MLD group entry on a specified port on a specified VLAN.

MIB Objects

```
alaMldMemberTable
   alaMldMemberVlan
   alaMldMemberIfIndex
   alaMldMemberGroupAddress
   alaMldMemberSourceAddress
   alaMldMemberMode
   alaMldMemberCount
   alaMldMemberTimeout
   alaMldMemberUpTime
alaMldStaticMemberTable
   alaMldStaticMemberVlan
   alaMldStaticMemberIfIndex
   alaMldStaticMemberGroupAddress
   alaMldStaticMemberRowStatus
```

show ipv6 multicast source

Displays the IPv6 Multicast Switching and Routing source table entries matching the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified.

show ipv6 multicast source [*ip_address***]**

Syntax Definitions

ip_address	IPv6 multicast group address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 multicast source

Total 1 Sources
Group Address   Host Address    Tunnel Address  VLAN  Port
---------------+---------------+---------------+-----+-----
ff05::6         4444::2         ::              1     2/1/1

-> show ipv6 multicast source ff05::6

Total 1 Sources
Group Address   Host Address    Tunnel Address  VLAN  Port
---------------+---------------+---------------+-----+-----
ff05::6         4444::2         ::              1     2/1/1
```

output definitions

Group Address	IPv6 group address of the IPv6 multicast source.
Host Address	IPv6 host address of the IPv6 multicast source.
Tunnel Address	IPv6 source tunnel address of the IPv6 multicast source.
VLAN	VLAN associated with the IPv6 multicast source.
Port	The slot and port number of the IPv6 multicast source.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 multicast static-group	Creates a static MLD group entry on a specified port on a specified VLAN.

MIB Objects

```
alaMldSourceTable
   alaMldSourceVlan
   alaMldSourceIfIndex
   alaMldSourceGroupAddress
   alaMldSourceHostAddress
   alaMldSourceDestAddress
   alaMldSourceOrigAddress
   alaMldSourceType
   alaMldSourceUpTime
```

show ipv6 multicast tunnel

Displays the IPv6 Multicast Switching and Routing tunneling table entries matching the specified IPv6 multicast group address, or all entries if no IPv6 multicast address is specified.

show ipv6 multicast tunnel [*address***]**

Syntax Definitions

address	IPv6 multicast group address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 multicast tunnel
Total 1 Tunnels
                                                Ingress
Group Address    Host Address   Tunnel Address  VLAN  Port
----------------+--------------+---------------+-----+-----
ff05::6          4444::2        3333::2         1     2/1/1
```

output definitions

Group Address	IPv6 group address of the IPv6 multicast tunnel.
Host Address	IPv6 host address of the IPv6 multicast tunnel.
Tunnel Address	IPv6 source tunnel address of the IPv6 multicast tunnel.
VLAN	VLAN associated with the IPv6 multicast tunnel.
Port	The slot and port number of the IPv6 multicast tunnel.

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 multicast source	Displays the IPv6 Multicast Switching and Routing source table entries matching the specified IPv6 multicast group address or all entries if no IPv6 multicast group address is specified

MIB Objects

```
alaMldTunnelTable
    alaMldTunnelVlan
    alaMldTunnelIfIndex
    alaMldTunnelGroupAddress
    alaMldTunnelHostAddress
    alaMldTunnelDestAddress
    alaMldTunnelOrigAddress
    alaMldTunnelType
    alaMldTunnelNextDestAddress
    alaMldTunnelNextType
```

show ipv6 multicast initial-packet-buffer

Displays the status and configuration parameters of initial multicast packet buffer for IPv6 flows on the switch.

show ipv6 multicast initial-packet-buffer

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 multicast initial-packet-buffer
Admin-status       = disabled,
Max Packet         = 4,
Max Flow           = 32,
Timeout(seconds)   = 10
```

output definitions

Admin-status	The status of IPv6 initial multicast packet buffer.
Max Packet	The maximum number of initial packets buffered per IPv6 multicast flow.
Max Flow	The maximum number of IPv6 multicast flows buffered for initial packet buffering.
Timeout (seconds)	The timeout value for the buffered IPv6 initial multicast packets in seconds.

Release History

Release 8.2.1; command introduced.

Related Commands

ipv6 multicast initial-packet-buffer admin-state	Enables or disables the initial packet buffering feature globally for IPv6 multicast flows on the switch.
ipv6 multicast initial-packet-buffer max-packet	Configures the maximum number of initial packets buffered per IPv6 multicast flow.
ipv6 multicast initial-packet-buffer max-flow	Configures the maximum number of IPv6 multicast flows buffered for initial packet.
ipv6 multicast initial-packet-buffer timeout	Configures the timeout value for the buffered IPv6 initial multicast packets.

29 DVMRP Commands

This chapter includes CLI command descriptions for Distance Vector Multicast Routing Protocol (DVMRP), version 3.

DVMRPv3 is a dense-mode multicast routing protocol that enables routers to efficiently propagate IP multicast traffic through a network. Multicast traffic consists of a data stream that originates from a single source and is sent to hosts that have subscribed to that stream. Live video broadcasts, video conferencing, corporate communications, distance learning, and distribution of software, stock quotes, and news services are examples of multicast traffic.

For more information about configuring DVMRP, see the applicable *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide*.

MIB information for the DVMRP commands is as follows:

Filename: AlcatelIND1Dvmrp.MIB
Module: ALCATEL-IND1-DVMRP-MIB

Filename: IETF_DVMRP_STD_DRAFT.MIB
Module: DVMRP-STD-MIB

A summary of the available commands is listed here:

ip load dvmrp
ip dvmrp admin-state
ip dvmrp flash-interval
ip dvmrp graft-timeout
ip dvmrp interface
ip dvmrp interface metric
ip dvmrp interface mbr-default-information
ip dvmrp neighbor-interval
ip dvmrp neighbor-timeout
ip dvmrp prune-lifetime
ip dvmrp prune-timeout
ip dvmrp report-interval
ip dvmrp route-holddown
ip dvmrp route-timeout
ip dvmrp subord-default
ip interface tunnel
show ip dvmrp
show ip dvmrp interface
show ip dvmrp neighbor
show ip dvmrp nexthop
show ip dvmrp prune
show ip dvmrp route
show ip dvmrp tunnel

ip load dvmrp

Dynamically loads DVMRP to memory.

ip load dvmrp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command must be executed before DVMRP can be configured on the switch. In addition, DVMRP must be administratively enabled before you can run the protocol on the switch. For more information, refer to the **ip dvmrp admin-state** command on page 29-3.

Examples

```
-> ip load dvmrp
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip dvmrp admin-state	Globally enables or disables DVMRP protocol on the switch.

MIB Objects

```
alaDrcTmConfig
   alaDrcTmIPDvmrpStatus
```

ip dvmrp admin-state

Globally enables or disables DVMRP protocol on the switch.

ip dvmrp admin-state {enable | disable}

Syntax Definitions

enable	Administratively enables DVMRP on the switch.
disable	Administratively disables DVMRP on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command must be set to **enable** before DVMRP can run on the switch. In addition, the **ip load dvmrp** command must be issued. For more information, refer to the **ip load dvmrp** command on page 29-2.
- To enable or disable DVMRP for a particular interface, refer to the **ip dvmrp interface** command on page 29-6.

Examples

```
-> ip dvmrp admin-state enable
-> ip dvmrp admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip dvmrp interface	Enables or disables the DVMRP protocol on a specified interface.
ip load dvmrp	Dynamically loads DVMRP to memory.
show ip dvmrp	Displays global DVMRP parameters, including current status.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpAdminStatus
```

ip dvmrp flash-interval

Configures the minimum flash update interval value. The flash update interval defines how often routing table change messages are sent to neighboring DVMRP routers.

ip dvmrp flash-interval *seconds*

Syntax Definitions

seconds	Specifies the interval value, in seconds (5–86400).

Defaults

parameter	default
seconds	5

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Because routing table change messages are sent between the transmission of complete routing tables, the flash update interval value must be lower than the route report interval.

Examples

```
-> ip dvmrp flash-interval 5
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip dvmrp	Displays global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpFlashUpdateInterval
```

ip dvmrp graft-timeout

Configures the graft message retransmission value. The graft message retransmission value is the duration of time that the routing switch will wait before retransmitting a graft message if it has not received an acknowledgement from its neighbor.

ip dvmrp graft-timeout *seconds*

Syntax Definitions

seconds	Specifies the graft message retransmission value, in seconds (5–86400).

Defaults

parameter	default
seconds	5

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip dvmrp graft-timeout 5
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip dvmrp	Displays global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpGraftRetransmission
```

ip dvmrp interface

Enables or disables the DVMRP protocol on a specified interface.

ip dvmrp interface {*interface_name***}**

no ip dvmrp interface {*interface_name***}**

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to delete an interface.

Examples

```
-> ip dvmrp interface vlan-10
-> no ip dvmrp interface vlan-10
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip dvmrp admin-state	Globally enables or disables the DVMRP protocol on the switch.
ip dvmrp interface metric	Configures the distance metric for an interface, which is used to calculate distance vectors.
show ip dvmrp interface	Displays information for all multicast-capable interfaces.

MIB Objects

```
dvmrpInterfaceTable
   dvmrpInterfaceLocalAddress
   dvmrpInterfaceStatus
```

ip dvmrp interface metric

Configures the distance metric for an interface, which is used to calculate distance vectors. DVMRP uses the distance metric value to determine the most cost-effective way to pass data through the network.

ip dvmrp interface *interface_name* **metric** *value*

Syntax Definitions

interface_name	The name of the interface.
value	Specifies the metric value (1–31).

Defaults

parameter	default
value	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

DVMRP uses the distance metric value to determine the most cost-effective way to pass data through the network. The higher the distance metric value, the higher the cost.

Examples

```
-> ip dvmrp interface vlan-2 metric 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip dvmrp interface	Enables or disables the DVMRP protocol on a specified interface.
show ip dvmrp interface	Displays the DVMRP interface table.

MIB Objects

```
dvmrpInterfaceTable
   dvmrpInterfaceLocalAddress
   dvmrpInterfaceMetric
```

ip dvmrp interface mbr-default-information

Configures a DVMRP interface to advertise the default route for the interface. This command only applies when the local switch is operating in the Multicast Border Router (MBR) mode.

ip dvmrp interface *interface_name* **mbr-default-information {enable | disable}**

Syntax Definitions

interface_name	The name of the interface.
enable	Enables advertisement of the default route on the specified interface.
disable	Disables advertisement of the default route on the specified interface.

Defaults

By default, advertising the default route is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Advertising a default route on the DVMRP interface provides a method for ensuring that sources inside the PIM domain can reach all routers inside the DVMRP domain.
- Make sure that the default route is not advertised on the MBONE.

Examples

```
-> ip dvmrp interface mbr-default-information enable
-> ip dvmrp interface mbr-default-information disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip dvmrp interface	Enables or disables the DVMRP protocol on a specified interface.
show ip dvmrp interface	Displays the DVMRP interface table.

MIB Objects

```
alaDvmrpIfAugTable
   alaDvmrpIfMbrDefaultInfoStatus
```

ip dvmrp neighbor-interval

Configures the neighbor probe interval time. The neighbor probe interval time specifies how often probes are transmitted on DVMRP-enabled interfaces.

ip dvmrp neighbor-interval *seconds*

Syntax Definitions

seconds	Specifies the probe interval time, in seconds (5–30).

Defaults

parameter	default
seconds	10

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip dvmrp neighbor-interval 10
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip dvmrp neighbor-timeout	Configures the neighbor timeout.
show ip dvmrp neighbor	Displays the DVMRP neighbor table.
show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpNeighborProbeInterval
```

ip dvmrp neighbor-timeout

Configures the neighbor timeout. This value specifies how long the switch will wait for activity from a neighboring DVMRP router before assuming that the inactive router is down.

ip dvmrp neighbor-timeout *seconds*

Syntax Definitions

seconds	Specifies the neighbor timeout, in seconds (5–86400).

Defaults

parameter	default
seconds	35

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip dvmrp neighbor-timeout 35
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip dvmrp neighbor-interval	Configures the neighbor probe interval time.
show ip dvmrp neighbor	Displays the DVMRP neighbor table.
show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpNeighborTimeout
```

ip dvmrp prune-lifetime

Indicates the length of time a prune will be in effect—i.e., its *lifetime*. When the prune lifetime expires, the interface is joined back onto the multicast delivery tree. If unwanted multicast datagrams continue to arrive, the prune mechanism will be re-initiated and the cycle will continue.

ip dvmrp prune-lifetime *seconds*

Syntax Definitions

seconds	Specifies the prune lifetime, in seconds (180–86400).

Defaults

parameter	default
seconds	7200

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip dvmrp prune-lifetime 7200
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip dvmrp prune-timeout	Configures the prune packet retransmission value.
show ip dvmrp prune	Displays DVMRP prune entries, including the router's upstream prune state.
show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpPruneLifetime
```

ip dvmrp prune-timeout

Configures the prune packet retransmission value. This value is the duration of time that the routing switch will wait if it continues to receive unwanted multicast traffic before retransmitting a prune message.

ip dvmrp prune-timeout *seconds*

Syntax Definitions

seconds	Specifies retransmission time, in seconds (30–86400).

Defaults

parameter	default
seconds	30

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip dvmrp prune-timeout 30
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip dvmrp prune-lifetime	Indicates the length of time a prune will be in effect.
show ip dvmrp prune	Displays DVMRP prune entries, including the router's upstream prune state.
show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpPruneRetransmission
```

ip dvmrp report-interval

Configures the route report interval. This value defines how often the switch will send its complete routing table to neighboring routers running DVMRP.

ip dvmrp report-interval *seconds*

Syntax Definitions

seconds	Specifies the report interval, in seconds (10–2000).

Defaults

parameter	default
seconds	60

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip dvmrp report-interval 60
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip dvmrp route	Displays the DVMRP routes that are being advertised to other routers.
show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpRouteReportInterval
```

ip dvmrp route-holddown

Configures the time during which DVMRP routes are kept in a hold down state. A holddown state refers to the time that a route to an inactive network continues to be advertised.

ip dvmrp route-holddown *seconds*

Syntax Definitions

seconds	Specifies the holddown time, in seconds (1–86400).

Defaults

parameter	default
seconds	120

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip dvmrp route-holddown 120
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip dvmrp route-timeout	Configures the route expiration timeout value.
show ip dvmrp	Displays the global DVMRP parameters.
show ip dvmrp route	Displays the DVMRP routes that are being advertised to other routers.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpRouteHoldDown
```

ip dvmrp route-timeout

Configures the route expiration timeout value. The route expiration timeout value specifies how long the switch will wait before aging out a route. When the route expiration timeout expires, the route is advertised as being in holddown until either its activity resumes or it is deleted from the route table.

ip dvmrp route-timeout *seconds*

Syntax Definitions

seconds	Specifies the timeout value, in seconds (20–4000).

Defaults

parameter	default
seconds	140

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip dvmrp route-timeout 140
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip dvmrp route-holddown	Configures the time during which DVMRP routes are kept in a hold down state.
show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpRouteExpirationTimeout
```

ip dvmrp subord-default

Changes the initial default assumption on a neighbor's subordinate or non-subordinate status. When the status value is true, DVMRP neighbors are assumed to be subordinate and traffic is automatically forwarded to the neighbor upon initial discovery. When the value is false, traffic is not forwarded to the neighbor until route reports have been exchanged and the neighbor has explicitly expressed dependency.

ip dvmrp subord-default {true | false}

Syntax Definitions

true	DVMRP neighbors are assumed subordinate; traffic is automatically forwarded to the neighbor on initial discovery.
false	DVMRP neighbors are *not* assumed to be subordinate; traffic is not forwarded until route reports have been exchanged and the neighbor has explicitly expressed dependency.

Defaults

parameter	default
true | false	**true**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- However, if neighbors in the DVMRP domain have difficulty handling large initial bursts of traffic, it is recommended that the neighbor's default status as a suboridinate be changed to false.
- To view the current subordinate neighbor status, use the **show ip dvmrp** command. For more information, refer to page 29-20.

Examples

```
-> ip dvmrp subord-default false
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ip dvmrp	Displays the global DVMRP parameters.

MIB Objects

```
alaDvmrpGlobalConfig
   alaDvmrpInitNbrAsSubord
```

ip interface tunnel

Configures the end points for the GRE and IPIP tunnels.

ip interface *name* **tunnel [source** *ip_address***] [destination** *ip_address***] [protocol {ipip | gre}]**

no ip dvmrp interface *name*

Syntax Definitions

name	Text string up to 20 characters. Use quotes around string if description contains multiple words with spaces between them (e.g. “Alcatel-Lucent Marketing”). Note that this value is case sensitive.
source *ip_address*	Source IP address of the tunnel.
destination *ip_address*	Destination IP address of the tunnel.
ipip	Specifies the tunneling protocol as IPIP.
gre	Specifies the tunneling protocol as GRE.

Defaults

parameter	default
ipip | gre	**ipip**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You can configure an interface as either a vlan or tunnel interface.
- The maximum number of GRE tunnel interfaces that can be configured on a switch is 8.
- The maximum number of IPIP tunnel interfaces that can be configured on a switch is 127.
- Use the **no** form of this command to remove an IP interface.

Examples

```
-> ip interface “tnl-1” tunnel source 23.23.23.1 destination 155.2.2.2 protocol gre
-> ip interface “tnl-1” tunnel source 23.23.23.1 destination 155.2.2.2 protocol
ipip
```

Release History

Release 8.1.1; command introduced

Related Commands

show ip dvmrp interface	Displays information for all multicast-capable interfaces or for a specified interface. This command also provides options to display only DVMRP-enabled or DVMRP-disabled interfaces.

```

show ip dvmrp

Displays the global DVMRP parameters configuration.

show ip dvmrp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip dvmrp
DVMRP Admin Status          = enabled,
Flash Interval              = 5,
Graft Timeout               = 5,
Neighbor Interval           = 10,
Neighbor Timeout            = 35,
Prune Lifetime              = 7200,
Prune Timeout               = 30,
Report Interval             = 60,
Route Holddown              = 120,
Route Timeout               = 140,
Subord Default              = true,
BFD status                  = disabled,
MBR Operational Status      = enabled,

Number of Routes            = 3,
Number of Reachable Routes  = 3
```

output definitions

DVMRP Admin Status	The current global (i.e., switch-wide) status of DVMRP, which can be **enabled** or **disabled**. To change the current DVMRP global status, use the **ip dvmrp admin-state** command.
Flash Interval	The current minimum flash update interval value, in seconds. The flash interval defines how often routing table change messages are sent to neighboring DVMRP routers. Because routing table change messages are sent between the transmission of complete routing tables, the flash update interval must be shorter than the route report interval. The default value is 5.

output definitions (continued)

Graft Timeout	The graft message retransmission value, in seconds. The graft message retransmission value defines the duration of time that the routing switch will wait before retransmitting a graft message if it has not received an acknowledgement from its neighbor. Values may range from 5–86400. The default value is 5.
Neighbor Interval	The current neighbor probe interval time, in seconds. The neighbor probe interval time specifies how often probes are transmitted to interfaces with attached DVMRP neighbors. Values may range from 5–30. The default value is 10.
Neighbor Timeout	The current neighbor timeout value, in seconds. This value specifies how long the routing switch will wait for activity from a neighboring DVMRP router before assuming the inactive router is down. Values may range from 5–86400. The default value is 35.
Prune Lifetime	The length of time, in seconds, a prune will be in effect. When the prune lifetime expires, the interface is joined back onto the multicast delivery tree. If unwanted multicast datagrams continue to arrive, the prune mechanism will be re-initiated and the cycle will continue. Values may range from 180–86400. The default value is 7200.
Prune Timeout	The current prune packet retransmission value, in seconds. This value indicates the duration of time that the routing switch will wait if it continues to receive unwanted multicast traffic before retransmitting a prune message. Values range from 30–86400. The default value is 30.
Report Interval	The current route report interval, in seconds. The route report interval defines how often routers will send their complete routing tables to neighboring routers running DVMRP. Values may range from 10–2000. The default value is 60.
Route Holddown	The current holddown time, in seconds. This value indicates the time during which DVMRP routes are kept in a holddown state. A holddown state refers to the time that a route to an inactive network continues to be advertised. Values may range from 1–120. The default value is 120.
Route Timeout	The current route expiration timeout value, in seconds. The route expiration timeout value specifies how long the routing switch will wait before aging out a route. Values may range from 20–4000. The default value is 140.
Subord Default	Displays the initial default assumption on a neighbor's subordinate or non-subordinate status. When the status value is true, DVMRP neighbors are assumed to be subordinate and traffic is automatically forwarded to the neighbor upon initial discovery. When the value is false, traffic is not forwarded to the neighbor until route reports have been exchanged and the neighbor has explicitly expressed dependency. To change the current subordinate neighbor status, use the **ip dvmrp subord-default** command. Options include **true** and **false**. The default value is true.
BFD Status	Not supported in the current release.
MBR Operational Status	Indicates whether or not DVMRP interaction with PIM is **enabled** or **disabled** on a MBR switch. MBR functionality is not operationally active until both PIM and DVMRP have at least one enabled and active interface.

output definitions (continued)

Number of Routes	The number of entries in the routing table. This number can be used to monitor the routing table size and detect illegal advertisements of unicast routes.
Number of Reachable Routes	The total number of reachable routes. The number of entries in the routing table with non-infinite metrics. This number can be used to detect network partitions by observing the ratio of reachable routes to total routes. Routes with unreachable metrics, routes in a holddown state, and routes that have aged out are not considered reachable.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip dvmrp admin-state	Globally enables or disables DVMRP protocol on the switch.
ip dvmrp flash-interval	Configures the minimum flash update interval value.
ip dvmrp graft-timeout	Configures the graft message retransmission value.
ip dvmrp neighbor-timeout	Configures the neighbor timeout.
ip dvmrp prune-lifetime	Indicates the length of time a prune will be in effect.
ip dvmrp prune-timeout	Configures the prune packet retransmission value.
ip dvmrp report-interval	Configures the route report interval.
ip dvmrp route-holddown	Configures the time during which DVMRP routes are kept in a hold down state.
ip dvmrp route-timeout	Configures the route expiration timeout value.
ip dvmrp subord-default	Configures the neighbor probe interval time.

show ip dvmrp interface

Displays information for all multicast-capable interfaces *or* for a specified interface. This command also provides options to display only DVMRP-enabled or DVMRP-disabled interfaces.

show ip dvmrp interface [*ip_address* **|** *interface_name* **| enabled | disabled]**

Syntax Definitions

ip_address	Specifies a particular interface IP address.
interface_name	The name of the interface.
enabled	Displays a list of all interfaces (i.e., VLAN router ports) on which DVMRP is currently *enabled*.
disabled	Displays a list of all interfaces (i.e., VLAN router ports) on which DVMRP is currently *disabled*.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If no optional syntax is specified in the command line, the entire interface table is displayed.
- For an interface to show as **enabled** in the **show ip dvmrp interface** or **show ip dvmrp interface enabled** output, the interface must be both administratively *and* operationally enabled. Although the interface does not have to be passing traffic, at least one VLAN router port must be operational on the corresponding DVMRP-enabled VLAN.
- To view the Generation ID being used on a particular interface, you must include the interface IP address in the command line.

Examples

```
-> show ip dvmrp interface

Total 4 Interfaces

Interface Name      Vlan  Metric  Admin-Status  Oper-Status  BFD-Status MBR-Default
------------------+-----+------+-------------+------------+----------+-----------
vlan-4                4       1   Disabled      Disabled      Disabled   Disabled
vlan-6                6       1    Enabled       Enabled      Disabled    Enabled
```

```
-> show ip dvmrp interface enabled

Total 1 Interfaces

Interface Name      Vlan  Metric  Admin-Status  Oper-Status  BFD-Status MBR-Default
------------------+-----+------+-------------+-------------+----------+-----------
vlan-6                6       1   Enabled       Enabled       Disabled   Enabled
```

output definitions

Interface Name	The name of the interface.
Vlan	The associated VLAN ID.
Tunnel	Indicates whether there is a DVMRP tunnel currently configured on the interface.
Metric	The current metric value. A metric is essentially used to determine the most cost-effective way to pass data through the network. The higher the metric value, the higher the cost.
Admin-Status	The current administrative status of the corresponding interface. Options include **Enabled** or **Disabled**. An interface can be configured for DVMRP without being operational. To change the DVMRP Admin-status for an individual interface, refer to the **ip dvmrp interface** command.
Oper-Status	The current operational status of the corresponding multicast-capable interface. Options include **Enabled** or **Disabled**. For an interface to be DVMRP-operational, the global DVMRP status must be enabled and the individual interface must be DVMRP-enabled. To change the global DVMRP status, refer to the **ip dvmrp admin-state** command.
BFD-Status	Nost supported in the current release.
MBR-Default	Whether or not the DVMRP interface will advertise a default route when the interface is configured on a Multicast Border Router. Options include **Enabled** or **Disabled**. Configured through the **ip dvmrp interface mbr-default-information** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip dvmrp interface	Enables or disables the DVMRP protocol on a specified interface.

MIB Objects

```

show ip dvmrp neighbor

Displays the DVMRP neighbor table. The DVMRP neighbor table displays either all neighboring DVMRP routers, or a specified neighboring DVMRP router.

show ip dvmrp neighbor [*ip_address***]**

Syntax Definitions

ip_address	Specifies a particular IP address for a neighboring DVMRP router.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If a neighbor IP address is not specified, the entire DVMRP Neighbor Table is displayed.

Examples

```
-> show ip dvmrp neighbor

Neighbor Address   Intf Name     Uptime      Expires     GenID     Vers  State
----------------+------------+-----------+-----------+----------+------+-------
143.209.92.214    vlan-2      00h:09m:12s 00h:00m:06s 546947509 3.255  active
```

output definitions

Neighbor Address	The 32-bit IP address of the DVMRP neighbor's router interface.
Itnf Name	The interface name of the neighbor's router.
Uptime	The amount of time the neighbor has been running, displayed in hours, minutes, and seconds.
Expires	The amount of time remaining before the neighbor expires, displayed in hours, minutes, and seconds.
GenID	The generation ID for the DVMRP neighbor. This value is used by neighboring routers to detect whether the DVMRP routing table should be resent.
Version	The DVMRP version number for the neighbor.
State	The current state of the DVMRP neighbor. Options include **active** and **down**.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip dvmrp neighbor-interval	Configures the neighbor probe interval time.
ip dvmrp neighbor-timeout	Configures the neighbor timeout.

MIB Objects

   dvmrpNeighborExpiryTime
   dvmrpNeighborGenerationId
   dvmrpNeighborMajorVersion
   dvmrpNeighborMinorVersion
   dvmrpNeighborState
```

show ip dvmrp nexthop

Displays DVMRP next hop entries. This command is used to show the list of next hops on outgoing interfaces to which IP multicast datagrams from particular sources are routed.

show ip dvmrp nexthop [*ip_address ip_mask***]**

Syntax Definitions

ip_address	Specifies a source IP address for which DVMRP next hop entries will be displayed.
ip_mask	Specifies a source IP mask for which DVMRP next hop entries will be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If an IP address and IP mask are not specified, the entire DVMRP Next Hop table is displayed.

Examples

```
-> show ip dvmrp nexthop 172.22.2.115 255.255.255.0

Src Address/Mask       Interface Name     Vlan    Hop Type
-------------------+-------------------+-------+----------

     172.22.2.115/24  vlan-2               2      branch
```

output definitions

Src Address/Mask	The 32-bit source IP address, along with the mask length, shown in bits. The source IP address and mask are separated by a slash (/).
Interface Name	The name of the interface.
Vlan	The associated VLAN ID.
Hop Type	The hop type of the associated entry (**leaf** or **branch**). If the next hop VLAN has a DVMRP neighbor attached to it, the hop type will be displayed as **branch**.

Release History

Release 8.1.1; command was introduced.

show ip dvmrp prune

Displays DVMRP prune entries that have been sent upstream.

show ip dvmrp prune [*group_address source_address source_mask***]**

Syntax Definitions

group_address	Specifies a pruned group address.
source_address	Specifies a source IP address.
source_mask	Specifies a source IP mask.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If a group address, source address, and source mask are not specified, the entire Prune table is displayed.

Examples

```
-> show ip dvmrp prune

Group Address     Source Address/Mask    Expires
-----------------+---------------------+-------------
224.0.0.4           143.209.92.14/24    00h:00m:30s
```

output definitions

Group Address	The 32-bit multicast group address.
Source Address/Mask	The 32-bit source IP address, along with the mask length, shown in bits. The source IP address and mask are separated by a slash (/).
Expires	The amount of time remaining before the current prune state expires, displayed in hours, minutes, and seconds.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip dvmrp prune-lifetime	Indicates the length of time a prune will be in effect.
ip dvmrp prune-timeout	Configures the prune packet retransmission value.

MIB Objects

```
dvmrpPruneTable
   dvmrpPruneGroup
   dvmrpPruneSource
   dvmrpPruneSourceMask
   dvmrpPruneExpiryTime
```

show ip dvmrp route

Displays the DVMRP routes that are being advertised to other routers.

show ip dvmrp route [*ip_address ip_mask***]**

Syntax Definitions

ip_address	The 32-bit source IP address representing route(s).
ip_mask	A 32-bit number that determines the subnet mask for the IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If a source IP address and IP mask are not specified, the entire DVMRP route table is displayed.

Examples

```
-> show ip dvmrp route
Legends:  Flags:  L = Local, R = Remote, F = Flash, H = Holddown, I = Invalid
     Address/Mask        Gateway       Metric     Age      Expires  Flags
------------------+-----------------+------+-----------+---------+-----
       11.0.0.0/8     55.0.0.5           2    00h:13m:14s  02m:07s    R
       22.0.0.0/8     44.0.0.4           2    00h:33m:14s  02m:15s    R
       44.0.0.0/8           -            1    05h:24m:59s     -       L
       55.0.0.0/8           -            1    05h:24m:59s     -       L
       66.0.0.0/8     44.0.0.4           2    00h:03m:11s  02m:15s    R
```

output definitions

Address/Mask	The 32-bit IP address for the router interface, along with the corresponding subnet mask. The interface's subnet mask is shown using the CIDR prefix length: 255.0.0.0 equals /8; 255.255.0.0 equals /16; 255.255.255.0 equals /24, etc.
Gateway	The corresponding 32-bit gateway address. Because it is not applicable, no gateway address is displayed for local routes.
Metric	The current metric value. A metric is essentially used to determine the most cost-effective way to pass data through the network. The higher the metric value, the higher the cost.
Age	The current age of the DVMRP route, displayed in hours, minutes, and seconds.

output definitions (continued)

Expires	The expiration time for the corresponding route. Because it is not applicable, no expiration time is displayed for local routes.
Flags	The flag type of a particular DVMRP route. Options include **L** (Local), **R** (Remote), **F** (Flash), **H** (Holddown), and **I** (Invalid).

Release History

Release 8.1.1; command was introduced.

Related Commands

ip dvmrp report-interval	Configures the route report interval.
ip dvmrp route-holddown	Configures the time during which DVMRP routes are kept in a hold down state.
ip dvmrp route-timeout	Configures the route expiration timeout value.

MIB Objects

```
dvmrpRouteTable
   dvmrpRouteSource
   dvmrpRouteSourceMask
   dvmrpRouteMetric
   dvmrpRouteExpiryTime
   dvmrpRouteUpTime
```

show ip dvmrp tunnel

Displays DVMRP tunnel entries.

show ip dvmrp tunnel [*local_address remote_address***]**

Syntax Definitions

local_address	The IP address of a particular local router interface. The local router interface IP address is an identifier for the local end of the DVMRP tunnel.
remote_mask	The IP address of a particular remote router interface. The remote router interface IP address is an identifier for the remote end of the DVMRP tunnel.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If optional local and remote IP address information is not specified, entire DVMRP Tunnels table is displayed.
- The local IP address of the tunnel must match the IP address of an existing DVMRP-enabled IP interface.

Examples

```
-> show ip dvmrp tunnel

Interface Name       Local Address     Remote Address    TTL    Status
-------------------+-----------------+-----------------+-----+----------
vlan-2              143.209.92.203   12.0.0.1          255    Enabled
```

output definitions

Interface Name	The interface name.
Local Address	The 32-bit local IP address for the DVMRP tunnel.
Remote Address	The 32-bit remote IP address for the DVMRP tunnel.
TTL	The current Time to Live (TTL) value. A value of 0 indicates that the value is copied from the payload's header. Values may range from 0–255.
Status	The corresponding interface status. Options include **Enabled** or **Disabled**. If the interface specified by the local address has been configured and is operationally enabled, the status is **Enabled**. If the interface is down, the value displayed is **Disabled**.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip interface tunnel	Adds or deletes a DVMRP tunnel.
show ip dvmrp	Configures the TTL value for the tunnel defined for the specified local address and remote address.

MIB Objects

```
tunnelIfTable
   tunnelIfLocalAddress
   tunnelIfRemoteAddress
   tunnelIfHopLimit

   dvmrpInterfaceStatus
```

30 PIM Commands

Protocol-Independent Multicast (PIM) is an IP multicast routing protocol that uses routing information provided by unicast routing protocols, such as RIP and OSPF. Note that PIM is not dependent on any particular unicast routing protocol. Sparse mode PIM (PIM-SM) contrasts with flood-and-prune dense mode multicast protocols, such as DVMRP and PIM Dense Mode (PIM-DM), in that multicast forwarding in PIM-SM is initiated only through specific requests.

Downstream routers must explicitly join PIM-SM distribution trees to receive multicast streams on behalf of directly connected receivers or other downstream PIM-SM routers. This paradigm of receiver-initiated forwarding makes PIM ideal for network environments where receiver groups are thinly populated and bandwidth conservation is a concern, such as in wide area networks (WANs). PIM-DM uses RPF (Reverse Path Forwarding) to prevent looping of multicast datagrams while flooding. If some areas of the network do not have group members, PIM-DM will prune the forwarding branch by instantiating the prune state.

PIM-DM differs from PIM-SM in two essential ways:

- There are no periodic joins transmitted, only explicitly triggered prunes and grafts.
- There is no Rendezvous Point (RP). This is particularly important in networks that cannot tolerate a single point of failure.

Alcatel-Lucent implementation of PIM can also be configured in an IPv6 environment.

MIB information for the PIM commands is as follows:

Filename: ALCATEL-IND1-PIM-MIB.mib
Module: alcatelIND1PIMMIB

Filename: PIM-BSR-MIB.mib
Module: pimBsrMIB

Filename: PIM-STD-MIB.mib

ip load pim

Dynamically loads PIM to memory.

ip load pim

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command must be executed before PIM can run on the switch.
- This command is supported in both IPv4 and IPv6 PIM.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

Examples

```
-> ip load pim
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip pim sparse admin-state	Globally enables or disables the PIM-SM protocol on the switch.
show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
ip pim dense admin-state	Globally enables or disables PIM-DM protocol on the switch.
show ip pim dense	Displays the status of the various global parameters for the PIM Dense mode.
ipv6 pim sparse admin-state	Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.
show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.
ipv6 pim dense admin-state	Enables or disables the IPv6 PIM-DM (dense mode) globally for IPv6.
show ipv6 pim dense	Displays the status of the various global parameters for the IPv6 PIM dense mode.

MIB Objects

```
alaDrcTmConfig
   alaDrcTmIPPimStatus
```

ip pim sparse admin-state

Globally enables or disables PIM-SM protocol on the switch.

ip pim sparse admin-state {enable | disable}

Syntax Definitions

enable	Globally enables PIM-SM on the switch.
disable	Globally disables PIM-SM on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command must be set to **enable** before PIM-SM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to page 30-3 for more information.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

Examples

```
-> ip pim sparse admin-state enable
-> ip pim sparse admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip pim interface	Enables or disables the PIM protocol on a specific interface.
ip load pim	Dynamically loads PIM to memory.
show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmAdminStatus
```

ip pim dense admin-state

Globally enables or disables PIM-DM protocol on the switch.

ip pim dense admin-state {enable | disable}

Syntax Definitions

enable	Globally enables PIM-DM on the switch.
disable	Globally disables PIM-DM on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command must be set to **enable** before PIM-DM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to page 30-3 for more information.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

Examples

```
-> ip pim dense admin-state enable
-> ip pim dense admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip pim interface	Enables or disables the PIM protocol on a specific interface.

show ip pim dense	Displays the status of the various global parameters for the PIM dense mode.

MIB Objects

```
alaPimdmGlobalConfig
   alaPimdmAdminStatus
```

ip pim ssm group

Statically maps the specified IP multicast group to the PIM Source Specific Multicast mode (SSM).

ip pim ssm group *group_address/prefix_length* **[[no] override] [priority** *priority***]**

no ip pim ssm group *group_address/prefix_length*

Syntax Definitions

group_address	Specifies a 32-bit group address.
/prefix_length	Specifies the prefix length of the multicast group.
override	Specifies the static SSM mode mapping configuration to override the dynamically learned group mapping information for the specified group.
priority	Specifies the preference value to be used for this static SSM mode configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a SSM mode group mapping.
- The PIM Source-Specific Multicast (SSM) mode for the default SSM address range (232.0.0.0 through 232.255.255.255) reserved by the Internet Assigned Numbers Authority is not enabled automatically and needs to be configured manually to support SSM.
- You can also map additional multicast address ranges for the SSM group using this command. However, the multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- Specifying the priority value obsoletes the **override** option.
- Note that once the priority option has been defined, a value of 65535 can be used to un-set the priority

Examples

```
-> ip pim ssm group 224.0.0.0/4 priority 50
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ip pim ssm group	Displays the static configuration of multicast group mappings for the PIM-Source Specific Multicast (SSM) mode.
show ip pim group-map	Displays the PIM group mapping table.

   alaPimStaticRPGrpPrefixLength
   alaPimStaticRPOverrideDynamic
   alaPimStaticRPPrecedence
   alaPimStaticRPRowStatus
```

ip pim dense group

Statically maps the specified IP multicast group to the PIM Dense mode (DM).

ip pim dense group *group_address/prefix_length* **[[no] override] [priority** *priority***]**

no ip pim dense group *group_address/prefix_length*

Syntax Definitions

group_address	Specifies a 32-bit group address.
/prefix_length	Specifies the prefix length of the multicast group.
override	Specifies this static Dense mode mapping configuration to override the dynamically learned group mapping information for the specified group.
priority	Specifies the preference value to be used for this static configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a dense mode group mapping.
- This command specifies the mode as Dense (PIM-DM) for the specified multicast group address.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to un-set the priority.

Examples

```
-> ip pim dense group 224.0.0.0/4 priority 50
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim dense	Displays the status of the various global parameters for the PIM dense mode.
show ip pim dense group	Displays the static configuration of multicast group mappings for PIM-Dense Mode (DM).
show ip pim group-map	Displays the PIM group mapping table.

MIB Objects

   alaPimStaticRPRowStatus
```

ip pim cbsr

Configures the local router as the Candidate-BSR for the PIM domain.

ip pim cbsr *ip_address* **[priority** *priority***] [mask-length** *bits***]**

no ip pim cbsr *ip_address*

Syntax Definitions

ip_address	Specifies the 32-bit address that the local router uses to advertise itself as a Candidate-BSR.
priority	Specifies the priority value of the local router as a Candidate-BSR. The higher the value, the higher the priority. Values may range from 0 to 255.
bits	Specifies a 32-bit mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group).Values may range from 1 to 32.

Defaults

parameter	default
priority	64
bits	30

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the local routers candidature as the BSR.
- This command is supported only in the sparse mode.
- The information configured using this command is used in the Bootstrap messages.
- Candidate-BSRs also avoid a single point of failure in a PIM domain.

Examples

```
-> ip pim cbsr 50.1.1.1 priority 100 mask-length 4
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim cbsr	Displays the Candidate-BSR information that is used in the Bootstrap messages.

MIB Objects

```

   alaPimBsrCandidateBSRAddress
   alaPimBsrCandidateBSRPriority
   alaPimBsrCandidateBSRHashMaskLength
   alaPimBsrCandidateBSRRowStatus
```

ip pim static-rp

Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

ip pim static-rp *group_address/prefix_length rp_address* **[[no] override] [priority** *priority***]**

no ip pim static-rp *group_address/prefix_length rp_address*

Syntax Definitions

group_address	Specifies a 32-bit group address.
/prefix_length	Specifies the prefix length of the multicast group.
rp_address	Specifies a 32-bit Rendezvous Point (RP) address.
override	Specifies this static RP configuration to override the dynamically learned RP information for the specified group.
priority	Specifies the preference value to be used for the static RP configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a static RP configuration.
- Specifying the priority value obsoletes the **override** option.
- The PIM Source-Specific Multicast (SSM) mode for the default SSM address range (232.0.0.0 through 232.255.255.255) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM. You can also map additional multicast address ranges for the SSM group. However, the multicast groups in the reserved address range can be mapped only to the SSM mode.
- This command is supported only in the sparse mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Note that once the priority option has been defined, a value of 65535 can be used to un-set the priority
- To view current static RP configuration settings, use the **show ip pim static-rp** command.

Examples

```
-> ip pim static-rp 224.0.0.0/4 10.1.1.1 priority 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ip pim static-rp	Displays the PIM static RP table for ASM mode, which includes group address/prefix length, the static Rendezvous Point (RP) address, and the current status of static RP configuration (i.e., enabled or disabled).
show ip pim group-map	Displays the PIM group mapping table.

MIB Objects

```
alaPimStaticRPTable
   alaPimStaticRPGrpAddress
   alaPimStaticRPGrpPrefixLength
   alaPimStaticRPRPAddress
   alaPimStaticRPOverrideDynamic
   alaPimStaticRPPrecedence
   alaPimStaticRPRowStatus
```

ip pim candidate-rp

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IP multicast group.

ip pim candidate-rp *rp_address group-address/prefix_length* **[priority** *priority***] [interval** *seconds***]**

no ip pim candidate-rp *rp_address group-address/prefix_length*

Syntax Definitions

rp_address	Specifies a 32-bit address that will be advertised as a Candidate-RP.
group_address	Specifies a 32-bit group address for which the local router will advertise itself as a Candidate-RP.
/prefix_length	Specifies the prefix length of the multicast group.
priority	Specifies the priority value of the Candidate-RP. Values may range from 0 to 192. The lower the value, the higher the priority.
seconds	Specifies the interval at which the C-RP advertisements are sent to the bootstrap router, in seconds. Values may range from 1 to 300.

Defaults

parameter	default
priority	192
seconds	60

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a C-RP for a particular multicast group.
- The specified *rp_address* must belong to a PIM enabled interface.
- Only one RP address is supported per switch. If multiple candidate-RP entries are defined, they must specify the same *rp-address.*
- The priority and the interval values are used by the switch. If they are modified for one entry, the switch will modify these for all the candidate-rp entries.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim candidate-rp 50.1.1.1 224.0.0.0/4 priority 100 interval 100
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim candidate-rp	Displays the IP multicast groups for which the local router will advertise itself as a Candidate-RP.

MIB Objects

   alaPimBsrCandidateRPAddress
   alaPimBsrCandidateRPGroupAddress
   alaPimBsrCandidateRPGroupPrefixLength
   alaPimBsrCandidateRPPriority
   alaPimBsrCandidateRPAdvInterval
   alaPimBsrCandidateRPRowStatus
```

ip pim rp-threshold

Specifies the data rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing a source-specific (S, G) Join message toward the source.

ip pim rp-threshold *bps*

Syntax Definitions

bps	The data rate value, in bits per second, at which the RP will attempt to switch to native forwarding (0–2147483647).

Defaults

parameter	default
bps	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is supported only in the sparse mode.
- To disable the RP threshold feature, specify a bits per second value of 0. When the RP threshold is disabled, the RP will never initiate an (S, G) Join message toward the source; the packets will be register-encapsulated to the RP. It will issue a (S, G) Join message upon receiving the first data packet, if its bits per second value is 1.
- To view the current RP threshold, use the **show ip pim sparse** command.

Examples

```
-> ip pim rp-threshold 131072
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim sparse	Displays the global parameters for PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmRPThreshold
```

ip pim keepalive-period

Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.

ip pim keepalive-period *seconds*

Syntax Definitions

seconds	Specifies the timeout value, in seconds (0-65535).

Defaults

parameter	default
seconds	210

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This timer is called the Keepalive Period in the PIM-SM specification and the Source Lifetime in the PIM-DM specification.
- This command includes support for both IPv4 PIM and IPv6 PIM.

Examples

```
-> ip pim keepalive-period 500
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ip pim dense	Displays the status of the various global parameters for the PIM dense mode.
show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.
show ipv6 pim dense	Displays the status of the various global parameters for the IPv6 PIM dense mode.

MIB Objects

```
alaPim
   alaPimKeepalivePeriod
```

ip pim max-rps

Configures the maximum number of C-RP routers allowed in the PIM-SM domain.

ip pim max-rps *number*

Syntax Definitions

number	The maximum number of C-RP routers allowed in the PIM-SM domain (1–100).

Defaults

parameter	default
number	32

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is supported only in the sparse mode.
- This command is used with both IPv4 and IPv6 PIM-SM. The PIM-SM must be disabled before changing **max-rps** value.
- PIM-SM must be globally disabled before changing the maximum number of C-RP routers. To globally disable PIM-SM, refer to the **ip pim sparse admin-state** command on page 30-5.

Examples

```
-> ip pim max-rps 32
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip pim sparse admin-state	Globally enables or disables the PIM-SM protocol on the switch.
ipv6 pim sparse admin-state	Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.
show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmMaxRPs
```

ip pim probe-time

Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.

ip pim probe-time *seconds*

Syntax Definitions

seconds	The probe time, in seconds (1–300).

Defaults

parameter	default
seconds	5

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used with both IPv4 and IPv6 PIM-SM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim probe-time 5
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmProbeTime
```

ip pim register checksum

Configures the application of the checksum function on sent and received register messages in the domain.

ip pim register checksum {header | full}

Syntax Definitions

header	Specifies that the checksum for registers is done only on the PIM header.
full	Specifies that the checksum is done over the entire PIM register message.

Defaults

parameter	default
header | full	**header**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The **full** option may be required for compatibility with older implementations of PIM-SM v2.
- This parameter setting must be consistent across the PIM domain.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim register checksum header
-> ip pim register checksum full
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmOldRegisterMessageSupport
```

ip pim register-suppress-timeout

Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.

ip pim register-suppress-timeout *seconds*

Syntax Definitions

seconds	The timeout value, in seconds (0–65535).

Defaults

parameter	default
seconds	60

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is supported in both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim register-suppress-timeout 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```
alaPim
   alaPimRegisterSuppressionTime
```

ip pim spt admin-state

Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first data packet is received.

ip pim spt admin-state {enable | disable}

Syntax Definitions

enable	Enables last hop DR switching to the SPT.
disable	Disables last hop DR switching to the SPT.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is supported only in the sparse mode.
- As mentioned above, if SPT status is enabled, last hop DR switching to the SPT begins once the first data packet is received.
- To view whether SPT status is currently enabled (default) or disabled, use the **show ip pim sparse** command.

Examples

```
-> ip pim spt admin-state enable
-> ip pim spt admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.

MIB Objects

```
alaPimsmGlobalConfig
   alaPimsmAdminSPTConfig
```

ip pim state-refresh-interval

Sets the interval between successive State Refresh messages originated by a router.

ip pim state-refresh-interval *seconds*

Syntax Definitions

seconds	The interval between successive State Refresh messages, in seconds. Values may range from 0 to 65535.

Defaults

parameter	default
seconds	60

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 PIM-DM and IPv6 PIM-DM.

Examples

```
-> ip pim state-refresh-interval 80
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip pim interface	Enables or disables the PIM protocol on a specific interface.
ipv6 pim interface	Enables IPv6 PIM and configures the statistics.
show ip pim dense	Displays the status of the various global parameters for the PIM dense mode.
show ipv6 pim dense	Displays the status of the various global parameters for the IPv6 PIM dense mode.

MIB Objects

```
alaPim
   alaPimRefreshInterval
```

ip pim state-refresh-limit

Sets the limit at which a router will not forward successive State Refresh messages if they are received at less than the interval.

ip pim state-refresh- limit *ticks*

Syntax Definitions

ticks	The limit at which the received State Refresh messages will not be forwarded, if the messages are received at less than the interval. Values may range from 0 to 65535.

Defaults

parameter	default
ticks	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 and IPv6.

Examples

```
-> ip pim state-refresh-limit 2
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip pim interface	Enables or disables the PIM protocol on a specific interface.
ipv6 pim interface	Enables IPv6 PIM and configures the statistics.
show ip pim dense	Displays the status of the various global parameters for the PIM dense mode.
show ipv6 pim dense	Displays the status of the various global parameters for the IPv6 PIM dense mode.

MIB Objects

```
alaPimdmGlobalConfig
   alaPimdmStateRefreshLimitInterval
```

ip pim state-refresh-ttl

Sets the Time to Live to be used in a router's originated State Refresh messages if the data packet's Time to Live is not recorded.

ip pim state-refresh- ttl *num*

Syntax Definitions

num	The Time to Live to be used. Values may range from 0 to 255.

Defaults

parameter	default
num	16

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 and IPv6 PIM-DM.

Examples

```
-> ip pim state-refresh-ttl 122
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip pim interface	Enables or disables the PIM protocol on a specific interface.
ipv6 pim interface	Enables IPv6 PIM and configures the statistics.
show ip pim dense	Displays the status of the various global parameters for the PIM dense mode.
show ipv6 pim dense	Displays the status of the various global parameters for the IPv6 PIM dense mode.

MIB Objects

```
alaPimdmGlobalConfig
   alaPimdmStateRefreshTimeToLive
```

ip pim interface

Enables PIM and configures PIM-related statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the interface.

ip pim interface *if_name* **[hello-interval** *seconds***] [triggered-hello** *seconds***] [joinprune-interval** *seconds***] [hello-holdtime** *seconds***] [joinprune-holdtime** *seconds***] [prune-delay** *milliseconds***] [override-interval** *milliseconds***] [dr-priority** *priority***] [[no] stub] [prune-limit-interval** *seconds***] [graft-retry-interval** *seconds***]**

no ip pim interface *if_name*

Syntax Definitions

if_name	The interface name on which PIM is being enabled or disabled.
hello-interval *seconds*	The frequency at which PIM Hello messages are transmitted on a specified interface, in seconds. Values may range from 0 to 18000.
triggered-hello *seconds*	Specifies the maximum time, in seconds, before a triggered PIM Hello message is sent on this interface. Values may range from 0 to 60.
joinprune-interval *seconds*	The frequency at which periodic Join/Prune messages are sent on this interface, in seconds. Values may range from 0 to 18000.
hello-holdtime *seconds*	Specifies the value set in the Holdtime field of PIM Hello messages sent on this interface, in seconds. Values may range from 0 to 65535.
joinprune-holdtime *seconds*	Specifies the value inserted into the Holdtime field of the Join/Prune messages sent on this interface, in seconds.Values may range from 0 to 65535.
prune-delay *milliseconds*	Specifies the value of the expected propagation delay between PIM routers on this network, inserted into the LAN prune-delay option of the Hello messages sent on this interface, in milliseconds. Values may range from 0 to 32767.
override-interval *milliseconds*	Specifies the value inserted into the Override Interval field of the LAN prune-delay option of the Hello messages sent on this interface, in *milliseconds.* Values may range from 0 to 65535.
dr-priority *priority*	Specifies the Designated Router priority inserted into the DR priority option on a specified interface. The DR priority option value can range between 1 to 192. A higher numeric value denotes a higher priority.
prune-limit-interval *seconds*	Specifies the minimum interval that must elapse between two successive prune messages sent on this interface, in seconds. Values may range from 0 to 65535.
graft-retry-interval *seconds*	Specifies the minimum interval that must elapse between two successive graft messages sent on this interface, in seconds. Values may range from 0 to 65535.
stub	Specifies the interface not to send any PIM packets through this interface, and to ignore received PIM packets.

Defaults

parameter	default
hello-interval *seconds*	30
triggered-hello *seconds*	5
joinprune-interval *seconds*	60
hello-holdtime *seconds*	105
joinprune-holdtime *seconds*	210
prune-delay *milliseconds*	500
override-interval *milliseconds*	2500
dr-priority *priority*	1
prune-limit-interval *seconds*	60
graft-retry-interval *seconds*	3
stub	Disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a PIM interface.
- PIM must be enabled globally on the switch before it runs on the interface. To globally enable or disable PIM-SM on the switch, refer to the **ip pim sparse admin-state** command on page 30-5. To enable or disable PIM-DM on the switch, refer to the **ip pim dense admin-state** command on page 30-6.
- Specifying zero for the hello-interval represents an infinite time, in which case periodic PIM Hello messages are not sent.
- Specifying zero for the joinprune-interval represents an infinite time, in which case periodic PIM Join/ Prune messages are not sent.
- Specifying the value of 65535 for hello-holdtime represents an infinite time. If a PIM router gets Hello packet from a neighbor with its hello-holdtime value as infinte time, then the PIM router will not time out the sender(neighbor). It is recommended that you should use a hello-holdtime interval that is 3.5 times the value of the hello-interval, or 65535 seconds if the hello-interval is set to zero.
- Specifying the value of 65535 for joinprune-holdtime represents an infinite time. The receipt of Join/ Prune messages with its joinprune-holdtime value as infinte time, then this specifies an infinite holdtime for the particular join/prune message. It is recommended that you use a joinprune-holdtime interval that is 3.5 times the value of the Join/Prune interval defined for the interface, or 65535 seconds if the joinprune-interval is set to zero.
- The interface configured as a **stub** will not send any PIM packets through that interface, and any received PIM packets are also ignored. By default, a PIM interface is not set to be a stub one.
- The **graft-retry-interval** and **prune-limit-interval** options can be used only with the PIM-DM mode.

Examples

```
-> ip pim interface vlan-2 hello-interval 100 triggered-hello 10 joinprune-inter-
val 100 hello-holdtime 350 joinprune-holdtime 400
-> no ip pim interface vlan-2
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim interface	Displays detailed PIM settings for a specific interface. In general, it displays PIM settings for all the interfaces if no argument is specified.

   alaPimInterfaceOverrideInterval
   alaPimInerfaceDRPriority
   alaPimInterfaceStubInterface
   alaPimInterfacePruneLimitInterval
   alaPimInterfaceGraftRetryInterval
```

ip pim neighbor-loss-notification-period

Specifies the minimum time that must elapse between PIM neighbor loss notifications originated by the router.

ip pim neighbor-loss-notification-period *seconds*

Syntax Definitions

seconds	Specifies the time value that must elapse between neighbor loss notifications, in seconds (0–65535).

Defaults

parameter	default
seconds	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The maximum value of 65535 represents an infinite time. The PIM neighbor loss notifications are never sent in case of infinite time.
- This command is used with both IPv4 and IPv6 PIM.

Examples

```
-> ip pim neighbor-loss-notification-period 100
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim notifications	Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

```
alaPim
   alaPimNeighborLossNotificationPeriod
```

ip pim invalid-register-notification-period

Specifies the minimum time that must elapse between the PIM invalid register notifications originated by the router.

ip pim invalid-register-notification-period *seconds*

Syntax Definitions

seconds	Specifies the minimum time value that must elapse between invalid register notifications, in seconds (10–65535).

Defaults

parameter	default
seconds	65535

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The default value of 65535 represents an infinite time. The PIM invalid register notifications are never sent in case of infinite time.
- The non-zero minimum allowed value provides resilience against the propagation of denial-of-service attacks from the data and control planes to the network management plane.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim invalid-register-notification-period 100
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim notifications	Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

```
alaPim
   alaPimInvalidRegisterNotificationPeriod
```

ip pim invalid-joinprune-notification-period

Specifies the minimum time that must elapse between the PIM invalid joinprune notifications originated by the router.

ip pim invalid-joinprune-notification-period *seconds*

Syntax Definitions

seconds	Specifies the minimum time value that must elapse between invalid joinprune notifications, in seconds (10–65535).

Defaults

parameter	default
seconds	65535

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The default value of 65535 represents an infinite time. The PIM invalid joinprune notifications are never sent in case of infinite time.
- The non-zero minimum allowed value provides resilience against the propagation of denial-of-service attacks from the control plane to the network management plane.
- This value is used with both IPv4 and IPv6 PIM.

Examples

```
-> ip pim invalid-joinprune-notification-period 100
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim notifications	Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

```
alaPim
   alaPimInvalidJoinPruneNotificationPeriod
```

ip pim rp-mapping-notification-period

Specifies the minimum time that must elapse between the PIM RP mapping notifications originated by the router.

ip pim rp-mapping-notification-period *seconds*

Syntax Definitions

seconds	Specifies the minimum time value that must elapse between RP mapping notifications, in seconds (0–65535).

Defaults

parameter	default
seconds	65535

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The default value of 65535 represents an infinite time. The RP mapping notifications are never sent in case of infinite time.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim rp-mapping-notification-period 100
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim notifications	Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

```
alaPim
   alaPimRPMappingNotificationPeriod
```

ip pim interface-election-notification-period

Specifies the minimum time that must elapse between the PIM interface election notifications originated by the router.

ip pim interface-election-notification-period *seconds*

Syntax Definitions

seconds	Specifies the minimum time value that must elapse between interface election notifications, in seconds (0–65535).

Defaults

parameter	default
seconds	65535

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The default value of 65535 represents an infinite time. The interface election notifications are never sent in case of infinite time.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ip pim interface-election-notification-period 100
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim notifications	Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

MIB Objects

```
alaPim
   alaPimInterfaceElectionNotificationPeriod
```

ip pim mbr all-sources

Configures whether or not PIM notifies DVMRP about the routes to all multicast sources learned. This command applies only when the local switch is operating as a Multicast Border Router (MBR).

ip pim mbr all-sources

no ip pim mbr all-sources

Syntax Definitions

N/A

Defaults

By default, PIM only notifies DVMRP about the routes for subnets directly connected to PIM interfaces.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable notification of all route sources learned.
- This command applies to both PIM-SM and PIM-DM. Note that PIM-SSM does not support MBR functionality.
- DVMRP advertises the routes received from PIM within the DVMRP domain using standard DVMRP mechanisms.

Examples

```
-> ip pim mbr all-sources
-> no ip pim mbr all-sources
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode.
show ip pim dense	Displays the status of the various global parameters for the PIM dense mode.
ip mroute mbr	Configures the switch to operate as a Multicast Border Router to provide interoperability between PIM and DVMRP.
ip dvmrp interface mbr-default-information	Configures whether or not the DVMRP interface on a Multicast Border Router advertises a default route.

MIB Objects

```
alaPimGlobalConfig
   alaPimMbrAllSourcesStatus
```

ip pim bfd-state

Enables or disables the BFD protocol at global level for PIM on the switch.

ip pim bfd-state {enable | disable}

Syntax Definitions

enable	Enable the BFD protocol at global level for PIM protocol.
disable	Disable the BFD protocol at global level for PIM protocol.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip pim bfd-state enable
-> ip pim bfd-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode
show ip pim dense	Displays the status of the various global parameters for the PIM dense mode

MIB Objects

```
alaPimBfdStatus
```

ip pim bfd-state all-interfaces

Enables or disables the BFD protocol at global level for all PIM interfaces on the switch.

ip pim bfd-state all-interfaces {enable | disable}

Syntax Definitions

enable	Enable the BFD protocol at global level for all PIM interfaces.
disable	Disable the BFD protocol at global level for all PIM interfaces.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip pim bfd-state all-interfaces enable
-> ip pim bfd-state all-interfaces disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show ip pim interface	Displays detailed PIM settings for PIM interfaces.

MIB Objects

```
alaPimBfdAllInterfaceStatus
```

ip pim interface bfd-state

Enables or disables the BFD for a specified PIM interface.

ip pim interface *if_name* **[bfd-state enable|disable]**

no ip pim interface *if_name*

Syntax Definitions

if_name	The PIM interface name for which the BFD is enabled or disabled.
enable	Enable the MoFRR for all PIM-SM routes on the switch.
disable	Disable the MoFRR for all PIM-SM routes on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the no form of this command to delete a PIM interface.

Examples

```
-> ip pim interface vlan-2 bfd-state enable
-> no ip pim interface vlan-2
```

Release History

Release 8.2.1; command introduced.

Related Commands

show ip pim interface	Displays detailed PIM settings for PIM interfaces.

MIB Objects

```
alaPimInterfaceBFDStatus
```

ip pim mofrr-state

Enables or disables the MoFRR for PIM on the switch.

ip pim mofrr-state {enable | disable}

Syntax Definitions

enable	Enable the MoFRR on the switch.
disable	Disable the MoFRR on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If enabled, MoFRR is applied only for the multicast routes that have local clients.
- If enabled, results in the consumption of bandwidth for the secondary (redundant) path. The secondary path in MoFRR will only be established on edge routers where there are local clients.

Note: MoFRR is not supported for PIM-SM with (*, g) enabled and PIM-Bidirectional.

Examples

```
-> ip pim mofrr-state enable
-> ip pim mofrr-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode
show ip pim dense	Displays the status of the various global parameters for the PIM dense mode

MIB Objects

```
alaPimMofrrStatus
```

ip pim mofrr-state all-routes

Enables or disables the MoFRR for all PIM routes on the switch.

ip pim mofrr-state all-routes {enable | disable}

Syntax Definitions

enable	Enable the MoFRR for all PIM routes on the switch.
disable	Disable the MoFRR for all PIM routes on the switch.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If enabled, this command enables MoFRR for all PIM routes, whether there are local clients or not.
- If enabled, this command enables the secondary path for all routes, whether there are local clients or not. However, since PIM-SM is not established for secondary paths for any (*, G) routes, MoFRR is not supported for PIM-SM with (*, g) enable.

Notes.

- MoFRR supports only 2 ECMP routes.
- MoFRR is not supported for PIM-Bidirectional.

Examples

```
-> ip pim mofrr-state all-routes enable
-> ip pim mofrr-state all-routes disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show ip pim sparse	Displays the status of the various global parameters for the PIM sparse mode
show ip pim dense	Displays the status of the various global parameters for the PIM dense mode

MIB Objects

```

show ip pim sparse

Displays the status of the various global parameters for the PIM sparse mode.

show ip pim sparse

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip pim sparse
Status                     = enabled,
Keepalive Period           = 210,
Max RPs                    = 32,
Probe Time                 = 5,
Register Checksum          = header,
Register Suppress Timeout  = 60,
RP Threshold               = 1,
SPT Status                 = enabled,
BIDIR Status               = disabled,
BIDIR Periodic Interval    = 60,
BIDIR DF Abort Status      = disabled,
BFD Status                 = enabled,
MoFRR Status               = disabled,
MoFRR All Routes Status    = disabled,
MBR All Sources Status     = enabled,
MBR Operational Status     = disabled
```

output definitions

Status	The current global (i.e., switch-wide) status of PIM-SM. Options include **enabled** and **disabled**.
Keepalive Period	The duration of the Keepalive timer. The default value is 210.
Max RPs	The maximum number of Rendezvous Points (RPs) allowed in the PIM-SM domain (1–100). The default value is 32.
Probe Time	The amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP. Values may range from 1 to 300. The default value is 5.
Register Checksum	The current application of the checksum function on register messages in the domain. Options include **header** and **full**. The default setting is **header**.
Register Suppress Timeout	The amount of time, in seconds, the Designated Router (DR) will stop sending registers to the Rendezvous Point (RP) once a Register-Stop is received (1–300). The default value is 60.
RP Threshold	Displays the current RP data rate threshold. This value indicates the rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing an (S, G) Join message toward the source. Values may range from 0 to 2147483647. The default value is 1. A value of 0 indicates that the feature is currently disabled.
SPT Status	The current status of last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). Options include **enabled** (the default) and **disabled**.
BIDIR Status **BIDIR Periodic Interval** **BIDIR DF Abort Status**	Not supported in the current release.
BFD Status	Global Administrative status of PIM with the BFD protocol on this router.
MoFRR Status	Global Administrative status of MoFRR on this router.
MoFRR All Routes Status	Administrative status of MoFRR for all routes on this router.
MBR All Sources Statu	Indicates whether or not PIM notifies DVMRP about the routes to all multicast sources learned. Options include **enabled** (routes to all sources) or **disabled** (only routes on PIM interfaces). This status only applies when the switch is operating in the Multicast Border Router (MBR) mode.
MBR Operational Status	Indicates whether or not PIM interaction with DVMRP is **enabled** or **disabled** on a MBR switch. MBR functionality is not operationally active until both PIM and DVMRP have at least one enabled and active interface.

Release History

Release 8.1.1; command introduced.
Release 8.2.1; command output modified.

Related Commands

ip pim sparse admin-state	Globally enables or disables PIM-SM protocol on the switch.
ip pim interface	Enables or disables the PIM protocol on a specific interface.
ip pim keepalive-period	Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.
ip pim max-rps	Configures the maximum number of C-RP routers allowed in the PIM-SM domain.
ip pim probe-time	Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.
ip pim register checksum	Configures the application of the checksum function on sent and received register messages in the domain.
ip pim register-suppress-timeout	Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.
ip pim rp-threshold	Specifies the data rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing a source-specific (S, G) Join message toward the source.
ip pim spt admin-state	Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first data packet is received.
ip pim mbr all-sources	Configures PIM to notify DVMRP of all learned routes to sources. This command only applies when the switch is operating in the Multicast Border Router mode.

show ip pim dense

Displays the status of the various global parameters for the PIM dense mode.

show ip pim dense

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip pim dense
Status                       = enabled,
Source Lifetime              = 210,
State Refresh Interval       = 60,
State Refresh Limit Interval = 0,
State Refresh TTL            = 16,
BFD Status                   = enabled,
MoFRR Status                 = disabled,
MBR All Sources Status       = disabled,
MBR Operational Status       = enabled
```

output definitions

Status	The current global (i.e., switch-wide) status of PIM-DM. Options include **enabled** and **disabled**.
Source Lifetime	The duration of the Keepalive or Source Lifetime timer. The default value is 210.
State Refresh Interval	The time-interval, in seconds, between successive State Refresh messages originated by the router. The default value is 60.
State Refresh Limit Interval	Displays the limit at which a router will not forward the State Refresh messages, if they are received at less than the interval.
State Refresh TTL	Displays the TTL to be used in the router's originated State Refresh messages. The default value is 16.
BFD Status	Global Administrative status of PIM with the BFD protocol on this router.
MoFRR Status	Global Administrative status of MoFRR on this router.

output definitions (continued)

MBR All Sources Status	Indicates whether or not PIM notifies DVMRP about the routes to all multicast sources learned. Options include **enabled** (routes to all sources) or **disabled** (only routes on PIM interfaces). This status only applies when the switch is operating in the Multicast Border Router (MBR) mode.
MBR Operational Status	Indicates whether or not PIM interaction with DVMRP is **enabled** or **disabled** on a MBR switch. MBR functionality is not operationally active until both PIM and DVMRP have at least one enabled and active interface.

show ip pim ssm group

Displays the static configuration of multicast group mappings for the PIM-Source Specific Multicast (SSM) mode.

show ip pim ssm group

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- This command is supported only in the sparse mode.

Examples

```
-> show ip pim ssm group
Group Address/Pref Length   Mode  Override Precedence Status
--------------------------+-----+--------+----------+--------
224.0.0.0/4                 ssm   false    none       enabled
```

output definitions

Group Address/Pref Length	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
Mode	The PIM mode to be used for groups in this prefix. The possible values include **asm**, **ssm**, or **dm**.
Override	Specifies this static RP configuration to override the dynamically learned RP information for the specified group.
Precedence	Specifies the precedence value to be used for this static RP configuration.
Status	Displays whether this entry is currently enabled or disabled. Options include **enabled** and **disabled**.

Release History

Release 8.1.1; command introduced.

Related Commands

ip pim ssm group	Statically maps the specified IP multicast group to the PIM Source Specific Multicast mode (SSM).
show ip pim group-map	Displays the PIM group mapping table.

MIB Objects

```
alaPimStaticRPTable

```

show ip pim dense group

Displays the static configuration of multicast group mappings for PIM-Dense Mode (DM).

show ip pim dense group

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- This command is supported only on PIM dense mode.

Examples

```
-> show ip pim dense group
Group Address/Pref Length   Mode  Override Precedence Status
---------------------------+-----+--------+----------+--------
224.0.0.0/4                 dm    false    none       enabled
```

output definitions

Group Address/Pref Length	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
Mode	The PIM mode to be used for groups in this prefix. The possible values include asm, ssm, or dm.
Override	Specifies this static RP configuration to override the dynamically learned RP information for the specified group.
Precedence	Specifies the precedence value to be used for this static RP configuration.
Status	Displays whether this entry is currently enabled or disabled. Options include **enabled** and **disabled**.

Release History

Release 8.1.1; command introduced.

Related Commands

ip pim dense group	Creates and manages the static configuration of dense mode (DM) group mappings.
show ip pim group-map	Displays the PIM group mapping table.

MIB Objects

```
alaPimStaticRPTable
   alaPimStaticRPGrpAddress

```

show ip pim neighbor

Displays a list of active PIM neighbors.

show ip pim neighbor [*ip_address***]**

Syntax Definitions

ip_address	The 32-bit IP address for the PIM neighbor.

Defaults

If a neighbor's IP address is not specified, the entire PIM neighbor table is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

To view more detailed information about a particular neighbor, specify the neighbor's IP address in the command line. Additional information will be displayed, which includes LAN Prune Delay, Override Interval, TBit field, State Refresh capable, and Designated Router option status.

Examples

```
-> show ip pim neighbor
Neighbor Address     Interface Name       Uptime      Expires    DR Priority
-----------------+-------------------+-----------+-----------+-------------
212.61.20.250          vlan-2            01h:07m:07s 00h:01m:38s 100
212.61.60.200          vlan-6            01h:07m:07s 00h:01m:38s 100
214.28.4.254           vlan-26           01h:07m:07s 00h:01m:38s 100
```

If a specific neighbor IP address is specified in the command line, *detailed information for the corresponding neighbor only* displays:

```
-> show ip pim neighbor 212.61.30.7
Neighbor IP Address        = 212.61.30.7,
Interface Name             = vlan-30,
Uptime                     = 00h:04m:14s,
Expires                    = 00h:01m:31s,
Lan Prune Delay Present    = true,
Propagation Delay          = 500,
Override Interval          = 2500,
TBit field                 = false,
Gen ID Present             = true,
Gen ID Value               = 0x79ca868e,
BiDir Capable              = false,
DR Priority Present        = true,
DR Priority                = 1,
State Refresh Capable      = true
```

output definitions

Neighbor (IP) Address	The 32-bit IP address of the active PIM neighbor.
Interface Name	The name of the interface used to reach this PIM neighbor.
Uptime	The amount of time since this PIM neighbor last became a neighbor of the local router, displayed in hours, minutes, and seconds.
Expiry time	The minimum amount of time remaining before the PIM neighbor will be aged out, displayed in hours, minutes, and seconds.
Lan Prune Delay Present	Evaluates to TRUE if this neighbor is using the Lan Prune Delay option.
Propagation Delay	The expected propagation delay between PIM routers on this network.
DR Priority Present	Evaluates to TRUE if the neighbor is using the DR Priority option.
DR Priority	The value of the Designated Router Priority from the last PIM Hello message received from this neighbor. This object is always zero if the DR Priority Present value is FALSE.
TBit field	The value of the Tbit field of the LAN prune delay option received from this neighbor. The Tbit specifies the ability of the neighbor to disable Join suppression.
Generation ID Present	Evaluates to TRUE if this neighbor is using the Generation ID option.
Generation ID Value	The value of the Generation ID from the last PIM Hello message received from the neighbor.
BiDir Capable	Evaluates to TRUE if this neighbor is using the Bidirectional-PIM Capable option.
State Refresh Capable	Displays whether the neighbor is capable of receiving State Refresh messages. Options include **true** or **false**.
Override Interval	The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.

show ip pim candidate-rp

Displays the IP multicast groups for which the local router advertises itself as a Candidate-RP.

show ip pim candidate-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip pim candidate-rp
RP Address         Group Address   Priority  Interval  Status
-----------------+---------------+---------+---------+--------
172.21.63.11       224.0.0.0/4     192       60        enabled
```

output definitions

RP Address	A 32-bit IP address that is advertised as the Candidate-Rendezvous Point (RP).
Group Address	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/). This is the group for which the local router advertises itself as a C-RP.
Priority	The C-RP router's priority. The lower the value, the higher the priority.
Interval	The time interval at which the C-RP advertisements are sent to the BSR.
Status	The current status of this entry. The status is shown as enabled only if the PIM-SM is globally enabled and the PIM interface is enabled.

Release History

Release 8.1.1; command introduced.

Related Commands

ip pim candidate-rp	Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IP multicast group.

MIB Objects

```
alaPimBsrCandidateRPTable
   alaPimBsrCandidateRPAddress

   alaPimBsrCandidateRPStatus
```

show ip pim group-map

Displays the PIM group mapping table.

show ip pim group-map [bsr | static-rp | ssm | dense]

Syntax Definitions

N/A

Defaults

If the keywords **bsr**, **static-rp**, **ssm**, or **dense** are included in the command line, then only the entries that were created by the specified origin are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If static RP configuration is being used, this information is obtained from those static RP addresses that are defined through the **ip pim static-rp** command. As long as the RP addresses defined in the static RP set are reachable, they will be added to the group mapping table.
- If the IP multicast groups are mapped to the mode SSM or DM, then the entries created by local SSM address range configuration using the **ip pim ssm group** command and local Dense Mode address range configuration using the **ip pim dense group** command are displayed.
- If the bootstrap mechanism is being used, this information is obtained from received Candidate-RP advertisements (when the local router is the BSR; when the local router is not the BSR, this information is obtained from received bootstrap messages).

Examples

```
-> show ip pim group-map
Origin    Group Address/Pref Length   RP Address    Mode  Precedence
---------+--------------------------+------------+-----+-----------
BSR       224.0.0.0/4                172.21.63.11  asm   192
BSR       224.0.0.0/4                214.0.0.7     asm   192
Static    232.0.0.0/8                              ssm

-> show ip pim group-map bsr
Origin    Group Address/Pref Length   RP Address    Mode  Precedence
---------+--------------------------+------------+-----+-----------
BSR       224.0.0.0/4                172.21.63.11  asm   192
BSR       224.0.0.0/4                214.0.0.7     asm   192

-> show ip pim group-map static
Origin    Group Address/Pref Length   RP Address    Mode  Precedence
---------+--------------------------+------------+-----+-----------
Static    232.0.0.0/8                              ssm
```

output definitions

Origin	The mechanism by which the PIM mode and RP for the group were learned. The possible values include 'static RP' for local static RP configuration, 'static SSM' for both SSM group configuration and Dense Mode Group configuration, and 'BSR' for the PIM Bootstrap Router mechanism.
Group Address/Prefix Length	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
RP Address	The IP address of the Rendezvous Point to be used for groups within the group prefix. There is no RP address if the PIM mode is either SSM or DM.
Mode	The PIM mode to be used for groups in this prefix.
Mapping Precedence	The precedence value of a particular row, which determines which row applies to a given group address. Numerically higher values for this object indicate lower precedences, with the value zero denoting the highest precedence.

Release History

Release 8.1.1; command introduced.

Related Commands

ip pim ssm group	Creates and manages the static configuration of a Source Specific Multicast mode group mappings.
ip pim dense group	Creates and manages the static configuration of dense mode (DM) group mappings.
ip pim static-rp	Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

MIB Objects

```
alaPimGroupMappingTable
   alaPimGroupMappingOrigin
   alaPimGroupMappingGrpAddress
   alaPimGroupMappingPrecedence
   alaPimGroupMappingRPAddress
   alaPimGroupMappingPimMode
   alaPimGroupMappingGrpPrefixLength
```

show ip pim interface

Displays detailed PIM settings for a specific interface. In general, it displays PIM settings for all the interfaces if no argument is specified.

show ip pim interface [*if_name***]**

Syntax Definitions

if_name	The interface name.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

To view more detailed information about a particular interface, specify the interface name in the command line. Additional information includes Triggered Hello Interval, Hello Holdtime, Prune Delay status and value, Override Interval, LAN Delay status, Generation ID status, and Join/Prune Holdtime.

Examples

```
-> show ip pim interface
Total 1 Interfaces

Interface   IP Address   Designated      Hello      J/P        Oper        BFD
Name                     Router          Interval   Interval   Status      Status
----------+------------+---------------+----------+----------+----------+----------
vlan-203   10.11.203.8   10.11.203.27      30       60       enabled      enabled
vlan-204   10.11.204.8   10.11.204.8       30       60       enabled      disabled

-> show ip pim interface tesvl
Interface Name              = tesvl,
IP Address                  = 50.1.1.1,
Designated Router           = 50.1.1.1,
Hello Interval              = 30,
Triggered Hello Interval    = 5,
Hello HoldTime              = 105,
Join/Prune Interval         = 60,
Join/Prune HoldTime         = 210,
Propagation (Prune) Delay   = 500,
Override Interval           = 2500,
Generation ID               = 0x46e68b13,
DR Priority                 = 1,
DR Priority Enabled         = true,
Lan Delay Enabled           = true,
Effective Propagation Delay = 500,
Effective Override Interval = 2500,
Suppression Enabled         = true,
```

```
Stub Interface              = false,
Prune Limit Interval        = 60,
Graft Retry Interval        = 3,
State Refresh Enabled       = true,
Operational Status          = enabled,
BFD Status                  = enabled
```

output definitions

Interface Name	The name of the interface on which PIM is enabled.
IP address	Specifies the IP address of the specified interface.
Designated Router	The 32-bit IP address for the Designated Router (DR). The DR acts on behalf of any directly-connected hosts with respect to the PIM-SM protocol. Only one router in the LAN will act as the DR.
Hello Interval	The frequency at which PIM Hello messages are transmitted on a specified interface. Values range from 1 to 18000.
Join/Prune Interval	The Join/Prune interval for the associated interface. The Join/Prune interval is the interval at which periodic PIM-SM Join/Prune messages are sent. Values range from 1 to 18000.
Triggered Hello Interval	The current Triggered Hello Interval. This value indicates the maximum time, in seconds, before a triggered PIM Hello message is transmitted on the corresponding interface. Values range from 1 to 60.
Hello Holdtime	The current Hello Holdtime value. This value indicates the maximum amount of time, in seconds, Hello messages will be held before they are considered invalid. Values range from 0 to 65535.
Join/Prune Holdtime	The current Join/Prune Holdtime value. This value indicates the maximum amount of time, in seconds, Join/Prune messages will be held before they are considered invalid. Values range from 0 to 65535.
Propagation Delay	The expected propagation delay between PIM routers on this network.
Override Interval	The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values range from 0 to 65535.
Generation ID Option	The value of the Generation ID this router inserted in the last PIM Hello message it sent on this interface.
DR Priority	Displays the Designated Router priority for each interface. This value is used in determining the Designated Router on an interface. Values range from 1 to 192. A higher numeric value denotes a higher priority. Note that priority-based election is used only if all routers on the interface are using the DR priority option.
Lan Delay Enabled	Options include **true** and **false**. The value will be true if all neighbors on the interface are using the LAN Prune Delay option. Otherwise, the setting will be false.
Effective Propagation Delay	The Effective Propagation Delay on this interface.
Effective Override Interval	The Effective Override Interval on this interface.
Suppression Enabled	Specifies whether the Join suppression is enabled on this interface.

output definitions (continued)

DR Priority Enabled	Evaluates to TRUE if all routers on this interface are using the DR Priority option.
Stub Interface	Specifies whether this interface is a 'stub interface'. If this is TRUE, then no PIM packets are sent out on this interface, and any received PIM packets are ignored.
Prune Limit Interval	The minimum interval that must transpire between two successive Prunes sent by a router. This is used only with PIM-DM.
Graft Retry Interval	Displays the time-interval a router waits for a Graft acknowledgment before resending a Graft on the interface. This is used only with PIM-DM. Values range from 1 to 65535.
SR Priority Enabled	Evaluates to TRUE if all routers on this interface are using the State Refresh option. This is used only by PIM-DM.
Operational Status	The operational status of the corresponding interface (**enabled** or **disabled**). Indicates whether the IP interface is operationally up. For example, if PIM is enabled on the interface, but the IP interface is currently down, this field will display as disabled. Configured through the **ip pim sparse admin-state** and **ip pim dense admin-state** commands.
BFD Status	Specifies whether BFD is enabled or disabled for a specified interface.

Release History

Release 8.1.1; command introduced.
Release 8.2.1; command output modified.

Related Commands

ip pim interface	Enables or disables the PIM protocol on a specific interface.

show ip pim static-rp

Displays the PIM Static RP table for the ASM mode, which includes group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the Static RP configuration (i.e., enabled or disabled).

show ip pim static-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range

Examples

```
-> show ip pim static-rp
Group Address/Pref Length   RP Address    Mode  Override Precedence Status
----------------------------+-------------+-----+--------+----------+--------
224.0.0.0/4                 172.21.63.11  asm   false    none       enabled
```

output definitions

Group Address/Pref Length	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/). To change the current multicast group address and mask, refer to the **ip pim static-rp** command on page 30-13.
RP Address	A 32-bit IP address of the Rendezvous Point (RP). To change the current RP address, refer to the **ip pim static-rp** command on page 30-13.
Mode	The PIM mode to be used for groups in this prefix. The possible values include **asm**, **ssm**, or **dm**.
Override	Specifies this static RP configuration to override the dynamically learned RP information for the specified group.
Precedence	Specifies the precedence value to be used for this static RP configuration.
Status	Displays whether static RP configuration is currently enabled or disabled. Options include **enabled** and **disabled**. To change the current status, refer to the **ip pim static-rp** command on page 30-13.

Release History

Release 8.1.1; command introduced.

Related Commands

ip pim static-rp	Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

MIB Objects

```

show ip pim cbsr

Displays the Candidate-BSR information that is used in the Bootstrap messages.

show ip pim cbsr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip pim cbsr
CBSR Address             = 214.0.0.7,
Status                   = enabled,
CBSR Priority            = 0,
Hash Mask Length         = 30,
Elected BSR              = False,
Timer                    = 00h:00m:00s
```

output definitions

CBSR Address	The 32-bit address that the local router uses to advertise itself as a Candidate-BSR.
Status	The current status of this entry. The status is shown as enabled only if the PIM-SM is globally enabled and the PIM interface is enabled.
CBSR Priority	The value for the local router as a Candidate-BSR. The higher the value, the higher the priority.
Hash Mask Length	The 32-bit mask length that is advertised in the bootstrap messages. The length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group.
Elected BSR	Specifies whether the local router is the elected BSR.
Timer	The time value that is remaining before the local router originates the next bootstrap message. This value is zero if this router is not the elected BSR.

Release History

Release 8.1.1; command introduced.

Related Commands

ip pim cbsr	Configures the Candidate-BSR information that is used in the Bootstrap messages.

```

show ip pim bsr

Displays information about the elected BSR.

show ip pim bsr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip pim bsr
BSR Address              = 214.0.0.7
BSR Priority             = 192,
Hash Mask Length         = 30,
Expiry Time              = 00h:01m:35s
```

output definitions

BSR Address	The 32-bit address of the elected BSR.
BSR Priority	The priority value of the elected BSR. The higher the value, the higher the priority.
Hash Mask Length	The 32-bit mask length that is advertised in the bootstrap messages by the elected BSR (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group).
Expiry Time	The minimum time remaining before the elected BSR will be declared down.

Release History

Release 8.1.1; command introduced.

Related Commands

ip pim cbsr	Configures the Candidate-BSR information that is used in the Bootstrap messages.

```

show ip pim notifications

Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

show ip pim notifications

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The outputs from this command includes both IPv4 and IPv6 information.

Examples

```
-> show ip pim notifications
Neighbor Loss Notifications
  Period       = 0
  Count        = 0
Invalid Register Notifications
  Period       = 65535
  Msgs Rcvd    = 0
  Origin       = None
  Group        = None
  RP           = None
Invalid Join Prune Notifications
  Period       = 65535
  Msgs Rcvd    = 0
  Origin       = None
  Group        = None
  RP           = None
RP Mapping Notifications
  Period       = 65535
  Count        = 0
Interface Election Notifications
  Period       = 65535
  Count        = 0
```

output definitions

Neighbor Loss Notification	**Period:** Minimum time interval that must elapse between the PIM neighbor loss notification originated by the device. **Count:** The number of neighbor loss events that have occurred. This counter is incremented whenever a neighbor loss notification is generated.
Invalid Register Notification	**Period:** Minimum time interval that must elapse between the PIM invalid register notifications originated by the device. **Msgs Rcvd:** The number of invalid PIM register notification messages that have been received by the device. **Group:** The multicast group address to which the last unexpected Register message received by the device was addressed. **RP:** The RP address to which the last unexpected Register message received by the device was delivered. **Origin**: The source address of the last unexpected Register message received by the device.
Invalid Join/Prune Notification	**Period:** Minimum time that must elapse between PIM invalid joinprune notifications originated by the device. **Msgs Rcvd:** The number of invalid PIM join/prune messages that have been received by the device. **Origin**: The source address of the last unexpected join/prune message received by the device. **Group**: The multicast group address carried in the last unexpected joinprune message received by the device. **RP**: The RP address carried in the last unexpected join/prune message received by the device.
RP Mapping Notifications	**Period**: Minimum time that must elapse between PIM RP mapping change notifications originated by the device. **Count**: The number of changes to active RP mappings on this device.
Interface Election Notifications	**Period**: Minimum time that must elapse between PIM Interface Election traps originated by the router. **Count:** The number of times this device has been elected DR on any interface.

Release History

Release 8.1.1; command introduced.

Related Commands

ip pim neighbor-loss-notification-period	Specifies the minimum time that must elapse between PIM neighbor loss notifications originated by the router.
ip pim invalid-register-notification-period	Specifies the minimum time that must elapse between PIM invalid register notifications originated by the router.
ip pim invalid-joinprune-notification-period	Specifies the minimum time that must elapse between PIM invalid joinprune notifications originated by the router.
ip pim rp-mapping-notification-period	Specifies the minimum time that must elapse between PIM RP mapping notifications originated by this router.
ip pim interface-election-notification-period	Specifies the minimum time that must elapse between the PIM interface election notifications originated by the router.

show ip pim groute

Displays all (*,G) state that the IPv4 PIM has.

show ip pim groute [*group_address***]**

Syntax Definitions

group_address	A 32-bit multicast address. If an IP address is not specified, the current PIM status for all multicast route entries are displayed.

Defaults

By default, entire (*,G) routing table is displayed. To view more detailed (*,G) state information about a particular group, specify the group address in the command line.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When the *group_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.

Examples

```
-> show ip pim groute

Total 1 (*,G)

Group Address   RP Address     RPF Interface       Upstream Neighbor UpTime
---------------+--------------+-------------------+-----------------+-----------
225.0.0.0       212.61.60.8    vlan-30             212.61.30.7       00h:01m:43s

```

output definitions

Group-address	The IPv4 Multicast Group Address.
RP Address	The address of the Rendezvous Point (RP) for the group.
RPF Interface	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
Upstream Neighbor	The primary address of the neighbor on the RPF Interface to which the local router is sending periodic (*,G) join messages.
UpTime	The time since this entry was created.
Pim Mode Origin	The mechanism by which the PIM mode and RP for the group were learned.
Upstream Join State	Whether the local router should join the RP tree for the group.
Upstream Join Timer	The time remaining before the local router next sends a periodic (*,G) Join message on the RPF IfIndex.
RPF Next Hop	The address of the RPF next hop towards the RP.

output definitions (continued)

RPF Route Protocol	The routing mechanism through which the route used to find the RPF interface towards the RP was learned.
RPF Route Address/Prefix Length	The IPv6 address combined with the prefix length identifies the route used to find the RPF interface towards the RP.
Route Metric Pref	The metric preference of the route used to find the RPF interface towards the RP.
Route Metric	The routing metric of the route used to find the RPF interface towards the RP.
Interface Name	The interface name that corresponds to the ifIndex.
Local Membership	Whether the local router has (*,G) local membership on this interface.
Join Prune State	The state resulting from (*,G) Join/Prune messages received on this interface.
Prune Pending Timer	The time remaining before the local router acts on a (*,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
Join Expiry Timer	The time remaining before (*,G) Join state for this interface expires.
Assert State	The (*,G) Assert state for this interface. The possible values are No Info, Winner or Loser.
Assert Timer	If Assert State is 'Winner', this is the time remaining before the local router next sends a (*,G) Assert message on this interface. If the Assert State is 'Loser', this is the time remaining before the (*,G) assert state expires.
Assert Winner Address	If the Assert State is 'Loser', this is the address of the assert winner.
Assert Winner Metric Pref	If the Assert State is 'Loser', this is the metric preference of the route to the RP advertised by the assert winner; otherwise, this is zero.
Assert Winner Metric	If the Assert State is 'Loser', this is the routing metric of the route to the RP advertised by the assert winner; otherwise, this is zero.

show ip pim sgroute

Displays all (S,G) state that the IPv4 PIM has.

show ip pim sgroute [*source_address group_address***]**

Syntax Definitions

source_address	The 32-bit IP address for a specific multicast source.
group_address	A 32-bit multicast address.

Defaults

By default, entire (S,G) routing table is displayed. To view the detailed information for a particular (S,G) entry, use the *source_address* and *group_address* associated with that entry.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the *source_address* and *group_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.
- If an IP address is not specified, the current PIM status for all multicast route entries are displayed.

Examples

```
-> show ip pim sgroute
Legend: Flags: D = Dense, S = Sparse, s = SSM Group,
               L = Local, R = RPT, T = SPT, F = Register,
               P = Pruned, O = Originator
Total 1 (S,G)

```

output definitions

Source-address	The IPv4 Source address.
Group-address	The IPv4 Multicast Group Address.
RPF Interface	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.

output definitions (continued)

Upstream Neighbor	The primary address of the neighbor on the RPF Interface to which the local router is sending periodic (S,G) join messages.
UpTime	The time since this entry was created.
Flags	Flags indicating SPTBit, Prune State, Join State, etc.
Pim Mode	Whether the Group Address is SSM, ASM or DM.
Upstream Join State	Whether the local router should join the SPT for the source and group represented by this entry.
Upstream Join Timer	The time remaining before the local router next sends a periodic (S,G) Join message.
RPF Next Hop	The address of the RPF next hop towards the source.
RPF Route Protocol	The routing mechanism through which the route used to find the RPF Interface towards the source was learned.
RPF Route Address/Prefix Length	The IP address which when combined with the Route Prefix length identifies the route used to find the RPF interface towards the source.
RPF Route Metric Pref	The metric preference of the route used to find the RPF interface towards the source.
RPF Route Metric	The metric preference of the route used to find the RPF interface towards the source.
DR Register State	Whether the local router should encapsulate (S,G) data packets in Register messages and send them to the RP. The possible values include No Info, Join, Join Pending, or Prune.
DR Register Stop Timer	The value of the Register Stop Timer. If the Register State is 'prune', this is the time remaining before the local router sends a Null-Register message to the RP. If the State is 'joinPending', this is the time remaining before the local router resumes encapsulating data packets and sending them to the RP.
Upstream Prune State	Whether the local router has pruned itself from the tree. This is only used by PIM-DM. The possible values include forwarding, Ack Pending, or Pruned.
Upstream Prune Limit Timer	The time remaining before the local router may send a (S,G) prune message on alaPimSGRPFIfIndex. This is only used by PIM-DM.
Originator State	Whether this router is an originator for the (S,G) message flow. This is only used by PIM-DM. The possible values include Not Originator or Originator.
Source Active Timer	If this router is the Originator, this is the time remaining before the local router reverts to notOriginator state. Otherwise, this is zero. This is only used by PIM-DM.
State Refresh Timer	If Originator state is 'originator', this is the time remaining before the local router sends a State Refresh Message. Otherwise, this is zero. This is only used by PIM-DM.
Interface Name	The interface name corresponding to the ifIndex that corresponds to this entry.
Uptime	The time since this entry was created.
Local Membership	Whether the local router has (S,G) local membership on this interface.

output definitions (continued)

Join Prune State	The state resulting from (S,G) Join/Prune messages received on this interface. The possible values include No Info, Join, or Prune Pending.
Prune Pending Timer	The time remaining before the local router acts on an (S,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
Join Expiry Timer	The time remaining before (S,G) Join state for this interface expires.
Assert State	The (S,G) Assert state for this interface. The possible values include No Info, Winner, or Loser.
Assert Timer	If Assert State is Winner, this is the time remaining before the local router sends a (S,G) Assert message on this interface. If the Assert State is Loser, this is the time remaining before the (S,G) Assert state expires.
Assert Winner	If the Assert State is Loser, this is the address of the assert winner.
Assert Winner Metric Pref	If the Assert State is Loser, this is the metric preference of the route to the source advertised by the assert winner.
Assert Winner Metric Metric	If the Assert State is Loser, this is the routing metric of the route to the source advertised by the assert winner.

ipv6 pim sparse admin-state

Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.

ipv6 pim sparse admin-state {enable | disable}

Syntax Definitions

enable	Enables PIM-SM globally for IPv6.
disable	Disables PIM-SM globally for IPv6.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command must be set to **enable** before PIM-SM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to page 30-3 for more information.

Examples

```
-> ipv6 pim sparse admin-state enable
-> ipv6 pim sparse admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 pim dense admin-state

Enables or disables the IPv6 PIM-DM (dense mode) globally for IPv6.

ipv6 pim dense admin-state {enable | disable}

Syntax Definitions

enable	Enables PIM-DM globally for IPv6.
disable	Disables PIM-DM globally for IPv6.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command must be set to **enable** before PIM-DM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to page 30-3 for more information.

Examples

ipv6 pim ssm group

Statically maps the specified IPv6 multicast group to the PIM Source Specific Multicast mode (SSM).

ipv6 pim ssm group *group_address/prefix_length* **[[no] override] [priority** *priority***]**

no ipv6 pim ssm group *group_address/prefix_length*

Syntax Definitions

group_address	Specifies the IPv6 multicast group address.
/prefix_length	Specifies the prefix length of the IPv6 multicast group. Values may range from 4 to 128.
override	Specifies the static SSM mode mapping configuration to override the dynamically learned group mapping information for the specified group.
priority	Specifies the preference value to be used for this static SSM mode configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a Source Specific Multicast mode group mapping.
- The IPv6 PIM Source-Specific Multicast (SSM) mode for the default SSM address range (FF3x::/32) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM.
- You can also map additional IPv6 multicast address ranges for the SSM group using this command. However, the IPv6 multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to un-set the priority.

Examples

```
-> ipv6 pim ssm group ff30::1234:abcd/128 priority 50
-> no ipv6 pim ssm group ff30::1234:abcd/128
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 pim group-map	Displays the IPv6 PIM group mapping table.
show ipv6 pim ssm group	Displays the static configuration of IPv6 multicast group mappings for PIM-Source Specific Multicast (SSM).

MIB Objects

```

```

ipv6 pim dense group

Statically maps the specified IPv6 multicast group to the PIM Dense mode (DM).

ipv6 pim dense group *group_address/prefix_length* **[[no] override] [priority** *priority***]**

no ipv6 pim dense group *group_address/prefix_length*

Syntax Definitions

group_address	Specifies the IPv6 multicast group address.
/prefix_length	Specifies the prefix length of the IPv6 multicast group.
override	Specifies the static dense mode mapping configuration to override the dynamically learned group mapping information for the specified group.
priority	Specifies the preference value to be used for this static configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a dense mode group mapping.
- This command specifies the mode as Dense (PIM-DM) for the specified IPv6 multicast group addresses.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to un-set the priority.

Examples

```
-> ipv6 pim dense group ff0e::1234/128 priority 50
-> no ipv6 pim dense group ff0e::1234/128
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 pim cbsr

Configures the local router as the Candidate-BSR for the PIM domain.

ipv6 pim cbsr *ipv6_address* **[priority** *priority***] [mask-length** *bits***]**

no ipv6 pim cbsr *ipv6_address*

Syntax Definitions

ipv6_address	The IPv6 unicast address that the local router will use to advertise itself as a Candidate-BSR. The specified address must be a domain-wide reachable address.
priority	The priority value of the local router as a Candidate-BSR. Values may range from 0 to255.
bits	The hash mask length that is advertised in the bootstrap messages for IPv6 PIM (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group). Values may range from 1 to 128.

Defaults

parameter	default
priority	64
bits	126

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a Candidate-BSR for a PIM domain.
- This command is supported only in the sparse mode.
- The information configured using this command is used in the Bootstrap messages.
- Candidate-BSRs also avoid a single point of failure in a PIM domain.

Examples

```
-> ipv6 pim cbsr 2000::1 priority 100 mask-length 4
-> no ipv6 pim cbsr 2000::1
```

Release History

Release 8.1.1; command introduced.

```

ipv6 pim static-rp

Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).

ipv6 pim static-rp *group_address/prefix_length rp_address* **[[no] override] [priority** *priority***]**

no ipv6 pim static-rp *group_address/prefix_length rp_address*

Syntax Definitions

group_address	Specifies the IPv6 multicast group address.
/prefix_length	Specifies the prefix length of the IPv6 multicast group.
rp_address	Specifies the IPv6 unicast address of the Rendezvous Point (RP). This must be a domain-wide reachable address.
override	Specifies the static RP configuration to override the dynamically learned RP information for the specified group.
priority	Specifies the preference value to be used for this static RP configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

Defaults

By default, the priority option is not set and the override option is set to false.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a static RP configuration.
- Specifying the priority value obsoletes the **override** option.
- The IPv6 PIM Source-Specific Multicast (SSM) mode for the default SSM address range (FF3x::/32) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM. You can also map additional IPv6 multicast address ranges for the SSM group. However, the IPv6 multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Note that once the priority option has been defined, a value of 65535 can be used to un-set the priority
- This command is supported only in the sparse mode.

Examples

```
-> ipv6 pim static-rp ff0e::1234/128 2000::1 priority 10
-> no ipv6 pim static-rp ff0e::1234/128 2000::1
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 pim group-map	Displays the IPv6 PIM group mapping table.
show ipv6 pim static-rp	Displays the IPv6 PIM Static RP table, which includes IPv6 multicast group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the Static RP configuration (i.e., enabled or disabled).

MIB Objects

```
alaPimStaticRPTable
   alaPimStaticRPGrpAddress
   alaPimStaticRPGrpPrefixLength
   alaPimStaticRPRPAddress
   alaPimStaticRPOverrideDynamic
   alaPimStaticRPPrecedence
   alaPimStaticRPRowStatus
```

ipv6 pim candidate-rp

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IPv6 multicast group.

ipv6 pim candidate-rp *rp_address group_address/prefix_length* **[priority** *priority***] [interval** *seconds***]**

no ipv6 pim candidate-rp *rp_address group_address/prefix_length*

Syntax Definitions

rp_address	Specifies the IPv6 unicast address that will be advertised as a Candidate-RP. This must be a domain-wide reachable address.
group_address	Specifies the IPv6 multicast group address for which the local router will advertise itself as a Candidate-RP.
/prefix_length	Specifies the prefix length of the specified IPv6 multicast group address.
priority	Specifies the priority value of the Candidate-RP. Values may range from 0 to 192. The lower the value, the higher the priority.
seconds	Specifies the interval at which the C-RP advertisements are sent to the bootstrap router, in seconds. Values may range from 1 to 300.

Defaults

parameter	default
priority	192
seconds	60

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a C-RP for a particular multicast group.
- Only one RP address is supported per switch. If multiple candidate-RP entries are defined, they must specify the same *rp-address.*
- This command is supported only in the sparse mode.

Examples

```
-> ipv6 pim candidate-rp 2000::1 ff0e::1234/128 priority 100 interval 100
-> no ipv6 pim candidate-rp 2000::1 ff0e::1234/128
```

Release History

Release 8.1.1; command introduced.

Related Commands

   alaPimBsrCandidateRPAddress
   alaPimBsrCandidateRPGroupAddress
   alaPimBsrCandidateRPGroupPrefixLength
   alaPimBSrCandidateRPPriority
   alaPimBsrCandidateRPAdvInterval
   alaPimBsrCandidateRPRowStatus
```

ipv6 pim rp-switchover

Enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated packet in the IPv6 PIM domain.

ipv6 pim rp-switchover {enable | disable}

Syntax Definitions

enable	Enables the RP to switch to native forwarding.
disable	Disables the RP from switching to native forwarding.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You cannot specify a pre-configured threshold, such as the RP threshold, as you would do for IPv4 PIM.
- This command is supported only in the sparse mode.

Examples

```
-> ipv6 pim rp-switchover enable
-> ipv6 pim rp-switchover disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 pim sparse	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

MIB Objects

```

   alaPimsmV6RPSwitchover
```

ipv6 pim spt admin-state

Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT).

ipv6 pim spt admin-state {enable | disable}

Syntax Definitions

enable	Enables last hop DR switching to the SPT.
disable	Disables last hop DR switching to the SPT.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is supported only in the sparse mode.
- If the SPT status is enabled, last hop DR switching to the SPT begins once the first data packet is received.

Examples

```
-> ipv6 pim spt admin-state enable
-> ipv6 pim spt admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 pim interface

Enables IPv6 PIM and configures the statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the IPv6 interface.

ipv6 pim interface *if_name* **[hello-interval** *seconds***] [triggered-hello** *seconds***] [joinprune-interval** *seconds***] [hello-holdtime** *seconds***] [joinprune-holdtime** *seconds***] [prune-delay** *milliseconds***] [override-interval** *milliseconds***] [dr-priority** *priority***] [[no] stub] [prune-limit-interval** *seconds***] [graft-retry-interval** *seconds***]**

no ipv6 pim interface *if_name*

Syntax Definitions

if_name	The interface name on which the IPv6 PIM is being enabled or disabled.
hello-interval *seconds*	The frequency at which IPv6 PIM Hello messages are transmitted on this interface, in seconds. Values may range from 0 to 18000.
triggered-hello *seconds*	Specifies the maximum time, in seconds, before a triggered IPv6 PIM Hello message is sent on this interface. Values may range from 0 to 60.
joinprune-interval *seconds*	The frequency at which periodic IPv6 PIM Join/Prune messages are sent on this interface, in seconds. Values may range from 0 to 18000.
hello-holdtime *seconds*	Specifies the value of the IPv6 PIM hello-holdtime for this interface. This value is set in the Holdtime field of IPv6 PIM Hello messages sent on this interface, in seconds. Values may range from 0 to 65535.
joinprune-holdtime *seconds*	Specifies the value that is set in the Holdtime field of the IPv6 PIM Joinprune messages sent on this interface, in seconds.Values may range from 0 to 65535.
prune-delay *milliseconds*	Specifies the value of the expected propagation delay between IPv6 PIM routers on this network, inserted into the LAN prune-delay option of the IPv6 PIM Hello messages sent on this interface, in milliseconds. Values may range from 0 to 32767.
override-interval *milliseconds*	Specifies the value set in the Override Interval field of the LAN prune-delay option of the IPv6 PIM Hello messages sent on this interface, if the prune-delay status is enabled, in *milliseconds.* Values may range from 0 to 65535.
dr-priority *priority*	Specifies the Designated Router priority set in the DR priority option on this interface. The DR priority option value (1–192). A higher numeric value denotes a higher priority.
prune-limit-interval *seconds*	Specifies the minimum interval that must elapse between two successive IPv6 PIM prune messages sent on this interface, in seconds. Values may range from 0 to 65535.
graft-retry-interval *seconds*	Specifies the minimum interval that must elapse between two successive IPv6 PIM graft messages sent on this interface, in seconds. Values may range from 0 to 65535.
stub	Specifies the interface not to send any IPv6 PIM packets through this interface, and to ignore received IPv6 PIM packets.

Defaults

parameter	default
hello-interval *seconds*	30
triggered-hello *seconds*	5
joinprune-interval *seconds*	60
hello-holdtime *seconds*	105
joinprune-holdtime *seconds*	210
prune-delay *milliseconds*	500
override-interval *milliseconds*	2500
dr-priority *priority*	1
prune-limit-interval *seconds*	60
graft-retry-interval *seconds*	3
stub	Disabled

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete an IPv6 PIM interface.
- IPv6 PIM must be enabled globally on the switch before IPv6 PIM will begin running on the interface. To globally enable or disable IPv6 PIM-SM on the switch, refer to the **ipv6 pim sparse admin-state** command on page 30-83. To enable or disable IPv6 PIM-DM on the switch, refer to the **ipv6 pim dense admin-state** command on page 30-84.
- Specifying zero for IPv6 PIM hello-interval represents an infinite time, in which case the periodic IPv6 PIM hello messages are not sent.
- Specifying zero for IPv6 PIM joinprune-interval represents an infinite time, in which case the periodic IPv6 PIM joinprune messages are not sent.
- Specifying the value of 65535 for IPv6 PIM hello-holdtime represents an infinite time. If an IPv6 PIM router gets IPv6 PIM Hello packet from a neighbor with its hello-holdtime value as infinte time, then the router will not time out the sender(neighbor). It is recommended that you use an IPv6 PIM hello-holdtime interval that is 3.5 times the value of the IPv6 PIM hello-interval, or 65535 seconds if the IPv6 PIM hello-interval is set to zero
- Specifying the value of 65535 for IPv6 PIM joinprune-holdtime represents an infinite time. The receipt of IPv6 Join/Prune messages with its joinprune-holdtime value as infinte time, then this specifies an infinite holdtime for the particular IPv6 join/prune message. It is recommended that you use a joinprune- holdtime interval that is 3.5 times the value of the IPv6 PIM Join/Prune interval defined for the interface, or 65535 seconds if the IPv6 PIM joinprune-interval is set to zero.
- The interface configured as a **stub** will not send any IPv6 PIM packets through that interface, and any received IPv6 PIM packets are also ignored. By default, an IPv6 PIM interface is not set to be a stub one.

- The IPv6 PIM **graft-retry-interval** and **prune-limit-interval** options can be used only with the IPv6 PIM-DM mode.

Examples

```
-> ipv6 pim interface vlan-2 hello-interval 100 triggered-hello 10 joinprune-
interval 100 hello-holdtime 350 joinprune-holdtime 400
-> no ipv6 pim interface vlan-2
```

Release History

Release 8.1.1; command introduced.

Related Command

show ipv6 pim interface	Displays detailed IPv6 PIM settings for a specific interface.

show ipv6 pim sparse

Displays the status of the various global parameters for the IPv6 PIM sparse mode.

show ipv6 pim sparse

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim sparse
Status                      = enabled,
Keepalive Period            = 210,
Max RPs                     = 32,
Probe Time                  = 5,
Register Suppress Timeout   = 60,
RP Switchover               = enabled,
SPT Status                  = enabled,
```

output definitions

Status	The current global (i.e., switch-wide) status of the IPv6 PIM sparse mode. Options include **enabled** and **disabled**.
Keepalive Period	The duration of the Keepalive timer. The default value is 210.
Max RPs	The maximum number of Rendezvous Points (RPs) allowed in the IPv6 PIM-SM domain (1–100). The default value is 32.
Probe Time	The amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP. Values may range from 1 to 300. The default value is 5.
Register Suppress Timeout	The amount of time, in seconds, the Designated Router (DR) will stop sending registers to the Rendezvous Point (RP) once a Register-Stop is received (1–300). The default value is 60.

output definitions

RP switchover	The current status of the RP Switchover capability. RP switchover enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated data packet. Options include **enabled** and **disabled**. The default setting is **enabled**.
SPT Status	The current status of last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). Options include **enabled** and **disabled**. The default setting is **enabled**.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 pim rp-switchover	Enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated packet in the IPv6 PIM domain.
ipv6 pim spt admin-state	Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first multicast data packet is received.
ipv6 pim sparse admin-state	Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.
ipv6 pim interface	Enables IPv6 PIM and configures statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the interface.
ip pim max-rps	Configures the maximum number of C-RP routers allowed in the PIM-SM domain.
ip pim probe-time	Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.
ip pim register-suppress-timeout	Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.

show ipv6 pim dense

Displays the status of the various global parameters for the IPv6 PIM dense mode.

show ipv6 pim dense

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show IPv6 pim dense
Status                       = enabled,
Source Lifetime              = 210,
State Refresh Interval       = 60,
State Refresh Limit Interval = 0,
State Refresh TTL            = 16
```

output definitions

Status	The current global (i.e., switch-wide) status of the IPv6 PIM dense mode. Options include **enabled** and **disabled**.
Source Lifetime	The duration of the Keepalive or Source Lifetime timer. The default value is 210.
State Refresh Interval	The time-interval, in seconds, between successive State Refresh messages originated by the router. The default value is 60.
State Refresh Limit Interval	Displays the limit at which a router will not forward the State Refresh messages, if they are received at less than the interval. The default value is 0.
State Refresh TTL	Displays the TTL to be used in the router's originated State Refresh messages. The default value is 16.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 pim dense admin-state	Enables or disables IPv6 PIM-DM (dense mode) globally on the switch.
ip pim keepalive-period	Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.
ip pim state-refresh-interval	Sets the interval between successive State Refresh messages originated by a router.
ip pim state-refresh-limit	Sets the limit at which a router will not forward successive State Refresh messages if they are received at less than the interval.
ip pim state-refresh-ttl	Sets the Time to Live to be used in a router's originated State Refresh messages if the data packet's Time to Live is not recorded.

MIB Objects

show ipv6 pim ssm group

Displays the static configuration of IPv6 multicast group mappings for PIM-Source Specific Multicast (SSM).

show ipv6 pim ssm group

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

Examples

```
-> show ipv6 pim ssm group

Group Address/Pref Length   Mode  Override Precedence Status
--------------------------+-----+--------+----------+--------
ff00::/8                   ssm    false    none       enabled
ff34::/32                  ssm    false    none       enabled
```

output definitions

Group Address/Pref Length	The IPv6 multicast group address along with the prefix length.
Mode	The IPv6 PIM mode that is used for the groups in this prefix.
Override	Specifies this static RP configuration to override the dynamically learned RP information for the specified group.
Precedence	The precedence value that can be used for this static RP configuration.
Status	Displays whether this entry is currently enabled or disabled. Options include **enabled** and **disabled**.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 pim ssm group	Statically maps the specified IPv6 multicast group to the PIM Source Specific Multicast mode (SSM).

MIB Objects

```

show ipv6 pim dense group

Displays the static configuration of IPv6 multicast group mappings for PIM Dense Mode (DM).

show ipv6 pim dense group

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

Examples

```
-> show ipv6 pim dense group
Group Address/Pref Length   Mode  Override Precedence Status
---------------------------+-----+--------+----------+--------
ff00::/8                    dm    false    none       enabled
ff34::/32                   dm    false    none       enabled
```

output definitions

Group Address/Pref Length	The IPv6 multicast group address along with the prefix length.
Mode	The IPv6 PIM mode that is used for the groups in this prefix.
Override	Specifies this static RP configuration to override the dynamically learned RP information for the specified group.
Precedence	The precedence value that can be used for this static RP configuration.
Status	Displays whether this entry is currently enabled or disabled. Options include **enabled** and **disabled**.

Release History

Release 8.1.1; command introduced.

show ipv6 pim interface

Displays detailed IPv6 PIM settings for a specific interface. In general, it displays IPv6 PIM settings for all the interfaces if no argument is specified.

show ipv6 pim interface [*if_name***]**

Syntax Definitions

if_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

To view more detailed information about a particular interface, specify the interface name in the command line. Additional information includes Triggered Hello Interval, Hello Holdtime, Prune Delay status and value, Override Interval, LAN Delay status, Generation ID status, and Join/Prune Holdtime.

Examples

```
-> show ipv6 pim interface

Interface Name       Designated                Hello    Join/Prune Oper
                     Router                    Interval Interval   Status
--------------------+-------------------------+--------+----------+---------
vlan-5               fe80::2d0:95ff:feac:a537  30       60         enabled
vlan-30              fe80::2d0:95ff:feac:a537  30       60         disabled
vlan-40              fe80::2d0:95ff:fee2:6eec  30       60         enabled

-> show ipv6 pim interface vlan-5
Interface Name              = vlan-5,
IP Address                  = fe80::2d0:95ff:fee2:6eec,
Designated Router           = fe80::2d0:95ff:fee2:a537,
Hello Interval              = 30,
Triggered Hello Interval    = 5,
Hello HoldTime              = 105,
Join/Prune Interval         = 60,
Join/Prune HoldTime         = 210,
Propagation (Prune) Delay   = 500,
Override Interval           = 2500,
Generation ID               = 0x4717be4d,
DR Priority                 = 1,
DR Priority Enabled         = true,
Lan Delay Enabled           = true,
Effective Propagation Delay = 500,
Effective Override Interval = 2500,
Suppression Enabled         = true,
```

```
Stub Interface              = false,
Prune Limit Interval        = 60,
Graft Retry Interval        = 3,
State Refresh Enabled       = true,
Operational Status          = enabled
```

output definitions

Interface Name	The name of the IPv6 PIM interface.
IPv6 address	Specifies the IPv6 address of the specified interface.
Designated Router	The primary IP address for the Designated Router (DR). The DR acts on behalf of any directly-connected hosts with respect to the PIM-SM protocol. Only one router in the LAN will act as the DR.
Hello Interval	The frequency at which PIM Hello messages are transmitted on a specified interface. Values may range from 1 to 18000. The default value is 30.
Join/Prune Interval	The Join/Prune interval for the associated interface. The Join/Prune interval is the interval at which periodic PIM-SM Join/Prune messages are sent. Values may range from 0 to 18000. The default value is 60.
Triggered Hello Interval	The current Triggered Hello Interval. This value indicates the maximum time, in seconds, before a triggered PIM Hello message is transmitted on the corresponding interface. Values may range from 0 to 60. The default value is 5.
Hello Holdtime	The current Hello Holdtime value. This value indicates the maximum amount of time, in seconds, Hello messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 105.
Join/Prune Holdtime	The current Join/Prune Holdtime value. This value indicates the maximum amount of time, in seconds, Join/Prune messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 210.
Propagation Delay	The expected propagation delay between PIM routers on the network. Values may range from 0 to 32767. The default value is 500.
Override Interval	The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.
Generation ID Option	The value of the Generation ID this router inserted in the last PIM Hello message it sent on this interface.
DR Priority	Displays the Designated Router priority for each interface. This value is used in determining the Designated Router on an interface. Values may range from 1 to 192. A higher numeric value denotes a higher priority. Note that priority-based election is used only if all routers on the interface are using the DR priority option. The default value is 1.

output definitions (continued)

Lan Delay Enabled	Options include **true** and **false**. The value will be true if all neighbors on the interface are using the LAN Prune Delay option. Otherwise, the setting will be false.
Effective Propagation Delay	The Effective Propagation Delay on this interface.
Effective Override Interval	The Effective Override Interval on this interface.
Suppression Enabled	Specifies whether the Join suppression is enabled on this interface.
DR Priority Enabled	Evaluates to TRUE if all routers on this interface are using the DR Priority option.
Stub Interface	Specifies whether this interface is a 'stub interface'. If this is TRUE, then no PIM packets are sent out on this interface, and any received PIM packets are ignored.
Prune Limit Interval	The minimum interval that must transpire between two successive Prunes sent by a router. This is used only with PIM-DM. Values may range from 0 to 65535. The default value is 60.
Graft Retry Interval	Displays the time-interval a router waits for a Graft acknowledgment before resending a Graft on the interface. This is only used with PIM-DM. Values may range from 0 to 65535. The default value is 3.
SR Priority Enabled	Evaluates to TRUE if all routers on this interface are using the State Refresh option. This is used only by PIM-DM.
Operational Status	The current operational status of the corresponding interface. Options include **enabled** and **disabled**. This value indicates whether the IPv6 interface is operationally up. For example, if PIM is enabled on the interface, but the interface is currently down, this field will display as disabled. The default setting is **disabled**. To enable or disable PIM on an interface, refer to the **ipv6 pim interface**. To globally enable or disable PIM on the switch, refer to the **ipv6 pim sparse admin-state** and **ipv6 pim dense admin-state**.

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 pim neighbor

Displays a list of active IPv6 PIM neighbors.

show ipv6 pim neighbor [*ipv6_address***] [***if_name***]**

Syntax Definitions

ipv6_address	The IPv6 address for the PIM neighbor.
if_name	The name of the interface.

Defaults

If the neighbor's IPv6 address or interface name is not specified, the entire IPv6 PIM neighbor table is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

To view more detailed information about a particular neighbor, specify the neighbor's IPv6 address or the associated interface name in the command line. Additional information will be displayed, which includes LAN Prune Delay, Override Interval, TBit field, State Refresh capable, and Designated Router option status.

Examples

```
-> show ipv6 pim neighbor
Neighbor Address               Interface Name       Uptime      Expires     DR Pri
------------------------------+--------------------+-----------+-----------+------

```

If a specific interface name is specified in the command line, *detailed information corresponding to all neighbors on the specified interface only* displays:

```
-> show IPv6 pim neighbor vlan-30
vlan-30
  Neighbor IPv6 Address        = fe80::2d0:95ff:feac:a537,
  Uptime                       = 02h:57m:09s,
  Expires                      = 00h:01m:40s,
  Lan Prune Delay Present            = True,
  Propagation Delay            = 500,
  Override Interval            = 2500,
  TBit Field                   = True,
  Gen ID Present               = True,
  Gen ID Value                 = 0x7720c123,
  BiDir Capable                = False,
  DR Priority Present          = True,
  DR Priority                  = 1,
  State Refresh Capable        = True,
  Secondary Addresses:
    3000::11
```

output definitions

Neighbor IPv6 Address	The IPv6 address of the active PIM neighbor.
Interface Name	The name of the IPv6 PIM interface that is used to reach the neighbor.
Uptime	The amount of time since this PIM neighbor last became a neighbor of the local router, displayed in hours, minutes, and seconds.
Expires	The minimum amount of time remaining before the PIM neighbor will be aged out, displayed in hours, minutes, and seconds.
LAN Prune Delay present	Specifies whether this neighbor is using the LAN Prune Delay option. Options include **true** or **false**.
Propagation Delay	The value of the propagation-delay field of the LAN prune-delay option received from this neighbor. A value of 0 indicates that no LAN prune-delay option was received from this neighbor.

output definitions (continued)

Override Interval	The current Override Interval of the LAN prune-delay option received from this neighbor. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by the neighboring router is dictated by this number. Values may range from 0 to 65535. A value of 0 indicates that no LAN prune-delay option was received from this neighbor.
TBit field	The value of the Tbit field of the LAN prune-delay option received from this neighbor. The Tbit specifies the ability of the neighbor to disable Join suppression.
Gen ID present	Specifies whether this neighbor is using Generation ID option. Options include **true** or **false**.
Gen ID Value	The value of the Generation ID in the last PIM Hello message received from this neighbor.
BiDir Capable	Specifies whether this neighbor is using the Bidirectional-PIM Capable option.
DR Priority Present	Displays whether the neighbor is using the Designated Router option. Options include **true** or **false**.
DR priority	The value of the Designated Router Priority in the last PIM Hello message received from this neighbor.
State Refresh Capable	Displays whether the neighbor is capable of receiving State Refresh messages. Options include **true** or **false**.
Secondary Addresses	The secondary IPv6 address of this PIM neighbor.

Release History

Release 8.1.1; command introduced.

show ipv6 pim static-rp

Displays the IPv6 PIM Static RP table, which includes IPv6 multicast group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the static RP configuration (i.e., enabled or disabled).

show ipv6 pim static-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

Examples

```
-> show ipv6 pim static-rp

Group Address/Pref Length   RP Address    Mode  Override Precedence Status
----------------------------+-------------+-----+--------+----------+--------
ff00::/8                    3000::11      asm   false    none       enabled
ff34::/32                   3000::11      asm   false    none       enabled
```

output definitions

Group Address/Pref Length	The IPv6 multicast group address along with the prefix length.
RP Address	The IPv6 address of the RP that is mapped for the groups within the group prefix. This field is set to zero, if the specified IPv6 PIM mode is SSM or DM.
Mode	The IPv6 PIM mode that is used for the groups in this prefix. The possible values include ASM, SSM, or DM.
Override	Specifies that this static RP configuration can override the dynamically learned RP information for the specified group.
Precedence	The precedence value that is used for this static RP configuration.
Status	Displays whether the static RP configuration is currently enabled or disabled. Options include **enabled** and **disabled**.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 pim static-rp	Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).

MIB Objects

```

show ipv6 pim group-map

Displays the IPv6 PIM group mapping table.

show ipv6 pim group-map [bsr | static-rp | ssm | dense]

Syntax Definitions

N/A

Defaults

If the keywords **bsr**, **static-rp**, **ssm**, or **dense** are included in the command line, then only the entries that were created by the specified origin are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If static RP configuration is being used, this information is obtained from those static RP addresses that are defined through the **ipv6 pim static-rp** command. As long as the RP addresses defined in the static RP set are reachable, they will be added to the group mapping table.
- If the IPv6 multicast groups are mapped to the mode DM or SSM, then the entries created by local SSM address range configuration using the **ipv6 pim ssm group** command and local Dense Mode address range configuration using the **ipv6 pim dense group** command are displayed.
- If the bootstrap mechanism is being used, this information is obtained from received Candidate-RP advertisements (when the local router is the BSR; when the local router is not the BSR, this information is obtained from received bootstrap messages).

Examples

```
-> show ipv6 pim group-map
Origin    Group Address/Pref Length   RP Address    Mode  Precedence
---------+--------------------------+------------+-----+-----------
BSR       ff00::/8                   3000::11      asm   192
BSR       ff00::/8                   4000::7       asm   192
SSM       ff33::/32                                ssm

-> show ipv6 pim group-map bsr
Origin    Group Address/Pref Length   RP Address    Mode  Precedence
---------+--------------------------+------------+-----+-----------
BSR       ff00::/8                   3000::11      asm   192
BSR       ff00::/8                   4000::7       asm   192

-> show ipv6 pim group-map ssm
Origin     Group Address/Pref Length   RP Address    Mode  Precedence
---------+--------------------------+------------+-----+-----------
```

```
SSM        ff33::/32                                  ssm
```

output definitions

Origin	The mechanism by which the PIM mode and RP for the group were learned. The possible values include 'static RP' for local static RP configuration, 'static SSM' for both static SSM group configuration and Dense Mode Group configuration, and 'BSR' for the PIM Bootstrap Router mechanism.
Group Address/Prefix Length	The IPv6 multicast group address along with the prefix length.
RP Address	The IPv6 address of the Rendezvous Point to be used for groups within the group prefix.
Mode	The IPv6 PIM mode to be used for groups in this prefix.
Mapping Precedence	The precedence value of a particular row, that determines which row applies to a given group address. Numerically higher values for this object indicate lower precedences, with the value zero denoting the highest precedence.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 pim static-rp	Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).
ipv6 pim ssm group	Statically maps the specified IPv6 multicast group to the PIM Source Specific Multicast mode (SSM).
ipv6 pim dense group	Statically maps the specified IPv6 multicast group to the PIM Dense mode (DM).

MIB Objects

show ipv6 pim candidate-rp

Displays the IPv6 multicast groups for which the local router advertises itself as a Candidate-RP.

show ipv6 pim candidate-rp

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim candidate-rp
RP Address         Group Address   Priority  Interval  Status
-----------------+---------------+---------+---------+--------
3000::11           FF00::/8        192       60        enabled
```

output definitions

RP Address	An IPv6 unicast address that is advertised as the Candidate-Rendezvous Point (RP).
Group Address	The IPv6 multicast group address along with the prefix length. This is the group for which the local router advertises itself as a C-RP.
Priority	The C-RP router's priority. The lower the value, the higher the priority.
Interval	The time interval at which the C-RP advertisements are sent to the BSR.
Status	The current status of this entry. The status is shown as enabled only if the IPv6 PIM-SM is globally enabled and the IPv6 PIM interface is enabled.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 pim candidate-rp	Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IPv6 multicast group.

```

show ipv6 pim cbsr

Displays the IPv6 Candidate-BSR information that is used in the Bootstrap messages.

show ipv6 pim cbsr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim cbsr
CBSR Address             = 3000::7,
Status                   = enabled,
CBSR Priority            = 0,
Hash Mask Length         = 126,
Elected BSR              = False,
Timer                    = 00h:00m:00s
```

output definitions

CBSR Address	An IPv6 unicast address that the local router uses to advertise itself as a Candidate-BSR.
Status	The current status of this entry. The status is shown as enabled only if the IPv6 PIM-SM is globally enabled and the IPv6 PIM interface is enabled.
CBSR Priority	The value for the local router as a Candidate-BSR. The higher the value, the higher the priority.
Hash Mask Length	The hash mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for an IPv6 multicast group)
Elected BSR	Specifies whether the local router is the elected BSR.
Timer	The time value that is remaining before the local router originates the next Bootstrap message. This value is zero if this router is not the elected BSR.

Release History

Release 8.1.1; command introduced.

Related Commands

ipv6 pim cbsr	Configures the Candidate-BSR information that is used in the Bootstrap messages.

show ipv6 pim bsr

Displays information about the elected IPv6 BSR.

show ipv6 pim bsr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 pim bsr
BSR Address              = 3000::7,
BSR Priority             = 192,
Hash Mask Length         = 126,
Expiry Time              = 00h:01m:35s
```

output definitions

BSR Address	The IPv6 unicast address of the elected BSR.
BSR Priority	The priority value of the elected BSR. The higher the value, the higher the priority.
Hash Mask Length	The hash mask length that is advertised in the Bootstrap messages by the elected BSR (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group.
Expiry Time	The minimum time remaining before the elected BSR will be declared down.

Release History

Release 8.1.1; command introduced.

show ipv6 pim groute

Displays all (*,G) state that the IPv6 PIM has.

show ipv6 pim groute [*group_address***]**

Syntax Definitions

group_address	The IPv6 address of the Multicast Group.

Defaults

By default, entire (*,G) routing table is displayed. To view more detailed (*,G) state information about a particular group, specify the group address in the command line.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When the *group_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.

Examples

```
-> show ipv6 pim groute
Total 1 (*,G)

Group Address          RP Address          RPF Interface                UpTime

    Assert State              = No Info,
    Assert Timer              = 00h:00m:00s,
```

output definitions

Group-address	The IPv6 Multicast Group Address.
RP Address	The address of the Rendezvous Point (RP) for the group.
RPF Interface	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
Upstream Neighbor	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (*,G) join messages to.
UpTime	The time since this entry was created.
Pim Mode Origin	The mechanism by which the PIM mode and RP for the group were learned.
Upstream Join State	Whether the local router should join the RP tree for the group.
Upstream Join Timer	The time remaining before the local router next sends a periodic (*,G) Join message on the RPF IfIndex.
RPF Next Hop	The address of the RPF next hop towards the RP.
RPF Route Protocol	The routing mechanism through which the route used to find the RPF interface towards the RP was learned.
RPF Route Address/Prefix Length	The IPv6 address combined with the prefix length identifies the route used to find the RPF interface towards the RP.
Route Metric Pref	The metric preference of the route used to find the RPF interface towards the RP.
Route Metric	The routing metric of the route used to find the RPF interface towards the RP.
Interface Name	The interface name that corresponds to the ifIndex.
Local Membership	Whether the local router has (*,G) local membership on this interface.

output definitions (continued)

Join Prune State	The state resulting from (*,G) Join/Prune messages received on this interface.
Prune Pending Timer	The time remaining before the local router acts on a (*,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
Join Expiry Timer	The time remaining before (*,G) Join state for this interface expires.
Assert State	The (*,G) Assert state for this interface. The possible values are No Info, Winner or Loser.
Assert Timer	If Assert State is 'Winner', this is the time remaining before the local router next sends a (*,G) Assert message on this interface. If the Assert State is 'Loser', this is the time remaining before the (*,G) assert state expires.
Assert Winner Address	If the Assert State is 'Loser', this is the address of the assert winner.
Assert Winner Metric Pref	If the Assert State is 'Loser', this is the metric preference of the route to the RP advertised by the assert winner; otherwise, this is zero.
Assert Winner Metric	If the Assert State is 'Loser', this is the routing metric of the route to the RP advertised by the assert winner; otherwise, this is zero.

Release History

Release 8.1.1; command introduced.

show ipv6 pim sgroute

Displays all (S,G) state that the IPv6 PIM has.

show ipv6 pim sgroute [*source_address group_address***]**

Syntax Definitions

source_address	The IPv6 address for a specific multicast source.
group_address	A IPv6 multicast address.

Defaults

By default, entire (S,G) routing table is displayed. To view the detailed information for a particular (S,G) entry, use the *source_address* and *group_address* associated with that entry.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the *source_address* and *group_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.
- If an IPv6 address is not specified, the current PIM status for all multicast route entries are displayed.

Examples

```
-> show ipv6 pim sgroute

Legend: Flags: D = Dense, S = Sparse, s = SSM Group,
               L = Local, R = RPT, T = SPT, F = Register,
               P = Pruned, O = Originator

  Assert State              = No Info,
  Assert Timer              = 00h:00m:00s,
```

output definitions

Source-address	The IPv6 Source address.
Group-address	The IPv6 Multicast Group Address.
RPF Interface	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
Upstream Neighbor	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (S,G) join messages to.
UpTime	The time since this entry was created.
Flags	Flags indicating SPTBit, Prune State, Join State, etc.
Pim Mode	Whether the Group Address is SSM, ASM or DM.
Upstream Join State	Whether the local router should join the SPT for the source and group represented by this entry.
Upstream Join Timer	The time remaining before the local router next sends a periodic (S,G) Join message.
RPF Next Hop	The address of the RPF next hop towards the source.
RPF Route Protocol	The routing mechanism through which the route used to find the RPF Interface towards the source was learned.
RPF Route Address/Prefix Length	The IP address which when combined with the Route Prefix length identifies the route used to find the RPF interface towards the source.
RPF Route Metric Pref	The metric preference of the route used to find the RPF interface towards the source.

output definitions (continued)

RPF Route Metric	The metric preference of the route used to find the RPF interface towards the source.
DR Register State	Whether the local router should encapsulate (S,G) data packets in Register messages and send them to the RP. The possible values include No Info, Join, Join Pending, or Prune.
DR Register Stop Timer	The value of the Register Stop Timer. If the Register State is 'prune', this is the time remaining before the local router sends a Null-Register message to the RP. If the State is 'joinPending', this is the time remaining before the local router resumes encapsulating data packets and sending them to the RP.
Upstream Prune State	Whether the local router has pruned itself from the tree. This is only used by PIM-DM. The possible values include forwarding, Ack Pending, or Pruned.
Upstream Prune Limit Timer	The time remaining before the local router may send a (S,G) prune message on alaPimSGRPFIfIndex. This is only used by PIM-DM.
Originator State	Whether this router is an originator for the (S,G) message flow. This is only used by PIM-DM. The possible values include Not Originator or Originator.
Source Active Timer	If this router is the Originator, this is the time remaining before the local router reverts to notOriginator state. Otherwise, this is zero. This is only used by PIM-DM.
State Refresh Timer	If Originator state is 'originator', this is the time remaining before the local router sends a State Refresh Message. Otherwise, this is zero. This is only used by PIM-DM.
Interface Name	The interface name corresponding to the ifIndex that corresponds to this entry.
Uptime	The time since this entry was created.
Local Membership	Whether the local router has (S,G) local membership on this interface.
Join Prune State	The state resulting from (S,G) Join/Prune messages received on this interface. The possible values include No Info, Join, or Prune Pending.
Prune Pending Timer	The time remaining before the local router acts on an (S,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
Join Expiry Timer	The time remaining before (S,G) Join state for this interface expires.
Assert State	The (S,G) Assert state for this interface. The possible values include No Info, Winner, or Loser.
Assert Timer	If Assert State is Winner, this is the time remaining before the local router sends a (S,G) Assert message on this interface. If the Assert State is Loser, this is the time remaining before the (S,G) Assert state expires.
Assert Winner	If the Assert State is Loser, this is the address of the assert winner.
Assert Winner Metric Pref	If the Assert State is Loser, this is the metric preference of the route to the source advertised by the assert winner.
Assert Winner Metric Metric	If the Assert State is Loser, this is the routing metric of the route to the source advertised by the assert winner.

Release History

Release 8.1.1; command introduced.

31 Multicast Routing Commands

This chapter describes multicast routing commands. Multicast routing is used in conjunction with IP Multicast Switching (IPMS). IPMS can operate either with or without multicast routing. However, for multicast routing to function, IPMS must be configured.

Multicast uses Class D IP addresses in the range 224.0.0.0 to 239.255.255.255. Addresses in the range 239.0.0.0 to 239.255.255.255 are reserved for boundaries, which are used to prevent multicast traffic from being forwarded on a VLAN group or network.

The multicast route boundary is extended to include the non-standard multicast group range (224.0.0.0 to 239.255.255.255). This allows to stop all multicast traffic from being forwarded on a VLAN group or network.

IP multicast routing is a way of controlling multicast traffic across networks. The multicast router discovers which networks want to receive multicast traffic by sending out Internet Group Management Protocol (IGMP) queries and receiving IGMP reports from attached networks. The IGMP reports signal that users want to join or leave a multicast group. If there is more than one multicast router in the network, the router with the lowest IP address is elected the querier router, which is responsible for querying the subnetwork for group members.

The current release also provides support for IPv6 multicast addresses. In the IPv6 addressing scheme, multicast addresses begin with the prefix ff00::/8. Similar to IPv6 unicast addresses, IPv6 multicast addresses also have different scopes depending on their prefix, though the range of possible scopes is different.

Multicast Listener Discovery (MLD) is the protocol used by an IPv6 router to discover the nodes which request multicast packets on its directly attached links and the multicast addresses that are of interest to those neighboring nodes. MLD is derived from version 2 of IPv4's Internet Group Management Protocol, IGMPv2. MLD uses ICMPv6 message types, rather than IGMP message types.

MIB information for the multicast routing commands is as follows:

Filename: ALCATEL-IND1-IPMRM-MIB.mib
Module: alcatelIND1IPMRMMIB

Filename: IPMCAST-MIB.mib
Module: IpMcastMib

A summary of the available commands is listed here:

ip mroute-boundary
ip mroute-boundary extended
ip mroute interface ttl
ip mroute mbr
show ip mroute-boundary
show ip mroute
show ip mroute interface
show ip mroute-nexthop
show ip mroute mbr
ipv6 mroute interface ttl
show ipv6 mroute
show ipv6 mroute interface
show ipv6 mroute-nexthop

ip mroute-boundary

Adds or deletes scoped multicast address boundaries for a router interface. When a user on the specified interface joins the multicast group as defined by the scoped address—plus the mask length—all multicast traffic will stop being forwarded on that interface. This provides a mechanism for the end user to control multicast traffic from the network.

Refer to the "Configuring Multicast Address Boundaries" chapter in the applicable *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* for detailed information.

ip mroute-boundary *if_name scoped_address mask*

no ip mroute-boundary *if_name scoped_address mask*

Syntax Definitions

if_name	The interface name on which the boundary is being assigned.
scoped_address	A scoped multicast address identifying the group range for the boundary. Scoped addresses may range from 239.0.0.0–239.255.255.255.
mask	A corresponding Class A, B, or C mask address (e.g., 255.0.0.0).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to delete the scoped multicast address boundaries for a router interface.

Examples

```
-> ip mroute-boundary vlan-2 239.0.0.0 255.0.0.0
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip mroute-boundary	Displays scoped multicast address boundaries for the switch's router interfaces.

MIB Objects

```
IpMRouteBoundaryTable
   ipMRouteBoundaryIfIndex
   ipMRouteBoundaryAddress
   ipMRouteBoundaryAddressMask
   ipMRouteBoundaryStatus
```

ip mroute-boundary extended

Enables or disables the multicast route boundary expansion feature. On enabling the multicast route boundary is extended to all the multicast groups (that is, the non-scoped address, 224.0.0.0 to 239.255.255.255). All multicast traffic will stop being forwarded on that interface. This provides a mechanism for the end user to control multicast traffic from the network.

Refer to the "Configuring Multicast Address Boundaries" chapter in the applicable *OmniSwitch AOS Release 8 Advanced Routing Configuration Guide* for detailed information.

ip mroute-boundary extended {enable | disable}

Syntax Definitions

enable	The multicast route boundary is extended to all the multicast cast address groups (224.0.0.0 through 239.255.255.255).
disable	The multicast route boundary is limited to administratively scoped multicast address (239.0.0.0 through 239.255.255.255).

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip mroute-boundary extended enable
-> ip mroute-boundary extended disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show ip mroute-boundary	Displays multicast address boundaries for the switch's router interfaces.

MIB Objects

```
IpMRouteBoundaryTable
   alaIpmrmExtendedBoundaryStatus
```

ip mroute interface ttl

Specifies a multicast datagram Time to Live (TTL) threshold for an existing router interface. IP multicast datagrams with a TTL value lower than the specified TTL threshold value will not be forwarded out of the interface.

ip mroute interface *if_ name* **ttl** *threshold*

Syntax Definitions

if_name	The interface name that has one of the Multicast routing protocols running (either DVMRP or PIM).
threshold	The TTL threshold value. Values may range from 0–255. The default value of 0 allows all multicast packets to be forwarded out of the interface.

Defaults

parameter	default
threshold	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ip mroute interface vlan-1 ttl 255
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip mroute interface	Displays IP multicast interface information.

MIB Objects

```
alaIpMcastInterfaceTable
   alaIpMcastInterfaceIfIndex
   alaIpMcastInterfaceTtl
```

ip mroute mbr

Configures the switch to serve as a Multicast Border Router (MBR) that will provide interoperability between DVMRP and PIM domains.

ip mroute mbr admin-state {enable | disable}

Syntax Definitions

enable	Enables MBR functionality on the switch.
disable	Disables MBR functionality on the switch.

Defaults

MBR functionality is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- To configure the switch to operate as an MBR, first configure the DVMRP and PIM protocols for the switch then enable MBR functionality.
- The MBR functionality is operationally enabled only when there is at lease one PIM interface and one DVMRP interface enabled and both interfaces are operationally active on the switch.
- The MBR feature only supports interoperability between DVMRP and PIM (includes PIM-DM and PIM-SM) domains; no other routing protocols are supported.
- The following is *not* supported by the MBR feature in the current release:
  - PIM-SSM
  - Interoperability between multiple PIM domains
  - IPv6 (only IPv4)

Examples

```
-> ip mroute mbr admin-state enable
-> ip mroute mbr admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ip mroute mbr	Displays MBR configuration information.

MIB Objects

`alaIpmrmMbrStatus`

ipv6 mroute interface ttl

Specifies a multicast datagram Time to Live (TTL) threshold for an existing IPv6 interface. Any IP multicast datagrams with a TTL value lower than the specified TTL threshold value will not be forwarded out of the interface.

ipv6 mroute interface *if_name* **ttl** *threshold*

Syntax Definitions

if_name	The name of the IPv6 interface.
threshold	The TTL threshold value. Values may range from 0–255. The default value of 0 allows all multicast packets to be forwarded out of the interface.

Defaults

parameter	default
threshold	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ipv6 mroute interface vlan-1 ttl 255
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 mroute interface	Displays IPv6 multicast interface information.

MIB Objects

```
alaIpMcastInterfaceTable
   alaIpMcastInterfaceIfIndex
   alaIpMcastInterfaceTtl
```

show ip mroute-boundary

Displays the status of multicast address boundaries for the switch's router interfaces.

show ip mroute-boundary

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip mroute-boundary
Extended Boundary Address Range: enabled

Interface Name  Interface Address  Boundary Address
--------------+------------------+------------------
vlan-4           214.0.0.7          239.1.1.1/32
vlan-2           170.2.0.1          224.2.2.2/24
```

output definitions

Extended Boundary Address Range	Displays the status of extended multicast route boundary on the interface.
Interface Name	The name of the interface on which the boundary is assigned. Packets with a destination address in the associated address/mask range will not be forwarded from this interface.
Interface Address	The IP address of this interface where the boundary is assigned.
Boundary Address	The multicast address when combined with the boundary mask identifies the boundary range. The boundary's subnet mask is shown using the CIDR prefix length: 255.0.0.0 equals /8; 255.255.0.0 equals /16; 255.255.255.0 equals /24.

Release History

Release 8.1.1; command introduced.
Release 8.2.1; **Extended Boundary Address Range** output filed added.

Related Commands

ip mroute-boundary	Adds or deletes a router's scoped multicast address boundaries.
ip mroute-boundary extended	Enables or disables the multicast route boundary expansion feature.
show ip mroute interface	Displays IP multicast interface information.

MIB Objects

IpMRouteBoundaryTable
   ipMRouteBoundaryIfIndex
   ipMRouteBoundaryAddress
   ipMRouteBoundaryAddressMask
   alaIpmrmExtendedBoundaryStatus
   ipMRouteBoundaryStatus
```

show ip mroute

Displays multicast routing information for IP datagrams sent by particular sources to the IP multicast groups known to this router.

show ip mroute

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ip mroute

Total 2 Mroutes
Group Address   Src Address      Upstream Nbr    Route Address      Proto
--------------+---------------+---------------+----------------+----------
225.0.0.0       214.0.0.2/32      0.0.0.0       214.0.0.0/24        PIM-SM
225.0.0.1       214.0.0.2/32      0.0.0.0       214.0.0.0/24        PIM-DM
```

output definitions

Group Address	The IP multicast group address for this entry.
Src Address	The network address which identifies the source for this entry.
Upstream Nbr	The address of the upstream neighbor from which IP datagrams from these sources to this multicast address are received.
Route Address	The address portion of the route used to find the upstream or parent interface for this multicast forwarding entry.
Proto	The multicast routing protocol through which this multicast forwarding entry was learned (i.e., DVMRP, PIM-SM or PIM-DM).

Release History

Release 8.1.1; command introduced.

Related Commands

show ip mroute interface	Displays IP multicast interface information.
show ip mroute-nexthop	Displays IP next-hop information on outgoing interfaces for routing IP multicast datagrams.

 Proto
-------------+--------------+---------+-----------------------+-----------------
+------+
ff06:7777::1  2600::7       vlan-30   fe80::2d0:95ff:feac:a537 2600::/64
 PIM-SM
ff06:7777::2  2600::7        vlan-30   fe80::2d0:95ff:feac:a537 2600::/64
 PIM-SM
```

output definitions

Group Address	The IPv6 multicast group address for this entry.
Source Address	The IPv6 multicast address, which identifies the source for this entry.
Interface	The name of the IPv6 interface on which the datagrams sent by these sources to this IPv6 multicast address are received.
Upstream Neighbor	The IPv6 address of the upstream neighbor from which the datagrams from these sources to this multicast address are received.
Route Addr/Prefix len	The IPv6 address portion of the route used to find the upstream or parent interface for this IPv6 multicast forwarding entry.
Proto	The IPv6 multicast routing protocol through which this IPv6 multicast forwarding entry was learned.

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 mroute interface	Displays IPv6 multicast interface information.
show ipv6 mroute-nexthop	Displays IPv6 next-hop information on outgoing interfaces for routing IPv6 multicast datagrams.

MIB Objects

```
alaIpMcastRouteTable
   alaIpMcastRouteGroup
   alaIpMcastRouteSource
   alaIpMcastRouteInIfIndex
   alaIpMcastRouteUpstreamNeighbor
   alaIpMcastRouteRtAddress
   alaIpMcastRouteRtPrefixLength
   alaIpMcastRouteProtocol
```

show ip mroute interface

Displays IP multicast interface information.

show ip mroute interface [*interface_name***]**

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Not specifying an interface name displays all known IP multicast interfaces information.

Examples

```
-> show ip mroute interface

Interface Name     IP Address     TTL   Multicast Protocol
---------------+---------------+------+--------------------
vlan-4             214.0.0.7       0        PIM
vlan-26            172.21.63.7     0        PIM
vlan-11            212.61.11.7     0        PIM
```

output definitions

Interface Name	The name configured for the interface.
IP Address	The IP address of this interface entry.
TTL	The datagram TTL threshold for the interface. Any IP multicast datagrams with a TTL less than the threshold displayed in the table will not be forwarded out of the interface. The default value, 0, specifies that *all* multicast packets are forwarded out of the interface.
Multicast Protocol	The multicast routing protocol currently running on this interface. Options include DVMRP and PIM.

Release History

Release 8.1.1; command introduced.

Related Commands

show ip mroute	Displays multicast routing information for IP datagrams sent by particular sources to the IP multicast groups known to this router.
show ip mroute-nexthop	Displays IP next-hop information on outgoing interfaces for routing IP multicast datagrams.

MIB Objects

   alaIpMcastInterfaceTtl
   alaIpMcastInterfaceProtocol
```

show ipv6 mroute interface

Displays IPv6 multicast interface information.

show ipv6 mroute interface {*interface_name***}**

Syntax Definitions

interface_name	The name of the interface.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Not specifying an interface name displays all known IPv6 multicast interfaces information.

Examples

```
-> show ipv6 mroute interface

Interface Name     IP Address     TTL   Multicast Protocol
---------------+---------------+------+--------------------
vlan-4             2000::1      0        PIM
vlan-26            2000::2      0        PIM
vlan-11            2000::3      0        PIM
```

output definitions

Interface Name	The name configured for the IPv6 interface.
IP Address	The IPv6 address of this interface entry.
TTL	The datagram TTL threshold for the interface. Any IPv6 multicast datagrams with a TTL less than the threshold displayed in the table will not be forwarded out of the interface. The default value, 0, specifies that *all* multicast packets are forwarded out of the interface.
Multicast Protocol	The multicast routing protocol currently running on this interface. Options include DVMRP and PIM.

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 mroute	Displays multicast routing information for IPv6 datagrams sent by particular sources to the IPv6 multicast groups known to this router.
show ipv6 mroute-nexthop	Displays IPv6 next-hop information on outgoing interfaces for routing IPv6 multicast datagrams.

MIB Objects

```
alaIpMcastInterfaceTable
   alaIpMcastInterfaceIfIndex
   alaIpMcastInterfaceTtl
   alaIpMcastInterfaceProtocol
```

show ip mroute-nexthop

Displays next-hop information on outgoing interfaces for routing IP multicast datagrams.

show ip mroute-nexthop

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```

225.0.0.7     214.0.0.2/32      vlan-26        225.0.0.7    PIM-SM
225.0.0.8     214.0.0.2/32      vlan-26        225.0.0.8    PIM-SM
225.0.0.9     214.0.0.2/32      vlan-26        225.0.0.9    PIM-SM
```

output definitions

Group Address	The IP multicast group address for this entry.
Src Address	The network address, which identifies the source for this entry.
Interface Name	Generally, this is the name configured for the interface.
Next Hop Address	The address of the next-hop that is specific to this entry.
Protocol	The routing protocol by which this next-hop was learned (i.e., DVMRP or PIM-SM).

Release History

Release 8.1.1; command introduced.

Related Commands

show ip mroute	Displays multicast routing information for IP datagrams sent by particular sources to the IP multicast groups known to this router.
show ip mroute interface	Displays IP multicast interface information.

MIB Objects

```
alaIpMcastRouteNextHopTable
   alaIpMcastRouteNextHopGroup
   alaIpMcastRouteNextHopSource
   alaIpMcastRouteNextHopIfIndex
   alaIpMcastRouteNextHopAddress
   alaIpMcastRouteNextHopProtocol
```

show ipv6 mroute-nexthop

Displays IPv6 next-hop information on outgoing interfaces for routing IPv6 multicast datagrams.

show ipv6 mroute-nexthop

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ipv6 mroute-nexthop
Total 2 Nexthops
Group Address   Source Address    Interface    Next Hop Address        Protocol
---------------+-----------------+------------+-----------------------+---------
ff06:7777::1    2600::7           vlan-40      ff06:7777::1            PIM-SM
ff06:7777::2    2600::7           vlan-40      ff06:7777::2            PIM-SM
```

output definitions

Group Address	The IPv6 multicast group address for this entry.
Src Address	The IPv6 multicast address, which identifies the source for this entry.
Interface Name	The name of the IPv6 interface on which the datagrams sent by these sources to this IPv6 multicast address are received.
Next Hop Address	The IPv6 address of the next-hop that is specific to this entry.
Protocol	The IPv6 multicast routing protocol by which this IPv6 multicast forwarding entry was learned.

Release History

Release 8.1.1; command introduced.

Related Commands

show ipv6 mroute	Displays multicast routing information for IPv6 datagrams sent by particular sources to the IPv6 multicast groups known to this router.
show ipv6 mroute interface	Displays IPv6 multicast interface information.

MIB Objects

```
alaIpMcastRouteNextHopTable

   alaIpMcastRouteNextHopSource
   alaIpMcastRouteNextHopIfIndex
   alaIpMcastRouteNextHopAddress
   alaIpMcastRouteNextHopProtocol
```

show ip mroute mbr

Displays the MBR status for the switch.

show ip mroute mbr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The MBR feature only supports interoperability between DVMRP and PIM. Both of these multicast protocols must be configured and operationally active on the switch.

Examples

```
-> show ip mroute mbr
MBR Status                      = enabled,
Protocols Registered            = DVMRP PIM
```

output definitions

MBR Status	The administrative status (**enabled** or **disabled**) of MBR functionality on the switch.
Protocols Registered	The operationally active multicast protocols (**DVMRP**, **PIM**) to which MBR functionality is applied.

Release History

Release 8.1.1; command introduced.

Related Commands

ip mroute mbr	Configures the administrative status of Multicast Border Router functionality.

MIB Objects

```
alaIpmrmGlobalConfig
   alaIpmrmMbrStatus
   alaIpmrmMbrProtocolApps
```

32 QoS Commands

Alcatel-Lucent's QoS software provides a way to manipulate flows coming through the switch based on user-configured policies. The flow manipulation (generally referred to as *Quality of Service* or *QoS*) may be as simple as allowing/denying traffic, or as complicated as remapping 802.1p bits from a Layer 2 network to ToS values in a Layer 3 network.

This chapter provides information about configuring QoS global and port parameters through the Command Line Interface (CLI). Refer to Chapter 44, "QoS Policy Commands," for information about commands used to configure QoS policy rules.

MIB information for the QoS commands is as follows:

Filename: ALCATEL-IND1-QOS-MIB_mib
Module alaQoSMIB

Filename: ALCATEL-IND1-VIRTUAL-FLOW-CONTROL-MIB_mib
Module alcatelIND1VfcMIB

Important Note. Some of the commands listed here are not currently supported on one or more platforms. See command descriptions in this chapter and check release notes for information about commands that are not supported.

The QoS commands are listed here:

Global commands	**qos** **qos trust-ports** **qos forward log** **qos log console** **qos log lines** **qos log level** **qos stats interval** **qos phones** **qos quarantine mac-group** **qos user-port** **qos dei** **qos dscp-table** **debug qos** **debug qos internal** **clear qos log** **qos apply** **qos revert** **qos flush** **qos reset** **qos stats reset** **show qos slice** **show qos log** **show qos config** **show qos statistics** **show qos dscp-table**

Port and Slice commands	**qos port** **qos port reset** **qos port trusted** **qos port maximum egress-bandwidth** **qos port maximum ingress-bandwidth** **qos port maximum depth** **qos port default 802.1p** **qos port default dscp** **qos port default classification** **qos port dei** **show qos port**
Queue Management commands	**qos qsi qsp** **qos qsi stats** **show qos qsi summary** **show qos qsp** **show qos qsi** **show qos qsi stats** **clear qos qsi stats**

qos

Enables or disables QoS. This section describes the base command with a single required option (**enable** or **disable**).

In lieu of this option, the base command (**qos**) may be used with other keywords to set up global QoS configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

qos {enable | disable}
[trust-ports]
[forward log]
[log console]
[log lines *lines***]**
[log level *level***]**
[stats interval *seconds***]**
[phones [priority *priority_value* **| trusted]]**
[user-port {filter | shutdown} {spoof | bgp | bpdu | rip | ospf | vrrp | dvmrp | pim | isis | dhcp-server | dns-reply}]

Syntax Definitions

enable	Enables QoS. The QoS software in the switch classifies flows coming into the switch to attempt to match them to QoS policies. If a match is found, the policy parameters are applied to the flow. The **enable** setting may be used alone or in conjunction with optional command keywords.
disable	Disables QoS. Flows coming into the switch are not matched to policies. The **disable** setting cannot be used with any other command keyword.

Defaults

parameter	default
enable | **disable**	enable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When QoS is disabled, flows coming into the switch are classified but not matched to a policy. Traffic is treated as best effort and assigned to default queues.
- The command keywords may be used with or without **enable**; these keywords cannot be used with **disable**.

Examples

```
-> qos enable default disposition deny
-> qos disable
-> qos enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy rule	Configures a policy rule on the switch.
show policy rule	Displays information for policy rules configured on the switch.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigEnable
   alaQoSConfigTrustedPorts
   alaQoSConfigForwardLog
   alaQoSConfigLogLines
   alaQoSConfigLogLevel
   alaQoSConfigLogConsolealaQoSConfigStatsInterval
   alaQoSConfigAutoPhones
   alaQoSConfigUserportFilter
   alaQoSConfigAppliedUserportFilter
   alaQoSConfigUserportShutdown
   alaQoSConfigAppliedUserportShutdown
```

qos trust-ports

Configures the global trust mode for QoS ports. Trusted ports can accept 802.1p and ToS/DSCP values in incoming packets; untrusted ports will set any 802.1p or ToS/DSCP values to zero in incoming packets, unless a default 802.1p or ToS/DSCP value is configured.

Any port configured through the **qos port** command will automatically be added in the trust mode specified by this command. See page 32-34 for more information about this command.

qos trust-ports

qos no trust-ports

Syntax Definitions

N/A

Defaults

By default, all ports are untrusted.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **qos ports trusted** command to override the default for a particular port.
- The setting only applies to ports with incoming traffic.
- Mobile ports are always trusted regardless of the global setting.
- Use the **qos port default 802.1p** or **qos port default dscp** commands to specify that a value other than zero should be applied to the incoming packets. Note that this value is overridden if a policy exists that specifies a different value for such packets.

Examples

```
-> qos trust-ports
-> qos no trust-ports
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos port	Configures a physical port for QoS.
qos port trusted	Configures whether or not a particular port is trusted or untrusted.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigTrustedPorts
```

qos forward log

Enables the QoS software in the switch to send events to the policy server software in the switch in real time. The policy server software may then be polled by an NMS application for logged events.

qos forward log

qos no forward log

Syntax Definitions

N/A

Defaults

By default, logged events are not sent to the policy server software in the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

An NMS application may query the Policy Manager in the switch for logged events. Use the **qos forward log** command to forward each event as it happens.

Examples

```
-> qos forward log
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos log lines	Configures the number of lines in the QoS log.
show qos log	Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigForwardLog
```

qos log console

Sends QoS log messages to the switch logging utility, which is an event logging application available on the OmniSwitch. The configuration of the switch logging utility determines if QoS messages are sent to a log file in the switch's flash file system, displayed on the switch console, or sent to a remote syslog server.

qos log console

qos no log console

Syntax Definitions

N/A

Defaults

QoS log messages are not sent to the switch logging utility by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- To display QoS log events as they happen on an output console attached to the switch, configure the switch logging utility to output events to the console. This is done using the **swlog output** command.
- The entire log may be viewed at any time using the **show qos log** command.

Examples

```
-> qos log console
-> qos no log console
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos log lines	Configures the number of lines in the QoS log.
swlog output	Enables or disables switch logging output to the console, file, or data socket (remote session).
swlog output	Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigLogConsole
```

qos log lines

Configures the number of lines in the QoS log.

qos log lines *lines*

Syntax Definitions

lines	The number of lines included in the QoS log. A value of zero turns off logging to the console. The range is 0–512.

Defaults

parameter	default
lines	10000

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- To turn off logging, enter 0 for the number of log lines. (Note that error messages will still be logged.)
- If you change the number of log lines, you may clear all messages in the QoS log. To avoid clearing all messages in the log, enter the **qos log lines** command in the **vcboot.cfg** file. The log length will be changed at the next reboot.

Examples

```
-> qos log lines 5
-> qos log lines 0
```

Release History

Release 8.1.1; command introduced.

Related Commands

show qos log	Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigLogLines
```

qos log level

Configures the level of log detail.

qos log level *level*

qos no log level

Syntax Definitions

level	The level of log detail, in the range from 1 (least detail) to 8 (most detail).

Defaults

parameter	default
level	5

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **qos debug** command to change the type of debugging messages that are logged. The **qos log level** command configures the level of detail for these messages.
- If the **qos debug** command is not configured to log any kind of information (this is the default), the **qos log level** command has no effect.
- To log fatal errors only, set the log level to 0.
- Note that a high log level value will impact the performance of the switch.

Examples

```
-> qos log level 4
-> qos log level 0
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos log lines	Configures the number of lines in the QoS log.
show qos log	Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigLogLevel
```

qos stats interval

Configures how often the switch polls network interfaces for statistics about QoS events.

qos stats interval *seconds*

Syntax Definitions

seconds	The number of seconds before the switch polls network interfaces for statistics. The range is 1–3600.

Defaults

parameter	default
seconds	60

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Change the statistics interval to a smaller interval if you want to monitor QoS events.
- Change the statistics interval to a larger interval if you want to free some switch memory.

Examples

```
-> qos stats interval 30
```

Release History

Release 8.1.1; command introduced.

Related Commands

show qos statistics	Displays statistics about the QoS configuration.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigStatsInterval
```

qos phones

Enables or disables the automatic prioritization of IP phone traffic.

qos phones [priority *priority_value* **| trusted]**

qos no phones

Syntax Definitions

priority_value	The priority given to scheduling traffic on the output port. Values range from 0 (lowest) to 7 (highest).
trusted	Trusts IP phone traffic; priority value of the IP phone packet is used.

Defaults

parameter	default
priority_value **| trusted**	trusted

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable automatic prioritization of IP phone traffic.
- IP phone traffic is identified by examining the source MAC address of the packet received on the port. If the source MAC falls within one of the following ranges, the QoS IP phone priority is automatically assigned to the MAC: 00-80-9F-xx-xx-xx or 00-13-FA-xx-xx-xx
- To automatically apply the QoS IP phone priority to other, non-IP phone traffic, add the source MAC addresses of such traffic to the QoS “alaPhone” group.
- When automatic prioritization of IP phone traffic is enabled, QoS policies that specify priority are not applied to the IP phone traffic. Other QoS policies, however, are applied to this type of traffic as usual.
- When automatic prioritization of QoS IP phone traffic is enabled, a rule gets configured in the FFP (Fast Filtering Processor) with the source MAC address as **00:80:9F:00:00:00** and the mask **FF:FF:FF:00:00:00** and 00-13-FA-xx-xx-xx and mask FF:FF:FF:00:00:00.
- The QoS IP phone prioritization and SIP Snooping features are mutually exclusive. If the QoS IP phone prioritization feature is enabled when the SIP Snooping feature is enabled, an error message is displayed and vice versa. Hence, to enable QoS IP phone prioritization, disable the SIP Snooping feature using the **sip-snooping admin-state disable** command. Similarly, to enable the SIP Snooping feature, disable the QoS IP phone prioritization feature using the **qos no phones** command.

Note. QoS IP phone prioritization is configured, by default, on initialization

Examples

```
-> qos phones priority 7
-> qos phones trusted
-> qos no phones
```

Release History

Release 8.1.1; command introduced.

Related Commands

show qos config	Displays the QoS configuration for the switch.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigAutoPhones
```

qos quarantine mac-group

Configures the name of the Quarantine MAC address group. The OmniVista Quarantine Manager application identifies source MAC addresses to quarantine and adds these addresses to the Quarantine MAC group.

qos quarantine mac-group *mac_group*

qos no quarantine mac-group

Syntax Definitions

mac_group	The name of the Quarantine MAC group (up to 31 alphanumeric characters).

Defaults

By default, the quarantine MAC group is not configured on the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to reset the default MAC group name back to “Quarantined”.
- The *mac-group* name specified with this command must match the group name specified with the OmniVista Quarantine Manager application.
- Each switch can have a different Quarantine MAC group name as long as each switch matches the OmniVista Quarantine Manager MAC group name for that switch. Note that there is only one such MAC group per switch.
- Do not use the Quarantine MAC group name in regular QoS policies.
- This group is also used by the switch Quarantine Manager and Remediation (QMR) application to restrict or restore network access to quarantined MACs.
- Note that QMR is not available if VLAN Stacking services or QoS VLAN Stacking inner VLAN and 802.1p policies are configured on the switch.
- QMR is considered active when there are MAC addresses in the Quarantine MAC address group. Use the **show quarantine mac group** command to display the contents of this group. In addition, the **show mac-learning** command output display identifies quarantined MAC addresses.

Examples

```
-> qos quarantine mac-group mac_group1
-> no quarantine mac-group
```

Release History

Release 8.1.1; command was introduced.

Related Commands

qmr quarantine path	Specifies the URL for a remediation server.
qmr quarantine page	Configures the Quarantine Manager and Remediation (QMR) application to send a Quarantined page to a client if a remediation server is not configured.
show quarantine mac group	Displays information about the Quarantine MAC group.
show qmr	Displays the QMR configuration for the switch.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigQuarantineMacGroupName
```

qos user-port

Configures the option to filter packets or administratively disable a port when the specified type of traffic is received on a port that is a member of the pre-defined UserPorts group.

qos user-port {filter | shutdown} {spoof | bgp | bpdu | rip | ospf | vrrp | dvmrp | pim | isis | dhcp-server | dns-reply}

qos no user-port {filter | shutdown}

Syntax Definitions

filter	Filters the specified type of traffic when it is received on UserPort ports.
shutdown	Administratively disables UserPort ports that receive the specified type of traffic.
spoof	Detects IP spoofing. The source IP address of a packet ingressing on a user port is compared to the subnet of the VLAN for the user port; the packet is dropped if these two items do not match. Also applies to ARP packets.
bgp	Filters only BGP protocol packets from a TCP session that was not originated by the same switch that has this filter configured.
bpdu	Filters conventional Spanning Tree BPDU (destination MAC address 0x0180c2:000000) packets and GVRP (destination MAC address 0x0180c2:000021) packets.
rip	Filters RIP protocol packets.
ospf	Filters OSPF protocol packets.
vrrp	Filters VRRP protocol packets.
dvmrp	Filters IGMP packets with a type of 0x13. This applies only to IP packets with no options.
pim	Filters PIMv1, PIM-DM, and PIM-SM packets. The PIMv1 filter applies only to IP packets with no options.
isis	Filters IS-IS protocol packets.
dhcp-server	Filters response packets originating from a DHCP or BOOTP server that is configured on the known UDP port 67.
dns-reply	Filters all packets (both TCP and UDP) that originate from the known DNS port 53.

Defaults

parameter	default
filter	spoof
shutdown	none

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable the filter or shutdown function. This form of the command effects the overall operation of the feature.
- To specify more than one traffic type in the same command line, enter each type separated by a space (e.g., **spoof bgp ospf**).
- Note that existing traffic types to filter or shutdown are removed each time the **filter** or **shutdown** option is configured. Specify all desired traffic types each time the **qos user-port** command is performed to retain previously configured traffic types.
- No changes to the **filtering** and **shutdown** options are applied to the switch until the **qos apply** command is performed.
- This command only applies to ports that are members of the UserPorts group. Use the **policy port group** command to create and assign members to the UserPorts group.
- An SNMP trap is sent when a port is administratively disabled through a UserPorts shutdown function or a port disable action.
- To enable a port disabled by a user port shutdown operation, use the **interfaces admin** command to administratively enable the port or disconnect and reconnect the port cable.
- Up to 126 IP interfaces are supported with spoof detection on user ports. If the number of interfaces exceeds this amount, user port packets ingressing on those interfaces that exceed the 126 limit are dropped.

Examples

```
-> qos user-port filter spoof bpdu
-> qos user-port shutdown spoof bgp ospf
-> qos no user-port shutdown
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy port group	Configures a port group and its associated slot and port numbers.
show qos config	Displays QoS configuration information.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigUserportFilter
   alaQoSConfigAppliedUserportFilter
   alaQoSConfigUserportShutdown
   alaQoSConfigAppliedUserportShutdown
```

qos dei

Configures the global Drop Eligible Indicator (DEI) bit mapping and marking setting for all QoS ports.The DEI setting applies to packets marked yellow (non-conforming) as the result of Tri-Color Marking (TCM) rate limiting.

qos dei {ingress | egress}

qos no dei {ingress | egress}

Syntax Definitions

ingress	Maps the DEI/CFI bit to yellow (non-conforming) if this bit is set for ingress traffic.
egress	Marks the DEI/CFI bit for egress packets if TCM marked the packets yellow.

Defaults

By default, no DEI/CFI bit marking or mapping is done.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable the global DEI bit mapping (ingress) or marking (egress) configuration for the switch.
- Use the **qos port dei** command to set the DEI bit mapping and marking configuration for a specific port. Note that the port setting takes precedence over the global DEI setting.
- Packets marked yellow by TCM rate limiting are still transmitted when there is no congestion on the egress port queues. Setting the DEI/CFI bit for yellow egress packets (**qos dei egress**) ensures that an upstream switch is made aware that the packet was marked yellow.
- When a switch receives a yellow packet with the DEI/CFI bit set and ingress DEI/CFI bit mapping is enabled (**qos dei ingress**), the packet is mapped to an internal drop precedence or yellow color marking for the switch.

Examples

```
-> qos dei ingress
-> qos dei egress
-> qos no dei ingress
-> qos no dei egress
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos port	Configures a physical port for QoS.
qos port dei	Configures the Drop Eligible Indicator (DEI) bit mapping and marking setting for the specified QoS port.
policy action cir	Configures a Tri-Color Marking policy action.
show qos config	Displays global information about the QoS configuration.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigDEIMapping
   alaQoSConfigDEIMarking
```

qos dscp-table

Configures the internal priority and drop precedence for the specified Differentiated Services Code Point (DSCP) value. This value defines the six most significant bits of the DS byte in the IP header.

qos dscp-table *value***[**-*value2***]** **priority** *priority* **drop-precedence {low | medium | high}**

Syntax Definitions

*value***[**-*value2***]**	The DSCP value. The range is 0–63.
priority	The internal priority value to map to the DSCP value. The valid range is 0–7,
low	Sets the drop precedence to low for the DSCP value.
medium	Sets the drop precedence to medium for the DSCP value.
high	Sets the drop precedence to high for the DSCP value.

Defaults

By default, the drop precedence value is set to low precedence.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The priority and drop precedence settings configured with this command are global settings that are applied to all trusted ports.
- The values set in the DSCP table do not apply to untrusted ports.

Examples

```
-> qos dscp-table 63 priority 1 drop-precedence medium
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show qos dscp-table	Configures the priority and drop-precedence to be associated with the configured DSCP table.

MIB Objects

```
alaQoSDSCPEntryNumber
alaQoSDSCPPriority
alaQoSDSCPDropPrecedence
```

debug qos

Configures the type of QoS events that will be displayed in the QoS log.

debug qos [info] [config] [rule] [main] [port] [msg] [sl] [ioctl] [mem] [mapper] [slot] [l2] [l3] [classifier] [nat] [sem] [pm] [ingress] [egress]

debug no qos

debug no qos [info] [config] [rule] [main] [port] [msg] [sl] [ioctl] [mem] [mapper] [slot] [l2] [l3] [classifier] [nat] [sem] [pm] [ingress] [egress]

Syntax Definitions

rule	Logs events for rules configured on the switch.
l2	Logs Layer 2 QoS events on the switch.
l3	Logs Layer 3 QoS events on the switch.
nat	Logs events for Network Address Translation policies. *Not supported for the OmniSwitch 6624/6648.*
port	Logs events related to QoS ports.
msg	Logs QoS messages.
classifier	Logs information whenever the switch classifies a flow; more details are provided if the log level is higher.
info	Logs basic information about the switch
config	Logs information about the global configuration.
main	Logs information about basic program interfaces.
sl	Logs information about source learning.
mem	Logs information about memory.
mapper	Logs information about mapping queues.
slot	Logs events related to slots.
sem	Logs information about semaphore, process locking.
pm	Logs events related to the Policy Manager.
ingress	Logs information about packets arriving on the switch.
egress	Logs information about packets leaving the switch.

Defaults

By default basic information messages are logged (**info**). Error messages are always logged.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to change the type of messages that will be logged or to return debugging to its default state.

- Use this command to troubleshoot QoS events on the switch.

Examples

```
-> debug qos flows queue
-> qos debug no flows no queue
-> debug no qos
```

Release History

Release 7.1.1; command was introduced.

Related Commands

qos forward log	Enables the switch to send events to the PolicyView application in real time.
qos log lines	Configures the number of lines in the QoS log.
show qos log	Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigDebug
```

debug qos internal

Displays debugging information for QoS internal to the switch.

debug qos internal [slice *slot/slice***] [flow] [queue] [port] [l2tree] [l3tree] [vector] [pending] [verbose] [mapper] [pool] [log] [pingonly | nopingonly]**

Syntax Definitions

slot/slice	The slot number and slice for which you want to view debugging information. A *slice* is a logical section of hardware that corresponds to particular ports on a network interface module.
flow	Displays information about QoS flows.
queue	Displays information about QoS queues.
port	Displays information about QoS ports.
l2tree	Displays information about Layer 2 flows.
l3tree	Displays information about Layer 3 flows.
vector	Displays information about vectors.
pending	Displays information about pending QoS objects.
verbose	Sets the output to verbose mode for more detailed information.
mapper	Displays information about QoS mapping flows to queues.
pool	Displays information about the buffer pool.
log	Displays information about QoS information that is logged.
pingonly	Specifies that any policies configured with an ICMP protocol condition apply only to ICMP echo-requests and echo-replies.
nopingonly	Configures the switch so that any policies configured with an ICMP protocol condition apply to any ICMP packets.

Defaults

Debugging is disabled by default.

parameter	default
pingonly | nopingonly	**nopingonly**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **debug qos** command to set the level of log detail in the QoS log.

Examples

```
-> debug qos internal "verbose log"
```

Release History

Release 7.1.1; command was introduced.

Related Commands

debug qos	Configures the type of QoS events that will be displayed in the QoS log.

MIB Objects

N/A

clear qos log

Clears messages in the current QoS log.

clear qos log

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command is useful for clearing messages from a large log file so that the file is easier to view. Logs can get large if invalid rules are configured on the switch, or if a lot of QoS events have taken place. Clearing the log makes the file easier to manage.

Examples

```
-> clear qos log
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos log lines	Configures the number of lines in the QoS log.
debug qos	Configures the type of QoS events that will be displayed in the QoS log.
show qos log	Displays the log of QoS events.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigClearLog
```

qos apply

Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).

qos apply

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is required to activate all QoS and policy commands. This is the only command that causes current changes to be written to flash.
- Rules are configured through the **policy rule** command, but are not active on the switch until you enter **qos apply**.

Examples

```
-> qos apply
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos revert	Removes any policies configured through policy rule but not applied to the current configuration through the **qos apply** command.
qos reset	Resets the QoS configuration to its default values.
qos flush	Deletes all pending policy information.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigApply
```

qos revert

Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

qos revert

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command to remove currently configured policies that have not yet been activated through the **qos apply** command.

Examples

```
-> qos revert
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy rule	Configures a policy rule and saves it to the current configuration but does not make it active on the switch.
qos apply	Applies all QoS settings configured on the switch to the current configuration.
qos reset	Resets the QoS configuration to its defaults.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigRevert
```

qos flush

Deletes all pending policy information. This command is different from **qos revert**, which returns the pending policy configuration to its last applied settings.

qos flush

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If you enter this command, the pending policy configuration is completely erased. If you then enter **qos apply**, the erased configuration *overwrites the applied policies and you will erase all of your policy configuration.*

Note. Do not use this command unless you want to erase all of your policy configuration and start configuring new policies.

- Use the **qos revert** command to return the pending policy configuration to its last applied value.
- Policy configuration includes the following commands:

base commands	
policy rule	**policy mac group**
policy network group	**policy port group**
policy service	**policy condition**
policy service group	**policy action**

Examples

```
-> qos flush
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos revert	Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.
qos apply	Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).
policy server flush	Removes all cached LDAP policy data from the switch.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigFlush
```

qos reset

Resets the QoS configuration to its defaults.

qos reset

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command to reset QoS configuration that has not yet been applied through the **qos apply** command. The parameters are reset to their defaults.

Note. If SIP Snooping is enabled for the switch, this command will not reset the automatic IP phone prioritization to the trusted default value.

Examples

```
-> qos reset
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies all QoS settings configured on the switch to the current configuration.
qos revert	Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigReset
```

qos stats reset

Resets QoS statistic counters to zero.

qos stats reset

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command to reset global QoS statistics to zero. Statistics may be displayed with the **show qos statistics** command.

Examples

```
-> qos stats reset
```

Release History

Release 8.1.1; command introduced.

Related Commands

show qos statistics	Displays statistics about the QoS configuration.

MIB Objects

```
alaQoSConfigTable
   alaQoSConfigStatsReset
```

qos port reset

Resets all QoS port configuration to the default values.

qos port *chassis/slot/port***[**-*port2***] reset**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The QoS port configuration parameters that are reset include:

parameter	default
default queues	8
trusted	not trusted

Examples

```
-> qos port 1/1/1 reset
```

Release History

Release 8.1.1; command introduced.

MIB Objects

```
alaQoSPortTable
   alaQoSPortSlot
   alaQoSPortPort
   alaQoSPortReset
```

qos port

Configures QoS parameters for a physical port. This section describes the base command with a single required option (*chassis*/*slot/port*).

In lieu of these options, the base command (**qos port**) may be used with other keywords to set up a QoS configuration on a per port basis. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

qos port *chassis/slot/port***[**-*port2***]**
[trusted]
[maximum egress-bandwidth bps]
[maximum ingress-bandwidth bps]
[maximum depth bps]
[default 802.1p value]
[default dscp value]
[default classification {802.1p | tos | dscp}]

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).

Defaults

- All ports are untrusted.
- By default, QoS ports do not preempt queues of lower priority.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **trusted** option to change the trust mode for the port.

Examples

```
-> qos port 1/1/1 trusted
-> qos port 1/1/2 no trusted
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures whether the default mode for QoS ports is trusted or untrusted.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortSlot
   alaQoSPortPort
   alaQoSPortTrusted
   alaQoSPortMaximumBandwidth
   alaQoSPortMaximumBandwidthStatus
   alaQoSPortMaximumIngBandwidth
   alaQoSPortMaximumIngBandwidthStatus
   alaQoSPortMaximumDefaultDepth
   alaQoSPortMaximumDefaultDepthStatus
   alaQoSPortDefault8021p
   alaQoSPortDefaultDSCP
   alaQoSPortDefaultClassification
```

qos port trusted

Configures whether an individual port is trusted or untrusted. Trusted ports can accept the 802.1p and ToS/DSCP values in incoming packets; untrusted ports will set any 802.1p or ToS/DSCP values to zero in incoming packets, unless a default 802.1p or ToS/DSCP value is configured.

qos port *chassis/slot/port***[**-*port2***] trusted**

qos port *chassis/slot/port***[**-*port2***] no trusted**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).

Defaults

By default, all ports are untrusted.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **qos trust ports** command to set the default trust mode for all QoS ports. The **qos port trusted** command may be used to override the default.
- The setting applies only to ports with incoming traffic.
- Use the **qos port default 802.1p** or **qos port default dscp** commands to specify that a value other than zero should be applied to the incoming packets. Note that this value is overridden if a policy exists that specifies a different 802.1p or ToS/DSCP value for such packets.

Examples

```
-> qos port 1/1/1 trusted
-> qos port 1/1/2 no trusted
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
qos trust ports	Configures the global trust mode for QoS ports.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortTrusted
```

qos port maximum egress-bandwidth

Configures the maximum rate at which to send traffic on the specified QoS port.

qos port *chassis/slot/port***[**-*port2***] maximum egress-bandwidth** *bps***[k | m | g | t]**

qos port *chassis/slot/port***[**-*port2***] no maximum egress-bandwidth**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*bps***[k | m | g | t]**	The maximum amount of bandwidth, in bits-per-second, for all traffic that egresses on the port. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m, 1g, 1t**).

Defaults

By default, the maximum bandwidth is the maximum allowed for the interface type on which the port resides.

parameter	default
k | m | g | t	**k**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a configured maximum egress bandwidth value from a port.
- If the maximum egress bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- The maximum egress bandwidth value cannot exceed the maximum bandwidth of the interface type associated with the port.
- Modifying the maximum egress bandwidth is most useful for low-bandwidth links.
- Port-based limiting takes the IFG of 20 bytes into account when calculating bandwidth.

Examples

```
-> qos port 1/1/1 maximum egress-bandwidth 1000
-> qos port 1/1/2-8 maximum egress-bandwidth 10m
-> qos port 1/1/1 no maximum egress-bandwidth
-> qos port 1/1/2-8 no maximum egress-bandwidth
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos port maximum ingress-bandwidth	Configures the rate at which traffic is received on a QoS port.
qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortSlot
   alaQoSPortPort
   alaQoSPortMaximumBandwidth
   alaQoSPortMaximumBandwidthStatus
```

qos port maximum ingress-bandwidth

Configures the maximum rate at which traffic is received on a QoS port.

qos port *chassis/slot/port***[**-*port2***] maximum ingress-bandwidth** *bps***[k | m | g | t]**

qos port *chassis/slot/port***[**-*port2***] no maximum ingress-bandwidth**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*bps***[k | m | g | t]**	The maximum amount of bandwidth, in bits-per-second, for all traffic that ingresses on the port. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m, 1g, 1t**).

Defaults

By default, the maximum bandwidth is the maximum allowed for the interface type on which the port resides.

parameter	default
k | m | g | t	**k**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a configured maximum ingress bandwidth value from a port.
- If the maximum ingress bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- The maximum ingress bandwidth value cannot exceed the maximum bandwidth of the interface type associated with the port.
- Modifying the maximum ingress bandwidth is most useful for low-bandwidth links.
- Port-based limiting takes the IFG of 20 bytes into account when calculating bandwidth.

Examples

```
-> qos port 1/1/1 maximum ingress-bandwidth 1000
-> qos port 1/1/2-8 maximum ingress-bandwidth 10m
-> qos port 1/1/1 no maximum ingress-bandwidth
-> qos port 1/1/2-8 no maximum ingress-bandwidth
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos port maximum egress-bandwidth	Configures the rate at which traffic is sent on a QoS port.
qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortSlot
   alaQoSPortPort
   alaQoSPortMaximumIngBandwidth
   alaQoSPortMaximumIngBandwidthStatus
```

qos port maximum depth

Configures the maximum bucket size used for traffic metering. The bucket size determines how much the traffic can burst over the maximum bandwidth rate.

qos port *chassis/slot/port***[**-*port2***] maximum depth** *bps***[k | m | g | t]**

qos port *chassis/slot/port***[**-*port2***] no maximum depth**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*bps***[k | m | g | t]**	The maximum bucket size, in bits-per-second. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m, 1g**).

Defaults

parameter	default
k | m | g | t	**k**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This QoS port parameter is configured in conjunction with the maximum bandwidth parameters. When the bucket size is reached, the switch starts to drop packets.
- Use the **no** form of the command to remove the maximum depth setting from a port.
- If the maximum depth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum depth value used. However, if **10G** is specified, the maximum depth value applied is **10** gbps.
- Modifying the maximum depth is most useful for low-bandwidth links.

Examples

```
-> qos port 1/1/1 maximum depth 100
-> qos port 1/1/2-8 maximum depth 10m
-> qos port 1/1/1 no maximum depth
-> qos port 1/1/2-8 no maximum depth
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortSlot
   alaQoSPortPort
   alaQoSPortMaximumDefaultDepth
```

qos port default 802.1p

Configures the 802.1p value to be inserted in flows ingressing on an untrusted port.

qos port *chassis/slot/port***[**-*port2***] default 802.1p** *value*

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
value	The priority value to be set. Values range from 0 (lowest priority) to 7 (highest priority).

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- By default untrusted ports will set the 802.1p bit to zero on incoming flows. Use this command to specify that a different 802.1p value should be applied to the flow.
- The default 802.1p value is not used if there is a matching QoS policy rule that sets the priority.

Examples

```
-> qos port 1/1/1 default 802.1p 5
-> qos port 1/1/2-8 default 802.1p 7
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortDefault8021p
```

qos port default dscp

Configures the ToS/DSCP value to be inserted in flows ingressing on an untrusted port.

qos port *chassis/slot/port***[**-*port2***] default dscp** *value*

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
value	The ToS/DSCP value. The range is 0–63.

Defaults

parameter	default
value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The value configured by this command sets the upper byte (precedence) and therefore configures the ToS/DSCP value for the port.
- The default DSCP value is not used if there is a matching QoS policy rule that sets the priority.

Examples

```
-> qos port 1/1/1 default dscp 63
-> qos port 1/1/2-8 default dscp 33
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortDefaultDSCP
```

qos port default classification

Specifies the default egress priority value to use for IP traffic ingressing on trusted ports.

qos port *chassis/slot/port***[**-*port2***] default classification {tos | 802.1p | dscp}**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
tos	Specifies that the ToS value of the flow will be used to prioritize flows coming in on the port.
802.1p	Specifies that the 802.1p value of the flow will be used to prioritize flows coming in on the port.
dscp	Specifies that the DSCP value of the flow will be used to prioritize flows coming in on the port.

Defaults

parameter	default
tos | 802.1p | dscp	dscp

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The egress priority assigned to an IP packet received on a trusted port is based on the DSCP value of the packet unless 802.1p is specified using this command.
- The default classification priority is not used if there is a matching QoS policy rule that sets the egress priority value.
- This command does not affect Layer 2 traffic, which is always classified with 802.1p.
- In some network situations, some IP traffic may be dropped before any QoS rules can take effect for the traffic.

Examples

```
-> qos port 1/1/24 default classification dscp
-> qos port 1/1/1-8 default classification dscp
-> qos port 2/1/1 default classification 802.1p
-> qos port 2/5/1-8 default classification 802.1p
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
qos port	Configures a physical port for QoS.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortDefaultClassification
```

qos port dei

Configures the Drop Eligible Indicator (DEI) bit mapping and marking setting for the specified QoS port. The DEI setting applies to packets marked yellow (non-conforming) as the result of Tri-Color Marking (TCM) rate limiting.

qos port *chassis/slot/port* **dei {ingress | egress}**

qos port *chassis/slot/port* **no dei {ingress | egress}**

Syntax Definitions

chassis/slot/port	The chassis ID, slot, and port number (3/1/1) for a specific port.
ingress	Maps the DEI/CFI bit to yellow (non-conforming) if this bit is set for ingress packets.
egress	Sets the DEI/CFI bit for egress packets if TCM marked the packets yellow.

Defaults

By default, no DEI/CFI bit mapping or marking is done.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable the DEI bit mapping (ingress) or marking (egress) configuration for the specified port
- Use the **qos dei** command to set the global DEI bit mapping and marking configuration for all QoS switch ports. Note that the port-level setting takes precedence over the global DEI setting.
- Packets marked yellow by TCM rate limiting are still transmitted when there is no congestion on the egress port queues. Setting the DEI/CFI bit for yellow egress packets (**qos port dei egress**) ensures that an upstream switch is made aware that the packet was marked yellow.
- When a switch receives a yellow packet with the DEI/CFI bit set and ingress DEI/CFI bit mapping is enabled (**qos port dei ingress**), the packet is mapped to an internal drop precedence or yellow color marking for the switch.
- When the default QoS classification value is set to DSCP, the DEI bit is not relevant for DSCP packets. As a result, the color/congestion is derived from the values carried in the DSCP bit, not from the incoming DEI. However, if the default QoS classification is set to 802.1p, the DEI/CFI is honored for both Layer 2 and Layer 3 traffic.

Examples

```
-> qos port 1/1/10 dei ingress
-> qos port 1/1/20 dei egress
-> qos port 1/1/10 no dei ingress
-> qos port 1/1/20 no dei egress
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos port	Configures a physical port for QoS.
qos dei	Configures the global Drop Eligible Indicator (DEI) bit mapping and marking setting for all QoS ports.
policy action cir	Configures a Tri-Color Marking policy action.
show qos config	Displays global information about the QoS configuration.
show qos port	Displays information about QoS ports.

MIB Objects

```
alaQoSPortTable
   alaQoSPortDEIMapping
   alaQoSPortDEIMarking
```

qos qsi qsp

Configures the QSet profile (QSP) association for the specified QSet instance (QSI). A QSI is a set of eight queues that is automatically associated with each port and link aggregate (LAG) ID.

qos qsi {port *chassis/slot/port***[**-*port2***] | slot** *slot* **| linkagg** *agg_id***[**-*agg_id2***]} qsp {***qsp_id* | *qsp_name***}**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis/slot	The chassis ID and slot number (3/1) for a specific slot. Associates all ports on the slot with QSet (3/1).
*agg_id***[**-*agg_id2***]**	The link aggregate ID to associate with the QSet. Use a hyphen to specify a range of IDs (10-20).
qsp_id	An existing QSet profile (QSP) ID number to assign to this instance. The valid range is 1–4.
qsp_name	An existing QSet profile name (qsp-1, qsp-2, qsp-3, qsp-4) to assign to this instance.

Defaults

By default, QSP 1 is assigned to each QSet instance.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- There is only one QSI per port or LAG ID and only one QSP associated with the QSI.
- A QSI hierarchy exists consisting of parent/child relationships. For example, all member ports of a link aggregate will import the QSI/QSP settings of the parent link aggregate. When a member port moves out of the link aggregate, the QSI/QSP settings for that port are reset to the default settings.
- The number of children supported for a LAG ID is 8.

Examples

```
-> qos qsi port 1/1/2 qsp 2
-> qos qsi port 1/1/2-10 qsp 3
-> qos qsi slot 3/1 qsp 4
-> qos qsi linkagg 10 qsp 2
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos qsi stats	Configures statistics collection for the QSet instance.
show qos qsi	Displays the QSet instance configuration.
show qos qsp	Displays the QSet profile attributes.

MIB Objects

```
alaVfcQsetInstanceTable
   alaVfcQsetQSPId
   alaVfcQsetQSPName
   alaVfcQsetWRPAdminState
   alaVfcQsetStatsAdmin
   alaVfcQsetStatsInterval
```

qos qsi stats

Configures the administrative status and interval for statistics collection for the specified QSet instance (QSI). A QSI is a set of eight queues that is automatically associated with each port and link aggregate (LAG) ID.

qos qsi {port *chassis/slot/port***[-***port2***] | slot** *chassis/slot* **| linkagg** *agg_id***[-***agg_id***]} stats {admin-state {enable | disable} | interval** *interval_time***}]}**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis/slot	The chassis ID and slot number (3/1) for a specific slot.
*agg_id***[-***agg_id***]**	The link aggregate ID to associate with the QSet. Use a hyphen to specify a range of IDs (10-20).
enable	Enables statistics collection for the instance.
disable	Disables statistics collection for the instance.
interval_time	The time interval for statistics gathering. The valid range is 10–300 seconds.

Defaults

By default, statistics collection is disabled and the time interval is set to 10 seconds.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- There is only one QSI per port or LAG ID and only one QSet profile (QSP) associated with the QSI.
- Changing the statistics collection status for a QSI only changes the status for the port or link aggregate to which the QSI is associated.

Examples

```
-> qos qsi port 1/1/2 stats admin-state enable
-> qos qsi port 1/1/2 stats interval 30
-> qos qsi port 1/1/5-10 stats admin-state enable
-> qos qsi slot 3/1 stats admin-state enable interval 250
-> qos qsi linkagg 10 stats admin-state enable interval 120
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos qsi qsp	Configures the QSet profile association for the QSet instance.
show qos qsi	Displays the QSet instance configuration.
show qos qsi stats	Displays statistics for one or more QSet instances.

MIB Objects

```
alaVfcQsetInstanceTable
   alaVfcQsetQSPId
   alaVfcQsetQSPName
   alaVfcQsetWRPAdminState
   alaVfcQsetStatsAdmin
   alaVfcQsetStatsInterval
```

show qos port

Displays information about all QoS ports or a particular port.

show qos port [*chassis/slot/port***] [statistics]**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
statistics	Displays statistics for high-density gigabit modules.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Information for all ports is displayed unless a particular port is specified.
- Use the **qos port** command to configure port parameters.
- For ports that are trusted (**Yes** displays in the Trust field), the Trust field includes one of the following characters:

character	definition
+	Indicates that the port is manually configured as trusted through the **qos port trusted** command; the port setting takes precedence over the global trust setting configured through the **qos trust ports** command.
*	Indicates that the port is automatically trusted regardless of the global setting set through the **qos trust ports** command. (Applies to mobile ports and ports configured for 802.1Q.)

Examples

```
-> show qos port
chassis/
Slot/              Default    Default                Bandwidth       DEI
Port  Active Trust P/DSCP Classification  Physical Ingress Egress  Map/Mark    Type
-----+------+-----+------+--------------+--------+-------+-------+---------+------------
 1/1/1    No     No  0/ 0           DSCP         0K       -       -   No / No   ethernet

```

output definitions

chassis/slot/port	The chassis, slot, and physical port number.
Active	Whether or not the port is sending/receiving QoS traffic.
Trust	Whether the port is trusted or not trusted. Configured through the **qos port trusted** command.
Default P	The default 802.1p setting for the port. Configured through the **qos port default 802.1p** command.
Default DSCP	The default ToS/DSCP setting for the port. Configured through the **qos port default dscp** command.
Default Classification	The default classification setting for the port (**802.1p, ToS,** or **DSCP**). Configured through the **qos port default classification** command.
Physical Bandwidth	The amount of physical bandwidth available on the port.
Ingress Bandwidth	The amount of ingress bandwidth configured for the port. Configured through the **qos port maximum ingress-bandwidth** command.
Egress Bandwidth	The amount of egress bandwidth configured for the port. Configured through the **qos port maximum egress-bandwidth** command.
DEI Map/Mark	The Drop Eligible Indicator (DEI) bit mapping and marking setting for the port. Configured through the **qos port dei** command.
Type	The interface type, **ethernet** or **wan**.

Release History

Release 8.1.1; command introduced.

Related Commands

qos port	Configures a physical port for QoS.

show qos slice

Displays rule availability and usage information for QoS slices of QoS slots. A *slice* is a logical section of hardware and corresponds to particular ports on the interface.

show qos slice [*chassis/slot/slice***]**

Syntax Definitions

chassis/slot/slice	The chassis ID, slot number, and slice for which you want to view information. The number of slices per module varies depending on the type of module.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Information for all slots/slices is displayed unless a particular slot/slice is requested.
- This command is useful for monitoring switch resources required for policy rules.

Examples

```
-> show qos slice
Slot/                  Ranges          Rules          Counters         Meters
Unit            Type Total/Free  CAM Total/Free      Total/Free      Total/Free

                                   3   256/256        256/256         256/256
```

output definitions

Slot/Slice	The chassis ID, slot, and slice number.
Type	The type of slice.
Ranges Total	The total number of TCP/UDP port ranges supported per slot/slice.
Ranges Free	The number of TCP/UDP port ranges that are still available for use.
CAM	The CAM number.
Rules Total	The total number of rules supported per CAM.
Rules Free	The number of rules that are still available for use. On startup, the switch uses 27 rules.
Counters Total	The total number of counters supported per CAM.
Counter Free	The number of counters that are still available for use.
Meters Total	The total number of meters supported per CAM.
Meters Free	The number of meters that are still available for use.

Release History

Release 8.1.1; command introduced.

Related Commands

policy rule	Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

MIB Objects

N/A

show qos log

Displays the log of QoS events.

show qos log

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command to display the current QoS log. To clear the log, use the **qos clear log** command.

Examples

```
-> show qos log
**QOS Log**
Insert rule 0
Rule index at 0
Insert rule 1
Rule index at 1
Insert rule 2
Rule index at 2
Enable rule r1 (1) 1,1
Enable rule r2 (0) 1,1
Enable rule yuba1 (2) 1,1
Verify rule r1(1)
Enable rule r1 (1) 1,1
Really enable r1
Update condition c1 for rule 1 (1)
Verify rule r2(1)
Enable rule r2 (0) 1,1
Really enable r2
Update condition c2 for rule 0 (1)
Verify rule yuba1(1)
Enable rule yuba1 (2) 1,1
Really enable yuba1
Update condition yubamac for rule 2 (1)
QoS Manager started TUE MAR 10 13:46:50 2002

Match rule 2 to 1
Match rule 2 to 2
Match rule 2 to 3
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos clear log	Clears messages in the current QoS log.
qos log lines	Configures the number of lines in the QoS log.

MIB Objects

N/A

show qos config

Displays global information about the QoS configuration.

show qos config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command to view the current global configuration for QoS. Use the **show qos statistics** command to view statistics about the QoS software in the switch.

Examples

```
-> show qos config
QoS Configuration,
  Admin                         = enable,
  Trust ports                   = no,
  Phones                        = trusted,
  Log lines                     = 10240,
  Log level                     = 5,
  Log console                   = no,
  Forward log                   = no,
  Stats interval                = 5,
  User-port filter              = spoof,
  User-port shutdown            = none,
  Debug                         = info,
  Pending changes               = port
```

output definitions

Admin	Whether or not QoS is enabled or disabled. Configured through the **qos** command.
Trust Ports	The default trusted mode for switch ports. Configured through the **qos trust ports** command.
Phones	Whether or not IP Phone traffic is automatically trusted or assigned a priority value. Configured through the **qos phones** command.
Log lines	The number of lines included in the QoS log. Configured through the **qos log lines** command.
Log level	The level of log detail. Configured through the **qos log level** command.

output definitions (continued)

Log console	Whether or not log messages are sent to the console. Configured through the **qos log console** command.
Forward log	Whether or not logged events are sent to the policy server software in the switch in real time. Configured through the **qos forward log** command.
Stats interval	How often the switch polls network interfaces for statistics about QoS events. Configured through the **qos stats interval** command.
User-port filter	The type of traffic that is filtered on ports that are members of the UserPorts group. Configured through the **qos user-port** command.
User-port shutdown	The type of traffic that will trigger an administrative shutdown of the port if the port is a member of the UserPorts group. Configured through the **qos user-port** command.
Debug	The type of information that will be displayed in the QoS log. A value of **info** indicates the default debugging type.
Pending changes	QoS changes not yet applied to the configuration.

Release History

Release 8.1.1; command introduced.

Related Commands

qos	Enables or disables QoS. This base command may be used with keyword options to configure QoS globally on the switch.
show qos statistics	Displays statistics about the QoS configuration.

MIB Objects

```

show qos statistics

Displays statistics about the QoS configuration.

show qos statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays statistics about the global QoS configuration. Use the **show qos config** command to display information about configurable global parameters.

Examples

```
-> show qos statistics

output definitions

Events	The number of Layer 2 or Layer 3 flows transmitted on the switch.
Matches	The number of Layer 2 or Layer 3 flows that match policies.
Drops	The number of Layer 2 or Layer 3 flows that were dropped.
L2	The number of Layer 2 events, matches, and drops.
L3 Ingress	The number of Layer 3 ingress events, matches, and drops.
L3 Egress	The number of Layer 3 egress events, matches, and drops
IGMP join	The number of multicast events, matches, and drops.
Fragments	The number of fragments dropped.
Bad Fragments	The number of fragments received with an offset of 1.
Unknown Fragments	The number of out-of-order fragments received.
Sent NI messages	The number of messages sent to network interfaces.
Received NI messages	The number of messages received by network interfaces.
Failed NI messages	The number of failed message attempts to network interfaces.
Load balanced flows	The number of Server Load Balance flow entries.
Reflexive flows	The number of reflexive flows.
Reflexive correction	The number of reflexive flow corrections.
Flow lookups	The number of flow table lookups.
Flow hits	The number of flow table lookup hits.
Max PTree nodes	The highest number of nodes in the classifier tree.
Max Ptree depth	The length of the longest path in the classifier tree.
Spoofed Events	The number of spoofed events.
Nonspoofed Events	The number of non-spoofed events.
DropServices	The number of TCP/UDP flows dropped.

Release History

Release 8.1.1; command introduced.

Related Commands

```

show qos dscp-table

Displays the QoS DSCP table. This table contains the internal priority mapping and drop precedence value for each of the DSCP values.

show qos dscp-table

Syntax Definitions

N/A

Defaults

N/A.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The DSCP table mapping is a global configuration that applies to all trusted ports; does not apply to untrusted ports.

Examples

```
-> show qos dscp-table
 DSCP-Table    Priority      Drop-Precedence
------------+--------------+--------------------
 0                  0              low
 1                  0              low
 2                  0              low
 3                  0              low
 4                  0              low
 5                  0              low
 6                  0              low
 7                  0              low
 8                  1              low
 9                  1              low
10                  1              low
```

output definitions

DSCP-Table	The DSCP number.
Priority	The priority number mapped to the DSCP value.
Drop-Precedence	The drop precedence value mapped to the DSCP value.

Release History

Release 8.1.1; command was introduced.

Related Commands

qos dscp-table	Configures the priority and drop-precedence value associated with the DSCP number.

MIB Objects

```
alaQoSDSCPEntryNumber
alaQoSDSCPPriority
alaQoSDSCPDropPrecedence
```

show qos qsi summary

Displays a list of switch ports showing the QoS profile assigned to each port.

show qos qsi {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id***]} summary**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id***]**	A link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays the summary of the user ports in the switch.

Examples

```
-> show qos qsi summary
Legends: * indicates port is misconfigured.

        Profile
Port    #   Name         Mode Parent
-------+---+------------+----+------
1/1/1   1   qsp-1        NDCB 1/1/1
1/1/2   1   qsp-1        NDCB 1/1/2
1/1/3   1   qsp-1        NDCB 1/1/3
1/1/4   1   qsp-1        NDCB 1/1/4
1/1/5   1   qsp-1        NDCB 1/1/5
1/1/6   1   qsp-1        NDCB 1/1/6
1/1/7   1   qsp-1        NDCB 1/1/7
1/1/8   1   qsp-1        NDCB 1/1/8
1/1/9   1   qsp-1        NDCB 1/1/9
```

Release History

Release 8.1.1; command introduced.

Related Commands

show qos qsi	Displays the QSet profile (QSP) configuration for the switch.
qos qsi qsp	Assigns a QSet profile to a port or link aggregate.

MIB Objects

```
alaVfcQsetInstanceTable
   alaVfcQsetId
   alaVfcQsetQSPId
   alaVfcQsetQSPName
   alaVfcQsapParent
```

show qos qsp

Displays the QSet profile (QSP) configuration for the switch.

show qos qsp [*qsp_id* **|** *qsp_name***] [detail [port** *chassis/slot/port***[-***port2***]] | slot** *chassis/slot* **| linkagg** *agg_id***[-***agg_id***]]**

Syntax Definitions

qsp_id	A QSet profile (QSP) ID number. The valid range is 1–4.
qsp_name	A QSP profile name.
detail	Displays QSP configuration details for a specific profile, port, slot, or link aggregate.
*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis/slot	The chassis ID and slot number (3/1) for a specific slot. Displays information for all ports on the slot.
*agg_id***[-***agg_id***]**	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

Defaults

By default, displays the configuration for all four of the QSet profiles (QSP 1–4).

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the *qse_id* or the *qsp_name* parameter to display information for a specific profile.
- Use the **detail** parameter to display additional profile information for all ports and link aggregates.
- Use the **port** *chassis/slot/port*, **slot** *chassis/slot*, and **linkagg** *agg_id* parameters to display profile information associated with specific ports or link aggregates. These parameters are used in combination with the **detail** parameter.

Examples

```
-> show qos qsp 2
QSP  2 (qsp-2)
  #Ports:    0, #Queues:  8, BW (%): 100,

output definitions

QSP	The QSet profile (QSP) ID number and name.
#Ports	The number of ports to which this profile is attached.
#Queues	The number of queues associated with this QSet. Currently there are eight queues for each QSet.
BW%	The bandwidth percentage for the QSet. The bandwidth is shared between all the queues.
WRP	The WRED profile (WRP) ID number associated with the QSet. *WRED is not supported on the OmniSwitch 6860.*
Name	The WRED profile (WRP) name. *WRED is not supported on the OmniSwitch 6860.*
Scheduler	The type of scheduler, such as queue specific priority (Qspec) or strict priority.

output definitions (continued)

Type	Whether the QSP is static or dynamic. Currently there are 4 pre-defined, static profiles (QSP 1–4). User-configured, dynamic profiles are not supported at this time.
QP 1...8	The queue profile configuration for each QSet queue. The configuration for each of the individual queue profiles is defined by the QSP in use. For example, QSP 1 applies a different queue configuration than QSP 2, 3, or 4.

output definitions

QSAP Port	The port number or link aggregate ID for the QSet attachment point (QSAP). A QSAP is a logical entity generated internally by the switch to identify the association between a QSet instance and a port or link aggregate. The QSAP is not configurable at this time.
QSAP Type	The type of QSAP port; Phy = physical (chassis/slot/port), Log = logical (linkagg ID).
dQSI	The default QSet instance (dQSI) ID number. This number is generated internally by the switch to identify the QSI that is automatically assigned to each port and link aggregate.
ID	The QSet profile (QSP) ID number.
Name	The QSP name.
QSAP Parent	The QSAP parent ID number.

output definitions (continued)

BW (%) Admin	The administrative bandwidth percentage for the QSet. The admin percentage is not configurable at this time.
BW (Mbps) Oper	The operational bandwidth value, which is based on port speed.
Type	The QSet profile is a static profile (S).

Release History

Release 8.1.1; command introduced.

Related Commands

qos qsi qsp	Changes the QSet profile association for a QSet instance.
show qos qsi	Displays the QSet instance configuration.

```

show qos qsi

Displays the QSet instance (QSI) configuration for the switch. A QSI is a logical set of eight virtual output queues or eight egress queues associated with each port and link aggregate (LAG) ID.

show qos qsi [port *chassis/slot/port***[-***port2***] | slot** *chassis/slot* **| linkagg** *agg_id***[-***agg_id***]] [detail]**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis/slot	The chassis ID and slot number (3/1) for a specific slot. Displays information for all ports on the slot.
*agg_id***[-***agg_id***]**	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
detail	Displays additional queue information for the instance.

Defaults

By default, displays the entire QSI configuration for the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **port** *chassis/slot/port*, **slot** *chassis/slot*, and **linkagg** *agg_id* parameters to display the QSI information associated with specific ports or link aggregates.
- Use the **detail** parameter to display additional profile information, such as the profile configuration associated with queues and ports.

output definitions

QSAP	The QSet attachment point (QSAP) ID number. This is a logical entity generated internally by the switch to identify the association between a QSet instance and a port or link aggregate. The QSAP is not configurable at this time.
Parent	The parent QSAP ID. If the parent ID is different than the QSAP ID, then the port is a member of a link aggregate.
QSI	The QSet instance (QSI) ID number, internally generated by the switch.
QSP, Name, Admin, Oper	The QSet profile (QSP) ID number and name associated with the QSI. Also indicates the administrative and operational status of the QSP for the QSI.
WRP, Name, Admin, Oper	The WRED profile (WRP) ID number and name associated with the QSI. Also indicates the administrative and operational status of the WRP for the QSI. *WRED is not supported on the OmniSwitch 6860.*
Stats, Admin, Oper, Interval	The QSI administrative status, operational status, and time interval for statistics collection.
BW Admin (%)	The administrative percentage of bandwidth (currently not user-configurable).
BW Oper (Mbps)	The operational amount of bandwidth as determined by the port speed. For a link aggregate, this value is the sum of the operational bandwidths for the member ports.
QI 1–8	The queue scheduling and bandwidth configuration for each QSI queue. These values are determined by which one of the QSet profiles (QSP 1–4) is associated with the QSI.

Release History

Release 8.1.1; command introduced.

Related Commands

qos qsi qsp	Changes the QSet profile association for a QSet instance.
show qos qsi stats	Displays packet count statistics collected for a specific QSet instance.

show qos qsi stats

Displays statistics for the QSet instance (QSI) queues that are associated with the specified port or link aggregate.

show qos qsi {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id***]} [qi** *qi_id***] stats [bytes | rate [bytes]]**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-15).
qi_id	The queue instance (QI) ID number. The valid range is 1–8.
bytes	Displays the total number of bytes (instead of packets) that flow through the QSI queues.
rate	Displays the number of packets-per-second that flow through the QSI queues.

Defaults

By the default, displays the total number of packets that flow through the QSI queues.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The specified port or link aggregate must have statistics collection enabled.
- Use the **port** *chassis/slot/port* or **linkagg** *agg_id* parameters to display QSI statistics associated with specific ports or link aggregates.
- Use the **qi** *qi_id* parameter to display statistics for a specific queue instance. There are eight queues associated with a single QSet instance. Each port and link aggregate is associated with one QSet instance.
- It is possible to combine the **bytes** parameter with the **rate** parameter to display the number of bytes-per-second that flow through the QSI queues. For example, **show qos qsi port 1/20 stats rate bytes**.

Examples

```
-> show qos qsi port 1/1/20 stats
              Total                Total
Port        Q  Tx                   Drop

1/1/20      8  694                  0
```

output definitions

Port	Configured QoS ports.
Q	Number of packets or bytes in queue.
Total Tx	Total packets or bytes transmitted.
Total Drop	Total packets or bytes dropped.

Release History

Release 8.1.1; command introduced.

Related Commands

qos qsi stats	Configures the administrative status and interval for statistics collection for the specified QSet instance.
clear qos qsi stats	Clears statistics collected for one or more QSet instances.

MIB Objects

```
alaVfcQInstanceTable
   alaVfcQInstancePacketsEnqueued
   alaVfcQInstanceBytesEnqueued
   alaVfcQInstancePacketsDropped
   alaVfcQInstanceBytesDropped
```

clear qos qsi stats

Clears QSet instance (QSI) statistics.

clear qos qsi {port *chassis/slot/port***[-***port2***] | slot** *chassis/slot* **| linkagg** *agg_id***[-***agg_id***]} [qi-id** *qi_id***] stats**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis/slot	The chassis ID and slot number (3/1) for a specific slot. Clears the statistics for all ports on the slot.
*agg_id***[-***agg_id***]**	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
qi-id	The queue instance (QI) ID number. The valid range is 1–8.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **port** *chassis/slot/port*, **slot** *chassis/slot*, and **linkagg** *agg_id* parameters to clear QSI statistics associated with specific ports or link aggregates.
- Use the **qi-id** *qi_id* parameter to clear statistics for a specific queue instance. There are eight queues associated with a single QSet instance.

Examples

```
-> clear qos qsi port 1/1/2 qi-id 3 stats
-> clear qos qsi linkagg 10 stats
-> clear qos qsi linkagg 5 qi-id 8 stats
-> clear qos qsi slot 1 stats
```

Release History

Release 8.1.1; command introduced.

Related Commands

show qos qsi stats	Displays QSet instance statistics.

MIB Objects

   alaVfcQsapClearStats
   alaVfcQsapQpId
```

33 QoS Policy Commands

This chapter describes CLI commands used for policy management in the switch. The Quality of Service (QoS) software in the switch uses policy rules for classifying incoming flows and deciding how to treat outgoing flows. A policy rule is made up of a policy condition and a policy action. Policy rules may be created on the switch through CLI or SNMP commands, or they may be created through the PolicyView GUI application on an attached LDAP server.

Note. Rules created through PolicyView cannot be modified through the CLI; however, you can create policies in the CLI that take precedence over policies created through PolicyView.

Refer to Chapter 32, "QoS Commands," for information about commands used to configure QoS software.

MIB information for the QoS policy commands is as follows:

Filename: alcatelIND1Qos.mib
*Module*ALCATEL-IND1-QoS-MIB.

Important Note. Some of the commands listed here are not currently supported on one or more platforms. See command descriptions in this chapter and check release notes for information about commands that are not supported.

The QoS Policy commands are listed here:

Policy commands	**policy rule** **policy validity-period** **policy list** **policy list rules** **policy condition** **policy action** **show policy action** **show policy condition** **show active policy rule** **show policy rule** **show policy validity period** **show active policy list** **show policy list**
Group commands	**policy network group** **policy service** **policy service protocol** **policy service group** **policy mac group** **policy port group** **policy map group** **show policy network group** **show policy mac group** **show policy port group** **show policy map group** **show policy service** **show policy service group**

Condition commands	**policy condition** **policy condition source ip** **policy condition source ipv6** **policy condition destination ipv6** **policy condition multicast ip** **policy condition source network group** **policy condition destination network group** **policy condition multicast network group** **policy condition source ip-port** **policy condition destination ip-port** **policy condition source tcp-port** **policy condition destination tcp-port** **policy condition source udp-port** **policy condition destination udp-port** **policy condition ethertype** **policy condition established** **policy condition tcpflags** **policy condition service** **policy condition service group** **policy condition icmptype** **policy condition icmpcode** **policy condition ip-protocol** **policy condition ipv6** **policy condition nh** **policy condition flow-label** **policy condition tos** **policy condition dscp** **policy condition source mac** **policy condition destination mac** **policy condition source mac group** **policy condition destination mac group** **policy condition source vlan** **policy condition inner source-vlan** **policy condition destination vlan** **policy condition 802.1p** **policy condition inner 802.1p** **policy condition source port** **policy condition destination port** **policy condition source port group** **policy condition source port split-group** **policy condition destination port group** **policy condition vrf** **policy condition fragments** **policy condition app-mon**

Action commands	**policy action** **policy action disposition** **policy action shared** **policy action priority** **policy action maximum bandwidth** **policy action maximum depth** **policy action cir** **policy action cpu priority** **policy action tos** **policy action 802.1p** **policy action dscp** **policy action map** **policy action permanent gateway-ip** **policy action port-disable** **policy action redirect port** **policy action redirect linkagg** **policy action no-cache** **policy action mirror**

Types of policies are generally determined by the kind of traffic they classify (policy conditions) and how the policy is enforced (policy actions). Commands used for particular types of policies are listed here. See the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about creating these types of policies and information about valid condition/action combinations.

Access Control Lists	**policy condition** **policy action disposition** **policy rule**
Traffic prioritization/shaping	**policy action shared** **policy action priority** **policy action maximum bandwidth** **policy rule**
802.1p/ToS/DSCP tagging or mapping	**policy condition tos** **policy condition dscp** **policy condition 802.1p** **policy action tos** **policy action 802.1p** **policy action dscp** **policy action map** **policy rule**
Network Address Translation (NAT)	**policy condition source ip** **policy condition source ipv6** **policy rule**
Policy based port mirroring	**policy action mirror**
VLAN Stacking	**policy condition inner source-vlan** **policy condition inner 802.1p**

policy rule

Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

policy rule *rule_name* **[enable | disable] [precedence** *precedence***] [condition** *condition***] [action** *action***] [validity-period** *name***] [save] [log [log-interval** *seconds***]] [count {packets | bytes}] [trap] [default-list]**

policy rule *rule_name* **no {validity-period | save | log | trap | default-list}**

no policy rule *rule_name*

Syntax Definitions

rule_name	The name of the policy rule, any alphanumeric string.
enable	Enables the policy rule.
disable	Disables the policy rule.
precedence	The precedence value in the range 0–65535. This value determines the order in which rules are searched for a matching condition. A higher number indicates higher precedence. Typically the range 30000–65535 is reserved for PolicyView.
condition	The condition name that is associated with this rule. Conditions are configured through the **policy condition** command.
action	The name of the action that is associated with this rule. Actions are configured through the **policy action** command.
name	The name of a user-defined validity period that is associated with this rule. Validity periods are configured through the **policy validity period** command.
save	Marks the policy rule so that it may be captured as part of the switch configuration.
log	Configures the switch to log messages about specific flows coming into the switch that match this policy rule.
seconds	Configures how often to look for packets that match this policy rule when rule logging is applied (in the range from 0–3600 seconds). A value of 0 specifies to log as often as possible.
packets	Counts the number of packets that match the rule.
bytes	Counts the number of bytes that match the rule.
trap	Enables or disables traps for the rule.
default-list	Adds the rule to the QoS default policy list.

Defaults

parameter	default
enable | disable	enable
precedence	0
log	no
seconds	60
packets | bytes	packets
trap	enable
default-list	adds rule to the default list

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Any rule configured through this command is not active on the switch until the **qos apply** command is issued.
- A policy rule configured through the PolicyView application may not be edited in the CLI. You may, however, create a rule using the CLI with a higher precedence that will override a rule created through PolicyView.
- Use the **no** form of the command to remove the rule from the configuration or to remove parameters from a particular rule. The change will not take effect, however, until the **qos apply** command is issued.
- Only one validity period is associated with a policy rule. Each time this command is entered with a validity period name specified, the existing period name is overwritten with the new one.
- Software and hardware resources are allocated for rules associated with a validity period even if the validity period is not active. Pre-allocating the resources makes sure the rule can be enforced when the validity period becomes active.
- The **save** option marks the policy rule so that the rule will be captured in an ASCII text file (using the **configuration snapshot** command), saved to the working directory after the **write memory** command or **copy running-config working** command is entered, or saved after a reboot. Rules are saved by default. If **no save** is entered for the rule, the policy rule will not be written to the configuration. The **save** option should be disabled only if you want to use a policy rule temporarily.
- The **default-list** option adds the rule to the default policy list. Rules are added to this list by default when the rule is created. A rule can belong to multiple policy lists. As a result, the rule remains a member of the default list even when it is subsequently assigned to additional lists.
- If the rule is going to belong to a QoS policy list for a Universal Network Profile (UNP), use the **no default-list** option when creating the rule. Doing so will give the rule precedence over default list rules when the policy list is applied to UNP device traffic.

- Note that each time a rule is assigned to a policy list, an instance of that rule is created and each instance is allocated system resources. Use the **no default-list** option with this command to exclude the rule from the default policy list.
- If the **configuration snapshot** command is entered after the **policy rule** command is configured, the resulting ASCII file will include the following additional syntax for the **policy rule** command:

  from {cli | ldap | blt}

  This syntax indicates how the rule was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in rule, this setting is not configurable.
- The **log** option is useful for determining the source of attacks on the switch firewall.
- If traps are enabled for the rule, a trap is only sent when a port disable action or UserPort shutdown operation is triggered.

Examples

```
-> policy rule rule2 condition c2 action a2
-> policy rule rule3 condition c3 action a3 no default-list
-> policy rule rule2 precedence 65535
-> policy rule rule2 validity-period vp01
-> policy rule rule2 no precedence
-> policy rule rule2 no validity-period
-> policy rule rule3 no default-list
-> no policy rule rule2
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy validity-period	Configures a validity period that specifies days, times, and/or months during which an associated policy rule is in effect.
policy condition	Configures condition parameters.
policy action	Configures action parameters.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy rule	Displays information for policy rules configured on the switch.
show active policy rule	Displays only those policy rules that are currently being enforced on the switch.

   alaQoSAppliedRuleLog
   alaQoSAppliedCountType
   alaQoSAppliedPacketCount
   alaQoSAppliedByteCount
   alaQosAppliedDefaultList
```

policy validity-period

Configures a validity period that specifies the days and times in which a policy rule is in effect.

policy validity-period *name* **[days** *days***] [months** *months***] [hours** *hh:mm* **to** *hh:mm***] [interval** *mm:dd:yyyy hh:mm* **to** *mm:dd:yyyy hh:mm***]**

policy validity-period *name* **no {hours** | **interval}**

no policy validity-period *name*

Syntax Definitions

name	The name of the validity period (up to 31 alphanumeric characters).
days	The day(s) of the week this validity period is active. Enter the actual day of the week (e.g., **monday**, **tuesday**, **wednesday**, etc.).
months	The month(s) in which the validity period is active. Enter the actual month (e.g., **january**, **february**, **march**, etc.).
hh:mm	The time of day, specified in hours and minutes, the validity period starts and the time of day the validity period ends (e.g., 10:30 to 11:30).
mm:dd:yyyy hh:mm	An interval of time in which a rule is in effect. Specify a start and end to the interval period by entering a beginning date and time followed by an end date and time (e.g., 11:01:2005 12:01 to 11:02:2005 12:01).

Defaults

By default, no validity period is in effect for a policy rule.

parameter	default
days	no restriction
months	no restriction
hh:mm	no specific time
mm:dd:yyyy hh:mm	no interval

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a validity period from the configuration, or to remove parameters from a particular validity period. Note that at least one parameter must be associated with a validity period.
- Any combination of days, months, hours, and interval parameters is allowed. The validity period is only in effect when all specified parameters are true.
- Use the **policy rule** command to associate a validity period with a rule.

- Software and hardware resources are allocated for rules associated with a validity period even if the validity period is not active. Pre-allocating the resources makes sure the rule can be enforced when the validity period becomes active.
- If the **snapshot** command is entered after the **policy validity-period** command is configured, the resulting ASCII file will include the following additional syntax for the **policy validity-period** command:

  from {cli | ldap | blt}

  This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy validity-period vp01 days tuesday thursday months january february
-> policy validity-period vp01 hours 13:00 to 19:00
-> policy validity-period vp02 interval 01/01/05 12:01 to 02/01/05 11:59
-> policy validity-period vp01 no days thursday
-> no policy-validity period vp02
```

Release History

Release 8.1.1; command introduced.

Related Commands

```

policy list

Configures a QoS policy list. There are two types of lists available: a Universal Network Profile (UNP) policy list, and EMP Access Control List (ACL) list, and the default policy list. Rules assigned to a UNP list are applied to traffic classified into a specific UNP profile. A default policy list is available when the switch boots up; all policy rules belong to this list unless otherwise specified.

policy list *list_name* **type {unp | empacl | egress} [enable | disable]**

no policy list *list_name*

Syntax Definitions

list_name	The name to assign to the policy list. Note that the list name is case sensitive.
unp	Specifies the list type as a Universal Network Profile list.
empacl	Specifies the list type as an ACL applied to the EMP port on the switch.
egress	**Note.** *This field is not supported in this release.*
enable	Enables the policy list.
disable	Disables the policy list.

Defaults

parameter	default
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a policy list from the configuration.
- The default policy list that is available in every switch has no name and is not configurable. All QoS policy rules are assigned to the default list unless the **no default-list** option of the **policy rule** command is used at the time the rule is created.
- Once a policy list is created, use the **policy list rules** command to add rules to the list.
- Any policy list configured through this command is not active on the switch until the **qos apply** command is issued.
- If the **snapshot** command is entered after the **policy list** command is configured, the resulting ASCII file will include the following additional syntax for the **policy list** command:

  from {cli | ldap | blt}

  This syntax indicates how the list was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy list unp1 type unp
-> policy list unp1 disable
-> policy list unp1 enable
-> no policy list unp1
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy list rules	Assigns QoS policy rules to a QoS policy list.
policy rule	Configures a policy rule on the switch and optionally associates that rule with a validity period.
show policy rule	Displays information for policy rules configured on the switch.
show active policy list	Displays only those policy lists that are currently being enforced on the switch.
show policy list	Displays information for policy lists configured on the switch.

MIB Objects

```
alaQoSRuleGroupsTable
   alaQoSRuleGroupsName
   alaQosRuleGroupsSource
   alaQosRuleGroupsType
   alaQosRuleGroupsEnabled
   alaQosRuleGroupsStatus
alaQosAppliedRuleGroupsTable
   alaQosAppliedRuleGroupsName
   alaQosAppliedRuleGroupsSource
   alaQosAppliedGroupsType
   alaQosAppliedGroupsEnabled
   alaQosAppliedRuleGroupsStatus
```

policy list rules

Assigns existing QoS policy rules to the specified QoS policy list.

policy list *list_name* **rules** *rule_name* **[***rule_name2***...]**

policy list *list_name* **no rules** *rule_name* **[***rule_name2***...]**

Syntax Definitions

list_name	The name of an existing QoS policy list. Note that the list name is case sensitive.
rule_name	The name of an existing QoS policy rule to include in the policy list.
rule_name2	Optional. The name of another QoS policy rule to include in the policy list. Separate each rule name specified with a space.

Defaults

A default policy list is available when the switch boots up. This list has no name and is not configurable. All QoS policy rules are assigned to the default list unless the **no default-list** option of the **policy rule** command is used.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a policy rule from an existing list.
- The QoS policy list and rule names specified with this command must already exist in the switch configuration.
- This command is only used to assign rules to a UNP policy list. Create the rules for this type of list using the **no default-list** option of the **policy rule** command to ensure these rules take precedence over other default list rules when the UNP policy list is applied to device traffic.
- A rule may belong to a UNP list and the default list at the same time. By default, a rule is assigned to a default policy list when the rule is created. If the rule is subsequently assigned to another policy list, it still remains associated with the default list.
- If a rule is a member of multiple policy lists but one or more of these lists are disabled, the rule is still active in those lists that are enabled.
- If the QoS status of a policy rule is disabled, then the rule is disabled for all lists even if a list to which the policy rule belongs is enabled.
- Any policy list configured through this command is not active on the switch until the **qos apply** command is issued.

Examples

```
-> policy list unp1 rules r1 r2 r3
-> policy list unp1 no rules r2
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy list	Configures a QoS policy list.
policy rule	Configures a policy rule on the switch and optionally associates that rule with a validity period.
show policy rule	Displays information for policy rules configured on the switch.
show active policy list	Displays only those policy lists that are currently being enforced on the switch.
show policy list	Displays information for policy lists configured on the switch.

   alaQosAppliedRuleGroupsStatus
```

policy network group

Configures a network group name and its associated IP addresses. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the network group.

policy network group *net_group ip_address* **[mask** *net_mask***] [***ip_address2* **[mask** *net_mask2***]...]**

no policy network group *net_group*

policy network group *net_group* **no** *ip_address* **[mask** *netmask***] [***ip_address2* **[mask** *net_mask2***]...]**

Syntax Definitions

net_group	The name of the network group (up to 31 alphanumeric characters).
ip_address	An IPv4 address included in the network group. IPv6 addresses are not supported with network groups.
net_mask	The mask for the IPv4 address. If no mask is entered, the IPv4 address is assumed to be a host address.
ip_address2	Optional. Another IPv4 address to be included in the network group. Multiple IP addresses may be configured for a network group. Separate each address/mask combination with a space.
net_mask2	Optional mask for the IPv4 address. If no mask is entered, the natural mask for the address will be used.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to configure a group of IPv4 addresses to which you want to apply QoS rules. Rather than create a condition for each IPv4 address, group the addresses together. Use the **policy condition** command to associate a condition with the network group.
- Use the **no** form of the command to remove a network group from the configuration, or to remove an IP address from a network group.
- If the **snapshot** command is entered after the **policy network group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy network group** command:

  from {cli | ldap | blt}

  This syntax indicates how the network group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in network group, this setting is not configurable.

Examples

```
-> policy network group webgroup1 10.10.12.5 10.50.3.1
-> policy network group webgroup1 no 10.10.12.5
-> no policy network group webgroup1
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy condition	Configures a policy condition. A network group may be configured as part of a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy network group	Displays information for policy network groups.

MIB Objects

```
alaQoSNetworkGroupsTable
   alaQoSNetworkGroupsName
   alaQoSNetworkGroupsSource
alaQoSAppliedNetworkGroupsTable
   alaQoSAppliedNetworkGroupsName
   alaQoSAppliedNetworkGroupsSource
alaQoSNetworkGroupTable
   alaQoSNetworkGroupIpAddr
   alaQoSNetworkGroupsIpMask
alaQoSAppliedNetworkGroupTable
   alaQoSAppliedNetworkGroupIpAddr
   alaQoSAppliedNetworkGroupsIpMask
```

policy service group

Configures a service group and its associated services. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the service group.

policy service group *service_group service_name1* **[***service_name2...***]**

no policy service group *service_group*

policy service group *service_group* **no** *service_name1* **[***service_name2...***]**

Syntax Definitions

service_group	The name of the service group (up to 31 alphanumeric characters).
service_name1	The service name is configured through the **policy service** command and includes information about protocol, source port, and destination port.
service_name2...	Optional. Additional service names may be configured for a service group. Separate each service name with a space.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to configure a group of services to which you want to apply QoS rules. Rather than create a condition for each service, group services together. Use the **policy condition** command to associate a condition with the service group.
- Use the **no** form of the command to remove a service group from the configuration, or to remove a service from a service group.
- To drop packets destined to specific TCP and UDP ports, create port services for the traffic that you want dropped and add these services to a service group. Then create a condition for this service group and a source port group, which can then be used in a deny rule. Refer to the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about ACL security enhancements.
- If the **snapshot** command is entered after the **policy service group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service group** command:

  from {cli | ldap | blt}

  This syntax indicates how the service group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in service group, this setting is not configurable.

Examples

```
-> policy service group servgroup2 telnet ftp
-> policy service group servgroup2 no telnet
-> no policy service group servgroup2
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy service	Configures a service that may be used as part of a policy service group.
policy condition	Configures a policy condition. A network group may be configured as part of a policy condition.
show policy service group	Displays information for policy service groups.

   alaQoSAppliedServiceGroupsName
   alaQoSAppliedServiceGroupsSource
alaQoSServiceGroupTable
   alaQoSServiceGroupServiceName
alaQoSAppliedServiceGroupTable
   alaQoSAppliedServiceGroupServiceName
```

policy mac group

Configures a MAC group and its associated MAC addresses. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the MAC group.

policy mac group *mac_group mac_address* **[mask** *mac_mask***] [***mac_address2* **[mask** *mac_mask2***]...]**

no policy mac group *mac_group*

policy mac group *mac_group* **no** *mac_address* **[mask** *mac_mask***] [***mac_address2* **[mask** *mac_mask2***]...]**

Syntax Definitions

mac_group	The name of the MAC group (up to 31 alphanumeric characters).
mac_address	The MAC address associated with the group (for example, 00:20:da:05:f6:23).
mac_mask	The mask of the MAC address, used to identify which bytes in the MAC address are significant when comparing the MAC address in the received frame with the MAC address in the policy condition. If no mask is specified, the switch automatically uses ff:ff:ff:ff:ff:ff.
mac_address2	Optional. Additional MAC addresses may be configured for a MAC group. Separate each address with a space.
mac_mask2	The mask of an additional MAC address, used to identify which bytes in the MAC address are significant when comparing the MAC address in the received frame with the MAC address in the policy condition. If no mask is specified, the switch automatically uses ff:ff:ff:ff:ff:ff.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to configure a group of source or destination MAC addresses to which you want to apply QoS rules. Rather than create a condition for each MAC address, group MAC addresses together. Use the **policy condition** command to associate a condition with the MAC group.
- Use the **no** form of the command to remove a MAC group from the configuration, or to remove a MAC address from a MAC group.
- The MAC group name “alaPhones” is a reserved group name used to identify the MAC addresses of IP phones. See the **qos phones** command for more information.
- If the **snapshot** command is entered after the **policy map group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy map group** command:

  from {cli | ldap | blt}

This syntax indicates how the map group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy mac group mac_group1 00:20:da:05:f6:23 00:20:da:05:f6:24
-> no policy mac group mac_group1
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy condition	Configures a policy condition. A MAC group may be configured as part of a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy mac group	Displays information about policy MAC groups.

MIB Objects

```
alaQoSMACGroupsTable
   alaQoSMACGroupsName
   alaQoSMACGroupsSource

   alaQoSMACGroupMacAddr
   alaQoSMACGroupMacMask
alaQoSAppliedMACGroupTable
   alaQoSAppliedMACGroupMacAddr
   alaQoSAppliedMACGroupMacMask
```

policy port group

Configures a port group and its associated slot and port numbers. A port group may be attached to a policy condition. The action associated with that policy will be applied to all members of the port group.

policy port group *group_name chassis/slot/port***[-***port***] [***chassis/slot/port***[-***port***]...]**

no policy port group *group_name*

policy port group *group_name* **no** *chassis/slot/port***[-***port***] [***chassis/slot/port***[-***port***]...]**

Syntax Definitions

group_name	The name of the port group (up to 31 alphanumeric characters).
*chassis/slot/port***[-***port***]**	The chassis ID, slot, and port (or port range) of the ports to be included in the group. At least one chassis/slot/port combination must be specified. Additional combinations may be included in the group; each combination should be separated by a space.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to configure a group of ports to which you want to apply QoS rules. Rather than create a condition for each port, group ports together. Use the **policy condition** command to associate a condition with the port group.
- Use the **no** form of the command to remove a port group from the configuration, or to remove a slot/port from a port group.
- If a range of ports is specified using the syntax *slot/port-port* (i.e., 2/1-8), a single port within that range cannot be removed on its own. The entire range must be deleted as it was entered.
- When a port group is used as part of a policy rule and a policy action specifies a maximum bandwidth, each interface in the port group will be allowed the maximum bandwidth.
- To prevent IP source address spoofing, add ports to the port group called **UserPorts**. This port group does not need to be used in a condition or rule to be effected on flows and only applies to routed traffic. Ports added to the UserPorts group will block spoofed traffic while still allowing normal traffic on the port. Refer to the *OmniSwitch AOS Release 8 Network Configuration Guide* for more information about ACL security enhancements.
- Use the **qos user-port** command to configure the option to filter or administratively disable a port when a specific type of traffic (Spoof, RIP, BPDU, OSPF, and/or BGP) is received on a port that is a member of the pre-defined UserPorts group.

- If the **snapshot** command is entered after the **policy port group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy port group** command:

  from {cli | ldap | blt}

  This syntax indicates how the port group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy port group port_group4 3/1/1-2 4/1/3 5/1/4
-> policy port group port_group4 no 3/1/1-2
-> policy port group UserPorts 4/1/1-8 5/1/1-8
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy condition	Configures a policy condition. A port group may be configured as part of a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
policy action maximum bandwidth	Configures a maximum bandwidth value for a policy action.
show policy port group	Displays information about policy port groups.

   alaQoSPortGroupPortEnd
alaAppliedPortGroupTable
   alaQoSAppliedPortGroupSlot
   alaQoSAppliedPortGroupPort
   alaQoSAppliedPortGroupPortEnd
```

policy map group

Configures a map group and its associated mappings for 802.1p, Type of Service (ToS), or Differentiated Services Code Point (DSCP) values. A map group may be referenced in a policy action with the **map** keyword.

policy map group *map_group* **{***value1***:***value2***...}**

no policy map group *map_group*

policy map group no {*value1***:***value2***...}**

Syntax Definitions

map_group	The name of the map group (up to 31 alphanumeric characters).
value1	The 802.1p, ToS, or DSCP value to be mapped to another value. May be a value or a range of values (for example, **1-2**).
value2...	The 802.1p, ToS, or DSCP value to be used in place of *value1*. Additional mapping pairs may be included.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a mapping pair or to remove the map group entirely.
- The map group may contain more than one mapping pair.
- If the **snapshot** command is entered after the **policy map group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy map group** command:

  from {cli | ldap | blt}

  This syntax indicates how the map group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy map group tosGroup 1-4:3 5-6:5 7:6
-> policy map group tosGroup no 7:6
-> no policy map group tosGroup
```

Release History

Release 8.1.1; command introduced.

```

policy service

Configures a service that may be used as part of a policy service group or included as part of a policy condition. A service is a source and/or destination TCP or UDP port or port range.

This overview section describes the base command. *At least one option must be configured with the base command.* Some options may be used in combination; some options are shortcuts for keyword combinations (see the Usage Guidelines). Options are described as separate commands. See the command descriptions and usage guidelines for valid combinations.

Use the **no** form for keywords to remove a parameter from a service.

policy service *service_name*
[protocol *protocol***]**
[source ip port *port***[-***port***]]**
[destination ip port *port***[-***port***]]**
[source tcp port *port***[-***port***]]**
[destination tcp port *port***[-***port***]]**
[source udp port *port***[-***port***]]**
[destination udp port *port***[-***port***]]**

no policy service *service_name*

Syntax Definitions

service_name	The name of the service (up to 31 alphanumeric characters).
protocol	The protocol associated with the service. The range of values is 0–255. Currently a value of 6 (for TCP) or 17 (for UDP) is supported. This value must be specified for **source ip port** or **destination ip port**; it cannot be specified for **source tcp port**, **destination tcp port**, **source udp port**, or **destination udp port**.
port	The well-known port number (or port range) for the desired service. For example, the port number for Telnet is 23. Specify a range of ports using a hyphen (for example, **22-23**).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.

- The command options offer alternate ways of configuring TCP or UDP ports for a service. Note that port types (TCP or UDP) cannot be mixed in the same service. The following table shows how the keywords are used:

To configure:	Use keywords:	Notes
TCP or UDP ports for a service	**protocol** **source ip port** **destination ip port**	*The protocol must be specified with at least one source or destination port.*
TCP ports for a service	**source tcp port** **destination tcp port**	*Keywords may be used in combination.*
UDP ports for a service	**source udp port** **destination udp port**	*Keywords may be used in combination.*

- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

  from {cli | ldap | blt}

  This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

The following two commands show two different ways of configuring the same service:

```
-> policy service telnet2 protocol 6 destination ip port 23
-> policy service telnet3 destination tcp port 23
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy map group	Configures a policy service group, which is made up of policy services.
policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy service	Displays information about policy services configured on the switch.

   alaQoSAppliedServiceDestinationUdpPort
   alaQoSAppliedServiceDestinationUdpPortEnd
```

policy service protocol

Configures a service with a protocol and IP port or port range that may be used as part of a policy service group or included as part of a policy condition.

policy service *service_name* **protocol** *protocol* **{[source ip-port** *port*[**-***port*]**] [destination ip-port** *port*[**-***port*]**]}**

no policy service *service_name*

policy service *service_name* **no {source ip-port | destination ip-port}**

Syntax Definitions

service_name	The name of the service (up to 31 alphanumeric characters).
protocol	The protocol associated with the service. The range of values is 0–255. Currently a value of 6 (for TCP) or 17 (for UDP) is supported.
port	The well-known port number (or port range) for the desired service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, **22-23**).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a service from the configuration or to remove parameters from a particular service. (A protocol value cannot be removed from a service.)
- Shortcut commands for the **policy service protocol** command include the following: **policy service source tcp-port**, **policy service destination tcp-port**, **policy service source udp-port**, and **policy service destination udp-port**.
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

  from {cli | ldap | blt}

  This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy service telnet2 protocol 6 destination ip-port 23 source ip-port 22
-> policy service telnet2 no source ip-port
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy service group	Configures a policy service group, which is made up of policy services.
policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy service	Displays information about policy services configured on the switch.

MIB Objects

```

   alaQoSAppliedServiceDestinationIpPort
   alaQoSAppliedServiceDestinationIpPortEnd
```

policy service source tcp-port

Configures a service with a source TCP port or port range that may be used as part of a policy service group or included as part of a policy condition.

policy service *service_name* **source tcp-port** *port***[-***port***]**

no policy service *service_name*

policy service *service_name* **no source tcp port**

Syntax Definitions

service_name	The name of the service (up to 31 alphanumeric characters).
port	The well-known port number (or port range) for the desired TCP service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, **22-23**).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.
- Ports associated with a particular service must all be of the same type. (The **destination tcp port** keyword may be used with this command; other keywords for the command are not allowed.)
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

  from {cli | ldap | blt}

  This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy service serv_5 source tcp port 21-22
-> policy service serv_5 no source tcp port
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy service group	Configures a policy service group, which is made up of policy services.
policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy service	Displays information about policy services configured on the switch.

MIB Objects

```
alaQoSServiceTable
   alaQoSServiceName
   alaQoSServiceSource
   alaQoSServiceSourceTcpPort
   alaQoSServiceSourceTcpPortEnd
alaQoSAppliedServiceTable
   alaQoSAppliedServiceName
   alaQoSAppliedServiceSource
   alaQoSAppliedSourceTcpPort
   alaQoSAppliedSourceTcpPortEnd
```

policy service destination tcp-port

Configures a service with a destination TCP port or port range that may be used as part of a policy service group or included as part of a policy condition.

policy service *service_name* **destination tcp-port** *port***[**-*port***]**

no policy service *service_name*

policy service *service_name* **no destination tcp-port**

Syntax Definitions

service_name	The name of the service (up to 31 alphanumeric characters).
port	The well-known port number (or port range) for the desired TCP service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, **22-23**).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a service from the configuration, or to remove parameters from a particular service.
- This command is a shortcut for the **policy service protocol** command.
- A policy service may be grouped in a policy group using the **policy service group** command. A policy condition may then be associated with the service group.
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

  from {cli | ldap | blt}

  This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy service service4 destination tcp-port 23
-> policy service service4 no destination tcp-port
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy service group	Configures a policy service group, which is made up of policy services.
policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy service	Displays information about policy services configured on the switch.

MIB Objects

alaQoSServiceTable
   alaQoSServiceName
   alaQoSServiceSource
   alaQoSServiceDestinationTcpPort
   alaQoSServiceDestinationTcpPortEnd
alaQoSAppliedServiceTable
   alaQoSAppliedServiceName
   alaQoSAppliedServiceSource
   alaQoSAppliedServiceDestinationTcpPort
   alaQoSAppliedServiceDestinationTcpPortEnd
```

policy service source udp-port

Configures a service with a source UDP port or port range that may be used as part of a policy service group or included as part of a policy condition.

policy service *service_name* **source udp-port** *port***[-***port***]**

no policy service *service_name*

policy service *service_name* **no source udp-port**

Syntax Definitions

service_name	The name of the service (up to 31 alphanumeric characters).
port	The well-known port number (or port range) for the desired UDP service. Specify a port range with a hyphen (for example, **22-23**).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.
- Ports associated with a particular service must all be of the same type. (The **destination tcp port** keyword may be used with this command; other keywords for the command are not allowed.)
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

  from {cli | ldap | blt}

  This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy service serv_a source udp-port 1000
-> no policy service serv_a source udp-port
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy service group	Configures a policy service group, which is made up of policy services.
policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy service	Displays information about policy services configured on the switch.

MIB Objects

```

   alaQoSServiceName
   alaQoSServiceSource
   alaQoSServiceSourceUdpPort
   alaQoSServiceSourceUdpPortEnd
alaQoSAppliedServiceTable
   alaQoSAppliedServiceName
   alaQoSAppliedServiceSource
   alaQoSAppliedSourceUdpPort
   alaQoSAppliedSourceUdpPortEnd
```

policy service destination udp-port

Configures a service with a destination UDP port or port range that may be used as part of a policy service group or included as part of a policy condition.

policy service *service_name* **destination udp-port** *port***[-***port***]**

no policy service *service_name*

policy service *service_name* **no destination udp-port**

Syntax Definitions

service_name	The name of the service (up to 31 alphanumeric characters).
port	The well-known port number (or port range) for the desired UDP service. For example, a port number for NETBIOS is 137. A port range should be separated by a hyphen (for example, **137-138**).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- A policy service may be grouped in a policy group using the **policy service group** command. A policy condition may then be associated with the service group.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service.
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

  from {cli | ldap | blt}

  This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

Examples

```
-> policy service service4 destination udp-port 137
-> policy service service4 no destination udp-port
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy service group	Configures a policy service group, which is made up of policy services.
policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy service	Displays information about policy services configured on the switch.

   alaQoSAppliedServiceName
   alaQoSAppliedServiceSource
   alaQoSAppliedServiceDestinationUdpPort
   alaQoSAppliedServiceDestinationUdpPortEnd
```

policy condition

Creates a QoS policy condition. The condition determines what parameters the switch uses to classify incoming flows. Condition parameters may be configured when the condition is created; or parameters may be configured for an existing condition. At least one parameter must be configured for a condition.

This section describes the base command. Optional keywords are listed below and described as separate commands later in this chapter. (Options may be used in combination but are described separately for ease in explanation.) Use the **no** form for keywords to remove a parameter from the condition.

Some condition parameters may not be supported depending on the platform you are using. Also some condition parameters may not be supported with some action parameters. See the condition/action tables in the *OmniSwitch AOS Release 8 Network Configuration Guide*.

policy condition *condition_name*
[source ip *ip_address* **[mask** *netmask***]]**
[source ipv6 {any | *ipv6_address* **[mask** *netmask***]}**
[destination ip *ip_address* **[mask** *netmask***]]**
[destination ipv6 {any | *ipv6_address* **[mask** *netmask***]}**
[multicast ip *ip_address* **[mask** *netmask***]]**
[source network group *network_group***]**
[destination network group *network_group***]**
[multicast network group *multicast_group***]**
[source ip port *port***[-***port***]]**
[destination ip port *port***[-***port***]]**
[source tcp port *port***[-***port***]]**
[destination tcp port *port***[-***port***]]**
[source udp port *port***[-***port***]]**
[destination udp port *port***[-***port***]]**
[ethertype *etype***]**
[established]
[tcpflags {any | all} *flag* **[mask** *flag***]**
[service *service***]**
[service group *service_group***]**
[icmptype *type***]**
[icmpcode *code***]**
[ip protocol *protocol***]**
[ipv6]
[nh *next_header_value***]**
[flow-label *flow_label_value***]**
[tos *tos_value tos_mask***]**
[dscp {*dscp_value***[-***value***} [***dscp_mask***]]**
[source mac *mac_address* **[mask** *mac_mask***]]**
[destination mac *mac_address* **[mask** *mac_mask***]]**
[source mac group *group_name***]**
[destination mac group *mac_group***]**
[source vlan *vlan_id***]**
[destination vlan *vlan_id***]**
[802.1p *802.1p_value***]**
[source port *chassis/slot/port***[-***port***]]**

[source port group *group_name***]**
[source port split-group *group_name***]**
[destination port *chassis/slot/port***[-***port***]]**
[destination port group *group_name***]**
[vrf {*vrf_name* | **default}]**
[fragments]
{app-mon-application-group *app_group_name* **| app-mon-application-name** *app_name***}**

no policy condition *condition_name*

Syntax Definitions

condition_name	The name of the condition. Any alphanumeric string.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A policy condition and a policy action are combined to make a policy rule. See the **policy rule** command on page 44-6.
- Use the **qos apply** command to activate configuration changes.
- If multiple keywords are defined for a single condition, the traffic flow must match all of the parameters in the condition before the rule is enforced.
- Use the **no** form of the command to remove a condition from a policy rule.
- At least one parameter must be associated with a condition.
- If the **snapshot** command is entered after the **policy condition** command is configured, the resulting ASCII file will include the following additional syntax for the **policy condition** command:

  from {cli | ldap | blt}

  This syntax indicates how the condition was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in condition, this option is not configurable.

Examples

```
-> policy condition cond4 source port 3/1
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Configures a policy action.
policy rule	Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).
show policy condition	Displays information about policy conditions configured on the switch.
show policy rule	Displays information about pending and applied policy rules.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSource
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSource
```

policy condition source ip

Configures a source IP address for a policy condition.

policy condition *condition_name* **source ip** *ip_address* **[mask** *netmask***]**

policy condition *condition_name* **no source ip**

Syntax Definitions

condition_name	The name of the condition.
ip_address	The source IP address of the Layer 3 flow.
netmask	The mask for the source IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A source IP address and a source IP network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a source IP address from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond3 source ip 173.201.18.3
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about a particular policy condition configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceIpAddr
   alaQoSConditionSourceIpMask
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceIpAddr
   alaQoSAppliedConditionSourceIpMask
```

policy condition source ipv6

Configures a source IPv6 address for a policy condition.

policy condition *condition_name* **source ipv6 {any |** *ipv6_address* **[mask** *netmask***]}**

policy condition *condition_name* **no source ipv6**

Syntax Definitions

condition_name	The name of the condition.
any	Any source IPv6 address.
ipv6_address	A specific source IPv6 address.
netmask	The mask for the source IPv6 address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a source IPv6 address from a condition; however, at least one classification parameter must be associated with a condition.
- If a mask is not specified, the IPv6 address is assumed to be a host address.

Examples

```
-> policy condition cond3 source ipv6 ::1234:531F:BCD2:F34A
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about a particular policy condition configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceIpv6Addr
   alaQoSConditionSourceIpv6AddrStatus
   alaQoSConditionSourceIpv6Mask
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceIpv6Addr
   alaQoSAppliedConditionSourceIpv6AddrStatus
   alaQoSAppliedConditionSourceIpMask
```

policy condition destination ip

Configures a destination IP address for a policy condition.

policy condition *condition_name* **destination ip** *ip_address* **[mask** *netmask***]**

policy condition *condition_name* **no destination ip**

Syntax Definitions

condition_name	The name of the condition.
ip_address	The destination IP address of the Layer 3 flow.
netmask	The mask for the destination IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A destination IP address and a destination IP network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a destination IP address from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond4 destination ip 208.192.21.0 mask 255.255.255.0
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy condition	Shows information about a particular policy condition configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDestinationIpAddr
   alaQoSConditionDestinationIpMask
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationIpAddr
   alaQoSAppliedConditionDestinationIpMask
```

policy condition destination ipv6

Configures a destination IPv6 address for a policy condition.

policy condition *condition_name* **destination ipv6 {any |** *ipv6_address* **[mask** *netmask***]}**

policy condition *condition_name* **no destination ipv6**

Syntax Definitions

condition_name	The name of the condition.
any	Any destination IPv6 address.
ipv6_address	A specific destination IPv6 address.
netmask	The mask for the source IPv6 address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a destination IPv6 address from a condition; however, at least one classification parameter must be associated with a condition.
- If a mask is not specified, the IPv6 address is assumed to be a host address.

Examples

```
-> policy condition cond3 destination ipv6 ::1234:531F:BCD2:F34A
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy condition	Applies configured QoS and policy settings to the current configuration.
qos apply	Creates a policy condition.
show policy condition	Shows information about a particular policy condition configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDestinationIpv6Addr
   alaQoSConditionDestinationIpv6AddrStatus
   alaQoSConditionDestinationIpv6Mask
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationIpv6Addr
   alaQoSAppliedConditionDestinationIpv6AddrStatus
   alaQoSAppliedConditionDestinationIpMask
```

policy condition multicast ip

Configures a multicast IP address for a policy condition.

policy condition *condition_name* **multicast ip** *ip_address* **[mask** *netmask***]**

policy condition *condition_name* **no multicast ip**

Syntax Definitions

condition_name	The name of the condition.
ip_address	The multicast IP address.
netmask	Optional. The mask for the multicast IP address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A multicast IP address and a multicast network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a multicast IP address from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond4 multicast ip 224.1.1.1
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSMulticastIpAddr
   alaQoSMulticastIpMask
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedMulticastIpAddr
   alaQoSAppliedMulticastIpMask
```

policy condition source network group

Associates a source network group with a policy condition.

policy condition *condition_name* **source network group** *network_group*

policy condition *condition_name* **no source network group**

Syntax Definitions

condition_name	The name of the condition.
network_group	The name of the source network group. Network groups are configured through the **policy network group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a source network group from a condition; however, at least one classification parameter must be associated with a condition.
- A source IP address and a source IP network group cannot be specified in the same condition.

Examples

```
-> policy condition cond5 source network group webgroup1
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
policy network group	Configures a network group name and its associated IP addresses.
show policy condition	Shows information about policy conditions configured on the switch.
show policy network group	Displays information about policy network groups.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceNetworkGroup
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceNetworkGroup
```

policy condition destination network group

Associates a destination network group with a policy condition.

policy condition *condition_name* **destination network group** *network_group*

policy condition *condition_name* **no destination network group**

Syntax Definitions

condition_name	The name of the condition.
network_group	The name of the destination network group. Network groups are configured through the **policy network group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a destination network group from a condition; however, at least one classification parameter must be associated with a condition.
- A destination IP address and a destination IP network group cannot be specified in the same condition.

Examples

```
-> policy condition cond6 destination network group webgroup1
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy condition	Creates a policy condition.
policy network group	Configures a network group name and its associated IP addresses.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy condition	Shows information about policy conditions configured on the switch.
show policy network group	Displays information about policy network groups.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDestinationNetworkGroup
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationNetworkGroup
```

policy condition multicast network group

Associates a multicast group with a policy condition.

policy condition *condition_name* **multicast network group** *multicast_group*

policy condition *condition_name* **no multicast network group**

Syntax Definitions

condition_name	The name of the condition.
multicast_group	The multicast group name. Multicast groups are configured through the **policy network group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a multicast group from a condition; however, at least one classification parameter must be associated with a condition.
- A multicast address and a multicast network group cannot be specified in the same condition.

Examples

```
-> policy condition cond3 multicast group video2
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
policy network group	Configures a network group name and its associated IP addresses.
show policy condition	Shows information about policy conditions configured on the switch.
show policy network group	Displays information about policy network groups.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionMulticastNetworkGroup
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionMulticastNetworkGroup
```

policy condition source ip-port

Configures a source IP port number for a policy condition.

policy condition *condition_name* **source ip-port** *port***[-***port***]**

policy condition *condition_name* **no source ip-port**

Syntax Definitions

condition_name	The name of the condition.
port	The TCP or UDP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a source IP port from a condition; however, at least one classification parameter must be associated with a condition.
- The protocol (TCP or UDP) must be specified in the condition, either on the same command line or in a previous command. Use the **ip protocol** keywords. See the **policy condition ip-protocol** command.
- The same condition cannot specify a source IP port with a source TCP port, source UDP port, service, or service group.

Examples

```
-> policy condition cond1 ip protocol 6 source ip-port 137
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition ip-protocol	Configures an IP protocol for a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceIpPort
   alaQoSConditionSourceIpPortEnd
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceIpPort
   alaQoSAppliedConditionSourceIpPortEnd
```

policy condition destination ip-port

Configures a destination IP port number for a policy condition.

policy condition *condition_name* **destination ip-port** *port***[-***port***]**

policy condition *condition_name* **no destination ip-port**

Syntax Definitions

condition_name	The name of the condition.
port	The TCP or UDP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a destination IP port from a condition; however, at least one classification parameter must be associated with a condition.
- The protocol (TCP or UDP) must be specified in the same condition, either on the same command line or in a previous command. Use the **ip protocol** keywords. See the **policy condition ip-protocol** command.
- The same condition cannot specify a destination IP port with a service or service group.

Examples

```
-> policy condition cond2 ip protocol 6 destination ip-port 137-138
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition ip-protocol	Configures an IP protocol for a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDestinationIpPort
   alaQoSConditionDestinationIpPortEnd
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationIpPort
   alaQoSAppliedConditionDestinationIpPortEnd
```

policy condition source tcp-port

Configures a source TCP port number for a policy condition.

policy condition *condition_name* **source tcp-port** *port***[-***port***]**

policy condition *condition_name* **no source tcp-port**

Syntax Definitions

condition_name	The name of the condition.
port	The TCP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a source TCP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition source ip-port** command, which requires that the protocol also be specified. Rather than specifying **source ip-port** and **ip protocol**, use **source tcp-port**.
- The same condition cannot specify a source TCP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

Examples

```
-> policy condition cond3 source tcp-port 137
-> policy condition cond4 ipv6 source tcp-port 21
-> policy condition cond3 no source tcp-port
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition ip-protocol	Configures an IP protocol for a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceTcpPort
   alaQoSConditionSourceTcpPortEnd
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceTcpPort
   alaQoSAppliedConditionSourceTcpPortEnd
```

policy condition destination tcp-port

Configures a destination TCP port number for a policy condition.

policy condition *condition_name* **destination tcp-port** *port***[**-*port***]**

policy condition *condition_name* **no destination tcp-port**

Syntax Definitions

condition_name	The name of the condition.
port	The TCP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a destination TCP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition destination ip-port** command, which requires that the protocol also be specified. Rather than specifying **destination ip-port** and **ip protocol**, use **destination tcp-port**.
- The same condition cannot specify a destination TCP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

Examples

```
-> policy condition cond4 destination tcp-port 137-138
-> policy condition cond5 ipv6 destination tcp-port 140
-> policy condition cond4 no destination tcp-port
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition ip-protocol	Configures an IP protocol for a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDestinationTcpPort
   alaQoSConditionDestinationTcpPortEnd
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationTcpPort
   alaQoSAppliedConditionDestinationTcpPortEnd
```

policy condition source udp-port

Configures a source UDP port number for a policy condition.

policy condition *condition_name* **source udp-port** *port***[-***port***]**

policy condition *condition_name* **no source udp-port**

Syntax Definitions

condition_name	The name of the condition.
port	The UDP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a source UDP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition source ip-port** command, which requires that the protocol also be specified. Rather than specifying **source ip port**, and **ip protocol**, use **source udp-port**.
- The same condition cannot specify a source UDP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

Examples

```
-> policy condition cond5 source udp-port 1200-1400
-> policy condition cond6 ipv6 source-udp port 1000
-> policy condition cond5 no source udp-port
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition ip-protocol	Configures an IP protocol for a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceUdpPort
   alaQoSConditionSourceUdpPortEnd
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceUdpPort
   alaQoSAppliedConditionSourceUdpPortEnd
```

policy condition destination udp-port

Configures a destination UDP port number for a policy condition.

policy condition *condition_name* **destination udp-port** *port***[-***port***]**

policy condition *condition_name* **no destination udp-port**

Syntax Definitions

condition_name	The name of the condition.
port	The UDP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a destination UDP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition destination ip-port** command, which requires that the protocol also be specified. Rather than specifying **destination ip-port** and **ip protocol**, use **destination udp-port**.
- The same condition cannot specify a destination UDP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

Examples

```
-> policy condition cond4 destination udp-port 137-138
-> policy condition cond5 ipv6 destination udp-port 140
-> policy condition cond4 no destination udp-port
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDestinationTcpPort
   alaQoSConditionDestinationTcpPortEnd
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationTcpPort
   alaQoSAppliedConditionDestinationTcpPortEnd
```

policy condition ethertype

Configures an ethertype value to use for traffic classification.

policy condition *condition_name* **ethertype** *etype*

policy condition *condition_name* **no ethertype**

Syntax Definitions

condition_name	The name of the condition.
etype	The Ethertype value, in the range 1536–65535 or 0x600–0xffff hex.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an Ethertype value from a condition; however, at least one classification parameter must be associated with a condition.
- Enter a numeric or equivalent hex value for the *etype*.

Examples

```
-> policy condition cond12 ethertype 8137
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionEthertype
   alaQoSConditionEthertypeStatus
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionEthertype
   alaQoSAppliedConditionEthertypeStatus
```

policy condition established

Configures an established TCP connection as a policy condition. A connection is considered established if the **ack** or **rst** flags in the TCP header of the packet are set.

policy condition *condition_name* **established**

policy condition *condition_name* **no established**

Syntax Definitions

condition_name	The name of the condition.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove **established** from a condition; however, at least one classification parameter must be associated with a condition.
- When an initial TCP connection packet is received only the **syn** flag is set. As a result, TCP packets are only examined if they are not the starting packet.
- Typically this condition is used in combination with **source ip, destination ip**, **source port**, **destination port**, **source TCP port**, or **destination TCP port** conditions.
- Note that even though **established** can be used with most action parameters, it is mainly intended for ACL use.

Examples

```
-> policy condition cond2 source ip 192.168.5.10 established
-> policy condition cond3 destination ip 10.255.11.40
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionTcpEstablished
alaQoSAppliedConditionTable
   alaQoSAppliedConditionTcpEstablished
```

policy condition tcpflags

Configures a specific TCP flag value or combination of flag values as a policy condition.

policy condition *condition_name* **tcpflags [any | all] {f | s | r | p | a | u | e | w} mask {f | s | r | p | a | u | e | w}**

policy condition *condition_name* **no tcpflags**

Syntax Definitions

condition_name	The name of the condition.
any	Match on any of the specified TCP flags.
all	Match all specified TCP flags.
f | s | r | p | a | u | e | w	TCP flag value to match (**f**=fin, **s**=syn, **r**=rst, **p**=psh, **a**=ack, **u**=urg, **e**=ecn, and **w**=cwr). *The **e** and **w** flags are currently not supported*.

Defaults

parameter	default
any | **all**	all

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove **tcpflags** from a condition; however, at least one classification parameter must be associated with a condition.
- Use the **any** option to indicate that a match on any one of the specified TCP flags qualifies as a match for the condition. Use the **all** option to indicate that a match on all specified TCP flags is required to qualify as a match for the condition.
- Enter one or more TCP flags after the **any** or **all** keyword to indicate that the value of the flag bit must be set to one to qualify as a match.
- Enter one or more TCP flags after the **mask** keyword to indicate which TCP flags to match.
- If a TCP flag is specified as part of the **mask** but does not have a corresponding match value specified with the **any** or **all** options, then zero is assumed as the match value. For example, **tcpflags all f s mask f s a** looks for the following bit values to determine a match: **f**=1, **s**=1, **a**=0.
- Typically this condition is used in combination with **source ip, destination ip**, **source port**, **destination port**, **source TCP port**, or **destination TCP port** conditions.
- Note that even though **tcpflags** can be used with most action parameters, it is mainly intended for ACL use.

Examples

```
-> policy condition c1 tcpflags all f s mask f s a
-> policy condition c2 tcpflags any a r mask a r
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionTcpFlags,
   alaQoSConditionTcpFlagsStatus,

   alaQoSAppliedConditionTcpFlagsMaskStatus,
```

policy condition service

Configures a service for a policy condition.

policy condition *condition_name* **service** *service_name*

policy condition *condition_name* **no service**

Syntax Definitions

condition_name	The name of the condition.
service_name	The service name, configured through the **policy service** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a service group from a condition; however, at least one classification parameter must be associated with a condition.
- A policy condition that specifies a service cannot also specify a service group, IP protocol, source IP port, or destination IP port.

Examples

```
-> policy condition cond12 service serv2
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy service	Configures a service that may be used as part of a policy service group.
qos apply	Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).
show policy service	Displays information about all particular policy services or a particular policy service configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionService
alaQoSAppliedConditionTable
   alaQoSAppliedConditionService
```

policy condition service group

Associates a policy service group with a policy condition.

policy condition *condition_name* **service group** *service_group*

policy condition *condition_name* **no service group**

Syntax Definitions

condition_name	The name of the condition.
service_group	The service group name. Service groups are configured through the **policy service group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a service group from a condition; however, at least one classification parameter must be associated with a condition.
- A policy condition that specifies a service group cannot also specify a service, IP protocol, source IP port, or destination IP port.

Examples

```
-> policy condition cond12 service group servgroup2
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy service group	Configures a service group and its associated services.
policy condition	Creates a policy condition.
qos apply	Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).
show policy condition	Shows information about policy conditions configured on the switch.

   alaQoSAppliedConditionName
   alaQoSAppliedConditionServiceGroup
```

policy condition icmptype

Configures an ICMP type value to use for traffic classification.

policy condition *condition_name* **icmptype** *type*

policy condition *condition_name* **no icmptype**

Syntax Definitions

condition_name	The name of the condition.
type	The ICMP type value, in the range 0–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of the command to remove an ICMP type value from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond12 icmptype 100
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy condition icmpcode	Configures an ICMP code value for traffic classification.
policy condition	Creates a policy condition.
qos apply	Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

   alaQoSAppliedConditionIcmpTypeStatus
```

policy condition icmpcode

Configures an ICMP code value to use for traffic classification.

policy condition *condition_name* **icmpcode** *code*

policy condition *condition_name* **no icmpcode**

Syntax Definitions

condition_name	The name of the condition.
code	The ICMP code value, in the range 0–255.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of the command to remove an ICMP code value from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond12 icmpcode 150
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy condition icmptype	Configures an ICMP type value for traffic classification.
policy condition	Creates a policy condition.
qos apply	Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionIcmpCode
   alaQoSConditionIcmpCodeStatus
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionIcmpCode
   alaQoSAppliedConditionIcmpCodeStatus
```

policy condition ip-protocol

Configures an IP protocol for a policy condition.

policy condition *condition_name* **ip-protocol** *protocol*

policy condition *condition_name* **no ip-protocol**

Syntax Definitions

condition_name	The name of the condition.
protocol	The protocol associated with the flow. The range is 0–255.

Defaults

parameter	default
protocol	6

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a protocol from a condition; however, at least one classification parameter must be associated with a condition.
- If a source or destination port is specified (through the **policy condition source ip-port** or **policy condition destination ip-port** commands), the protocol must be specified.
- The same condition cannot specify an IP protocol with a service or service group.

Examples

```
-> policy condition cond4 ip protocol 6
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy condition source ip-port	Configures a source IP port number for a policy condition.
policy condition destination ip-port	Configures a destination IP port number for a policy condition.
qos apply	Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionIpProtocol
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionIpProtocol
```

policy condition ipv6

Configures a policy condition to classify IPv6 traffic.

policy condition *condition_name* **ipv6**

policy condition *condition_name* **no ipv6**

Syntax Definitions

condition_name	The name of the condition.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove IPv6 traffic as a condition; however, at least one classification parameter must be associated with a condition.
- When the **ipv6** keyword is used in a condition, a policy that uses the condition is considered an IPv6 policy. IPv6 policies are effected only on IPv6 traffic. All other IP policies are considered IPv4 policies and are effected only on IPv4 traffic.
- IPv6 Layer 4 policies are supported and are configured using the **ipv6** keyword in a condition that specifies Layer 4 information, services, or service groups. Note that IPv6 Layer 4 policies only work with packets that contain a single header.
- The **icmptype** and **icmpcode** keywords in an IPv6 policy imply the ICMPv6 protocol, not the ICMPv4 protocol.

Examples

```
-> policy condition cond4 ipv6
-> policy condition cond5 ipv6 tos 7
-> policy condition cond6 ipv6 source port 1/1
-> policy condition cond7 ipv6 source tcp port 21
-> policy condition cond8 ipv6 source tcp port 0-1024
-> policy condition cond6 no ipv6
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionIpv6Traffic
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionIpv6Traffic
```

policy condition nh

Configures an IPv6 next header value as a policy condition. This value is compared to the next header value in the IPv6 header.

policy condition *condition_name* **nh** *next_header_value*

policy condition *condition_name* **no nh**

Syntax Definitions

condition_name	The name of the condition.
next_header_value	The next header value (0–255).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of the command to remove the next header value as a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond4 nh 100
-> policy condition cond4 no nh
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
show policy condition	Displays information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionIpv6NH
   alaQoSConditionIpv6NHStatus
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionIpv6NH
   alaQoSAppliedConditionIpv6NHStatus
```

policy condition flow-label

Configures an IPv6 flow label value as a policy condition. This value is compared to the flow label value in the IPv6 header.

policy condition *condition_name* **flow-label** *flow_label_value*

policy condition *condition_name* **no flow-label**

Syntax Definitions

condition_name	The name of the condition.
flow_label_value	The flow-label value (0–1048575).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of the command to remove the flow label value as a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond4 flow-label 1500
-> policy condition cond4 no flow-label
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionIpv6FlowLabel
   alaQoSConditionIpv6FlowLabelStatus
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionIpv6FlowLabel
   alaQoSAppliedConditionIpv6FlowLabelStatus
```

policy condition tos

Configures the precedence bits in the Type of Service (ToS) byte value for a policy condition.

policy condition *condition_name* **tos** *tos_value* **[mask** *tos_mask***]**

policy condition *conditioning* **no tos**

Syntax Definitions

condition_name	The name of the condition.
tos_value	The Type of Service bits value included in the IP header. The three most significant bits of the byte determine the precedence (i.e, priority) of the frame (0 is the lowest, 7 is the highest).
tos_mask	The mask for the ToS bits, in the range 0–7.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a ToS value from a condition; however, at least one classification parameter must be associated with a condition.
- If a ToS value is specified, a DSCP value may not be specified.

Examples

```
-> policy condition cond2 tos 7
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionTos
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionTos
```

policy condition dscp

Configures the Differentiated Services Code Point (DSCP) for a policy condition. The DSCP value defines the six most significant bits of the DS byte in the IP header.

policy condition *condition_name* **dscp {***dscp_value***[-***value***]} [mask** *dscp_mask***]**

policy condition *condition_name* **no dscp**

Syntax Definitions

condition_name	The name of the condition.
dscp_value[*-value*]	The DiffServ Code Point value, in the range 0–63. Use a hyphen to specify a range of DSCP values for the condition (for example, 10-20).
dscp_mask	The mask for the DiffServ Code Point, in the range 0–63.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a DSCP value from a condition; however, at least one classification parameter must be associated with a condition.
- If a DSCP value is specified, a ToS value may not be specified.
- When a DSCP policy condition is configured on one of these switches, QoS automatically calculates the appropriate mask value.

Examples

```
-> policy condition cond4 dscp 10
-> policy condition cond5 dscp 20-30
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy condition	Creates a policy condition.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDscp
   alaQoSConditionDscpMask
   alaQoSConditionDscpEnd
   alaQoSConditionDscpStatus
alaQosAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDscp
   alaQoSAppliedConditionDscpMask
   alaQoSAppliedConditionDscpEnd
   alaQoSAppliedConditionDscpStatus
```

policy condition source mac

Configures a source MAC address for a policy condition.

policy condition *condition_name* **source mac** *mac_address* **[mask** *mac_mask***]**

policy condition *condition_name* **no source mac**

Syntax Definitions

condition_name	The name of the condition.
mac_address	The source MAC address in the Layer 2 header of the frame (for example, 00:20:da:05:f6:23)
mac_mask	Optional. The mask for the source MAC address (for example, ff:ff:ff:ff:ff:ff).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a source MAC address from a condition; however, at least one classification parameter must be associated with a condition.
- A source MAC address and a source MAC group cannot be specified in the same condition.

Examples

```
-> policy condition cond2 source mac 00:20:da:05:f6:23
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceMacAddr
   alaQoSConditionSourceMacMask
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceMacAddr
   alaQoSAppliedConditionSourceMacMask
```

policy condition destination mac

Configures a destination MAC address for a policy condition.

Note. Specifying a destination MAC address and mask of all zeros (00:00:00:00:00:00) as a policy condition can result in the switch dropping all traffic. Only use this type of condition in combination with other policies that will allow desired traffic and/or if a source or destination slot/port is also part of the destination MAC condition.

policy condition *condition_name* **destination mac** *mac_address* **[mask** *mac_mask***]**

policy condition *condition_name* **no destination mac**

Syntax Definitions

condition_name	The name of the condition.
mac_address	The destination MAC address in the Layer 2 header of the frame (for example, 00:20:da:05:f6:23).
mac_mask	Optional. The mask for the destination MAC address (for example, ff:ff:ff:ff:ff:ff).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a destination MAC address from a condition; however, at least one classification parameter must be associated with a condition.
- A destination MAC address and a destination MAC group cannot be specified in the same condition.

Examples

```
-> policy condition cond3 destination mac 00:20:da:05:f6:23
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSource
   alaQoSConditionDestinationMacAddr
   alaQoSConditionDestinationMacMask
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSource
   alaQoSAppliedConditionDestinationMacAddr
   alaQoSAppliedConditionDestinationMacMask
```

policy condition source mac group

Associates a source MAC group with a policy condition.

policy condition *condition_name* **source mac group** *group_name*

policy condition *condition_name* **no source mac group**

Syntax Definitions

condition_name	The name of the condition.
group_name	The name of the source MAC group, configured through the **policy mac group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a source MAC group from a condition; however, at least one classification parameter must be associated with a condition.
- A source MAC address and a source MAC group cannot be specified in the same condition.

Examples

```
-> policy condition cond4 source mac group mac_group1
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy mac group	Configures a MAC group and its associated MAC addresses.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceMacGroup
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceMacGroup
```

policy condition destination mac group

Associates a destination MAC group with a policy condition.

policy condition *condition_name* **destination mac group** *mac_group*

policy condition *condition_name* **no destination**

Syntax Definitions

condition_name	The name of the condition.
mac_group	The name of the destination MAC group, configured through the **policy mac group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a destination MAC group from a policy condition; however, at least one classification parameter must be associated with a condition.
- A destination MAC address and a destination MAC group cannot be specified in the same condition.

Examples

```
-> policy condition cond5 destination mac group mac_group1
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy mac group	Configures a MAC group and its associated MAC addresses.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDestinationMacGroup
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationMacGroup
```

policy condition source vlan

Configures a source VLAN for a policy condition.

policy condition *condition_name* **source vlan** *vlan_id*

policy condition *condition_name* **no source vlan**

Syntax Definitions

condition_name	The name of the condition.
vlan_id	The source VLAN ID for the flow.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of the command to remove a source VLAN from a policy condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond5 source vlan 3
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceVlan
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceVlan
```

policy condition inner source-vlan

Configures an inner source VLAN ID as a policy condition. This condition applies to double-tagged VLAN Stacking traffic and is used to classify such traffic based on the inner VLAN ID tag, also known as the customer VLAN ID.

policy condition *condition_name* **inner source-vlan** *vlan_id*

policy condition *condition_name* **no inner source-vlan**

Syntax Definitions

condition_name	The name of the condition.
vlan_id	The inner source VLAN ID (customer VLAN ID) to match on double-tagged packets.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove an inner source VLAN from a policy condition; however, at least one classification parameter must be associated with a condition.
- Policies that use the inner source VLAN condition are referred to as QoS VLAN Stacking policies. These are separate policies from those configured through the VLAN Stacking Service application.

Examples

```
-> policy condition cond5 inner source-vlan 3
-> policy condition cond5 no inner source-vlan
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionInnerSourceVlan
   alaQoSConditionInnerSourceVlanStatus
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionInnerSourceVlan
   alaQoSAppliedConditionInnerSourceVlanStatus
```

policy condition destination vlan

Configures a destination VLAN (multicast only) for a policy condition. Use the **no** form of the command to remove a destination VLAN from a condition.

policy condition *condition_name* **destination vlan** *vlan_id*

policy condition *condition_name* **no destination vlan**

Syntax Definitions

condition_name	The name of the condition.
vlan_id	The destination VLAN ID for the flow.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a destination VLAN from a condition; however, at least one classification parameter must be associated with a condition.
- Note that this condition is supported for multicast only policies.

Examples

```
-> policy condition cond4 destination vlan 3 multicast ip any
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDestinationVlan
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationVlan
```

policy condition 802.1p

Configures the 802.1p value for a policy condition.

policy condition *condition_name* **802.1p** *802.1p_value*

policy condition *condition_name* **no 802.1p**

Syntax Definitions

condition_name	The name of the condition.
802.1p_value	The 802.1p value in the 802.1Q VLAN tag for the flow. Values range from 0 (lowest priority) to 7 (highest priority).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of the command to remove an 802.1p value for a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond3 802.1p 7
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSCondition8021p
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedCondition8021p
```

policy condition inner 802.1p

Configures an inner (customer) source 802.1p value for a policy condition. This condition applies to double-tagged VLAN Stacking traffic and is used to classify such traffic based on the inner 802.1p bit value.

policy condition *condition_name* **inner 802.1p** *802.1p_value*

policy condition *condition_name* **no inner 802.1p**

Syntax Definitions

condition_name	The name of the condition.
802.1p_value	The inner 802.1p value of the inner 802.1Q VLAN tag (customer VLAN) to match on double-tagged packets. Values range from 0 (lowest priority) to 7 (highest priority).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove an 802.1p value for a condition; however, at least one classification parameter must be associated with a condition.
- Policies that use the inner 802.1p condition are referred to as QoS VLAN Stacking policies. These are separate policies from those configured through the VLAN Stacking Service application.

Examples

```
-> policy condition cond3 inner 802.1p 7
-> policy condition cond3 no inner 802.1p
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionInner8021p
   alaQoSConditionInner8021pStatus
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionInner8021p
   alaQoSAppliedConditionInner8021pStatus
```

policy condition source port

Configures a source port number for a policy condition.

policy condition *condition_name* **source port** *chassis/slot/port***[**-*port2***]**

policy condition *condition_name* **no source port**

Syntax Definitions

condition_name	The name of the condition.
*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of the command to remove a source port from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond2 source port 3/1/1
-> policy condition cond3 source port 3/1/2-4
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourceSlot
   alaQoSConditionSourcePort
   alaQoSConditionSourcePortEnd
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourceSlot
   alaQoSAppliedConditionSourcePort
   alaQoSAppliedConditionSourcePortEnd
```

policy condition destination port

Configures a destination port number for a policy condition.

policy condition *condition_name* **destination port** *chassis/slot/port***[**-*port***]**

policy condition *condition_name* **no destination port**

Syntax Definitions

condition_name	The name of the condition.
*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a destination port from a condition; however, at least one classification parameter must be associated with a condition.
- The destination port condition is only applied to bridged traffic, it is not applied to routed traffic.

Examples

```
-> policy condition cond3 destination port 4/1/2
-> policy condition cond4 destination port 4/1/3-4
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionDestinationSlot
   alaQoSConditionDestinationPort
   alaQoSConditionDestinationPortEnd
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationSlot
   alaQoSAppliedConditionDestinationPort
   alaQoSAppliedConditionDestinationPortEnd
```

policy condition source port group

Associates a source port group with a policy condition.

policy condition *condition_name* **source port group** *group_name*

policy condition *condition_name* **no source port group**

Syntax Definitions

condition_name	The name of the condition.
group_name	The name of the source port group. Port groups are configured through the **policy port group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a source port group from a condition; however, at least one classification parameter must be associated with a condition.
- When a source port group condition is used in a policy rule to apply rate limiting actions, the rate limiting values are shared across all the ports that are associated with the specified group name. To apply rate limiting actions on an individual basis to each port in the group, use the **policy condition source port split-group** command.

Examples

```
-> policy condition cond6 source port group portgr4
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy port group	Configures a port group and its associated slot and port numbers.
qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
policy condition source port split-group	Associates a source port split-group with a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourcePortGroup
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourcePortGroup
```

policy condition source port split-group

Associates a source port split-group with a policy condition. A split-group condition is used in policy rules that are defined to apply rate limiting actions to each individual port within the specified group. In other words, the rate limiting values are not shared among all members of the port group.

policy condition *condition_name* **source port split-group** *group_name*

policy condition *condition_name* **no source port split-group**

Syntax Definitions

condition_name	The name of the condition.
group_name	The name of the source port group. Port groups are configured through the **policy port group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a source port split-group from a condition; however, at least one classification parameter must be associated with a condition.
- Using a split-group condition in a rate limiting policy rule avoids having to create a separate policy rule for each individual port. This reduces the amount of configuration and switch resources required to apply rate limiting actions to individual ports.
- A source port group is the only QoS group that supports the split-group option; other QoS groups (for example, a destination port group or network group) do not support the split-group option.
- A policy rule containing a source port split-group condition can only belong to the default policy list. Assigning this type of rule to other QoS policy lists is not allowed.
- Do not use a shared bandwidth policy action (**policy action shared**) in a policy rule that specifies a source port split-group condition. This type of action shares metering resources with all other rules that contain the same shared policy action. Sharing these resources with rules that contain a split-group condition is not recommended.

Examples

```
-> policy condition cond7 source port split-group portgr4
-> policy condition cond7 no source port split-group
```

Release History

Release 8.2.1; command introduced.

Related Commands

policy port group	Configures a port group and its associated slot and port numbers.
qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.
show active policy rule	Displays details about applied policy rules that are active (enabled) on the switch, including per-port statistics.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionName
   alaQoSConditionSourcePortGroup
   alaQoSConditionSourcePortSplitGroup

   alaQoSAppliedConditionName
   alaQoSAppliedConditionSourcePortGroup
   alaQoSAppliedConditionSourcePortSplitGroup
   alaQoSAppliedConditionSourcePortSplitGroupStatus
```

policy condition destination port group

Associates a destination port group with a policy condition. Use the **no** form of the command to remove a destination port group from a condition.

policy condition *condition_name* **destination port group** *group_name*

policy condition *condition_name* **no destination port**

Syntax Definitions

condition_name	The name of the condition.
group_name	The name of the destination port group. Port groups are configured through the **policy port group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of the command to remove a destination port group from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond6 destination port group portgr4
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy port group	Configures a port group and its associated slot and port numbers.
qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```

   alaQoSConditionName
   alaQoSConditionDestinationPortGroup
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionDestinationPortGroup
```

policy condition vrf

Associates a Virtual Routing and Forwarding (VRF) instance with a policy condition.

policy condition *condition_name* **vrf {***vrf_name* | **default}**

policy condition *condition_name* **no vrf**

Syntax Definitions

condition_name	The name of the condition.
vrf_name	The name of the VRF instance to which the QoS policy condition applies.
default	Specifies the default VRF instance.

Defaults

By default, QoS policy conditions are not associated with any VRF instance. The policy applies across all instances.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a VRF instance from a condition; however, at least one classification parameter must be associated with a condition.
- VRF policies are configured in the default VRF, similar to how all other QoS policies are configured. If the VRF name specified does not exist, the policy is not allocated any system resources.
- Policies that do not specify a VRF name are considered global policies and are applied across all VRF instances and VLANs.
- Policies that specify the default VRF apply only to traffic in the default VRF instance.
- Policies that specify a VRF name apply only to traffic in the VRF instance associated with that name.
- The **switch** network group is supported only in VRF policies that specify the default VRF instance. If this group is specified in a global policy (no VRF specified) then the policy is applied across all VRF instances.

Examples

```
-> policy condition cond6 vrf engr-vrf
-> policy condition cond7 vrf default
-> policy condition cond6 no vrf
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

   alaQoSConditionVrfName
   alaQoSConditionVrfNameStatus
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionVrfName
   alaQoSAppliedConditionVrfNameStatus
```

policy condition fragments

Associates TCP packet fragments with a policy condition.

policy condition *condition_name* **fragments**

policy condition *condition_name* **no fragments**

Syntax Definitions

condition_name	The name of the condition.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of the command to remove TCP packet fragments from a condition; however, at least one classification parameter must be associated with a condition.

Examples

```
-> policy condition cond6 fragments
-> policy condition cond7 no fragments
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy condition	Creates a policy condition.
show policy condition	Shows information about policy conditions configured on the switch.

MIB Objects

```
alaQoSConditionTable
   alaQoSConditionAppFpGroup
   alaQoSConditionAppFpGroupStatus
   alaQoSConditionName
   alaQoSConditionFragments
alaQoSAppliedConditionTable
   alaQoSAppliedConditionName
   alaQoSAppliedConditionFragments
```

policy condition app-mon

Associates an application group or application with a policy condition for application enforcement.

policy condition *condition_name* **{app-mon-application-group** *app_group_name* **| app-mon-application-name** *app_name***}**

policy condition *condition_name* **no {app-mon-application-group** *app_group_name* **| app-mon-application-name** *app_name***}**

Syntax Definitions

condition_name	The name of the condition.
app_group_name	Application group to which the QoS policy condition applies.
app_name	Name of the application to which the QoS policy condition applies.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove an application group or an application name from a condition.
- If the **app-mon-application-group** option is used, QoS policy condition as ‘application group’ is created. If the **app-mon-application-name** option is used, QoS policy condition as ‘application’ is created.
- While configuring an AppMon enforcement policy rule, multiple condition parameters (for example, source IP, destination IP, source VLAN and so on) cannot be defined in a single policy condition along with the application name or group.
- Application name and application group name is a case sensitive string.

Examples

```
-> policy condition c1 app-mon-application-group apg1
-> policy condition c2 app-mon-application-name whatsapp
```

Release History

Release 8.2.1; command introduced.

Related Commands

policy condition	Creates a policy condition.
show policy condition	Displays information about policy conditions configured on the switch.

   alaQoSConditionDPIGrpName
   alaQosConditionDpiAppGroupStatus
   alaQosConditionDpiAppName
   alaQosConditionDpiAppNameStatus
```

policy action

Configures or deletes a QoS action. A QoS action describes how traffic that matches a particular QoS condition should be treated. It may specify a particular set of bandwidth and queue parameters, or it may simply specify whether the flow is allowed or denied on the switch.

This section describes the base command. Optional keywords are listed below and described as separate commands later in this chapter. (Options may be used in combination but are described separately for ease in explanation.) Use the **no** form for keywords to remove the parameter from the action.

Note that some action parameters may not be supported depending on the platform you are using. Also some action parameters may not be supported with some conditions. See the conditions in the *OmniSwitch AOS Release 8 Network Configuration Guide.*

policy action *action_name*
[disposition {accept | drop | deny}]
[shared]
[priority *priority_value***]**
[maximum bandwidth *bps***]**
[maximum depth *bytes***]**
[cir *bps* **[cbs** *bps***] [pir** *bps***] [pbs** *bps***] [cpu priority** *priority***] [color-only]**
[tos *tos_value***]**
[802.1p *802.1p_value***]**
[dcsp *dcsp_value***]**
[map {802.1p | tos | dscp} to {802.1p | tos| dscp} using *map_group***]**
[permanent gateway ip *ip_address***]**
[port-disable]
[redirect port *chassis/slot/port***]**
[redirect linkagg *link_agg***]**
[no-cache]
[{ingress | egress | ingress egress | no} mirror *chassis/slot/port***]**

policy no action *action_name*

Syntax Definitions

action_name	A name for the action, any alphanumeric string.

Defaults

By default, no drop algorithm is configured for the action, and any queues created by the action are not shared.

parameter	default
accept | drop | deny	accept

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Any condition parameters that the hardware supports will be used to classify the traffic; any condition parameters that are not supported by the hardware will not be used to classify traffic, and the event will be logged in the QoS log.
- Bandwidth parameters may be specified when the action is created or may be specified as separate commands.
- Use the **qos apply** command to activate configuration changes.
- Use the **no** form of the command to remove a QoS action from the configuration.
- If the **snapshot** command is entered after the **policy action** command is configured, the resulting ASCII file will include the following additional syntax for the **policy action** command:

  from {cli | ldap | blt}

  This syntax indicates how the action was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in action, this setting is not configurable.

Examples

```
-> policy action action1 accept
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy condition	Configures a condition associated with the action.
qos apply	Applies configured QoS and policy settings to the current configuration.
show policy action	Displays information about policy actions.

MIB Objects

```
alaQoSActionTable
   alaQoSActionName
   alaQoSActionSource
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionSource
```

policy action disposition

Configures a disposition for a policy action.

policy action *action_name* **disposition {accept | drop | deny}**

policy action *action_name* **no disposition**

Syntax Definitions

action_name	The name of the action.
accept	Specifies that the switch should accept the flow.
drop	Specifies that the switch should silently drop the flow.
deny	Specifies that the switch should drop the flow and issue an ICMP message indicating the flow was dropped for administrative reasons. Currently this option will provide the same result as **drop**; that is, the flow is silently dropped.

Defaults

parameter	default
accept | drop | deny	accept

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to remove a disposition from an action.

Examples

```
-> policy action a3 disposition deny
-> policy action a3 no disposition
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

```

   alaQoSActionName
   alaQoSActionDisposition
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionDisposition
```

policy action shared

Enables bandwidth sharing among multiple QoS rules that use the same maximum bandwidth action.

policy action *action_name* **shared**

policy action *action_name* **no shared**

Syntax Definitions

action_name	The name of the action.

Defaults

By default, queues created by an action are *not* shared.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the **shared** policy action is not specified, then each bandwidth rule will implement a separate instance of the specified bandwidth allocation.
- Use the **no** form of the command to disable sharing.

Example

```
-> policy action action5 maximum bandwidth 10m shared
-> policy action action6 maximum bandwidth 10m shared
-> policy action action5 no shared
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action maximum bandwidth	Creates a maximum bandwidth policy action.
show policy action	Displays information about policy actions.

MIB Objects

```
alaQoSActionTable
   alaQoSActionName
   alaQoSActionShared
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionShared
```

policy action priority

Configures the priority for queuing a flow to which the QoS action applies.

policy action *action_name* **priority** *priority_value*

policy action *action_name* **no priority**

Syntax Definitions

action_name	The name of the action.
priority_value	The priority value assigned for scheduling traffic on the output port. The valid range is 0–12.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a priority value from an action.
- The priority value specified with this command is applied as follows:
  - Priority 0–7 for ToS/802.1p priority values (CS0–CS7 for DSCP).
  - Priority 8–11 for DSCP AF1x–AF4x code point.
  - Priority 12 for DSCP EF code point.

Examples

```
-> policy action action1 priority 1
-> policy action action2 priority 10
-> policy action action1 no priority
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

```
alaQoSActionTable
   alaQoSActionName
   alaQoSActionPriority
   alaQoSActionPriorityStatus
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionPriority
   alaQoSAppliedActionPriorityStatus
```

policy action maximum bandwidth

Configures a maximum bandwidth value for a policy action.

policy action *action_name* **maximum bandwidth** *bps***[k | m | g | t]**

policy action *action_name* **no maximum bandwidth**

Syntax Definitions

action_name	The name of the action.
*bps***[k | m | g | t]**	The maximum amount of bandwidth, in bits-per-second, for all traffic that ingresses on the port. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m, 1g, 1t**).

Defaults

parameter	default
k | m | g | t	**k**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a maximum bandwidth value from an action.
- If the maximum bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- Use the **shared** policy action to enable sharing of bandwidth across policy rules that specify the same maximum bandwidth action.
- Flow based limiting does not take the IFG of 20 bytes into account when calculating bandwidth.

Examples

```
-> policy action action3 maximum bandwidth 10000
-> policy action action4 maximum bandwidth 10k shared
-> policy action action5 maximum bandwidth 10k shared
-> policy action action4 no maximum bandwidth
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

```
alaQoSActionTable
   alaQoSActionName
   alaQoSActionMaximumBandwidth
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionMaximumBandwidth
```

policy action maximum depth

Configures the maximum bucket size assigned to this action. The bucket size determines how much the traffic can burst over the maximum bandwidth rate. When the bucket size is reached, the switch starts to drop packets.

policy action *action_name* **maximum depth** *bps***[k | m | g | t]**

policy action *action_name* **no maximum depth**

Syntax Definitions

action_name	The name of the action.
*bps***[k | m | g | t]**	The maximum bucket size, in bits-per-second. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m, 1g**).

Defaults

parameter	default
k | m | g | t	**k**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a maximum depth value from a policy action.
- If the maximum depth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum depth value used. However, if **10G** is specified, the maximum depth value applied is **10** gbps.
- A maximum depth action is used in combination with a maximum bandwidth action.

Examples

```
-> policy action action2 maximum depth 100
-> policy action action2 no maximum depth
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

alaQoSActionTable
   alaQoSActionName
   alaQoSActionMaximumDepth
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionMaximumDepth
```

policy action cir

Configures a Tri-Color Marking (TCM) policy action. This type of action includes parameters for Committed Information Rate (CIR), Committed Burst Size (CBS), Peak Information Rate (PIR), and Peak Burst Size (PBS). The TCM policier meters and marks packets red, green, or yellow based on the parameter values of this policy action.

policy action *action_name* **cir** *bps* **[cbs** *bps***] [pir** *bps***] [pbs** *bps***] [color-only]**

policy action *action_name* **no cir**

policy action *action_name* **no pir**

Syntax Definitions

action_name	The name of the action.
*bps***[k | m | g | t]**	The maximum amount of bandwidth, in bits-per-second, for all traffic that ingresses on the port. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m, 1g, 1t**).
color-only	Disables TCM rate limiting based on the metering results. Packets are only marked the specific color that applies to the level of packet conformance.

Defaults

parameter	default
cbs pir pbs *bps*	0
k | m | g | t	**k**
priority	0

By default, this action enables rate limiting based on TCM marking and metering.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the TCM parameter values.
- If the **color-only** parameter is specified with this command, the TCM action will only mark packet color; packets are not rate limited based on the metering results. In this case, packets are then subject to any rate limiting specifications as defined in the queue management configuration for the switch.
- This implementation of TCM supports two rate limiting modes: Single-Rate (srTCM) and Two-Rate (trTCM). The srTCM mode marks packets based only on the CIR and the two burst sizes: CBS and PBS. The trTCM mode marks packets based on both the CIR and PIR and their associated CBS and PBS values.
- There is no explicit CLI command to configure the mode (srTCM or trTCM) in which the TCM meter operates. Instead, the mode is determined by the CIR and PIR values configured for the policy action.

If the PIR value is greater than the CIR value, trTCM is used. If the PIR value is less than the CIR value, srTCM is used.

- Configuring CIR and CBS is similar to configuring a maximum bandwidth. Configuring CIR and PIR is similar to configuring maximum depth.
- The number of packets counted as a result of the counter color mode setting is displayed using the **show active policy rule** command. These statistics are only shown for those rules that are configured with a TCM policy action.

Examples

The following command examples configure srTCM (the default):

```
-> policy action A3 cir 10M
-> policy action A4 cir 10M cbs 4k
-> policy action A5 cir 10M cbs 4k pir 10M
-> policy action A6 cir 10M cbs 4k pir 10M pbs 4k
-> policy action a7 cir 5M cbs 2k color-only
-> policy action A3 no cir
-> policy action A5 no pir
```

The following command examples configure trTCM (note that PIR is greater than CIR):

```
-> policy action A7 cir 10M cbs 4k pir 20M
-> policy action A8 cir 10M cbs 4k pir 20M pbs 40M
-> policy action a9 cir 5M cbs 1M pbs 10M pbs 2M color-only
-> policy action A7 no cir
```

Release History

Release 8.1.1; command introduced.

```

policy action cpu priority

Configures a CPU priority policy action.

policy action *action_name* **cpu priority** *priority*

policy action *action_name* **no cpu priority**

Syntax Definitions

action_name	The name of the action.
priority	The CPU queue on which packets destined for the CPU are received. The valid range is 0–31.

Defaults

By default, the CPU priority is set to zero.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to remove the CPU priority parameter value.

Examples

```
-> policy action A7 cpu priority 15
-> policy action A8 cpu priority 31
-> policy action A7 no cpu priority
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

   alaQoSActionCPUPriority
   alaQoSActionCPUPriorityStatus
alaQoSAppliedActionTable
   alaQoSAppliedActionCPUPriority
   alaQoSAppliedActionCPUPriorityStatus
```

policy action tos

Configures a Type of Service (ToS) bits value to be applied to packets in outgoing flows to which the specified policy applies.

policy action *action_name* **tos** *tos_value*

policy action *action_name* **no tos**

Syntax Definitions

action_name	The name of the action.
tos_value	The three-bit priority value in the IP header that should be set on outgoing frames in flows that match the specified policy. Values range from 0 (lowest priority) to 7 (highest priority).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a ToS value from a policy action.
- Note that specifying both ToS and DSCP in the same action is *not* allowed.

Examples

```
-> policy action action3 tos 4
-> policy action action3 no tos
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

```

   alaQoSActionName
   alaQoSActionTos
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionTos
```

policy action 802.1p

Configures a value to be set in the 802.1p bits of the 802.1Q byte of an outgoing frame for traffic that matches a policy with this action.

policy action *action_name* **802.1p** *802.1p_value*

policy action *action_name* **no 802.1p**

Syntax Definitions

action_name	The name of the action.
802.1p_value	The priority value to be set in 802.1Q frames. Values range from 0 (lowest priority) to 7 (highest priority).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove an 802.1p value from a policy action.
- Note that specifying both ToS and DSCP in the same action is not allowed.

Examples

```
-> policy action action4 802.1p 7
-> policy action action4 no 802.1p
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

```

   alaQoSActionName
   alaQoSAction8021p
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedAction8021p
```

policy action dscp

Configures a Differentiated Services Code Point (DSCP) value to be set in an outgoing flow for traffic that matches rules with this action.

policy action *action_name* **dscp** *dscp_value*

policy action *action_name* **no dscp**

Syntax Definitions

action_name	The name of the action.
dscp_value	The DSCP value to be set, in the range 0–63.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a DSCP value from a policy action.
- Note that specifying both ToS and DSCP in the same action is *not* allowed.

Examples

```
-> policy action action2 dscp 61
-> policy action action2 no dscp
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

```
alaQoSActionTable
   alaQoSActionName
   alaQoSActionDscp

   alaQoSAppliedActionName
   alaQoSAppliedActionDscp
```

policy action map

Configures a mapping group for a policy action.

policy action map {802.1p | tos | dscp} to {802.1p | tos| dscp} using *map_group*

policy action no map

Syntax Definitions

action_name	The name of the action.
802.1p	Indicates that an 802.1p value should be mapped.
tos	Indicates that a ToS value should be mapped.
dscp	Indicates that a DSCP value should be mapped.
map_group	The name of the map group, configured through the **policy map group** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When remapping is configured with this command and a flow matches a policy with this remapping action, and the 802.1p, ToS, or DSCP setting in the incoming flow is specified by the map group, the value will be remapped in the outgoing flow according to the map group.
- If the 802.1p, ToS, or DSCP setting in the incoming flow is not a value specified in the map group, the switch will do one of two things:

  If the *remap from* and *remap to* types are the same (802.1p to 802.1p, ToS to ToS, or DSCP to DSCP), the values in the outgoing flow will be unchanged. If the *remap from* and *remap to* types are not the same (for example: 802.1p to ToS), the switch will determine the outgoing 802.1p and ToS based on whether or not the port is trusted or untrusted).
- Use the **no** form of the command to delete the map group from the configuration.

Examples

```
-> policy action a1 map 802.1p to 802.1p using mapGroup2
-> policy action a2 map 802.1p to tos using mapGroup3
```

Release History

Release 8.1.1; command introduced.

Related Commands

   alaQoSAppliedActionMapTo
   alaQoSAppliedActionMapGroup
```

policy action permanent gateway-ip

Used for Policy Based Routing (PBR). Routed flows to which this action is applied will be directed to the IP address specified in the action regardless of whether or not a route already exists in the switch routing table.

policy action *action_name* **permanent gateway-ip** *ip_address*

policy action *action_name* **no permanent gateway-ip**

Syntax Definitions

action_name	The name of the action.
ip_address	The destination IP address to which packets will be routed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a gateway IP address from a policy action.
- If the gateway goes down, the traffic to be routed over the gateway will be dropped.

Examples

```
-> policy action pbr2 permanent gateway-ip 10.10.2.1
-> policy action pbr2 no permanent gateway-ip
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

```
alaQoSActionTable
   alaQoSActionName
   alaQoSActionPermanentGatewayIpAddr
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionPermanentGatewayIpAddr
```

policy action port-disable

Administratively disables the source port of the traffic to which this action is applied.

policy action *action_name* **port-disable**

policy action *action_name* **no port-disable**

Syntax Definitions

action_name	The name of the action.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove **port-disable** from the policy action.
- An SNMP trap is sent when a port is administratively disabled through a port disable action or a UserPorts shutdown function.
- To enable a port disabled by this action, use the **interfaces** or **clear violation** command to administratively enable the port, or physically disconnect and reconnect the port cable.

Examples

```
-> policy action pd01 port-disable
-> policy action pb02 no port-disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.
interfaces	Administratively enables or disables a port.
interfaces wait-to-restore	Administratively clears the violation that disabled the port or link aggregate and restores the port to enabled status.

MIB Objects

```
alaQoSActionTable
   alaQoSActionName
   alaQoSActionPortdisable
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionPortdisable
```

policy action redirect port

Redirects all traffic (flooded, bridged, routed, and multicast) matching a redirect policy to the specified port instead of the port to which the traffic was destined.

policy action *action_name* **redirect port** *chassis/slot/port*

policy action *action_name* **no redirect port**

Syntax Definitions

action_name	The name of the action.
chassis/slot/port	The chassis ID, slot, and port number (3/1/1) for a specific port.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove **redirect port** from the policy action.
- When redirecting routed traffic from VLAN A to VLAN B, the redirect port must belong to VLAN B (tagged or default VLAN).
- Routed packets (from VLAN A to VLAN B) are not modified after they are redirected; the source and MAC address remain the same. In addition, if the redirect port is tagged, the redirected packets will have a tag from the ingress VLAN A.
- If a route exists for the redirected flow, then redirected packets are the final post-routing packets.
- If a route does not exist for the redirected flow, the flow is not redirected to the specified port or link aggregate and is “blackholed”. As soon as a route is available, the flow is then redirected as specified in the policy.
- In most cases, a redirected flow will *not* trigger an update to the routing and ARP tables. If necessary, create a static route for the flow or assign the redirect port to the ingress VLAN (VLAN A) to send packets to the redirect port until a route is available.
- When redirecting bridged traffic on VLAN A, the redirect port must belong to VLAN A (tagged or default VLAN).

Examples

```
-> policy action rp01 redirect port 1/1/12
-> policy action rp01 no redirect port
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

   alaQoSActionName
   alaQoSActionRedirectSlot
   alaQoSActionRedirectPort
alaQoSAppliedActionTable
   alaQoSAppliedActionName
   alaQoSAppliedActionRedirectSlot
   alaQoSAppliedActionRedirectPort
```

policy action redirect linkagg

Redirects all traffic (flooded, bridged, routed, and multicast) matching a redirect policy to the specified link aggregate ID instead of the link aggregate to which the traffic was destined.

policy action *action_name* **redirect linkagg** *link_agg*

policy action *action_name* **no redirect linkagg**

Syntax Definitions

action_name	The name of the action.
link_agg	The link aggregate ID number (0–32) to assign to the specified VLAN. See Chapter 12, "Link Aggregation Commands."

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove **redirect linkagg** from the policy action.
- When redirecting routed traffic from VLAN A to VLAN B, the redirect link aggregate ID must belong to VLAN B (tagged or default VLAN).
- Routed packets (from VLAN A to VLAN B) are not modified after they are redirected; the source and MAC address remain the same. In addition, if the redirect link aggregate ID is tagged, the redirected packets will have a tag from the ingress VLAN A.
- If a route exists for the redirected flow, then redirected packets are the final post-routing packets.
- If a route does not exist for the redirected flow, the flow is not redirected to the specified link aggregate ID and is "blackholed". As soon as a route is available, the flow is then redirected as specified in the policy.
- In most cases, a redirected flow will *not* trigger an update to the routing and ARP tables. If necessary, create a static route for the flow or assign the redirect port or link aggregate ID to the ingress VLAN (VLAN A) to send packets to the redirect port until a route is available.
- When redirecting bridged traffic on VLAN A, the redirect port or link aggregate ID must belong to VLAN A (tagged or default VLAN).

Examples

```
-> policy action rp01 redirect linkagg 10
-> policy action rp01 no redirect linkagg
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

   alaQoSAppliedActionName
   alaQoSAppliedActionRedirectAgg
```

policy action no-cache

Disables logging of rule entries to the hardware cache.

policy action *action_name* **no-cache**

policy action *action_name* **no no-cache**

Syntax Definitions

action_name	The name of the action.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove **no cache** from the policy action.
- Recommended for use when applied to traffic going to the switch.

Examples

```
-> policy action nc01 no-cache
-> policy action nc01 no no-cache
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

   alaQoSAppliedActionName
   alaQoSAppliedActionNocache
```

policy action mirror

Mirrors ingress, egress, or both ingress and egress packets that match a mirroring policy to the specified port.

policy action *action_name* **[ingress | egress | ingress egress] mirror** *chassis/slot/port*

policy action *action_name* **no mirror** *chassis/slot/port*

Syntax Definitions

action_name	The name of the action.
ingress	Mirrors ingress packets.
egress	Mirrors egress packets.
ingress egress	Mirrors ingress and egress packets.
chassis/slot/port	The chassis ID, slot, and port number (3/1/1) for a specific port.

Defaults

parameter	default
ingress | egress | ingress egress	**ingress**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove **mirror** from the policy action.
- Use this command to configure a mirror-to-port (MTP) action that is used for policy based mirroring.
- Only one MTP session is supported at any given time. As a result, all mirroring policies should specify the same MTP port.
- Policy based mirroring and the port based mirroring feature can run simultaneously on the same switch.

Examples

```
-> policy action a1 mirror 1/1/7 (default ingress)
-> policy action a1 ingress mirror 1/1/7
-> policy action a1 egress mirror 1/1/7
-> policy action a1 ingress egress mirror 1/1/7
-> policy action a1 no mirror
```

Release History

Release 8.1.1; command introduced.

Related Commands

qos apply	Applies configured QoS and policy settings to the current configuration.
policy action	Creates a policy action.
show policy action	Displays information about policy actions.

MIB Objects

   alaQosActionMirrorMode
   alaQosActionMirrorModeStatus
```

show policy network group

Displays information about pending and applied policy network groups.

show [applied] policy network group [*network_group***]**

Syntax Definitions

applied	Indicates that only network groups that have been applied should be displayed.
network_group	The name of the policy network group for which you want to display information; or a wildcard sequence of characters for displaying information about network groups with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Information for all policy network groups displays unless *network_group* is specified.

Examples

```
-> show policy network group
Group Name                      : netg1
  State                         = new,
  Entries                       = 198.206.10.1

-> show policy network group
Group Name                      : group1
  Entries                       = 203.185.129.0 mask 255.255.255.0,
                                  203.185.131.192 mask 255.255.255.192,
                                  203.185.132.0 mask 255.255.252.0,
                                  204.226.0.0 mask 255.255.0.0
```

output definitions

Group Name	The name of the port group, configured through the **policy network group** command.
State	This field appears if the group was created or modified but not yet applied to the QoS configuration. When the **qos apply** command is issued, this field no longer displays.
Entries	The IP addresses associated with the network group.

Release History

Release 8.1.1; command introduced.

Related Commands

policy network group	Configures policy network groups.

MIB Objects

```

```

show policy service

Displays information about pending and applied policy services.

show [applied] policy service [*service_name***]**

Syntax Definitions

applied	Indicates that only services that have been applied should be displayed.
service_name	The name of the service for which you want to display information; or a wildcard sequence of characters for displaying information about services with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Information about all policy services is displayed unless *service_name* is specified.

Examples

```
-> show policy service
Service name                    : ps1
  State                         = new,
  Protocol                      = 6,
  Source IP port                = 4,
  Destination IP port           = 5
```

output definitions

Service Name	The name of the port group, configured through the **policy service** command.
State	This field appears if the service was created or modified but not yet applied to the QoS configuration. When the **qos apply** command is issued, this field no longer displays.
Protocol	The IP protocol associated with the service.
Source IP port	A source port associated with the service.
Destination IP port	A destination port associated with the service.

Release History

Release 8.1.1; command introduced.

Related Commands

policy service	Configures a service that may be used as part of a policy service group.

show policy condition

Displays information about pending and applied policy conditions.

show [applied] policy condition [*condition_name***]**

Syntax Definitions

applied	Displays only conditions that have been applied.
condition_name	The name of the condition for which you want to display information; or a wildcard sequence of characters for displaying information about conditions with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Information for all policy conditions displays unless *condition_name* is specified.

Examples

```
-> show policy condition
Condition name                  : c1
  Source VLAN                   = 1001

Condition name                  : c2
  State                         = new,
  Source IP                     = 10.2.2.1,
  Destination UDP port          = 17

-> show applied policy condition
Condition name                  : app-mon1
  App-Mon Application Group Name = grp1

Condition name                  : app-mon2
  Source chassis                = 1/1/11

Condition name                  : user-traffic1
  Source chassis                = 1/1/1

Condition name                  : user-traffic2
  Source chassis                = 2/1/1
```

output definitions

Condition Name	The name of the condition, configured through the **policy condition** command.
State	This field appears if the condition was created or modified but not yet applied to the QoS configuration. When the **qos apply** command is issued, this field no longer displays.
App-Mon Application Group Name	Name of the application group to which the QoS policy condition applies.

Release History

Release 8.1.1; command introduced.

Related Commands

policy condition	Creates a policy condition. The condition determines what parameters the switch uses to classify incoming flows.

show active policy rule

Displays details about applied policy rules that are active (enabled) on the switch, including per-port statistics.

show active [multicast] policy rule [*rule_name***] [extended]**

Syntax Definitions

multicast	Displays active rules that apply to multicast traffic.
rule_name	The name of the rule for which you want to display information; or a wild card sequence of characters for displaying information about rules with similar names. Use an asterisk (*) to indicate a wild card character.
extended	Displays statistics for individual ports when the policy rule contains a source port split-group condition.

Defaults

By default, information is displayed for all active rules.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **show policy rule** command to display inactive as well as active policy rules.
- Information for all rules is displayed unless a *rule_name* is specified.
- Information for all rule types is displayed unless a keyword (**bridged**, **routed**, **multicast**) is specified.
- Applied rules may or may not be active on the switch. Applied rules are inactive if they have been administratively disabled with the **disable** option of the **policy rule** command.
- When a source port split-group condition is used in a rate limiting policy rule, the rule is split into sub-rules. One sub-rule is created for each member port of the split-group. Each sub-rule is assigned a unique split rule ID. Use this command with the **extended** keyword option to display sub-rule details and statistics for a policy rule that contains a split-group policy condition.

Examples

```
-> show active policy rule
Rule name                       : r1
  Condition name                = c1,
  Action name                   = a1,
  Packets                       = 4166772,
  Bytes                         = 266665728
```

output definitions

Rule name	The name of the policy rule, configured through the **policy rule** command.
Condition name	The name of the condition configured for this rule.

output definitions (continued)

Action name	The name of the action configured for this rule.
Packets	The number of packets that match this rule.
Bytes	The number of bytes that match this rule.

```
-> show active policy rule extended
Rule name                       : r1
Split Rule Id                   : 1,
Port                            = 1/1/2,
Packets                         = 31864846,
Bytes                           = 16314794432,
Green Packets                   = 33136,
Yellow Packets                  = 0,
Red Packets                     = 31831710,
Green Bytes                     = 16965632,
Yellow Bytes                    = 0,
Red Bytes                       = 16297828800
Rule name                       : r1
Split Rule Id                   : 2,
Port                            = 1/1/3,
Packets                         = 31864846,
Bytes                           = 16314794432,
Green Packets                   = 33136,
Yellow Packets                  = 0,
Red Packets                     = 31831710,
Green Bytes                     = 16965632,
Yellow Bytes                    = 0,
Red Bytes                       = 16297828800
```

output definitions

Rule name	The name of the policy rule, configured through the **policy rule** command.
Split Rule Id	The ID number for the sub-rule. A rate limiting policy rule is split into sub-rules when the rule contains a source port split-group condition.
Packets	The number of packets that match this rule.
Bytes	The number of bytes that match this rule.
Green Packets	The number of packets marked green that match this rule.
Yellow Packets	The number of packets marked yellow that match this rule.
Red Packets	The number of packets marked red that match this rule.
Green Bytes	The number of bytes marked green that match this rule.
Yellow Bytes	The number of bytes marked yellow that match this rule.
Red Bytes	The number of bytes marked red that match this rule.

Release History

Release 8.1.1; command introduced.
Release 8.2.1; **extended** parameter and related fields added.

Related Commands

policy rule	Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).
policy condition source port split-group	Configures a source port split-group policy condition that is used in rate limiting policy rules.

show policy rule

Displays information about pending and applied policy rules.

show [applied] [bridged | routed | multicast] policy rule [*rule_name***]**

Syntax Definitions

applied	Indicates that only policy rules that have been applied should be displayed.
bridged	Displays active rules that apply to bridged traffic.
routed	Displays active rules that apply to routed traffic.
multicast	Displays active rules that apply to multicast traffic.
rule_name	The name of the rule for which you want to display information; or a wildcard sequence of characters for displaying information about rules with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Information for all rules is displayed unless *rule_name* is specified.
- Information for all rule types is displayed unless a keyword (**bridged**, **routed**, **multicast**) is specified.
- Use the **show active policy rule** command to display only active rules that are currently being enforced on the switch.

Examples

```
-> show policy rule
Rule name                       : r1
  Condition name                = c1,
  Action name                   = a1

Rule name                       : r2
  State                         = new,
  Condition name                = c2,
  Action name                   = a1

Rule name                       : r3
  State                         = new,
  Condition name                = c2,
  Action name                   = a2

-> show applied policy rule
Rule name                       : r1
```

```
Condition name                  = c1,
Action name                     = a1
```

output definitions

Rule name	The name of the policy rule, configured through the **policy rule** command.
State	This field appears if the rule was created or modified but not yet applied to the QoS configuration. When the **qos apply** command is issued, this field no longer displays.
Condition name	The name of the condition configured for this rule.
Action name	The name of the action configured for this rule.

Release History

Release 8.1.1; command introduced.

Related Commands

policy rule	Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

show policy validity period

Displays information about policy validity periods.

show policy validity period [*name***]**

Syntax Definitions

name	The name of the validity period.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Information for all validity periods is displayed unless *name* is specified.
- Use the **show policy rule** command to display the validity period that is associated with a policy rule.

Examples

```
-> show policy validity-period
Validity period name             = tuesday
  State                          = new,
  Days                           = tuesday

Validity period name             = february
  Months                         = february

-> show applied policy validity-period
Validity period name             = february
  Months                         = february
```

output definitions

Validity period name	The name of the policy validity period, configured through the **policy validity period** command.
State	This field appears if the validity period was created or modified but not yet applied to the QoS configuration. When the **qos apply** command is issued, this field no longer displays.
Days	The days of the week the validity period is active, configured through the **policy validity period** command. If this field does not appear, then the validity period is not restricted to specific days.
Months	The months during which the validity period is active, configured through the **policy validity period** command. If this field does not appear, then the validity period is not restricted to specific months.

output definitions

Hours	The time of day the validity period begins and ends, configured through the **policy validity period** command. If this field does not appear, then the validity period is not restricted to a specific time.
Interval	The date and time a validity period interval begins and ends, configured through the **policy validity period** command. If this field does not appear, then the validity period is not restricted to a specific date and time interval.

Release History

Release 8.1.1; command introduced.

Related Commands

policy validity-period	Configures a validity period that specifies days, times, and/or months during which an associated policy rule is in effect.

```

show active policy list

Displays information about applied policy lists that are active (enabled) on the switch.

show active policy list [*list_name***]**

Syntax Definitions

list_name	The name of the list for which you want to display information; or a wildcard sequence of characters for displaying information about lists with similar names. Use an asterisk (*) to indicate a wildcard character.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Information for all active rules is displayed unless a *list_name* is specified.
- Use the **show policy list** command to display inactive as well as active policy lists.
- Applied lists may or may not be active on the switch. Applied lists are inactive if they have been administratively disabled with the **disable** option in the **policy list** command.
- The display may include any of the following characters:

character	definition
+	Indicates that the policy list has been modified or has been created since the last **qos apply**.
-	Indicates the policy list is pending deletion.
#	Indicates that the policy list differs between the pending/ applied lists.

Examples

```
-> show active policy list
 Group Name                      From  Type  Enabled  Entries

 list1                           cli   unp    Yes      r1
                                                      r2

 +list2                          cli   unp    Yes      r3

 egress_list1                    cli   egress Yes      r1
                                                      r2
                                                      r3
```

output definitions

Group Name	The name of the policy list. Configured through the **policy list** command. A plus sign (+) preceding a policy list name indicates that the list was modified or created since the last **qos apply**.
From	Where the list originated.
Type	The type of rule (**unp** or **egress**). Configured through the **policy list** command. Note that the default policy list is not shown. Use the **show policy rule** command to display rules that are members of the default policy list.
Enabled	Whether or not the rule is enabled. Configured through the **policy list** command.
Entries	The QoS policy rules that are grouped together in this policy list. Configured through the **policy list** command.

Release History

Release 8.1.1; command introduced.

Related Commands

show policy list	Displays information about pending and applied policy lists.

34 Policy Server Commands

This chapter describes CLI commands used for managing policies downloaded to the switch from an attached LDAP server. Policy rules can be created on an attached server through the PolicyView GUI application. Policy rules can also be created on the switch directly through CLI or SNMP commands. This chapter describes commands related to managing LDAP policies only. See Chapter 32, "QoS Commands," for information about commands for creating and managing policies directly on the switch.

The policy commands are based on RFC 2251 and RFC 3060.

MIB information for policy server commands is as follows:

Filename: alcatelIND1policy.mib
Module: ALCATEL-IND1-POLICY-MIB

The policy server commands are summarized here:

policy server load
policy server flush
policy server
show policy server
show policy server long
show policy server statistics
show policy server rules
show policy server events

policy server load

Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

policy server load

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Policies are downloaded to the switch from the directory server with the highest preference setting; this server must be enabled and operational (able to bind).

Examples

```
-> policy server load
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy server flush	Removes all cached LDAP policy data from the switch.

MIB Objects

```
serverPolicyDecision
```

policy server flush

Removes all cached LDAP policy data from the switch.

policy server flush

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command to remove LDAP policies. Policies configured through the CLI or SNMP are not removed.

Examples

```
-> policy server flush
```

Release History

Release 8.1.1; command introduced.

Related Commands

policy server load	Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

MIB Objects

```
serverPolicyDecision
```

policy server

Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

policy server *ip_address* **[port** *port_number***] [admin-state {enable | disable}] [preference** *preference***] [user** *user_name* **password** *password***] [searchbase** *search_string***] [ssl | no ssl]**

no policy server *ip_address* **[port** *port_number***]**

Syntax Definitions

ip_address	The IP address of the LDAP-enabled directory server.
port_number	The TCP/IP port number used by the switch to connect to the directory server.
enable	Enables the specified policy server to download rules to the switch.The policy servers are **up** by default.
disable	Prevents the specified policy server from downloading rules to the switch.
preference	Determines which directory server is used for policy downloads when multiple servers are configured. The range is 0–255. The server with the highest value is used as the policy server. If that server becomes unavailable, the server with the next highest preference value is used for policy downloads.
user_name	The user name for accessing the database entries on the directory server. When spaces are used in the user name, quotation marks must be included: (e.g. “Directory Manager”).
password	The password associated with the user name. The password must match the password defined on the directory server.
search_string	The root of the directory required for searching the policy information. Typically, the *search_string* includes **o=***organization* and **c=***country*. For example, **o=company** and **c=country**.
ssl	Enables a Secure Socket Layer between the switch and the policy server.
no ssl	Disables a Secure Socket Layer between the switch and the policy server.

Defaults

parameter	default
admin	**up**
port_number	389 (SSL disabled) 636 (SSL enabled)
preference	0
ssl | no ssl	**no ssl**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If you change the port number, another entry is added to the policy server table; the existing port number is not changed. To remove a port number, use the **no** form of this command with the relevant policy server IP address and the port number you want to remove.

Examples

```
-> policy server 222.22.22.2 port 345 user dirmgr password secret88 searchbase
ou=qos,o=company,c=country
```

Release History

Release 8.1.1; command introduced.

Related Commands

show policy server	Displays information about policies downloaded from an LDAP server.

MIB Objects

```
directoryServerTable
   directoryServerAddress
   directoryServerPort
   directoryServerAdminStatus
   directoryServerPreference
   directoryServerUserId
   directoryServerAuthenticationType
   directoryServerPassword
   directoryServerSearchbase
   directoryServerEnableSSL
```

show policy server

Displays information about servers from which policies can be downloaded to the switch.

show policy server

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays basic information about policy servers. Use the **show policy server long** command to display more details about the servers.

Examples

```
-> show policy server

Server   IP Address    port   enabled  status   primary
------+--------------+-----+---------+--------+--------
   1   208.19.33.112  389       Yes      Up        X
   2   208.19.33.66   400       No       Down      -
```

output definitions

Server	The index number corresponding to the LDAP server.
IP Address	The IP address of the LDAP server.
port	The TCP/IP port number used by the switch to connect to the policy server.
enabled	Whether or not the policy server is enabled.
status	The state of the policy server, **Unkn**, **Up** or **Down**.
primary	Indicates whether the server is the primary server; this server can be used for the next download of policies; only one server is a primary server.

Release History

Release 8.1.1; command introduced.

Related Commands

policy server	Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

MIB Objects

```
directoryServerTable
   directoryServerAddress
   directoryServerPort
   directoryServerAdminState
```

show policy server long

Displays more detailed information about an LDAP policy server.

show policy server long

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays detailed information about policy servers. Use the **show policy server** command to display basic information about policy servers.

Examples

```
-> show policy server long
LDAP server 0
  IP address           : 155.132.44.98,
  TCP port             : 16652,
  Enabled              : Yes,
  Operational status   : Unkn,
  Preference           : 99,
  Authentication       : password,
  SSL                  : Disabled,
  login DN             : cn=Directory Manager,
  searchbase           : ou:4.1, cn=policyRoot, o=company.fr
  Last load time       : 09/13/01 16:38:18
LDAP server 1
  IP address           : 155.132.48.27,,
  TCP port             : 21890,
  Enabled              : Yes,
  Operational status   : Unkn,
  Preference           : 50,
  Authentication       : password,
  SSL                  : Disabled,
  login DN             : cn=Directory Manager,
  searchbase           : o=company.fr
  Last load time       : 00/00/00 00:00:00
```

output definitions

IP address	The IP address of the policy server.
TCP port	The TCP/IP port number used by the switch to connect to the policy server.

output definitions (continued)

Enabled	Displays whether the policy server is enabled through the PolicyView application.
Operational status	The state of the policy server, **Up** or **Down**.
Preference	Determines which directory server is used for policy downloads when multiple servers are configured. The range is 0–255. The server with the highest value is used as the policy server. If that server becomes unavailable, the server with the next highest preference value is used for policy downloads.
Authentication	Displays **password** if a user name and password was specified for the server through the **policy server** command. Displays **anonymous** if a user name and password are not configured.
login DN	The directory user name.
searchbase	The searchbase name, which is the root of the directory that can be searched for policy download information.
Last load time	The date and time that policies were last downloaded. Values of zero indicate that no policies have been downloaded.

Release History

Release 8.1.1; command introduced.

MIB Objects

```
directoryServerTable
   directoryServerAddress
   directoryServerPort
   directoryServerPreference
   directoryServerAuthenticationType
   directoryServerSearchbase

   directoryServerLastChange
   directoryServerAdminStatus
   directoryServerOperStatus
```

show policy server statistics

Displays statistics about policy directory servers.

show policy server statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays statistics about server downloads. For information about server parameters, use the **show policy server** command.

Examples

```
-> show policy server statistics
Server   IP Address     port   accesses  delta   successes delta  errors  delta
------+--------------+-------+---------+-------+----------+-----+-------+------
   1     155.132.44.98  16652      793     793       295     295       0     0
   2     155.132.48.27  21890        0       0         0       0       0     0
```

output definitions

Server	The index number corresponding to the server.
IP Address	The IP address of the LDAP server.
port	The TCP/IP port number used by the switch to connect to the policy server.
accesses	The number of times the server was polled by the switch to download policies.
delta	The change in the number of accesses since the last time the policy server was accessed.
successes	The number of times the server was polled by the switch to download policies and the policies were successfully downloaded.
delta	The change in the number of successful policy downloads since the last time the policy server was accessed.
errors	The number of errors returned by the server.
delta	The change in the number of errors returned by the server since the last time the policy server was accessed.

Release History

Release 8.1.1; command introduced.

Related Commands

policy server	Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

MIB Objects

```

   policyStatsAddress
   policyStatsServerPort
   policyStatsAccessCount
   policyStatsSuccessAccessCount
   policyStatsNotFoundCount
```

show policy server rules

Displays the names of policies originating from a directory server, that have been downloaded to the switch.

show policy server rules

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays information about policies created on directory servers only. Chapter 32, “QoS Commands,” for information about configuring and displaying policies directly on the switch.

Examples

```
-> show policy server rules
Num       name           prio        scope       status
---+------------------+-------+-------------+------------
1             QoSRule1    0      Provisioned    Active
2             QoSrule2    0      Provisioned    Active
```

Fields are defined here:

output definitions

Num	An index number corresponding to the policy rule.
name	The name of the policy rule; only rules configured through PolicyView are displayed in this table.
prio	The priority or preference of the rule. Indicates the order in which rules can be checked to match to the incoming traffic. If two or more rules apply to the traffic, the rule with the highest preference is applied. Preference is determined when the rule is created.
scope	The type of rule. **Provisioned** is the only type valid for the current release.
status	The status of the rule: **Active** indicates that the rule is available in the QoS software on the switch and is available to be applied to the traffic; **notInService** means the rule can be pushed to the QoS software in the future but is not available yet (typically because of a variable validity period); **notReady** indicates that the rule can never be pushed to the QoS software because its validity period has expired or because it has been disabled through SNMP.

Release History

Release 8.1.1; command introduced.

Related Commands

policy server load	Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

MIB Objects

```

show policy server events

Displays any events related to a directory server on which policies are stored.

show policy server events

Syntax Definitions

N/A

Defaults

The display is limited to 50 events.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The Policy Manager initialization event is always the first event logged.

Examples

```
-> show policy server events
 Event Time                      event description
-----------------+-------------------------------------------
09/13/01 16:38:15 Policy manager log init

35 AAA Commands

This chapter includes descriptions for authentication, authorization, and accounting (AAA) commands. The commands are used for configuring the type of authentication as well as the AAA servers and the local user database on the switch.

- Authenticated switch access—Authenticates user sessions into the switch to manage the switch. User information is stored on a RADIUS, TACACS+, or LDAP server or information may be stored locally in the switch user database.
- Access Guardian device authentication—Provides authentication and accounting functions to provide port-based network access control. The OmniSwitch serves as the authenticator for 802.1X, MAC, and Captive Portal device authentication sessions.
- Local user database—User information may be configured for authenticated switch access. For functional management access, users may be allowed to access specific command families or domains.

MIB information for the AAA commands is as follows:

Filename: alcatelIND1AAA.mib
Module: ALCATEL-IND1-AAA-MIB

A summary of the available commands is listed here:

Authentication servers	**aaa radius-server** **aaa tacacs+-server** **aaa ldap-server** **aaa test-radius-server** **show aaa server**
Authenticated switch access	**system fips admin-state** **aaa authentication** **aaa authentication default** **aaa accounting session** **aaa accounting command** **show aaa authentication** **show aaa accounting** **show system fips**

Port-based Network Access Control (Access Guardian)	**aaa device-authentication** **aaa accounting** **aaa accounting radius calling-station-id** **aaa 802.1x re-authentication** **aaa interim-interval** **aaa session-timeout** **aaa inactivity-logout** **aaa radius nas-port-id** **aaa radius nas-identifier** **aaa radius mac-format** **aaa profile** **show aaa device-authentication** **show aaa accounting** **show aaa config** **show aaa radius config** **show aaa profile**
Local User Database and Partitioned Management	**user** **password** **user password-size min** **user password-expiration** **show user** **show aaa priv hexa**
Password Policy	**user password-policy cannot-contain-username** **user password-policy min-uppercase** **user password-policy min-lowercase** **user password-policy min-digit** **user password-policy min-nonalpha** **user password-history** **user password-size min** **user password-min-age** **user password-expiration** **show user** **show user password-policy**
User Lockout Settings	**user lockout-window** **user lockout-threshold** **user lockout-duration** **user lockout unlock** **show user** **show user lockout-setting**

aaa radius-server

Configures a RADIUS server for authenticated switch access and device authentication.

aaa radius-server *server* **{host {***hostname* | *ip_address***} [***hostname2* | *ip_address2***]} {key** *secret* | **hash-key** *hash_secret***} [retransmit** *retries***] [timeout** *seconds***] [auth-port** *auth_port***] [acct-port** *acct_port***] [vrf-name** *vrf_name***]**

no aaa radius-server *server*

Syntax Definitions

server	The name of the RADIUS server.
hostname	The host name (DNS name) of the primary RADIUS server. The host name or IP address is required when creating a server.
ip_address	The IP address of the primary RADIUS server. An IP address or host name is required when creating a server.
hostname2	The host name (DNS name) of an optional backup RADIUS server.
ip_address2	The IP address of an optional backup RADIUS server.
secret	A shared secret (key) known only to the switch and the server; this value is *not* sent over the network. Can specify any text or hexadecimal string but MUST match the secret configured on the server. The secret is case-sensitive. Required when creating a server.
hash_secret	A shared secret that the switch saves with a hashing algorithm.
retries	The number of retries the switch makes to authenticate a user before trying the backup server (*hostname2* or *ip_address2*).
seconds	The timeout for server replies to authentication requests.
auth_port	The UDP destination port for authentication requests.
acct_port	The UDP destination port for accounting requests.
vrf_name	The name of the VRF to be used to access the server.

Defaults

parameter	default
retries	3
seconds	2
auth_port	1812
acct_port	1813
vrf_name	default

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a RADIUS server from the configuration. Only one server can be deleted at a time.
- A host name (or IP address) and a secret (**key** or **hash-key**) are required when configuring a server.
- The server and the backup servers must all be RADIUS servers.
- RADIUS server can be configured on any VRF instance or the default VRF instance. However, all the RADIUS servers must reside on the same VRF instance.

Examples

```
-> aaa radius-server pubs2 host 10.10.2.1 key wwwtoe timeout 5
-> no aaa radius-server pubs2

-> aaa radius-server radsrv1 host rad1_ipaddr key rad1_secret vrf-name rad_vrf
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show aaa server	Displays the AAA server configuration for the switch.
aaa authentication	Configures the interface for authenticated switch access and specifies the servers to be used.
aaa accounting session	Specifies the accounting servers to be used for authenticated switch access.
aaa device-authentication	Enables or disables the switch for MAC, 802.1X, or Captive Portal authentication and specifies the servers to be used.

MIB Objects

```
aaaServerTable
   aaasProtocol
   aaasHostName
   aaasIpAddress
   aaasHostName2
   aaasIpAddress2
   aaasRadKey
   aaasRadKeyHash
   aaasRetries
   aaasTimout
   aaasRadAuthPort
   aaasRadAcctPort
   aaasVrfName
```

aaa tacacs+-server

Configures a TACACS+ server for authenticated switch access.

aaa tacacs+-server *server* **{host {***hostname* | *ip_address***} [***hostname2* | *ip_address2***]} {key** *secret* | **hash-key** *hash_secret***} [timeout** *seconds***] [port** *port***] [vrf-name** *vrf_name***]**

no aaa tacacs+-server *server*

Syntax Definitions

server	The name of the TACACS+ server.
hostname	The host name (DNS name) of the primary TACACS+ server. The host name or IP address is required when creating a server.
ip_address	The IP address of the primary TACACS+ server. An IP address or host name is required when creating a server.
hostname2	The host name (DNS name) of an optional backup TACACS+ server.
ip_address2	The IP address of an optional backup TACACS+ server.
secret	The shared secret known to the switch and the server, but which is not sent over the network. Can be any text or hexadecimal string but MUST match the secret configured on the server. The secret is case-sensitive. required when creating a server.
hash_secret	A shared secret that the switch saves with a hashing algorithm.
seconds	The timeout for server replies to authentication requests.
port	The port number for the primary TACACS+ server.
vrf_name	The name of the VRF to be used to access the server.

Defaults

parameter	default
seconds	2
port	49
vrf_name	default

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a TACACS+ server from the configuration. Only one server may be deleted at a time.
- A host name (or IP address) and a secret are required when configuring a server.
- The server and the backup server must both be TACACS+ servers.

- A TACACS+ server can be configured on any VRF instance or the default VRF instance. However, all the TACACS+ servers must reside on the same VRF instance.

Examples

```
-> aaa tacacs+-server tpub host 10.10.2.2 key otna timeout 10
-> no aaa tacacs+-server tpub
-> aaa tacacs+-server tacsrv1 host tac1_ipaddr key tac1_secret vrf-name tac_vrf
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show aaa server	Displays the AAA server configuration for the switch.
aaa authentication	Configures the interface for authenticated switch access and specifies the servers to be used.
aaa accounting session	Specifies the accounting servers to be used for authenticated switch access.
aaa device-authentication	Configures which authentication servers to use for MAC, 802.1X, or Captive Portal device authentication.

MIB Objects

```
aaaServerTable
   aaasName
   aaasProtocol
   aaasHostName
   aaasIpAddress
   aaasHostName2
   aaasIpAddress2
   aaasTacacsKey
   aaasTacacsKeyHas
   aaasTimout
   aaasTacacsPort
   aaasVrfName
```

aaa ldap-server

Configures an LDAP server for authenticated switch access.

aaa ldap-server *server_name* **{host {***hostname* **|** *ip_address***} [***hostname2* **|** *ip_address2***]} {dn** *dn_name***} {password** *super_password* **| hash-key** *hash_password***} {base** *search_base***} [retransmit** *retries***] [time-out** *seconds***] [ssl | no ssl] [port** *port***] [vrf-name** *vrf_name***]**

no aaa ldap-server *server-name*

Syntax Definitions

server_name	The name of the LDAP server.
hostname	The host name (DNS) of the primary LDAP server. The host name or IP address is required when creating a new server.
ip_address	The IP address of the primary LDAP server.
hostname2	The host name (DNS) of the backup LDAP server.
ip_address2	The IP address of a backup host for the LDAP server.
dn_name	The super-user or administrative distinguished name in a format that is recognized by the LDAP-enabled directory servers. For example, **cn=manager**. Must be different from the *search-base* name and must be in a format supported by the server. Required when creating a new server.
super_password	The super-user password recognized by the LDAP-enabled directory servers. The password may be clear text or hexadecimal format. Required when creating a new server.
hash_password	A super-user password that the switch saves with a hashing algorithm.
search_base	The search base recognized by the LDAP-enabled directory servers. For example, **o=company** or **c=country**. Must be different from the *dn_name*. Required when creating a new server.
retries	The number of retries the switch makes to the LDAP server to authenticate a user before trying the backup server.
seconds	The timeout in seconds for server replies to authentication requests from the switch.
ssl	Enables a secure switch layer (SSL) between the switch and the LDAP server.
no ssl	Disables a secure switch layer (SSL) between the switch and the LDAP server.
port	The port number for the primary LDAP server and any backup server. Must match the port number configured on the server.
vrf_name	The name of the VRF to be used to access the server.

Defaults

Defaults for optional parameters are as follows:

parameter	default
port	389 (SSL disabled) 636 (SSL enabled)
retries	3
seconds	2
ssl | no ssl	**no ssl**
vrf_name	**default**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove an LDAP server from the configuration. Only one server may be removed at a time.
- The *dn_name* must be different from the *search_base* name.
- The port number configured on the switch must match the port number configured for the server.
- LDAP server can be configured on any VRF instance or the default VRF instance. However, all the LDAP servers must reside on the same VRF instance.

Examples

```
-> aaa ldap-server topanga5 host 10.10.3.4 dn cn=manager password tpub base c=us
retransmit 4
-> aaa ldap-server omnivista host 1.2.3.4 dn "cn=DirMgr, o=alcatel.com" password
somepass base "ou=People, o=alcatel.com" vrf-name ldap_vrf
-> no aaa ldap-server topanga5
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show aaa server	Displays the AAA server configuration for the switch.
aaa authentication	Configures the interface for authenticated switch access and specifies the servers to be used.
aaa accounting session	Specifies the accounting servers to be used for authenticated switch access.
aaa device-authentication	Configures which authentication servers to use for MAC, 802.1X, or Captive Portal device authentication.

MIB Objects

```
aaaServerTable
   aaasProtocol
   aaasHostName
   aaasIpAddress
   aaasHostName2
   aaasIpAddress2
   aaasLdapPort
   aaasLdapDn
   aaasLdapPasswd
   aaasLdapPasswdHash
   aaasLdapSearchBase
   aaasLdapServType
   aaasRetries
   aaasTimeout
   aaasLdapEnableSsl
   aaasVrfName
```

aaa test-radius-server

RADIUS test tool allows the user to test the RADIUS server reachability from the OmniSwitch. Use this command to start the authentication or accounting test for the specified user name and password.

aaa test-radius-server *server-name* **type {authentication user** *user-name* **password** *password* **[method {md5 | pap}] | accounting user** *user-name***}**

Syntax Definitions

server_name	RADIUS server name for which test has been configured.
authentication | accounting	Type of test to run.
user-name	User name configured on the server.
password	Password for the given user name.
md5|pap	Authentication method for the test.

Defaults

By default, MD5 is used as the authentication method.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- RADIUS server must be configured on the switch to test the tool.
- The switch must have the following RADIUS server configuration before starting the test tool: RADIUS server name, acct-port, auth-port, secret key, retransmit count, and timeout. See the **aaa radius-server** command for more information on RADIUS server configuration.
- Supports multiple sessions (console, telnet, SSH) to test multiple RADIUS servers.
- The CLI of the user session (console, telnet, SSH) goes in the blocking state when the test is started. In the blocking state, no other command (CLI) is accepted. The blocking state of the CLI prompt of the switch can be terminated by pressing any key.
- Two IP addresses are configurable for a RADIUS server. When the test starts, the requests are sent to the first address. When all the requests to the first address time out, then the requests are sent to the second address.

Examples

```
-> aaa test-radius-server rad1 type authentication user admin password switch
method MD5
-> aaa test-radius-server rad2 type authentication user admin password switch
method pap
-> aaa test-radius-server rad1 type accounting user admin
```

Release History

Release 8.1.1; command introduced.

Related Commands

aaa authentication	servers for authenticated switch access.
show aaa server	Displays information about AAA servers configured for the switch.

MIB Objects

N/A

system fips admin-state

Enable or disable the FIPS mode on the switch.

system fips admin-state {enable | disable}

Syntax Definitions

enable | disable	Enables or disable FIPS mode.

Defaults

parameter	default
enable | disable	*disable*

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- FIPS mode is disabled by default.
- Enabling or disabling FIPS mode takes effect only after a switch reboot. The FIPS mode configuration is persistent across reboots.
- When FIPS mode is disabled, all other existing cryptographic algorithms will be supported.
- A FIPS supported client is required to access the switch in FIPS enabled mode. For example, Absolute Telnet.
- Other unsecured management interfaces, such as Telnet or FTP, have to be manually disabled after FIPS mode is enabled to achieve a completely secure device.

Examples

```
-> system fips admin-state enable
-> system fips admin-state disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show system fips	Show the Configured and Running status of the FIPS mode on the Switch.

MIB Objects

`systemFipsAdminState`

aaa authentication

Configures the interface for authenticated switch access and specifies the server(s) to be used. This type of authentication gives users access to manage the switch.

aaa authentication {console | telnet | ftp | http | snmp | ssh | default} *server1* **[***server2***...] [local]**

no aaa authentication [console | telnet | ftp | http | snmp | ssh | default]

Syntax Definitions

console	Configures authenticated switch access through the console port.
telnet	Configures authenticated switch access for any port used for Telnet.
ftp	Configures authenticated switch access for any port used for FTP.
http	Configures authenticated switch access for any port used for Web-based management.
snmp	Configures authenticated switch access for any port used for SNMP.
ssh	Configures authenticated switch access for any port used for Secure Shell.
default	Configures authenticated switch access for any port using any service (**telnet**, **ftp**, etc.). Note that SNMP access is enabled only if an LDAP or local server is specified with the command.
server1	The name of the authentication server used for authenticated switch access. At least one server is required. The server may be a RADIUS, TACACS+, LDAP, or the local user database. RADIUS, TACACS+, and LDAP server names are set up through the **aaa radius-server**, **aaa tacacs+-server**, and **aaa ldap-server** commands.
server2...	The names of backup servers for authenticated switch access. Up to 3 backups may be specified (including **local**). These backups are only used if *server1* becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the authentication server.
local	Specifies that the local user database will be a backup for the authentication servers. If you want to use the local user database as the only authentication server, specify **local** for *server1*.

Defaults

- At switch startup, authenticated switch access is available through console port via the local database. Authentication for other management interfaces (Telnet, FTP, etc.) is disabled.
- The default user on the switch is **admin**, and **switch** is the password.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The server type may be RADIUS, TACACS+, LDAP, or the local user database. Up to 4 servers may be configured for an interface type; at least one is required. Each server name should be separated by a space.
- The switch uses ***only the first available server*** in the list to check for user information. For example, if *server1* is not available, the switch will poll *server2*. If user information is not found on the first available server, the authentication request will fail.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the **aaa radius-server**, **aaa tacacs+-server**, and **aaa ldap-server** commands.
- If the local switch database will be used as the only authentication server, specify **local** for *server1*. If **local** is specified as a backup server, it should be entered last in the list of servers. The local user database is always available if the switch is up.
- Only LDAP or the local database may be used for authenticated SNMP management.
- If Secure Shell (**ssh**) is enabled, Telnet and FTP should be disabled.

Examples

```
-> aaa authentication telnet pubs1
-> no aaa authentication telnet
-> aaa authentication default pubs2 pubs3
```

Release History

Release 8.1.1; command was introduced.

Related Commands

aaa radius-server	Configures or modifies a RADIUS server for authenticated switch access.

   aaatsName1
   aaatsName2
   aaatsName3
   aaatsName4
```

aaa authentication default

Sets the authenticated switch access type to the default server setting.

aaa authentication {console | telnet | ftp | http | snmp | ssh} default

Syntax Definitions

console	Configures the default authenticated switch access server setting for the console port.
telnet	Configures the default authenticated switch access server setting for Telnet.
ftp	Configures the default authenticated switch access server setting for FTP.
http	Configures the default authenticated switch access server setting for Web-based management.
snmp	Configures the default authenticated switch access server setting for any port used for SNMP.
ssh	Configures the default authenticated switch access server setting for any port used for Secure Shell.

Defaults

By default, the default authenticated switch access server setting does not include any servers.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **aaa authentication** command to set the default servers.

Examples

```
-> aaa authentication telnet default
-> aaa authentication default default
```

Release History

Release 8.1.1; command was introduced.

Related Commands

aaa radius-server	Configures or modifies a RADIUS server for authenticated switch access.
aaa tacacs+-server	Configures or modifies an LDAP server for authenticated switch access.
user	Configures user information for the local database on the switch.
show aaa server	Displays the AAA authentication server configuration.

MIB Objects

   aaatsName2
   aaatsName3
   aaatsName4
```

aaa accounting session

Configures an accounting server or servers for authenticated switch access sessions. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

aaa accounting session *server1* **[***server2***...] [local]**

no accounting session

Syntax Definitions

server1	The name of the RADIUS, TACACS+, or LDAP server used for accounting of authenticated switch sessions. At least one server is required. RADIUS, TACACS+, and LDAP server names are set up through the **aaa radius-server**, **aaa tacacs+-server**, and **aaa ldap-server** commands.
server2...	The names of backup servers. Up to 3 backups may be specified (including **local**); each server name should be separated by a space. These backups are only used if *server1* becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
local	Local accounting is done through the Switching Logging feature on the switch.

Defaults

Accounting is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to disable accounting for authenticated switch access.
- Up to 4 accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The servers may be RADIUS, TACACS+, LDAP servers, and/or the local Switch Logging facility.
- If **local** is specified as *server1*, the switch will ***only*** use the local Switching Logging facility for accounting.
- If **local** is specified as a backup, it should be entered last in the list of servers. The Switch Logging facility is always available if the switch is up.
- The switch uses ***only the first available server*** in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the **aaa radius-server**, **aaa tacacs+-server**, and **aaa ldap-server** commands.

Examples

```
-> aaa accounting session ldap1 radius2 local
-> no aaa accounting session
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show aaa accounting	Displays the AAA accounting server configuration.

MIB Objects

   aaacsName1
   aaacsName2
   aaacsName3
   aaacsName4
```

aaa accounting command

Enables or disables command accounting with the specified TACACS+ server. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

aaa accounting command *server1* **[***server2***...] [local]**

no accounting command

Syntax Definitions

server1	The name of the TACACS+ server used for command accounting. At least one server is required. TACACS+ server names are set up through the **aaa tacacs+-server** commands.
server2...	The names of TACACS+ backup servers. Up to 3 backups may be specified; each server name should be separated by a space. These backups are only used if *server1* becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
local	Local accounting is done through the Switching Logging feature on the switch.

Defaults

Accounting is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to disable command accounting.
- Up to 4 accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- Command accounting is supported only with TACACS+ servers.
- The switch uses ***only the first available server*** in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.
- TACACS+ server may each have an additional backup specified through the **aaa tacacs+-server** command.

Examples

```
-> aaa accounting command tacacs1 tacacs2 tacacs3
-> no aaa accounting command
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show aaa accounting	Displays the AAA accounting server configuration.

MIB Objects

```

   aaacmdSrvName1
   aaacmdSrvName2
   aaacmdSrvName3
   aaacmdSrvName4
```

aaa device-authentication

Configures the switch to use RADIUS servers for 802.1X, MAC, or Captive Portal authentication.

aaa device-authentication {802.1x | mac | captive-portal} *server1* **[***server2***] [***server3***] [***server4***]**

no device-authentication {802.1x | mac | captive-portal}

Syntax Definitions

802.1x	Use the specified RADIUS server to authenticate 802.1X users.
mac	Use the specified RADIUS server for MAC authentication.
captive-portal	Use the specified RADIUS server for Captive Portal authentication.
server1	The name of the RADIUS authentication server to use for the specified type of authentication. (*Note that only RADIUS servers are supported for these types of authentication.*) At least one server is required. RADIUS server names are configured through the **aaa radius-server** command.
server2...server4	The names of backup servers used for authentication. Up to 3 backups may be specified; include a space between each server name. These backups are only used if *server1* becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the authentication server.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a RADIUS server assignment for a specific authentication type.
- Up to 4 RADIUS servers (total) may be specified for each type of authentication. At least one server is required. Each server name should be separated by a space.
- The switch uses ***only the first available server*** in the list to check for user information. For example, if *server1* is not available, the switch will poll *server2*. If user information is not found on the first available server, the authentication request will fail.
- RADIUS servers may each have an additional backup specified through the **aaa radius-server** command.
- Configuring the RADIUS servers to use for 802.1X, MAC, and Captive Portal authentication is required to support authentication and classification of devices connected to Universal Network Profile (UNP) ports.

Examples

```
-> aaa device-authentication mac rad1 rad2
-> aaa device-authentication 802.1x serv1 serv2 serv3 serv4
-> aaa device-authentication captive-portal rad3 rad4
-> no aaa device-authentication mac
-> no aaa device-authentication 802.1x
-> no aaa device-authentication captive-portal
```

Release History

Release 8.1.1; command was introduced.

Related Commands

aaa radius-server	Configures or modifies a RADIUS server for authenticated switch access or device authentication.
show aaa device-authentication	Displays a list of RADIUS servers assigned to provide 802.1X, MAC, or Captive Portal authentication.

MIB Objects

```

   aaadaInterface
   aaadaName1
   aaadaName2
   aaadaName3
   aaadaName4
```

aaa accounting

Configures RADIUS server accounting or local Switch Logging (syslog) accounting for 802.1X, MAC, and Captive Portal authenticated device sessions. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

aaa accounting {802.1x | mac | captive-portal} {*server1* **[***server2***...] | syslog** *ip_address* **[port** *udp_port***]}**

no accounting {802.1x | mac | captive-portal}

Syntax Definitions

802.1x	Enables the specified RADIUS or syslog server to log accounting of 802.1X authenticated sessions.
mac	Enables the specified RADIUS or syslog server to log accounting for MAC authenticated sessions.
captive-portal	Enables the specified RADIUS or syslog server to log accounting for Captive Portal authenticated sessions.
server1	The name of the RADIUS server used for accounting of authenticated switch sessions. At least one server is required. RADIUS server names are configured through the **aaa radius-server** command.
server2...	The names of backup servers. Up to 3 backups may be specified; each server name should be separated by a space. These backups are only used if *server1* becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
ip_address	The IP network address for syslog accounting.
udp_port	The UDP port number for syslog accounting.

Defaults

By default, no RADIUS server or syslog accounting is configured for the switch.

parameter	default
udp_port	514

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to disable accounting for device authentication sessions.
- Up to 4 RADIUS accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The switch uses ***only the first available server*** in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.

- Accounting with the local syslog facility is not allowed if RADIUS accounting is already configured. In other words, configure either RADIUS *or* syslog accounting.
- RADIUS servers may each have an additional backup specified through the **aaa radius-server** command.

Examples

```
-> aaa accounting 802.1x rad1
-> aaa accounting 802.1x rad1 rad2 rad3 rad4
-> aaa accounting 802.1x syslog 10.135.67.99 port 8000
-> no aaa accounting 802.1x

-> aaa accounting mac rad1
-> aaa accounting mac rad1 rad2
-> aaa accounting mac syslog 10.135.67.99 port 8000
-> no aaa accounting mac

-> aaa accounting captive-portal rad1
-> aaa accounting captive-portal rad1 rad2 rad3
-> aaa accounting captive-portal syslog 10.135.67.99 port 8000
-> no aaa accounting captive-portal
```

```

aaa accounting radius calling-station-id

Configures the RADIUS Calling-Station-Id attribute for the specified accounting session type.

aaa accounting {802.1x | mac | captive-portal} radius calling-station-id {mac-address | ip-address}

Syntax Definitions

802.1x	Configures the attribute for 802.1X accounting sessions.
mac	Configures the attribute for MAC accounting sessions.
captive-portal	Configures the attribute for Captive Portal accounting sessions.
mac-address	Sets the Calling Station ID to the MAC address of the user.
ip-address	Sets the Calling Station ID to the IP address of the user.

Defaults

By default, the RADIUS Calling -Station-Id attribute is set to the MAC address of the user.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Configuring the Calling-Station-ID attribute is not allowed if the accounting server configuration is set to use local Switch Logging (syslog) for the specified accounting session type (802.1x, MAC, or Captive Portal).
- The Calling Station ID attribute is defined in a RADIUS Accounting-Request message that is sent to the RADIUS accounting server.

Examples

```
-> aaa accounting 802.1x radius calling-station-id ip-address
-> no aaa accounting 802.1x radius calling-station-id ip-address
-> aaa accounting 802.1x radius calling-station-id mac-address

-> aaa accounting mac radius calling-station-id ip-address
-> no aaa accounting mac radius calling-station-id ip-address
-> aaa accounting mac radius calling-station-id mac-address

-> aaa accounting captive-portal radius calling-station-id ip-address
-> no aaa accounting onex radius calling-station-id ip-address
-> aaa accounting captive-portal radius calling-station-id mac-address
```

Release History

aaa 802.1x re-authentication

Enables or disables the automatic re-authentication of authenticated 802.1X users.

aaa 802.1x re-authentication {enable | disable} [interval *seconds***] [trust-radius {enable | disable}]**

Syntax Definitions

enable	Enables re-authentication of 802.1X users.
disable	Disables re-authentication of 802.1X users.
seconds	The amount of time the switch waits before triggering re-authentication of 802.1X users. The valid range is 600–7200 seconds.
trust-radius enable	Directs the switch to use the Session-Timeout attribute value for the re-authentication time interval. This attribute is returned from the RADIUS server in an Accept-Accept message.
trust-radius disable	Directs the switch to use the locally configured re-authentication time interval value.

Defaults

By default, 802.1X re-authentication is disabled for the switch.

parameter	default
seconds	3600
trust-radius enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The re-authentication time interval is triggered when 802.1X re-authentication is enabled.
- When the trust RADIUS option is enabled, the Session-Timeout attribute value received from the RADIUS server overrides the locally configured value for the switch.
- When the re-authentication time interval is changed, the new value does not apply to existing authenticated 802.1X users until the user is flushed out or when the user is authenticated again. Any new 802.1X users are re-authenticated based on the current time interval setting.

Examples

```
-> aaa 802.1x re-authentication enable
-> aaa 802.1x re-authentication enable interval 7200
-> aaa 802.1x re-authentication enable trust-radius enable
-> aaa 802.1x re-authentication enable interval 7200 trust-radius enable
-> aaa 802.1x re-authentication enable interval 7200 trust-radius disable
-> aaa 802.1x re-authentication disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show aaa config	Displays the global AAA parameter configuration for 802.1X sessions.

MIB Objects

```

aaa interim-interval

Configures the amount of time between each interim accounting update for any given session.

aaa {802.1x | mac | captive-portal} interim-interval *seconds* **[trust-radius {enable | disable}]**

Syntax Definitions

802.1x	Configures the interim interval value for 802.1X accounting sessions.
mac	Configures the interim interval value for MAC accounting sessions.
captive-portal	Configures the interim interval value for Captive Portal accounting sessions.
seconds	The amount of time between each interim accounting update. The valid range is 60–1200 seconds.
trust-radius enable	Directs the switch to use the Acct-Interim-Interval attribute value for the interim time interval. This attribute is returned from the RADIUS server in an Accept-Accept message.
trust-radius disable	Directs the switch to use the locally configured interim time interval value.

Defaults

By default, the accounting interim interval value is set to 600 seconds.

parameter	default
trust-radius enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the trust RADIUS option is enabled, the accounting interim interval value received from the RADIUS server overrides the locally configured value for the switch.
- When the accounting interim interval is changed, the new value does not apply to existing authenticated users until the user is flushed out or when the user is authenticated again.

Examples

```
-> aaa 802.1x interim-interval 1200
-> aaa 802.1x interim-interval 1200 trust-radius enable
-> aaa 802.1x interim-interval 1200 trust-radius disable

-> aaa mac interim-interval 1200
-> aaa mac interim-interval 1200 trust-radius enable
-> aaa mac interim-interval 1200 trust-radius disable

-> aaa captive-portal interim-interval 1200
```

```
-> aaa captive-portal interim-interval 1200 trust-radius enable
-> aaa captive-portal interim-interval 1200 trust-radius disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

   alaAaaMacIntrmIntrvl
   alaAaaMacIntmIntvlTrstRadStatus
   alaAaaCpIntrmIntrvl
   alaAaaCpIntmIntvlTrstRadStatus
```

aaa session-timeout

Configures whether or not an authenticated user is automatically logged out of the network based on a session timeout value.

aaa {mac | captive-portal} session-timeout {enable | disable} [interval *seconds***] [trust-radius {enable | disable}]**

Syntax Definitions

mac	Configures the session timeout parameter for authenticated MAC users.
captive-portal	Configures the session timeout parameter for authenticated Captive Portal users.
enable	Enables the session timeout timer for authenticated user sessions.
disable	Disables the session timeout timer for authenticated user sessions.
seconds	The session timeout value. The valid range is 12000–86400 seconds.
trust-radius enable	Directs the switch to use the Session-Timeout attribute returned from the RADIUS server in an Accept-Accept message.
trust-radius disable	Directs the switch to use the locally configured timeout interval value.

Defaults

By default, the session timer is disabled for the switch.

parameter	default
seconds	43200 seconds (12 hours)
trust-radius enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The session timeout parameter is configurable only for MAC and Captive Portal authentication sessions.
- The timeout interval is triggered when the session timeout parameter is enabled for the switch.
- When the trust RADIUS option is enabled, the timeout interval value received from the RADIUS server overrides the locally configured value for the switch.
- When the session timeout interval is changed, the new value does not apply to existing authenticated users until the user is flushed out or when the user is authenticated again.
- When the session timeout value is reached, the authenticated users are logged out and the MAC address for each logged out user device is flushed.

Examples

```
-> aaa mac session-timeout enable interval 13000
-> aaa mac session-timeout enable interval 14000 trust-radius enable
-> aaa mac session-timeout disable

-> aaa captive-portal session-timeout enable interval 13000
-> aaa captive-portal session-timeout enable interval 14000 trust-radius enable
-> aaa captive-portal session-timeout disable
```

Release History

Release 8.1.1; command was introduced.

   alaAaaMacSesTimeoutTrstRadStatus
   alaAaaCpSessTimeoutStatus
   alaAaaCpSessTimeoutIntrvl
   alaAaaCpSsTmotTrstRadStatus
```

aaa inactivity-logout

Configures whether or not an authenticated user is automatically logged out of the network after a specific period of inactivity.

aaa {mac | captive-portal} inactivity-logout {enable | disable} [interval *seconds***]**

Syntax Definitions

mac	Configures the inactivity logout timer for authenticated MAC users.
captive-portal	Configures the inactivity logout timer for authenticated Captive Portal users.
enable	Enables the inactivity logout timer for the specified authentication type.
disable	Disables the inactivity logout timer for the specified authentication type.
seconds	The inactivity logout time. The valid range is 60–1200 seconds.

Defaults

By default, the inactivity logout timer is disabled for the switch.

parameter	default
seconds	MAC address aging time

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The inactivity logout timer is configurable only for MAC and Captive Portal authentication sessions.
- The timer is triggered when the inactivity logout parameter is enabled for the switch.
- Make sure the configured inactivity logout time is set to a value greater than the MAC address aging time for the switch.
- If a specific time is configured for the inactivity logout timer, the user is not logged out of the network if the MAC address aging time expires before the configured timer value.
- When the inactivity logout time is changed, the new value does not apply to existing authenticated users until the user is flushed out or when the user is authenticated again.

Examples

```
-> aaa mac inactivity-logout enable
-> aaa mac inactivity-logout enable interval 600
-> aaa mac inactivity-logout disable

-> aaa captive-portal inactivity-logout enable
-> aaa captive-portal inactivity-logout enable interval 600
-> aaa captive-portal inactivity-logout disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show aaa config	Displays the global AAA parameter configuration for device authentication and accounting sessions.

   alaAaaMacInActLogoutIntrvl
   alaAaaCpInActLogoutStatus
   alaAaaCpInActLogoutIntrvl
```

aaa radius nas-port-id

Configures the RADIUS client NAS-Port attribute for authentication and accounting sessions.

aaa radius nas-port-id {user-string *string* **| default}**

Syntax Definitions

string	A text string (up to 31 characters) used to define a NAS-Port identifier for the NAS-Port attribute.
default	Sets the NAS-Port attribute value to the chassis/slot/port of the user.

Defaults

By default, the NAS-Port attribute is set to the user port (chassis/slot/port).

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The NAS-Port attribute value specified with this command is used in Account-Request messages and in Accounting-Request messages.

Examples

```
-> aaa radius nas-port-id default
-> aaa radius nas-port-id user-string nasport
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show aaa radius config	Displays the global RADIUS client attribute configuration.

MIB Objects

```
alaAaaClientAttrGroup
   alaAaaRadNasPortId
```

aaa radius nas-identifier

Configures the RADIUS client NAS-Identifier attribute for authentication and accounting sessions.

aaa radius nas-identifier {user-string *string* **| default}**

Syntax Definitions

string	A text string (up to 31 characters) used to identify the switch (RADIUS client) in the NAS-Identifier attribute.
default	Sets the NAS-Identifier attribute to the system name of the switch.

Defaults

By default, the NAS-Identifier attribute is set to the system name of the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The NAS-Identifier attribute value specified with this command is used in both Account-Request and Accounting-Request messages.

Examples

```
-> aaa radius nas-identifier default
-> aaa radius nas-identifier user-string os6860
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show aaa radius config	Displays the global RADIUS client attribute configuration.

MIB Objects

```
alaAaaClientAttrGroup
   alaAaaRadNasIdentifier
```

aaa radius mac-format

Configures the MAC address format to use in the specified RADIUS client attributes.

aaa radius mac-format {username | password | calling-station-id | called-station-id} delimiter {*char* **| none} case {uppercase | lowercase}**

Syntax Definitions

username	Configures the MAC address format for the User-Name attribute.
password	Configures the MAC address format for the User-Password attribute.
calling-station-id	Configures the MAC address format for the Calling-Station-Id attribute.
called-station-id	Configures the MAC address format for the Called-Station-Id attribute.
char	The delimiter character to use to separate the octets within a MAC address. The valid characters are a space (“ “), a hyphen (“-”), or a colon (“:”). For example, “e8 e7 32 a4 63 23”, “e8-e7-32-a4-63-23”, or “e8:e7:32:a4:63:23”.
none	No delimiter is used in the MAC address format.
uppercase	Uses uppercase characters in the MAC address format.
lowercase	Uses lowercase characters in the MAC address format.

Defaults

By default, no delimiter is used and the MAC address characters are in uppercase.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The MAC address format configured for the User-Name and User-Password attributes is only applied for MAC authentication and accounting, where these attributes are set to the MAC address of the user. The configured format is not applied for 802.1X or Captive Portal authentication and accounting.
- The MAC address format configured for the Called-Station-Id and Calling-Station-Id attributes is applied for MAC, 802.1X, and Captive Portal authentication and accounting sessions when these attributes are set to a MAC address value.
- The Called-Station-Id attribute is set to the base MAC address of the switch.
- The Calling-Station-ID attribute is configurable and can be set to the MAC address or IP address of the user.

Examples

```
-> aaa radius mac-format username delimiter none case lowercase
-> aaa radius mac-format username delimiter ":" case lowercase

-> aaa radius mac-format password delimiter none case lowercase
-> aaa radius mac-format password delimiter ":" case lowercase
```

```
-> aaa radius mac-format calling-station-id delimiter none case lowercase
-> aaa radius mac-format calling-station-id delimiter ":" case lowercase

-> aaa radius mac-format called-station-id delimiter none case lowercase
-> aaa radius mac-format called-station-id delimiter ":" case lowercase
```

Release History

Release 8.1.1; command was introduced.

aaa profile

Configures an AAA profile that is used to define and apply specific AAA parameter values to Universal Network Profile (UNP) Edge ports, link aggregates, or an Access Guardian Captive Portal profile. This section describes the base command (**aaa profile** *profile_name*) along with the other command keywords that are used to configure AAA parameter values that are applied when the profile is assigned to a UNP port or link aggregate.

aaa profile *profile_name*
[device-authentication {802.1x | mac | captive-portal} *server1* **[***server2***] [***server3***] [***server4***]]**
[accounting {802.1x | mac | captive-portal} {*server1* **[***server2***...] | syslog** *ip_address*
[port *udp_port***]}]**
[accounting {802.1x | mac | captive-portal} radius calling-station-id {mac-address | ip-address}]
[802.1x re-authentication {enable | disable} [interval *seconds***] [trust-radius {enable | disable}]]**
[{802.1x | mac | captive-portal} interim-interval *seconds* **[trust-radius {enable | disable}]]**
[{mac | captive-portal} session-timeout {enable | disable} [interval *seconds***] [trust-radius {enable | disable}]]**
[{mac | captive-portal} inactivity-logout {enable | disable} [interval *seconds***]]**
[radius nas-port-id {user-string *string* **| default}]**
[radius nas-identifier {user-string *string* **| default}]**
[radius mac-format {username | password | calling-station-id | called-station-id} delimiter {*char* **| none} case {uppercase | lowercase}]**

no aaa profile *profile_name*

Syntax Definitions

profile_name	The name to associate with the AAA configuration profile.

Defaults

The AAA profile parameters are set to the same default values that are set when the explicit AAA command is used to configure the parameter value. See the **show aaa profile** command output example in the “Examples” section of this command page to determine default values for AAA profile parameters.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the AAA profile from the switch configuration.
- Creating the template name with the base command (**aaa profile** *profile_name*) is required before attempting to configure profile parameter values.
- When an AAA profile is assigned to a UNP Edge port, the parameter values defined in the profile will override any existing global AAA configuration for users authenticating on that port.

- When an AAA profile is assigned to a Captive Portal profile, the parameters values defined in the AAA profile will override any existing global AAA configuration for users authenticated through the Captive Portal profile configuration.
- For more information about specific AAA parameter values, refer to the following explicit AAA configuration commands for each profile parameter option:

AAA Profile Parameter	Explicit Port Configuration Command
[device-authentication {802.1x | mac | captive-portal} *server1* **[***server2***] [***server3***] [***server4***]]**	**aaa device-authentication**
[accounting {802.1x | mac | captive-portal} {*server1* [*server2*...] | **syslog** *ip_address* [**port** *udp_port*]}]	**aaa accounting**
[accounting {802.1x | mac | captive-portal} radius calling-station-id {mac-address | ip-address}]	**aaa accounting radius calling-station-id**
[802.1x re-authentication {enable | disable} [interval *seconds***] [trust-radius {enable | disable}]]**	**aaa 802.1x re-authentication**
[{802.1x | mac | captive-portal} interim-interval *seconds* **[trust-radius {enable | disable}]]**	**aaa interim-interval**
[{mac | captive-portal} session-timeout {enable | disable} [interval *seconds***] [trust-radius {enable | disable}]]**	**aaa session-timeout**
[{mac | captive-portal} inactivity-logout {enable | disable} [interval *seconds***]]**	**aaa inactivity-logout**
[radius nas-port-id {user-string *string* | **default}]**	**aaa radius nas-port-id**
[**radius nas-identifier {user-string** *string* | **default}]**	**aaa radius nas-identifier**
[radius mac-format {username | password | calling-station-id | called-station-id} delimiter {*char* | **none} case {uppercase | lowercase}]**	**aaa radius mac-format**

Examples

```
-> aaa profile prof1
-> no aaa profile prof1

-> aaa profile ap-1 device-authentication mac rad1 rad2
-> aaa profile ap-1 device-authentication 802.1x serv1 serv2 serv3 serv4
-> aaa profile ap-2 device-authentication captive-portal rad3 rad4
-> no aaa profile ap-2 device-authentication captive-portal

-> aaa profile ap-1 accounting 802.1x rad1 rad2 rad3
-> aaa profile ap-1 accounting mac rad1 rad2
-> aaa profile ap-1 accounting captive-portal syslog 10.135.67.99 port 8000
-> no aaa profile ap-1 accounting captive-portal

-> aaa profile ap-1 mac inactivity-logout enable
-> aaa profile ap-1 mac inactivity-logout enable interval 600
-> aaa profile ap-1 mac inactivity-logout disable

-> aaa profile ap-1 captive-portal inactivity-logout enable
-> aaa profile ap-1 captive-portal inactivity-logout enable interval 600
-> aaa profile ap-1 captive-portal inactivity-logout disable
```

The following **show aaa profile** command output example shows the default values applied when the AAA profile is created:

```
-> show aaa profile ap-2

AAA profile name = ap-2
Authentication type = mac
    Session Timeout:
      Status            = disable,
      Interval (sec)    = 43200,
      Trust Radius      = disable

    Inactivity Timeout:
      Status            = disable,
      Interval (sec)    = 600

    Accounting Interim:
      Interval (sec)    = 600,
      Trust Radius      = disable

Authentication type = 802.1x
    Re-Authentication Timeout:
      Status            = disable,
      Interval (sec)    = 3600,
      Trust Radius      = disable

    Accounting Interim:
      Interval (sec)    = 600,
      Trust Radius      = disable

Authentication type = captive-portal
    Session Timeout:
      Status            = disable,
      Interval (sec)    = 43200,
      Trust Radius      = disable

    Inactivity Timeout:
      Status            = disable,
      Interval (sec)    = 600

    Accounting Interim:
      Interval (sec)    = 600,
      Trust Radius      = disable

RADIUS client attributes:
  NAS port id       = default,
  NAS identifier    = default,
    MAC format delimiter:
      Username           = none, UserNameCase = uppercase,
      Password           = none, PasswordCase = uppercase,
      calling station id = none, ClgStaIdCase = uppercase,
      called station id  = none, CldStaIdCase = uppercase
```

Release History

Release 8.1.1; command was introduced.

Related Commands

user

Configures or modifies user entries in the local user database. Use the **no** form of the command to remove the user from the local database.

user *username* **[password** *password***] [expiration {***day* | *date***}] [read-only | read-write [***families...* | *domains...*| **all | none]] [no snmp | no auth | sha | md5 | sha+des | md5+des | sha+aes] [console-only {enable | disable}]**

no user *username*

Syntax Definitions

username	The name of the user. Used for logging into the switch. Required to create a new user entry or for modifying a user. Maximum 63 characters.
password	The user's password in clear text or hexadecimal (corresponding to encrypted form). Required to create a new user entry. Maximum 47 characters.
day	The number of days before this user's current password expires. The range is 1 to 150 days.
date	The date (in the format *mm/dd/yyyy hh:mm*) that the user's current password will expire.
read-only	Specifies that the user will have read-only access to the switch.
read-write	Specifies that the user will have read-write access to the switch.
families	Determines the command families available to the user on the switch. Each command family should be separated by a space. Command families are subsets of domains.
domains	Determines the command domains available to the user on the switch. Each domain should be separated by a space.
all	Specifies that all command families and domains are available to the user.
none	Specifies that no command families or domains are available to the user.
no snmp	Denies the specified user SNMP access to the switch.
no auth	Specifies that the user has SNMP access without any required SNMP authentication and encryption protocol.
sha	Specifies that the SHA authentication algorithm should be used for authenticating SNMP PDU for the user.
md5	Specifies that the MD5 authentication algorithm should be used for authenticating SNMP PDU for the user.
sha+des	Specifies that the SHA authentication algorithm and DES encryption standard should be used for authenticating and encrypting SNMP PDU for the user.
md5+des	Specifies that the MD5 authentication algorithm and the DES encryption standard should be used for authenticating and encrypting SNMP PDU for the user.

sha+aes	Specifies that the SHA authentication algorithm and the AES encryption standard should be used for authenticating and encrypting SNMP PDU for the user.
console-only enable	Enables console only access for the user *admin*.
console-only disable	Disables console only access for the user *admin*.

Defaults

By default, if a user is created without indicating the read and write privileges and SNMP access, the user will be given privileges based on the *default user account*. The ***default*** user account may be modified.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- At least one user with SHA/MD5 authentication and/or DES encryption must be configured on the switch for SNMPv3 communication with OmniVista.
- Note that the exclamation point (!) is not a valid password character. In addition, specifying an asterisk (*) as one or more characters in a password is allowed as long as every character is not an asterisk. For example, **password** ****123456**** is allowed; **password ********* is not allowed.
- A password expiration for the user's current password may be configured with the **expiration** option. However, if the password is changed, or the global password expiration setting is configured with the **user password-expiration** command, the user's password expiration will be configured with the global expiration setting.
- When modifying a user's SNMP access, the user password must be re-entered (or a new one configured). This is required because the hash algorithm used to save the password in the switch depends on the SNMP authentication level.
- At initial startup, the default user on the switch is **admin** with a password of **switch**. The switch will not recreate this user at any successive startup as long as there exists at least one user defined with write access to all commands. (Note that if password expiration is configured for the **admin** user, or configured globally through the **user password-expiration** command, when the **admin** user's password expires, the **admin** user will have access only through the console port.)
- New users or updated user settings are saved *automatically*.

Examples

```
-> user techpubs password writer_pass read-only config
-> no user techpubs
```

Release History

Release 8.1.1; command was introduced.

Related Commands

password	Configures the password for the current user.
show user	Displays information about users configured in the local database on the switch.

MIB Objects

```
aaaUserTable
   aaauPassword
   aaauReadRight
   aaauWriteRight
   aaauSnmpLevel
   aaauSnmpAuthKey
   aaauPasswordExpirationDate
```

password

Configures the password for the current user.

password

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The **password** command does not require a password in-line; instead, after the command is entered, the system displays a prompt for the password. Enter any alphanumeric string. (The string displays on the screen as asterisks.) The system displays a prompt to verify the new password.
- The password may be up to 47 characters. The default minimum password length is 8 characters.
- A new password cannot be identical to the current password; it cannot be identical to any of the three passwords that preceded the current password.
- Note that the exclamation point (!) is not a valid password character. In addition, specifying an asterisk (*) as one or more characters in a password is allowed as long as every character is not an asterisk. For example, **password** ****123456**** is allowed; **password ********** is not allowed.
- Password settings are *automatically* saved to the switch configuration.
- Passwords with non-alphanumeric characters should be enclosed in single quotes.
- If the **snapshot** command is used to capture the switch configuration, the text of the password is not displayed in the file. Instead an authentication key is included in the file.

Examples

```
-> password
enter old password: ********
enter new password: *********
reenter new password: *********
->
```

Release History

Release 8.1.1; command was introduced.

Related Commands

user	Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges.

MIB Objects

```
aaaUserTable
   aaauPassword
   aaauOldPassword
```

user password-size min

Configures the minimum number of characters required when configuring a user password.

user password-size min *size*

Syntax Definitions

size	The number of characters required when configuring a user password through the **password** command or when setting up a user password through the **user** command. The range is 1 to 14 characters.

Defaults

parameter	default
size	6

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> user password-size min 9
```

Release History

Release 8.1.1; command was introduced.

Related Commands

user	Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges.
show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordSizeMin
```

user password-expiration

Configures an expiration date for all user passwords stored locally on the switch or disables password expiration.

user password-expiration {*day* | **disable}**

Syntax Definitions

day	The number of days before locally configured user passwords will expire. The range is 1 to 150 days.
disable	Disables password expiration for users configured locally on the switch.

Defaults

parameter	default
day | **disable**	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The **user password-expiration** command sets a default password expiration for users configured locally on the switch.
- Password expiration may be configured on a per-user basis through the **user** command; the user setting overrides the **user password-expiration** setting until the user password is changed or the **user password-expiration** command is entered again.

Examples

```
-> user password-expiration 2
-> user password-expiration disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

user	Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges.
show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaDefaultPasswordExpirationInDays
```

user password-policy cannot-contain-username

Specifies whether or not a user can configure a password that contains the username for the account.

user password-policy cannot-contain-username {enable | disable}

Syntax Definitions

enable	Does not allow the password to contain the username.
disable	Allows the password to contain the username.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The status of this function is specified as part of a global password policy that is applied to all passwords when they are created or modified.
- When this function is enabled, a check is done at the time the password is created or modified to ensure that the username is not specified as part of the password text.

Examples

```
-> user password-policy cannot-contain-username enable
-> user password-policy cannot-contain-username disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordContainUserName
```

user password-policy min-uppercase

Configures the minimum number of uppercase English characters required for a valid password.

user password-policy min-uppercase *number*

Syntax Definitions

number	The minimum number of uppercase characters. The range is 0 to 7.

Defaults

parameter	default
number	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Specify **0** with this command to disable the minimum uppercase character requirement.
- The minimum number of uppercase characters is specified as part of a global password policy that is applied to all passwords when they are created or modified.

Examples

```
-> user password-policy min-uppercase 2
-> user password-policy min-uppercase 0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordMinUpperCase
```

user password-policy min-lowercase

Configures the minimum number of lowercase English characters required for a valid password.

user password-policy min-uppercase *number*

Syntax Definitions

number	The minimum number of lowercase characters. The range is 0 to 7.

Defaults

parameter	default
number	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Specify **0** with this command to disable the minimum lowercase character requirement.
- The minimum number of lowercase characters is specified as part of a global password policy that is applied to all passwords when they are created or modified.

Examples

```
-> user password-policy min-lowercase 2
-> user password-policy min-lowercase 0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordMinLowerCase
```

user password-policy min-digit

Configures the minimum number of base-10 digits required for a valid password.

user password-policy min-digit *number*

Syntax Definitions

number	The minimum number of digits. The range is 0 to 7.

Defaults

parameter	default
number	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Specify **0** with this command to disable the minimum number of digits requirement.
- The minimum number of digits requirement is specified as part of a global password policy that is applied to all passwords when they are created or modified.

Examples

```
-> user password-policy min-digit 2
-> user password-policy min-digit 0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordMinDigit
```

user password-policy min-nonalpha

Configures the minimum number of non-alphanumeric characters (symbols) required for a valid password.

user password-policy min-nonalpha *number*

Syntax Definitions

number	The minimum number of non-alphanumeric characters. The valid range is 0–7.

Defaults

parameter	default
number	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Specify **0** with this command to disable the minimum non-alphanumeric character requirement.
- The minimum number of non-alphanumeric characters is specified as part of a global password policy that is applied to all passwords when they are created or modified.
- Passwords with non-alphanumeric characters should be enclosed in single quotes.

Examples

```
-> user password-policy min-nonalpha 2
-> user password-policy min-nonalpha 0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordMinNonAlpha
```

user password-history

Configures the maximum number of old passwords to retain in the password history.

user password-history *number*

Syntax Definitions

number	The maximum number of old passwords to retain. The range is 0 to 24.

Defaults

parameter	default
number	4

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Specify **0** with this command to disable the password history function.
- The user is prevented from specifying any passwords that are recorded in the password history and fall within the range configured through this command.
- The password history value is specified as part of a global password policy that is applied to all passwords when they are created or modified.

Examples

```
-> user password-history 2
-> user password-history 0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordHistory
```

user password-min-age

Configures the minimum number of days during which a user is prevented from changing a password.

user password-min-age *days*

Syntax Definitions

days	The number of days to use as the minimum age of the password. The range is 0 to 150.

Defaults

parameter	default
days	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Specify **0** with this command to disable the minimum number of days requirement.
- Configure the minimum age of a password with a value that is less than the value configured for the password expiration.
- The password minimum age value is specified as part of a global password policy that is applied to all passwords when they are created or modified.

Examples

```
-> user password-min-age 7
-> user password-min-age 0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show user password-policy	Displays the global password policy configuration for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaPasswordMinAge
```

user lockout-window

Configures a moving period of time (observation window) during which failed login attempts are counted to determine if the number of failed attempts has exceeded the number of allowed attempts. The number of failed login attempts is decremented by the number of failed attempts that age beyond the observation window time period.

user lockout-window *minutes*

Syntax Definitions

minutes	The number of minutes the observation window remains active. The range is 0 to 99999.

Defaults

parameter	default
minutes	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is only available to the **admin** user because the **admin** user account is the only account protected from any type of lockout attempt.
- Specify **0** with this command to disable the observation window function. This means that failed login attempts will never age out; the number of failed attempts is never decremented.
- Do not configure an observation window time period that is greater than the lockout duration time period.
- If the number of failed login attempts exceeds the number of failed attempts allowed before the observation window time expires, then the user account is locked out of the switch.
- The observation window time period is a global lockout setting that is applied to all passwords configured on the switch.
- Lockout settings are saved *automatically*.

Examples

```
-> user lockout-window 500
-> user lockout-window 0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

user lockout-duration	Configures the amount of time a user account remains locked out of the switch.
user lockout-threshold	Configures the number of failed password attempts allowed before the user account is locked out of the switch.
user lockout unlock	Manually locks or unlocks a user account on the switch.
show user lockout-setting	Displays the global user lockout settings for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaLockoutWindow
```

user lockout-threshold

Configures the number of failed password login attempts allowed during a certain period of time (observation window). If the number of failed attempts exceeds the lockout threshold number before the observation window period expires, the user account is locked out.

user lockout-threshold *number*

Syntax Definitions

number	The number of failed login attempts allowed. The range is 0 to 999.

Defaults

parameter	default
number	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is only available to the **admin** user because the **admin** user account is the only account protected from any type of lockout attempt.
- If the lockout threshold is set to zero (the default), there is no limit to the number of failed login attempts allowed.
- A user account remains locked out for the length of the lockout duration time period; at the end of this time, the account is automatically unlocked.
- If the lockout duration time period is set to zero, only the **admin** user or a user with read/write AAA privileges can unlock a locked user account. An account is unlocked by changing the user account password or with the **user lockout unlock** command.
- The lockout threshold time period is a global lockout setting that is applied to all passwords configured on the switch.
- Lockout settings are saved *automatically*; that is, these settings do not require the **issu slot**, **reload slot**, or **configuration snapshot** command to save user settings over a reboot.

Examples

```
-> user lockout-threshold 3
-> user lockout-threshold 0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

user lockout-window	Configures a window of time during which failed login attempts are counted to determine if the number of failed attempts has exceeded the number of allowed attempts.
user lockout-duration	Configures the length of time a user account remains locked out of the switch.
user lockout unlock	Manually locks or unlocks a user account on the switch.
show user lockout-setting	Displays the global user lockout settings for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaLockoutThreshold
```

user lockout-duration

Configures the length of time a user account remains locked out of the switch. At the end of this time period, the user account is automatically unlocked.

user lockout-duration *minutes*

Syntax Definitions

minutes	The number of minutes the user account remains locked out. The range is 0 to 99999.

Defaults

parameter	default
minutes	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is only available to the **admin** user because the **admin** user account is the only account protected from any type of lockout attempt.
- Note that if the lockout duration time period is set to zero (the default), then locked user accounts are never automatically unlocked.
- Only the **admin** user or a user with read/write AAA privileges can unlock a locked user account when the lockout duration time is set to zero. An account is unlocked by changing the user password or with the **user lockout unlock** command.
- Do not configure a lockout duration time period that is less than the amount of time configured for the observation window.
- The lockout duration time period is a global lockout setting that is applied to all passwords configured on the switch.
- Lockout settings are saved *automatically*; that is, these settings do not require the **issu slot**, **reload slot**, or **configuration snapshot** command to save user settings over a reboot.

Examples

```
-> user lockout-duration 60
-> user lockout-duration 0
```

Release History

Release 8.1.1; command was introduced.

Related Commands

user lockout-window	Configures a window of time during which failed login attempts are counted to determine if the number of failed attempts has exceeded the number of allowed attempts.
user lockout-threshold	Configures the number of failed password attempts allowed before the user account is locked out of the switch.
user lockout unlock	Manually locks or unlocks a user account on the switch.
show user lockout-setting	Displays the global user lockout settings for the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaLockoutDuration
```

user lockout unlock

Manually locks or unlocks a user account on the switch.

user *username* **{lockout | unlock}**

Syntax Definitions

username	The username of the account to lock or unlock.
lockout	Locks the user account out of the switch.
unlock	Unlocks a locked user account.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is only available to the **admin** user or a user with read/write AAA privileges.
- The **admin** user account is protected from any type of lockout attempt.
- User lockouts and unlocks are saved *automatically*.

Examples

```
-> user j_smith lockout
-> user j_smith unlock
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show user	Displays information about all users or a particular user configured in the local user database on the switch.
show user lockout-setting	Displays the global user lockout settings for the switch.

MIB Objects

```
aaaUserTable
   aaauPasswordLockoutEnable
```

show aaa server

Displays information about a particular AAA server or AAA servers.

show aaa server [*server_name***]**

Syntax Definitions

server_name	The server name, which is defined through the **aaa radius-server, aaa tacacs+-server**, or **aaa ldap-server** commands.

Defaults

By default, the configuration for all servers is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter the name of a server with this command to display information about a specific server.
- RADIUS, TACACS+, and LDAP parameters are configured through the **aaa radius-server**, **aaa tacacs+-server**, and **aaa ldap-server** commands.

Examples

```
-> show aaa server
Server name = rad1
   Server type         = RADIUS,
   IP Address 1        = 10.10.2.1,
   IP Address 2        = 10.10.3.5,
   Retry number        = 3,
   Timeout (in sec)    = 2,
   Authentication port = 1645,
   Accounting port     = 1646
   VRF                 = default
Server name = ldap2
   Server type         = LDAP,
   Host name 1         = ors40535,
   Port                = 389,
   Domain name         = manager,
   Search base         = c=us,
   Retry number        = 3,
   Timeout (in sec)    = 2,
   SSL enable          = TRUE
   VRF                 = default
Server name = Tpub1
   Server type          = TACACS+,
   IP Address 1         = 10.10.5.1,
   Port                 = 49,
   Timeout (in sec)     = 2,
   Encryption enabled   = no
   VRF                 = default
```

```
-> show aaa server ldap2
Server name = ldap2
   Server type         = LDAP,
   Host name 1         = ors40535,
   Port                = 389,
   Domain name         = manager,
   Search base         = c=us,
   Retry number        = 3,
   Timeout (in sec)    = 2,
   SSL enable          = TRUE
   VRF                 = default
```

output definitions

Server name	The name of the server. A RADIUS, TACACS+ or LDAP server name is defined through the **aaa radius-server, aaa tacacs+-server,** and **aaa ldap-server** commands respectively.
Server type	The type of server (LDAP, TACACS+, or RADIUS).
Host name	The name of the primary LDAP, TACACS+, or RADIUS host.
IP address	The IP address of the server.
Retry number	The number of retries the switch makes to authenticate a user before trying the backup server.
Timeout	The timeout for server replies to authentication requests.
Port	The port number for the primary LDAP or TACACS+ server.
Encryption enabled	The status of the encryption.
Domain name	The super-user or administrative distinguished name in the format recognized by the LDAP-enabled directory servers.
Search base	The search base recognized by the LDAP-enabled directory servers.
Authentication port	The UDP destination port for authentication requests.
Accounting port	The UDP destination port for accounting requests.
SSL enable	Whether or not a secure switch layer (SSL) is enabled between the switch and the LDAP server.
VRF	Name of the VRF associated with the server.

Release History

Release 8.1.1; command was introduced.

Related Commands

aaa radius-server	Configures or modifies a RADIUS server for authenticated switch access.
aaa ldap-server	Configures or modifies an LDAP server for authenticated switch access.
aaa tacacs+-server	Configures or modifies an TACACS+ server for authenticated switch access.

```

show aaa authentication

Displays information about the current authenticated switch session.

show aaa authentication

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **show aaa authentication** command to display authentication information about switch management services (Telnet, FTP, console port, Secure Shell, etc.).

Examples

```
-> show aaa authentication
Service type = Default
   1rst authentication server  = RadiusServer
   2nd authentication server   = local
Service type = Console
   1rst authentication server  = local
Service type = Telnet
   Authentication = Use Default,
   1rst authentication server  = RadiusServer
   2nd authentication server   = local
Service type = FTP
   Authentication = Use Default,
   1rst authentication server  = RadiusServer
   2nd authentication server   = local
Service type = Http
   Authentication = Use Default,
   1rst authentication server  = RadiusServer
   2nd authentication server   = local
Service type = Snmp
   Authentication = Use Default,
   1rst authentication server  = RadiusServer
   2nd authentication server   = local
Service type = Ssh
   Authentication = Use Default,
   1rst authentication server  = TacacsServer
   2nd authentication server   = local
```

output definitions

Authentication	Displays **denied** if the management interface is disabled. Displays **Use Default** if the management interface is configured to use the default configuration.
1st authentication server	The first server to be polled for authentication information.
2nd authentication server	The next server to be polled for authentication information.

Release History

Release 8.1.1; command was introduced.

Related Commands

aaa authentication	Configures the interface for authenticated switch access and specifies the server(s) to be used.

MIB Objects

```
aaaAuthSATable
   aaatsName1
   aaatsName2
   aaatsName3
   aaatsName4
```

show aaa device-authentication

Displays a list of RADIUS servers assigned to provide 802.1X, MAC, or Captive Portal authentication.

show aaa device-authentication [802.1x | mac | captive-portal]

Syntax Definitions

802.1x	Displays the servers used for 802.1X authentication.
mac	Displays the servers used for MAC authentication.
captive-portal	Uses the servers used for Captive Portal authentication.

Defaults

By default, all assigned servers are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the optional **802.1x**, **mac**, or **captive-portal** parameters to display the servers assigned to provide the specified type of authentication.

Examples

```
-> show aaa device-authentication
Authentication type = mac
    Authentication Server:
      1st authentication server = cppm,
      2nd authentication server = rad1
      3rd authentication server = rad2,
      4th authentication server = rad3

Authentication type = 802.1x
    Authentication Server:
      1st authentication server = cppm,
      2nd authentication server = rad1

Authentication type = captive-portal
    Authentication Server:
      1st authentication server = cppm,
      2nd authentication server = rad1
```

output definitions

Authentication type	The type of authentication the server is assigned to provide (**802.1x**, **mac**, or **captive-portal**)
1st authentication server	The first server to be polled for authentication information. Any backup servers are also displayed on subsequent lines.

Release History

Release 8.1.1; command was introduced.

Related Commands

aaa device-authentication	Configures the RADIUS server to use for 802.1X, MAC, or Captive Portal authentication.

MIB Objects

```
aaaAuthDATable
   aaadaInterface
   aaadaName1
   aaadaName2
   aaadaName3
   aaadaName4
```

show aaa accounting

Displays information about accounting servers configured for authenticated switch access and device authentication sessions. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

show aaa accounting [802.1x | mac | captive-portal]

Syntax Definitions

802.1x	Displays the RADIUS or syslog server used to log accounting for 802.1X authenticated sessions.
mac	Displays the RADIUS or syslog server used to log accounting for MAC authenticated sessions.
captive-portal	Displays the RADIUS or syslog server to log accounting for Captive Portal authenticated sessions.

Defaults

By default, the accounting server configuration is displayed for TACACS+ commands and management sessions (Telnet, FTP, console port, HTTP, or SNMP).

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **802.1x**, **mac**, or **captive-portal** parameters to display the accounting server configuration for a specific type of device authentication.
- If no parameters are entered with this command, the accounting server configuration for authentication sessions and TACACS+ commands is displayed.

Examples

```
-> show aaa accounting mac
Accounting type = mac
    Accounting Server:
      1st Accnt Server = rad1,
      2nd Accnt Server = rad2

-> show aaa accounting 802.1x
Accounting type = 802.1x
    Syslog Accnt Server:
      IP Address = 135.254.163.110,
      UDP port   = 514

-> show aaa accounting captive-portal
Accounting type = captive-portal
    Syslog Accnt Server:
      IP Address = 135.254.163.110,
      UDP port   = 514
```

```
-> show aaa accounting
Session (telnet, ftp, ...)
  1st accounting server  = rad1
Command accounting server
  1st accounting server  = server1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

aaa accounting session	Configures an accounting server for authenticated switch access sessions.

   aaacdSyslogIPAddr
   aaacdSyslogUdpPort
   aaacdRowStatus
```

show aaa config

Displays the AAA parameter configuration for 802.1X, MAC, and Captive Portal sessions.

show aaa {802.1x | mac | captive-portal} config

Syntax Definitions

802.1x	Displays the parameter configuration for 802.1X authenticated sessions.
mac	Displays the parameter configuration for MAC authenticated sessions.
captive-portal	Displays the parameter configuration for Captive Portal authenticated sessions.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **802.1x**, **mac**, or **captive-portal** parameters to display the parameter configuration for a specific type of device authentication.

Examples

```
-> show aaa 802.1x config
Authentication type = 802.1x
    Re-Authentication Timeout:
      Status                  = enable,
      Interval (sec)          = 3600,
      Trust Radius            = disable

    Accounting Interim:
      Interval (sec)          = 600,
      Trust Radius            = disable

-> show aaa mac config
Authentication type = mac
    Session Timeout:
      Status                  = disable,
      Interval (sec)          = 43200,
      Trust Radius            = disable

    Inactivity Timeout:
      Status                  = disable,
      Interval (sec)          = 600

    Accounting Interim:
      Interval (sec)          = 600,
      Trust Radius            = disable
```

```
-> show aaa captive-portal config
Authentication type = captive-portal
    Session Timeout:
      Status                  = disable,
      Interval (sec)          = 43200,
      Trust Radius            = disable

    Inactivity Timeout:
      Status                  = disable,
      Interval (sec)          = 600

    Accounting Interim:
      Interval (sec)          = 600,
      Trust Radius            = disable
```

output definitions

Authentication type	The type of authentication (**802.1x**, **mac**, or **captive-portal**).
Session Timeout	The parameter values for the AAA session timeout parameter. Does not apply to 802.1X authentication. Configured through the **aaa session-timeout** command.
Inactivity Logout	The parameter values for the AAA inactivity logout parameter. Does not apply to 802.1X authentication. Configured through the **aaa inactivity-logout** command.
Accounting Interim	The parameter values for the AAA accounting interim parameter. Configured through the **aaa interim-interval** command.
Re-authentication Timeout	The parameter values for the AAA 802.1X re-authentication timeout parameter. Does not apply to MAC or Captive Portal authentication. Configured through the **aaa 802.1x re-authentication** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

show aaa device-authentication	Displays the device authentication server configuration.
show aaa accounting	Displays the accounting server configuration.
show aaa profile	Displays the AAA parameter profile configuration.

MIB Objects

```

show aaa radius config

Displays the global AAA attribute values and MAC address format.

show aaa radius config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The MAC address format determines the delimiter character used between MAC address octets and whether or not characters are in uppercase or lowercase. This format is applied only when the RADIUS attribute value is set to a MAC address.

Examples

```
-> show aaa radius config
RADIUS client attributes:
  NAS port id         = default,
  NAS identifier      = default
    MAC format delimiter:
      Username            = none, UserNameCase = uppercase,
      Password            = none, PasswordCase = uppercase,
      calling station id  = none, ClgStaIdCase = uppercase,
      called station id   = none, CldStaIdCase = uppercase
```

Release History

Release 8.1.1; command was introduced.

Related Commands

   alaAaaCpInActLogoutIntrvl
```

show aaa profile

Displays the AAA profile configuration.

show aaa profile *profie_name*

Syntax Definitions

profile_name	The name of an existing AAA profile.

Defaults

By default, all profiles are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Enter an AAA profile name with this command to display information about a specific profile.

Examples

```
-> show aaa profile ap2

AAA profile name = ap2
Authentication type = mac
    Session Timeout:
      Status            = disable,
      Interval (sec)    = 43200,
      Trust Radius      = disable

    Inactivity Timeout:
      Status            = disable,
      Interval (sec)    = 600

    Accounting Interim:
      Interval (sec)    = 600,
      Trust Radius      = disable

Authentication type = 802.1x
    Re-Authentication Timeout:
      Status            = disable,
      Interval (sec)    = 3600,
      Trust Radius      = disable

    Accounting Interim:
      Interval (sec)    = 600,
      Trust Radius      = disable

Authentication type = captive-portal
    Session Timeout:
      Status            = disable,
      Interval (sec)    = 43200,
```

```
      Trust Radius      = disable

    Inactivity Timeout:
      Status            = disable,
      Interval (sec)    = 600

    Accounting Interim:
      Interval (sec)    = 600,
      Trust Radius      = disable

RADIUS client attributes:
  NAS port id       = default,
  NAS identifier    = default,
    MAC format delimiter:
      Username           = none, UserNameCase = uppercase,
      Password           = none, PasswordCase = uppercase,
      calling station id = none, ClgStaIdCase = uppercase,
      called station id  = none, CldStaIdCase = uppercase
```

output definitions

Authentication type	The type of authentication (**802.1x**, **mac**, or **captive-portal**) configured through the profile.
Session Timeout	The profile values defined for the AAA session timeout parameter. Does not apply to 802.1X authentication.
Inactivity Logout	The profile values defined for the AAA inactivity logout parameter. Does not apply to 802.1X authentication.
Accounting Interim	The profile values defined for the AAA accounting interim parameter.
Re-authentication Timeout	The profile values defined for the AAA re-authentication timeout parameter. Does not apply to MAC or Captive Portal authentication.
RADIUS client attributes	The profile values defined for the NAS-Port and NAS-Port-Identifier attributes and the format to use when the specified attribute value is set to a MAC address.

Release History

Release 8.1.1; command was introduced.

show user

Displays information about all users or a particular user configured in the local user database on the switch.

show user [*username***]**

Syntax Definitions

username	The name of the user. Used for logging into the switch.

Defaults

By default, all users are displayed if the *username* parameter is not specified with this command.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command to display information about read/write access and partitioned management access (domains and families).

Examples

```
-> show user
User name = admin,
  Password expiration     = None,
  Password allow to be modified date     = None,
  Account lockout     = None,
  Password bad attempts     = 2,
  Read Only for domains   = None,
  Read/Write for domains  = All ,
  Snmp allowed     = NO
  Console-Only    = Disabled
User name = default (*),
  Password expiration     = None,
  Password allow to be modified date     = None,
  Account lockout     = None,
  Password bad attempts     = 0,
  Read Only for domains   = None,
  Read/Write for domains  = None,
  Snmp allowed     = NO
  Console-Only    = Disabled,
(*)Note:
  The default user is not an active user account.
  It constains the default user account settings,
  for new user accounts.

User name = snmpadmin,
  Password expiration     = None,
  Password allow to be modified date     = None,
  Account lockout     = None,
  Password bad attempts     = 0,
```

```
  Read Only for domains   = None,
  Read/Write for domains  = None,
  Snmp allowed     = YES,
  Snmp authentication     = MD5,
  Snmp encryption     = DES
  Console-Only    = Disabled
User name = tpubs,
  Password expiration     = None,
  Password allow to be modified date     = None,
  Account lockout     = None,
  Password bad attempts     = 0,
  Read Only for domains   = None,
  Read/Write for domains  = All ,
  Snmp allowed     = NO
  Console-Only    = Disabled
```

output definitions

User name	The user name for this account.
Password expiration	The date and time on which the password will expire. This field only displays if the password expiration is configured specifically for a user, or a default password expiration is configured globally on the switch through the **user password-expiration** command. (Note that the date/time are based on the switch's default system date/time or the system date/time configured through the **system date** and **system time** commands.)
Password allow to be modified date	The earliest date and time on which the user may change the password. Configured through the **user password-min-age** command.
Account lockout	Indicates if the user account is locked out (**Yes** or **No**) and how many minutes remain until the user account is automatically unlocked. If no remaining time is displayed, the **admin** user or a user with admin privileges must manually unlock the account. Configured through the **user lockout-duration** and **user lockout unlock** commands.
Password bad attempts	The number of failed password login attempts for this user account.
Read Only for domains	The command domains available with the user's read-only access. See the table on the next page for a listing of valid domains.
Read/Write for domains	The command domains available with the user's read-write access. See the table on the next page for a listing of valid domains.
Read Only for families	The command families available with the user's read-only access. See the table on the next page for a listing of valid families.
Read/Write for families	The command families available with the user's read-write access. See the table on the next page for a listing of valid families.
Snmp allowed	Indicates whether or not the user is authorized to use SNMP (**YES** or **NO**). SNMP is allowed for the user account when SNMP authentication is specified for the account.
Snmp authentication	The level of SNMP authentication, if any, configured for the user. This field only displays if the user is authorized to use SNMP.
Snmp encryption	The level of SNMP encryption, if any, configured for the user. This field only displays if the user is authorized to use SNMP.

Possible values for command domains and families are listed here:

Domain	Corresponding Families
domain-admin	file telnet dshell debug
domain-system	system aip snmp rmon webmgt config
domain-physical	chassis module interface pmm health
domain-network	ip rip ospf bgp vrrp ip-routing ipx ipmr ipms
domain-layer2	vlan bridge stp 802.1q linkagg ip-helper
domain-service	dns
domain-policy	qos policy slb
domain-security	session avlan aaa

Release History

Release 8.1.1; command was introduced.

Related Commands

user	Configures user entries in the local user database.
show user password-policy	Displays the global password policy configuration for the switch.
show user lockout-setting	Displays the global user lockout settings for the switch.

show user password-policy

Displays the global password settings configured for the switch.

show user password-policy

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The password policy contains parameter values that define configuration requirements for all passwords that are created on the switch. Use this command to display the current parameter values for the password policy.

Examples

```
-> show user password-policy
Password Policy:
Contain username flag: Enable
Minimum number of English uppercase characters: 6
Minimum number of English lowercase characters: 4
Minimum number of base-10 digit: 2
Minimum number of non-alphanumeric: 3
Minimum size: 8
Password history: 4
Password minimum age: 20 (days)
Password expiration: 40 (days)
```

output definitions

Contain username flag	Indicates if the username is included with the password check (**Enable** or **Disable**). Configured through the **user password-policy cannot-contain-username** command.
Minimum number of English uppercase characters	The minimum number of uppercase characters required in a password. Configured through the **user password-policy min-uppercase** command.
Minimum number of English lowercase characters	The minimum number of lowercase characters required in a password. Configured through the **user password-policy min-lowercase**.
Minimum number of base-10 digit	The minimum number of digits required in a password. Configured through the **user password-policy min-digit** command.

output definitions

Minimum number of non-alphanumeric	The minimum number of non-alphanumeric characters required in a password. Configured through the **user password-policy min-nonalpha** command.
Minimum size	The minimum number of characters required for the password size. Configured through the **user password-size min** command.
Password history	The maximum number of old passwords retained in the password history. Configured through the **user password-history** command.
Password minimum age	The number of days a password is protected from any modification. Configured through the **user password-min-age** command.
Password expiration	The default expiration date applied to all passwords. Configured through the **user password-expiration** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

show user password-policy	Displays the expiration date for passwords configured for user accounts stored on the switch.

MIB Objects

   aaaAsaPasswordSizeMin
   aaaAsaDefaultPasswordExpirationInDays
```

show user lockout-setting

Displays the global user lockout settings for the switch.

show user lockout-setting

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The global lockout settings include parameter values that determine the length of a user observation window, the amount of time a locked user remains locked, and the number of failed password login attempts allowed.

Examples

```
-> show user lockout-setting
Lockout Setting:
Observation window: 30 (minutes)
Duration: 200 (minutes)
Threshold: 20
```

output definitions

Observation window	The amount of time, in minutes, during which the number of failed password login attempts are counted. Configured through the **user lockout-window** command.
Duration	The amount of time, in minutes, that a locked user account remains locked out of the switch. Configured through the **user lockout-duration** command.
Threshold	The maximum number of failed password login attempts allowed before the user is locked out of the switch. Configured through the **user lockout-threshold** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

user lockout unlock	Manually locks or unlocks a user account on the switch.
show user	Displays information about all users or a particular user configured in the local user database on the switch.

MIB Objects

```
aaaAsaConfig
   aaaAsaLockoutWindow
   aaaAsaLockoutDuration
   aaaAsaLockoutThreshold
```

show aaa priv hexa

Displays hexadecimal values for command domains/families. Useful for determining how to express command families in hexadecimal; hexadecimal values are used in configuring user privileges in attributes on an external LDAP or RADIUS authentication server.

show aaa priv hexa [*domain or family***]**

Syntax Definitions

domain or family	The CLI command domain or particular command family for which you want to display hexadecimal values. See table in Usage Guidelines.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Valid values for the family parameter are listed in the Corresponding Families column of the following table:

Domain	Corresponding Families
domain-admin	**file telnet dshell debug**
domain-system	**system aip snmp rmon webmgt config**
domain-physical	**chassis module interface pmm health**
domain-network	**ip rip ospf bgp vrrp ip-routing ipx ipmr ipms**
domain-layer2	**vlan bridge stp 802.1q linkagg ip-helper**
domain-service	**dns**
domain-policy	**qos policy slb**
domain-security	**session avlan aaa**

- Note that some command families may not be supported depending on the hardware platform you are running.
- If you do not specify a command family, hexadecimal values for all commands sets will display.

Examples

```
-> show aaa priv hexa
file            = 0x00000001 0x00000000,
telnet          = 0x00000008 0x00000000,
dshell          = 0x00000020 0x00000000,
debug           = 0x00000040 0x00000000,

Release History

Release 8.1.1; command was introduced.

Related Commands

user	Configures or modifies user entries in the local user database.

MIB Objects

N/A

show system fips

Displays the configured and running status of the FIPS mode on the switch.

show system fips

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Status of the FIPS mode can be checked using the **show system fips-status** command.
- The **show system fips** is the only command that can be used to view the FIPS mode status. The FIPS status is not shown in **showconfiguration snaphot** command output.

Examples

```
-> show system fips

Admin State: Enabled
Oper State: Enabled
```

Release History

Release 8.1.1; command introduced.

Related Commands

system fips admin-state	Enable or disable the FIPS mode on the switch.

MIB Objects

```
systemFipsAdminState
systemFipsOperState
```

36 UNP Commands

The Universal Network Profile (UNP) feature provides administrators with the ability to define and apply network access control to specific types of devices by grouping such devices according to specific matching profile criteria. This allows network administrators to create virtual machine network profiles (vNPs) *and* user device profiles from a unified framework of operation and administration.

UNP is not limited to creating profiles to classify only certain types of devices. However, the following authentication and classification methods implemented through UNP functionality and profile criteria provide the ability to tailor profiles for specific devices (physical or virtual):

- MAC-based and 802.1X-based authentication using a RADIUS-capable server.
- Redirection for Captive Portal authentication.
- Redirection to ClearPass Policy Manager (CPPM) for Bring Your Own Devices (BYOD) user device registration, integrity check, UNP assignment, and policy list assignment.
- Switch-wide classification rules to classify users based on port and device attributes (for example, source MAC, Group ID, IP address). No authentication required.
- Default UNP classification for traffic not classified through other methods.

Basically, UNP provides a method for dynamically assigning network devices to VLAN domains. A profile consists of configurable attributes. When a device sends traffic that matches these attributes, the device is then assigned to a VLAN associated with the UNP. The UNP may also specify role-based attributes (such as a QoS/ACL policy list, a location-based policy, or a time-based policy) that are subsequently applied to device traffic associated with the UNP VLAN.

Dynamic assignment of devices using UNP is achieved through port-based functionality that provides the ability to authenticate and classify device traffic. Authentication verifies the device identity and provides a UNP name. In the event authentication is not available or is unsuccessful, classification rules associated with the UNPs are applied to the traffic to determine the UNP VLAN assignment.

The UNP feature is a major component of the OmniSwitch Access Guardian functionality that provides proactive, dynamic solutions for network security. This chapter provides information about configuring UNP port parameters and profile attributes through the Command Line Interface (CLI).

In addition to UNP, this chapter also documents the CLI commands used to configure Captive Portal and Quarantine Manager and Remediation (QMR) functionality. These features are Access Guardian components that interact with the UNP framework to provide post-authentication and post-classification security functions.

MIB information for the UNP commands is as follows:

Filename: ALCATEL-IND1-DA-MIB
Module: alcatelIND1DaMIB

Filename: ALCATEL-IND1-UDP-RELAY-MIB
Module: alcatelIND1UDPRelayMIB

A summary of the available commands is listed here:

Global Configuration Commands	**unp group-id** **unp customer-domain** **unp policy validity-period** **unp policy validity-location** **unp dynamic-vlan-configuration** **unp dynamic-profile-configuration** **unp auth-server-down** **unp auth-server-down timeout** **unp redirect port-bounce** **unp redirect pause-timer** **unp redirect proxy-server-port** **unp redirect-server** **unp redirect allowed-name** **unp edge-user flush** **unp spb-access-user flush** **show unp global configuration** **show unp group-id** **show unp customer-domain** **show unp user** **show unp edge-user** **show unp edge-user status** **show unp edge-user details** **show unp vlan-user details** **show unp spb-access-user details** **show unp policy validity-period** **show unp policy validity-location**

VLAN Profile Commands	**unp vlan-profile** **unp vlan-profile qos-policy-list** **unp vlan-profile mobile-tag** **unp vlan-profile maximum-ingress-bandwidth** **unp vlan-profile maximum-egress-bandwidth** **unp vlan-profile maximum-ingress-depth** **unp vlan-profile maximum-egress-depth** **unp vlan-profile saa-profile** **show unp vlan-profile**
SPB Profile Commands	**unp spb-profile** **unp spb-profile qos-policy-list** **unp spb-profile multicast-mode** **unp spb-profile vlan-xlation** **unp spb-profile mobile-tag** **show unp spb-profile**
SAA Profile Commands	**unp saa-profile** **show unp saa-profile**
Classification Rule Commands	**unp classification port** **unp classification group-id** **unp classification mac-address** **unp classification mac-oui** **unp classification mac-address-range** **unp classification ip-address** **unp classification vlan-tag** **unp classification lldp med-endpoint ip-phone** **unp classification authentication-type** **show unp classification**
Extended Classification Rule Commands	**unp classification-rule** **unp classification-rule port** **unp classification-rule group-id** **unp classification-rule mac-address** **unp classification-rule mac-oui** **unp classification-rule mac-address-range** **unp classification-rule ip-address** **unp classification-rule vlan-tag** **unp classification-rule lldp med-endpoint ip-phone** **unp classification-rule authentication-type** **show unp classification-rule**
User Role Commands	**unp user-role** **unp user-role policy-list** **unp user-role edge-profile** **unp user-role authentication-type** **unp user-role cp-status-post-login** **unp restricted-role policy-list** **show unp user-role** **show unp restricted-role**

Captive Portal Commands	**captive-portal name** **captive-portal ip-address** **captive-portal success-redirect-url** **captive-portal proxy-server-port** **captive-portal retry-count** **captive-portal authentication-pass** **captive-portal-profile** **captive-portal customization** **show captive-portal configuration** **show captive-portal profile-name**
Quarantine Manager and Remediation (QMR) Commands	**qmr quarantine path** **qmr quarantine page** **qmr quarantine allowed-name** **qmr quarantine custom-proxy** **show qmr** **show quarantine mac group**
Multicast Domain Name System (mDNS) Commands	**mdns-relay** **mdns-relay tunnel** **show mdns-relay config**
Simple Service Discovery Protocol (SSDP) Relay Commands	**ssdp-relay** **ssdp-relay tunnel** **show ssdp-relay config**

unp edge-profile

Configures an Edge classification profile that is used to provide role-based access to the switch. This type of UNP profile determines the VLAN a device can join and applies any additional profile-defined attributes to the device.

When an Edge profile is created with this command, the base command (**unp edge-profile** *profile_name*) may be used with other command keywords to define attributes for the specified profile. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

unp edge-profile *profile_name*
[qos-policy-list *list_name***]**
[location-policy *policy_name***]**
[period-policy *policy_name***]**
[captive-portal-authentication {enable | disable}]
[captive-portal-profile *profile_name***]**
[authentication-flag {enable | disable}]
[mobile-tag {enable | disable}]
[redirect {enable | disable}]
[maximum ingress-bandwidth *bps***[k | m]]**
[maximum egress-bandwidth *bps***[k | m]]**
[maximum ingress-depth *bps***]**
[maximum egress-depth *bps***]**

no unp edge-profile *profile_name*

Syntax Definitions

edge-profile *profile_name*	The name to assign to the UNP Edge profile.

Defaults

By default, no profile attributes are enabled or defined when the Edge profile is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an Edge profile from the switch configuration.
- Edge profiles are applied only to traffic received on UNP Edge ports or link aggregates.

Examples

```
-> unp edge-profile unp-edge1
-> no unp edge-profile unp-edge1
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **maximum ingress-bandwidth**, **maximum egress-bandwidth**, and **maximum default-depth** parameters added.

Related Commands

unp edge-profile qos-policy-list	Assigns a QoS policy list to an existing Edge profile.
unp edge-profile location-policy	Assigns a UNP location policy to the specified Edge profile.
unp edge-profile period-policy	Assigns a UNP time-based policy to the specified Edge profile.
unp edge-profile captive-portal-authentication	Configures the status of Captive Portal authentication for the specified Edge profile.
unp edge-profile captive-portal-profile	Assigns a Captive Portal configuration to the specified Edge profile.
unp edge-profile authentication-flag	Configures whether the specified Edge profile only allows authenticated devices into the profile.
unp edge-profile mobile-tag	Configures whether a tagged VLAN-port association is created for a device port that is classified into the specified Edge profile.
unp edge-profile redirect	Configures the redirect status for the specified Edge profile.
unp edge-profile maximum-ingress-bandwidth	Configures a maximum ingress bandwidth value that is applied to UNP ports associated with the specified Edge profile.
unp edge-profile maximum-egress-bandwidth	Configures a maximum egress bandwidth value that is applied to UNP ports associated with the specified Edge profile.
unp edge-profile maximum-ingress-depth	Configures a maximum depth value that is applied to UNP ports associated with the specified Edge profile.
show unp edge-profile	Displays the Edge profile configuration for the switch.

MIB Objects

```
alaDaUNPEdgeProfTable
   alaDaUNPEdgeProfName
```

unp edge-profile qos-policy-list

Configures the QoS policy list attribute for the specified Edge profile. Use this command to assign the name of an existing QoS policy list to the Edge profile. A policy list contains QoS policy rules/ACLs that are applied to devices classified with the associated profile.

unp edge-profile *profile_name* **qos-policy-list** *list_name*

no unp edge-profile *profile_name* **qos-policy-list**

Syntax Definitions

profile_name	The name of a UNP Edge profile.
list_name	The name of a policy list to associate with the specified UNP.

Defaults

By default, no profile attributes are enabled or defined when the Edge profile is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the QoS list name from the Edge profile configuration.
- Specifying a QoS policy list name that is inactive or does not already exist in the switch configuration is allowed. However, the list will remain inactive for the UNP until the list is enabled or configured using the QoS **policy list** command.

Examples

```
-> unp edge-profile qos-policy-list unp-edge1
-> no unp edge-profile qos-policy-list unp-edge1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
policy list	Configures a QoS policy list.
show unp edge-profile	Displays the Edge profile configuration for the switch.

MIB Objects

```
alaDaUNPEdgeProfTable
   alaDaUNPEdgeProfName
   alaDaUNPEdgeProfQosPolicyList
```

unp edge-profile location-policy

Configures the location policy attribute for the specified Edge profile. Use this command to assign the name of an existing UNP location policy to an Edge profile. This type of policy defines criteria (such as the slot/port, system name and location) to determine if a device is accessing the network from a valid location.

unp edge-profile *profile_name* **location-policy** *policy_name*

no unp edge-profile *profile_name* **location-policy**

Syntax Definitions

profile_name	The name of a UNP Edge profile.
policy_name	The name of an existing UNP location policy.

Defaults

By default, no profile attributes are enabled or defined when the Edge profile is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the location policy name from the Edge profile configuration.
- The location policy name specified with this command must already exist in the switch configuration.
- If a UNP device does not meet the criteria applied through the location policy, the device role is changed to unauthorized.

Examples

```
-> unp edge-profile unp-edge1 location-policy alu-na
-> no unp edge-profile unp-edge1 location-policy
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
unp policy validity-location	Configures a UNP location policy.
show unp edge-profile	Displays the Edge profile configuration for the switch.

MIB Objects

```
alaDaUNPEdgeProfTable
   alaDaUNPEdgeProfName
   alaDaUNPEdgeProfLocationPolicy
```

unp edge-profile period-policy

Configures the period policy attribute for the specified Edge profile. Use this command to assign the name of an existing UNP period policy to an Edge profile. This type of policy specifies the days and times during which a device can access the network.

unp edge-profile *profile_name* **period-policy** *policy_name*

no unp edge-profile *profile_name* **period-policy**

Syntax Definitions

profile_name	The name of a UNP Edge profile.
policy_name	The name of an existing UNP period policy.

Defaults

By default, no profile attributes are enabled or defined when the Edge profile is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the period policy name from the Edge profile configuration.
- The period policy name specified with this command must already exist in the switch configuration.
- If a UNP device does not meet the criteria applied through the period policy, the device role is changed to unauthorized.

Examples

```
-> unp edge-profile unp-edge1 period-policy office-time
-> no unp edge-profile unp-edge1 period-policy
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
unp policy validity-period	Configures a UNP period policy.
show unp edge-profile	Displays the Edge profile configuration for the switch.

MIB Objects

```
alaDaUNPEdgeProfTable
   alaDaUNPEdgeProfName
   alaDaUNPEdgeProfPeriodPolicy
```

unp edge-profile captive-portal-authentication

Configures the status of Captive Portal (CP) authentication for the specified UNP Edge profile. When enabled, the Captive Portal authentication process is triggered for devices classified into the profile.

unp edge-profile *profile_name* **captive-portal-authentication {enable | disable}**

Syntax Definitions

profile_name	The name of a UNP Edge profile.
enable	Enables Captive Portal authentication for profile devices.
disable	Disables Captive Portal authentication for profile devices.

Defaults

By default, Captive Portal authentication is disabled for the Edge profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When CP authentication is enabled, the UNP user is assigned an implicit CP pre-login role to facilitate the CP authentication process with the configured CP RADIUS server through the CP profile associated with the Edge profile or the global CP configuration.
- If CP authentication for the device is successful, the user role is automatically changed according to the CP pass policy list returned from the RADIUS server, if it is the highest precedence role known for the user.
- If CP authentication for the device fails, the user role will be changed to the last known highest precedence role for the user.

Examples

```
-> unp edge-profile unp-edge1 captive-portal-authentication enable
-> unp edge-profile unp-edge1 captive-portal-authentication disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
show unp edge-profile	Displays the Edge profile configuration for the switch.

MIB Objects

```
alaDaUNPEdgeProfTable
   alaDaUNPEdgeProfName
   alaDaUNPEdgeProfCPortalAuth
```

unp edge-profile captive-portal-profile

Configures the Captive Portal (CP) profile attribute for the specified Edge profile. Use this command to assign the name of an existing CP profile to an Edge profile. This type of profile defines a CP configuration that is applied to devices when CP authentication is enabled for the Edge profile.

unp edge-profile *profile_name* **captive-portal-profile** *cp_profile_name*

no unp edge-profile *profile_name* **captive-portal-profile**

Syntax Definitions

profile_name	The name of a UNP Edge profile.
cp_profile_name	The name of an existing UNP Captive Portal profile.

Defaults

By default, no CP profile is assigned to an Edge profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the CP profile name from the Edge profile configuration.
- The CP profile name specified with this command must already exist in the switch configuration.
- The configuration defined in the CP profile overrides the global CP configuration for the switch.

Examples

```
-> unp edge-profile unp-edge1 captive-portal-profile cp-prof
-> no unp edge-profile unp-edge1 captive-portal-profile
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
captive-portal-profile	Configures a Captive Portal profile.
show unp edge-profile	Displays the Edge profile configuration for the switch.

MIB Objects

```
alaDaUNPEdgeProfTable
   alaDaUNPEdgeProfName
   alaDaUNPEdgeProfCPortalProf
```

unp edge-profile authentication-flag

Configures the authentication flag status for the specified UNP Edge profile. When enabled, only devices successfully authenticated are classified into the profile.

unp edge-profile *profile_name* **authentication-flag {enable | disable}**

Syntax Definitions

profile_name	The name of a UNP Edge profile.
enable	Allows only authenticated (802.1X or MAC) devices into the profile.
disable	Allows authenticated or classified devices into the profile.

Defaults

By default, the authentication flag is disabled for the Edge profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When the authentication flag is enabled for an Edge profile, devices that did not pass L2 authentication (802.1X or MAC) are not allowed into the Edge profile. However, other configured classification options are applied to such devices to determine the appropriate network access control for that device.

Examples

```
-> unp edge-profile unp-edge1 authentication-flag enable
-> unp edge-profile unp-edge1 authentication-flag disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
show unp edge-profile	Displays the Edge profile configuration for the switch.

MIB Objects

```
alaDaUNPEdgeProfTable
   alaDaUNPEdgeProfName
   alaDaUNPEdgeProfAuthStatus
```

unp edge-profile mobile-tag

Configures the mobile tag status for the specified UNP Edge profile. When enabled, the UNP port to which a device is connected is tagged with the VLAN associated with the Edge profile when the device is classified into that profile.

unp edge-profile *profile_name* **mobile-tag {enable | disable}**

Syntax Definitions

profile_name	The name of a UNP Edge profile.
enable	Enables the mobile tag status for the profile.
disable	Disables the mobile tag status for the profile.

Defaults

By default, the mobile tag status is disabled for the Edge profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the mobile tag status is disabled for an Edge profile, any user device classified into the profile will remain learned in that profile. In this case, the tagged/untagged VLAN-port association would be determined based on the user traffic which was learned as tagged or untagged, respectively.
- If the device port is already an untagged member of the VLAN associated with the profile, then a tagged association is not created.

Examples

```
-> unp edge-profile unp-edge1 mobile-tag enable
-> unp edge-profile unp-edge1 mobile-tag disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
show unp edge-profile	Displays the Edge profile configuration for the switch.

MIB Objects

```
alaDaUNPEdgeProfTable
   alaDaUNPEdgeProfName
   alaDaUNPEdgeProfMobileTag
```

unp edge-profile redirect

Configures the redirect status for the specified UNP Edge profile. When enabled, the Edge profile will interact with the ClearPass Policy Manager (CPPM) as part of the OmniSwitch Bring Your Own Devices (BYOD) solution.

unp edge-profile *profile_name* **redirect {enable | disable}**

Syntax Definitions

profile_name	The name of a UNP Edge profile.
enable	Enables the redirect status for the profile.
disable	Disables the redirect status for the profile.

Defaults

By default, the redirect status is disabled for the Edge profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- An OmniSwitch Edge profile with redirect enabled must also exist in the CPPM configuration.
- To ensure proper redirection for devices classified into the profile, configure the redirection server as the preferred server through authentication, authorization, and accounting (AAA) commands for MAC and 802.1X authentication.

Examples

```
-> unp edge-profile unp-edge1 redirect enable
-> unp edge-profile unp-edge1 redirect disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
show unp edge-profile	Displays the Edge profile configuration for the switch.

MIB Objects

```
alaDaUNPEdgeProfTable
   alaDaUNPEdgeProfName
   alaDaUNPEdgeProfRedirectStatus
```

unp edge-profile maximum-ingress-bandwidth

Configures the maximum bandwidth limit allocated for ingress traffic on UNP ports assigned to the specified Edge profile.

unp edge-profile *profile_name* **maximum-ingress-bandwidth** *bps***[k | m]**

no unp edge-profile *profile_name* **maximum-ingress-bandwidth**

Syntax Definitions

profile_name	The name of a UNP Edge profile.
*bps***[k | m]**	The maximum amount of bandwidth, in bits-per-second. The valid range is 0–10485760. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m**).

Defaults

By default, the maximum ingress bandwidth value is not defined for the Edge profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the maximum ingress bandwidth value is specified as an integer without an abbreviated unit designation, the value is applied in Kbps by default. For example, if the number **10** is specified, **10K** is the value applied.
- If the maximum ingress bandwidth value is set to zero, then all egress traffic is allowed on the UNP port.
- The maximum ingress bandwidth, egress bandwidth, and depth values are applied to the port of a user device that is classified into the specified Edge profile. If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.

Examples

```
-> unp edge-profile unp-edge1 maximum-ingress-bandwidth 100
-> unp edge-profile unp-edge1 maximum-ingress-bandwidth 10m
-> no unp edge-profile unp-edge1 maximum-ingress-bandwidth
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
unp edge-profile maximum-ingress-depth	Configures how much the traffic can burst over the maximum ingress bandwidth rate.
show unp edge-profile	Displays the Edge profile configuration for the switch.

MIB Objects

```
alaDaUNPEdgeProfTable
   alaDaUNPEdgeProfName
   alaDaUNPEdgeProfMaxIngressBw
```

unp edge-profile maximum-egress-bandwidth

Configures the maximum bandwidth limit allocated for egress traffic on UNP ports assigned to the specified Edge profile.

unp edge-profile *profile_name* **maximum-egress-bandwidth** *bps***[k | m]**

no unp edge-profile *profile_name* **maximum-egress-bandwidth**

Syntax Definitions

profile_name	The name of a UNP Edge profile.
*bps***[k | m]**	The maximum amount of bandwidth, in bits-per-second. The valid range is 0–10485760. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m**).

Defaults

By default, the maximum egress bandwidth value is not defined for the Edge profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the maximum egress bandwidth value is specified as an integer without an abbreviated unit designation, the value is applied in Kbps by default. For example, if the number **10** is specified, **10K** is the value applied.
- If the maximum egress bandwidth value is set to zero, then all egress traffic is allowed on the UNP port.
- The maximum ingress bandwidth, egress bandwidth, and depth values are applied to the port of a user device that is classified into the specified Edge profile. If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.

Examples

```
-> unp edge-profile unp-edge1 maximum-egress-bandwidth 100
-> unp edge-profile unp-edge1 maximum-egress-bandwidth 10m
-> no unp edge-profile unp-edge1 maximum-egress-bandwidth
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
unp edge-profile maximum-egress-depth	Configures how much the traffic can burst over the maximum egress bandwidth rate.
show unp edge-profile	Displays the Edge profile configuration for the switch.

MIB Objects

```
alaDaUNPEdgeProfTable
   alaDaUNPEdgeProfName
   alaDaUNPEdgeProfMaxEgressB
```

unp edge-profile maximum-ingress-depth

Configures the maximum ingress depth value that is applied to traffic on UNP ports that are assigned to the specified UNP Edge profile. This value determines how much the traffic can burst over the maximum ingress bandwidth rate.

unp edge-profile *profile_name* **maximum-ingress-depth** *bps*

no unp edge-profile *profile_name* **maximum-ingress-depth**

Syntax Definitions

profile_name	The name of a UNP Edge profile.
bps	The maximum ingress depth value in Kbps. The valid range is 0–16384.

Defaults

By default, the maximum ingress depth value is determined by dividing the maximum ingress bandwidth value by 25. If the result of this calculation is 0 or 1, then 2K is used as the ingress depth value.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the maximum ingress depth value from the profile.
- The maximum ingress depth value is configured in conjunction with the maximum ingress bandwidth parameter. When the ingress depth value is reached, the switch starts to drop packets.
- Configure the maximum ingress bandwidth rate (**unp edge-profile maximum-ingress-bandwidth**) before attempting to set the maximum ingress depth value.
- The maximum ingress bandwidth and depth values are applied to the port of a user device that is classified into the specified Edge profile. If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.

Examples

```
-> unp edge-profile unp-edge1 maximum-ingress-bandwidth 10
-> unp edge-profile unp-edge1 maximum-ingress-depth 5
-> no unp edge-profile unp-edge1 maximum-ingress-depth
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
unp edge-profile maximum-ingress-bandwidth	Configures the maximum bandwidth limit allocated for ingress traffic on UNP ports assigned to the specified Edge profile.
show unp edge-profile	Displays the Edge profile configuration for the switch.

MIB Objects

```
alaDaUNPEdgeProfTable
   alaDaUNPEdgeProfName
   alaDaUNPEdgeProfMaxIngressDepth
```

unp edge-profile maximum-egress-depth

Configures the maximum egress depth value that is applied to traffic on UNP ports that are assigned to the specified UNP Edge profile. This value determines how much the traffic can burst over the maximum egress bandwidth rate.

unp edge-profile *profile_name* **maximum-egress-depth** *bps*

no unp edge-profile *profile_name* **maximum-egress-depth**

Syntax Definitions

profile_name	The name of a UNP Edge profile.
bps	The maximum egress depth value in Kbps. The valid range is 0–16384.

Defaults

By default, the maximum egress depth value is determined by dividing the maximum ingress bandwidth value by 25. If the result of this calculation is 0 or 1, then 2K is used as the ingress depth value.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the maximum egress depth value from the profile.
- The maximum egress depth value is configured in conjunction with the maximum egress bandwidth parameter. When the egress depth value is reached, the switch starts to drop packets.
- Configure the maximum egress bandwidth rate (**unp edge-profile maximum-egress-bandwidth**) before attempting to set the maximum egress depth value.
- The maximum egress bandwidth and depth values are applied to the port of a user device that is classified into the specified Edge profile. If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.

Examples

```
-> unp edge-profile unp-edge1 maximum-egress-bandwidth 10
-> unp edge-profile unp-edge1 maximum-egress-depth 5
-> no unp edge-profile unp-edge1 maximum-egress-depth
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
unp edge-profile maximum-egress-bandwidth	Configures the maximum bandwidth limit allocated for egress traffic on UNP ports assigned to the specified Edge profile.
show unp edge-profile	Displays the Edge profile configuration for the switch.

MIB Objects

```
alaDaUNPEdgeProfTable
   alaDaUNPEdgeProfName
   alaDaUNPEdgeProfMaxEgressDepth
```

unp vlan-mapping edge-profile

Configures the mapping of a standard VLAN to a UNP Edge profile. When a device is assigned to an Edge profile through authentication or classification, the device and the port on which the device was learned are dynamically assigned to the VLAN associated with the profile.

unp vlan-mapping edge-profile *profile_name* **vlan** *vlan_id*

no unp vlan-mapping edge-profile *profile_name* **vlan**

Syntax Definitions

edge-profile *profile_name*	The name of an existing UNP Edge profile.
vlan_id	The VLAN ID number to associate with the specified Edge profile name. Devices assigned to the profile are assigned to the associated VLAN.

Defaults

By default, no VLAN mapping configuration is applied to an Edge profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a VLAN mapping from the specified profile name.
- Only one VLAN is associated with an Edge profile at any given time.
- Configuring a new VLAN-to-profile mapping for an Edge profile will overwrite the existing VLAN mapping for that profile.

Examples

```
-> unp vlan-mapping edge-profile UNP1 vlan 10
-> no unp vlan-mapping edge-profile UNP1 vlan
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
show unp edge-profile vlan-mapping	Displays the VLAN mapping configuration for the Edge profile.

MIB Objects

```
alaDaUNPVlanMapTable
   alaDaUNPVlanMapEdgeProf
   alaDaUNPVlanMapIdent
   alaDaUNPVlanMapRowStatus
```

unp vlan-profile

Configures a VLAN classification profile that is used to provide role-based access to the switch. This type of UNP profile determines the VLAN a device can join and applies any additional profile-defined attributes to the device.

When a VLAN profile is created with this command, the base command (**unp vlan-profile** *profile_name* **vlan** *vlan_id*) may be used with other command keywords to define attributes for the specified profile. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

unp vlan-profile *profile_name* **vlan** *vlan_id*
[qos-policy-list *list_name***]**
[mobile-tag {enable | disable}]
[maximum ingress-bandwidth *bps***[k | m]]**
[maximum egress-bandwidth *bps***[k | m]]**
[maximum ingress-depth *bps***]**
[maximum ingress-depth *bps***]**
[saa-profile *profile_name***]**

no unp vlan-profile *profile_name*

Syntax Definitions

vlan-profile *profile_name*	The name to assign to the UNP VLAN profile.
vlan_id	The VLAN ID number to associate with the specified VLAN profile. Devices classified with the profile are assigned to the associated VLAN.

Defaults

By default, no profile attributes are enabled or defined when the VLAN profile is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a VLAN profile from the switch configuration.
- VLAN classification profiles are applied only to traffic received on ports or link aggregates configured as UNP bridge ports.
- If the UNP dynamic VLAN configuration capability is enabled, a VLAN specified with this command that does not exist in the switch configuration is automatically created when the UNP is created.

Note. Dynamic VLANs are not saved in the VLAN section of the **boot.cfg** file. However, the **unp** commands to enable dynamic VLAN configuration and create a UNP are saved in the UNP section of the **boot.cfg** file. As a result, the VLAN is created again on the next switch bootup.

Examples

```
-> unp vlan-profile unp-vlan1 vlan 200
-> no unp vlan-profile unp-vlan1
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp vlan-profile qos-policy-list	Assigns a QoS policy list to an existing VLAN profile.
unp vlan-profile mobile-tag	Configures whether a tagged VLAN-port association is created for a device port that is classified into the specified VLAN profile.
unp vlan-profile maximum-ingress-bandwidth	Configures a maximum ingress bandwidth value that is applied to UNP ports associated with the specified VLAN profile.
unp vlan-profile maximum-egress-bandwidth	Configures a maximum egress bandwidth value that is applied to UNP ports associated with the specified VLAN profile.
unp vlan-profile maximum-ingress-bandwidth	Configures a maximum ingress depth value that is applied to UNP ports associated with the specified VLAN profile.
unp vlan-profile maximum-egress-bandwidth	Configures a maximum egress depth value that is applied to UNP ports associated with the specified VLAN profile.
unp vlan-profile saa-profile	Assigns a Service Assurance Agent (SAA) profile to a VLAN profile.
show unp vlan-profile	Displays the VLAN profile configuration for the switch.

MIB Objects

```
alaDaUserNetProfileTable
   alaDaUserNetProfileName
   alaDaUserNetProfileVlanID
```

unp vlan-profile qos-policy-list

Configures the QoS policy list attribute for the specified VLAN profile. Use this command to assign the name of a QoS policy list to the VLAN profile. A policy list contains QoS policy rules/ACLs that are applied to devices classified with the associated profile.

unp vlan-profile *profile_name* **vlan** *vlan_id* **qos-policy-list** *list_name*

no unp vlan-profile *profile_name* **qos-policy-list**

Syntax Definitions

profile_name	The name of a UNP VLAN profile.
vlan_id	The VLAN ID number to associate with the specified VLAN profile. Devices classified with the profile are assigned to the associated VLAN.
list_name	The name of a QoS policy list to associate with the specified VLAN profile.

Defaults

By default, no QoS policy list is assigned to the VLAN profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a QoS policy list from a VLAN profile configuration.
- Specifying a QoS policy list name that is inactive or does not already exist in the switch configuration is allowed. However, the list will remain inactive for the UNP until the list is enabled or configured using the QoS **policy list** command.

Examples

```
-> unp vlan-profile unp1 vlan 200 qos-policy-list list1
-> no unp vlan-profile unp1 qos-policy-list
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp vlan-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
policy list	Configures a QoS policy list.
show unp vlan-profile	Displays the VLAN profile configuration for the switch.

MIB Objects

```
alaDaUserNetProfileTable
   alaDaUserNetProfileName
   alaDaUserNetProfileVlanID
   alaDaUserNetProfileQosPolicyListName
```

unp vlan-profile mobile-tag

Configures the mobile tag status for the specified UNP VLAN profile. When enabled, the UNP port to which a device is connected is tagged with the VLAN associated with the VLAN profile when the device is classified into that profile.

unp vlan-profile *profile_name* **vlan** *vlan_id* **mobile-tag {enable | disable}**

Syntax Definitions

profile_name	The name of a UNP VLAN profile.
vlan_id	The VLAN ID number to associate with the specified VLAN profile. Devices classified with the profile are assigned to the associated VLAN.
enable	Enables mobile tagging for the specified UNP VLAN profile.
disable	Disables mobile tagging for the specified UNP VLAN profile.

Defaults

By default, mobile tagging is disabled for the VLAN profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the mobile tag status is enabled, the first user device that is learned on a UNP port and subsequently classified into a VLAN profile, triggers a tagged VLAN-port association between the UNP port and the VLAN associated with the profile.
- When the mobile tag status is disabled, any user device classified into the VLAN profile will remain learned in that profile. In this case, the tagged/untagged VLAN-port association is determined based on the user traffic which was learned as tagged or untagged, respectively.
- If the device port is already an untagged member of the VLAN associated with the profile, then a tagged association is not created.

Examples

```
-> unp vlan-profile unp2 vlan 501 mobile-tag enable
-> unp vlan-profile unp2 vlan 501 mobile-tag disable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp vlan-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
show unp vlan-profile	Displays the VLAN profile configuration for the switch.

MIB Objects

```
alaDaUserNetProfileTable
   alaDaUserNetProfileName
   alaDaUserNetProfileVlanID
   alaDaUserNetProfileMobileTag
```

unp vlan-profile maximum-ingress-bandwidth

Configures the maximum bandwidth limit allocated for ingress traffic on UNP ports assigned to the specified VLAN profile.

unp vlan-profile *profile_name* **maximum-ingress-bandwidth** *bps***[k | m]**

no unp vlan-profile *profile_name* **maximum-ingress-bandwidth**

Syntax Definitions

profile_name	The name of a UNP VLAN profile.
*bps***[k | m]**	The maximum amount of bandwidth, in bits-per-second. The valid range is 0–10485760. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m**).

Defaults

By default, the maximum ingress bandwidth value is not defined for the VLAN profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the maximum ingress bandwidth value is specified as an integer without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the value applied.
- If the maximum ingress bandwidth value is set to zero, then all egress traffic is allowed on the UNP port.
- The maximum ingress bandwidth, egress bandwidth, and depth values are applied to the port of a user device that is classified into the specified VLAN profile. If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.

Examples

```
-> unp vlan-profile unp1 maximum-ingress-bandwidth 100
-> unp vlan-profile unp1 maximum-ingress-bandwidth 10m
-> no unp vlan-profile unp1 maximum-ingress-bandwidth
```

Release History

Release 8.2.1; command was introduced.

Related Commands

```

unp vlan-profile maximum-egress-bandwidth

Configures the maximum bandwidth limit allocated for egress traffic on UNP ports assigned to the specified VLAN profile.

unp vlan-profile *profile_name* **maximum-egress-bandwidth** *bps***[k | m]**

no unp vlan-profile *profile_name* **maximum-egress-bandwidth**

Syntax Definitions

profile_name	The name of a UNP VLAN profile.
*bps***[k | m]**	The maximum amount of bandwidth, in bits-per-second. The valid range is 0–10485760. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k, 5m**).

Defaults

By default, the maximum egress bandwidth value is not defined for the VLAN profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the maximum egress bandwidth value is specified as an integer without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the value applied.
- If the maximum egress bandwidth value is set to zero, then all egress traffic is allowed on the UNP port.
- The maximum ingress bandwidth, egress bandwidth, and depth values are applied to the port of a user device that is classified into the specified VLAN profile. If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.

Examples

```
-> unp vlan-profile unp1 maximum-egress-bandwidth 100
-> unp vlan-profile unp1 maximum-egress-bandwidth 10m
-> no unp vlan-profile unp1 maximum-egress-bandwidth
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp vlan-profile	Configures a UNP VLAN profile. This type of profile is applied to traffic learned on UNP bridge ports and link aggregates.
show unp vlan-profile	Displays the VLAN profile configuration for the switch.

MIB Objects

```
alaDaUserNetProfileTable
   alaDaUserNetProfileName
   alaDaUserNetProfileVlanID
   alaDaUserNetProfileMaxEgressBw
```

unp vlan-profile maximum-ingress-depth

Configures the maximum ingress depth value that is applied to traffic on UNP ports that are assigned to the specified UNP VLAN profile. This value determines how much the traffic can burst over the maximum ingress bandwidth rate.

unp vlan-profile *profile_name* **maximum-ingress-depth** *bps*

no unp vlan-profile *profile_name* **maximum-ingress-depth**

Syntax Definitions

profile_name	The name of a UNP VLAN profile.
bps	The maximum ingress depth value in Kbps. The valid range is 0–16384.

Defaults

By default, the maximum ingress depth value is determined by dividing the maximum ingress bandwidth value by 25. If the result of this calculation is 0 or 1, then 2K is used as the ingress depth value.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the maximum ingress depth value from the profile.
- The maximum ingress depth value is configured in conjunction with the maximum ingress bandwidth parameter. When the ingress depth value is reached, the switch starts to drop packets.
- Configure the maximum ingress bandwidth rate (**unp vlan-profile maximum-ingress-bandwidth**) before attempting to set the maximum ingress depth value.
- The maximum ingress bandwidth and depth values are applied to the port of a user device that is classified into the specified VLAN profile. If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.

Examples

```
-> unp vlan-profile unp-vlan10 maximum-ingress-bandwidth 10
-> unp vlan-profile unp-vlan10 maximum-ingress-depth 5
-> no unp vlan-profile unp-vlan10 maximum-ingress-depth
```

Release History

Release 8.2.1; command was introduced.

Related Commands

   alaDaUserNetProfileName
   alaDaUserNetProfileVlanID
   alaDaUserNetProfileMaxIngressDepth
```

unp vlan-profile maximum-egress-depth

Configures the maximum egress depth value that is applied to traffic on UNP ports that are assigned to the specified UNP VLAN profile. This value determines how much the traffic can burst over the maximum egress bandwidth rate.

unp vlan-profile *profile_name* **maximum-egress-depth** *bps*

no unp vlan-profile *profile_name* **maximum-egress-depth**

Syntax Definitions

profile_name	The name of a UNP VLAN profile.
bps	The maximum egress depth value in Kbps. The valid range is 0–16384.

Defaults

By default, the maximum egress depth value is determined by dividing the maximum egress bandwidth value by 25. If the result of this calculation is 0 or 1, then 2K is used as the egress depth value.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the maximum egress depth value from the profile.
- The maximum egress depth value is configured in conjunction with the maximum egress bandwidth parameter. When the egress depth value is reached, the switch starts to drop packets.
- Configure the maximum egress bandwidth rate (**unp vlan-profile maximum-egress-bandwidth**) before attempting to set the maximum egress depth value.
- The maximum egress bandwidth and depth values are applied to the port of a user device that is classified into the specified VLAN profile. If multiple user devices are classified into different profiles but learned on the same UNP port, the bandwidth parameter values obtained for the last user learned are applied on the port. Parameter values applied through previously learned users are overwritten.

Examples

```
-> unp vlan-profile unp-vlan10 maximum-egress-bandwidth 10
-> unp vlan-profile unp-vlan10 maximum-egress-depth 5
-> no unp vlan-profile unp-vlan10 maximum-egress-depth
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp vlan-profile	Configures a UNP VLAN profile. This type of profile is applied to traffic learned on UNP bridge ports and link aggregates.
unp vlan-profile maximum-egress-bandwidth	Configures the maximum bandwidth limit allocated for egress traffic on UNP ports assigned to the specified VLAN profile.
show unp vlan-profile	Displays the VLAN profile configuration for the switch.

MIB Objects

```
alaDaUserNetProfileTable
   alaDaUserNetProfileName
   alaDaUserNetProfileVlanID
   alaDaUserNetProfileMaxEgressDepth
```

unp vlan-profile saa-profile

Note: *This command is not supported in this release.*

Assigns a Service Assurance Agent (SAA) profile to the specified VLAN profile. Although an SAA profile can be assigned to a VLAN profile with this command, an SAA profile is mainly used by the Alcatel-Lucent OmniVista network management application to monitor connections between virtual machines (VMs) in a data center network.

unp vlan-profile *profile_name* **saa-profile** *profile_name*

no unp vlan-profile *profile_name* **saa-profile**

Syntax Definitions

vlan-profile *profile_name*	The name of a UNP VLAN profile.
saa-profile *profile_name*	The name of the SAA profile to assign to the UNP VLAN profile.

Defaults

By default, no SAA profile is assigned to the VLAN profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an SAA profile assignment from a VLAN profile configuration.
- The SAA profile specified with this command must already exist in the switch configuration.

Examples

```
-> unp vlan-profile unp1 vlan 200 saa-profile saa1
-> no unp vlan-profile unp1 saa-profile
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp vlan-profile	Configures a UNP VLAN profile. This type of profile is applied to traffic learned on UNP bridge ports and link aggregates.
unp saa-profile	Configures an SAA profile.
show unp vlan-profile	Displays the VLAN profile configuration for the switch.

MIB Objects

   alaDaUserNetProfileName
   alaDaUserNetProfileVlanID
   alaDaUserNetProfileSaaProfileNam
```

unp spb-profile

Configures a service classification profile that is used to provide role-based access to the switch. This type of UNP profile determines the Shortest Path Bridging (SPB) service a device can join and applies any additional profile-defined attributes to the device.

When a service profile is created with this command, the base command (**unp spb-profile** *profile_name* **tag-value {0 |** *qtag* | *outer_qtag:inner_qtag}* **isid** *instance_id* **bvlan** *bvlan_id*) may be used with other command keywords to define attributes for the specified profile. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

unp spb-profile *profile_name* **tag-value {0 |** *qtag* | *outer_qtag:inner_qtag}* **isid** *instance_id* **bvlan** *bvlan_id*
[qos-policy-list *list_name***]**
[multicast-mode {headend | tandem}]
[vlan-xlation {enable | disable}]
[mobile-tag {enable | disable}]

no unp spb-profile *profile_name*

Syntax Definitions

profile_name	The name to assign to the UNP service profile.
0	Use VLAN tag information from classified traffic to create the Service Access Point (SAP) for the traffic. If the traffic is untagged, the SAP is created with 0 as the encapsulation value (for example, 1/12:0).
qtag	The outer VLAN ID tag to use when creating a SAP for single-tagged traffic.
outer_qtag:inner_qtag	An outer VLAN ID tag and an inner VLAN tag to use when creating a SAP for double-tagged (QinQ) classified traffic.
instance_id	A service instance identifier (I-SID) that is used to identify an SPB service in a provider backbone bridge (PBB) network. The valid range is 256–16777214.
bvlan_id	The VLAN ID number of an existing SPB backbone VLAN (BVLAN).

Defaults

By default, no profile attributes are enabled or defined when the SPB service profile is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the service profile from the switch configuration.
- UNP service classification profiles are applied only to traffic received on ports or link aggregates configured as UNP service access ports.

- The **tag-value** parameter specifies the VLAN tag values that are used to create the SAP to which profile traffic is mapped. The SAP is then bound to the I-SID and BVLAN profile values specified with this command.
- Consider the following when configuring the profile tag value:
  - If the tag value is set to zero, the SAP for the classified traffic is created using the VLAN tags of the traffic. For example, a SAP with an encapsulation value set to 1/12:5 is created when classified traffic received on port 1/12 is single-tagged with VLAN ID 5.
  - Enabling the trust VLAN tag option for the UNP service port triggers the same functionality as setting the service profile tag value to zero. In both cases, the VLAN tags of the classified traffic are used to specify the encapsulation value of the SAP to which the traffic is mapped.
  - If the trust VLAN tag option is disabled for the UNP port and the service profile tag value is *not* set to zero (for example, **tag-value** 10), the VLAN tag values of the classified traffic are compared to the configured profile tag value. If the traffic tag values match the profile tag value, the traffic is mapped to the appropriate SAP. If the traffic tags do not match, traffic is not mapped to a SAP.
- UNP first checks the switch configuration to see if a SAP already exists for the expected VLAN tag value (CVLAN tags) and I-SID. If a SAP already exists, the MAC addresses are learned on that SAP. If the SAP does not exist, the switch dynamically creates a SAP for the profile traffic.
- If the I-SID specified with this command does not exist in the switch configuration, the switch will dynamically create the expected service and then the SAP as needed.
- The BVLAN ID specified with this command must already exist in the switch configuration.
- Dynamically creating services and related SAPs is subject to available switch resources. If an attempt to dynamically create a service or SAP fails, the MAC addresses classified for the service profile are learned as filtering.

Examples

```
-> unp spb-profile spb1 tag-value 10 isid 1525 bvlan 4001
-> no spb-profile spb1 tag-value 20:100 isid 1525 bvlan 4001
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp port	Configures the port type (service access, edge, or bridge) for the specified port or link aggregate.
unp spb-profile qos-policy-list	Assigns a QoS policy list name to the SPB profile.
unp spb-profile multicast-mode	Selects the multicast replication mode for the SPB service associated with the profile.
unp spb-profile vlan-xlation	Configures the VLAN translation status for the SPB service associated with the profile.
unp spb-profile mobile-tag	Configures the mobile tag status for the SPB service associated with the profile.
service spb	Configures an SPB service, which identifies the SPB I-SID value.
show unp spb-profile	Displays the service-based profile configuration for the switch.

MIB Objects

```
alaDaSpbProfileTable
   alaDaSpbProfileName
   alaDaSpbProfileEncapVal
   alaDaSpbProfileIsid
   alaDaSpbProfileBVlan
```

unp spb-profile qos-policy-list

Configures the QoS policy list attribute for the specified SPB service profile. Use this command to assign the name of a QoS policy list to the profile. The policy list contains QoS policy rules/ACLs that are applied to devices classified with the UNP.

unp spb-profile *profile_name* **tag-value {0 |** *qtag* | *outer_qtag:inner_qtag}* **isid** *instance_id* **bvlan** *bvlan_id* **[qos-policy-list** *list_name***]**

no unp spb-profile *profile_name* **qos-policy-list**

Syntax Definitions

profile_name	The name of an SPB service profile.
0	Use VLAN tag information from classified traffic to create the Service Access Point (SAP) for the traffic. If the traffic is untagged, the SAP is created with 0 as the encapsulation value (for example, 1/12:0).
qtag	The outer VLAN ID tag to use when creating a SAP for single-tagged traffic.
outer_qtag:inner_qtag	An outer VLAN ID tag and an inner VLAN tag to use when creating a SAP for double-tagged (QinQ) classified traffic.
instance_id	A service instance identifier (I-SID) that is used to identify an SPB service in a provider backbone bridge (PBB) network. The valid range is 256–16777214.
bvlan_id	The VLAN ID number of an existing SPB backbone VLAN (BVLAN).
list_name	The name of a policy list to associate with the specified UNP.

Defaults

By default, no QoS policy list is assigned to the SPB service profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the QoS policy list from an SPB service profile configuration.
- Specifying a QoS policy list name that is inactive or does not already exist in the switch configuration is allowed. However, the list will remain inactive for the UNP until the list is enabled or configured using the QoS **policy list** command.

Examples

```
-> unp spb-profile spb2 tag-value 20:100 isid 1525 bvlan 4001 qos-policy-list list1
-> no spb-profile spb1 qos-policy-list
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp spb-profile	Configures a UNP VLAN profile. This type of profile is applied to traffic learned on UNP bridge ports and link aggregates.
policy list	Configures a QoS policy list.
show unp spb-profile	Displays the service-based profile configuration for the switch.

MIB Objects

```
alaDaSpbProfileTable
   alaDaSpbProfileName
   alaDaSpbProfileEncapVal
   alaDaSpbProfileQosPolicyListName
   alaDaSpbProfileIsid
   alaDaSpbProfileBVlan
```

unp spb-profile multicast-mode

Configures the multicast mode attribute for the specified SPB service profile. Use this command to specify the replication mode for the SPB service that is associated with the SPB profile.

unp spb-profile *profile_name* **tag-value {0 |** *qtag* **|** *outer_qtag:inner_qtag}* **isid** *instance_id* **bvlan** *bvlan_id* **multicast-mode {headend | tandem}**

Syntax Definitions

profile_name	The name of an SPB service profile.
0	Use VLAN tag information from classified traffic to create the Service Access Point (SAP) for the traffic. If the traffic is untagged, the SAP is created with 0 as the encapsulation value (for example, 1/12:0).
qtag	The outer VLAN ID tag to use when creating a SAP for single-tagged traffic.
outer_qtag:inner_qtag	An outer VLAN ID tag and an inner VLAN tag to use when creating a SAP for double-tagged (QinQ) classified traffic.
instance_id	A service instance identifier (I-SID) that is used to identify an SPB service in a provider backbone bridge (PBB) network. The valid range is 256–16777214.
bvlan_id	The VLAN ID number of an existing SPB backbone VLAN (BVLAN).
headend	Specifies the head-end replication mode.
tandem	Specifies the tandem replication mode.

Defaults

By default, the multicast mode is set to **headend**.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When an SPB service is configured to use the head-end multicast mode, a non-unicast packet received on an SPB access port is replicated once for each receiver in the provider backbone bridge (PBB) network using its unicast base MAC (BMAC) address.
- When a SPB service is configured to use the tandem multicast mode, a non-unicast packet received on an SPB access port is replicated once at each node using the multicast group address.

Examples

```
-> unp spb-profile spb3 tag-value 200 isid 1500 bvlan 4002 multicast-mode tandem
-> unp spb-profile spb3 tag-value 200 isid 1500 bvlan 4002 multicast-mode headend
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp spb-profile	Configures a UNP VLAN profile. This type of profile is applied to traffic learned on UNP bridge ports and link aggregates.
show unp spb-profile	Displays the service-based profile configuration for the switch.

MIB Objects

```
alaDaSpbProfileTable
   alaDaSpbProfileName

   alaDaSpbProfileQosPolicyListName
   alaDaSpbProfileIsid
   alaDaSpbProfileBVlan
   alaDaSpbProfileMulticastMode
```

unp spb-profile vlan-xlation

Configures the status of VLAN translation for the specified SPB service profile.

unp spb-profile *profile_name* **tag-value {0 |** *qtag* **|** *outer_qtag:inner_qtag}* **isid** *instance_id* **bvlan** *bvlan_id* **vlan-xlation {enable | disable}**

Syntax Definitions

profile_name	The name of an SPB service profile.
0	Use VLAN tag information from classified traffic to create the Service Access Point (SAP) for the traffic. If the traffic is untagged, the SAP is created with 0 as the encapsulation value (for example, 1/12:0).
qtag	The outer VLAN ID tag to use when creating a SAP for single-tagged traffic.
outer_qtag:inner_qtag	An outer VLAN ID tag and an inner VLAN tag to use when creating a SAP for double-tagged (QinQ) classified traffic.
instance_id	A service instance identifier (I-SID) that is used to identify an SPB service in a provider backbone bridge (PBB) network. The valid range is 256–16777214.
bvlan_id	The VLAN ID number of an existing SPB backbone VLAN (BVLAN).
list_name	The name of a policy list to associate with the specified UNP. The policy list contains QoS policy rules/ACLs that are applied to devices classified with the UNP.
enable	Enables egress VLAN translation for the SPB service associated with this UNP.
disable	Disables egress VLAN translation for the SPB service associated with this UNP.

Defaults

By default, the VLAN translation mode is disabled for the SPB service profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enabling VLAN translation at the service level is only applicable if the corresponding SPB access ports for the SPB Service Access Points (SAPs) also have VLAN translation enabled.
- When VLAN translation is enabled for the profile, the VLAN tags for profile traffic are processed according to the settings for the SAP on which the frames will egress, not according to the settings for the SAP on which the frames were received.

Examples

```
-> unp spb-profile spb3 tag-value 200 isid 1500 bvlan 4002 vlan-xlation enable
```

```
-> unp spb-profile spb3 tag-value 200 isid 1500 bvlan 4002 vlan-xlation disable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp spb-profile	Configures a UNP VLAN profile. This type of profile is applied to traffic learned on UNP bridge ports and link aggregates.
show unp spb-profile	Displays the service-based profile configuration for the switch.

   alaDaSpbProfileQosPolicyListName
   alaDaSpbProfileIsid
   alaDaSpbProfileBVlan
   alaDaSpbProfileSapVlanXlation
```

unp spb-profile mobile-tag

Configures the mobile tag attribute for the specified SPB service profile.

unp spb-profile *profile_name* **tag-value {0 |** *qtag* | *outer_qtag:inner_qtag}* **isid** *instance_id* **bvlan** *bvlan_id* **[mobile-tag {enable | disable}]**

Syntax Definitions

profile_name	The name of an SPB service profile.
0	Use VLAN tag information from classified traffic to create the Service Access Point (SAP) for the traffic. If the traffic is untagged, the SAP is created with 0 as the encapsulation value (for example, 1/12:0).
qtag	The outer VLAN ID tag to use when creating a SAP for single-tagged traffic.
outer_qtag:inner_qtag	An outer VLAN ID tag and an inner VLAN tag to use when creating a SAP for double-tagged (QinQ) classified traffic.
instance_id	A service instance identifier (I-SID) that is used to identify an SPB service in a provider backbone bridge (PBB) network. The valid range is 256–16777214.
bvlan_id	The VLAN ID number of an existing SPB backbone VLAN (BVLAN).
mobile-tag enable	Enables mobile tagging of egress packets for the service associated with this UNP.
mobile-tag disable	Disables mobile tagging of egress packets for the service associated with this UNP.

Defaults

By default, the mobile tag status is disabled for the SPB service profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the mobile tag status is enabled, the first user device that is learned on a UNP access port and subsequently classified into an SPB service profile, triggers a tagged VLAN-port association between the UNP port and the BVLAN associated with the profile.
- When the mobile tag status is disabled, any user device classified into the SPB profile will remain learned in that profile. In this case, the tagged/untagged VLAN-port association is determined based on the user traffic which was learned as tagged or untagged, respectively.

Examples

```
-> unp spb-profile spb3 tag-value 200 isid 1500 bvlan 4002 mobile-tag enable
-> unp spb-profile spb3 tag-value 200 isid 1500 bvlan 4002 mobile-tag disable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp spb-profile	Configures a UNP VLAN profile. This type of profile is applied to traffic learned on UNP bridge ports and link aggregates.
show unp spb-profile	Displays the service-based profile configuration for the switch.

   alaDaSpbProfileQosPolicyListName
   alaDaSpbProfileIsid
   alaDaSpbProfileBVlan
   alaDaSpbProfileMobileTag
```

unp saa-profile

Note: *This command is not supported in this release.*

Configures a Service Assurance Agent (SAA) performance monitoring profile. This type of profile is assigned to UNP VLAN profiles to specify jitter and latency threshold values for SAA sessions that apply to the assigned UNP VLAN profile.

unp saa-profile *profile_name* **[jitter-threshold** *jitter_thresh***] [latency-threshold** *latency_thresh***]**

no unp saa-profile *profile_name*

Syntax Definitions

profile_name	The name to assign to the SAA profile.
jitter_thresh	The jitter threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.
latency_thresh	The latency threshold value, in microseconds. A trap is generated when this value is crossed. The valid range is 0–1000000.

Defaults

parameter	default
jitter_thresh	0 (disabled)
latency_thresh	0 (disabled)

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the SAA profile from the switch configuration.
- Although SAA profiles can be configured and assigned to a UNP through the CLI, these profiles are mainly used by the Alcatel-Lucent OmniVista network management application to trigger SAA sessions that monitor connections between virtual machines (VMs) in a data center network.
- Assigning SAA profiles is supported only with UNP VLAN-based profiles; UNP service-based profiles do not support this functionality.

Examples

```
-> unp saa-profile unp_saa1 jitter-threshold 100 latency-threshold 500
-> unp saa-profile unp_saa2 jitter-threshold 150
-> unp saa-profile unp_saa3 latency-threshold 250
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp vlan-profile	Configures a UNP VLAN profile.
show unp vlan-profile	Displays the UNP VLAN profile configuration for the switch.
show unp saa-profile	Displays the SAA profile configuration for the switch.

MIB Objects

   alaDaSaaProfileName
   alaDaSaaProfileLatencyThreshold
   alaDaSaaProfileJitterThreshold
```

unp port

Configures UNP functionality on a port or link aggregate.

unp {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***} [port-type {edge | bridge | spb-access}]**

no unp {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***}**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
agg_id	The link aggregate ID number.
edge	Configures the specified port or link aggregate as an edge port. This port type is used for classifying traffic into Edge-based profiles.
bridge	Configures the specified port or link aggregate as a standard bridge port. This port type is used for classifying traffic into VLAN-based profiles.
spb-access	Configures the specified port or link aggregate as a Shortest Path Bridging (SPB) service access port. This port type is used for classifying traffic into service-based SPB profiles.

Defaults

By default, UNP is disabled on all ports and link aggregates. However, when UNP is enable on a port or link aggregate, the following default port type value applies:

parameter	default
edge | bridge | spb-access	**edge**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the UNP configuration from a port or link aggregate.
- To change the port type of an existing UNP port, remove the current UNP configuration first using the **no unp port** or **no unp linkagg** command then use the **unp port-type** command to set the new port type.
- Any configuration change to a UNP-enabled port will flush all MAC addresses learned on that port. This applies only to CLI commands used to configure UNP port parameters.
- There is no limit to the number of switch ports that can have UNP enabled.
- Traffic received on UNP edge, bridge, and service access ports is classified as follows:
  - UNP edge port traffic is classified using Edge-based profiles.
  - UNP bridge port traffic is classified using VLAN-based profiles.
  - UNP service access port traffic is classified using service-based SPB profiles.

- Enabling UNP is *not* supported on the following port types:
  - 802.1q-tagged ports.
  - MVRP ports.
  - Port Mirroring destination ports (MTP).
  - Port Mapping network ports.
  - STP and ERP ports.
  - Ports on which a static MAC address is configured.
  - Ports on which dynamic Source Learning is disabled.
  - VLAN Stacking (Ethernet Services NNI or UNI) ports.
  - Service Manager access and network ports.
  - Ethernet OAM ports.
  - Edge Virtual Bridging (EVB) ports.
- UNP and Learned Port Security (LPS) are supported on the same port with the following conditions:
  - LPS is not supported on link aggregates.
  - The LPS learning window is set globally but not on a per-port basis. So the window applies to all UNP ports.
  - When LPS is enabled or disabled on a UNP edge or bridge port (LPS is not supported on UNP access ports), MAC addresses already learned on that port are flushed.
  - Configuring a static MAC address is not allowed on a UNP port unless LPS is also enabled on the same port.
  - When both LPS and UNP are enabled on the same port, UNP first authenticates and classifies any MAC addresses received, then LPS rules are applied. If a MAC address violates any of the LPS rules for the port, the address may get filtered or the port violated even if UNP initially determined the address was valid. In other words, LPS rules take precedence over UNP to determine if a MAC address is bridged or filtered on the port.
  - If UNP classifies a MAC address as learning but LPS learns the address as filtering, an untagged packet will show as filtering in the default VLAN for the port and a tagged packet MAC will show as filtering in the specific tagged VLAN.
  - When a MAC address is filtered by LPS, the **show unp edge-user** command will display “LPS-Blocked” as the classification source for that MAC address.
- UNP ports support both tagged and untagged packets. If the VLAN ID of a tagged packet matches the VLAN associated with a UNP into which the packet was classified, the packet is learned as forwarding and a tagged VLAN-port association is created. However, if the VLAN ID tag does not match the VLAN ID associated with the profile, the packet is filtered.
- UNP edge and bridge ports support single-tagged packets. However, double-tagged packets are treated the same as single-tagged packets in that UNP will only use the outer VLAN tag to determine how the packet is processed on the UNP bridge port.
- UNP access ports use the inner VLAN tag of double-tagged packets received on the port to determine the service access port (SAP) to use or create for forwarding the traffic on the network backbone.

Examples

```
-> unp port 2/1/1
-> unp port 1/1/5-10 port-type bridge
```

```
-> unp port 1/15-20 port-type spb-access
-> unp linkagg 10 port-type edge
-> unp linkagg 2-5 port-type bridge
-> no unp port 2/1/1
-> no unp linkagg 10
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **bridge** and **spb-access** parameters added.

Related Commands

unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic received on UNP Edge ports.
unp vlan-profile	Configures a UNP VLAN profile. This type of profile is applied to traffic received on UNP bridge ports.
unp spb-profile	Configures a UNP SPB profile. This type of profile is applies to traffic received on UNP service access ports.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortType
```

unp redirect port-bounce

Enables or disables the port bounce action on the specified UNP port or globally for the switch. When enabled, a port bounce is triggered upon receipt of a RADIUS Change of Authorization (COA) or a Disconnect request (DM) message from a redirection server to enforce a user role or terminate a user session.

unp [port *chassis/slot/port1***[**-*port2***]] redirect port-bounce {enable | disable}**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP edge port. Use a hyphen to specify a range of ports (3/1/1-8).
enable	Enables the port bounce function.
disable	Disables the port bounce function.

Defaults

By default, port bounce is enabled on all UNP ports.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **port** parameter to enable or disable the port bounce status for a specific UNP edge port. Note that port bounce is not supported on link aggregates or on UNP bridge or access ports.
- If a port is not specified with this command, then the port bounce status is enabled or disabled for all UNP edge ports on the entire switch.
- The port bounce action only applies to a MAC authenticated non-supplicant (non-802.1x device). If the device is a supplicant (802.1X device), then an EAP-Fail frame is sent instead. In both cases, re-authentication is triggered for both types of devices.
- The port-level setting of the port bounce action overrides the global setting for the switch. The following table indicates when a port is toggled based on the status of port bounce at the global and port level:

Global Port Bounce	Per-Port Bounce	Action
Enabled	Disabled	Port is not toggled
Enabled	Enabled	Port is toggled
Disabled	Enabled	Port is toggled
Disabled	Disabled	Port is not toggled

- This command is used when configuring the switch to interact with the ClearPass Policy Manager (CPPM) as part of the OmniSwitch Bring Your Own Devices (BYOD) solution.

Examples

```
-> unp port 1/1/6 redirect port-bounce disable
-> unp redirect port-bounce disable
```

Release History

Release 8.1.1; command was introduced.

   alaDaUNPRedirectPortBounce
```

unp port group-id

Assigns a UNP edge port or link aggregate to a group ID. This command is used to group physical UNP ports or link aggregates into one logical domain.

unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} group-id** *group_id*

no unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} group-id**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP edge port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
group_id	The numerical group ID to which the specified port or link aggregate is assigned.

Defaults

By default, all UNP edge ports are assigned to group ID zero (0).

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to set the group ID back to zero (the default).
- The group ID specified with this command must already exist in the switch configuration.
- This command is only allowed on UNP edge ports and link aggregates, not on UNP bridge or service access ports.

Examples

```
-> unp port 1/1/1 group-id 1
-> unp port 1/1/1-3 group-id 2
-> unp linkagg 5 group-id 5
-> unp linkagg 8-10 group-id 6
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp port	Configures the status of UNP for the specified port or link aggregate.
unp group-id	Creates a group ID to assign to UNP ports or link aggregates.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
    alaDaUNPPortGroupId
```

unp unp-customer-domain

Assigns a UNP port or link aggregate to a customer domain (UNP group). This command applies only to UNP bridge and service access ports.

unp {port *chassis_id/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} unp-customer-domain** *domain_id*

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
domain_id	The numerical domain ID to which the specified port or link aggregate is assigned.

Defaults

By default, all UNP ports are assigned to customer domain zero (0).

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The domain ID specified with this command must already exist in the switch configuration.
- Customer domains are used to group physical UNP ports or link aggregates into one logical domain.
- Once a port is assigned to a specific customer domain, only classification rules associated with the same customer domain ID are applied to that port.

Examples

```
-> unp port 1/1 unp-customer-domain 1
-> unp port 1/1-3 unp-customer-domain 2
-> unp linkagg 5 unp-customer-domain 5
-> unp linkagg 8-10 unp-customer-domain 6
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp port	Configures the status of UNP for the specified port or link aggregate.
unp customer-domain	Creates a customer domain ID.
show unp customer-domain	Displays the available customer domain IDs.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   laDaUNPPortCustomerDomainId
```

unp default-edge-profile

Assigns the name of an existing UNP Edge classification profile to serve as the default profile for the specified UNP edge port or link aggregate.

unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} default-edge-profile** *profile_name*

no unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***} default-edge-profile**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP edge port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
profile_name	The name of an existing Edge classification profile.

Defaults

By default, there is no default profile configured for UNP ports or link aggregates.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove the default Edge profile from the port configuration.
- This command applies only to UNP-enabled ports and link aggregates that are configured as edge ports and link aggregates.
- The Edge classification profile specified with this command must already exist in the switch configuration.
- The default UNP is used to classify devices on the port when one of the following conditions occur:
  - UNP authentication *and* UNP classification are not enabled on the port.
  - UNP authentication fails *and* UNP classification is not enabled on the port.
  - UNP authentication is not enabled for the port *and* UNP classification fails.
  - UNP authentication *and* UNP classification fails.
  - UNP authentication passes but no profile or an invalid profile is returned *and* UNP classification fails or is not enabled on the port.
  - The UNP trust VLAN tag option (see **unp trust-tag**) is enabled for the port, but the VLAN ID specified in the tag field of the device traffic does not exist.

Examples

```
-> unp port 1/1/1 default-edge-profile “Sales”
-> no unp port 1/1/1 default-edge-profile
-> unp port 1/1/1-4 default-edge-profile “Sales”
```

```
ERROR: Port 1/1/2 is not a unp port
ERROR: Port 1/1/3 is not a unp port
-> unp port 1/1/1 default-edge-profile “BAD-UNP”
ERROR: UNP doesn't exist
-> no unp port 1/1/1-4 default-edge-profile
-> unp linkagg 5 default-edge-profile “VM1-Server1”
-> no unp linkagg 5 default-edge-profile
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp port	Configures the UNP status and port type for the specified port or link aggregate.
unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic received on UNP Edge ports.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortDefaultEdgeProfName
```

unp default-vlan-profile

Configures the name of an existing VLAN classification profile to serve as the default UNP for the specified UNP bridge port or link aggregate.

unp {port *chassis_id/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} default-vlan-profile** *profile_name*

no unp {port *chassis_id/slot/port1***[**-*port2***] | linkagg** *agg_id***} default-vlan-profile**

Syntax Definitions

chassis_id	The chassis identifier when running in virtual chassis mode.
*slot/port***[**-*port2***]**	The slot and port number (3/1) for a specific UNP bridge port. Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
profile_name	The name of an existing VLAN classification profile.

Defaults

By default, there is no default profile configured for UNP ports or link aggregates.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove the default UNP from the port configuration.
- This command applies only to UNP-enabled ports and link aggregates that are configured as bridge ports and link aggregates.
- The VLAN classification profile specified with this command must already exist in the switch configuration.
- The default UNP is used to classify devices on the port when one of the following conditions occur:
  - UNP authentication *and* UNP classification are not enabled on the port.
  - UNP authentication fails *and* UNP classification is not enabled on the port.
  - UNP authentication is not enabled for the port *and* UNP classification fails.
  - UNP authentication *and* UNP classification fails.
  - UNP authentication passes but no profile or an invalid profile is returned *and* UNP classification fails or is not enabled on the port.
  - The UNP trust VLAN tag option (see **unp trust-tag**) is enabled for the port, but the VLAN ID specified in the tag field of the device traffic does not exist.

Examples

```
-> unp port 1/1 default-vlan-profile Sales
-> no unp port 1/1 default-vlan-profile
```

```
-> unp port 1/1-4 default-vlan-profile Sales
ERROR: Port 1/2 is not a unp port
ERROR: Port 1/3 is not a unp port
-> unp port 1/1 default-vlan-profile “BAD-UNP”
ERROR: UNP doesn't exist
-> no unp port 1/1-4 default-vlan-profile
-> unp linkagg 5 default-vlan-profile “VM1-Server1”
-> no unp linkagg 5 default-vlan-profile
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp vlan-profile	Configures a UNP VLAN profile. This type of profile is applied to traffic received on UNP bridge ports.
unp port	Configures the UNP status and port type for the specified port or link aggregate.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortDefaultProfileName
```

unp default-spb-profile

Configures the name of an existing Shortest Path Bridging (SPB) service-based UNP to serve as the default profile for the specified UNP access port or link aggregate.

unp {port *chassis_id/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} default-spb-profile** *profile_name*

no unp {port *chassis_id/slot/port1***[**-*port2***] | linkagg** *agg_id***} default-spb-profile**

Syntax Definitions

chassis_id	The chassis identifier when running in virtual chassis mode.
*slot/port***[**-*port2***]**	The slot and port number (3/1) for a specific UNP access port. Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
profile_name	The name of an existing SPB service classification profile.

Defaults

By default, there is no default SPB service profile configured for UNP access ports or link aggregates.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove the default service profile from the port configuration.
- This command applies only to UNP-enabled ports and link aggregates that are configured as SPB service access ports and link aggregates.
- The SPB service classification profile specified with this command must already exist in the switch configuration.
- The default service profile is used to classify devices on the access port when one of the following conditions occur:
  - UNP authentication *and* UNP classification are not enabled on the port.
  - UNP authentication fails *and* UNP classification is not enabled on the port.
  - UNP authentication is not enabled for the port *and* UNP classification fails.
  - UNP authentication *and* UNP classification fails.
  - UNP authentication passes but no profile or an invalid profile is returned *and* UNP classification fails or is not enabled on the port.
  - The UNP trust VLAN tag option (see **unp trust-tag**) is enabled for the port, but the VLAN ID specified in the tag field of the device traffic does not exist.

Examples

```
-> unp port 1/10 default-spb-profile “SLA_1”
```

```
-> no unp port 1/10 default-spb-profile
-> unp port 1/1-4 default-spb-profile “CustomerA”
ERROR: Port 1/2 is not a unp port
ERROR: Port 1/3 is not a unp port
-> unp port 1/1 default-spb-profile “BAD-UNP”
ERROR: UNP doesn't exist
-> no unp port 1/1-4 default-spb-profile
-> unp linkagg 5 default-spb-profile “VM1-Server1”
-> no unp linkagg 5 default-spb-profile
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp spb-profile	Configures a UNP SPB service profile. This type of profile is applied to traffic received on UNP access ports.
unp port	Configures the UNP status and port type for the specified port or link aggregate.
show unp port 802.1x statistics	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortDefaultSpbProfileName
```

unp aaa-profile

Assigns the name of an existing authentication, authorization, and accounting (AAA) profile to the specified UNP edge port or link aggregate. This type of profile defines AAA configuration options (such as RADIUS servers and RADIUS client attributes) that are applied to device traffic received on the UNP port to which the profile is assigned.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} aaa-profile** *profile_name*

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} aaa-profile**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP edge port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
profile_name	The name of an existing AAA profile.

Defaults

By default, there is no AAA profile assigned to UNP ports or link aggregates. The global AAA configuration for the switch is applied.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove the AAA profile from the port configuration.
- This command applies only to UNP-enabled ports and link aggregates that are configured as edge ports and link aggregates.
- The AAA profile specified with this command must already exist in the switch configuration.
- AAA profiles are configured using the **aaa profile** command. See the “AAA Commands” chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide* for more information.

Examples

```
-> unp port 1/1/5 aaa-profile A1
-> no unp port 1/1/5 aaa-profile

-> unp port 1/1/1-5 aaa-profile A2
-> no unp port 1/1/1-5 aaa-profile

-> unp linkagg 10 aaa-profile A3
-> no unp linkagg 10 aaa-profile
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp port	Configures the UNP status and port type for the specified port or link aggregate.
aaa profile	Configures an AAA configuration profile.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortAaaProfile
```

unp port edge-template

Assigns the name of an existing Edge template to the specified UNP edge port or link aggregate. An Edge template defines UNP port configuration options (such as the type of authentication, classification status, a default profile) that is applied to the UNP port to which the template is assigned.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} edge-template** *template_name*

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} edge-template**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP edge port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
template_name	The name of an existing Edge template.

Defaults

By default, there is no Edge template configured for UNP ports or link aggregates.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove the Edge template from the port configuration.
- This command applies only to UNP-enabled ports and link aggregates that are configured as edge ports and link aggregates.
- The Edge template specified with this command must already exist in the switch configuration.

Examples

```
-> unp port 1/1/5 edge-template up1
-> no unp port 1/1/5 edge-template

-> unp port 1/1/1-5 edge-template up2
-> no unp port 1/1/1-5 edge-template

-> unp linkagg 10 edge-template up3
-> no unp linkagg 10 edge-template

-> unp linkagg 10-50 edge-template up4
-> no unp linkagg 10-50 edge-template
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp port	Configures the UNP status and port type for the specified port or link aggregate.
unp edge-template	Configures an Edge configuration template.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortEdgeTemplate
```

unp mac-authentication

Configures the status of MAC authentication for the specified UNP port. Enable this functionality to invoke MAC-based authentication for devices connected to the UNP port.

unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} mac-authentication {enable | disable}**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
enable	Enables MAC authentication.
disable	Disables MAC authentication.

Defaults

By default, MAC authentication is disabled on UNP ports.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is only allowed on UNP-enabled ports and link aggregates.
- MAC-based authentication is supported only through a RADIUS-capable server.
- If a range of ports is specified with this command, any non-UNP ports within the range are skipped.
- An option exists to classify a device into an alternate UNP in the event successful MAC authentication does not return a UNP name. See the **unp mac-authentication pass-alternate** command.
- If UNP MAC authentication, 802.1x authentication, and classification (see **unp classification**) are disabled on the UNP port, all MAC addresses received on that port are blocked unless a default UNP is configured.
- Configuring an authentication server down UNP (see **unp auth-server-down)** is highly recommended when MAC or 802.1X authentication is enabled on any UNP port or link aggregate. This is because after a switch reload, traffic from devices connected to UNP ports and link aggregates reaches the switch and triggers the authentication process before route convergence has completed and the server can be reached.
  - If an authentication server down UNP is configured, devices are temporarily learned in that profile and authentication is automatically attempted again after the timeout period expires. This allows time for the server to become reachable from the switch after a reload.
  - If an authentication server down UNP is not configured, devices are learned as filtering and will remain in that state. There is no further attempt to authenticate these devices again.

Examples

```
-> unp port 1/1/1 mac-authentication enable
-> unp port 1/1/1 mac-authentication disable
-> unp linkagg 2 mac-authentication enable
-> unp linkagg 2 mac-authentication disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp port	Configures the UNP status and port type for the specified port or link aggregate.
unp mac-authentication pass-alternate	Assigns the device to another UNP when successful MAC authentication does not return a UNP name.
unp 802.1x-authentication	Configures the 802.1x authentication status for the UNP port.
unp classification	Configures the classification status for the UNP port.
unp auth-server-down	Configures an authentication server down UNP for the switch.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortMacAuthFlag
```

unp mac-authentication pass-alternate

Configures the name of an existing UNP to use as an alternate profile. A device is assigned to the alternate profile when successful MAC authentication does not return a UNP name.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} mac-authentication pass-alternate {edge-profile** | **vlan-profile | spb-profile}** *profile_name*

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***} mac-authentication pass-alternate {edge-profile** | **vlan-profile | spb-profile}**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
edge-profile	Assigns an Edge profile as an alternate profile.
vlan-profile	Assigns a VLAN profile as an alternate profile.
spb-profile	Assigns a Shortest Path Bridging (SPB) service profile as an alternate profile.
profile_name	An Edge profile name.

Defaults

By default, no alternate UNP is configured.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the alternate profile from the UNP port configuration.
- The profile name specified with this command must already exist in the switch configuration.

Examples

```
-> unp port 2/1/1 mac-authentication pass-alternate edge-profile Finance
-> unp port 2/1/2-5 mac-authentication pass-alternate vlan-profile CustomerA
-> unp port 3/1 mac-authentication pass-alternate spb-profile SLA-10
-> no unp port 2/1/1 mac-authentication pass-alternate edge-profile
-> no unp port 2/1/2-5 mac-authentication pass-alternate vlan-profile
-> no unp port 3/1 mac-authentication pass-alternate spb-profile
-> unp linkagg 5 mac-authentication pass-alternate edge-profile AltUNP
-> unp linkagg 10 mac-authentication pass-alternate vlan-profile CustomerB
-> unp linkagg 20 mac-authentication pass-alternate spb-profile SLA-20
-> no unp linkagg 5 mac-authentication pass-alternate edge-profile
-> no unp linkagg 10 mac-authentication pass-alternate vlan-profile
-> no unp linkagg 20 mac-authentication pass-alternate spb-profile
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1 **vlan-profile** and **spb-profile** parameters added.

Related Commands

unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic received on UNP Edge ports and link aggregates.
unp port	Configures the status of UNP functionality on the port.
unp mac-authentication	Configures the MAC authentication status for the UNP port.
show unp port	Displays the UNP port parameter configuration.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortMacPassEdgeProfName
   alaDaUNPPortPassAltProfileName
   alaDaUNPPortPassAltSpbProfileName
```

unp 802.1x-authentication

Configures the status of 802.1x authentication for the specified UNP port. Enable this functionality to invoke 802.1x-based authentication for devices connected to the UNP port.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} 802.1x-authentication {enable | disable}**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
enable	Enables 802.1x authentication.
disable	Disables 802.1x authentication.

Defaults

By default, 802.1x authentication is disabled on UNP ports.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is only allowed on UNP-enabled ports and link aggregates.
- If a range of ports or link aggregates is specified with this command, any non-UNP ports or aggregates within the range are skipped.
- An option exists to classify a device into an alternate UNP in the event successful 802.1x authentication does not return a UNP name. See the **unp 802.1x-authentication pass-alternate** command.
- If UNP MAC authentication, 802.1x authentication, and classification (see **unp classification**) are not enabled on the UNP port, all MAC addresses received on that port are blocked unless a default UNP is configured.
- Configuring an authentication server down UNP (see **unp auth-server-down)** is highly recommended when MAC or 802.1X authentication is enabled on any UNP port or link aggregate. This is because after a switch reload, traffic from devices connected to UNP ports and link aggregates reaches the switch and triggers the authentication process before route convergence has completed and the server can be reached.
  - If an authentication server down UNP is configured, devices are temporarily learned in that profile and authentication is automatically attempted again after the timeout period expires. This allows time for the server to become reachable from the switch after a reload.
  - If an authentication server down UNP is not configured, devices are learned as filtering and will remain in that state. There is no further attempt to authenticate these devices again.

Examples

```
-> unp port 1/1/5 802.1x-authentication enable
-> unp port 1/1/5 802.1x-authentication disable

-> unp port 1/1/10-15 802.1x-authentication enable
-> unp port 1/1/10-15 802.1x-authentication disable

-> unp linkagg 10 802.1x-authentication enable
-> unp linkagg 20 802.1x-authentication disable

-> unp linkagg 10-50 802.1x-authentication enable
-> unp linkagg 10-50 802.1x-authentication disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp port	Configures the status of UNP functionality on the port.
unp 802.1x-authentication pass-alternate	Assigns the device to another profile when successful 802.1x authentication does not return a UNP name.
unp mac-authentication	Configures the MAC authentication status for the UNP port.
unp classification	Configures the classification status for the UNP port.
unp auth-server-down	Configures an authentication server down UNP for the switch.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPort8021XAuthFlag
```

unp 802.1x-authentication pass-alternate

Configures the name of an existing UNP to use as an alternate profile. A device is assigned to the alternate profile when successful 802.1X authentication does not return the name of a profile.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} 802.1x-authentication pass-alternate {edge-profile | vlan-profile | spb-profile}** *profile_name*

no unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***} 802.1X-authentication pass-alternate edge-profile**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
edge-profile	Assigns an Edge profile as an alternate profile.
vlan-profile	Assigns a VLAN profile as an alternate profile.
spb-profile	Assigns a Shortest Path Bridging (SPB) service profile as an alternate profile.
profile_name	The name of a UNP Edge profile.

Defaults

By default, no alternate UNP is configured.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the alternate profile from the UNP port configuration.
- This command is only allowed on UNP-enabled ports and link aggregates.
- If a range of ports or link aggregates is specified with this command, any non-UNP ports or aggregates within the range are skipped.
- The profile name specified with this command must already exist in the switch configuration.

Examples

```
-> unp port 1/1/1 802.1x-authentication pass-alternate edge-profile Finance
-> unp port 1/1/2-5 802.1x-authentication pass-alternate vlan-profile CustomerA
-> unp port 3/1 802.1x-authentication pass-alternate spb-profile SLA-10
-> no unp port 1/1/1 802.1x-authentication pass-alternate edge-profile
-> no unp port 1/1/2-5 802.1x-authentication pass-alternate vlan-profile
-> no unp port 3/1 802.1x-authentication pass-alternate spb-profile
-> unp linkagg 5 802.1x-authentication pass-alternate edge-profile AltUNP
-> unp linkagg 10-15 802.1x-authentication pass-alternate vlan-profile CustomerB
```

```
-> unp linkagg 20 802.1x-authentication pass-alternate spb-profile SLA-20
-> no linkagg 5 802.1x-authentication pass-alternate edge-profile
-> no linkagg 5 802.1x-authentication pass-alternate vlan-profile
-> no linkagg 5 802.1x-authentication pass-alternate spb-profile
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1 **vlan-profile** and **spb-profile** parameters added.

Related Commands

unp edge-profile	Configures an Edge UNP. This type of profile is applied to traffic received on UNP Edge ports.
unp port	Configures the status of UNP functionality on the port.
unp 802.1x-authentication	Configures the 802.1X authentication status for the UNP port.
show unp port	Displays the UNP port parameter configuration.

MIB Objects

   alaDaUNPPort8021XPassAltUserNetProfName
   alaDaUNPPort8021XPassAltSpbProfName
```

unp 802.1x-authentication tx-period

Configures the 802.1x authentication re-transmission time interval for the specified UNP port.

unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} 802.1x-authentication tx-period** *seconds*

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
seconds	The amount of time before an EAP Request Identity is retransmitted. The valid range is 1–60 seconds.

Defaults

By default, the retransmission period is set to 30 seconds.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is only allowed on UNP-enabled ports and link aggregates.
- The re-transmission time period only applies to UNP ports on which 802.1X authentication is enabled.
- If a range of ports is specified with this command, any non-UNP ports within the range are skipped.

Examples

```
-> unp port 1/1/5 802.1x-authentication tx-period 60
-> unp port 1/1/6-10 802.1x-authentication tx-period 20

-> unp linkagg 10 802.1x-authentication tx-period 60
-> unp linkagg 20-25 802.1x-authentication tx-period 20
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp port	Configures the status of UNP functionality on the port.
unp 802.1x-authentication	Configures the 802.1X authentication status for the UNP port.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPort8021XTxPeriodStatus
   alaDaUNPPort8021XTxPeriod
```

unp 802.1x-authentication supp-timeout

Configures the 802.1x authentication supplicant timeout for the specified UNP port. This value is the amount of time the switch will wait before timing out an 802.1X user that is attempting to authenticate.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} 802.1x-authentication supp-timeout** *seconds*

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15)
seconds	The timeout value. The valid range is 1–120 seconds.

Defaults

By default, the supplicant timeout value is set to 30 seconds.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Increase the supplicant timeout value if the authentication process requires additional steps by the user (for example, entering a challenge).
- This command is only allowed on UNP-enabled ports and link aggregates.
- The supplicant timeout is applied only to 802.1x users connected to a UNP port on which 802.1X authentication is enabled.
- If a range of ports is specified with this command, any non-UNP ports within the range are skipped.

Examples

```
-> unp port 1/1/5 802.1x-authentication supp-timeout 10
-> unp port 1/1/10-15 802.1x-authentication supp-timeout 60

-> unp linkagg 10 802.1x-authentication supp-timeout 40
-> unp linkagg 2-5 802.1x-authentication supp-timeout 40
```

Release History

Release 8.1.1; command was introduced.

   alaDaUNPPort8021XSuppTimeOutStatus
   alaDaUNPPort8021XSuppTimeout
```

unp 802.1x-authentication max-req

Configures the maximum number of times the switch will retransmit a request for authentication information (request identity, password, challenge) to an 802.1x user on the specified UNP port.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} 802.1x-authentication max-req** *max_req*

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
max_req	The maximum number of times information requests are retransmitted. The valid range is 0–3.

Defaults

By default, the maximum number of requests is set to two.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The 802.1X requests are transmitted, up to the maximum number allowed, until the authentication session is shut down based on the supplicant timeout value configured for the 802.1X port.
- This command is only allowed on UNP-enabled ports and link aggregates.
- The maximum number of requests is applied only to 802.1x users connected to a UNP port on which 802.1X authentication is enabled.
- If a range of ports or link aggregates is specified with this command, any non-UNP ports within the range are skipped.

Examples

```
-> unp port 1/1/5 802.1x-authentication max-req 1
-> unp port 1/1/10-15 802.1x-authentication max-req 3

-> unp linkagg 10 802.1x-authentication max-req 1
-> unp linkagg 2-5 802.1x-authentication max-req 3
```

Release History

Release 8.1.1; command was introduced.

```

unp 802.1x-authentication bypass

Configures whether the 802.1X authentication process is bypassed on the specified UNP port. When enabled, the 802.1x device authentication process is skipped; only MAC authentication or rule classification is applied to device traffic on the UNP port.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} 802.1x-authentication bypass {enable | disable}**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
enable	Enables 802.1X bypass on the specified port; MAC authentication is performed first.
disable	Disables 802.1X bypass on the specified port; 802.1X authentication is attempted first.

Defaults

By default, 801.1X authentication bypass is disabled on the UNP port; 802.1X authentication is attempted first.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is only allowed on UNP-enabled ports and link aggregates.
- Enabling 802.1X authentication bypass is not allowed on UNP ports that are configured with an 802.1X authentication failure policy.

Examples

```
-> unp port 1/1/5 802.1x-authentication bypass enable
-> unp port 1/1/5 802.1x-authentication bypass disable
-> unp port 1/1/10-15 802.1x-authentication bypass enable
-> unp port 1/1/10-15 802.1x-authentication bypass disable

-> unp linkagg 10 802.1x-authentication bypass enable
-> unp linkagg 10 802.1x-authentication bypass disable
-> unp linkagg 2-5 802.1x-authentication bypass enable
-> unp linkagg 2-5 802.1x-authentication bypass disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp 802.1x-authentication	Configures the 802.1X authentication status for the UNP port.
unp mac-authentication allow-eap	Configures whether or not subsequent 802.1x authentication is attempted based on the MAC authentication results.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPort8021XBypassStatus
```

unp mac-authentication allow-eap

Configures whether the switch attempts subsequent 802.1x authentication for a device connected to a UNP port on which 802.1x-authentication bypass is enabled. When 802.1x bypass is enabled on the port, MAC authentication is performed first on any device connected to that port. This command specifies the conditions under which 802.1x authentication is performed or bypassed after the initial MAC authentication process.

unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} mac-authentication allow-eap {pass | fail | noauth | none}**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
pass	Perform 802.1x (EAP frame) authentication if the device passes MAC authentication.
fail	Perform 802.1x (EAP frame) authentication if the device fails MAC authentication.
noauth	Perform 802.1x (EAP frame) authentication if MAC authentication is not configured on the UNP port.
none	Prevents subsequent 802.1x authentication; only MAC authentication is performed on any device accessing the UNP port.

Defaults

By default, the allow 801.1X authentication option is set to none.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The port specified with this command must also have 802.1x bypass enabled (see the **unp 802.1x-authentication bypass** command). If bypass is not enabled, the option configured with this command does not apply.
- This command is only allowed on UNP-enabled ports and link aggregates.

Examples

```
-> unp port 1/1/5 mac-authentication allow-eap pass
-> unp port 1/1/10-15 mac-authentication allow-eap fail

-> unp linkagg 10 mac-authentication allow-eap noauth
-> unp linkagg 2-5 mac-authentication allow-eap none
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp port	Configures the status of UNP functionality on the port.
unp 802.1x-authentication bypass	Configures the 802.1x bypass operation status for the UNP port.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortMacAllowEap
```

unp 802.1x-authentication failure-policy

Configures whether the switch attempts subsequent MAC authentication for a device after the initial 802.1X authentication process fails.

unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} 802.1x-authentication failure-policy {mac-authentication | default}**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
mac-authentication	Perform MAC authentication if 802.1x authentication fails.
default	Perform device classification if 802.1x authentication fails; MAC authentication is not performed.

Defaults

By default, the 801.1X authentication failure policy is set to classification (**default**).

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Configuring the 802.1X authentication failure policy is not allowed on UNP ports on which 802.1X authentication bypass is enabled.
- Device classification (the default) is performed based on the classification options configured for the UNP port.

Examples

```
-> unp port 1/1/5 802.1x-authentication failure-policy mac-authentication
-> unp port 1/1/10-15 802.1x-authentication failure-policy default

-> unp linkagg 10 802.1x-authentication failure-policy mac-authentication
-> unp linkagg 2-5 802.1x-authentication failure-policy classification
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp port	Configures the status of UNP functionality on the port.
unp 802.1x-authentication	Configures the 802.1X authentication status for the UNP port.

show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortMacAllowEap
```

unp classification

Configures the classification status for the specified UNP port. When enabled and MAC authentication is disabled or fails, UNP classification rules are applied to the traffic received on the UNP port.

unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***} classification {enable | disable}**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
agg_id	Link aggregate ID.
enable	Enables classification.
disable	Disables classification.

Defaults

By default, classification is disabled on the UNP port.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is allowed only on UNP-enabled ports and link aggregates.
- If a range of ports or link aggregates is specified with this command, any non-UNP ports or aggregates within the range are skipped.
- UNP classification rules are applied when one of the following occurs:
  - 802.1X authentication fails.
  - MAC authentication fails.
  - MAC and 802.1X authentication are disabled on the port.
  - MAC or 802.1X authentication passes but no profile or an invalid profile is returned.
- If device traffic does not match any of the classification rules, the device is assigned to the default UNP configured for the port.
- If both UNP MAC authentication and classification (see **unp mac-authentication**) are not enabled on the UNP port, all MAC addresses received on that port are blocked unless a default UNP is specified for the port.

Examples

```
-> unp port 1/1/5 classification enable
-> unp port 1/1/5 classification disable
-> unp port 1/1/10-15 classification enable
-> unp port 1/1/10-15 classification disable

-> unp linkagg 10 classification enable
```

```
-> unp linkagg 10 classification disable
-> unp linkagg 10-50 classification enable
-> unp linkagg 10-50 classification disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show unp classification	Displays the UNP classification rule configuration for the switch.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortClassificationFlag
```

unp trust-tag

Configures the option of whether or not to trust the VLAN ID of a tagged packet to determine how the packet is classified.

unp port {port *chassis_id/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} trust-tag {enable | disable}**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
enable	Trust the VLAN ID tag.
disable	Do not trust the VLAN ID tag.

Defaults

By default, the VLAN tag is not trusted.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When this option is enabled, the device is classified into a VLAN or service access point (SAP) when one of the following conditions occur:
  - MAC or 802.1X authentication passes, but the RADIUS server returns a UNP that does not exist in the switch configuration.
  - MAC or 802.1X authentication passes, but the RADIUS server does not return a UNP and the alternate UNP option is disabled for the port.
  - Device traffic does not match any of the classification rules configured for the UNP port.
  - The UNP VLAN obtained from the matching classification rule does not exist in the switch configuration.
  - Auth-Server-Down UNP option is used, but the VLAN associated with that UNP does not exist in the switch configuration.
- When the trust tag option is triggered on a regular UNP bridge or edge port and a VLAN exists in the switch configuration that matches the VLAN tag, a VLAN-port-association (VPA) is created between the UNP port and the matching VLAN even if the matching VLAN is *not* associated with a UNP.
- When the trust tag option is triggered on a UNP SPB access port, the VLAN tag information is used to create a dynamic SAP (virtual port) to which the access port is associated.
- Enabling the trust VLAN ID tag option provides an implicit method of VLAN tag classification that will accept tagged traffic matching any of the existing UNPs without the need to create specific classification rules for those profiles.

Examples

```
-> unp port 1/1 trust-tag enable
-> unp port 1/1 trust-tag disable
-> unp port 1/1-4 trust-tag enable

-> unp linkagg 5 trust-tag enable
-> unp linkagg 6-10 trust-tag enable
-> unp linkagg 5 trust-tag disable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortTrustTagStatus
```

unp direction

Configures whether network access control is applied to both incoming and outgoing traffic or only applied to incoming traffic on the specified UNP port or link aggregate.

unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} direction {both | in}**

no unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} direction**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP edge or bridge port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
both	Enables bidirectional network access control on the specified port or link aggregate.
in	Enables network access control for incoming traffic only on the specified port or link aggregate.

Defaults

By default, bidirectional network access control is enabled on the port.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to set the network access control direction to the default (**both**).
- This command applies only to UNP-enabled ports or link aggregates configured as edge or bridge ports; does not apply to UNP access ports.
- When the port control direction is set to **both**, egress broadcast, unknown unicast, and multicast traffic is blocked on the UNP port.
- When the port control direction is set to **in**, egress broadcast, unknown unicast, and multicast traffic is allowed on the UNP port.

Examples

```
-> unp port 1/1/5 direction in
-> unp port 1/1/10-15 direction both
-> no unp port 1/1/10-15 direction

-> unp linkagg 10 direction in
-> unp linkagg 2-5 direction both
-> no unp linkagg 2-5 direction
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp port	Configures the status of UNP functionality on the port.
unp 802.1x-authentication	Configures the 802.1X authentication status for the UNP port.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUNPPortTable
   alaDaUNPPortIfIndex
   alaDaUNPPortAdminControlledDirections
```

unp vlan

Configures an untagged VLAN-port association between the specified UNP port and VLAN ID.

unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} vlan** *vlan_id* **[**-*vlan_id2***]**

no unp {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]} vlan** *vlan_id* **[**-*vlan_id2***]**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP edge or bridge port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
vlan_id **[**-*vlan_id2***]**	The VLAN ID to assign to the UNP port. Use a hyphen to specify a range of VLAN IDs.

Defaults

By default, no VLAN associations are configured for UNP edge and bridge ports.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a VLAN association from the UNP port configuration.
- This command applies only to UNP-enabled ports or link aggregates configured as edge or bridge ports; does not apply to UNP access ports.
- When this command is used to assign a VLAN to a UNP edge or bridge port, the port goes into a forwarding state for egress traffic associated with the VLANs assigned to the port. This automatically occurs even when there is no MAC address learned on the UNP port in the assigned VLANs and regardless of the direction value (in or both) set for the port.

Examples

```
-> unp port 1/1/5 vlan 500
-> unp port 1/1/10 vlan 100-105
-> no unp port 1/1/5 vlan 500
-> no unp port 1/1/10 vlan 100-105

-> unp linkagg 10 vlan 500
-> unp linkagg 20 vlan 100-105
-> no unp linkagg 10 vlan 500
-> no unp linkagg 20 vlan 100-105
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp port	Configures the status of UNP functionality on the port.
show unp port configured-vlans	Displays the VLAN assignments configure for UNP edge and bridge ports or link aggregates.

MIB Objects

```
alaDaUNPPortVlanTable
   alaDaUNPPortVlanVID
```

unp edge-template

Configures an Edge port template that is used to apply pre-defined port configuration to UNP Edge ports or link aggregates. This section describes the base command (**unp edge-template** *template_name*) along with the other command keywords that are used to configure port parameter values that are applied when the template is assigned to a UNP port or link aggregate.

unp edge-template *template_name*
[802.1x-authentication {enable | disable}]
[802.1x-authentication pass-alternate edge-profile *profile_name***]**
[mac-authentication {enable | disable}]
[mac-authentication pass-alternate edge-profile *profile_name***]**
[classification {enable | disable}]
[default-edge-profile *profile_name***]**
[group-id *group_id***]**
[aaa-profile *profile_name***]**
[redirect port-bounce {enable | disable}]
[direction {in | both}]
[802.1x-authentication tx-period *seconds***]**
[802.1x-authentication supp-timeout *seconds***]**
[802.1x-authentication max-req *max_req***]**
[802.1x-authentication bypass {enable | disable}]
[802.1x-authentication failure-policy {mac-authentication | default}]
[mac-authentication allow-eap {pass | fail | noauth | none}]
[trust-tag {enable | disable}]
[vlan *vlan_id* **[-***vlan_id2***]**

no unp edge-template *template_name*

Syntax Definitions

template_name	The name to associate with the Edge port template.

Defaults

When a template is created without specifying any port parameter values, the template parameters are set to the following default values:

parameter	default
802.1x-authentication {enable | disable}]	**disable**
802.1x-authentication pass-alternate edge-profile *profile_name*	none
mac-authentication {enable | disable}	**disable**
mac-authentication pass-alternate edge-profile *profile_name***]**	none
classification {enable | disable}	**disable**

parameter	default
default-edge-profile *profile_name*	none
group-id *group_id*	**0**
aaa-profile *profile_name*	none
redirect port-bounce {enable | disable}	**enable**
direction {in | both}	**both**
802.1x-authentication tx-period *seconds*	**30**
802.1x-authentication supp-timeout *seconds*	**30**
802.1x-authentication max-req *max_req*	**2**
802.1x-authentication bypass {enable | disable}	**disable**
802.1x-authentication failure-policy {mac-authentication | default}	**default**
mac-authentication allow-eap {pass | fail | noauth | none}	**none**
trust-tag {enable | disable}	**disable**
vlan *vlan_id* **[-***vlan_id2***]**	none

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the Edge port template from the switch configuration.
- Using an Edge port template to configure UNP functionality on a port or link aggregate avoids having to configure each parameter with a separate CLI command. Applying an Edge template configures all port-based parameters with a single CLI command.
- Creating the template name with the base command (**unp edge-template** *template_name*) is not required to configure a template port parameter value. If the template does not exist, the switch will automatically create the template name specified when the port parameter is configured. For example, the **unp edge-template et-1 mac-authentication enable** command will create the “et-1” template if it does not already exist in the switch configuration.
- When an Edge template is applied to a UNP Edge port, the parameter values defined in the template will override any existing UNP port configuration. In addition, any attempt to explicitly configure a port that is associated with a template is not allowed.
- For more information about specific port parameter values, refer to the following explicit UNP port configuration commands for each template parameter:

Edge Template Parameter	Explicit Port Configuration Command
[802.1x-authentication {enable | disable}]	**unp 802.1x-authentication**
[802.1x-authentication pass-alternate edge-profile *profile_name***]**	**unp 802.1x-authentication pass-alternate**

Edge Template Parameter	Explicit Port Configuration Command
[mac-authentication {enable | disable}]	**unp mac-authentication**
[mac-authentication pass-alternate edge-profile *profile_name*]	**unp mac-authentication pass-alternate**
[classification {enable | disable}]	**unp classification**
[default-edge-profile *profile_name***]**	**unp default-edge-profile**
[group-id *group_id***]**	**unp port group-id**
[aaa-profile *profile_name***]**	**unp aaa-profile**
[redirect port-bounce {enable | disable}]	**unp redirect port-bounce**
[direction {in | both}	**unp direction**

unp classification port

Defines a Port classification rule for the specified UNP Edge profile. If the UNP edge port or link aggregate on which the device traffic is received matches the port or link aggregate defined for the rule, the specified profile is applied to the device.

unp classification {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***} [vlan-tag** *vlan_id***] edge-profile** *profile_name*

no unp classification {port *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***} edge-profile**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
agg_id	Link aggregate ID.
vlan_id	A VLAN ID.
profile_name	The name of an existing Edge profile.

Defaults

By default, no classification rules are defined for an Edge profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the rule from an Edge profile configuration. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- The Port rule configured for the specified Edge profile is applied only to traffic learned on the specified UNP edge port or aggregate. This type of rule is not configurable for VLAN and SPB service profiles.
- If a range of ports is specified with this command, any non-UNP ports within the range are skipped.
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets received on the specified UNP edge port *and* the VLAN ID tag.
- Untagged packets are only classified using the specified UNP edge port; the VLAN ID tag is ignored if it is specified with this rule.
- A Port rule can be combined with a MAC address rule, IP address rule, or VLAN tag rule to configure a binding classification rule. The following binding rule combinations are supported:
  - Port + MAC address + IP address + VLAN tag
  - Port + MAC address + VLAN tag
  - Port + IP address + VLAN tag

Examples

```
-> unp classification port 1/1/5 edge-profile myProfile1
-> unp classification port 1/1/6 vlan-tag 100 edge-profile myProfile2
-> no unp classification port 1/1/5 edge-profile
-> no unp classification port 1/1/6 edge-profile

-> unp classification port 1/1/10-15 edge-profile myProfile2
-> no unp classification port 1/1/10-15 edge-profile
```

Port + MAC address binding rule example:

```
-> unp classification mac-address 00:11:22:33:44:55 port 1/1/5 edge-profile Pr1
-> no unp classification mac-address 00:11:22:33:44:55 port 1/1/5 edge-profile
```

Port + IP address binding rule example:

```
-> unp classification ip-address 10.0.0.20 mask 255.255.0.0 port 1/1/10 edge-
profile Pr2
-> no unp classification ip-address 10.0.0.20 mask 255.255.0.0 port 1/1/10 edge-
profile
```

Port + MAC address + IP address binding rule example:

```
-> unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 port 1/1/15 edge-profile Pr3
-> no unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 port 1/1/15 edge-profile
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **vlan-tag** parameter added.

Related Commands

unp classification	Configures the classification status for the UNP port. Rules are not applied when classification is disabled for the port.
unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
show unp classification	Displays the UNP classification rule configuration.

MIB Objects

```
alaDaUNPPortRuleTable
  alaDaUNPPortRuleNum
  alaDaUNPPortRuleEdgeProf
  alaDaUNPPortRuleRowStatus
  alaDaUNPPortRuleVlanTag
```

unp classification group-id

Defines a Group ID classification rule for the specified UNP Edge profile. If the port or link aggregate on which the device traffic is received belongs to a Group ID that matches the Group ID defined for the rule, the specified profile is applied to the device.

unp classification group-id *group_id* **[vlan-tag** *vlan_id***] edge-profile** *profile_name*

no unp classification group-id *group_id* **edge-profile**

Syntax Definitions

group_id	Group ID number.
vlan_id	A VLAN ID.
profile_name	The name of an existing Edge profile.

Defaults

By default, no classification rules are defined for an Edge profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the rule from an Edge profile configuration. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- The Group ID rule configured for the specified Edge profile is applied only to traffic learned on UNP edge ports. This type of rule is not configurable for VLAN and SPB service profiles.
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets received on a UNP edge port associated with the Group ID *and* tagged with the specified VLAN ID.
- Untagged packets are only classified using the specified Group ID; the VLAN ID tag is ignored if it is specified with this rule.
- A Group ID rule can be combined with a MAC address rule, IP address rule, or VLAN tag rule to configure a binding classification rule. The following binding rule combinations are supported:
  - Group ID + MAC address + IP address + VLAN tag
  - Group ID + MAC address + VLAN tag
  - Group ID + IP address + VLAN tag

Examples

```
-> unp classification group-id 10 edge-profile myProfile1
-> unp classification group-id 20 vlan-tag 100 edge-profile myProfile2
-> no unp classification group-id 10 edge-profile
-> no unp classification group-id 20 edge-profile
```

Group ID + MAC address binding rule example:

```
-> unp classification mac-address 00:11:22:33:44:55 group-id GRP1 edge-profile Pr1
-> no unp classification mac-address 00:11:22:33:44:55 group-id GRP1 edge-profile
```

Group ID + IP address binding rule example:

```
-> unp classification ip-address 10.0.0.20 mask 255.255.0.0 group-id GRP2 edge-
profile Pr2
-> no unp classification ip-address 10.0.0.20 mask 255.255.0.0 group-id GRP2 edge-
profile
```

Group ID + MAC address + IP address binding rule example:

```
-> unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 group-id GRP3 edge-profile Pr3
-> no unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 group-id GRP3 edge-profile
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **vlan-tag** parameter added.

```

unp classification mac-address

Defines a MAC address classification rule for the specified UNP profile. If the source MAC address of the device traffic matches the MAC address defined for the rule, the specified profile is applied to the device.

unp classification mac-address *mac_address* **[group-id** *group_id***] [vlan-tag** *vlan_id***] edge-profile** *profile_name*

unp classification mac-address *mac_address* **[vlan-tag** *vlan_id***] [unp-customer-domain** *domain_id***] {vlan-profile | spb-profile}** *profile_name*

no unp classification mac-address *mac_address* **edge-profile**

no unp classification mac-address *mac_address* **[unp-customer-domain** *domain_id***]**

Syntax Definitions

mac_address	MAC address (e.g., 00:00:39:59:f1:0c).
group_id	An existing group ID number to which this rule will apply.Use this optional parameter with Edge profiles.
vlan_id	A VLAN ID.
domain_id	An existing customer domain ID to which this rule will apply. Use this optional parameter with VLAN and SPB service profiles.
edge-profile	Assigns the rule to an Edge profile.
vlan-profile	Assigns the rule to a VLAN profile.
spb-profile	Assigns the rule to a Shortest Path Bridging (SPB) service profile.
profile_name	The name of an existing Edge, VLAN, or SPB profile.

Defaults

By default, no classification rules are defined for UNP profiles.

parameter	default
group_id	**0**
vlan_id	**none**
domain_id	**0**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the rule from the profile configuration. When removing a rule from an Edge profile configuration, the **edge-profile** keyword is required with the **no** form of this command.
- When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.

- When configuring a MAC address classification rule, specify and optional VLAN tag and/or an optional customer domain ID (VLAN and SPB service profiles) or group ID (Edge profiles) before specifying the UNP for which the rule will classify traffic.
- When a customer domain ID or group ID is configured for this rule, the rule is applied only to traffic received on UNP ports that are associated with the same domain ID or group ID.
- The default customer domain ID and group ID is zero (0). All UNP ports not associated with a customer domain ID or group ID are automatically assigned to ID zero.
- The MAC address rule configured for the specified profile is applied only to traffic learned on UNP ports to which the profile is applied. For example:
  - Edge profiles classify traffic received on UNP edge ports.
  - VLAN profiles classify traffic received on UNP bridge ports.
  - SPB service profiles classify traffic received on UNP access ports.
- It is possible to configure a single VLAN-based profile, a single SPB service-based profile, or both types of profiles for the classification rule. Configuring both types of profiles for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- Adding a rule does not cause a MAC address flush. If necessary, use the **no mac-learning** command to clear and re-learn any addresses after the rule is added.
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified source MAC address *and* the VLAN ID tag.
- Untagged packets are only classified using the specified MAC address; the VLAN ID tag is ignored if it is specified with this rule.
- A MAC address rule can be combined with a Group ID rule, Port rule, IP address rule, and VLAN tag rule to configure a binding classification rule for an Edge profile (binding rules are not supported with VLAN and SPB service profiles). The following binding rule combinations are supported:
  - Port + MAC address + IP address + VLAN tag
  - Port + MAC address + VLAN tag
  - Port + IP address + VLAN tag
  - Group ID + MAC address + IP address + VLAN tag
  - Group ID + MAC address + VLAN tag
  - Group ID + IP address + VLAN tag

Examples

```
-> unp classification mac-address 00:11:22:33:44:55 edge-profile myProfile1
-> unp classification mac-address 00:11:22:33:44:55 group-id 1 vlan-tag 200 edge-
profile myProfile1
-> no unp classification mac-address 00:11:22:33:44:55 edge-profile

-> unp classification mac-address 00:11:22:33:44:55 vlan-profile CustA
-> unp classification mac-address 00:2a:95:00:00:01 spb-profile VNP1
-> no unp classification mac-address 00:11:22:33:44:55
-> no unp classification mac-address 00:2a:95:00:00:01

-> unp classification mac-address 00:11:22:33:44:56 vlan-tag 100 vlan-profile CustB
-> unp classification mac-address 00:2a:95:00:00:02 unp-customer-domain 1 vlan-
```

```
profile unp1 spb-profile-name spb1
-> no unp classification mac-address 00:2a:95:00:00:02 unp-customer-domain 1
-> no unp classification mac-address 00:11:22:33:44:56
```

The following examples apply only to rules configured for Edge profiles:

MAC address + port binding rule example.

```
-> unp classification mac-address 00:11:22:33:44:55 port 1/1/10 edge-profile Pr1
-> no unp classification mac-address 00:11:22:33:44:55 port 1/1/10 edge-profile
```

MAC address + Group ID binding rule example.

```
-> unp classification mac-address 00:11:22:33:44:55 group-id GRP1 edge-profile Pr1
-> no unp classification mac-address 00:11:22:33:44:55 group-id GRP1 edge-profile
```

MAC address + IP address + port binding rule example.

```
-> unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 port 1/1/1 edge-profile Pr3
-> no unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 port 1/1/1 edge-profile
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **group-id**, **unp-customer-domain**, **vlan-tag**, **vlan-profile**, **spb-profile** parameters added.

Related Commands

unp classification mac-oui

Defines a MAC address Organizationally Unique Identifier (OUI) classification rule for the specified UNP Edge profile. If the OUI of the source MAC address of the device traffic matches the OUI defined for the rule, the specified profile is applied to the device.

unp classification mac-oui *mac_oui* **[vlan-tag** *vlan_id***] edge-profile** *profile_name*

no unp classification mac-oui *mac_oui* **edge-profile**

Syntax Definitions

mac_oui	The first three octets of the MAC address (for example, e8:39:35 is the OUI of MAC address e8:39:35:10:fe:11).
vlan_id	A VLAN ID.
profile_name	The name of an existing Edge profile.

Defaults

By default, no classification rules are defined for an Edge profile.

parameter	default
vlan_id	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the rule from an Edge profile configuration. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- When configuring a MAC address OUI classification rule, specify and optional VLAN tag before specifying the UNP for which the rule will classify traffic.
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified source MAC address OUI *and* the VLAN ID tag.
- Untagged packets are only classified using the specified MAC address OUI; the VLAN ID tag is ignored if it is specified with this rule.
- The MAC address OUI rule configured for the specified Edge profile is applied only to traffic learned on UNP Edge ports. This type of rule is not configurable for VLAN and SPB service profiles.

Examples

```
-> unp classification mac-oui 00:11:22 edge-profile myProfile1
-> unp classification mac-oui 00:11:33 vlan-tag 10 edge-profile myProfile2
-> no unp classification mac-oui 00:11:22
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **vlan-tag** parameter added.

Related Commands

  alaDaUNPMacOuiRuleEdgeProfile
  alaDaUNPMacOuiRuleRowStatus
  alaDaUNPMacOuiRuleVlanTag
```

unp classification mac-address-range

Defines a MAC address range classification rule for the specified UNP profile. If the source MAC address of the device traffic matches any of the MAC addresses within the range of MAC addresses, the specified profile is applied to the device.

unp classification mac-address-range *low_mac_address high_mac_address* **[vlan-tag** *vlan_id***] edge-profile** *profile_name*

unp classification mac-address-range *low_mac_address high_mac_address* **[vlan-tag** *vlan_id***] [unp-customer-domain** *domain_id***] {vlan-profile | spb-profile}** *profile_name*

no unp classification mac-address-range *low_mac_address* **edge-profile**

no unp classification mac-address-range *low_mac_address* **[unp-customer-domain** *domain_id***]**

Syntax Definitions

low_mac_address	MAC address that defines the low end of the range (e.g., 00:00:39:59:f1:00).
high_mac_address	MAC address that defines the high end of the range (e.g., 00:00:39:59:f1:90).
vlan_id	A VLAN ID.
domain_id	An existing customer domain ID to which this rule will apply. Use this optional parameter with VLAN and SPB service profiles.
edge-profile	Assigns the rule to an Edge profile.
vlan-profile	Assigns the rule to a VLAN profile.
spb-profile	Assigns the rule to a Shortest Path Bridging (SPB) service profile.
profile_name	The name of an existing Edge, VLAN, or SPB profile.

Defaults

By default, no classification rules are defined for UNP profiles.

parameter	default
vlan_id	**none**
domain_id	**0**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the rule from the profile configuration. When removing a rule from an Edge profile, the **edge-profile** keyword is required along with the **no** form of this command.

- When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- When configuring a MAC address range classification rule, specify and optional VLAN tag and/or an optional customer domain ID (VLAN and SPB service profiles) or group ID (Edge profiles) before specifying the UNP for which the rule will classify traffic.
- When a customer domain ID or group ID is configured for this rule, the rule is applied only to traffic received on UNP ports that are associated with the same domain ID or group ID.
- The default customer domain ID and group ID is zero (0). All UNP ports not associated with a customer domain ID or group ID are automatically assigned to ID zero.
- The MAC address range rule configured for the specified profile is applied only to traffic learned on UNP ports to which the profile is applied. For example:
  - Edge profiles classify traffic received on UNP edge ports.
  - VLAN profiles classify traffic received on UNP bridge ports.
  - SPB service profiles classify traffic received on UNP access ports.
- It is possible to configure a single VLAN-based profile, a single SPB service-based profile, or both types of profiles for the classification rule. Configuring both types of profiles for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- Adding a rule does not cause a MAC address flush. If necessary, use the **no mac-learning** command to clear and re-learn any addresses after the rule is added.
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified source MAC address *and* the VLAN ID tag.
- Untagged packets are only classified using the specified MAC address; the VLAN ID tag is ignored if it is specified with this rule.

Examples

```

unp classification ip-address

Defines an IP network address classification rule for the specified UNP profile. If the source IP address of the device traffic matches the IP address defined for the rule, the specified profile is applied to the device.

unp classification ip-address *ip_address* **[mask** *subnet_mask* **| group-id** *group_id***] [vlan-tag** *vlan_id***] edge-profile** *profile_name*

unp classification ip-address *ip_address* **mask** *subnet_mask* **[vlan-tag** *vlan_id***] [unp-customer-domain** *domain_id***] {vlan-profile | spb-profile}** *profile_name*

no unp classification ip-address *ip_address* **[mask** *subnet_mask* **| group-id** *group_id***] edge-profile**

no unp classification ip-address *ip_address* **mask** *subnet_mask* **[unp-customer-domain** *domain_id***]**

Syntax Definitions

ip_address	IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).
subnet_mask	An IP address mask to identify the IP subnet for the interface (supports class-less masking).
group_id	An existing group ID number to which this rule will apply.Use this optional parameter with Edge profiles.
vlan_id	A VLAN ID.
domain_id	An existing customer domain ID to which this rule will apply. Use this optional parameter with VLAN and SPB service profiles.
edge-profile	Assigns the rule to an Edge profile.
vlan-profile	Assigns the rule to a VLAN profile.
spb-profile	Assigns the rule to a Shortest Path Bridging (SPB) service profile.
profile_name	The name of an existing Edge, VLAN, or SPB profile.

Defaults

By default, no classification rules are defined for UNP profiles.

parameter	default
group_id	**0**
vlan_id	**none**
domain_id	**0**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the rule from an Edge profile configuration. When removing a rule from an Edge profile configuration, the **edge-profile** keyword is required along with the **no** form of this command.

- When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- When configuring an IP address classification rule, specify and optional VLAN tag and/or an optional customer domain ID (VLAN and SPB service profiles) or group ID (Edge profiles) before specifying the UNP for which the rule will classify traffic.
- When a customer domain ID or group ID is configured for this rule, the rule is applied only to traffic received on UNP ports that are associated with the same domain ID or group ID.
- The default customer domain ID and group ID is zero (0). All UNP ports not associated with a customer domain ID or group ID are automatically assigned to ID zero.
- The IP address rule configured for the specified profile is applied only to traffic learned on UNP ports to which the profile is applied. For example:
  - Edge profiles classify traffic received on UNP edge ports.
  - VLAN profiles classify traffic received on UNP bridge ports.
  - SPB service profiles classify traffic received on UNP access ports.
- It is possible to configure a single VLAN-based profile, a single SPB service-based profile, or both types of profiles for the classification rule. Configuring both types of profiles for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- Adding a rule does not cause a MAC address flush. If necessary, use the **no mac-learning** command to clear and re-learn any addresses after the rule is added.
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified source MAC address *and* the VLAN ID tag.
- Untagged packets are only classified using the specified MAC address; the VLAN ID tag is ignored if it is specified with this rule.
- An IP address rule can be combined with a Group ID rule, Port rule, MAC address rule, or VLAN tag rule to configure a binding classification rule for an Edge profile (binding rules are not supported with VLAN and SPB service profiles). The following binding rule combinations are supported:
  - Port + MAC address + IP address + VLAN tag
  - Port + MAC address + VLAN tag
  - Port + IP address + VLAN tag
  - Group ID + MAC address + IP address + VLAN tag
  - Group ID + MAC address + VLAN tag
  - Group ID + IP address + VLAN tag

Examples

```
-> unp classification ip-address 10.0.0.2 mask 255.255.255.0 edge-profile myPro-
file1
-> unp classification ip-address 10.0.0.2 group-id 1 edge-profile myProfile1
-> unp classification ip-address 10.0.0.2 vlan-tag 5 edge-profile myProfile1
-> unp classification ip-address 10.0.0.2 group-id 2 vlan-tag 10 edge-profile
myProfile1
-> no unp classification ip-address 10.0.0.2 mask 255.255.255.0 edge-profile
-> no unp classification ip-address 10.0.0.2 group-id 2 edge-profile
```

```
-> unp classification ip-address 10.1.1.1 mask 255.255.255.0 vlan-profile CustA
-> unp classification ip-address 20.1.1.2 mask 255.255.255.0 spb-profile vNP1
-> no unp classification ip-address 10.1.1.1 mask 255.255.255.0
-> no unp classification ip-address 20.1.1.2 mask 255.255.255.0

-> unp classification ip-address 50.1.1.1 mask 255.255.255.0 vlan-tag 300 vlan-
profile CustB
-> unp classification ip-address 60.1.1.1 mask 255.255.0.0 unp-customer-domain 2
unp-name unp2 spb-profile-name spb2
-> no unp classification ip-address 50.1.1.1 mask 255.255.255.0
-> no unp classification ip-address 60.1.1.1 mask 255.255.0.0 unp-customer-domain 2
```

The following examples apply only to rules configured for Edge profiles:

IP address + port binding rule example.

```
-> unp classification ip-address 10.0.0.20 mask 255.255.0.0 port 1/1/10 edge-
profile Pr1
-> no unp classification ip-address 10.0.0.20 mask 255.255.0.0 port 1/1/10 edge-
profile
```

IP address + Group ID binding rule example.

```
-> unp classification ip-address 10.0.0.20 mask 255.255.0.0 group-id GRP1 edge-
profile Pr1
-> no unp classification ip-address 10.0.0.20 mask 255.255.0.0 group-id GRP1 edge-
profile
```

IP address + MAC address binding rule example.

```
-> unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 port 1/1/1 edge-profile Pr3
-> no unp classification mac-address 00:11:22:33:44:55 ip-address 10.0.0.20 mask
255.255.0.0 port 1/1/1 edge-profile
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **group-id**, **unp-customer-domain**, **vlan-tag**, **vlan-profile**, **spb-profile** parameters added.

Related Commands

unp classification	Configures the classification status for the UNP port. Rules are not applied when classification is disabled for the port.
unp port group-id	Assigns a UNP edge port or link aggregate to a group ID.
unp unp-customer-domain	Assigns a UNP bridge/access port or link aggregate to the specified customer domain ID.
unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
unp vlan-profile	Configures a UNP VLAN profile. This type of profile is applied to traffic learned on UNP bridge ports and link aggregates.
unp spb-profile	Configures a UNP SPB service profile. This type of profile is applied to traffic learned on UNP access ports and link aggregates.
show unp classification	Displays the UNP classification rule configuration.

unp classification vlan-tag

Defines a VLAN tag classification rule for the specified Universal Network Profile (UNP). If the VLAN ID tag of the device traffic matches the VLAN ID defined for the rule, the specified UNP is applied to the device.

unp classification vlan-tag *vlan_id* **[tag-position {inner | outer}] [unp-customer-domain** *domain_id***] {edge-profile | vlan-profile | spb-profile}** *profile_name*

no unp classification vlan-tag *vlan_id* **[unp-customer-domain** *domain_id* **| edge-profile]**

Syntax Definitions

vlan_id	A VLAN ID.
inner	Classify by matching the specified rule VLAN ID to the inner VLAN tag of a double-tagged packet.
outer	Classify by matching the specified rule VLAN ID to the outer VLAN tag of the double-tagged packet.
domain_id	An existing customer domain ID to which this rule will apply. A customer domain ID is configurable only for VLAN and SPB profiles.
edge-profile	Assigns the rule to an Edge profile.
vlan-profile	Assigns the rule to a VLAN profile.
spb-profile	Assigns the rule to a Shortest Path Bridging (SPB) service profile.
profile_name	The name of an existing Edge, VLAN, or SPB profile.

Defaults

By default, no classification rules are defined for a UNP.

parameter	default
inner | **outer**	**inner**
domain_id	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a VLAN tag rule. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- When configuring a VLAN tag classification rule, specify an optional VLAN tag position and/or an optional customer domain ID before specifying the name of the UNP for which the rule will classify traffic.
- When a customer domain ID is configured for this rule, the rule is applied only to traffic received on UNP bridge and access ports that are associated with the same domain ID.

- The default customer domain ID is zero (0). All UNP ports not associated with a customer domain ID are automatically assigned to domain zero.
- The VLAN tag rule configured for the specified profile is applied only to traffic learned on UNP ports to which the profile is applied. For example:
  - Edge profiles classify traffic received on UNP edge ports.
  - VLAN profiles classify traffic received on UNP bridge ports.
  - SPB service profiles classify traffic received on UNP access ports.
- It is possible to configure a single VLAN-based profile, a single SPB service-based profile, or both types of profiles for the classification rule. Configuring both types of profiles for the same rule ensures that the rule will be applied to traffic received on both types of UNP ports (bridge and access).
- Adding a rule does not cause a MAC address flush. If necessary, use the **no mac-learning** command to clear and re-learn any addresses after the rule is added.
- Untagged packets are not classified with this rule if a VLAN ID tag is specified with this command.
- A VLAN tag rule can be combined with a Group ID rule, Port rule, MAC address rule, or IP address rule to configure a binding classification rule for an Edge profile (binding rules are not supported with VLAN and SPB service profiles). The following binding rule combinations are supported:
  - Port + MAC address + IP address + VLAN tag
  - Port + MAC address + VLAN tag
  - Port + IP address + VLAN tag
  - Group ID + MAC address + IP address + VLAN tag
  - Group ID + MAC address + VLAN tag
  - Group ID + IP address + VLAN tag

Examples

```
-> unp classification vlan-tag 200 edge-profile CustA
-> unp classification vlan-tag 400 vlan-profile CustB
-> unp classification vlan-tag 300 tag-position inner spb-profile CustC
-> unp classification vlan-tag 10 unp-customer-domain 3 vlan-profile CustB spb-
profile CustC
-> no unp classification vlan-tag 200 edge-profile
-> no unp classification vlan-tag 400
-> no unp classification vlan-tag 10 unp-customer-domain 3
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp classification	Configures the classification status for the UNP port. Rules are not applied when classification is disabled for the port.
unp unp-customer-domain	Assigns a UNP port or link aggregate to the specified customer domain (UNP group) ID.
unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
unp vlan-profile	Configures a UNP VLAN profile. This type of profile is applied to traffic learned on UNP bridge ports and link aggregates.
unp spb-profile	Configures a UNP SPB service profile. This type of profile is applied to traffic learned on UNP access ports and link aggregates.
show unp classification	Displays the UNP classification rule configuration.

unp classification lldp med-endpoint ip-phone

Defines a Link Layer Discovery Protocol (LLDP) classification rule for the specified UNP Edge profile. This rule is specifically for IP phones. When the LLDP TLVs from an IP phone are detected, the specified profile is applied to the IP phone.

unp classification lldp med-endpoint ip-phone edge-profile *profile_name*

no unp classification lldp med-endpoint ip-phone edge-profile

Syntax Definitions

profile_name	The name of an existing Edge profile.

Defaults

By default, no classification rules are defined for an Edge profile.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the rule from an Edge profile configuration. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- The LLDP rule configured for the specified Edge profile is applied only to traffic learned on UNP Edge ports. This type of rule is not configurable for VLAN and SPB service profiles.

Examples

```
-> unp classification lldp med-endpoint ip-phone edge-profile myProfile1
-> no unp classification lldp med-endpoint ip-phone edge-profile
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp classification	Configures the classification status for the UNP port. Rules are not applied when classification is disabled for the port.
unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
show unp classification	Displays the UNP classification rule configuration.

MIB Objects

```
alaDaUNPEndPoinRuleTable
  alaDaUNPEndPoinRuleId
  alaDaUNPEndPoinEdgeProfile
  alaDaUNPEndPoinRuleRowStatus
```

unp classification authentication-type

Defines an Authentication Type classification rule for the specified UNP Edge profile. If the type of authentication applied to the device traffic matches the authentication type defined for the rule, the specified profile is applied to the device.

unp classification authentication-type {none | mac [fail] | 802.1x [fail]} [vlan-tag *vlan_id***] edge-profile** *profile_name*

no unp classification authentication-type {none | mac [fail] | 802.1x [fail]} edge-profile

Syntax Definitions

none	No authentication was applied to the device.
mac	The device was successfully authenticated through MAC authentication.
802.1x	The device was successfully authenticated through 802.1X authentication.
fail	Optional parameter to specify failed MAC or 802.1x authentication.
vlan_id	A VLAN ID.
profile_name	The name of an existing Edge profile.

Defaults

By default, no classification rules are defined for an Edge profile.

parameter	default
vlan_id	none

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the rule from an Edge profile configuration. When a classification rule is removed or modified, all MAC addresses classified with that rule are flushed.
- The optional **fail** parameter is used only in combination with the **mac** or **802.1x** parameter. When configured, the device is checked for a failed MAC or 802.1x authentication condition to determine whether or not the profile is applied.
- When the **fail** parameter is not specified (the default), the device is checked for a successful MAC or 802.1x authentication condition to determine whether or not the profile is applied.
- When configuring this type of classification rule, specify and optional VLAN tag before specifying the UNP Edge profile name for which the rule will classify traffic.
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified authentication type *and* the VLAN ID tag.

- Untagged packets are only classified using the specified authentication type; the VLAN ID tag is ignored if it is specified with this rule.
- The Authentication Type rule configured for the specified Edge profile is applied only to traffic learned on UNP edge ports. This type of rule is not configurable for VLAN and SPB service profiles.

Examples

```
-> unp classification authentication-type 802.1X edge-profile myProfile1
-> no unp classification authentication-type 802.1X edge-profile

-> unp classification authentication-type MAC edge-profile myProfile2
-> no unp classification authentication-type MAC edge-profile

-> unp classification authentication-type 802.1X fail edge-profile myProfile3
-> no unp classification authentication-type 802.1X fail edge-profile

-> unp classification authentication-type MAC fail edge-profile myProfile4
-> no unp classification authentication-type MAC fail edge-profile

-> unp classification authentication-type MAC vlan-tag 10 edge-profile myProfile4
-> no unp classification authentication-type MAC edge-profile
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **vlan-tag** parameter added.

Related Commands

unp classification	Configures the classification status for the UNP port. Rules are not applied when classification is disabled for the port.
unp edge-profile	Configures a UNP Edge profile. This type of profile is applied to traffic learned on UNP Edge ports and link aggregates.
show unp classification	Displays the UNP classification rule configuration.

alaDaUNPAuthRuleTable
  alaDaUNPAuthRuleType
  alaDaUNPAuthRuleEdgeProfile
  alaDaUNPAuthRuleRowStatus
  alaDaUNPAuthRuleVlanTag
```

unp classification-rule

Configures an extended classification rule name and assigns a precedence value to the specified name. This type of rule defines a list of rule conditions, all of which a device must match to be classified into the Edge profile associated with the extended rule name.

unp classification-rule *rule_name* **[precedence** *precedence_value***] [edge-profile** *profile_name***]**

no unp classification-rule *rule_name* **[edge-profile** *profile_name***]**

Syntax Definitions

rule_name	The name to associate with the extended classification rule.
precedence_value	The precedence level to assign to the extended rule. The valid range is 1–255 (1 = lowest, 255 = highest).
profile_name	The name of an existing Edge profile to assign to the extended rule.

Defaults

parameter	default
precedence_value	**1**
profile_name	none

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the extended rule from the switch configuration or to remove the Edge profile name assigned to the rule.
- The precedence value specified with this command is used to determine precedence among extended classification rules.
- Extended rules take precedence over all other UNP classification rules (individual rules and binding rule combinations).
- Although some individual classification rules can be combined to form a binding rule, a binding rule is not assigned a rule name and does not have a configurable precedence value. In addition, extended classification rules offer more rule combinations than binding rules.
- An extended classification rule is associated with an Edge profile and applied to traffic learned on UNP edge ports. This type of rule is not configurable for VLAN and SPB service profiles.

Examples

```
-> unp classification-rule ext-r1
-> unp classification-rule ext-r1 edge-profile UNP1
-> no unp classification-rule ext-r1 edge-profile UNP1
-> no unp classification-rule ext-r1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

  alaDaUNPClassifRuleEdgeProfile
```

unp classification-rule port

Defines a Port rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **{port** *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***}**

no unp classification-rule *rule_name* **{port | linkagg}**

Syntax Definitions

rule_name	The name of an extended classification rule to which the port condition is assigned.
*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
agg_id	Link aggregate ID.

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the Port rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 port 1/1/10
-> no unp classification-rule ext-r1 port 1/1/10

-> unp classification-rule ext-r2 port 1/1/1-5
-> no unp classification-rule ext-r2 port 1/1/1-5
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp classification-rule group-id	Configures a Group ID rule condition for an extended rule.
unp classification-rule mac-address	Configures a MAC address, MAC OUI, or MAC range rule condition for an extended rule.
unp classification-rule ip-address	Configures an IP address rule condition for an extended rule.
unp classification-rule lldp med-endpoint ip-phone	Configures an LLDP endpoint rule condition for an extended rule.
unp classification-rule authentication-type	Configures an authentication type rule condition for an extended rule.
show unp classification-rule	Displays the UNP extended classification rule configuration.

MIB Objects

```
alaDaUNPClassifRuleTable
  alaDaUNPClassifRuleName
  alaDaUNPClassifRulePort
```

unp classification-rule group-id

Defines a Group ID rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **group-id** *group_id*

no unp classification-rule *rule_name* **group-id**

Syntax Definitions

rule_name	The name of an extended classification rule to which the port condition is assigned.
group_id	Group ID number.

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the Group ID rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 group-id GRP1
-> no unp classification-rule ext-r1 group-id
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp classification-rule	Configures an extended classification rule name and associated Edge profile.

```

unp classification-rule mac-address

Defines a MAC address, rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **mac-address** *mac_address*

no unp classification-rule *rule_name* **mac-address**

Syntax Definitions

rule_name	The name of an extended classification rule to which the port condition is assigned.
mac_address	MAC address (e.g., 00:00:39:59:f1:0c).

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 mac-address 00:11:22:33:44:55
-> no unp classification-rule ext-r1 mac-address
```

Release History

Release 8.1.1; command was introduced.

unp classification-rule mac-oui

Defines a MAC OUI rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **mac-oui** *mac_oui*

no unp classification-rule *rule_name* **mac-oui**

Syntax Definitions

rule_name	The name of an extended classification rule to which the port condition is assigned.
mac_address	MAC address (e.g., 00:00:39:59:f1:0c).
mac_oui	The Organizationally Unique Identifier (OUI) of the MAC address. The OUI is the first three octets of the MAC address (for example, e8:39:35 is the OUI of MAC address e8:39:35:10:fe:11).

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 mac-oui 00:11:22
-> no unp classification-rule ext-r1 mac-oui
```

Release History

Release 8.1.1; command was introduced.

unp classification-rule mac-address-range

Defines a MAC address range rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **mac-address-range** *low_mac_address high_mac_address*

no unp classification-rule *rule_name* **mac-address-range**

Syntax Definitions

rule_name	The name of an extended classification rule to which the port condition is assigned.
low_mac_address	MAC address that defines the low end of the range (for example, 00:00:39:59:f1:00).
high_mac_address	MAC address that defines the high end of the range (for example, 00:00:39:59:f1:90).

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 mac-address-range 00:11:22:33:44:55
00:11:22:33:44:66
-> no unp classification-rule ext-r1 mac-address-range
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp classification-rule	Configures an extended classification rule name and associated Edge profile.
show unp classification-rule	Displays the UNP extended classification rule configuration.

MIB Objects

```
alaDaUNPClassifRuleTable
  alaDaUNPClassifRuleName
  alaDaUNPClassifRuleMacRngLoaddr
  alaDaUNPClassifRuleMacRngHiaddr
```

unp classification-rule ip-address

Defines an IP network address rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **ip-address** *ip_address* **mask** *subnet_mask*

no unp classification-rule *rule_name* **ip-address**

Syntax Definitions

rule_name	The name of an extended classification rule to which the IP address rule condition is assigned.
ip_address	IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).
subnet_mask	An IP address mask to identify the IP subnet for the interface (supports class-less masking).

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 ip-address 10.0.0.20 mask 255.0.0.0
-> no unp classification-rule ip-address
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp classification-rule	Configures an extended classification rule name and associated Edge profile.
show unp classification-rule	Displays the UNP extended classification rule configuration.

MIB Objects

```
alaDaUNPClassifRuleTable
  alaDaUNPClassifRuleName
  alaDaUNPClassifRuleIpAddressType
  alaDaUNPClassifRuleIpAddress
  alaDaUNPClassifRuleIpMaskType
  alaDaUNPClassifRuleIpMask
```

unp classification-rule vlan-tag

Defines a VLAN tag rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **vlan-tag** *vlan_id*

no unp classification-rule vlan-tag

Syntax Definitions

rule_name	The name of an extended classification rule to which the VLAN tag rule condition is assigned.
vlan_id	A VLAN ID.

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 vlan-tag 200
-> no unp classification-rule vlan-tag
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp classification-rule	Configures an extended classification rule name and associated Edge profile.
show unp classification-rule	Displays the UNP extended classification rule configuration.

MIB Objects

```
alaDaUNPClassifRuleTable
   alaDaUNPClassifRuleName
   alaDaUNPClassifRuleVlanTag
```

unp classification-rule lldp med-endpoint ip-phone

Defines an LLDP rule condition for the specified extended classification rule name. This rule condition is specifically to detect IP phone TLVs.

unp classification-rule *rule_name* **lldp med-endpoint ip-phone**

no unp classification-rule *rule_name* **lldp med-endpoint ip-phone**

Syntax Definitions

rule_name	The name of an extended classification rule to which the port condition is assigned.

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.

Examples

```
-> unp classification-rule ext-r1 lldp med-endpoint ip-phone
-> no unp classification-rule ext-r1 lldp med-endpoint ip-phone
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp classification-rule	Configures an extended classification rule name and associated Edge profile.
show unp classification-rule	Displays the UNP extended classification rule configuration.

MIB Objects

```
alaDaUNPClassifRuleTable
  alaDaUNPClassifRuleName
  alaDaUNPClassifRuleEndPoin
```

unp classification-rule authentication-type

Defines an authentication type rule condition for the specified extended classification rule name.

unp classification-rule *rule_name* **authentication-type {none | mac [fail] | 802.1x [fail]}**

no unp classification-rule *rule_name* **authentication-type**

Syntax Definitions

rule_name	The name of an extended classification rule to which the port condition is assigned.
none	No authentication was applied to the device.
mac	The device was successfully authenticated through MAC authentication.
802.1x	The device was successfully authenticated through 802.1X authentication.
fail	Optional parameter to specify failed MAC or 802.1x authentication.

Defaults

By default, no conditions are defined when an extended classification rule is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the rule condition from the specified extended classification rule name.
- If the extended classification rule name specified with this command does not exist, the switch will automatically create the extended rule name and associate the port rule condition with that name.
- The optional **fail** parameter is used only in combination with the **mac** or **802.1x** parameter. When configured, the device is checked for a failed MAC or 802.1x authentication condition to determine whether or not the profile is applied.
- When the **fail** parameter is not specified (the default), the device is checked for a successful MAC or 802.1x authentication condition to determine whether or not the profile is applied.

Examples

```
-> unp classification-rule ext-r1 authentication-type 8021x
-> no unp classification-rule ext-r1 authentication-type

-> unp classification-rule ext-r1 authentication-type mac
-> no unp classification-rule ext-r1 authentication-type

-> unp classification-rule ext-r1 authentication-type 8021X fail
-> no unp classification-rule ext-r1 authentication-type
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp classification-rule	Configures an extended classification rule name and associated Edge profile.
show unp classification-rule	Displays the UNP extended classification rule configuration.

MIB Objects

```
alaDaUNPClassifRuleTable
  alaDaUNPClassifRuleName
  alaDaUNPClassifRuleAuthType
```

unp user-role

Configures a user-defined role name and assigns a precedence value to the specified name. This type of role is used to define a list of conditions and a QoS policy list name. If the current context of a device matches all the role conditions, then the policy list is applied to that device.

unp user-role *role_name* **[precedence** *precedence_value***]**

no unp user-role *role_name*

Syntax Definitions

role_name	The name to associate with the user-defined role.
precedence_value	The precedence level to assign to the user-defined role. The valid range is 1–255 (1 = lowest, 255 = highest).

Defaults

parameter	default
precedence_value	**1**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the user-defined role from the switch configuration.
- The precedence value specified with this command is used to determine precedence among other user-defined roles.
- Every time the user context changes for a device, all the user-defined roles are checked to see if there is a role that matches the current user context.
- Only one user-defined role per user is allowed because only one QoS policy list per user is allowed.

Examples

```
-> unp user-role role1
-> unp user-role role2 precedence 255
-> no unp user-role role2
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp user-role policy-list	Assigns a QoS policy list to a user-defined role.
unp user-role edge-profile	Configures an Edge profile condition for a user-defined role name.
unp user-role authentication-type	Defines an authentication type condition for a user-defined role name.
unp user-role cp-status-post-login	Configures the Captive Portal post login status as a condition for a user-defined role.
show unp user-role	Displays the user-defined role configuration for the switch.

MIB Objects

```
alaDaUNPUserRoleTable
  alaDaUNPUserRoleName
  alaDaUNPUserRolePrecedenceNum
```

unp user-role policy-list

Assigns a QoS policy list to the specified user-defined role name. When the context of a user device matches all the user-defined role conditions, the policy list associated with the role is applied to the device.

unp user-role *role_name* **policy-list** *list_name*

no unp user-role *role_name* **policy-list**

Syntax Definitions

role_name	The name of a user-defined role to which the QoS policy list is assigned.
list_name	The name of an existing QoS policy list.

Defaults

By default, no QoS policy list is assigned to a user-defined role.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a QoS policy list from the specified user-defined role.
- If the user-defined role name specified with this command does not exist, the switch will automatically create the role name and associate the QoS policy list with that name.
- The QoS policy list name specified with this command must already exist in the switch configuration.

Examples

```
-> unp user-role role1 policy-list role1-list
-> unp user-role role2 policy-list role2-list
-> no unp user-role role2 policy-list
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp user-role	Configures the name and precedence for a user-defined role.
unp user-role edge-profile	Configures an Edge profile condition for a user-defined role name.
unp user-role authentication-type	Defines an authentication type condition for the specified user-defined role name.
unp user-role cp-status-post-login	Configures the Captive Portal post login status as a condition for a user-defined role.
policy list	Configures a QoS policy list.
show unp user-role	Displays the user-defined role configuration for the switch.

MIB Objects

```
alaDaUNPUserRoleTable
  alaDaUNPUserRoleName
  alaDaUNPUserRolePolicyList
```

unp user-role edge-profile

Defines an Edge profile condition for the specified user-defined role name.

unp user-role *role_name* **edge-profile** *profile_name*

no unp user-role *role_name* **edge-profile**

Syntax Definitions

role_name	The name of a user-defined role.
profile_name	The name of an existing Edge profile.

Defaults

By default, the Edge profile condition is not configured for a user-defined role.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the Edge profile name as a condition for the specified user-defined role.
- If the user-defined role name specified with this command does not exist, the switch will automatically create the role name and associate the Edge profile with that name.
- The Edge profile name specified with this command must already exist in the switch configuration.

Examples

```
-> unp user-role role1 edge-profile edge1
-> no unp user-role role1 edge-profile
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp user-role	Configures the name and precedence for a user-defined role.
unp user-role policy-list	Assigns a QoS policy list to a user-defined role.
unp user-role authentication-type	Defines an authentication type condition for the specified user-defined role name.
unp user-role cp-status-post-login	Configures the Captive Portal post login status as a condition for a user-defined role.
show unp user-role	Displays the user-defined role configuration for the switch.

MIB Objects

```
alaDaUNPUserRoleTable
  alaDaUNPUserRoleName
  alaDaUNPUserRoleEdgeProfile
```

unp user-role authentication-type

Defines an authentication type condition for the specified user-defined role name.

unp user-role *role_name* **authentication-type {none | mac [fail] | 802.1x [fail]}**

no unp user-role *role_name* **authentication-type**

Syntax Definitions

role_name	The name of a user-defined role.
none	No authentication was applied to the device.
mac	The device was successfully authenticated through MAC authentication.
802.1x	The device was successfully authenticated through 802.1X authentication.
fail	Optional parameter to specify failed MAC or 802.1x authentication.

Defaults

By default, the authentication type condition is not configured for a user-defined role.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the authentication type as a condition for the specified user-defined role.
- If the user-defined role name specified with this command does not exist, the switch will automatically create the role name and associate the Edge profile with that name.
- The optional **fail** parameter is used only in combination with the **mac** or **802.1x** parameter. When configured, the device is checked for a failed MAC or 802.1x authentication condition to determine whether or not the user role (policy list associated with the derivation rule) is applied to the device.
- When the **fail** parameter is not specified (the default), the device is checked for a successful MAC or 802.1x authentication condition to determine whether or not the user role (policy list associated with the derivation rule) is applied to the device.

Examples

```
-> unp user-role role1 authentication-type 8021x
-> no unp user-role role1 authentication-type

-> unp user-role role1 authentication-type mac
-> no unp user-role role1 authentication-type

-> unp user-role role1 authentication-type 8021X fail
-> no unp user-role role1 authentication-type
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp user-role	Configures the name and precedence for a user-defined role.
unp user-role policy-list	Assigns a QoS policy list to a user-defined role.
unp user-role edge-profile	Configures an Edge profile condition for a user-defined role name.
unp user-role cp-status-post-login	Configures the Captive Portal post login status as a condition for a user-defined role.
show unp user-role	Displays the user-defined role configuration for the switch.

MIB Objects

```
alaDaUNPUserRoleTable
  alaDaUNPUserRoleName
  alaDaUNPUserRoleAuthType
```

unp user-role cp-status-post-login

Configures the Captive Portal (CP) post login status as a condition for the specified user-defined role name.

unp user-role *role_name* **cp-status-post-login**

no unp user-role *role_name* **cp-status-post-login**

Syntax Definitions

role_name	The name of an existing user-defined role.

Defaults

By default, the CP post login status condition is not configured for a user-defined role.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the CP post login status as a condition for the specified user-defined role.
- When this condition is active for a user-defined role, the switch will check to see if a device is in a CP post login state before applying the QoS policy list associated with the user-defined role.

Examples

```
-> unp user-role role1 cp-status-post-login
-> no unp user-role role1 cp-status-post-login
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp user-role	Configures the name and precedence for a user-defined role.
unp user-role policy-list	Assigns a QoS policy list to a user-defined role.
unp user-role edge-profile	Configures an Edge profile condition for a user-defined role name.
unp user-role authentication-type	Configures an authentication type condition for a user-defined role name.
show unp user-role	Displays the user-defined role configuration for the switch.

MIB Objects

```
alaDaUNPUserRoleTable
  alaDaUNPUserRoleName
  alaDaUNPUserRolePostLoginStatus
```

unp restricted-role policy-list

Assigns an explicit QoS policy list to an implicit restricted role. When the switch assigns a user device to one of the restricted role states (unauthorized, Quarantine Manager, or Captive Portal pre-login), the explicit QoS policy list is applied instead of the built-in policy list associated with the restricted role.

unp restricted-role {unauthorized | qmr | cp-prelogin} policy-list *list_name*

no unp restricted-role {unauthorized | qmr | cp-prelogin} policy-list

Syntax Definitions

list_name	The name of an existing QoS policy list.
unauthorized	Applies the explicit policy list to unauthorized devices.
qmr	Applies the explicit policy list to quarantined devices.
cp-prelogin	Applies the explicit policy list to devices in a Captive Portal pre-login state.

Defaults

By default, the built-in policy list associated with the restricted role state.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the explicit QoS policy list assignment.
- An explicit QoS policy list overrides the built-in policy list associated with the restricted role state. When the explicit policy list assignment is removed, the switch reverts back to using the built-in policy list associated with the restricted role state.

Examples

```
-> unp restricted-role unauthorized policy-list unauth1
-> unp restricted-role qmr policy-list quarantined1
-> unp restricted-role cp-prelogin policy-list cplogin1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

policy list	Configures a QoS policy list.
show unp restricted-role	Displays the UNP restricted role policy list configuration.

MIB Objects

```
alaDaUNPRstrctedRoleTable
  alaDaUNPRstrctedRoleType
  alaDaUNPRstrctedRolePolicyList
```

unp group-id

Configures a group ID to which UNP Edge ports or link aggregates are assigned to form a logical domain. The Group-ID is also used in UNP classification rules as a criteria for classifying only those ports that are assigned to a specific Group ID.

unp group-id *group_id* **[description** *group_description***]**

no unp group-id *group_id*

Syntax Definitions

group_id	A numerical group ID. The valid range is 0–255.
group_description	An alphanumeric string (1–128 characters).

Defaults

By default, no group ID is assigned to UNP ports.

parameter	default
group_description	group ID

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the group ID from the switch configuration.
- UNP edge ports are assigned to group IDs to form a logical domain. UNP bridge and service access ports are assigned to customer domain IDs to form a logical domain.
- When a group ID is specified in a classification rule, the rule is applied to all ports and link aggregates that are assigned to the group ID that matches the ID defined by the rule.

Examples

```
-> unp group-id 1
-> unp group-id 2 description CustomerA
-> no unp group-id 2
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp port group-id	Assigns UNP ports and link aggregate IDs to a Group ID.
show unp group-id	Displays the group ID configuration for the switch.

MIB Objects

```
alaDaUnpGroupIdTable
   alaDaUnpGroupId
   alaDaUnpGroupDescription
```

unp customer-domain

Configures a customer domain ID to which UNP ports and classification rules are assigned. The customer domain ID is also used in UNP classification rules as a criteria for classifying only those ports that are assigned to a specific domain ID.

unp customer-domain *domain_id* **[description** *domain_description***]**

no unp customer-domain *domain_id* **[description** *domain_description***]**

Syntax Definitions

domain_id	A numerical customer domain ID.
domain_description	An alphanumeric string (1–128 characters).

Defaults

By default, customer domain ID zero (0) is assigned to all UNP ports.

parameter	default
domain_description	**Domain ID**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the customer domain ID from the switch configuration. When a domain ID is removed, all UNP ports are assigned to the default domain and any classification rules assigned to that domain are also removed.
- Customer domains are used to group physical UNP ports or link aggregates into one logical domain.
- UNP bridge and service access ports are assigned to customer domain IDs to form a logical domain. UNP edge ports are assigned to group IDs to form a logical domain.
- Once a port is assigned to a specific customer domain, classification rules associated with the same customer domain ID are applied only to UNP ports associated with the same domain ID.

Examples

```
-> unp customer-domain 1
-> unp customer-domain 2 description CustomerA
-> no unp customer-domain 2
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp unp-customer-domain	Assigns a UNP port or link aggregate to the specified customer domain (UNP group) ID.
show unp customer-domain	Displays the customer domain ID configuration for the switch.

MIB Objects

```
alaDaUnpCustomerDomainTable
   alaDaUnpCustomerDomainId
   alaDaUnpCustomerDomainDesc
```

unp policy validity-period

Configures a UNP validity period policy that specifies the days and times during which a device can access the network. This type of policy is assigned to a UNP Edge profile and applied to devices classified into the profile. A device must match all of the policy criteria.

unp policy validity-period *policy_name* **[days** *days***] [months** *months***] [hours** *hh:mm* **to** *hh:mm***] [interval** *mm:dd:yyyy hh:mm* **to** *mm:dd:yyyy hh:mm***] [timezone** *zones***]**

unp policy validity-period *name* **no {days | months | hours** | **interval | timezone}**

no unp policy validity-period *name*

Syntax Definitions

policy_name	The name of the validity period (up to 31 alphanumeric characters).
days	The day(s) of the week this validity period is active. Enter the actual day of the week (e.g., **monday**, **tuesday**, **wednesday**, etc.).
months	The month(s) in which the validity period is active. Enter the actual month (e.g., **january**, **february**, **march**, etc.).
hh:mm	The time of day, specified in hours and minutes, the validity period starts and the time of day the validity period ends (e.g., 10:30 to 11:30).
mm:dd:yyyy hh:mm	An interval of time during which the validity period is active. Specify a start and end to the interval period by entering a beginning date and time followed by an end date and time (e.g., 11:01:2005 12:01 to 11:02:2005 12:01).
zones	The timezone in which the validity period is active (for example, **pst**, **est**, **gmt**, etc.)

Defaults

parameter	default
days	no restriction
months	no restriction
hh:mm	no specific time
mm:dd:yyyy hh:mm	no interval
zones	local timezone

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a UNP period policy from the configuration, or to remove parameters from a particular period policy.

- Any combination of the **days**, **months**, **hours**, **interval**, and **timezone** parameters is allowed. The validity period is only in effect when all specified parameters are true.
- Use the **unp edge-profile period-policy** command to associate a period policy with a UNP Edge profile.

Examples

```
-> unp policy validity-period "Office-Time"
-> no unp policy validity-period "Office-Time"

-> unp policy validity-period "Office-Time" days MONDAY
-> unp policy validity-period "Office-Time" days MONDAY time-zone IST
-> unp policy validity-period "Office-Time" days MONDAY no time-zone
-> unp policy validity-period "Office-Time" no days MONDAY

-> unp policy validity-period "Office-Time" days MONDAY WEDNESDAY
-> unp policy validity-period "Office-Time" days MONDAY WEDNESDAY time-zone PST
-> unp policy validity-period "Office-Time" no days MONDAY TUESDAY

-> unp policy validity-period "Office-Time" hours 9:00 to 17:00
-> unp policy validity-period "Office-Time" hours 9:00 to 17:00 time-zone IST
-> unp policy validity-period "Office-Time" no hours 9:00 to 17:00

-> unp policy validity-period "holiday" months JANUARY
-> unp policy validity-period "holiday" no months JANUARY

-> unp policy validity-period "holiday" months FEBRUARY MARCH time-zone IST
-> unp policy validity-period "holiday" months FEBRUARY no time-zone IST
-> unp policy validity-period "holiday" no months FEBRUARY MARCH

-> unp policy validity-period "Seminar" interval 02/01/13 10:30 to 02/05/13 16:00
-> unp policy validity-period "Seminar" no interval 02/01/13 10:30 to 02/05/13
16:00

-> unp policy validity-period "Seminar" interval 02/01/13 10:30 to 02/05/13 16:00
time-zone PST
-> unp policy validity-period "Seminar" interval 02/01/13 10:30 to 02/05/13 16:00
no time-zone PST
-> unp policy validity-period "Seminar" no interval 02/01/13 10:30 to 02/05/13
16:00
```

Release History

Release 8.1.1; command introduced.

Related Commands

unp edge-profile period-policy Assigns a UNP period policy to an Edge profile.

show unp policy validity-period Displays information about the UNP period policy configuration.

MIB Objects

```
alaDaUNPValidityPeriodTable
   alaDaUNPValidityPeriodName
   alaDaUNPValidityPeriodDays

   alaDaUNPValidityPeriodTimezone
   alaDaUNPValidityPeriodTimezoneStatus
   alaDaUNPValidityPeriodActiveStatus
```

unp policy validity-location

Configures a UNP validity location policy that defines a specific location from which a device can access the network. This type of policy is assigned to a UNP Edge profile and applied to devices classified into the profile. A device must match all of the policy criteria defined.

unp policy validity-location *policy_name* **[port** *chassis/slot/port***[-***port2***] | linkagg** *agg_id***[-***agg_id2***] [system-name** *system_name***] [system-location** *system_location***]**

unp policy validity-period *name* **no {days | months | hours** | **interval | timezone}**

no unp policy validity-period *name*

Syntax Definitions

policy_name	The name of the validity period (up to 31 alphanumeric characters).
chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1) of a UNP Edge port. Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	The link aggregate ID number of a UNP link aggregate. Use a hyphen to specify a range of link aggregate IDs (10-15).
system_name	The configured system name for the switch from which the device can access the network.
system_location	The configured system location for the switch from which the device can access the network.

Defaults

parameter	default
chassis/slot/port	no restriction
agg_id	no restriction
system_name	no restriction
system_location	no restriction

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove a UNP location policy from the configuration, or to remove parameters from a particular location policy.
- Any combination of the **port**, **linkagg**, **system-name**, and **system-location** parameters is allowed. The location policy is only in effect when all specified parameters are true.
- Use the **unp edge-profile location-policy** command to associate a location policy with a UNP Edge profile.

Examples

```
-> unp policy validity-location ALU-NA
-> no unp policy validity-location ALU-NA

-> unp policy validity-location ALU-NA port 1/1/10
-> unp policy validity-location ALU-NA no port
-> unp policy validity-location ALU-NA port 1/1/1-5
-> unp policy validity-location ALU-NA no port

-> unp policy validity-location ALU-NA linkagg 10
-> unp policy validity-location ALU-NA no linkagg
-> unp policy validity-location ALU-NA linkagg 1-5
-> unp policy validity-location ALU-NA no linkagg

-> unp policy validity-location ALU-NA system-name OS6860
-> unp policy validity-location ALU-NA no system-name OS6860

-> unp policy validity-location ALU-NA system-location US-West
-> unp policy validity-location ALU-NA no system-location
```

Release History

Release 8.1.1; command introduced.

Related Commands

unp edge-profile location-policy	Assigns a UNP location policy to an Edge profile.
show unp policy validity-location	Displays information about the UNP location policy configuration.

MIB Objects

```
alaDaUNPLocationPolicyTable
   alaDaUNPLocationPolicyName

   alaDaUNPLocationPolicyPortHigh
   alaDaUNPLocationPolicyPortStatus
   alaDaUNPLocationPolicySystemName
   alaDaUNPLocationPolicySystemLocation
```

unp dynamic-vlan-configuration

Configures the UNP status for dynamic VLAN configuration. When this functionality is enabled and the UNP is created with a VLAN that does not exist, the switch will dynamically create the VLAN at the time the UNP is created.

unp dynamic-vlan-configuration {enable | disable}

Syntax Definitions

enable	Enables dynamic VLAN configuration for UNPs.
disable	Disables dynamic VLAN configuration for UNPs**.**

Defaults

By default, dynamic VLAN configuration is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Note. Dynamic VLANs are not saved in the VLAN section of the **boot.cfg** file. However, the **unp** commands to enable dynamic VLAN configuration and create a UNP are saved in the UNP section of the **boot.cfg** file. As a result, the VLAN is created again on the next switch bootup.

- When dynamic VLAN configuration is disabled, creating a UNP with a VLAN that does not exist in the switch configuration is not allowed.
- Dynamic VLAN configuration applies only to VLAN-based profiles; UNP Edge and SPB service profiles are not supported.
- The VLAN status and other port (non-UNP port) assignments for a dynamic UNP VLAN are configurable using standard VLAN commands. In addition, the STP status is configurable and enabled by default when the dynamic VLAN is created.
- A dynamic VLAN cannot be deleted using standard VLAN commands (**no vlan** *vlan_id*).
- UNP dynamic VLANs are identified as a separate type of VLAN. The **vlan show** commands will display this type with the default name of “UNP-DYN-VLAN” and the designated type as “UNP Dynamic Vlan”.

Examples

```
-> unp dynamic-vlan-configuration enable
-> unp dynamic-vlan-configuration disable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp edge-profile	Configures a UNP in the switch configuration.
show unp global configuration	Displays the dynamic VLAN configuration status for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPDynamicVlanConfigFlag
```

unp dynamic-profile-configuration

Configures the UNP status for dynamic profile configuration. When this functionality is enabled, a UNP VLAN profile is dynamically created based on specific traffic conditions.

unp dynamic-profile-configuration {enable | disable}

Syntax Definitions

enable	Enables dynamic profile configuration for UNPs.
disable	Disables dynamic profile configuration for UNPs**.**

Defaults

By default, dynamic profile configuration is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When dynamic profile configuration is enabled, a UNP VLAN profile is dynamically created when the trust VLAN tag option is enabled on the UNP bridge port or link aggregate and one of the following conditions occurs:
  - A tagged packet received on the UNP bridge port contains a VLAN tag that matches an existing MVRP VLAN in the switch configuration that is not assigned to a profile.
  - There is no matching VLAN in the switch configuration.
- Dynamically created profiles are saved in the **boot.cfg** file for the switch.
- By default, dynamically created profiles are automatically named **dynamic_profile_***vlan_id*, where the VLAN ID is the ID of the VLAN contained in the packet tag.
- After the dynamic profile is created, changing the profile name, associated VLAN ID, or the QoS policy list is allowed. To avoid any confusion, change the profile name if the VLAN ID associated with the profile has changed.
- If the dynamic profile configuration option is enabled along with the dynamic VLAN configuration option and a dynamically created profile refers to a VLAN that is an MVRP VLAN, then the MVRP VLAN is automatically converted to a dynamic UNP VLAN (UNP-DYN-VLAN).

Examples

```
-> unp dynamic-profile-configuration enable
-> unp dynamic-profile-configuration disable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp vlan-profile	Configures a VLAN-based profile in the switch configuration.
unp dynamic-vlan-configuration	Configures the status of dynamic VLAN configuration. When enabled, UNP will create a VLAN at the time a profile is created that specifies a VLAN ID that does not exist in the switch configuration.
show unp global configuration	Displays the dynamic profile configuration status for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPDynamicProfileConfigFlag
```

unp auth-server-down

Configures a UNP to which a device is classified if MAC or 802.1X authentication fails because the RADIUS-capable server is unreachable. This functionality is applied to traffic received on all UNP ports.

unp auth-server-down {edge-profile | vlan-profile} *profile_name*

no unp auth-server-down {edge-profile | vlan-profile}

Syntax Definitions

edge-profile	Assigns an Edge profile as the authentication server down UNP for devices authenticating on edge ports.
vlan-profile	Assigns a VLAN profile as the authentication server down UNP for devices authenticating on bridge ports.
profile_name	The name of an existing UNP Edge or VLAN profile.

Defaults

By default, there is no authentication server down UNP configured.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the authentication server down UNP. Removing this profile globally disables this functionality for the switch.
- When a device is classified into the specified profile, a configurable authentication down timer is started for that device. When the timer runs out, the authentication process is performed again. If authentication fails again, the device is classified back into the authentication server down profile. The switch will repeat this process until the device authentication is completed.
- When the authentication server down UNP is disabled, the associated timer is also disabled for the switch.
- Configuring an authentication server down UNP is highly recommended when MAC or 802.1X authentication is enabled on any UNP port or link aggregate. This is because after a switch reload, the traffic from devices connected to UNP ports and link aggregates reaches the switch and triggers the authentication process before route convergence has completed and the server can be reached.
  - If an authentication server down UNP is configured, devices are temporarily learned in that profile and authentication is automatically attempted again after the timeout period expires. This allows time for the server to become reachable from the switch after a reload.
  - If an authentication server down UNP is not configured, devices are learned as filtering and will remain in that state. There is no further attempt to authenticate these devices again.

Examples

```
-> unp auth-server-down edge-profile edgeprof-1
-> no unp auth-server-down edge-profile
```

```
-> unp auth-server-down vlan-profile vlanprof-1
-> no unp auth-server-down vlan-profile
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **vlan-profile** parameter added.

Related Commands

unp auth-server-down timeout	Configures the value for the authentication server down timer.
show unp global configuration	Displays the profile designated as the authentication server down UNP for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPAuthSrvDownEdgeProfName
   alaDaUNPAuthServerDownUnp
```

unp auth-server-down timeout

Configures the authentication server down timer value. This timer value is applied to each device that is learned in the authentication server down UNP.

unp auth-server-down {edge-profile | vlan-profile} timeout *seconds*

Syntax Definitions

edge-profile	Configures a timer value for devices assigned to the Edge profile that is designated as the authentication server down UNP.
vlan-profile	Configures a timer value for devices assigned to the VLAN profile that is designated as the authentication server down UNP.
seconds	The number of seconds the authentication server down timer is active. The valid range is 10 to 1000 seconds.

Defaults

By default, the timeout value is set to 60 seconds.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the timer runs out for a particular device, the switch clears the device from the authentication server down UNP and triggers another authentication attempt for that device. If authentication fails again, the device is classified back into the authentication server down profile. The switch will repeat this process until the device authentication is completed.
- When the authentication server down UNP is removed, the authentication server down timer is also cleared.
- If the timeout value is changed, the associated timer for each device in the authentication server down UNP is reset.

Examples

```
-> unp auth-server-down edge-profile timeout 500
-> unp auth-server-down vlan-profile timeout 300
```

Release History

Release 8.1.1; command introduced.
Release 8.2.1; **vlan-profile** parameter added.

Related Commands

unp auth-server-down	Specifies a UNP to which a device is classified if MAC authentication fails because the RADIUS server is unreachable.
show unp global configuration	Displays the authentication server down timeout value for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPAuthServerDowneEdgeProfTimeout
   alaDaUNPAuthServerDownTimeout
```

unp redirect pause-timer

Configures the global pause timer value for the switch. Use this command to configure the amount of time the switch filters traffic from a non-supplicant (non-802.1X device) on a UNP port. This is done to allow enough time for the switch to clear the authentication state of the non-supplicant, at which time the device is re-authenticated.

unp redirect pause-timer *seconds*

no redirect pause-timer

Syntax Definitions

seconds	The pause timer value. The valid range is 60–65535

Defaults

By default, the pause timer is set to zero.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to reset the pause time back to the default (timer no set).
- The pause timer is triggered when a Change of Authorization (COA) request is received that requires a VLAN change for a non-supplicant (non-802.1X device) *and* the port bounce action is not triggered for the device.
- During the pause time period, it is expected that the DHCP lease of the client IP in the old VLAN will expire and the client device will re-initiate DHCP resulting in new authentication and a UNP VLAN assignment.
- This command is used when configuring the switch to interact with the ClearPass Policy Manager (CPPM) as part of the OmniSwitch Bring Your Own Devices (BYOD) solution.

Examples

```
-> unp redirect pause-timer 180
-> no unp redirect pause-timer
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp redirect port-bounce	Configures the port bounce action for a port or globally for the switch.
unp redirect proxy-server-port	Configures the HTTP proxy port number to use for redirection.
unp redirect allowed-name	Configures a list of additional IP addresses to which a host can access.
unp redirect-server	Configures an IP network address to allow HTTP traffic redirection.
show unp global configuration	Displays the global UNP parameter settings for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
   alaDaUNPRedirectPauseTimer
```

unp redirect proxy-server-port

Configures the HTTP proxy port number to use for redirection to the ClearPass Policy Manager (CPPM) server.

unp redirect proxy-server-port *proxy_port*

no unp rediret proxy-server-port

Syntax Definitions

proxy_port	The HTTP proxy port number. The valid range is 1024–49151.

Defaults

By default, the redirect proxy port number is set to 8080 (traps HTTP 80, 8080, and 443).

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to set the proxy port number back to the default (8080).
- Configuring the switch to interact with the CPPM is done as part of the OmniSwitch implementation of the Bring Your Own Devices (BYOD) solution.

Examples

```
-> unp redirect proxy-server-port 8887
-> no unp redirect proxy-server-port
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp redirect port-bounce	Configures the port bounce action for a port or globally for the switch.
unp redirect pause-timer	Configures the global pause timer value for the switch.
unp redirect allowed-name	Configures a list of additional IP addresses to which a host can access.
unp redirect-server	Configures an IP network address to allow HTTP traffic redirection.
show unp global configuration	Displays the global UNP parameter settings for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
  alaDaUNPRedirectServerIP
```

unp redirect-server

Configures an IP network address to allow redirection of HTTP traffic to a ClearPass Policy Manager (CPPM) server. Specify the address that is associated with the dynamic URL returned from the CPPM server.

unp redirect-server ip-address *ip_address*

no unp redirect-server ip-address

Syntax Definitions

ip_address	IPv4 network address (e.g., 171.15.0.0).

Defaults

By default, no redirect server IP address is specified.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the redirect server IP from the switch configuration.
- If the redirect server IP address does not match the CPPM server configuration, then redirection to the URL will not work. This provides additional security.
- Configuring the switch to interact with the CPPM is done as part of the OmniSwitch implementation of the Bring Your Own Devices (BYOD) solution.

Examples

```
-> unp redirect-server ip-address 10.0.0.20
-> no unp redirect-server ip-address
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp redirect port-bounce	Configures the port bounce action for a port or globally for the switch.
unp redirect pause-timer	Configures the global pause timer value for the switch
unp redirect proxy-server-port	Configures the HTTP proxy port number to use for redirection.
unp redirect allowed-name	Configures a list of additional IP addresses to which a host can access.
show unp global configuration	Displays the global UNP configuration for the switch.

MIB Objects

```
alaDaUNPGlobalConfiguration
  alaDaUNPRedirectServerIP
```

unp redirect allowed-name

Configures a list of additional IP addresses to which a host can access. This allows traffic to reach additional subnets other than that of the ClearPass Policy Manager (CPPM) server.

unp redirect allowed-name *name* **ip-address** *ip_address* **ip-mask** *ip_mask*

no unp redirect allowed-name *name*

Syntax Definitions

name	Specify a name to assign to the allowed IP network address.
ip_address	An IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).
ip_mask	The IP subnet mask for the allowed IP network address.

Defaults

By default, no allowed IP addresses are configured.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an IP address from the allowed list.
- Explicitly configure and append the allowed IP list to the built-in "restrictedPolicylist" policy list.

Examples

```
-> unp redirect allowed-name server2 ip-address 10.0.0.20 ip-mask 255.0.0.0
-> no unp redirect allowed-name server2
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp redirect port-bounce	Configures the port bounce action for a port or globally for the switch.
unp redirect pause-timer	Configures the global pause timer value for the switch
unp redirect proxy-server-port	Configures the HTTP proxy port number to use for redirection.
unp redirect-server	Configures an IP network address to allow HTTP traffic redirection.
show unp global configuration	Displays the global UNP configuration for the switch.

MIB Objects

```
alaDaUNPRedirectAllowedServerTable
  alaDaUNPRedirectAllowedServerName
  alaDaUNPRedirectAllowedServerIP
  alaDaUNPRedirectAllowedMaskIP
```

unp edge-user flush

Performs a MAC address flush of Access Guardian users (devices learned on UNP ports) based on the specified port, link aggregate, authentication type or MAC address.

unp edge-user flush [port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]] [type {mac | 802.1x | none} [edge-profile** *profile_name***] [mac-address** *mac_address***]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).
mac	Flush only MAC authenticated users.
802.1x	Flush only 802.1X authenticated users.
none	Flush only users that have not been authenticated.
mac_address	MAC address (e.g., 00:00:39:59:f1:0c).
profile_name	The name of an existing UNP Edge profile.

Defaults

By default, all MAC addresses learned on all UNP edge ports are flushed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **port** or **linkagg** parameter to flush users on a specific port or link aggregate.
- Use the **type** parameter with the **mac**, **802.1x**, or **none** options to flush users that were authenticated (mac or 802.1x) or users that were not authenticated.
- Use the **mac-address** parameter to flush a specific device.
- Use the **edge-profile** parameter to flush all users associated with the specified Edge profile name. Combine this parameter with the **mac-address** parameter to flush a specific user associated with the specified Edge profile name.

Examples

```
-> unp edge-user flush
-> unp edge-user flush port 1/1/6
-> unp edge-user flush linkagg 10
-> unp edge-user flush type mac
-> unp edge-user flush mac-address 00:11:22:33:44:55
-> unp edge-user flush edge-profile EP-1
-> unp edge-user flush edge-profile EP-1 mac-address 00:da:95:11:22:01
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **edge-profile** parameter added.

Related Commands

show unp edge-user	Displays information about the devices learned on a UNP port.

MIB Objects

```
alaDaUNPEdgeFlushTable
   alaDaUNPEdgeFlushIndex
   alaDaUNPEdgeFlushPortLow
   alaDaUNPEdgeFlushPortHigh
   alaDaUNPEdgeFlushType
   alaDaUNPEdgrFlushMac
   alaDaUNPEdgeFlushComplete
   alaDaUNPEdgeFlushProfile
```

unp spb-access-user flush

Performs a MAC address flush of Access Guardian users (devices learned on UNP SPB access ports) based on the specified port, link aggregate, authentication type or MAC address.

unp spb-access-user flush [sap-id [linkagg] *sap_id***] [service-id** *service_id***] [type {mac | 802.1x | none} [spb-profile** *profile_name***] [mac-address** *mac_address***]**

Syntax Definitions

[linkagg] *sap_id*	Clears users associated with the specified SPB Service Access Point (SAP) ID. Use the optional **linkagg** parameter if the SAP ID is for a link aggregate.
service_id	Clears users associated with the specified SPB service ID.
mac	Clears MAC authenticated users.
802.1x	Clears 802.1X authenticated users.
none	Clears users that have not been authenticated.
mac_address	MAC address (e.g., 00:00:39:59:f1:0c).
profile_name	The name of an existing UNP SPB profile.

Defaults

By default, all MAC addresses learned on all UNP SPB access ports are flushed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A SAP ID is comprised of a device-facing port or link aggregate (referred to as a service access port) and an encapsulation value that is used to identify the type of device traffic to map to the associated service.
- Use the **sap-id** or **service-id** parameter to flush users learned on a specific SPB SAP or service.
- Use the **type** parameter with the **mac**, **802.1x**, or **none** options to flush users that were authenticated (mac or 802.1x) or users that were not authenticated.
- Use the **mac-address** parameter to flush a specific device.
- Use the **spb-profile** parameter to flush all users associated with the specified SPB profile name. Combine this parameter with the **mac-address** parameter to flush a specific user associated with the specified Edge profile name.
- Combine the **sap-id** or **service-id** parameter with the **spb-profile** parameter option to flush only users on the SPB SAP or service that are classified into the specified profile.
- Combine the **sap-id** or **service-id** parameter with the **type** parameter option to flush only users on the SPB SAP or service that were authenticated with the specified authentication type.

Examples

```
-> unp spb-user flush
-> unp spb-user flush sap-id 1/1/2:50
-> unp spb-user flush service-id 10
-> unp spb-user flush type mac
-> unp spb-user flush mac-address 00:11:22:33:44:55
-> unp spb-user flush spb-profile SP-1
-> unp spb-user flush spb-profile SP-1 mac-address 00:da:95:11:22:01
```

Release History

Release 8.2.1; command was introduced.

Related Commands

service spb sap	Configures an SPB SAP by associating a SAP ID with an SPB service.
show unp spb-access-user details	Displays information about the devices learned on UNP SPB access ports.

MIB Objects

```
alaDaUNPSpbFlushTable
   alaDaUNPSpbFlushIndex
   alaDaUNPSpbFlushComplete
   alaDaUNPSpbFlushAuthType

   alaDaUNPSpbFlushSapIDEncapVal
   alaDaUNPSpbFlushServiceID
   alaDaUNPSpbFlushSpbProfile
```

show unp global configuration

Displays the global Universal Network Profile (UNP) parameter settings for the switch.

show unp global configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

A hyphen, "-", indicates that a value has not been configured for the global UNP parameter.

Examples

```
-> show unp global configuration
Mode : Bridge
  Dynamic Vlan Configuration     = Disabled,
  Dynamic Profile Configuration  = Disabled,
  Auth Server Down UNP           = -,
  Auth Server Down Timeout       = 60,
  Auth Server Down VXLAN UNP     = -,
  Auth Server Down VXLAN Timeout = 60,

Mode : Edge
  Auth Server Down UNP           = ag_SrvDownPrf,
  Auth Server Down Timeout       = 60,
  Redirect Port Bounce           = Enabled,
  Redirect Pause Timer           = -,
  Redirect http proxy-port       = 8090,
  Redirect Server IP             = 10.255.1.1,
  Allowed IP                     = Server2,
                                   10.255.1.2/255.255.0.0,
```

output definitions

Mode	The mode (**Bridge** and **Edge**) to which the global parameter values apply. Bridge mode applies to VLAN profile classification; Edge mode applies to Edge profile classification.
Dynamic Vlan Configuration	The status (**Enabled** or **Disabled**) of dynamic VLAN configuration. Configured through the **unp dynamic-vlan-configuration** command. Applies only to VLAN profile classification.

output definitions

Dynamic Profile Configuration	The status (**Enabled** or **Disabled**) of dynamic VLAN profile configuration. Configured through the **unp dynamic-profile-configuration** command. Applies only to VLAN profile classification.
Auth Server Down UNP	The name of a UNP that a device is assigned to in the event the RADIUS server is unreachable. Configured through the **unp auth-server-down** command.
Auth Server Down Timeout	The amount of time, in seconds, that devices remain in the VLAN associated with the authentication server down UNP. Configured through the **unp auth-server-down timeout** command.
Auth Server Down VXLAN UNP	**Note.** *This field is not supported in this release.*
Auth Server Down VXLAN Timeout	**Note.** *This field is not supported in this release.*
Redirect Port Bounce	The status (**Enabled** or **Disabled**) of the port bounce operation for non-supplicant devices. Configured through the **unp redirect port-bounce** command. Applies only to Edge profile classification.
Redirect Pause Timer	The amount of time, in seconds, the switch pauses to clear all device authentication states and trigger re-authentication. Configured through the **unp redirect pause-timer** command. Applies only to Edge profile classification.
Redirect http proxy-port	The HTTP proxy port number to use for redirection to a server. Configured through the **unp redirect proxy-server-port** command. Applies only to Edge profile classification.
Redirect Server IP	The IP network address of a redirection server. Configured through the **unp redirect-server** command. Applies only to Edge profile classification.
Allowed IP	A list of IP addresses to which a host can access additional servers. Configured through the **unp redirect allowed-name** command. Applies only to Edge profile classification.

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; Bridge mode output display added.

Related Commands

show unp edge-profile

Displays the UNP Edge profile configuration for the switch.

show unp edge-profile [*profile_name***]**

Syntax Definitions

profile_name	The name of the UNP to display.

Defaults

By default, the configuration for all Edge profiles is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter an Edge profile name with this command to display information for a specific profile.
- Use the show unp **vlan-mapping** command to display the VLAN-to-Edge profile association.

Examples

```
-> show unp edge-profile
Profile QoS    Location Period CP      Redirect CP    Authen Mobile Ingrs Egrs Ingrs  Egrs
Name    Policy Policy   Policy Profile State    State        Tag    BW    BW   Depth  Depth

```

output definitions

Profile Name	The Edge profile name. Configured through the **unp edge-profile** command.
QoS Policy	The name of the QoS policy list associated with the Edge profile. Configured through the **unp edge-profile qos-policy-list** command.
Location Policy	The name of the location policy assigned to the Edge profile. Configured through the **unp edge-profile location-policy** command.
Period Policy	The name of the period policy assigned to the Edge profile. Configured through the **unp edge-profile period-policy** command.

output definitions

Captive-Portal Profile	The name of the Captive Portal (CP) profile assigned to the Edge profile A CP profile defines a CP configuration that is applied to devices when CP authentication is enabled for the Edge profile. Configured through the **unp edge-profile captive-portal-profile** command.
Redirect State	The redirection status (**Ena** or **Dis**) for the Edge profile. Indicates whether the Edge profile is one that is returned through interaction with the ClearPass Policy Manager (CPPM). Configured through the **unp edge-profile redirect** command.
CP State	The CP authentication status (**Ena** or **Dis**) for the Edge profile. Indicates whether CP authentication is triggered for devices classified into the profile. Configured through the **unp edge-profile captive-portal-authentication** command.
Authen	The authentication flag status (**Ena** or **Dis**) for the Edge profile. Indicates whether only authenticated devices are allowed into the Edge profile. Configured through the **unp edge-profile authentication-flag** command.
Mobile Tag	The mobile tag status (**Ena** or **Dis**) for the Edge profile. Indicates whether the UNP port is tagged with the Edge profile VLAN when the device on that port is classified into the Edge profile. Configured through the **unp edge-profile mobile-tag** command.
Ingress-BW	The maximum ingress bandwidth setting applied to ports associated with the profile. Configured through the **unp edge-profile maximum-ingress-bandwidth** command.
Egress-BW	The maximum egress bandwidth setting applied to ports associated with the profile. Configured through the **unp edge-profile maximum-egress-bandwidth** command.
Ingress-Depth	The maximum ingress depth setting applied to ports associated with the profile. Configured through the **unp edge-profile maximum-ingress-depth** command.
Egress-Depth	The maximum egress depth setting applied to ports associated with the profile. Configured through the **unp edge-profile maximum-egress-depth** command.

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **ingress-BW**, **egress-BW**, **ingress-depth**, **egress-depth** fields added.

Related Commands

show unp classification	Displays the UNP classification rule configuration for the switch.
show unp global configuration	Displays the UNP global parameter values configured for the switch.
show unp port	Displays the UNP configuration for the port.
show unp edge-user	Displays information about the devices learned on a UNP port.

show unp edge-profile vlan-mapping

Displays the VLAN ID that is associated with an Edge profile.

show unp edge-profile [*profile_name***] vlan-mapping**

Syntax Definitions

profile_name	The name of the UNP to display.
vlan-mapping	Displays the VLAN mapping configuration for each Edge profile.

Defaults

By default, the VLAN mapping for all Edge profiles is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter an Edge profile name with this command to display information for a specific profile.
- Only one VLAN is associated with an Edge profile at any given time.

Examples

```
-> show unp edge-profile vlan-mapping
Edge Profile Name                Vlan
---------------------------------+----
edge1                            500
edge2                            501
edge3                            502

Total Edge-Profile Vlan-Map Count: 3

-> show unp edge-profile edge2 vlan-mapping
Edge Profile Name                Vlan
---------------------------------+----
edge2                            501
```

output definitions

Edge Profile Name	The name of the Edge profile that is mapped to the VLAN ID. Configured through the **unp edge-profile** command.
Vlan	The VLAN ID associated with the profile. Configured through the **unp vlan-mapping edge-profile** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

unp vlan-mapping edge-profile .Configures the mapping of a standard VLAN to a UNP Edge profile.

   alaDaUNPVlanMapIdent
```

show unp edge-template

Displays the Edge port template configuration for the switch.

show unp edge-template [*template_name* **[configured-vlans] | config [***template_name***]]**

Syntax Definitions

template_name	The name of the UNP Edge port template to display.
configured-vlans	Displays the VLAN IDs that the specified template assigns to a UNP edge port.
config	Displays additional details about the parameter configuration for the template.

Defaults

By default, displays the configuration information for all Edge templates.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter a template name with this command to display information for a specific Edge template.
- Use the **config** option with this command to display the full configuration for each template.

Examples

```
-> show unp edge-template
Template             802.1x                Mac-Auth    Redirect
Name      802.1x  Pass-Alt Prof Mac-Auth Pass-Alt Prof Port-Bounce Class. Trust-Tag

  Redirect Port Bounce            = Enabled,
  Port Control Direction          = Both,
  802.1x Tx-Period                = 30,
  802.1x Supp-Timeout             = 30,
  802.1x Max-Req                  = 2
  802.1x Bypass                   = Disabled
  802.1x failure-policy           = default
  Mac-auth allow-eap              = none
  Trust-Tag                       = Enabled
```

output definitions

Edge Template	The name of an Edge port template.
802.1x Authentication	The 802.1x authentication status (**Enabled** or **Disabled**).
802.1x Pass Alternate Profile	The name of an alternate Edge profile for devices that pass 802.1x authentication.
Mac Authentication	The MAC authentication status (**Enabled** or **Disabled**).
Mac-Auth Pass Alternate Profile	The name of an alternate Edge profile for devices that pass MAC authentication.
Classification	The classification status (**Enabled** or **Disabled**).
Default Edge Profile	The name of a default Edge profile for devices not classified by any other classification methods.
Group-ID	The Group ID number assignment for the UNP port.
AAA Profile	The name of an AAA profile to apply to the port.
Redirect Port Bounce	The status of port bounce (**Enabled** or **Disabled**) for BYOD registration and authorization.
Port Control Direction	Whether 802.1x access control is applied to ingress and egress traffic (**both**) or just ingress traffic (**in**).
802.1x Tx-Period	The amount of time, in seconds, before an EAP Request Identity is retransmitted.
802.1x Supp-Timeout	The amount of time, in seconds, the switch will wait before timing out an 802.1X user that is attempting to authenticate.
802.1x Max-Req	The maximum number of times the switch will retransmit a request for authentication information.
802.1x Bypass	The status of 802.1x bypass (**Enabled** or **Disabled**).
802.1x failure-policy	Whether the switch attempts subsequent MAC authentication for a device after the initial 802.1X authentication process fails (**default** = no MAC authentication or **mac-authentication**).

output definitions

Mac-auth allow-eap	The conditions under which 802.1x authentication is performed or bypassed based on the initial MAC authentication process (**pass** = if MAC authentication passes, **fail** = if MAC authentication fails, **noauth** = if MAC authentication is not configured, or **none** = do not attempt 802.1X authentication). This parameter option only applies to UNP ports on which 802.1X authentication bypass is enabled.
Trust-Tag	The trust VLAN ID tag status (**Enabled** or **Disabled**).

```
-> show unp edge-template etemp1 configured-vlans
Template Name                   Configured Vlans
--------------------------------+----------------
etemp1                            503
```

output definitions

Template Name	The name of an Edge port template.
Configured VLANs	The VLAN IDs that are assigned to the UNP edge port when the template is applied to the port.

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **configured-vlans** parameter added; **Trust-Tag** field added.

Related Commands

unp edge-template	Configures UNP port parameter values for an Edge port template.
unp port edge-template	Assigns an Edge port configuration template to a UNP port.
show unp port	Displays the UNP configuration for the port, including the name of an Edge template associated with the port, if any.

show unp vlan-profile

Displays the VLAN-based Universal Network Profile (UNP) configuration for the switch.

show unp vlan-profile [*profile_name***]**

Syntax Definitions

profile_name	The name of the UNP VLAN profile to display.

Defaults

By default, all VLAN-based profiles are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Enter the name of a UNP VLAN profile with this command to display information for a specific profile.

Examples

```
-> show unp vlan-profile
Name  Vlan Policy    Saa          Status  Mobile MC Conf Ingrs  Egrs   Ingrs   Egrs
           List Name Profile Name         Tag    Status  BW     BW     Depth   Depth

```

output definitions

Name	The name of the UNP VLAN profile. Configured through the **unp vlan-profile** command.
Vlan	The VLAN ID associated with the profile. Configured through the **unp vlan-profile** command.
Policy List Name	The name of the QoS policy list associated with the profile. Configured through the **unp vlan-profile qos-policy-list** command.
Saa Profile Name	**Note.** *This field is not supported in this release.*
Status	The status of the profile (**Active** or **Inactive**). An active profile indicates devices are assigned to the profile VLAN.

output definitions

Mobile Tag	The mobile tagging status (**Ena** or **Dis**) applied to egress packets for the service associated with this UNP. Applies to 802.1X-enabled devices connected to the UNP port. Configured through the **unp vlan-profile mobile-tag** command.
MC Conf Status	**Note.** *This field is not supported in this release.*
Ingress-BW	The maximum ingress bandwidth setting applied to ports associated with the profile. Configured through the **unp vlan-profile maximum-ingress-bandwidth** command.
Egress-BW	The maximum egress bandwidth setting applied to ports associated with the profile. Configured through the **unp vlan-profile maximum-egress-bandwidth** command.
Ingress-Depth	The maximum ingress depth setting applied to ports associated with the profile. Configured through the **unp vlan-profile maximum-ingress-depth** command.
Egress-Depth	The maximum egress depth setting applied to ports associated with the profile. Configured through the **unp vlan-profile maximum-egress-depth** command.

Release History

Release 8.2.1; command was introduced.

Related Commands

show unp classification	Displays the UNP classification rule configuration for the switch.

   alaDaUserNetProfileMobileTag
```

show unp spb-profile

Displays the Shortest Path Bridging (SPB) service-based UNP configuration for the switch.

show unp spb-profile [*profile_name***]**

Syntax Definitions

profile_name	The name of a service UNP to display.

Defaults

By default, all SPB service profiles are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Enter an SPB service profile name with this command to display information for a specific UNP.

Examples

```
-> show unp spb-profile
Profile            Tag                    Mcast  VLAN   QOS                Mobile
Name               Value    ISID/bVlan    Mode   Xlate  Policy List Name   Tag
-----------------+--------+-----------+--------+------+-----------------+---------
spb1                    0   2000/4001  Head-end  Dis    spb1_list         Dis
spb2                10:500   1524/4001    Tandem  Ena                      Dis

-> show unp spb-profile spb2
Profile            Tag                    Mcast  VLAN   QOS                Mobile
Name               Value    ISID/bVlan    Mode   Xlate  Policy List Name   Tag
-----------------+--------+-----------+--------+------+-----------------+---------
spb2                10:500   1524/4001    Tandem  Ena                      Dis
```

output definitions

Profile Name	The name of the service profile.
Tag Value	The VLAN tag values that are used to determine the service access point (SAP) to which profile traffic is mapped.
ISID/bVlan	The SPB service instance identifier (I-SID) and backbone VLAN (BVLAN) that will be associated with the SAP to carry profile traffic.
Mcast Mode	The SPB multicast mode (**head-end** or **tandem**) for the SPB service associated with this profile.
VLAN Xlate	The status (**Ena** or **Dis**) of egress VLAN translation for the SAP associated with this profile.

output definitions

QoS Policy List Name	The name of the QoS policy list associated with the profile.
Mobile Tag	The mobile tagging status (**Ena** or **Dis**) applied to egress packets for the service associated with this UNP. Applies to 802.1X-enabled devices connected to the UNP port.

Release History

Release 8.2.1; command was introduced.

Related Commands

unp spb-profile	Configures UNP SPB service-based profiles.

```

show unp saa-profile

Note: *This command is not supported in this release.*

Displays the Service Assurance Agent (SAA) performance monitoring profile configuration for the switch. SAA profiles are assigned to UNP VLAN profiles to specify jitter and latency threshold values for SAA sessions that apply to the assigned UNP VLAN profile.

show unp saa-profile [*profile_name***]**

Syntax Definitions

profile_name	The name of an existing SAA profile to display.

Defaults

By default, all SAA profiles are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter an SAA profile name with this command to display information for a specific profile.
- This command does not provide the UNP assignment for each SAA profile. To display the assignment information, use the **show unp vlan-profile** command.

Examples

```
-> show unp saa-profile
Profile                          Latency     Jitter       MC Conf
Name                             Threshold   Threshold    Status
---------------------------------+-----------+------------+----------
unp_saa1                               500          100   Local
unp_saa2                                 0          150   Local
unp_saa3                               250            0   Local
```

output definitions

Profile Name	The name of the SAA profile.
Latency Threshold	The latency threshold value applied with this profile. A value of “0” indicates no threshold value is applied.
Jitter Threshold	The jitter threshold value applied with this profile. A value of “0” indicates no threshold value is applied.
MC Conf Status	**Note.** *This field is not supported in this release.*

Release History

Release 8.2.1; command was introduced.

Related Commands

unp saa-profile	Configures SAA performance monitoring profiles.
show unp vlan-profile	Displays the UNP profile configuration for the switch.

MIB Objects

```
alaDaSaaProfileTable
   alaDaSaaProfileName
   alaDaSaaProfileLatencyThreshold
   alaDaSaaProfileJitterThreshold
   alaDaSaaProfileRowStatus
```

show unp group-id

Displays the UNP Group ID configuration for the switch. Group IDs are used to group physical UNP ports or link aggregates into one logical domain.

show unp group-id

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- UNP edge ports are assigned to group IDs to form a logical domain. UNP bridge and service access ports are assigned to customer domain IDs to form a logical domain.
- Once a port is assigned to a specific Group ID, classification rules associated with the same Group ID are applied only to UNP ports associated with the same Group ID.

Examples

```
-> show unp group-id
Group-ID Description
--------+--------------------------
0        Default-Group-ID
1        UNP Group ID 1
2        UNP Group ID 2
10       UNP Group ID 10
```

Release History

Release 8.1.1; command was introduced.

Related Commands

unp group-id	Configures a group ID to which UNP ports and classification rules are assigned.
unp port group-id	Assigns a UNP edge port to a group ID.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUnpGroupIdTable
   alaDaUnpGroupId
   alaDaUnpGroupDescription
```

show unp customer-domain

Displays the UNP customer domain configuration for the switch. Customer domains are used to group physical UNP ports or link aggregates into one logical domain.

show unp customer-domain

Syntax Definitions

N/A

Defaults

N/A.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- UNP bridge and service access ports are assigned to customer domain IDs to form a logical domain. UNP edge ports are assigned to group IDs to form a logical domain.
- Once a port is assigned to a specific customer domain, classification rules associated with the same customer domain ID are applied only to UNP ports associated with the same domain ID.

Examples

```
-> show unp customer-domain
Customer
Domain   Description
--------+-----------------------------------
0        Default-Customer-Domain
1        UNP Customer Domain 1
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp customer-domain	Configures a customer domain ID to which UNP ports and classification rules are assigned.
unp unp-customer-domain	Assigns a UNP port to a customer domain ID.
show unp port	Displays the UNP configuration for the port.

MIB Objects

```
alaDaUnpCustomerDomainTable
   alaDaUnpCustomerDomainId
   alaDaUnpCustomerDomainDesc
```

show unp classification

Displays the UNP classification rule configuration for the switch.

show unp classification [edge-profile | vlan-profile | spb-profile] *rule_type*

Syntax Definitions

rule_type	The rule type to display (refer to the table in the "Usage Guidelines" section of this command page for a list of rule type parameters).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If none of the profile parameters (**edge-profile**, **vlan-profile**, or **spb-profile**) are specified with this command, then only rules associated with VLAN and SPB profiles are displayed; the **edge-profile** parameter is required to display rules configured for Edge profiles.
- Specifying one of the classification rule type parameters is required with this command.The following table provides a list of the rule type parameters and the UNP profile that supports the configuration of that rule type:

Rule Type Parameter	Edge Profile	VLAN Profile	SPB Profile
mac-rule	Yes	Yes	Yes
mac-oui-rule	Yes	No	No
mac-range-rule	Yes	Yes	Yes
ip-rule	Yes	Yes	Yes
vlan-tag-rule	Yes	Yes	Yes
port-rule	Yes	No	No
group-id-rule	Yes	No	No
authentication-type-rule	Yes	No	No
lldp-rule	Yes	No	No
mac-port-rule	Yes	No	No
mac-ip-port-rule	Yes	No	No
mac-ip-group-rule	Yes	No	No
mac-group-rule	Yes	No	No
ip-port-rule	Yes	No	No
ip-group-rule	Yes	No	No

- Standard classification rule parameters are combined at the time a rule is created to define a binding classification rule. The parameter combinations provided with this command reflect the allowed binding rule parameter combinations.
- An extended classification rule defines a list of rules and allows more combinations of standard rules than the binding rule configuration (see the **show unp classification-rule** command).

Examples

```
-> show unp classification mac-rule
Customer                  Vlan Profile             SPB Profile              Vlan
Domain   MAC Address      Name                     Name                     Tag
--------+----------------+------------------------+------------------------+------
0        00:00:5e:2a:95:11  VNP-10                  -                        0

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **vlan-profile** and **spb-profile** parameters and fields added.

Related Commands

show unp classification-rule	Displays the extended classification rule configuration for the switch.
show unp edge-profile	Displays the Edge profile configuration for the switch.
show unp vlan-profile	Displays the VLAN profile configuration for the switch.
show unp spb-profile	Displays the SPB profile configuration for the switch.

MIB Objects

N/A

show unp classification-rule

Displays the UNP extended classification rule configuration for the switch. An extended classification rule defines a list of rule conditions, all of which a device must match to be classified into the Edge profile associated with the extended rule name. A name and precedence value is also assigned to the list of rule conditions.

show unp classification-rule [*rule-name***]**

Syntax Definitions

rule_name	The name of an existing extended classification rule.

Defaults

By default, the configuration for all extended rules is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter the name of an extended classification rule to display information for a specific rule.
- An extended classification rule defines a list of rules and allows more combinations of standard rules than the binding rule configuration.
- An extended classification rule is associated with an Edge profile and applied to traffic learned on UNP edge ports. This type of rule is not configurable for VLAN and SPB service profiles.

Examples

```
-> show unp classification-rule
Rule Name: “ext_rule1”
  Precedence              = 10
  Edge-Profile            = usr_emp
    Conditions:
      Authenticaton-Type  = 802.1x
Rule Name: "ext-rule2"
  Precedence              = 20,
  Edge-Profile            = usr_mgr,
    Conditions:
      IP-Address          = 10.1.1.2,
      IP-Address Mask     = 255.255.255.0,
      VLAN Tag            = 20

-> show unp classification-rule ext_rule1
Rule Name: "ext-rule2"
  Precedence              = 20,
  Edge-Profile            = usr_mgr,
    Conditions:
      IP-Address          = 10.1.1.2,
      IP-Address Mask     = 255.255.255.0,
      VLAN Tag            = 20
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **VLAN Tag** field added.

Related Commands

unp classification-rule	Configures an extended classification rule.
show unp classification	Displays the standard classification rule configuration for the switch.

```

show unp user-role

Displays the user-defined role configuration for the switch.

show unp user-role [*role_name***]**

Syntax Definitions

role_name	The name of an existing user-defined role.

Defaults

By default, all user-defined role are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Enter a user-defined role name with this command to display information for a specific role.

Examples

```
-> show unp user-role
Role Name: ur1
  Qos Policy List       : qlist1
  Priority              : 1
  Conditions:
    Edge-Profile        : edge1
    Authentication-Type : Mac
    CP Status           : Enabled

Role Name: ur2
  Qos Policy List       : qlist-allow
  Priority              : 1
  Conditions:
    Edge-Profile        : -
    Authentication-Type : 802.1x Fail
    CP Status           : Disabled

Total User Role Derivation Rule Count: 2
```

output definitions

Role Name	The name of the user-defined role. Configured through the **unp user-role** command.
Qos Policy List	The name of the QoS policy list associated with the role name. The specified list defines the user role for the device. Configured through the **unp user-role policy-list** command.

output definitions

Priority	The role precedence, which assigns a priority value to the user-defined role. This value determines which role to apply if a device matches the conditions of more than one user-defined role. Configured through the **unp user-role** command.
Edge-Profile	The name of an Edge profile. The user-defined role is only applied to devices classified into the specified profile name. Configured through the **unp user-role edge-profile** command.
Authentication-Type	The type of authentication applied to a device (**none**, **mac**, or **802.1x**). The user-defined role is only applied to devices authenticated with the specified type. Configured through the **unp user-role authentication-type** command.
CP Status	The Captive Portal post login status. If enabled, the role is only applied to devices in this state. Configured through the **unp user-role cp-status-post-login** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

unp user-role	Configures a user-defined role.
show unp edge-user	Displays information about devices learned on UNP ports.

MIB Objects

```
alaDaUNPUserRoleTable
   alaDaUNPUserRoleName
   alaDaUNPUserRolePrecedenceNum
   alaDaUNPUserRolePolicyList
   alaDaUNPUserRoleEdgeProfile
   alaDaUNPUserRoleAuthType
   alaDaUNPUserRolePostLoginStatus
```

show unp restricted-role

Displays the names of the explicit QoS policy lists assigned to the built-in restricted role states (Captive Portal pre-login, Unauthorized, and QMR) used by the switch.

show unp restricted-role

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

An explicit QoS policy list overrides the built-in policy list associated with the restricted role state. When the explicit policy list assignment is removed, the switch reverts back to using the built-in policy list associated with the restricted role state.

Examples

```
-> show unp restricted-role
Role name    Qos Policy List Name
------------+------------------------
UNAUTHORIZED qlist-bad
QMR          qlist-qmr
CP PRE-LOGIN qlist-cp

Total Restricted Role Count: 3
```

output definitions

Role Name	The restricted role name.
Qos Policy List	The name of the QoS policy list associated with the restricted role name.

Release History

Release 8.1.1; command was introduced.

Related Commands

unp restricted-role policy-list	Configures a user-defined role.
show unp edge-user	Displays information about devices learned on UNP ports.

MIB Objects

```
alaDaUNPRstrctedRoleTable
   alaDaUNPRstrctedRoleType
   alaDaUNPRstrctedRolePolicyList
```

show unp port

Displays the UNP configuration for the port. Includes only UNP-enabled ports and link aggregates.

show unp {port [*chassis/slot/port1***[-***port2***]] | linkagg [***agg_id***[-***agg_id2***]} [config]**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).
config	Displays additional configuration details the UNP port or link aggregate.

Defaults

By default, information for all ports or link aggregates is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **port** or **linkagg** parameter to display information for a specific port or link aggregate ID.
- Use the **config** parameter to display additional configuration information for the port or link aggregate.

Examples

```
-> show unp port
Port   Grp-ID/ Type       802.1x   Mac      Class.   Default    802.1X   MAC

------+-------+----------+--------+--------+--------+----------+--------+----------
0/11   2       Bridge     Disabled Disabled Disabled  -          -        -
```

output definitions

Port	The port or link aggregate on which UNP is enabled. Configured through the **unp port** command. A "0" indicates the port is a link aggregate (for example, 0/11 is link aggregate ID 11).
Grp-ID/CDomain	The group ID or customer domain ID assigned to the UNP port or link aggregate. A group ID is assigned to UNP edge ports; a customer domain ID is assigned to UNP bridge and access ports. Configured through the **unp port group-id** command or the **unp unp-customer-domain** command depending on the port type.
Type	The type of UNP port (**Edge**, **Bridge**, or **SPB Access**). Configured through the **unp port** command.
802.1x Auth	The 802.1X authentication status (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp 802.1x-authentication** command.
Mac-Auth	The MAC authentication status (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp mac-authentication** command.
Class.	The classification status (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp classification** command.
Default	The name of the default UNP Edge profile assigned to the port or link aggregate. Configured through the **unp default-edge-profile** command.
802.1x Pass-Alt	The name of the 802.1x authentication pass alternate Edge profile assigned to the port or link aggregate. Configured through the **unp 802.1x-authentication pass-alternate** command.
Mac Pass-Alt	The name of the MAC authentication pass alternate Edge profile assigned to the port or link aggregate. Configured through the **unp mac-authentication pass-alternate** command.

```
-> show unp port 1/1/6 config
Port 1/1/6
        Port-Type                     : Edge,
        Redirect Port Bounce          : Enabled,
        802.1x authentication         : Disabled,
        802.1x Pass Alternate Profile : -,
        802.1x Bypass                 : Disabled,
        802.1x failure-policy         : default,
        Mac-auth allow-eap            : none,
        Mac authentication            : Disabled,
        Mac Pass Alternate Profile    : -,
        Classification                : Disabled,
        Default Profile               : -,
        Group-ID                      : 0,
        AAA Profile                   : -,
        Edge Template                 : et-1,
        Port Control Direction        : both,
```

```
Egress Flooding                 : Not Allowed,
Trust-tag Status                = Disabled,
802.1x Parameters:
        Tx-Period         : 30,
        Supp-Timeout      : 30,
        Max-req  : 2
```

output definitions

Port	The port or link aggregate on which UNP is enabled. Configured through the **unp port** command. A "0" indicates the port is a link aggregate (for example, 0/11 is link aggregate ID 11).
Port Type	The type of UNP port (**Edge**, **Bridge**, or **SPB Access**). Configured through the **unp port** command. The fields displayed with the **show unp port config** command may vary based on port type.
Redirect Port Bounce	The status of the port bounce operation (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp redirect port-bounce** command.
802.1x Authentication	The 802.1x authentication status (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp 802.1x-authentication** command.
802.1x Pass Alternate Profile	The name of the 802.1x authentication pass alternate Edge profile assigned to the port or link aggregate. Configured through the **unp 802.1x-authentication pass-alternate** command
802.1x Bypass	The status of 802.1x bypass (**Enabled** or **Disabled**).
802.1x failure-policy	Whether the switch attempts subsequent MAC authentication for a device after the initial 802.1X authentication process fails (**default** = no MAC authentication or **mac-authentication**).
Mac-auth allow-eap	Indicates the conditions under which 802.1x authentication is performed or bypassed based on the initial MAC authentication process (**pass** = MAC authentication passes, **fail** = if MAC authentication fails, **noauth** = no MAC authentication, or **none** = do not attempt 802.1X authentication). This parameter option only applies to a UNP port or link aggregate on which 802.1X authentication bypass is enabled. Configured through the **unp mac-authentication allow-eap** command.
Mac Authentication	The MAC authentication status (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp mac-authentication** command.
Mac Pass Alternate Profile	The name of the MAC authentication pass alternate Edge profile assigned to the port or link aggregate. Configured through the **unp mac-authentication pass-alternate** command.
Classification	The classification status (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp classification** command.
Default Profile	The name of the default UNP Edge profile assigned to the UNP port or link aggregate. Configured through the **unp default-edge-profile** command.
Group-ID	The Group ID number assigned to the UNP port or link aggregate. Configured through the **unp port group-id** command.
AAA Profile	The name of an AAA profile assigned to the UNP port or link aggregate. Configured through the **unp aaa-profile** command.

output definitions

Edge Template	The name of an Edge port template assigned to the UNP port or link aggregate. Configured through the **unp port edge-template** command.
Port Control Direction	Whether 802.1x access control is applied to ingress and egress traffic (**both**) or just ingress traffic (**in**). Configured through the **unp direction** command.
Egress Flooding	Indicates whether egress broadcast, unknown unicast, and multicast traffic is blocked (**Not Allowed**) or unblocked (**Allowed**) on the UNP port. The value displayed in this field is based on the port control direction setting for the port (**both** = Not Allowed; **in** = Allowed).
Trust-tag Status	The trust the VLAN ID tag status (**Enabled** or **Disabled**) for the UNP port or link aggregate. Configured through the **unp trust-tag** command.
802.1x Tx-Period	The amount of time, in seconds, before an EAP Request Identity is retransmitted. Configured through the **unp 802.1x-authentication tx-period** command.
802.1x Supp-Timeout	The amount of time, in seconds, the switch waits before timing out an 802.1X user (supplicant) that is attempting to authenticate. Configured through the **unp 802.1x-authentication supp-timeout** command.
802.1x Max-Req	The maximum number of times the switch will retransmit a request for authentication information. Configured through the **unp 802.1x-authentication max-req** command.

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **Trust-tag Status** field added.

Related Commands

show unp edge-template	Displays the Edge port template configuration for the switch.
show unp edge-profile	Displays the UNP configuration for the switch.
show unp edge-user	Displays information about the devices learned on a UNP port.

show unp port bandwidth

Displays the maximum ingress bandwidth, maximum egress bandwidth, and maximum depth configuration for the UNP port. These values are optionally assigned through the Edge and VLAN profiles to which a UNP port is associated.

show unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***[-***agg_id2***]} bandwidth**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **port** or **linkagg** parameter to display information for a specific port or link aggregate ID.
- The optional bandwidth parameter values are applied when a UNP port is classified into a UNP Edge or VLAN profile. The Edge or VLAN profile is obtained through local classification or returned from the RADIUS server.
- The source from which the bandwidth parameter values were last updated is also included in the display information. The source updates are based on the following conditions:
  - The UNP Edge or VLAN profile applies the bandwidth values at the time the UNP port is classified into the profile. This overrides any existing QoS bandwidth policies configured on the physical port.
  - QoS bandwidth policies defined in a QoS policy list associated with the Edge or VLAN profile are applied after the port is classified into the profile. This overrides the profile bandwidth values initially applied.
  - User configured QoS bandwidth policies are applied after the port is classified into the profile.
- Configuring the bandwidth parameter values is an option provided only through UNP Edge and VLAN profiles. UNP SPB service profiles do not provide this option.

Examples

```
-> show unp port 1/1/10 bandwidth
Port   Grp-ID/ Type Max       Ingr   Ingr    Max       Egress Egress  Max    Max
       CDomain      Ingress   BW     BW      Egress    BW     BW      Def    Depth
                    Bandwidth Source Profile Bandwidth Source Profile Depth  Source
------+-------+----+---------+------+-------+---------+------+-------+------+------
1/1/10 0       Edge                -                          -
```

output definitions

Port	The port or link aggregate on which UNP is enabled. A “0” indicates the port is a link aggregate (for example, 0/11 is link aggregate ID 11).
Grp-ID/CDomain	The group ID or customer domain ID assigned to the UNP port or link aggregate. A group ID is assigned to UNP edge ports; a customer domain ID is assigned to UNP bridge ports.
Type	The type of UNP port (**Edge** or **Bridge**).
Max Ingress Bandwidth	The maximum ingress bandwidth value applied to the UNP port.
Ingr BW Source	The source from which the maximum ingress bandwidth value was updated on the port (**UNP** or **QoS**).
Ingr BW Profile	The name of the UNP profile responsible for setting the maximum ingress bandwidth value on the UNP port. This field is only applicable when UNP classification applies the bandwidth setting on the port.
Max Egress Bandwidth	The maximum egress bandwidth value applied to the UNP port.
Egress BW Source	The source from which the maximum egress bandwidth value was updated on the port (**UNP** or **QoS**).
Egress BW Profile	The name of the UNP profile responsible for setting the maximum egress bandwidth value on the UNP port. This field is only applicable when UNP classification applies the bandwidth setting on the port.
Max Default Depth	The maximum default depth (bucket size) value applied to the UNP port.
Max Depth Source	The source from which the maximum depth value was updated on the port (**UNP** or **QoS**).

Release History

Release 8.2.1; command was introduced.

Related Commands

unp port	Configures UNP functionality on a port or link aggregate.
unp port group-id	Assigns a UNP edge port or link aggregate to a group ID.
unp unp-customer-domain	Assigns a UNP port or link aggregate to a customer domain (UNP group). Applies only to UNP bridge and service access ports.
unp edge-profile	Configures the optional bandwidth parameters for an Edge profile.
unp vlan-profile	Configures the optional bandwidth parameters for a VLAN profile.
show unp edge-profile	Displays the Edge profile configuration for the switch.
show unp vlan-profile	Displays VLAN profile configuration for the switch.

show unp port 802.1x statistics

Displays 802.1X statistics for a UNP port or link aggregate on which 802.1X authentication is enabled.

show unp {port *chassis/slot/port1***[-***port2***] | linkagg** *agg_id***} 802.1x statistics**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
agg_id	Link aggregate ID.

Defaults

By default, this command displays statistics for all ports and link aggregates on which 802.1X authentication is enabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **port** or **linkagg** parameter to display information for a specific port or link aggregate ID.

Examples

```
-> show unp port 1/1/13 802.1x statistics
Port  1/1
    Mac-address=00:00:00:00:00:01,
        Vlan=0,
          Rx EAP Frames=0,
          Tx EAP Frames=0,
          Rx EAP Logoff Frames=0,
          Tx EAP Request Frames=0,
          Tx EAP Request ID Frames=0,
          Rx EAP Response Frames=0,
          Rx EAP Response ID Frames=0,
          Rx EAP Start Frames=0,
          Rx Invalid EAP Frames=0,
          Rx Length Error EAP Frames=0,
          Last EAP Frame Version=0,
          Last EAP Frame Version=0,
          Last EAP Source=00:00:00:00:00:00

-> show unp linkagg 20 802.1x statistics
Linkagg ID 0/10
    Mac-address=00:00:00:00:00:01,
        Vlan=0,
          Rx EAP Frames=0,
          Tx EAP Frames=0,
          Rx EAP Logoff Frames=0,
          Tx EAP Request Frames=0,
          Tx EAP Request ID Frames=0,
```

```
Rx EAP Response Frames=0,
Rx EAP Response ID Frames=0,
Rx EAP Start Frames=0,
Rx Invalid EAP Frames=0,
Rx Length Error EAP Frames=0,
Last EAP Frame Version=0,
Last EAP Frame Version=0,
Last EAP Source=00:00:00:00:00:00
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show unp port	Displays the UNP port configuration for the switch.
show unp edge-user	Displays information about the devices learned on a UNP port.

MIB Objects

N/A

show unp port configured-vlans

Displays the VLANs assigned to UNP edge and bridge ports or link aggregates.

show unp {port [*chassis/slot/port1***[-***port2***]] | linkagg** *agg_id***[-***agg_id2***]} configured-vlans**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific UNP edge or bridge port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID for a specific UNP edge or bridge link aggregate. Use a hyphen to specify a range of link aggregate IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **port** or **linkagg** parameter to display information for a specific UNP edge and bridge port or link aggregate ID.
- If the **port** parameter is used without specifying an individual port or a range of ports, then the configured VLAN information for all UNP ports and link aggregates is displayed.

Examples

```
-> show unp port configured-vlans
Port    Configured Vlans
-------+----------------
0/10      500
0/10      501
1/1/10    500
1/1/11    501
1/1/11    502
1/1/11    503

-> show unp port 1/1/11 configured-vlans
Port    Configured Vlans
-------+----------------
1/1/11    501
1/1/11    502
1/1/11    503

-> show unp linkagg 10 configured-vlans
LagID   Configured Vlans
-------+----------------
0/10      500
0/10      501
```

Release History

Release 8.2.1; command was introduced.

Related Commands

unp vlan	Configures VLAN assignments for UNP edge and bridge ports.
show unp port	Displays the UNP port and link aggregate configuration for the switch.

MIB Objects

```
alaDaUNPPortVlanTable
   alaDaUNPPortVlanVID
```

show unp user

Displays information about the MAC addresses learned on a UNP port or link aggregate.

show unp user [*mac_address***] [***chassis_id/slot/port***[-***port2***] | linkagg** *agg_id***[***agg_id2***]] [count]**

Syntax Definitions

mac_address	The device MAC address.
chassis_id	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[-***agg_id2***]**	Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).
count	Displays the number of UNP users.

Defaults

By default, information is displayed for all learned devices on all UNP ports and link aggregates.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The **count** parameter is used on its own or in combination with a specified port or link aggregate ID number.
- Enter a chassis, slot, and port number to display devices learned on a specific port.
- Use the **linkagg** parameter and an aggregate ID number to display devices learned on a specific link aggregate.
- A zero is displayed instead of a slot number to designate a link aggregate. For example “0/10” specifies the device was learned on aggregate ID number 10.

Examples

```
-> show unp user
                                          User                              Learning

output definitions

Port	The port or link aggregate on which the MAC address was learned.
Username	The user name of the device (or the MAC address of the device).
Mac address	The MAC address of the device. This field and the **Username** field may contain the same MAC address.
User IP	The IP network address of the device.
Vlan	The UNP VLAN ID to which the device was classified.
Profile	The name of the UNP to which the device was assigned.
Type	The type of UNP port on which the device was learned (**Bridge** or **Access**).
Status	The status of the device (**Active** or **Blocked**)
Learning Source	**Note.** *This field is not supported in this release.*

```
-> show unp user 00:00:00:00:00:01
Vlan 10:

-> show unp user 1/1-5 count
Total users: 3

-> show unp user linkagg 11 count
Total users: 2
```

output definitions

Port	The port or link aggregate on which the MAC address was learned.
Mac-address	The MAC address of the device.
IP	The IP network address of the device.
UNP-Profile	The name of the UNP to which the device was assigned.
Login Timestamp	The date and time the device was learned.
Authentication Type	The type of authentication used (**Mac-Authentication** or **802.1x-Authentication**).
Authentication Status	The status of the authentication process (**blank** "–", **Authenticated**, **Failed**, or **In Progress**).
Classification Source	Indicates how the device was classified (see list of possible classification source values below).
Role Applied	The name of the QoS policy list applied to this user for network access control.
Learning Source	**Note.** *This field is not supported in this release.*

The following is a list of possible values for the "Classification Source" field:

- Pass alternate UNP
- Pass alternate UNP - Blocked
- Default UNP
- Default UNP - Blocked
- Server UNP
- Server UNP - Blocked
- Auth Fail - Default UNP
- Auth Fail - Default UNP - Blocked
- Auth Fail - MAC Rule UNP

show unp vlan-profile	Displays the UNP VLAN profile configuration for the switch.
show unp spb-profile	Displays the UNP SPB profile configuration for the switch.
show unp port	Displays the UNP configuration for the port.

MIB Objects

N/A

show unp edge-user

Displays information about the MAC addresses learned on a UNP Edge port or link aggregate.

show unp edge-user {port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***] [edge-profile** *profile_name***] [authentication-type {none | mac | 802.1x}]}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).
profile_name	The name of an existing Edge profile.
none	Displays users that did not undergo the authentication process.
mac	Displays users that were authenticated through MAC authentication.
802.1x	Displays users that were authenticated through 802.1X authentication.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **port** or **linkagg** parameter to display users learned on a specific port or link aggregate.
- Use the **edge-profile** parameter to display users classified into a specific Edge profile.
- Combine the port or linkagg parameter with the **edge-profile** parameter option to display only users on the port or link aggregate that are classified into the specified profile.
- Combine the port or linkagg parameter with the **authentication-type** parameter option to display users on the port or link aggregate that were authenticated with the specified authentication type.

Examples

```
-> show unp edge-user port 1/1/6

Total users : 2
```

output definitions

Port	The port or link aggregate on which the MAC address was learned. A “0” indicates the UNP port is a link aggregate (e.g., 0/10 refers to link aggregate ID 10).
Username	Displays the user name entered through 802.1x or captive-portal authentication for an 802.1X user or a Captive-Portal-passed user. If the user undergoes 802.1x authentication and later undergoes successful Captive Portal authentication, then the user name entered during the Captive Portal authentication is displayed.
MAC address	The MAC address of the user device.
User IP	The IP network address of the user device.
Vlan	The UNP VLAN ID to which the user device was assigned.
Profile	The name of the UNP to which the user device was assigned.
Auth	The type of authentication applied to the user (**none**, **mac**, or **802.1X**).
Role	The user role (policy list) applied to the user device.

Release History

Release 8.1.1; command was introduced.

Related Commands

show unp edge-user status	Displays information about the authentication and validation status of users learned on UNP ports.
show unp edge-user details	Displays detailed information about users learned on UNP ports.
unp edge-user flush	Performs a MAC address flush of Access Guardian users (devices learned on UNP edge ports).
show unp edge-profile	Displays the UNP configuration for the switch.
show unp port	Displays the UNP configuration for the port.

MIB Objects

N/A

show unp edge-user status

Displays the status of the authentication and validation process for MAC addresses learned on a UNP Edge port or link aggregate.

show unp edge-user status [port *chassis/slot/port***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***] [edge-profile** *profile_name***] [authentication-type {none | mac | 802.1x}] [mac-address** *mac_address***]**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[**-*port2***]**	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
*agg_id***[**-*agg_id2***]**	Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).
profile_name	The name of an existing Edge profile.
none	Displays users that did not undergo the authentication process.
mac	Displays users that were authenticated through MAC authentication.
802.1x	Displays users that were authenticated through 802.1X authentication.
mac_address	The user device MAC address.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **port** or **linkagg** parameter to display users learned on a specific port or link aggregate.
- Use the **edge-profile** parameter to display users classified into a specific Edge profile.
- Combine the port or linkagg parameter with the **edge-profile** parameter option to display only users on the port or link aggregate that are classified into the specified profile.
- Combine the port or linkagg parameter with the **authentication-type** parameter option to display users on the port or link aggregate that were authenticated with the specified authentication type.

output definitions

Port	The UNP bridge port or link aggregate on which the device was learned.
Mac-address	The MAC address of the device.
Access Timestamp	The date and time the device was learned.
User Name	The MAC address of the user.
IP-Address	The IP network address of the device.
Vlan	The VLAN ID number for the VLAN in which the device was learned.
Authentication Type	The type of authentication used (**Mac-Authentication** or **802.1x-Authentication**).
Authentication Status	The status of the authentication process (**blank** "–", **Authenticated**, **Failed**, or **In Progress**).
Authentication Failure Reason	The reason authentication failed.
Authentication Retry Count	The number of times authentication has been attempted.
Authentication Server IP Used	The IP address of the authentication server.
Authentication Server Used	The name of the authentication server used.
Server Reply-Message	Reply message from the authentication server.
Profile	The name of the VLAN profile to which the user was assigned.
Profile Source	The source of the profile (returned from the server or assigned through the UNP process on the switch).

output definitions

Profile From Auth Server	The name of the VLAN profile returned from the authentication server.
Classification profile rule	The rule that resulted in the device classification into the profile VLAN.
QMR Status	The Quarantine Manager Remediation status for the device.
Redirect Url	The URL to which the device is redirected upon classification.
SIP Call Type	The Session Initiation Protocol (SIP) call type status for a non-supplicant (non-802.1x) device.
SIP Media Type	The SIP media type status for a non-supplicant device.
Applications	The applications a non-supplicant device is running.

Release History

Release 8.1.1; command was introduced.

Related Commands

unp edge-user flush	Performs a MAC address flush of Access Guardian users (devices learned on UNP edge ports).
show unp edge-user	Displays information about users learned on a UNP Edge ports.
show unp edge-user status	Displays information about the authentication and validation status of users learned on UNP ports.
show unp edge-profile	Displays the UNP configuration for the switch.
show unp port	Displays the UNP configuration for the port.

MIB Objects

N/A

show unp vlan-user details

Displays information about the MAC addresses learned on UNP bridge ports or link aggregates.

show unp vlan-user details [port *chassis/slot/port***[**-*port2*****] | linkagg** *agg_id***[**-*agg_id2*****] [vlan-profile** *profile_name***] [type {802.1x | mac | none}] [mac-address** *mac_address***]**

Syntax Definitions

*chassis/slot/port***[**-*port2*****]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2*****]**	Link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (10-15).
profile_name	Displays only users associated with the specified VLAN profile name.
802.1x	Displays only 802.1X authenticated users.
mac	Displays only MAC authenticated users.
none	Displays only users that were not authenticated.
mac_address	Displays only users with the specified source MAC address.

Defaults

By default, information is displayed for all learned VLAN users on all UNP bridge ports and link aggregates.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the optional parameters provided with this command to filter the output display results.

Examples

```
-> show unp vlan-user details linkagg 100
Port:  0/100
  MAC-Address: 00:00:00:00:00:03
    Access Timestamp               : 02/01/2013 20:45:26,
    User Name                      : guest3,
    IP-address                     : 30.0.0.1,
    Vlan                           : 30,

    Authentication Status          : Authenticated,
    Authentication Failure Reason  : -,
    Authentication Retry Count     : -,
    Authentication Server IP Used  = 10.135.62.129,
    Authentication Server Used     = rad1,
    Server Reply-Message           = -,
    Profile                        : Contractor,
    Profile Source                 : Auth - Pass - Default UNP,
    Profile From Auth Server       : Employee [Not Configured],
```

```
Classification profile rule    : -,
QMR Status                     : -,
Redirect Url                   : -,
SIP Call Type                  = Not in a call,
SIP Media Type                 = None,
Applications                   = ;Facebook;rediff;
```

output definitions

Port	The UNP bridge port or link aggregate on which the device was learned.
Mac-address	The MAC address of the device.
Access Timestamp	The date and time the device was learned.
User Name	The MAC address of the user.
IP-Address	The IP network address of the device.
Vlan	The VLAN ID number for the VLAN in which the device was learned.
Authentication Type	The type of authentication used (**Mac-Authentication** or **802.1x-Authentication**).
Authentication Status	The status of the authentication process (**blank** "–", **Authenticated**, **Failed**, or **In Progress**).
Authentication Failure Reason	The reason authentication failed.
Authentication Retry Count	The number of times authentication has been attempted.
Authentication Server IP Used	The IP address of the authentication server.
Authentication Server Used	The name of the authentication server used.
Server Reply-Message	Reply message from the authentication server.
Profile	The name of the VLAN profile to which the user was assigned.
Profile Source	The source of the profile (returned from the server or assigned through the UNP process on the switch).
Profile From Auth Server	The name of the VLAN profile returned from the authentication server.
Classification profile rule	The rule that resulted in the device classification into the profile VLAN.
QMR Status	The Quarantine Manager Remediation status for the device.
Redirect Url	The URL to which the device is redirected upon classification.
SIP Call Type	The Session Initiation Protocol (SIP) call type status for a non-supplicant (non-802.1x) device.
SIP Media Type	The SIP media type status for a non-supplicant device.
Applications	The applications a non-supplicant device is running.

Release History

Release 8.2.1; command was introduced.

Related Commands

show unp vlan-profile	Displays the UNP SPB profile configuration for the switch.
show unp port	Displays the UNP configuration for a port or link aggregate.

MIB Objects

N/A

show unp spb-access-user details

Displays information about the MAC addresses learned on UNP Shortest Path Bridging (SPB) access ports or link aggregates.

show unp spb-access-user details [mac-address *mac_address***] [sap-id** *sap_id***] [service-id** *service_id***] [spb-profile** *profile_name***] [type {802.1x | mac | none}]**

Syntax Definitions

mac_address	Displays only users with the specified source MAC address.
sap_id	Displays only users associated with the specified SPB Service Access Point (SAP) ID.
service_id	Displays only users associated with the specified SPB service ID.
profile_name	Displays only users associated with the specified SPB profile name.
802.1x	Displays only 802.1X authenticated users.
mac	Displays only MAC authenticated users.
none	Displays only users that were not authenticated.

Defaults

By default, information is displayed for all learned SPB users on all UNP SPB access ports and link aggregates.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **sap-id** or **service-id** parameter to display users learned on a specific SPB SAP or service.
- Use the **spb-profile** parameter to display users classified into a specific SPB profile.
- Combine the **sap-id** or **service-id** parameter with the **spb-profile** parameter option to display only users on the SPB SAP or service that are classified into the specified profile.
- Combine the **sap-id** or **service-id** parameter with the **type** parameter option to display users on the SPB SAP or service that were authenticated with the specified authentication type.

Examples

```
-> show unp spb-access-user details
SAP = 0/1:1000
    MAC-Address: 00:00:00:00:00:01
      Service ID                    = 32768,
      ISID                          = 10000000,
      CVlan                         = 1000,
      Access Timestamp              = 01/21/2014 16:02:55,
      User Name                     = 00:00:00:00:00:01,
      IP-Address                    = -,
      Authentication Type           = -,
```

```
      Authentication Status           = -,
      Authentication Failure Reason   = -,
      Authentication Retry Count      = 0,
      Authentication Server IP Used   = -,
      Authentication Server Used      = -,
      Server Reply-Message            = -,
      Profile                         = System Default,
      Profile Source                  = System Default SPB,
      Profile From Auth Server        = -
      SIP Call Type                   = Not in a call,
      SIP Media Type                  = None,
      Applications                    = ;Facebook;rediff;

Total users : 1
```

output definitions

SAP	The port or link aggregate and encapsulation value for an SPB Service Access Point (SAP).
Mac-address	The MAC address of the device.
Service ID	The SPB service ID number.
ISID	The SPB service instance identifier. This value is associated with the SPB service ID.
CVlan	The customer VLAN identified through the SAP encapsulation.
Access Timestamp	The date and time the device was learned.
User Name	The MAC address of the user.
IP-Address	The IP network address of the device.
Authentication Type	The type of authentication used (**Mac-Authentication** or **802.1x-Authentication**).
Authentication Status	The status of the authentication process (**blank** "–", **Authenticated**, **Failed**, or **In Progress**).
Authentication Failure Reason	The reason authentication failed.
Authentication Retry Count	The number of times authentication has been attempted.
Authentication Server IP Used	The IP address of the authentication server.
Authentication Server Used	The name of the authentication server used.
Server Reply-Message	Reply message from the authentication server.
Profile	The name of the SPB profile to which the user was assigned.
Profile Source	The source of the profile (returned from the server or assigned through the UNP process on the switch).
Profile From Auth Server	The name of the SPB profile returned from the authentication server.
SIP Call Type	The Session Initiation Protocol (SIP) call type status for a non-supplicant (non-802.1x) device.
SIP Media Type	The SIP media type status for a non-supplicant device.
Applications	The applications a non-supplicant device is running.

Release History

Release 8.2.1; command was introduced.

Related Commands

unp spb-access-user flush	Performs a MAC address flush of Access Guardian users (devices learned on UNP SPB access ports).
show unp spb-profile	Displays the UNP SPB profile configuration for the switch.
show unp port	Displays the UNP configuration for a port or link aggregate.

MIB Objects

N/A

show unp policy validity-period

Displays the UNP period policy configuration for the switch. This type of policy is assigned to a UNP Edge profile and applied to devices classified into the profile.

show unp policy validity-period [*policy_name***]**

Syntax Definitions

policy_name	The name of an existing UNP period policy.

Defaults

By default, all UNP period policies are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Enter a UNP period policy name to display information about a specific policy.

Examples

```
-> show unp policy validity-period
Policy Days    Months       Hours         Interval                          TZ Active
------+-------+------------+-------------+---------------------------------+---+----
tp1    SMTWTFS JFMAMJJASOND 08:00 - 17:00            - - -                 -   NO
tp2    ------- ------------     - - -     01/01/13 00:00 - 01/02/13 00:00 CST NO

Total Period Policy Count: 2

-> show unp policy validity-period tp1
Policy Days    Months       Hours         Interval                          TZ Active
------+-------+------------+-------------+---------------------------------+---+----
tp1    SMTWTFS JFMAMJJASOND 08:00 - 17:00              - - -               -   NO
```

Release History

Release 8.1.1; command introduced.

Related Commands

unp policy validity-period	Configures a UNP period policy.
unp edge-profile period-policy	Assigns a UNP period policy to an Edge profile.

MIB Objects

   alaDaUNPValidityPeriodTimezone
   alaDaUNPValidityPeriodTimezoneStatus
   alaDaUNPValidityPeriodActiveStatus
```

show unp policy validity-location

Displays the UNP location policy configuration for the switch. This type of policy is assigned to a UNP Edge profile and applied to devices classified into the profile.

show unp policy validity-location [*policy_name***]**

Syntax Definitions

policy_name	The name of an existing UNP location policy.

Defaults

By default, all UNP location policies are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Enter a location policy name to display information about a specific policy.

Examples

```
-> show unp policy validity location
Policy: l1
  Port            = 1/1
  System Name     = shasta
  System Location = Bangalore

Total Location Policy Count: 1
```

Release History

Release 8.1.1; command introduced.

Related Commands

unp policy validity-location	Configures a UNP location policy.
unp edge-profile location-policy	Assigns a UNP location policy to an Edge profile.

MIB Objects

```
alaDaUNPLocationPolicyTable
   alaDaUNPLocationPolicyName
   alaDaUNPLocationPolicyPort
   alaDaUNPLocationPolicySystemName
   alaDaUNPLocationPolicySystemLocation
```

captive-portal name

Configures the name of the redirect URL to use for Captive Portal.

captive-portal name *cp_url_name*

no captive-portal name *cp_url_name*

Syntax Definitions

cp_url_name	The Captive Portal redirect URL.

Defaults

By default, the Captive Portal redirect name is set to “captive-portal.com”.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to revert the URL name back to the default, “captive-portal.com”.
- Use this command to change the Captive Portal redirect URL name to match the common name (cn) used by the public certificate on the switch. Matching these two names prevents a certificate warning message caused when these names do not match.
- When a device is classified into an Edge profile that has the Captive Portal authentication attribute enabled, the device is placed into a Captive Portal pre-login state. In this state, the device can contact a DHCP server to get an IP address and get the DNS server address.
- Initial HTTP requests received from a user device are responded to with the Captive Portal redirect name. The user device contacts the DNS server to resolve the redirect name and receives the Captive Portal IP address. Requests are then sent to the Captive Portal IP address that is mapped internally to the OmniSwitch web server, which then presents login Web pages to the user device.
- Make sure the DNS server configuration reflects the same Captive Portal name and IP address that is configured for the OmniSwitch.

Examples

```
-> captive-portal name cert-name
-> no captive-portal name
```

Release History

Release 8.1.1; command was introduced.

Related Commands

captive-portal ip-address	Configures the internal Captive Portal IP address for the switch.
show captive-portal configuration	Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalGlobalConfig
   alaDaCPortalRedirectUrlName
```

captive-portal ip-address

Configures the internal Captive Portal IP address for the switch.

captive-portal ip-address *ip_address*

no captive-portal ip-address

Syntax Definitions

ip_address	IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).

Defaults

By default, no Captive Portal IP address is set for the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the internal IP address from the Captive Portal global configuration.
- When a device is classified into an Edge profile that has the Captive Portal authentication attribute enabled, the device is placed into a Captive Portal pre-login role. In this state, the device can contact a DHCP server to get an IP address and get the DNS server address.
- Initial HTTP requests received from a user device are responded to with the Captive Portal redirect name. The user device contacts the DNS server to resolve the redirect URL name and receives the Captive Portal IP address. Requests are then sent to the Captive Portal IP address that is mapped internally to the OmniSwitch web server, which then presents login web pages to the user device.
- Make sure the DNS server configuration reflects the same Captive Portal name and IP address that is configured for the OmniSwitch.

Examples

```
-> captive-portal ip-address 10.255.0.20
-> no captive-portal ip-address
```

Release History

Release 8.1.1; command was introduced.

Related Commands

captive-portal name	Configures the name of the redirect URL that is used for accessing a public certificate.
show captive-portal configuration	Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalGlobalConfig
   alaDaCPortalIpAddress
```

captive-portal success-redirect-url

Configures the URL of a specific site to which a user is redirected after a successful Captive Portal authentication.

captive-portal success-redirect-url *redirect_url*

no captive-portal success-redirect-url

Syntax Definitions

redirect_url	The redirect URL (up to 63 characters).

Defaults

By default, no success redirect URL is configured.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to remove the success redirect URL from the Captive Portal global configuration.

Examples

```
-> captive-portal success-redirect-url http://server-1.com/pass.html
-> no captive-portal success-redirect-url
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show captive-portal configuration	Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalGlobalConfig
   alaDaCPortalSuccRedirectUrl
```

captive-portal proxy-server-port

Configures the proxy server port to use for Captive Portal.

captive-portal proxy-server-port *proxy_port*

no captive-portal proxy-server-port

Syntax Definitions

proxy_port	The HTTP proxy port number. The valid range is 1024–49151.

Defaults

By default, the proxy port number is set to 8080.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to set the proxy port number back to the default (8080).
- This command overwrites the existing proxy port number for the switch.
- The proxy port number only requires changing if the proxy port used is not 80 or 8080.

Examples

```
-> captive-portal proxy-server-port 1200
-> no captive-portal proxy-server-port
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show captive-portal configuration	Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalGlobalConfig
   alaDaCPortalProxyPort
```

captive-portal retry-count

Configures the number of times a device can try to login before Captive Portal determines that authentication for that device has failed.

captive-portal retry-count *retries*

no captive-portal retry-count

Syntax Definitions

retries	The number of login attempts allowed. The valid range is 1–99.

Defaults

By default, the retry count is set to 3.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to set the number of login retries back to the default (3).
- No access page is sent to devices that exceed the number of login retries allowed.

Examples

```
-> captive-portal retry-count 5
-> no captive-portal retry-count
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show captive-portal configuration	Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalGlobalConfig
   alaDaCPortalRetryCnt
```

captive-portal authentication-pass

Configures the name of a QoS policy list or UNP Edge profile for the global Captive Portal configuration. The specified list or Edge profile is applied to each device that passes Captive Portal authentication.

captive-portal authentication-pass [realm {prefix | suffix} domain *domain_name***] {policy-list** *list_name* **| edge-profile** *profile_name* **| edge-profile-change {enable | disable}}**

no captive-portal authentication-pass [realm {prefix | suffix} domain *domain_name***] {policy-list | edge-profile}**

Syntax Definitions

prefix	Specifies a prefix domain name (e.g., *domain_name*/user).
suffix	Specifies a suffix domain name (e.g., user*@domain_name*)
domain_name	The domain name for the user device.
list_name	The name of a QoS policy list to apply to the authenticated user device.
profile_name	The name of an existing UNP Edge profile.
enable	Applies the policy list specified in the Edge profile.
disable	Does not apply the policy list specified in the Edge profile.

Defaults

By default, no policy list name or UNP Edge profile name is specified for the global Captive Portal configuration. The Edge profile change parameter is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the Captive Portal authentication pass policy from the global Captive Portal configuration.
- Use the optional **realm prefix domain** or **realm suffix domain** parameter to apply the authentication policy list or UNP Edge profile based on the domain name of the Captive Portal authenticated user device.
- If none of the optional parameters (**realm prefix domain** or **realm suffix domain)** are specified with this command, then the policy list or UNP Edge profile is applied to all Captive Portal authenticated user devices.
- If the **edge-profile-change** parameter is enabled, the Edge profile initially assigned to the Captive Portal users is changed to the profile derived through successful Captive Portal authentication. The QoS policy list specified in the new Edge profile is then applied to the authenticated users.
- When an Edge profile change occurs, the new profile may assign a different VLAN to the authenticated device. If so, a port bounce or pause timer operation is triggered to learn the device in the new VLAN.
- The initial Edge profile assignment for a user device is not changed to the new Edge profile (a profile derived through successful Captive Portal authentication) unless the **edge-profile-change** parameter is

enabled. When an Edge profile change is triggered, the new profile may assign a different VLAN to the user device. If so, a port bounce or pause timer operation will occur to learn the device in the new VLAN.

- If the new Edge profile assigned also has Captive Portal authentication enabled, the process is not started again. The results from the initial Captive Portal authentication process are used instead.
- If the **edge-profile-change** parameter is disabled, then the QoS policy list name returned from the RADIUS server or the list name specified with this command is applied instead.
- The QoS policy list to apply to Captive Portal authenticated devices is derived through one of the following methods:
  - The policy list name returned from the RADIUS server.
  - The policy list name specified with this command for the global Captive Portal configuration.
  - The policy list name specified in the UNP Edge profile returned from the RADIUS server.
  - The policy list name specified in the UNP Edge profile specified with this command for the global Captive Portal configuration.
- Devices connected to UNP ports initially undergo Layer 2 authentication and/or classification at the port level to determine an initial UNP Edge profile assignment. Then, based on the Edge profile settings, the user may be redirected for secondary authentication through the Captive Portal mechanism. Successful Captive Portal authentication can result in one of the following:
  - A QoS policy list name returned from the RADIUS server is applied.
  - If a policy list name is not returned from the server, the list name specified with this command is applied.
  - A UNP Edge profile name returned from the RADIUS server is applied.
  - If an Edge profile name is not returned from the server, the profile name specified through this command is applied.
- An Edge profile name returned from the RADIUS server takes precedence over the Edge profile name configured through this command.
- A successful Captive Portal authentication could result in the assignment of a new Edge profile, which may designate a different VLAN. This new VLAN assignment is functional only after a port bounce or pause timer operation is completed. Existing BYOD global commands are leveraged to configure port-bounce or pause-timer. The usage example is as given below.

Examples

```
-> captive-portal authentication-pass policy-list list1
-> captive-portal authentication-pass edge-profile edge1
-> captive-portal authentication-pass realm prefix domain asia-pacific policy-list
list2
-> captive-portal authentication-pass realm suffix domain north-america edge-
profile edge2
-> captive-portal authentication-pass edge-profile-change enable
-> captive-portal authentication-pass edge-profile-change disable
-> no captive-portal authentication-pass policy-list
-> no captive-portal authentication-pass edge-profile
-> no captive-portal authentication-pass realm suffix domain north-america
```

Release History

Release 8.1.1; command was introduced.
Release 8.2.1; **edge-profile** and **edge-profile-change** parameters added.

   alaDaCPortalUNPProfile
   alaDaCPortalUNPProfileChange
```

captive-portal-profile

Configures a Captive Portal profile that is used to define and apply a specific configuration to devices classified into an Edge profile to which the Captive Portal profile is assigned. This section describes the base command (**captive-portal-profile** *profile_name*) along with the other command keywords that are used to configure profile attributes that are applied when the Captive Portal profile is assigned to an Edge profile.

captive-portal-profile *profile_name*
[aaa-profile *aaa_profile_name***]**
[success-redirect-url *redirect_url***]**
[retry-count *retries***]**
[authentication-pass [realm {prefix | suffix} domain *domain_name***] {policy-list** *list_name* **| edge-profile** *profile_name* **| edge-profile-change {enable | disable}}]**

no captive-portal-profile *profile_name*

Syntax Definitions

profile_name	The name to assign to the Captive Portal profile (up to 32 characters).
aaa_profile_name	The name of an authentication, authorization, and accounting (AAA) profile to associate with the Captive Portal profile.
redirect_url	A URL (up to 63 characters) to which user devices are redirected after successful Captive Portal authentication.
retries	The number of login attempts allowed. The range is 1–99.
realm prefix	Specifies a prefix domain name (e.g., *domain_name*/user).
realm suffix	Specifies a suffix domain name (e.g., user@*domain_name*).
domain_name	The domain name for the user device.
list_name	The name of a QoS policy list to apply to the authenticated user device.
profile_name	The name of an existing UNP Edge profile.
enable	Applies the QoS policy list specified in the Edge profile to the user device.
disable	Does not apply the QoS policy list specified in the Edge profile.

Defaults

parameter	default
aaa_profile_name	none
redirect_url	none
retries	3
realm prefix | suffix	none
domain_name	none
list_name	none
profile_name	none
enable | disable	disabled

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the Captive Portal profile from the switch configuration.
- Creating a Captive Portal profile name with the base command (**captive-portal-profile** *profile_name*) is not required to configure a profile attribute value. If the profile name does not exist, the switch will automatically create the name specified when the attribute is configured. For example, the **unp captive-portal-profile cp-prof1 retry-count 5** command will create the "cp-prof1" profile if it does not already exist in the switch configuration.
- When a Captive Portal profile is applied to a UNP Edge profile, the parameter values defined in the profile override the global Captive Portal parameter values configured for the switch.
- A Captive Portal profile is only applied when Captive Portal authentication is enabled for the UNP Edge profile. If there is no Captive Portal profile associated with an Edge profile, then the global Captive Portal configuration is applied.
- Assigning an AAA profile to a Captive Portal profile defines specific AAA configuration options (such as RADIUS servers and RADIUS client attributes) that are used for Captive Portal authentication. If there is no AAA profile assigned, then the global AAA configuration is used.
- AAA profiles are configured using the **aaa profile** command. See the "AAA Commands" chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide* for more information.

Examples

```
-> captive-portal-profile cp-p1
-> captive-portal-profile cp-p1 aaa-profile aaa_p1
-> captive-portal-profile cp-p1 authentication-pass realm prefix domain asia-
pacific policy-list list1
-> no captive-portal-profile cp-p1 aaa-profile aaa_p1
-> no captive-portal-profile cp-p1

-> captive-portal-profile cp-p2 retry-count 5
-> captive-portal-profile cp-p2 authentication-pass edge-profile ep-1
-> captive-portal-profile cp-p2 authentication-pass edge-profile-change enable
```

```
-> captive-portal-profile cp-p2 success-redirect-url http://server-1.com/pass.html
-> captive-portal-profile cp-p2 authentication-pass edge-profile-change disable
-> no captive-portal-profile cp-p2 authentication-pass edge-profile
-> no captive-portal-profile cp-p2
```

Release History

```

captive-portal customization

Enables or disables the use of custom Web pages for Captive Portal authentication. When customization is enabled, Captive Portal presents Web pages stored in the “/flash/switch/captive_portal/custom_files/” directory on the switch. When customization is disabled, Captive Portal presents Web pages stored in the “/flash/switch/captive_portal/release_files/” directory on the switch.

captive-portal customization {enable | disable}

Syntax Definitions

enable	Displays custom web pages for Captive Portal authentication.
disable	Displays default web pages for Captive Portal authentication.

Defaults

By default, the web pages provided on the switch are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- To create custom Web pages, create a folder in the same path as the “release_files” folder and name the new folder “custom_files” (for example “/flash/switch/captive_portal/custom_files/”). Next, copy the “assets” and “templates” folders found under “/flash/switch/captive_portal/release_files/” to the “custom_files” folder. Modify the contents in the copied folders to create custom Web pages.
- The “release_files” folder is overwritten each time the switch reboots, so ***DO NOT*** modify the files in this folder for custom use.
- The folders "assets" and "templates" under the /flash/switch/captive_portal/custom_files/ directory are used to create and display Web pages to Captive Portal users when the switch reboots or at runtime when Captive Portal customization is enabled for the switch, if the “custom_files” folder exists.
- Anything in the custom "assets" folder is statically served by the internal Web server on the switch whenever they are requested. These pages are typically **.css** files, javascript files, or the acceptable use policy and are linked to files in the custom "templates" folder.
- The custom "templates" folder contains the Web pages that are dynamically served to users depending on the Captive Portal state of each user. The file names in this folder must not be changed. The login form field names and form action in these pages must not be changed. The variables in these pages, as denoted by "<?=$(name)?>”, are substituted in place by the internal Web server.

Examples

```
-> captive-portal customization enable
-> captive-portal customization disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show captive-portal configuration	Displays the global Captive Portal configuration for the switch.

MIB Objects

```
alaDaCPortalGlobalConfig
   alaDaCPortalCustomization
```

show captive-portal configuration

Displays the global Captive Portal parameter settings configured for the switch.

show captive-portal configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Currently only the internal (Web server on the switch) Captive Portal mode is configurable for the switch. An external Captive Portal operation is provided through interaction with the ClearPass Policy Manager (CPPM) as part of the OmniSwitch BYOD solution.
- The parameter values configured and applied through a Captive Portal profile override any values set through the global Captive Portal configuration. A Captive Portal profile is associated with a UNP Edge profile and is applied to devices classified into that profile.

Examples

```
-> show captive-portal configuration

Captive Portal Global Configuration:

  Captive Portal Mode                  = Internal
  Captive Portal IP address            = 1.1.1.3
  Captive Portal Redirect String       = captive-portal.com
  Captive Portal Success Redirect URL  =
  Captive Portal Proxy Server Port     = 8080
  Captive Portal Retry Count           = 3
  Captive Portal Global Auth Policy List=
  Captive Portal Page Customization    = Disable
  Captive Portal Edge Profile Name     =
  Captive Portal Edge Profile Change   = Disable
  Domain Specific Policy Lists:
            Domain             |  Realm |          Policy List
-------------------------------|--------|-------------------------------
```

output definitions

Captive Portal Mode	The Captive Portal mode of operation. Only internal mode (Web server on the OmniSwitch) is supported at this time.
Captive Portal IP address	The internal Captive Portal IP address for the switch. Configured through the **captive-portal ip-address** command.
Captive Portal Redirect String	The name of the redirect URL that is used for accessing a public certificate. Configured through the **captive-portal name** command.
Captive Portal Success Redirect URL	The URL of a specific site to which a user is redirected after a successful Captive Portal authentication. Configured through the **captive-portal success-redirect-url** command.
Captive Portal Proxy Server Port	The proxy server port to use for Captive Portal. Configured through the **captive-portal proxy-server-port** command.
Captive Portal Retry Count	The number of times a device can try to login before Captive Portal determines that authentication for that device has failed. Configured through the **captive-portal retry-count** command.
Captive Portal Global Auth Policy List	The name of a QoS policy list for the global Captive Portal configuration. The specified list is applied to each device that passes Captive Portal authentication. Configured through the **captive-portal authentication-pass** command.
Captive Portal Page Customization	The status of Captive Portal page customization (**Enable** or **Disable**). When enabled, custom Web pages are presented to the user from the "/flash/switch/captive_portal/custom_files/" location on the switch. Configured through the **captive-portal customization** command.
Captive Portal Edge Profile Name	The name of a UNP Edge profile for the global Captive Portal configuration. The specified profile is applied to each device that passes Captive Portal authentication. Configured through the **captive-portal authentication-pass** command.
Captive Portal Edge Profile Change	The status of Edge profile change (**Enable** or **Disable**). When enabled, the Edge profile initially assigned to the Captive Portal user is changed to the profile derived through successful Captive Portal authentication. Configured through the **captive-portal authentication-pass** command.
Domain Specific Policy Lists:	A list of QoS policy list names and the associated domain criteria for each list name. The policy list is applied when the domain for a Captive Portal authenticated user device matches the domain criteria associated with the list.
Domain	The domain name associated with the domain specific policy list. Configured through the **captive-portal authentication-pass** command.
Realm	The realm of the domain name (**prefix** or **suffix**) associated with the domain specific policy list. The realm identifies the domain name as a prefix (*domain-name*/user) or as a suffix (user@*domain-name*). Configured through the **captive-portal authentication-pass** command.
Policy List	The name of the policy list that is applied when the domain of a Captive Portal authenticated user device matches the domain criteria associated with the list name. Configured through the **captive-portal authentication-pass** command.

Release History

Release 8.1.1; command was introduced.

show captive-portal {profile-names | profile-name *profile_name* **configuration}**

Syntax Definitions

profile-names	Displays a list of configured Captive Portal profiles.
profile-name *profile_name* **configuration**	Displays the Captive Portal parameter configuration for the specified profile.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The parameter values configured and applied through a Captive Portal profile override any values set through the global Captive Portal configuration.
- Currently only the internal (Web server on the switch) Captive Portal mode is configurable for the switch. An external Captive Portal operation is provided through interaction with the ClearPass Policy Manager (CPPM) as part of the OmniSwitch BYOD solution.

Examples

```
-> show captive-portal profile-names

      Captive Portal Profile Names
---------------------------------------
1. cp1
2. cp2
3. cp3

-> show captive-portal profile-name cp1 configuration

Captive Portal Profile cp1 Configuration:

  Captive Portal Mode                   = Internal
  Captive Portal AAA Profile Name       =
  Captive Portal Success Redirect URL   =
  Captive Portal Retry Count            = 3
  Captive Portal Global Auth Policy List =
  Domain Specific Policy Lists:
            Domain             |  Realm |          Policy List
-------------------------------|--------|-------------------------------
```

output definitions

Captive Portal Mode	The Captive Portal mode of operation. Only internal mode (Web server on the OmniSwitch) is supported at this time.
Captive Portal AAA Profile Name	The name of an authentication, authorization, and accounting (AAA) profile associated with the Captive Portal profile.
Captive Portal Success Redirect URL	The URL of a specific site to which a user is redirected after a successful Captive Portal authentication.
Captive Portal Retry Count	The number of times a device can try to login before Captive Portal determines that authentication for that device has failed.
Captive Portal Global Auth Policy List	The name of a QoS policy list for the global Captive Portal configuration. The specified list is applied to each device that passes Captive Portal authentication.
Domain Specific Policy Lists:	A list of QoS policy list names and the associated domain criteria for each list name. The policy list is applied when the domain for a Captive Portal authenticated user device matches the domain criteria associated with the list.
Domain	The domain name associated with the domain specific policy list.
Realm	The realm of the domain name (**prefix** or **suffix**) associated with the domain specific policy list. The realm identifies the domain name as a prefix (*domain-name*/user) or as a suffix (user@*domain-name*).
Policy List	The name of the policy list that is applied when the domain of a Captive Portal authenticated user device matches the domain criteria associated with the list name.

qmr quarantine path

Specifies the URL for a remediation server. This information is used by the Quarantine Manager and Remediation (QMR) application. A quarantined user is redirected to a remediation server to correct the condition that put the user into a quarantined state.

qmr quarantine path *url*

no qmr quarantine path

Syntax Definitions

url	The URL for the QMR remediation server.

Defaults

By default, no URL is configured.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to remove the remediation server URL from the configuration.
- Make sure to add the corresponding IP address for the remediation server to the QMR list of exception subnets configured through the **qmr quarantine allowed-name** command.
- Configuring the URL *and* adding the server IP address to the allowed list is required to redirect quarantined MAC addresses to the remediation server.

Examples

```
-> qos quarantine path www.remediate.com
-> no quarantine path
```

Release History

Release 8.1.1; command was introduced.

Related Commands

qmr quarantine page	Configures whether or not QMR will send a “Quarantined” page to a user when a remediation server is not configured.
qmr quarantine allowed-name	Configures a list of IP addresses to which a restricted quarantined user can access.
qmr quarantine custom-proxy	Configures the HTTP proxy port number that is used to redirect traffic from a quarantined device.
qos quarantine mac-group	Configures the name of the Quarantine MAC address group.
show qmr	Displays the Access Guardian QMR configuration.
show quarantine mac group	Displays the contents of the QoS quarantined MAC address group.

MIB Objects

```
alaDaQMRGlobalConfig
   alaDaQMRPath
```

qmr quarantine page

Configures the QMR application to send a “Quarantined” page to a client if a remediation server is not configured. This page is used to notify the client that QMR has quarantined the client.

qmr qos quarantine page {enable | disable}

Syntax Definitions

enable	Enables the sending of a “Quarantined” page to the client.
disable	Disables the sending of a “Quarantined” page to the client.

Defaults

By default, no “Quarantined” page is sent to the client.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

A “Quarantined” page is only sent if a remediation server path was not configured for QMR. Note that even if the remediation server is not active, QMR will not send the page as long as there is a value set for the remediation server path.

Examples

```
-> qmr quarantine page enable
-> qmr quarantine page disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

qmr quarantine path	Specifies the URL for a remediation server.
qmr quarantine allowed-name	Configures a list of IP addresses to which a restricted quarantined user can access.
qmr quarantine custom-proxy	Configures the HTTP proxy port number that is used to redirect traffic from a quarantined device.
qos quarantine mac-group	Configures the name of the Quarantine MAC address group.
show qmr	Displays the Access Guardian QMR configuration.
show quarantine mac group	Displays the contents of the QoS quarantined MAC address group.

MIB Objects

```
alaDaQMRGlobalConfig
   alaDaQMRPage
```

qmr quarantine allowed-name

Configures a list of IP addresses that a restricted quarantined user is allowed to access.

qmr quarantine allowed-name *name* **ip-address** *ip_address* **[ip-mask** *ip_mask***]**

no qmr quarantine allowed-name *name*

Syntax Definitions

name	Specify a name to assign to the allowed IP network address.
ip_address	An IPv4 network address (for example, 10.0.0.0, 171.15.0.0, or 196.190.254.0).
ip_mask	A valid IP address mask for the allowed IP network address (for example, 255.0.0.0 or 255.255.0.0)

Defaults

By default, no IP addresses are configured as QMR allowed addresses.

parameter	default
ip_mask	IP address class

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an IP address from the allowed list.
- A maximum of three allowed IP addresses is supported.
- Make sure the IP address of the QMR remediation server is configured as an allowed IP address. A quarantined user is redirected to a remediation server to correct the condition that put the user into a quarantined state.

Examples

```
-> qmr quarantine allowed-name server2 ip-address 10.0.0.20 ip-mask 255.0.0.0
-> no qmr quarantine allowed-name server2
```

Release History

Release 8.1.1; command was introduced.

Related Commands

qmr quarantine path	Specifies the URL for a remediation server.
qmr quarantine page	Configures whether or not QMR will send a “Quarantined” page to a user when a remediation server is not configured.
qmr quarantine custom-proxy	Configures the HTTP proxy port number that is used to redirect traffic from a quarantined device.
qos quarantine mac-group	Configures the name of the Quarantine MAC address group.
show qmr	Displays the Access Guardian QMR configuration.
show quarantine mac group	Displays the contents of the QoS quarantined MAC address group.

MIB Objects

```
alaDaQMRAllowedTable
   alaDaQMRAllowedName
   alaDaQMRAllowedIpAddr
   alaDaQMRAllowedIpMask
```

qmr quarantine custom-proxy

Configures the HTTP proxy port number to which quarantined traffic is redirected for remediation.

qmr quarantine custom-proxy *proxy_port*

no qmr quarantine custom-proxy

Syntax Definitions

proxy_port	The HTTP proxy port number. The valid range is 1025–65535.

Defaults

By default, the redirect proxy port number is set to 8080.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to set the proxy port number back to 8080 (the default).
- Setting the custom proxy to “0” also reverts the proxy port number back to 8080 (the default).

Examples

```
-> qmr quarantined custom-proxy 8887
-> qmr quarantined custom-proxy 0
-> no qmr quarantined custom-proxy
```

Release History

Release 8.1.1; command was introduced.

Related Commands

qmr quarantine path	Specifies the URL for a remediation server.
qmr quarantine page	Configures whether or not QMR will send a “Quarantined” page to a user when a remediation server is not configured.
qmr quarantine allowed-name	Configures a list of IP addresses to which a restricted quarantined user can access.

MIB Objects

```
alaDaQMRGlobalConfig
  alaDaQMRCustomHttpProxyPort
```

show qmr

Displays the Quarantine Manager and Remediation (QMR) configuration for the switch.

show qmr

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

QMR is an OmniSwitch application that interacts with the OmniVista Quarantine Manager (OVQM) application to restrict the network access of quarantined clients and provide a remediation path for such clients to regain their network access. This command displays the OmniSwitch QMR configuration.

Examples

```
-> show qmr

Quarantine Mac Group Name    : Quarantine,
Allowed IP Subnets           : IT-HD 135.254.1.10 /255.255.255.248,
                               oss-lan 10.1.1.0 /255.255.255.0,
                               rem-ser 135.254.200.0 /255.255.255.0,
Custom Proxy port            : 8888,
Quarantine Path              : www.remediation-server.alu.com,
Quarantine Page              : enabled,
```

output definitions

Quarantine MAC Group Name	The name of the QoS Quarantine MAC address group. Configured through the **qos quarantine mac-group** command.
Allowed IP Subnets	A list of IP network addresses that devices can still access while in a quarantined state. Configured through the **qmr quarantine allowed-name** command.
Custom Proxy port	The HTTP proxy port number used for redirection of HTTP traffic from quarantined devices. Configured through the **qmr quarantine custom-proxy** command.

output definitions

Quarantine Path	The URL of a remediation server to which a device is redirected when the device is quarantined. Configured through the **qmr quarantine path** command.
Quarantine Page	Whether or not QMR sends a “Quarantined” page notification to a quarantined user when there is no remediation server configuration. Configured through the **qmr quarantine page** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

show quarantine mac group	Displays the contents of the QoS Quarantine MAC address group.

MIB Objects

   alaDaQMRAllowedIpMask
alaDaQMRGlobalConfig
   alaDaQMRCustomHttpProxyPort
   alaDaQMRPath
   alaDaQMRPage
```

show quarantine mac group

Displays the contents of the QoS Quarantine MAC address group.

show quarantine mace group

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The QoS MAC address group contains the MAC addresses of clients that the OmniVista Quarantine Manager (OVQM) application has quarantined. This command displays the quarantined MAC addresses that belong to this group.

Examples

```
-> show quarantine mac group

Group Name    : Quarantine,
Number of MACs quarantined    : 11,
00:00:00:11:11:1b,
00:00:00:11:11:1a,
00:00:00:11:11:19,
00:00:00:11:11:18,
00:00:00:11:11:17,
00:00:00:11:11:16,
00:00:00:11:11:15,
00:00:00:11:11:14,

00:00:00:11:11:12,
00:00:00:11:11:11,
```

Release History

Release 8.1.1; command was introduced.

Related Commands

qos quarantine mac-group	Configures the name of the QoS Quarantine MAC address group.

MIB Objects

N/A

mdns-relay

Enables or disables the Multicast Domain Name System (mDNS) relay on the switch.

mdns-relay {enable | disable}

Syntax Definitions

enable	Enables mDNS relay.
disable	Disables mDNS relay.

Defaults

The MDNS relay feature is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A GRE tunnel interface must be associated with the mDNS tunnel relay before mDNS can be enabled.
- When MDNS relay is disabled on the switch, mDNS packets are handled in the same manner as conventional packets.

Example

```
-> mdns-relay enable
-> mdns-relay disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

mdns-relay tunnel	Associates a GRE tunnel interface with the mDNS relay feature.
show mdns-relay config	Displays the mDNS relay configuration.

MIB Objects

```
iphelperMIB
   alaMdnsAdminStatus
```

mdns-relay tunnel

Associates a GRE tunneling interface for the Multicast DNS (mDNS) relay feature.

mdns-relay tunnel *ip-interface-name*

no mdns-relay tunnel *ip-interface-name*

Syntax Definitions

ip-interface-name	The name of an existing IP GRE tunnel interface to associate with the mDNS tunnel relay.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the associated GRE tunnel interface.
- Configure the GRE tunnel interface before attempting to associate the interface with the mDNS tunnel relay. An IP address is required to bring the interface up; if necessary, specify a dummy IP address when configuring the interface.
- Only a Layer 2 GRE Tunnel interface is supported.
- GRE Tunneling is supported only for IPv4 frames.
- To change the GRE tunnel interface, execute the command with the new existing IP interface name.

Example

```
-> mdns-relay tunnel Payroll
-> no mdns-relay tunnel Payroll
```

Release History

Release 8.1.1; command introduced.

Related Commands

ip interface tunnel	Configures a GRE tunnel interface.
mdns-relay	Enables or disables mDNS tunnel relay for the switch.
show mdns-relay config	Displays the mDNS relay configuration.

MIB Objects

```
iphelperMIB
   alaMdnsGreTunnelName
```

show mdns-relay config

Displays the mDNS relay configuration.

show mdns-relay config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Example

```
-> show mdns-relay config
mdns-relay admin status       : disabled
mdns-relay tunnel interface   : byod_dev
mdns-relay operational status : down
```

output definitions

mdns-relay admin status	The mDNS relay administrative status (**enabled** or **disabled**).
mdns-relay tunnel interface	The GRE tunnel interface name for the mDNS relay feature.
mdns-relay operational status	The mDNS relay operational status (**up** or **down**).

Release History

Release 8.1.1; command introduced.

Related Commands

mdns-relay	Enables or disables mDNS tunnel relay for the switch.
mdns-relay tunnel	Associates a GRE tunnel interface with the mDNS relay feature.

MIB Objects

```
iphelperMIB
   alaMdnsAdminStatus
   alaMdnsGreTunnelName
```

ssdp-relay

Enables or disables the Simple Service Discovery Protocol (SSDP) relay on the switch. SSDP relay enables the OmniSwitch to allow non-Apple devices to discover services with minimal configuration by the administrator.

ssdp-relay {enable | disable}

Syntax Definitions

enable	Enables SSDP relay.
disable	Disables SSDP relay.

Defaults

The SSDP relay feature is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A GRE tunnel interface must be configured specifically for the SSDP feature before SSDP relay can be enabled.
- The Digital Living Network Alliance (DLNA) uses Universal Plug and Play (UPnP) for media management, discovery, and control. DLNA/UPNP uses SSDP to discover services, similar to how Bonjour uses mDNS for the same. All the SSDP packets coming in on an OmniSwitch are intercepted and tunneled through the GRE tunnel to the WLAN controller (acting as a gateway).
- When SSDP relay is disabled on the switch, SSDP packets are handled in the same manner as conventional packets.

Example

```
-> ssdp-relay enable
-> ssdp-relay disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

ssdp-relay tunnel	Associates a GRE tunnel interface with the SSDP relay feature.
show ssdp-relay config	Displays the SSDP relay configuration.

MIB Objects

```
iphelperMIB
   alaSsdpAdminStatus
```

ssdp-relay tunnel

Assigns a GRE tunneling interface for the Simple Service Discovery Protocol (SSDP) relay feature. The GRE tunnel is setup between the switch and a WLAN controller to tunnel SSDP frames.

ssdp-relay tunnel *ip_interface_name*

no ssdp-relay tunnel *ip_interface_name*

Syntax Definitions

ip_interface_name	The name of an existing IP GRE tunnel interface to associate with the SSDP tunnel relay.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the associated GRE tunnel interface.
- Configure the GRE tunnel interface before attempting to associate the interface with the SSDP tunnel relay. An IP address is required to bring the interface up; use the IP address of the wireless controller as the destination IP address for the GRE tunnel.
- Only a Layer 2 GRE Tunnel interface is supported.
- GRE Tunneling is supported only for IPv4 frames.
- To change the GRE tunnel interface, use this command again with a new existing IP interface name.

Example

```
-> ssdp-relay tunnel “SSDP Relay Tunnel”
-> no ssdp-relay tunnel “SSDP Relay Tunnel”
```

Release History

Release 8.2.1; command introduced.

Related Commands

ip interface tunnel	Configures a GRE tunnel interface.
ssdp-relay	Enables or disables SSDP tunnel relay for the switch.
show ssdp-relay config	Displays the SSDP relay configuration.

MIB Objects

```
iphelperMIB
   alaSsdpGreTunnelName
```

show ssdp-relay config

Displays the Simple Service Discovery Protocol (SSDP) relay configuration.

show ssdp-relay config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Example

```
-> show ssdp-relay config
ssdp-relay admin status       : disabled,
ssdp-relay tunnel interface   : byod_dev,
ssdp-relay operational status : down
```

output definitions

ssdp-relay admin status	The SSDP relay administrative status (**enabled** or **disabled**).
ssdp-relay tunnel interface	The GRE tunnel interface name associated with the SSDP relay feature.
ssdp-relay operational status	The SSDP relay operational status (**up** or **down**).

Release History

Release 8.2.1; command introduced.

Related Commands

ssdp-relay	Enables or disables SSDP tunnel relay for the switch.
ssdp-relay tunnel	Associates a GRE tunnel interface with the SSDP relay feature.

37 Application Monitoring and Enforcement Commands

Application usage patterns in the enterprise network is changing with the increase in use of the social networking, browser based file sharing, and peer to peer applications. The use of these applications result in the new traffic patterns in the network that are not straightforward to distinguish. There is also an increase in consumerization of IT with multiplication of thin clients, HTTP based, and virtual desktop clients.

OmniSwitch Application Monitoring and Enforcement (AppMon) feature addresses the key challenges of real time classification of flows at application level by providing differential QoS treatment in the form of higher priority marking and security policies at application level. AppMon feature improves the quality of user experience through application aware network optimization and control.

Note. AppMon is supported in a virtual chassis of OmniSwitch 6860 and OmniSwitch 6860E platforms where at least one OmniSwitch 6860E is mandatory for the feature to work.

MIB information for the AppMon commands is as follows:

Filename: ALCATEL-IND1-APP-MON-MIB.mib
Module: alaAppMonMIB

A summary of the available commands is listed here:

app-mon admin-state
app-mon port admin-state
app-mon auto-group create
app-mon app-group
app-mon app-list
app-mon apply
app-mon l3-mode
app-mon l4-mode
app-mon l4port-exclude
app-mon flow-table flush
app-mon flow-table enforcement stats
app-mon aging enforcement
app-mon logging-threshold
app-mon flow-sync enforcement interval
app-mon force-flow-sync
show app-mon config
show app-mon port
show app-mon app-pool
show app-mon app-list
show app-mon app-group
show app-mon app-record
show app-mon ipv4-flow-table
show app-mon ipv6-flow-table
show app-mon l4port-exclude
show app-mon stats
show app-mon aging enforcement
show app-mon vc-topology
clear app-mon app-list

app-mon admin-state

Enable or disable the Application Monitoring and Enforcement (AppMon) feature.

app-mon admin-state {enable | disable}

Syntax Definitions

enable	Enables AppMon support on the switch.
disable	Disables AppMon support on the switch.

Defaults

By default, AppMon is disabled on the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- AppMon cannot be enabled globally when,
  - all the mirroring sessions are used by port mirroring or monitoring features.
  - mirroring session is used by policy manager.
- When AppMon is enabled globally, it reserves a mirroring session in the system.
- If AppMon functionality is enabled at a port level, disabling AppMon globally overrides the functionality of all AppMon ports; however, configuration on the ports remain the same.

Examples

```
-> app-mon admin-state enable
-> app-mon admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon port admin-state	Enable or disable AppMon on one or more switch ports.
show app-mon config	Displays global AppMon configuration, which includes information about admin-state, running mode, IP mode, aging-timer, and total signatures.

MIB Objects

`alaAppMonAdminStatus`

app-mon port admin-state

Enable or disable AppMon Monitoring and Enforcement on one or more switch ports.

app-mon {port *chassis/slot/port***[**-*port2***] | slot** *chassis/slot* **[**-*slot***]} admin-state {enable | disable}**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis/slot	The chassis ID and slot number (3/1) for a specific slot.
enable	Enables AppMon on the port.
disable	Disables AppMon on the port.

Defaults

By default, AppMon is disabled on all ports.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- It is mandatory to enable AppMon globally for the port level AppMon to function.
- When slot option is used, then AppMon configuration is applied on all the physical ports of that particular slot.
- AppMon configuration is not allowed on Virtual Fabric Link ports.
- AppMon cannot be configured on a port that is part of a link aggregate or a port mirroring port.
- AppMon must not be configured on user ports and uplink ports at the same time.

Examples

```
-> app-mon slot 1/1 admin-state enable
-> app-mon port 1/1/2-5 admin-state enable
-> app-mon slot 1/1 admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon admin-state	Enable or disable the Application Monitoring feature.
show app-mon port	Displays AppMon status per physical port or per slot for the switch.

MIB Objects

```
alaAppMonPortConfigTable
   alaAppMonPortConfigSlotPortIndex
   alaAppMonPortConfigPortStatus
```

app-mon auto-group create

Creates application groups automatically on the switch. The application groups are automatically created based on the ‘category' field of each application present in the application pool.

app-mon auto-group create

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Modifications are allowed in auto application groups with addition or deletion of applications using the **app-mon app-group** command.
- Enter **app-mon apply** and **write memory** to save the auto group configuration or modification on the switch.
- The **show app-mon app-pool** command displays the application categories in the signature file. The application group names are derived from the category name.

Examples

```
-> app-mon auto-group create
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon apply	Updates the set of application signatures configured for application monitoring.
show app-mon app-group	Displays the details of all the applications in an application group.
show app-mon app-pool	Displays all the applications that are part of an application pool.

MIB Objects

```
alaAppMonAutoGroupCreation
```

app-mon app-group

Creates an application group. Applications can be added or removed from the application group.

app-mon app-group *app_group_name* **{add | remove} {app-name** *app_name* **| from** *app_name* **to** *app_name***}**

no app-mon app-group *app_group_name*

Syntax Definitions

app_group_name	Name of the application group. The group name can be a maximum of 32 alphanumeric characters.
app_name	The name of the application to be added to the application group. The application name can be a maximum of 32 alphanumeric characters.
from *app_name*	The first application name when adding a range of applications to an application group.
to *app_name*	The last application name when adding a range of applications to an application group.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an application group.
- This command can be used to add or delete applications for the auto application groups as well.
- One application can belong to more than one application group.
- Only those applications that are part of an application pool are allowed to be added to an application group.
- To add a range of applications or multiple applications to an application group, use the **from** and **to** options. Range is expanded based on the list of applications in the app-pool list (application pool). Use the **show app-mon app-pool** command to view the application names.
- If an application is removed from an application group which has only one application, then the complete application group is removed.
- If any application is added to a user group (group name same name as category name), and signature toolkit update operation or 'app-mon auto-group create' is done, then added group is not deleted. Only update happens.
- If an application group contains a single application and the group is part of an application list, then this single application cannot be removed from the application group.
- An application group cannot be deleted when it is part of an application list.

- When the last application from the application group is removed, the application group is automatically deleted.
- The list of applications (added or deleted) to an application group is displayed in **show configuration snapshot** command after **app-mon apply** command is entered. A list of applications (added or deleted) are displayed with the **show app-mon app-group** command even without using the **app-mon apply** command.

Examples

```
-> app-mon app-group apg2 add app-name whatsapp
-> app-mon app-group apg2 remove app-name whatsapp
-> no app-mon app-group apg2
```

To add a range of applications or multiple applications to an application group, use the **show app-mon app-pool** command to view the application names. For example:

```
-> show app-mon app-pool
Legend: Application-name: *= Not present in recently updated kit,
 AppId       Application-name             Revision       Category
-------+--------------------------------+-----------+----------------
968           amazon                        1.0.0         Web
244           facebook                      1.0.0         Web
182           sip                           1.0.0         Audio/Video
183           skype                         1.1.0         Instant Messaging
211           tftp                          1.0.0         File Server
503           twitter                       1.0.0         Web
597           viber                         1.0.0         Audio/Video
890           webex                         1.0.0         Audio/Video
1093          whatsapp                      1.0.0         Instant Messaging
240           youtube                       1.0.0         Web
--------------------------------
Number of Applications: 10
```

Select any two applications for the range option using the **app-mon app-group** command.

```
-> app-mon app-group apg1 add from sip to viber
```

This command adds the applications from sip to viber to the application group (sip, skype, tftp, twitter, and viber).

If an application is removed from an application group which has only one application, then the complete application group is removed. For example:

```
-> show app-mon app-group group1
AppGrp-Id   App-group                        App-name
----------+------------------------------+--------------------------
1093         whatsapp                      Instant Messaging
```

Now, remove the application name ‘whatsapp’ from the application group. The complete application group gets removed as shown below.

```
-> app-mon app-group group1 remove app-name whatsapp
-> show app-mon app-group group1
AppGrp-Id   App-group                        App-name
----------+--------------------------------+--------------------------
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon apply	Updates the set of application signatures configured for application monitoring.
show app-mon app-group	Displays the details of all the applications in an application group.
show app-mon app-list	Displays a list of applications and application groups added to an application list.
show app-mon app-pool	Displays all the applications that are part of an application pool.

MIB Objects

```
alaAppMonAppGroupTable
   alaAppMonAppGroupName
   alaAppMonAppGroupMember
   alaAppMonAppGroupStatus
   alaAppMonAppGrpFromAppName
   alaAppMonAppGrpToAppName
   alaAppMonAddAppGrpName
   alaAppMonAppGroupBuiltIn
   alaAppMonAppGroupCategoryName
   alaAppMonAppGrpId
   alaAppMonAppGroupAppStatus
```

app-mon app-list

Add or remove applications or application groups to an application list for enforcement or monitoring.

app-mon app-list {enforcement | monitor} {add | remove} {app-name *app_name* **| app-group** *app_group_name***}**

Syntax Definitions

add	Adds the specified application or application group to an application list.
remove	Removes the specified application or application group from an application list.
app_name	Name of the application to be added to the application list. This adds the specified application to the application list.
app_group_name	Name of the application group to be added to the application list. This enables the addition of multiple applications in the application group to the application list.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The application group can be user created or generated automatically (see **app-mon app-group** and **app-mon auto-group create** command).
- Separate application list is maintained for enforcement and monitoring.
- The **show configuration snapshot** command displays the applications added or removed from the application list only after the **app-mon apply** command is used. The **app-mon apply** command saves the list of applications added or removed to the application list. The saved list of applications are displayed with the **show app-mon app-list active** command.
- QoS policy rules can be configured for a given application as well as an application group where the same application also exists. QoS matches policies based on the application-name or application-group name configured in an application list. For more information on configuring enforcement for QoS policy rules, see the "**QoS Policy Commands**" chapter.

Examples

```
-> app-mon app-list enforcement add app-name whatsapp
-> app-mon app-list enforcement add app-group apg1
-> app-mon app-list monitor add app-group apg2
-> app-mon app-list enforcement remove app-name whatsapp
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon auto-group create	Enables or disables Auto-Group functionality on the switch.
app-mon app-group	Creates an application group. Applications can be added or removed from the application group.
show app-mon app-list	Displays list of applications and application groups added to an application list.
clear app-mon app-list	Removes all applications signatures from the application list.

MIB Objects

```
alaAppMonAppListTable
   alaAppMonAppListMemberName
   alaAppMonAppListMemberType
   alaAppMonAppListMemberStatus
   alaAppMonAppListAppId
   alaAppMonAppListAppStatus
```

app-mon apply

This activates both enforcement and monitoring application lists for flow classification.

app-mon apply

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The following operations are performed with the **app-mon apply** command:

- Saves the current application-list, application-group, and auto-groups to flash when 'write memory' command is used.
- The application list is checked for any application configured more than once in an application list (individually or as a part of application group).
  - The **app-mon apply** command will not be successful until the conflict is resolved.
  - The **show app-mon app-list** command with the **monitor conflict** or the **enforcement conflict** parameter displays the available conflicts in an application list.
  - The duplicate application names must be removed for a successful **app-mon apply** operation.
- QoS is applied to the flows learned for the activated applications based on the configured QoS policies for Enforcement application list.

Examples

```
-> app-mon apply
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon config	Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.
show app-mon port	Displays AppMon status per physical port or per slot for the switch.
show app-mon app-list	Displays a list of applications and application groups added to an application list.

MIB Objects

```
alaAppMonUpdateAppList
```

app-mon l3-mode

Enables or disables monitoring and enforcement for IPv4 flows, IPv6 flows, or both.

app-mon l3-mode {ipv4 | ipv6} admin-state {enable | disable}

Syntax Definitions

IPv4	Applies monitoring and enforcement to IPv4 flows.
IPv6	Applies monitoring and enforcement to IPv6 flows.
enable	Enables the specified L3 mode on the switch.
disable	Disables the specified L3 mode on the switch.

Defaults

By default, monitoring and enforcement is enabled for both IPv4 and IPv6 flows.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> app-mon l3-mode ipv4 admin-state disable
-> app-mon l3-mode ipv4 admin-state enable
-> app-mon l3-mode ipv6 admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon ipv4-flow-table	Displays the flow table for IPv4 flows entries for enforcement and monitor flows.
show app-mon ipv6-flow-table	Displays the flow table for IPv6 flows entries for enforcement and monitor flows.
show app-mon config	Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.

MIB Objects

```
alaAppMonEnforcementIpv4
alaAppMonEnforcementIpv6
```

app-mon l4-mode

Enables or disables monitoring and enforcement for TCP or UDP flows.

app-mon {port *chassis/slot/port***[-***port2***] | slot** *chassis/slot***} l4-mode {tcp | udp} admin-state {enable | disable}**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis/slot	The chassis ID and slot number (3/1) for a specific slot.
tcp	Applies monitoring and enforcement to TCP flows.
udp	Applies monitoring and enforcement to UDP flows.
enable	Enables the specified L4 mode on the switch.
disable	Disables the specified L4 mode on the switch.

Defaults

By default, both TCP and UDP flows are processed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> app-mon port 1/1/2 l4-mode udp admin-state disable
-> app-mon slot 1/1 l4-mode tcp admin-state enable
-> app-mon port 1/1/2 l4-mode udp admin-state enable
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon l4port-exclude	Configures the L4 port range to exclude from the AppMon operation.
show app-mon ipv4-flow-table	Displays the flow table for IPv4 flows entries for enforcement and monitor flows.
show app-mon ipv6-flow-table	Displays the flow table for IPv6 flows entries for enforcement and monitor flows.
show app-mon config	Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.

MIB Objects

```
alaAppMonPortConfigTable
   alaAppMonPortConfigSlotPortIndex
   alaAppMonEnforcementPortConfigTcpStatus
   alaAppMonEnforcementPortConfigUdpStatus
```

app-mon l4port-exclude

Configures the L4 port range to exclude from the AppMon operation.

app-mon l4port-exclude range-id *number* **{tcp-service-port | udp-port} start** *number* **end** *number*

no app-mon l4port-exclude range-id

Syntax Definitions

range-id *number*	The range ID number. The valid range is 1–8.
tcp-service-port	Specifies TCP service ports.
udp-port	Specifies UDP ports.
start *number*	The first port associated with the range ID number. The valid port range is 1–65535.
end *number*	The last port associated with the range ID number. The valid port range is 1–65535.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an L4 exclude range ID from the switch configuration.
- For the **udp-port** option, the AppMon operation is not performed on the flows with a source or destination port that is in the excluded port range.
- For the **tcp-service-port** option, the AppMon operation is not performed on the flows with a destination TCP port of TCP-SYN packet or a source TCP port of TCP-SYN-ACK packet that is in the excluded port range.
- This configuration applies to both enforcement and monitor features.

Examples

```
-> app-mon l4port-exclude range-id 5 tcp-service-port start 20 end 30
-> app-mon l4port-exclude range-id 6 udp-port start 90 end 100
-> no app-mon l4port-exclude range-id 6
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon l4port-exclude Displays the port range excluded from AppMon operation.

MIB Objects

```
alaAppMonEnforcementL4PortRangeTable
   alaAppMonEnforcementL4PortRangeStart
   alaAppMonEnforcementL4PortRangeEnd
   alaAppMonEnforcementL4PortType
   alaAppMonEnforcementL4PortStatus
```

app-mon flow-table flush

Clears all the learned flow-table entries for both IPv4 and IPv6 flow tables.

app-mon flow-table {enforcement | monitor} flush

Syntax Definitions

enforcement	Flushes all the learned flow-table entries from the enforcement application.
monitor	Flushes all the learned flow-table entries from the monitor application.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the **enforcement** option is used, all the active flows information are cleared; no QoS treatment is provided (if configured). The data (active, gross counters, statistics, and flow information) in the following commands are cleared: **show app-mon app-list enforcement active**, **show app-mon app-list enforcement active stats**, **show app-mon ipv4-flow-table enforcement**, **show app-mon ipv6-flow-table enforcement**, **show app-mon stats**.
- When the **monitor** option is used, all the learned flows information will be cleared. The data (gross counters and flow information) in the following commands are cleared: **show app-mon app-list monitor active**, **show app-mon ipv4-flow-table monitor**, **show app-mon ipv6-flow-table monitor**.
- When this command is used, application-record information is not cleared.

Examples

```
-> app-mon flow-table enforcement flush
-> app-mon flow-table monitor flush
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon config	Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.
show app-mon app-list	Displays a list of applications and application groups added to an application list. ‘stats’ option in this command displays active or gross packets/byte counters on per application basis.
show app-mon ipv4-flow-table	Displays the flow table for IPv4 flows entries for enforcement and monitor flows.
show app-mon ipv6-flow-table	Displays the flow table for IPv6 flows entries for enforcement and monitor flows.

MIB Objects

```
alaAppMonFlowTableFlush
```

app-mon flow-table enforcement stats

Enable or disable flow table statistics update for enforcement applications.

app-mon flow-table enforcement stats admin-state {enable | disable}

Syntax Definitions

enable	Enable flow-table statistics update.
disable	Disable flow-table statistics update.

Defaults

By default, statistics admin status is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is applicable only for enforcement applications.
- The statistics collection capability is shared with Service Manager, which means that either the Service Manager feature or AppMon can use this capability at any given time. Hence, disabling the counter usage in Service Manager using the **service stats disable** command is required to view the flow table statistics update for enforcement applications. For more information about this command, see the "Service Manager Commands" chapter in the *OmniSwitch AOS Release 8 CLI Reference Guide*.
- When update statistics is enabled, the updated statistics is displayed in the **show app-mon ipv4-flow-table enforcement verbose**, **show app-mon ipv6-flow-table enforcement verbose**, and **show app-mon app-list enforcement active stats** commands. Statistics are refreshed every 160 seconds from data path, and based on the flow sync interval between the data path and the control path.

Examples

```
-> app-mon flow-table enforcement stats admin-state enable
-> app-mon flow-table enforcement stats admin-state disable
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon config	Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.

MIB Objects

```
alaAppMonEnforcementFlowTableStatsAdminStatus
```

app-mon aging enforcement

Configures aging time for dynamically learned TCP/UDP flows for each application for Enforcement applications.

app-mon aging enforcement app-name *app_name* **[tcp | udp] interval {120m | 60m | 30m | 10m | 5m | 3m | default}**

Syntax Definitions

app_name	Name of the application to configure its aging interval. The application must be part of the application pool.
interval	The aging time interval for dynamically learned flows in the flow table, in minutes.
default	Configures the default aging interval.

Defaults

By default, aging interval is set per application and TCP or UDP flow type basis.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- User can set separate TCP or UDP flows aging interval for an given application.
- When TCP option is used to configure aging interval for an application, TCP flows generated by a given application age out with configured value.
- When UDP option is used to configure aging interval for an application, UDP flows generated by a given application age out with configured value.
- Flow aging is supported for the applications that are part of the enforcement application list. Flows related with enforcement application list are made active for QoS treatment as well statistics collection.
- Flow aging is not supported for applications that are part of Monitor application list. Monitor flow tables log these flows when they are detected until logging threshold is reached.

Examples

```
-> app-mon aging enforcement app-name sip tcp interval 60m
-> app-mon aging enforcement app-name tftp udp interval 120m
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon config	Displays global AppMon configuration, which includes information like admin-state, running mode, IP mode, aging-timer, and total signatures.
show app-mon aging enforcement	Displays the aging interval for each application for enforcement feature.

MIB Objects

```
alaAppMonEnforcementAgingTimerTable
   alaAppMonEnforcementAgingTimerValue
```

app-mon logging-threshold

Configures the threshold for the number of matched flows for enforcement and monitor applications.

app-mon logging-threshold {enforcement | monitor} num-of-flows {*number* | **default}**

Syntax Definitions

number	Threshold value for the number of matched flows. The valid range is 1000–60000.
default	Sets the threshold back to the default value of 20K.

Defaults

By default, 20000 flows are logged.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the logging threshold value is set to ‘0’, flows are not logged to the log file.
- When used with enforcement option, it configures the threshold for the number of matched flows to be saved on to the log file for enforcement applications.
- When used with monitor option, it configures the threshold for the number of matched flows to be displayed in the monitor flow table commands.

Examples

```
-> app-mon logging-threshold monitor num-of-flows 10000
-> app-mon logging-threshold monitor num-of-flows default
-> app-mon logging-threshold enforcement num-of-flows 10000
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon config	Displays global AppMon configuration, which includes information about admin-state, running mode, IP mode, aging-timer, and total signatures.

MIB Objects

```
alaAppMonThresholdNumberOfFlows
```

app-mon flow-sync enforcement interval

Configures the interval at which the enforcement flows information is refreshed.

app-mon flow-sync enforcement interval {*number* **| default}**

Syntax Definitions

number	Flow sync interval at which the enforcement flows information is refreshed. The valid range is 10–3600 seconds. The interval can be configured only for the enforcement feature.
default	Configures the default flow-sync interval.

Defaults

Default flow-sync interval is 60 seconds for enforcement.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The refreshed information is shown in the following show commands: **show app-mon applist enforcement active**, **show app-mon applist enforcement active stats**, **show app-mon ipv4-flow-table enforcement**, **show app-mon stats**.

Examples

```
-> app-mon flow-sync enforcement interval 10
-> app-mon flow-sync enforcement interval default
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon ipv4-flow-table	Displays the flow table for IPv4 flows entries.
show app-mon ipv6-flow-table	Displays the flow table for IPv6 flows entries.

MIB Objects

```
alaAppMonFlowSyncEnforcementInterval
```

app-mon force-flow-sync

Synchronizes flows learned in the data path.

app-mon force-flow-sync {enforcement | monitor}

Syntax Definitions

enforcement	Synchronizes flows learned in the data path for the enforcement feature from the hardware.
monitor	Synchronizes flows learned in the data path for the monitor feature from the hardware.

Defaults

By default, flow synchronization occurs every 5 minutes for monitor flows and 60 seconds for enforcement flows.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command to force a flow synchronization with the control path database in real time.

Examples

```
-> app-mon force-flow-sync enforcement
-> app-mon force-flow-sync monitor
```

Release History

Release 8.2.1; command introduced.

Related Commands

show app-mon ipv4-flow-table	Displays the flow table for IPv4 flows entries.
show app-mon ipv6-flow-table	Displays the flow table for IPv6 flows entries.

MIB Objects

```
alaAppMonForceFlowSyncStatus
```

show app-mon config

Displays global AppMon configuration, which includes information about admin-state, running mode, IP mode, aging-timer, and total signatures.

show app-mon config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The operational state is enabled if there is at least one OmniSwitch 6860E chassis in the virtual chassis (VC). If there is no OmniSwitch 6860E in the VC, the operational-state is disabled.

Examples

```
-> show app-mon config
Admin State                          : Enable,
Operational State                    : Enable,
L3-IPv4                              : Enable,
L3-IPv6                              : Enable,
Enforcement Flow-Table Stats         : Enable,
Enforcement Flow-Sync Interval       : 10 seconds,
Monitor Logging Threshold            : 20000,
Enforcement Logging Threshold        : 20000,
App-Pool Applications                : 10,
Monitor Applied Applications         : 10,
Enforcement Applied Applications     : 10,
Upgraded Signature File Type         : Factory,
AOS Compatible Signature Kit Version : 1,
Signature Kit version                : 1.1.1
```

output definitions

Admin-state	The AppMon administrative status (**Enabled** or **Disabled**). Configured through the **app-mon admin-state** command.
Operational State	The operational status (**Enabled** or **Disabled**).
L3-IPv4	Status of IPv4 l3 mode on the switch (**Enable** or **Disable**)
L3-IPv6	Status of IPv6 l3 mode on the switch (**Enable** or **Disable**)
Enforcement Flow-Table Stats	Status of the enforcement flow table statistics update.
Enforcement Flow Sync interval	Enforcement flow sync interval at which the switch polls for flow information.

output definitions (continued)

Monitor Logging-Threshold	Monitor threshold value for the flows to be saved in the IPv4 or IPv6 flow table.
Enforcement Logging-Threshold	Enforcement threshold value for the flows to be saved on to the log file.
App-Pool Applications	The number of application signatures in the application pool.
Monitor Applied Applications	The number of active applications in the Monitor application list.
Enforcement Applied Applications	The number of active applications in the enforcement application list.
Upgraded Signature File Type	The signature file type: Factory or Production
AOS Compatible Signature Kit Version	Determines the compatibility between AOS software and the signature file.
Signature Kit version	The signature file version that contains the application signatures.

Release History

Release 8.2.1; command introduced.

show app-mon port

Displays AppMon status per physical port or per slot for the switch.

show app-mon [port *chassis/slot/port* **| slot** *chassis/slot***]**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis/slot	The chassis ID and slot number (3/1) for a specific slot.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

```

show app-mon app-list

Displays a list of applications and application groups added to an application list.

show app-mon app-list {monitor | enforcement} [active [stats]] [conflict]

Syntax Definitions

monitor	Displays information for applications added for monitoring.
enforcement	Displays information for applications added for enforcement.
active [stats]	Displays the list of activated applications in an application list. Use the **stats** option together with the **enforcement** option.
conflict	Displays the list of applications that are present more than once in an application list.

Defaults

By default, all applications and application groups that belong to an application list are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **conflict** option to identify applications that are present more than once in an application list. This needs to be checked and resolved for **app-mon apply** to be successful.
- The **active** option displays active and gross number of flows detected on per application basis.
- For monitor feature, **active** option displays only the gross counters.
- The **stats** option is used only for the **enforcement** option. This displays active or gross packets/byte counters per application basis.

Examples

```
-> show app-mon app-list monitor
App-Id/        Application-List                          Application-List

show app-mon app-group

Displays the details of all the applications in an application group.

show app-mon app-group [group-name *group_name***]**

Syntax Definitions

group_name	The name of an application group. This is a case sensitive string.

Defaults

By default, information is displayed for all application groups.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command displays both user created and automatically created application groups and the applications added to the respective group.
- Application names which are added to group and not yet activated are also displayed.
- This also display the auto application groups.

Examples

```
-> show app-mon app-group
Legend: Application-name: *= Not present in recently updated kit,

AppGrp-Id  App-group                                App-name

```

show app-mon app-record

Displays current-hour application-record information as well the historic application-records on the hourly or 24-hours basis for monitored applications.

show app-mon app-record [hourly | twenty-four-hours | current-hour] [verbose]

Syntax Definitions

hourly	Displays flows detected for an applications in an hour. An Hour is defined with fixed boundary (for example, 1:30 p.m to 2:30 p.m).
twenty-four-hours	Displays aggregate of available 'hourly' records for each application, flows detected in last 24-hours since last hour boundary. 'current-hour' data will not be part of this. This information is updated every one hour when 'hourly' record is updated.
current-hour	Displays new flow detected for an application in the current hour which is not part of 'hourly' historic data. When current-hour reaches an hour boundary, this data is moved to 'hourly' records. For example, if current time is 2.40 p.m, then information between 2.30 p.m to 2.40 p.m is displayed. On 3.30 p.m, current-hour information is moved to the latest hourly record.
verbose	Select this option to view detail information for each option. Detail information include minimum, maximum and average flows detected for each application.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This is supported for monitoring.

show app-mon ipv4-flow-table

Displays the flow table for IPv4 flows entries for enforcement and monitor flows.

show app-mon ipv4-flow-table {monitor | enforcement [verbose]} [{src-ipv4 | dest-ipv4} *ip_address*] **[app-name** *app_name* **| app-group** *grp_name*]

Syntax Definitions

verbose	Displays detailed information of the flows.
src-ipv4 *ip_address*	Filter flow table based on the specified source IPv4 address.
dest-ipv4 *ip_address*	Filter flow table based on the specified destination IPv4 address.
app_name	Filter flow table based on application name.
grp_name	Filter flow table based on application group.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The **verbose** option displays additional information about the flow start time, statistics counters, associated application group, policy rule, and so on. This option is supported only for enforcement feature.

Examples

```
-> show app-mon ipv4-flow-table monitor

show app-mon l4port-exclude

Displays the port range excluded from AppMon operation.

show app-mon l4port-exclude range-id [*number***]**

Syntax Definitions

number	A range ID number. The valid range is 1–8.

Defaults

By default, information is displayed for all range ID numbers.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Enter a range ID number with this command to display information for a specific range.

Examples

```
-> show app-mon l4port-exclude range-id
Range-Id     Start-port     End-port      Port-type
----------+-------------+--------------+----------
1             100           200           UDP-Port
2             20            25            TCP-Service-Port

-> show app-mon l4port-exclude range-id 1
Range-Id     Start-port     End-port      Port-type
----------+-------------+--------------+----------
1             100             200         UDP-Port
```

output definitions

Range-Id	The service port range ID.
Start-port	The start port associated with the range ID.
End-port	The end port associated with the range ID.
Port-type	Indicates the port type (**TCP** or **UDP**)

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon l4port-exclude	Configures the L4 port range to exclude from the AppMon operation.

MIB Objects

```
alaAppMonEnforcementL4PortRangeTable
   alaAppMonEnforcementL4PortRangeID
   alaAppMonEnforcementL4PortRangeStart
   alaAppMonEnforcementL4PortRangeEnd
   alaAppMonEnforcementL4PortType
   alaAppMonEnforcementL4PortStatus
```

show app-mon stats

Displays the number of flow statistics.

show app-mon stats

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **app-mon flow-table enforcement flush** command to clear the counters.

Examples

```
-> show app-mon stats
Chassis/  Total Enforcement Total           Total TCP         Total UDP
Slot      Matched Flows     Used Flows      Overflow Flows    Overflow Packets
--------+----------------+---------------+-----------------+----------------
1/1         8192              8192             1422            0
2/1         0                 3                0               0
3/1         0                 0                0               0
4/1         0                 0                0               0
Total       8192              8195             1422            0
```

output definitions

Chassis/Slot	The chassis ID and slot number.
Total Enforcement Matched Flows	Total number of active flows that matched to any active application signature for enforcement feature.
Total Used Flows	Total number of active flows (including unmatched and enforcement matched) on a given chassis/slot. Each IPv4 flow takes one entry count, while each IPv6 flow takes two entries for Total Used Flows count.
Total TCP Overflow Flows	Total number of TCP flows missed to create flow entry in flow table due to hash collision.
Total UDP Overflow Packets	Cumulative number of UDP packets missed to create flow entry in flow table due to hash collision.

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon flow-table enforcement stats	Enable or disable flow table statistics update for enforcement applications.

MIB Objects

```
alaAppMonStatisticsTable
   alaAppMonStatsSlotIndex
   alaAppMonTotalEnforcementActiveFlows
   alaAppMonTotalFlowTableInUseFlows
   alaAppMonTCPOverflowFlows
   alaAppMonUDPOverflowPackets
```

show app-mon aging enforcement

Displays the aging interval for each application for enforcement feature.

show app-mon aging enforcement [*app_name***]**

Syntax Definitions

app_name	The name of the application. This is a case sensitive string.

Defaults

By default, the aging time for all applications is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show app-mon aging enforcement
AppId    Application-name                      TCP Aging-time/
                                               UDP Aging-time(minutes)

240        youtube                                6/1

-> show app-mon aging enforcement app-name SIP
AppId    Application-name                      TCP Aging-time/
                                               UDP Aging-time(minutes)
------+--------------------------------------+-------------------------
182      sip                                    60/60
```

output definitions

AppId	Identity of the application.
Application-name	Name of the application.
TCP Aging-time/UDP Aging-time (minutes)	Aging time configured for the application.

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon aging enforcement	Configures the aging time for dynamically learned flows for each application for enforcement feature.

MIB Objects

```
alaAppMonEnforcementAgingTimerTable
   alaAppMonEnforcementAgingTimerAppName
   alaAppMonEnforcementAgingTimerValue
```

show app-mon vc-topology

Displays the AppMon virtual chassis topology.

show app-mon vc-topology

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Displays the topology of the available OmniSwitch 6860 and OmniSwitch 6860E chassis. This also displays the connectivity between the chassis for flow classification.

Examples

```
-> show app-mon vc-topology
Chassis/    Node            Designated
Slot        Type            Chassis/Slot
--------+----------------+----------------
1/1         OS6860             2/1
2/1         OS6860E            2/1
3/1         OS6860E            3/1
```

output definitions

Chassis/Slot	The chassis ID and slot number.
Node Type	Indicates the switch type.
Designated Chassis/Slot	The chassis and slot of the switch.

Release History

Release 8.2.1; command introduced

Related Commands

N/A

MIB Objects

```

clear app-mon app-list

Removes all applications from the enforcement or monitor application list.

clear app-mon app-list {monitor| enforcement}

Syntax Definitions

monitor	Removes all applications from the monitor application list.
enforcement	Removes all applications from the enforcement application list.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command does not clear the active application list until the **app-mon apply** command is used.

Examples

```
-> clear app-mon app-list enforcement
-> clear app-mon app-list monitor
```

Release History

Release 8.2.1; command introduced.

Related Commands

app-mon app-list	Add or remove applications or application groups to an application list for enforcement or monitoring.

MIB Objects

```
alaAppMonClearAppList
```

38 Port Mapping Commands

Port Mapping is a security feature that controls communication between peer users. Each session comprises of a session ID and a set of user ports and/or a set of network ports. The user ports within a session cannot communicate with each other and can only communicate through network ports. In a port mapping session with user port set A and network port set B, ports in set A can communicate with ports in set B only. If set B is empty, the ports in set A can communicate with the rest of the ports in the system.

A port mapping session can be configured in a unidirectional or bidirectional mode. In the unidirectional mode, the network ports can communicate with each other within the same session. In the bidirectional mode, the network ports cannot communicate with each other. Network ports of a unidirectional port mapping session can be shared with other unidirectional sessions, but cannot be shared with any session that is configured in bidirectional mode. Network ports of different sessions can communicate with each other.

MIB information for the Port Mapping commands is as follows:

Filename: AlcatelIND1PortMapping.mib
Module: ALCATEL-IND1-PORT-MAPPING

A summary of the available commands is listed here:

port-mapping user-port network-port
port-mapping (configures port mapping status)
port-mapping [unidirectional | bidirectional]
port-mapping unknown-unicast-flooding
show port-mapping status
show port-mapping

port-mapping user-port network-port

Creates a port mapping session with the user ports, network ports, or both user ports and network ports. Use the **no** form of the command to delete ports or a link aggregate group from a session.

port-mapping *port_mapping_sessionid* **[user-port {slot** *chassis/slot* **|** *chassis//slot/port***[**-*port2***] | linkagg** *linkagg_id***}] [network-port {slot** *chassis/slot* **|** *chassis//slot/port***[**-*port2***] | linkagg** *linkagg_id***}]**

no port-mapping *port_mapping_sessionid* **[user-port {slot** *chassis/slot* **|** *chassis//slot/port***[**-*port2***] | linkagg** *linkagg_id***}] [network-port {slot** *chassis/slot* **|** *chassis//slot/port***[**-*port2***] | linkagg** *linkagg_id***}]**

Syntax Definitions

port_mapping_sessionid	The port mapping session ID.
user-port	Specifies a user port of the mapping session.
network-port	Specifies a network port of the mapping session.
slot	Specifies that a slot is assigned to the mapping session.
chassis	The chassis identifier.
slot	Enter the slot number to be assigned to the mapping session.
port	Enter the port number to be assigned to the mapping session.
port2	Last port number in a range of ports assigned to the mapping session.
linkagg	Specifies that a link aggregation group is assigned to the mapping session.
linkagg_id	Enter a link aggregate ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- User ports that are part of one session cannot communicate with each other. The user ports can communicate only through network ports of the session to the other elements of the system.
- User ports can be part of only one port mapping session.
- An aggregable port of a link aggregation group cannot be a mapped port and a mapped port cannot be an aggregable port of a link aggregation group.
- A mirrored port cannot be a mapped port and a mapped port cannot be a mirrored port.

Examples

```
-> port-mapping 3 user-port 2/1/3 network-port 6/1/4
-> port-mapping 4 user-port 2/1/5-8
-> port-mapping 5 user-port 2/1/3 network-port slot 3
-> no port-mapping 5 user-port 2/1/3
-> no port-mapping 6 network-port linkagg 7
```

Release History

Release 8.1.1; command introduced.

Related Commands

port-mapping	Enables, disables, or deletes a port mapping session.
port-mapping [unidirectional | bidirectional]	Configures the direction of a port mapping session.
port-mapping unknown-unicast-flooding	Enables or disables flooding of unknown unicast traffic from all ports to user ports for a particular session.
show port-mapping	Displays the configuration of one or more port mapping sessions.

MIB Objects

```
PortMappingSessionTable
   pmapSessionNumber
portMappingTable
   pmapPortIfindex
   pmapPortType
```

port-mapping

Enables, disables, or deletes a port mapping session.

port-mapping *port_mapping_sessionid* **{enable | disable}**

no port-mapping *port_mapping_sessionid*

Syntax Definitions

port_mapping_sessionid	The port mapping session ID.
enable	Enables a port mapping session.
disable	Disables a port mapping session.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

To be enabled, a session should have a minimum of two ports.

Examples

```
-> port-mapping 3 enable
-> port-mapping 4 disable
-> no port-mapping 5
```

Release History

Release 8.1.1; command introduced.

Related Commands

port-mapping user-port network-port	Creates a port mapping session with or without the user ports, network ports, or both.
port-mapping [unidirectional | bidirectional]	Configures the direction of a port mapping session.
show port-mapping status	Displays the status of one or more port mapping sessions.
show port-mapping	Displays the configuration of one or more port mapping sessions.

MIB Objects

```
PortMappingSessionTable
   pmapSessionNumber
   pmapSessionStatus
```

port-mapping [unidirectional | bidirectional]

Configures the direction of a port mapping session.

port-mapping *port_mapping_sessionid* **[unidirectional | bidirectional]**

Syntax Definitions

port_mapping_sessionid	The port mapping session ID.
unidirectional	Specifies unidirectional port mapping.
bidirectional	Specifies bidirectional port mapping.

Defaults

parameter	default
enable | disable	**enable**
unidirectional | bidirectional	**bidirectional**

Platform Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- In the bidirectional mode, the network ports of a session cannot communicate with each other. Also, the network ports of that session cannot be a part of a network port set of another session.
- In the unidirectional mode, the network ports of a session can communicate with each other. Also, the network ports of that session can be part of a network port set of another session that is in the unidirectional mode.
- To change the directional mode of an active session with network ports, delete the network ports of the session, change the direction, and recreate the network ports.

Examples

```
-> port-mapping 5 enable unidirectional
-> port-mapping 5 disable unidirectional
-> port-mapping 6 enable bidirectional
-> port-mapping 5 disable bidirectional
```

Release History

Release 8.1.1; command introduced.

Related Commands

port-mapping user-port network-port	Creates a port mapping session with or without the user ports, network ports or both.
port-mapping	Enables, disables, or deletes a port mapping session.
show port-mapping	Displays the configuration of one or more port mapping sessions.

MIB Objects

```
PortMappingSessionTable
   PmapSessionNumber
   PmapSessionDirection
```

port-mapping unknown-unicast-flooding

Enables or disables flooding of unicast traffic from all the switch ports to the user ports related to a particular session.

port-mapping *session_id* **unknown-unicast-flooding {enable | disable}**

Syntax Definitions

session_id	Enter the port mapping session ID.
enable	Enables the flooding of unknown unicast traffic from all ports to the user ports for a particular session.
disable	Disables the flooding of unknown unicast traffic from all ports to the user ports for a particular session.

Defaults

parameter	default
enable | disable	**enable**

Platform Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Configuring unknown unicast flooding creates a new port mapping session if there is no existing session.
- When a link aggregate is configured as a user port, the unknown unicast flooding configuration is applied to all the member ports of the aggregate.

Examples

```
-> port-mapping 1 unknown-unicast-flooding enable
-> port-mapping 2 unknown-unicast-flooding disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

port-mapping user-port network-port	Creates a port mapping session with or without the user ports, network ports or both.
port-mapping	Enables, disables, or deletes a port mapping session.
show port-mapping	Displays the configuration of one or more port mapping sessions.
show port-mapping status	Displays the status of one or more port mapping sessions.

MIB Objects

```
portMappingSessionTable
   pmapSessionUnknownUnicastFloodStatus
```

show port-mapping status

Displays the status of one or more port mapping sessions.

show port-mapping [*port_mapping_sessionid*] **status**

Syntax definitions

port_mapping_sessionid	The port mapping session ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If you do not specify the port mapping session ID, then the status of all the port mapping sessions are displayed.

Examples

```
-> show port-mapping status

SessionID       Direction       Status         Unknown Unicast
------------+-----------------+--------------+-----------------
     1           bi            enable          drop
     2           bi            disable         flood
```

output definitions

SessionID	Displays the port mapping session ID.
Direction	Displays the direction of a port mapping session.
Status	Displays status of a port mapping session.

Release History

Release 8.1.1; command introduced.

Related Commands

port-mapping user-port network-port	Creates a port mapping session with or without the user ports, network ports, or both.

show port-mapping

Displays the configuration of one or more port mapping sessions.

show port-mapping [*port_mapping_sessionid***]**

Syntax Definitions

port_mapping_sessionid	The port mapping session ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If you do not specify the port mapping session ID, then the user port and network port information are displayed for all the port mapping sessions active on the switch.

Examples

```
-> show port-mapping 3

SessionID       USR-PORT        NETWORK-PORT
----------+---------------+-----------------
     1           1/2               1/1/3
     1           1/6
     1           1/7
```

output definitions

SessionID	Displays the port mapping session ID.
USR-PORT	Displays the set of user ports of a port mapping session.
NETWORK-PORT	Displays the set of network ports of a port mapping session.

Release History

Release 8.1.1; command introduced.

Related Commands

port-mapping user-port network-port	Creates a port mapping session with or without the user ports, network ports, or both.

39 Learned Port Security Commands

Learned Port Security (LPS) provides a mechanism for controlling network device communication on one or more switch ports. Configurable LPS parameters allow the user to restrict source learning on a port to:

- A maximum number of learned source MAC addresses.
- A specific amount of time in which source MAC addresses are learned.
- An individual learned source MAC address.
- A range of learned source MAC addresses.

This chapter includes descriptions of the CLI commands used to define LPS parameters and display information about the current LPS configuration.

MIB information for Learned Port Security commands is as follows:

Filename: ALCATEL-IND1-LPS-MIB
Module: alcatelIND1LearnedPortSecurityMIB

A summary of the available commands is listed here:

port-security
port-security learning-window
port-security convert-to-static
port-security maximum
port-security port max-filtering
port-security mac-range
port-security port violation
port-security learn-trap-threshold
show port-security
show port-security brief
show port-security learning-window

port-security

Enables or disables Learned Port Security (LPS) on the switch port(s). When LPS is enabled, only devices that have a source MAC address that complies with LPS restrictions are learned on the port(s).

port-security {port *chassis/slot/port***[**-*port2***] | chassis} [admin-state {enable | disable | locked}]**

no port-security port *chassis/slot/port***[**-*port2***]**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
enable	Administratively enables LPS on the specified port(s).
disable	Administratively disables LPS on the specified port(s). All bridged and filtered MAC addresses are cleared, but the static MAC address and LPS configuration for the port is retained. Learning is unrestricted.
locked	Administratively disables all learning on the port. Existing MAC addresses are retained but no additional learning of addresses, except for static MAC addresses, is allowed.

Defaults

By default, LPS functionality is disabled on all ports.

The following default value applies if the **admin-state** parameter is *not* specified with this command:

parameter	default
admin-state	enable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the LPS configuration from the specified port *and* clear all MAC addresses learned on the port. Note that the **chassis** parameter is not supported when using the **no** form of this command.
- The **admin-state disable** option disables LPS on the port but does not clear the LPS configuration.
- Use the **chassis** parameter to administratively disable or enable all active LPS ports with one command. This option does not apply to ports on which LPS was not previously enabled.
- LPS is supported on Ethernet fixed and 802.1Q-tagged ports. However, LPS is *not* supported on ports that are configured as service access ports.
- LPS is not supported on link aggregates, 802.1Q tagged (trunked) link aggregates, or link aggregate member ports.

- Note that when LPS is enabled on an active port, all MAC addresses previously learned on that port are cleared from the source learning MAC address table.
- LPS is also supported on ports that have Universal Network Profile (UNP) functionality enabled, with the following conditions:
  - When LPS is enabled or disabled on a UNP edge or bridge port (LPS is not supported on UNP access ports), MAC addresses already learned on that port are flushed.
  - UNP authentication and classification is applied first, then LPS rules.
  - If UNP classifies a MAC address as forwarding but LPS learns the address as filtering, an untagged packet will show as filtering in the default VLAN for the port and a tagged packet MAC will show as filtering in the specific tagged VLAN.
  - When a MAC address is filtered by LPS, the **show unp edge-user** command will display "LPS-B" as the classification source for that MAC address.
- LPS allows for the configuration of the following source MAC address learning restrictions:
  - A source learning time limit window to specify the length of time learning is allowed on a port.
  - A maximum number of bridged and filtered MAC addresses allowed on a specific port
  - A list of MAC addresses (individual or range of addresses) allowed on a port.
  - How a port handles traffic that is unauthorized.

Examples

```
-> port-security port 4/1/8 admin-state enable
-> port-security port 2/1/1-10 admin-state enable
-> port-security chassis admin-state disable
-> no port-security port 1/1/1-12
```

Release History

Release 8.1.1; command introduced.

Related Commands

port-security mac-range	Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port.
port-security maximum	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
port-security learning-window	Configures the amount of time, in minutes, to allow source learning on all LPS ports.
port-security port violation	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port(s).

MIB Objects

```
learnedPortSecurityTable
   lpsAdminStatus
```

port-security learning-window

Configures the amount of time, in minutes, to allow source learning on all LPS ports. This LPS parameter applies to the entire switch, so when the time limit expires, source learning of *new* MAC addresses is stopped on all LPS ports. Only authorized MAC addresses are allowed to be associated on LPS ports after this timer expires. This command also enables or disables the conversion of dynamic MAC addresses to static MAC addresses on LPS ports.

port-security learning-window *minutes* **[convert-to-static {enable | disable}] [no-aging {enable | disable}] [learn-as-static {enable | disable}] [mac-move {enable | disable}] [boot-up {enable | disable}]**

no port-security learning-window

Syntax Definitions

minutes	The number of minutes during which LPS allows source learning across all LPS ports. This amount of time defines the LPS learning window. The valid range is 0–2880. When this value is set to zero, the learning window time is set to infinity (no source learning time restriction on LPS ports).
convert-to-static enable	Enables the **convert-to-static** option for the learning window. Dynamically learned bridged (not filtered) MAC addresses are automatically converted to static addresses when the learning window closes. This option is automatically disabled when the LPS learning window is set to infinity (zero).
convert-to-static disable	Disables the **convert-to-static** option for the learning window. Dynamically learned MAC addresses are not converted to static addresses and will start to age out when the learning window closes.
no-aging enable	Enables the **no-aging** option for the learning window. Dynamic bridged MAC addresses are learned as *pseudo-static* MACs, which do not age out but are not saved in the switch configuration.
no-aging disable	Disables the **no-aging** option for the learning window. MAC addresses are learned as dynamic addresses that will age out.
learn-as-static enable	Enables the **learn-as-static** option for the learning window. Bridged MAC addresses are learned as static MAC addresses during the learning window time and regardless of whether or not the **convert-to-static** option is enabled.
learn-as-static disable	Disables the **learn-as-static** option for the learning window. Learned bridged MAC addresses are not converted to static until the window is closed *and* the **convert-to-static** option is enabled.
mac-move enable	Enables the **mac-move** option. Allows a pseudo-static MAC address to move to a different port in the same VLAN without getting dropped. Enabling the **no-aging** option is required to support the **mac-move** option.
mac-move disable	Disables the **mac-move** option. Frames from a duplicate pseudo-static MAC address are dropped.

boot-up enable	Enables the automatic start of the LPS learning window timer when the switch restarts.
boot-up disable	Disables the automatic start of the LPS learning window timer when the switch restarts.

Defaults

By default, the LPS source learning time limit is not set for the switch; the learning window defaults to infinity (source learning is not limited to a specific time frame).

parameter	default
convert-to-static	**disable**
no-aging	**disable**
learn-as-static	**disable**
mac-move	**disable**
boot-up	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to clear the learning window time (no learning window time limit is applied to the port).
- The LPS source learning time window is started and/or reset each time the **port-security learning-window** command is issued or when the **port-security learning-window boot-up** option is enabled and the switch restarts.
- Setting the LPS learning window time to 0 (zero) configures an infinite source learning time period for all LPS ports. The learning of MAC addresses on LPS ports never times out.
- When the LPS learning window time is set to zero, all options except the **convert-to-static** option are still valid. For example, the **no-aging** option setting still applies.
- After the LPS learning window time expires, MAC addresses are learned as filtered addresses until the maximum number of filtered MAC addresses allowed for the LPS port is reached. For example, if the maximum number of bridged MAC addresses allowed is set to 30 and the learning window expires when the port has only learned 15, the port is still allowed to learn an additional 15 filtered MAC addresses.
- If the **no-aging** option is enabled, then all new bridged MAC addresses are learned as pseudo-static MAC addresses during the learning window time period. Pseudo-static addresses do not age out but are not saved to the switch configuration.
- When the **no-aging** option is enabled and the learning window starts, any MAC addresses that were learned prior to the learning window time period are retained as dynamic addresses; they are not converted to pseudo-static MAC addresses.
- Enabling the **mac-move** option is not allowed unless the **no-aging** option is also enabled. When the **mac-move** option is enabled, disabling the **no-aging** option is *not* allowed.

- If the **convert-to-static** option is enabled, then all dynamic bridged and pseudo-static MAC addresses are converted to static MAC addresses when the learning window closes. Static MAC addresses do not age out and are saved to the switch configuration.

Note. When UNP is enabled on any one LPS port, the **convert-to-static**, **no-aging**, and **boot-up** parameter options are not supported on *all* LPS-enabled ports. This is because the learning window configuration is global and applies to all LPS ports.

Examples

```
-> port-security learning-window 25
-> port-security learning-window 2 convert-to-static enable
-> port-security learning-window 60 no-aging enable mac-move enable
-> port-security learning-window 0 learn-as-static enable
-> port-security learning-window 500 boot-up disable
-> port-security learning-window 2 convert-to-static enable no-aging enable
-> port-security learning-window 2 no-aging enable convert-to-static enable boot-up
enable learn-as-static enable mac-move enable
-> no port-security learning-window
```

Release History

Release 8.1.1; command introduced.
Release 8.2.1; **learn-as-static** and **mac-move** parameters added.

Related Commands

port-security	Enables or disables Learned Port Security (LPS) on the switch port(s).
port-security maximum	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
port-security port max-filtering	Configures the maximum number of MAC addresses that can be filtered on the LPS port.
port-security port violation	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.
show port-security learning-window	Displays the source learning window configuration.

MIB Objects

```
learnedPortSecurityGlobalGroup
   lpsLearningWindowTime
   lpsLearningWindowTimeWithStaticConversion
   lpsLearningWindowNoAging
   lpsLearningWindowBootupStatus
   lpsLearningWindowLearnAsStatic,
   lpsLearningWindowPseudoMacMove
```

port-security convert-to-static

Converts all MAC addresses dynamically learned on the LPS port(s) to static MAC addresses. This command does not apply to MAC addresses that are filtered.

port-security {port *chassis/slot/port***[-***port2***]** | **chassis} convert-to-static**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
chassis	Specifies all the LPS ports on the chassis.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Converting dynamic MAC addresses to static MAC addresses is not supported on Universal Network Profile (UNP) ports.
- You can stop the aging out of dynamic MAC addresses on the LPS port(s) by converting them to static MAC addresses.
- The number of converted static MAC addresses cannot exceed the maximum number of MAC addresses allowed on the port(s).

Note. The **port-security convert-to-static** command is not supported on Universal Network Profile (UNP) ports.

Examples

```
-> port-security port 4/1/8 convert-to-static
-> port-security chassis convert-to-static
```

Release History

Release 8.1.1; command introduced.

Related Commands

port-security	Enables or disables Learned Port Security (LPS) on the switch port(s).
port-security maximum	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.

MIB Objects

```
learnedPortSecurityGlobalGroup
   lpsConvertToStatic
```

port-security maximum

Specifies the maximum number of bridged MAC addresses that an LPS port(s) is allowed to learn.

port-security {port *chassis/slot/port***[-***port2***]} maximum** *number*

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
number	The number of source MAC addresses that are allowed on this port. The valid range is 1–1000.

Defaults

By default, the number of MAC addresses allowed is set to 1.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Any additional source MAC addresses received that exceed the maximum number of bridged addresses allowed are filtered on the port, regardless of the LPS learning window time limit. Once the number of filtered MAC addresses reaches the maximum number of filtered addresses allowed, the port violation mode is applied.
- Note that source learning of configured authorized MAC addresses is still allowed after the LPS time limit has expired; however, all learning is stopped if the number of MAC addresses learned meets or exceeds the maximum number of addresses allowed, even if the LPS time limit has not expired.

Examples

```
-> port-security 2/1/14 maximum 25
-> port-security 4/1/10-15 maximum 100
```

Release History

Release 8.1.1; command introduced.

Related Commands

port-security	Enables or disables Learned Port Security (LPS) on the switch port(s).
port-security learning-window	Configures the amount of time in minutes to allow source learning on all LPS ports.
port-security learn-trap-threshold	Configures the number of bridged MAC addresses to learn before sending a SNMP trap.
port-security port violation	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.

MIB Objects

```
learnedPortSecurityTable
   lpsMaxMacNum
```

port-security learn-trap-threshold

Configures the number of bridged MAC addresses to learn before sending a SNMP trap.

port-security {port *chassis/slot/port***[-***port2***]} learn-trap-threshold** *number*

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
number	The number of bridged MAC addresses to learn before sending a trap. The valid range is 0–1000.

Defaults

By default, the number of bridged MAC addresses to learn before sending a trap is set to the same value as the maximum number of bridged MAC addresses allowed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the number of bridged MAC addresses learned on the port matches the specified threshold amount, a trap is sent for every bridged MAC address learned thereafter.
- Sending a trap when this threshold is reached provides notification of newly learned bridged MAC addresses. Trap contents includes identifying information about the MAC, such as the address itself, the corresponding IP address, switch identification, and the slot and port number on which the MAC was learned.
- If this threshold value is set to zero, a trap is sent for every MAC address learned on the LPS port.

Examples

```
-> port-security port 1/1/10 learn-trap-threshold 6
-> port-security port 1/1/10-13 learn-trap-threshold 18
```

Release History

Release 8.1.1; command introduced.

Related Commands

port-security maximum	Configures the maximum number of source MAC addresses that an LPS port is allowed to learn.
show port-security	Displays Learned Port Security (LPS) configuration and table entries.

MIB Objects

```
learnedPortSecurityTable
   lpsLearnTrapThreshold
```

port-security port max-filtering

Configures the maximum number of MAC addresses that can be filtered on the LPS port(s).

port-security port *chassis/slot/port***[**-*port2***]** **max-filtering** *number*

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
number	The maximum number of filtered MAC addresses that are allowed on this port. The valid range is 0–100.

Defaults

By default, the maximum number of MAC addresses that can be filtered on an LPS port is 5.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the number of filtered MAC addresses learned on the port reaches the maximum, the violation mode (restrict, discard, or shutdown) configured for the port is applied.
- Any additional source MAC addresses received that exceed the maximum number of bridged addresses allowed are filtered on the port, regardless of the LPS learning window time limit. Once the number of filtered MAC addresses reaches the maximum number of filtered addresses allowed, the port violation mode is applied.
- Even after the LPS learning window time expires, MAC addresses are learned as filtered addresses until the maximum number of filtered MAC addresses allowed for the LPS port is reached. For example, if the maximum number of MAC addresses allowed is set to 30 and the learning window expires when the port has only learned 15, the port is still allowed to learn an additional 15 filtered MAC addresses.

Examples

```
-> port-security 1/1/10 max-filtering 6
-> port-security 1/1/10-13 max-filtering 18
```

Release History

Release 8.1.1; command introduced.

Related Commands

port-security maximum	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
port-security learning-window	Configures the amount of time in minutes to allow source learning on all LPS ports.
port-security port violation	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.
show port-security	Displays Learned Port Security (LPS) configuration and table entries.

MIB Objects

```
learnedPortSecurityTable
   lpsMaxFilteredMacNum
```

port-security mac-range

Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port. This command also enables LPS on the specified port, if LPS is not already active on the port.

port-security {port *chassis/slot/port***[-***port2***]} mac-range [low** *mac_address* | **high** *mac_address***]**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
low *mac_address*	MAC address that defines the low end of a range of MACs (for example, 00:20:95:00:10:2A).
high *mac_address*	MAC address that defines the high end of a range of MACs (for example, 00:20:95:00:10:2F).

Defaults

parameter	default
high *mac_address*	ff:ff:ff:ff:ff:ff
low *mac_address*	00:00:00:00:00:00

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If **low** and **high** end MAC addresses are not specified with this command, then the range is set back to the default range value (00:00:00:00:00:00– ff:ff:ff:ff:ff:ff).
- Source MAC addresses received on an LPS port that fall within the authorized range are allowed on the port. An additional entry is made in the LPS table for each of these learned addresses.
- Any additional source MAC addresses received that do not match the configured authorized addresses are not allowed (filtered) on the port, regardless of the LPS learning window time limit or the maximum number of bridged addresses allowed. Once the number of filtered MAC addresses reaches the maximum number of filtered addresses allowed, the port violation mode is applied.

Examples

```
-> port-security port 4/1/20 mac-range low 00:20:95:00:fa:5c
-> port-security port 5/1/11-15 mac-range low 00:da:95:00:00:10 high
00:da:95:00:00:1f
-> port-security port 5/1/16-20 mac-range high 00:da:95:00:00:1f
-> port-security port 5/1/11-15 mac-range
```

Release History

Release 8.1.1; command introduced.

Related Commands

port-security	Enables or disables Learned Port Security (LPS) on the switch port(s).
port-security learning-window	Configures the amount of time in minutes to allow source learning on all LPS ports.
port-security maximum	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
port-security port max-filtering	Configures the maximum number of MAC addresses that can be filtered on the LPS port.
port-security port violation	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.
show port-security	Displays Learned Port Security (LPS) configuration and table entries.

MIB Objects

```
learnedPortSecurityTable
   lpsLoMacRange
   lpsHiMacRange
   lpsRowStatus
```

port-security port violation

Selects the method for handling traffic that does not comply with LPS restrictions for the specified port(s).

port-security port *chassis/slot/port***[**-*port2***] violation {shutdown | restrict | discard}**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
shutdown	The port is administratively disabled when the port receives unauthorized traffic. No further traffic is allowed on the port.
restrict	Disables learning on the port when unauthorized traffic is received or the configured maximum number of MAC addresses is reached.
discard	Discards unauthorized traffic but allows traffic that complies with LPS restrictions to forward on the port. The port remains administratively enabled.

Defaults

By default, the security violation mode is set to **restrict** when LPS is enabled on the port.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When a traffic violation occurs on an LPS port, a notice is sent to the switch log.
- If the violation mode is set to **restrict**, unauthorized source MAC addresses are not learned in the LPS table, but they are recorded in the source learning MAC address table with a filtered operational status. This allows the user to view MAC addresses attempting unauthorized access to the LPS port.

Examples

```
-> port-security port 2/1/14 violation restrict
-> port-security port 4/1/10-15 violation shutdown
-> port-security port 1/1/37 violation discard
```

Release History

Release 8.1.1; command introduced.

Related Commands

port-security	Enables or disables Learned Port Security (LPS) on the switch port(s).
interfaces wait-to-restore	Clears all port violations; allows the port to resume normal operation without a manual reset of the port or module.
show port-security	Displays Learned Port Security (LPS) configuration and table entries.

MIB Objects

```
learnedPortSecurityTable
   lpsViolationOption
```

show port-security

Displays Learned Port Security (LPS) configuration and table entries.

show port-security {port [*chassis/slot/port***[-***port2***] | slot** *chassis/slot***]}**

Syntax Definitions

chassis	The chassis identifier.
*slot/port***[-***port2***]**	The slot and port number. Use a hyphen to specify a range of ports.
slot	Enter the slot number for a module to specify that the command should include all ports on that module (for example, 6 specifies all ports on the module found in slot 6 of the switch chassis).

Defaults

By default, all ports with an LPS configuration are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Displays ports that have an LPS configuration, even if LPS is disabled on the port.
- Use the **port** parameter with this command to display the LPS configuration for a specific port or a range of ports.
- Use the **slot** parameter with this command to display the LPS configuration for all the ports on a specific slot.
- In addition, MAC addresses learned on the LPS enabled port that are within the specified MAC address range appear as a separate entries in the LPS table as dynamic MAC type addresses.
- The MAC Type field is blank if an authorized MAC address range is configured for the LPS port.

Examples

```
-> show port-security port 1/1/1
Port:  1/1
 Admin-State      :                ENABLED,
 Operation Mode   :                ENABLED,
 Max MAC bridged  :                      3,
 Trap Threshold   :                      1,
 Violation        :               RESTRICT
 Max MAC filtered :                      5,
 Low MAC Range    :      00:00:00:00:00:00,
 High MAC Range   :      ff:ff:ff:ff:ff:ff,
 Violating MAC    :                   NULL

            MAC             VLAN       MAC TYPE          OPERATION
------------------------+--------+-----------------+-----------------
 00:11:22:22:22:21           1       STATIC           bridging
```

```
00:11:22:22:22:22          1       STATIC           bridging
00:11:22:22:22:23          1       PSEUDO-STATIC    bridging
```

output definitions

Port	The module slot number and the physical port number on that module.
Admin-State	The LPS administrative state for the port (**Enabled**, **Disabled**, or **Locked**). Configured through the **port-security** command.
Operation Mode	The LPS operational mode for the port (**Enabled**, **Disabled**, **Restricted**, **Shutdown**, **Discard**, **Locked**, or **Filtered-only**).
Max MAC bridged	The maximum number of bridged MAC addresses that are allowed on this port. Configured through the **port-security maximum** command.
Trap Threshold	The number of bridged MACs to learn before sending a trap. After this number is reached, a trap is sent out for every MAC learned thereafter. If **disabled** is displayed in this field, the trap threshold is not in force. Configured through the **port-security learn-trap-threshold** command.
Violation	The security violation mode for the port (**restrict**, **shutdown**, or **discard**). Configured through the **port-security port violation** command.
Max MAC filtered	The maximum number of filtered MAC addresses that the LPS port can learn. Configured through the **port-security port max-filtering** command.
Low MAC Range	MAC address that defines the lower end of a MAC address range. Configured through the **port-security mac-range** command.
High MAC Range	MAC address that defines the higher end of a MAC address range. Configured through the **port-security mac-range** command.
Violating MAC	The MAC Address that caused the violation on this port.
MAC	The MAC address learned dynamically or configured statically on the LPS port.
VLAN	The VLAN to which the LPS port belongs.
MAC TYPE	Indicates if the MAC address was dynamically learned or statically configured as an authorized MAC address for the port.
OPERATION	The operational status of the MAC address (**bridging** or **filtering**).

Release History

Release 8.1.1; command introduced.

Related Commands

show port-security learning-window	Displays the amount of time during which source learning can occur on all LPS ports.

show port-security brief

Displays the LPS port configuration for all the LPS ports.

show port-security brief

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The LPS port parameter values are displayed even if the LPS is disabled on the port.
- The operation mode displayed for the LPS port is based on a combination of the existing admin status and operational status of the port, the result of which is one of the following values:
  - Enabled
  - Restricted (only when admin status is enabled)
  - Shutdown (only when admin status is enabled)
  - Discard (only when admin status is enabled)
  - Disabled
  - Locked
  - Filtered_only

Examples

```
-> show port-security brief

Slot/                  Max      Max      Nb Macs  Nb Macs    Nb Macs    Nb Macs
Port  Operation Mode   Bridge   Filter   Dyn Br   Dyn Fltr   Static Br  Static Fltr

```

output definitions

Slot/Port	The slot number for the module and the physical port number on that module (e.g., 1/2 specifies port 2 on slot 1).
Operation Mode	Displays the status of the LPS port.
Max Bridge	The maximum number of bridged MAC addresses that are allowed on the LPS port. Configured through the **port-security maximum** command.
Max Filter	The maximum number of filtered MAC addresses that the LPS port can learn. Configured through the **port-security port max-filtering** command.
Nb Macs Dyn Br	Total number of bridged MAC addresses learned on the LPS port.
Nb Macs Dyn Fltr	Total number of filtered MAC addresses learned on the LPS port.
Nb Macs Static Br	Total number of bridged static MAC addresses (configured static and MAC addresses learned as pseudo-static) on the LPS port.
Nb Macs Static Fltr	Total number of filtered static MAC addresses configured on the LPS port.

Release History

Release 8.1.1; command introduced.

Related Commands

show port-security	Displays the LPS configuration and table entries for individual LPS ports.

   lpsAdminStatus
```

show port-security learning-window

Displays the source learning window configuration.

show port-security learning-window

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The source learning time limit is a switch-wide parameter that applies to all ports that have LPS enabled.
- If the learning window time is not set, then no source learning time limit is applied to LPS ports.
- Even after the LPS learning window time expires, dynamic MAC addresses are learned as filtered addresses until the maximum number of filtered MAC addresses allowed for the LPS port is reached. For example, if the maximum number of bridged MAC addresses allowed is set to 30 and the learning window expires when the port has only learned 15, the port is still allowed to learn an additional 15 filtered MAC addresses.

Examples

```
-> show port-security learning-window
Learning-Window             =  2 min,
Convert-to-static           =  DISABLE,
No Aging                    =  DISABLE,
Boot Up                     =  ENABLE,
Remaining Learning Window   =  120 sec
Learn As Static             =  ENABLE,
Mac Move                    =  ENABLE,
```

output definitions

Learning-Window	The configured amount of time during which the LPS port can learn new MAC addresses.
Convert-to-static	Indicates whether or not dynamic bridged or pseudo-static MACs are converted to static MACs (**enabled** or **disabled**). This option is always disabled when the LPS learning window is set to infinity (zero).
No Aging	Indicates whether or not bridged MAC addresses are learned as pseudo-static MAC addresses, which do not age out during the LPS learning window time period (**disabled** or **enabled**).

output definitions

Boot Up	Indicates whether or not the LPS learning window automatically starts when the switch boots up (**enabled** or **disabled**).
Learn As Static	Indicates whether or not dynamic MAC addresses are automatically learned as static MAC addresses during the LPS learning window time period.
Mac Move	Indicates whether or not pseudo-static MAC addresses are allowed to move to a different port in the same VLAN during the LPS learning window time period.
Remaining Learning Window	The remaining amount of time during which the LPS port can learn MAC addresses. If the learning time window is set to **INFINITY** (zero), this field does not display in the show command output.

Release History

Release 8.1.1; command introduced.

Related Commands

port-security learning-window	Configures the learning window parameters that are applied to all LPS ports.

   lpsLearningWindowTimeRemaining
```

40 Port Mirroring and Monitoring Commands

The Port Mirroring and Port Monitoring features are primarily used as diagnostic tools.

The Port Mirroring feature allows you to have all the inbound and outbound traffic of an Ethernet port sent to another port on the switch. When you enable port mirroring, the active, or "mirrored," port transmits and receives network traffic normally and the "mirroring" port receives a copy of all transmit and receive traffic to the active port. You can connect an RMON probe or network analysis device to the mirroring port to see an exact duplication of traffic on the mirrored port without disrupting network traffic to and from the mirrored port.

The Port Monitoring feature allows you to capture and examine the data traffic to and from a monitored Ethernet port.

MIB information for the Port Mirroring commands is as follows:

Filename: AlcatelIND1portMirMon.mib
Module: ALCATEL-IND1-PORT-MIRRORING-MONITORING-MIB

The following table summarizes the available commands:

Port Mirroring Commands	**port-mirroring source destination** **port-mirroring** **show port-mirroring status**
Port Monitoring Commands	**port-monitoring source** **port-monitoring** **show port-monitoring status** **show port-monitoring file**

port-mirroring source destination

Defines the port to mirror and the port that is to receive data from the mirrored port. Also, enables or disables remote port mirroring.

port-mirroring *port_mirror_sessionid* **source {***chassis/slot/port***[-***port2***] [***chassis/slot/port***[-***port2***]...] destination** *chassis/slot/port* **[rpmir-vlan** *vlan_id***] [bidirectional |inport |outport] [unblocked** *vlan_id***] [enable | disable]**

port-mirroring *port_mirror_sessionid* **no source {***chassis/slot/port***[-***port2***] [***chassis/slot/port***[-***port2***]...]**

Syntax Definitions

port_mirror_sessionid	Mirroring session identifier.
source	Specifies source port, or range of ports desired to be mirrored.
no source	Removes a port or range of ports from a port mirroring session.
destination	Specifies the destination port, that receives all the mirrored packets.
*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
rpmir-vlan *vlan_id*	Specifies a reserved VLAN to carry the mirroring traffic.
bidirectional	Specifies bidirectional port mirroring.
inport	Specifies incoming unidirectional port mirroring.
outport	Specifies outgoing unidirectional port mirroring.
unblocked *vlan_id*	Specifies the VLAN that is to be protected from Spanning Tree changes when port mirroring is active. Ports in this VLAN remain unblocked.
enable	Enables port mirroring status.
disable	Disables port mirroring status.

Defaults

parameter	default
bidirectional | inport | outport	**bidirectional**
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You can configure a port mirroring and a port monitoring session on the same network interface module in an OmniSwitch 6860, 6860E.
- A mirroring port can not be assigned to a tagged VLAN port.
- When a port is configured as a mirroring port, it does not belong to any VLAN. Inbound traffic to the mirroring port is dropped since it does not belong to any VLAN.

- Spanning tree is disabled by default on a mirroring port.
- Port mirroring is not supported on logical link aggregate ports. However, it is supported on individual ports that are members of a link aggregate.
- Execute the **port mirroring source destination** command to define the mirrored port and enable port mirroring status. Use the **port mirroring** command to enable the port mirroring session.
- Specify the *vlan_id* number of the mirroring port that is to remain **unblocked** when the command is executed. The **unblocked** VLAN becomes the default VLAN for the mirroring port. This VLAN handles the inbound traffic for the mirroring port. Spanning tree remains disabled on the unblocked VLAN.

Usage Guidelines - Remote Port Mirroring

- Remote port mirroring is supported only on OmniSwitch 6860, 6860E switches.
- Use the **rpmir-vlan** parameter and VLAN ID with this command to configure remote port mirroring and to assign the VLAN ID for remote port mirroring.
- The VLAN ID assigned for remote port mirroring cannot be assigned to a general port mirroring port.
- There must not be any physical loop present in the remote port mirroring VLAN.
- Source learning must be disabled or overridden on the ports belonging to the remote port mirroring VLAN on intermediate and destination switches.
- On OmniSwitch 6860, 6860E switches, the QoS redirect feature can be used to override source learning.
- The **mac-learning** command can also be used to disable learning on the RPMIR VLAN ID.

Examples

```
-> port-mirroring 6 source 2/1/2
-> port-mirroring 6 source 2/1/3-5
-> port-mirroring 6 destination 1/1/12 rpmir-vlan 7
-> port-mirroring 6 no source 2/1/2-5

-> port-mirroring 7 source 2/1/3 destination 6/1/4 unblocked 750

-> port-mirroring 8 source 1/1/7 bidirectional
-> port-mirroring 8 no source 1/1/7

-> port-mirroring 9 source 1/1/23 inport
-> port-mirroring 9 destination 1/1/24
-> port-mirroring 9 disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

port-mirroring	Enables, disables, or deletes a port mirroring session.
show port-mirroring status	Displays the status of mirrored ports. This value may be enabled or disabled.

MIB Objects

```
mirrorTable
   mirrorMirroringIfindex
   mirrorDirection
   mirrorStatus
   mirrorUnblockedVLAN
   mirrorRowStatus
   mirrorDirection
   mirrorSessOperStatus
   mirrorTaggedVLAN
```

port-mirroring

Enables, disables, or deletes a port mirroring session.

port-mirroring *port_mirror_sessionid* **{enable | disable}**

no port-mirroring *port_mirror_sessionid*

Syntax Definitions

port_mirror_sessionid	Mirroring session identifier.
enable	Enables port mirroring.
disable	Disables port mirroring.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a port mirroring session.
- Use the **port-mirroring source destination** command to specify the mirrored ports and destination port. before using this command to enable or disable port mirroring activity for the particular port mirroring session.

Examples

```
-> port-mirroring 6 enable
-> port-mirroring 6 disable
-> no port-mirroring 6
```

Release History

Release 8.1.1; command introduced.

Related Commands

port-mirroring source destination	Defines a port to mirror and the port that is to receive data from the mirrored port, and enables or disables port mirroring status.
show port-mirroring status	Displays the status of mirrored ports. This value may be enabled or disabled.

MIB Objects

```
mirrorTable
   mirrorMirroringIfindex
   mirrorTaggedVLAN
   mirrorStatus
```

port-monitoring source

Configures a port monitoring session.

port-monitoring *port_monitor_sessionid* **source** *chassis/slot/port* **[{no file | file** *filename* **[size** *filesize***] | [overwrite {on | off}]}] [inport | outport | bidirectional] [timeout** *seconds***] [enable | disable] [capture-type {full | brief}]**

Syntax Definitions

port_monitor_sessionid	Monitoring session identifier.
*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
file *filename*	Specifies a file name and pathname for capturing information related to the monitoring session (for example, **/flash/port2.enc**).
filesize	Specifies the size of the file in 64K byte increments. For example, a value of 3 would specify a size of (3 x 64K) bytes.
overwrite on	Specifies that capturing of data packets into the port monitoring file continues and old information is overwritten if the total data exceeds the specified file size.
overwrite off	Specifies that capturing of data packets into the port monitoring file is stopped when the maximum file size is reached.
inport	Specifies incoming unidirectional port monitoring.
outport	Specifies outgoing unidirectional port monitoring.
seconds	Specifies the number of seconds after which the session is disabled.
enable	Enables the port monitoring status.
disable	Disables the port monitoring status.
full	Captures port monitoring information in detail.
brief	Captures only the concise port monitoring data transmitted.

Defaults

parameter	default
filesize	1
on | off	**on**
bidirectional | inport | outport	**bidirectional**
seconds	0
enable | disable	**disable**
capture-type	**brief**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You can configure a port mirroring and a port monitoring session on the same NI module in an OmniSwitch 6860, 6860E.
- If the port monitoring capture-type is set to **brief**, the first 64 bytes of the traffic is captured. If the port-monitoring capture-type is set to **full**, the entire packet is captured.
- By default, a file called **pmonitor.enc** is created in the **/flash** directory when you configure and enable a port monitoring session. Use the **file** option to create a user-specified file.
- The **/flash** directory is the default and the only directory used to capture the port monitoring files.
- The format of the file created is compliant with the ENC file format (Network General Sniffer Network Analyzer Format).
- By default, the recent frames overwrite the older frames in a port monitoring file if the total data exceeds the specified file size. Use the **overwrite off** option to prevent this from occurring.

Examples

```
-> port-monitoring 6 source 2/1/3
-> port-monitoring 6 source 2/1/3 file /flash/user_port size 2 enable
-> port-monitoring 6 source 2/1/3 file /flash/user_port capture-type full
```

Release History

Release 8.1.1; command introduced.

Related Commands

port-monitoring	Disables, pauses, resumes, or deletes a port monitoring session.
show port-monitoring status	Displays the port monitoring status.
show port-monitoring file	Displays the port monitoring data.

MIB Objects

```
monitorTable
   monitor
   monitorSessionNumber
   monitorIfindex
   monitorFileStatus
   monitorFileName
   monitorFileSize
   monitorScreenStatus
   monitorScreenLine
   monitorCaptureType
   monitorTrafficType
   monitorStatus
   monitorFileOverWrite
   monitorDirection
   monitorTimeout
```

port-monitoring

Disables, pauses, resume, or deletes an existing port monitoring session.

port-monitoring *port_monitor_sessionid* **{disable | pause | resume}**

no port-monitoring *port_monitor_sessionid*

Syntax Definitions

port_monitor_sessionid	Monitoring session identifier.
disable	Disables the port monitoring session.
pause	Pauses the port monitoring session.
resumes	Resumes the port monitoring session.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to delete a port monitoring session.

Examples

```
-> port-monitoring 6 pause
-> port-monitoring 6 disable
-> port-monitoring 6 resume
-> no port-monitoring 6
```

Release History

Release 8.1.1; command introduced.

Related Commands

port-monitoring	Configures a port monitoring session.
show port-monitoring status	Displays the port monitoring status.

MIB Objects

```
monitorTable
   monitorSessionNumber
   monitorScreenStatus
```

show port-mirroring status

Displays the status of mirrored ports.

show port-mirroring status [*port_mirror_sessionid***]**

Syntax Definitions

port_mirror_sessionid	Mirroring session identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If a port mirroring session identifier is not specified with this command, then all port mirroring sessions are displayed.

Examples

```
-> show port-mirroring status

 Session    Mirror        Mirror     Unblocked    Config     Oper
          Destination    Direction     Vlan       Status    Status
----------+----------+--------------+----------+----------+---------
   6.        1/1/41            -         NONE       Enable    Off
----------+----------+--------------+----------+----------+---------
           Mirror

   6.        1/1/29      bidirectional     -        Enable    Off
   6.        1/1/30      bidirectional     -        Enable    Off
```

output definitions

Session	The port mirroring session identifier.
Mirror Destination	The location of the mirrored port.
Mirror Direction	The direction of the mirroring or mirrored port, which can be **bidirectional** (the default), **inport**, or **outport**.

output definitions (continued)

Unblocked VLAN	The mirroring VLAN ID number.
Config Status	The configuration status of the session.
Oper Status	The current status of the mirroring or mirrored port.
Mirror Source	The location of the mirroring port.

On OmniSwitch 6860, 6860E series switches:

```
-> show port-mirroring status

 Session    Mirror        Mirror     Unblocked    Config     Oper
          Destination    Direction     Vlan       Status    Status
----------+----------+--------------+----------+----------+---------

   6.        1/1/20      bidirectional     -        Enable    Off
   6.        1/1/21      bidirectional     -        Enable    Off
   6.        1/1/22      bidirectional     -        Enable    Off
   6.        1/1/23      bidirectional     -        Enable    Off
   6.        1/1/24      bidirectional     -        Enable    Off
   6.        1/1/25      bidirectional     -        Enable    Off
   6.        1/1/26      bidirectional     -        Enable    Off
   6.        1/1/27      bidirectional     -        Enable    Off
   6.        1/1/28      bidirectional     -        Enable    Off
   6.        1/1/29      bidirectional     -        Enable    Off
   6.        1/1/30      bidirectional     -        Enable    Off
```

output definitions

Session	The port mirroring session identifier.
Mirror Destination	The location of the mirrored port.
Mirror Direction	The direction of the mirroring or mirrored port, which can be **bidirectional** (the default), **inport**, or **outport**.
Unblocked VLAN	The mirroring VLAN ID number.
Config Status	The configuration status of the session.
Oper Status	The current status of the mirroring or mirrored port.
Mirror Source	The location of the mirroring port.

Release History

Release 8.1.1; command introduced.

Related Commands

port-mirroring	Enables, disables, or deletes a port mirroring session.
port-mirroring source destination	Defines a port to mirror and a port that receives data from the mirrored port, and enables or disables port mirroring status.

MIB Objects

```
mirrorTable
   mirrorMirroringIfindex
   mirrorMirroredIfindex
   mirrorDirection
   mirrorStatus
   mirrorSessionNumber
   mirrorSessOperStatus
   mirrorSrcStatus
   mirrorSrcDirection
   mirrorSrcRowStatus
   mirrorSrcOperStatus
   mirrorUnblockedVLAN
```

show port-monitoring status

Displays port monitoring status.

show port-monitoring status [*port_monitor_sessionid***]**

Syntax Definitions

port_monitor_sessionid	Monitoring session identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If a port monitoring session identifier is not specified with this command, then all port monitoring sessions are displayed.

Examples

```
-> show port-monitoring status

 Sess Mon. Mon. Over  Oper.  Admin  Capt.   Max.   File
      Src  Dir  write Stat   Stat   Type    Size   Name
-----+----+----+-----+------+------+-------+------+-------------------------
  1.  1/1/2   Out  OFF    OFF   OFF   Brief     64K  /flash/pm.enc
```

output definitions

Sess	**Session** - The port monitoring session identifier.
Mon. Src	**Monitor Source** - The source ports that are monitored.
Mon Dir	**Monitor Direction** - The direction of the monitoring session, which can be **bidirectional** (the default), **inport**, or **outport**.
Overwrite	Whether files created by a port monitoring session can be overwritten. The default is ON.
Oper Stat	**Operating Status** - The current operating status of the port monitoring session (on/off).
Admin Stat	**Admin Status** - The current administrative status of the port monitoring session (on/off).
Capt Type	**Capture type** - **Brief (**captures only 64 bytes of data per traffic data packet) or **Full** (captures the entire packet).
Max Size	**Maximum Size** - The maximum size of the port monitoring file.
File Name	The name of the port monitoring file.

Release History

Release 8.1.1; command introduced.

Related Commands

port-monitoring source	Configures a port monitoring session.
port-monitoring	Disables, pauses, resumes, or deletes a port monitoring session.
show port-monitoring file	Displays port monitoring data.

MIB Objects

```
monitorTable
   monitorSessionNumber
   monitorIfindex
   monitorStatus
   monitorFileStatus
   monitorFileName
   monitorFileSize
   monitorScreenStatus
   monitorScreenLine

   monitorDirection
   monitorTimeout
   monitorCaptureType
   monitorFileOverWrite
   monitorDirection
```

show port-monitoring file

Displays port monitoring data.

show port-monitoring file *port_monitor_sessionid*

Syntax Definitions

port_monitor_sessionid	Monitoring session identifier.

Defaults

A single line from the captured packet is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Only a single line from the captured packet is displayed, even though the full packet is captured. To view the entire packet, download the file and view it using compatible network analyzer tool.

Examples

```
-> show port-monitoring file 1

Destination       | Source            |  Type  | Data
------------------------------------------------------------------------------
01:80:C2:00:00:00 | 00:20:DA:8F:92:C6 |  BPDU  | 00:26:42:42:03:00:00:00:00:00
00:20:DA:C7:2D:D6 | 08:00:20:95:F3:89 |  UDP   | 08:00:45:00:00:6B:FE:4A:40:00
00:20:DA:A3:89:F6 | 08:00:20:95:F3:89 |  UDP   | 08:00:45:00:00:6B:CF:89:40:00
00:20:DA:BF:5B:76 | 08:00:20:95:F3:89 |  UDP   | 08:00:45:00:00:6B:CF:85:40:00
00:20:DA:A3:89:F6 | 08:00:20:95:F3:89 |  UDP   | 08:00:45:00:00:6B:CF:8A:40:00
00:20:DA:BF:5B:76 | 08:00:20:95:F3:89 |  UDP   | 08:00:45:00:00:6B:CF:86:40:00
00:20:DA:A3:89:F6 | 08:00:20:95:F3:89 |  UDP   | 08:00:45:00:00:6B:CF:8B:40:00
01:80:C2:00:00:00 | 00:20:DA:8F:92:C6 |  BPDU  | 00:26:42:42:03:00:00:00:00:00
00:20:DA:BF:5B:76 | 08:00:20:95:F3:89 |  UDP   | 08:00:45:00:00:6B:CF:87:40:00
```

output definitions

Destination	The destination MAC address of the packet.
Source	The source MAC address of the packet.
Type	The type of packet.
Data	The packet displayed in hexadecimal format.

Release History

Release 8.1.1; command introduced.

Related Commands

port-monitoring source	Configures a port monitoring session.
port-monitoring	Disables, pauses, resumes, or deletes a port monitoring session.
show port-monitoring status	Displays the port monitoring status.

MIB Objects

```
monitorTable
   monitorSessionNumber
   monitorIfindex
   monitorTrafficType
   monitorFileStatus
   monitorFileName
   monitorFileSize
   monitorScreenStatus
   monitorScreenLine
```

41 sFlow Commands

sFlow is a network monitoring technology that gives visibility in to the activity of the network, by providing network usage information. It provides the data required to effectively control and manage the network usage. sFlow is a sampling technology that meets the requirements for a network traffic monitoring solution.

sFlow provides a network-wide view of usage and active routes. It is used for measuring network traffic, collecting, storing, and analyzing the traffic data. As it is scalable, that doesn't add significant network load. sFlow is an industry standard with many vendors delivering products with this support. Some of the applications of the sFlow data include:

- Detecting, diagnosing, and fixing network problems
- Real-time congestion management
- Detecting unauthorized network activity
- Usage accounting and billing
- Understanding application mix
- Route profiling and peer optimization
- Capacity planning

sFlow is a sampling technology embedded within switches/routers. It provides the ability to monitor the traffic flows. It requires an sFlow agent software process running as part of the switch software and a sFlow collector which receives and analyses the monitored data. The sFlow collector makes use of SNMP to communicate with an sFlow agent in order to configure sFlow monitoring on the device (switch).

An sFlow agent running on the switch/router combines interface counters and traffic flow (packet) samples, preferably, on all the interfaces into sFlow datagrams that are sent across the network to an sFlow collector.

Packet sampling on the switch/router is typically performed by the switching/routing ASICs, providing wire-speed performance. In this case, an sFlow agent does very little processing, by packaging data into sFlow datagrams that are immediately sent on network. This minimizes the memory and CPU utilization by the sFlow agent.

MIB information for the sFlow commands is as follows:

Filename: Alcatel-IND1-PORT-MIRRORING-MONITORING-MIB.mib
Module: AlcatelIND1PortMirMon

Filename: SFLOW--MIB.MIB
Module: sFlow

A summary of the available commands is listed here:

sflow receiver
sflow sampler
sflow poller
show sflow agent
show sflow receiver
show sflow sampler
show sflow poller

sflow receiver

Sets the destination hosts where the sFlow datagrams are sent out. If there are multiple destinations, then each destination has an instance of the receiver. All these receivers are attached to the sFlow manager instance and to an associated sampler/poller.

sflow receiver *receiver_index* **{name** *string* **| timeout {** *seconds* **| forever} | address {***ip_address* **|** *ipv6address***} | udp-port** *port* **| packet-size** *size* **Version** *num* **| release}**

Syntax Definitions

receiver_index	Specifies the receiver index.
string	Specifies the name.
seconds **| forever**	Specifies the timeout value.
ip_address	*ipv6address*	Specifies the 32/128-bit ip address.
port	Specifies the UDP (destination) port.
size	Specifies the maximum number of data bytes (size) that can be sent.
num	Specifies the version number.

Defaults

parameter	default
string	empty
seconds	0
ip_address	0.0.0.0(ipv4)
port	6343
size	1400
version num	5

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **release** form at the end of the command to delete a receiver.

Examples

```
-> sflow receiver 1 name Golden Rcvr1 address 198.206.181.3
-> sflow receiver 1 release
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sflow receiver	Displays the receiver table.

MIB Objects

```
sFlowRcvrTable
   sFlowRcvrIndex
   sFlowRcvrOwner
   sFlowRcvrTimeout
   sFlowRcvrMaximumDatagramSize
   sFlowRcvrAddressType
   sFlowRcvrAddress
   sFlowRcvrPort
   sFlowRcvrDatagramVersion
```

sflow sampler

Gets the hardware sampled from Q-dispatcher and fills up the sampler part of the UDP datagram.

sflow sampler *num* **port** *chassis/slot/port***[-***port***] {receiver** *receiver_index* **| rate** *value* **| sample-hdr-size** *size***}**

no sflow sampler *num portlist*

Syntax Definitions

num	Specifies the instance id.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
receiver_index	Specifies the receiver index.
value	Specifies the rate value for packet sampling.
size	Specifies the maximum number of bytes (size) that can be copied from a sampled packet.
portlist	Specifies the interface index range.

Defaults

parameter	default
receiver_index	0
value	0
size	128

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a sampler.
- A sampling rate of 1 counts all packets. A sampling rate of 0 disables sampling.

Examples

```
-> sflow sampler 1 2/1/1 receiver 1 rate 5 sample-hdr-size 64
-> no sflow sampler 1 2/1/1-5
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sflow sampler	Displays the sampler table.

MIB Objects

```
sFlowFsTable
   sFlowFsDataSource
   sFlowFsInstance
   sFlowFsReceiver
   sFlowFsPacketSamplingRate
   sFlowFsMaximumHeaderSize
```

sflow poller

Gets counter samples from ethernet driver and fills up the counter part of the UDP datagram.

sflow poller *num* **port** *chassis/slot/port***[-***port***] {receiver** *receiver_index* **| interval** *value***}**

no sflow poller *num portlist*

Syntax Definitions

num	Specifies the instance id.
chassis	The chassis identifier.
slot/port	The slot number for the module and the physical port number on that module.
receiver_index	Specifies the receiver index.
value	Specifies the maximum number of seconds between successive samples (interval value).
portlist	Specifies the interface index range.

Defaults

parameter	default
receiver_index	0
value	0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **no** form of this command to delete a poller.

Examples

```
-> sflow poller 1 1/1/1 receiver 2 interval 20
-> sflow poller 1 2/1/6-10 receiver 1 interval 30
-> no sflow poller 1 2/1/6-10
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show sflow poller	Displays the poller table.

MIB Objects

```
sFlowCpTable
   sFlowCpDataSource
   sFlowCpInstance
   sFlowCpReceiver
   sFlowCpInterval
```

show sflow agent

Displays the sFlow agent table.

show sflow agent

Syntax Definitions

agent	Collects sample datagrams and send it to the collector across the network.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- It is necessary to execute the **ip interface** command to make a loopback0 IP address as the fixed primary address of the switch, in order to avoid interface changes, which might need the collector software to be restarted for it to communicate using the new agent IP address. Normally, the primary IP address could change depending on the IP interface going up/down. Therefore, the sFlow agent always needs to send a fixed IP address in the datagram.
- The loopback address should be an IP interface configured on the switch.

Examples

```
-> ip interface loopback0 address 198.206.181.100
-> show sflow agent
Agent Version  = 1.3; Alcatel-Lucent; 6.1.1
Agent IP       = 127.0.0.1
```

output definitions

Agent Version	Identifies the version which includes the MIB version, organization name, and the specific software build of the agent.
Agent address	IP address associated with the agent. Configured through the **ip service source-ip** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

show sflow receiver	Displays the receiver table.

MIB Objects

```
sFlowAgent
   sFlowVersion
   sFlowAgentAddressType
   sFlowAgentAddress
```

show sflow receiver

Displays the sflow receiver table.

show sflow receiver [*num***]**

Syntax Definitions

num	Specifies the receiver index.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show sflow receiver
Receiver 1
Name       = Golden
Address    = IP_V4  198.206.181.3
UDP Port   = 6343
Timeout    = 65535
Packet Size= 1400
DatagramVer= 5
```

output definitions

Name	Name of the entry to claim.
Address	IP address of the sFlow collector.
UDP Port	Destination port for sFlow datagrams.
Timeout	Time remaining before the sampler is released and stops sampling.
Packet size	Maximum number of data bytes that can be sent in a single sample datagram.
Datagram ver	Version of sFlow datagrams that should be sent.

Release History

Release 8.1.1; command was introduced.

Related Commands

ip service source-ip	Sets the destination hosts where the sFlow datagrams are sent out.

MIB Objects

```
sFlowRcvrTable
   sFlowRcvrIndex
```

show sflow sampler

Displays the sflow sampler table.

show sflow sampler [*num***]**

Syntax Definitions

num	Specifies the instance id.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show sflow sampler
Instance   Interface    Receiver  Sample-rate   Sample-hdr-size
-----------------------------------------------------------------
   1         2/1/1          1         2048             128
   1         2/1/2          1         2048             128
   1         2/1/3          1         2048             128
   1         2/1/4          1         2048             128
   1         2/1/5          1         2048             128
```

output definitions

Instance	Instance for the flow sampler.
Interface	Interface used for the flow sampler.
Receiver	Receiver associated with the flow sampler.
Sample-rate	Statistical sampling rate for packet sampling from the source.
Sample-hdr-size	Maximum number of bytes that should be copied from a sampled packet.

Release History

Release 8.1.1; command was introduced.

Related Commands

sflow sampler	Gets hardware sampled from Q-dispatcher.

MIB Objects

```
sFlowFsTable
   sFlowFsInstance
```

show sflow poller

Displays the sflow poller table.

show sflow poller [*num***]**

Syntax Definitions

num	Specifies the instance ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show sflow poller
Instance   Interface    Receiver  Interval
----------------------------------------
     1        2/1/6         1         30
     1        2/1/7         1         30
     1        2/1/8         1         30
     1        2/1/9         1         30
     1        2/1/10        1         30
```

output definitions

Instance	Instance for the counter poller.
Interface	Interface used for the counter poller.
Receiver	Receiver associated with the counter poller.
Interval	The maximum number of seconds between successive samples of the counters associated with the data source.

Release History

Release 8.1.1; command was introduced.

Related Commands

sflow poller	Gets counter samples.

MIB Objects

```
sFlowCpTable
   sFlowCpInstance
```

42 RMON Commands

Remote Network Monitoring (RMON) probes can be used to monitor, manage, and compile statistical data about network traffic from designated active ports in a LAN segment without negatively impacting network performance. This feature supports basic RMON 4 group implementation compliant with RFC 2819 (Remote Network Monitoring Management Information Base), but does not support RMON 10 group or RMON 2. This chapter includes descriptions of RMON commands used to enable or disable individual (or a group of a certain flavor type) RMON probes, show a list of (or individual) RMON probes and show a list of (or individual) RMON logged events.

MIB information for the RMON commands is as follows:

Filename: IETF_RMON.mib
Module: RMON-MIB

The following table summarizes the available commands:

rmon probes
show rmon probes
show rmon events

rmon probes

This command enables or disables types of RMON probes.

rmon probes {stats | history | alarm} [*entry-number***] {enable | disable}**

Syntax Definitions

stats	Ethernet Statistics Table probe entries.
history	History Control Table probe entries.
alarm	Alarm Table probe entries.
entry-number	The entry number in the list of probes *(optional)*.
enable	Enables the RMON probe.
disable	Disables the RMON probe.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Network activity on subnetworks attached to the RMON probe can be monitored by NMS applications.
- RMON will not monitor activities on the CMM onboard Ethernet Management port.

Examples

```
-> rmon probes stats 4012 enable
-> rmon probes history 10240 disable
-> rmon probes alarm 11235 enable
-> rmon probes stats enable
-> rmon probes history disable
-> rmon probes alarm enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show rmon probes	Displays a list of RMON probes or a single RMON probe.
show rmon events	Displays a list of RMON logged events or a single RMON event.

MIB Objects

```
ETHERSTATSTABLE
   etherStatsStatus
HISTORYCONTROLTABLE
   historyControlStatus
ALARMTABLE
   alarmStatus
```

show rmon probes

Displays a list of RMON probes or a single RMON probe.

show rmon probes [stats | history | alarm] [*entry-number***]**

Syntax Definitions

stats	Ethernet Statistics Table probe entries.
history	History Control Table probe entries.
alarm	Alarm Table probe entries.
entry-number	The entry number in the list of probes *(optional)*.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- To display a list of current probes, omit the *entry-number* from the command line.
- To display statistics for a particular probe, include the probe's *entry-number* in the command line.
- The **show rmon probes** command displays the following information: Entry number, Slot/Port, Flavor (whether the probe type is Ethernet, History or Alarm), Status (Active or Inactive), Duration (time since the last change in status, in hours/minutes) and System Resources (the amount of memory allocated to this probe).
- The **show rmon probes** *entry-number* command displays the following information: Probe's Owner (probe type and location), Slot/Port, Entry number, Flavor (whether the probe type is Ethernet, History or Alarm), Status (Active or Inactive), Time since the last change in status (hours/minutes), and System Resources (the amount of memory allocated to this probe). Displayed statistics may vary, depending on whether the probe type is Ethernet, History or Alarm.

Examples

```
-> show rmon probes stats

         Chassis/
Entry    Slot/Port   Flavor     Status       Duration          System Resources
-------+-----------+-----------+----------+---------------+---------------------
 4001    4/1/1       Ethernet    Active      00:25:00          275 bytes
 4008    4/1/8       Ethernet    Active      00:25:00          275 bytes
 4005    4/1/5       Ethernet    Active      00:25:00          275 bytes
```

```
-> show rmon probes history

        Chassis/
Entry    Slot/Port   Flavor      Status       Duration          System Resources
-------+-----------+-----------+----------+---------------+---------------------
    1    4/1/1       History     Active      00:25:00          9063 bytes
10240    4/1/5       History     Active      00:14:00          601 bytes
10325    4/1/8       History     Active      00:14:00          601 bytes

-> show rmon probes alarm

         Chassis/
Entry    Slot/Port   Flavor      Status       Duration          System Resources
-------+-----------+-----------+----------+---------------+---------------------
11235    4/1/8       Alarm       Active      00:07:00          835 bytes

-> show rmon probes stats 4005

Probe's Owner: Switch Auto Probe on Chassis 4, Slot 1, Port 5
    Entry 4005
      Flavor = History, Status = Active
      Time = 48 hrs 54 mins,
      System Resources (bytes) = 275

-> show rmon probes history 10325

Probe's Owner: Analyzer-p:128.251.18.166 on Chassis 4, Slot 1, Port 5
  History Control Buckets Requested  = 2
  History Control Buckets Granted    = 2
  History Control Interval           = 30 seconds
  History Sample Index               = 5859
   Entry 10325
      Flavor = History, Status = Active
      Time = 48 hrs 53 mins,
      System Resources (bytes) = 601

-> show rmon probes alarm 11235

Probe's Owner: Analyzer-t:128.251.18.166 on Chassis 4, Slot 1, Port 8
  Alarm Rising Threshold         = 5
  Alarm Falling Threshold        = 0
  Alarm Rising Event Index       = 26020
  Alarm Falling Event Index      = 0
  Alarm Interval                 = 10 seconds
  Alarm Sample Type              = delta value
  Alarm Startup Alarm            = rising alarm
  Alarm Variable = 1.3.6.1.2.1.16.1.1.1.5.4008
   Entry 11235
      Flavor = Alarm, Status = Active
      Time = 48 hrs 48 mins,
      System Resources (bytes) = 1677
```

output definitions

Probe's Owner	Description and interface (location) of the probe.
Slot/Port	The Slot/Port number (interface) that this probe is monitoring.
Entry	The Entry number in the list of probes.
Flavor	Whether the probe type is Ethernet, History, or Alarm.
Status	The status of the probe–**Creating** (the probe is under creation), **Active** (the probe is Active), or **Inactive** (the probe is inactive).
Duration	Elapsed time (hours/minutes/seconds) since the last change in status.
System Resources	Amount of memory that has been allocated to this probe.

Release History

Release 8.1.1; command introduced.

Related Commands

rmon probes	Enables or disables types of RMON probes.
show rmon events	Displays RMON logged events.

MIB Objects

```
ETHERSTATSTABLE
   etherStatsIndex
HISTORYCONTROLTABLE
   historyControlIndex
ALARMTABLE
   alarmIndex
```

show rmon events

Displays RMON events (actions that take place based on alarm conditions detected by the RMON probe).

show rmon events [*event-number***]**

Syntax Definitions

event-number	The event number *(optional)* in the list of probes.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- To display a list of logged events, omit the *event-number* from the command line.
- To display statistics for a particular event, include the *event-number* in the command line.
- The **show rmon events** command displays the following information for all RMON Logged Events: Entry number, Time (hours/minutes/seconds) since the last change in status and Description (nature of the event).
- The **show rmon events** *event-number* command displays the following information for a particular RMON Logged Event: Entry number, Time (hours/minutes/seconds) since the last change in status and Description (nature of the event).

Examples

```
-> show rmon events

Entry               Time               Description
---------+------------------+-----------------------------------------------------
1               00:08:00       etherStatsPkts.4008: [Falling trap] “Falling Event”
2               00:26:00       etherStatsCollisions.2008: “Rising Event”

-> show rmon events 2

Entry               Time               Description
---------+------------------+-----------------------------------------------------
2               00:26:00       etherStatsCollisions.2008: “Rising Event”
```

output definitions

Entry	The entry number in the list of probes.
Time	Time (hours, minutes, and seconds) since the last change in status.
Description	Description of the Alarm condition detected by the probe.

Release History

Release 8.1.1; command introduced.

Related Commands

rmon probes	Enables or disables types of RMON probes.
show rmon probes	Displays RMON probes or a single RMON probe.

MIB Objects

```
EVENTTABLE
   eventIndex
```

43 Switch Logging Commands

This chapter includes descriptions for Switch Logging commands. These commands are used to configure parameters for the Switch Logging utility.

MIB information for the system commands is as follows:

Filename: AlcatelIND1System.MIB
Module: ALCATEL-IND1-SYSTEM-MIB

A summary of the available commands is listed here.

swlog
swlog appid
swlog output
swlog output flash-file-size
swlog clear
show log swlog
show swlog

swlog

Enables or disables switch logging. Switch logging allows you to view a history of various switch activities in a text format.

swlog {[enable | disable] | remote command-log {enable| disable} | preamble | hash-time-limit *num* **| duplicate-detect | console level** *num***}**

no swlog

Syntax Definitions

enable | disable	Enables or disables the switch logging functionality.
command-log enable | disable	Enables or disables the logging of commands to syslog.
preamble	Enables or disables the display of the preamble to the console.
hash-time-limit *num*	Configures the amount of elapsed time for an entry to no longer be considered a duplicate entry.
duplicate-detect	Enables or disables the duplicate detection capability.
level *num*	The severity level filter keyword or numeric value for the application ID. *(see table for* **swlog appid** *command).*

Defaults

By default, switch logging is enabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of the command to enable or disable the **preamble** and **duplicate-detect** setting.
- The syslog preamble includes the level, appid and timestamps that precedes the actual log messages.
- If duplicate entries are received within the configured **hash-time-limit** only a single entry will be logged along with the number of times duplicated.

Examples

```
-> swlog enable
-> swlog hash-time-limit 30
-> no swlog preamble
```

Release History

Release 8.1.1; command was introduced.

Related Commands

swlog appid	Defines the level at which switch logging information will be filtered for the specified application.
swlog output	Enables or disables switch logging output to the console, file, or data socket.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.

MIB Objects

```
systemSwitchLoggingGroup
   systemSwitchLoggingEnable
```

swlog appid

Defines the level at which switch logging information will be filtered for the specified application. All application events of the defined level and lower are captured.

swlog appid {all | *string***} {[library {all |** *string***} | subapp {all |** *num***}]} {[disable | enable | level {***level* **|** *num***]} [vrf** *num***]**

Syntax Definitions

string	An application or library identification keyword.
subapp *num*	A numerical equivalent value for the subapp ID.
disable | enable	Enables or disables the logging of the associated application.
level *level* | *num*	The severity level filter keyword or numerical equivalent value for the application ID *(see table below)*. All switch logging messages of the specified level and lower will be captured. The severity level is a value assigned to the relative severity of the switch logging message. A lower value indicates messages that are more severe, a higher value indicates messages that are less severe.
vrf *num*	The VRF ID.

Supported Levels	Numeric Equivalents	Description
off	**0**	Disabled
alarm	**1**	Highest severity. The system is about to crash and reboot.
error	**2**	System functionality is reduced.
alert	**3**	A violation has occurred.
warning	**4**	A unexpected, non-critical event has occurred.
info	**5**	Any other non-debug message (default).
debug1	**6**	A normal event debug message.
debug2	**7**	A debug-specific message.
debug3	**8**	All debug messages.

Defaults

Default severity level is **info**.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **show swlog appid all** command to display all available registered applications.

Examples

```
-> swlog appid all subid all enable
-> swlog appid mvrpNi subapp 1 level 8
-> show swlog appid mvrpNi
Application Name                  : mvrpNi,

SubAppl ID Sub Application Name  Level         VRF Level
----------+--------------------+--------+------------------------------
         1 main                 error    VRF  1-64 info
```

Release History

Release 8.1.1; command was introduced.

Related Commands

swlog	Enables or disables switch logging.
swlog output	Enables or disables switch logging output to the console, file, or data socket.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.

MIB Objects

```
systemSwitchLoggingGroup
   systemSwitchLoggingLevelAppName
   systemSwitchLoggingLevel
   systemSwitchLoggingVrf
```

swlog output

Enables or disables switch logging output to the console, file, or data socket (remote session).

swlog output {tty {enable | disable} | console | flash | socket *ip_address* **[vrf-name** *name***]}**

no swlog output {console | flash | socket *ip_address***}**

Syntax Definitions

tty enable | disable	Enables or disables switch logging to a connected Telnet session.
console	Specifies console output. When enabled, switch logging output is printed to the user console.
flash	Specifies /flash file output. When enabled, switch logging output is printed to a file in the switch's /flash file system.
socket	Specifies data socket output. When enabled, switch logging output is printed to a remote session.
ip_address	The IPv4 or IPv6 address for the remote session host.
name	Specifies the VRF to be used to access the remote syslog server.

Defaults

parameter	default
console | **flash** | **socket**	**flash** and **console**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable one or more configured output IP addresses.
- This command can also be used on the secondary CMM.
- You can send output to a syslog server using the **socket** keyword, followed by the IP address of the remote host. Up to 12 servers can be configured.
- VRF name must either be 'default'or pre-defined VRF (user-defined).

Examples

```
-> swlog output console
-> no swlog output flash
-> swlog output socket 14.1.1.1
-> swlog output socket 14.1.1.1 vrf-name vrf1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

swlog	Enables or disables switch logging.
swlog appid	Defines the level at which switch logging information will be filtered for the specified application.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.

MIB Objects

```
systemSwitchLoggingGroup
   systemSwitchLoggingFlash
   systemSwitchLoggingSocket
   systemSwitchLoggingSocketIpAddr
   systemSwitchLoggingConsole
systemSwitchLoggingHostTable
   systemSwitchLoggingHostIpAddr
   systemSwitchLoggingHostPort
   systemSwitchLoggingHostStatus
   systemSwitchLoggingHostVrfName
```

swlog output flash-file-size

Configures the size of the switch logging file.

swlog output flash-file-size *kilobytes*

Syntax Definitions

kilobytes	The size of the switch logging file in kilobytes.

Defaults

parameter	default
kilobytes	1250

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **show hardware-info** command to determine the amount of available flash memory.
- This command can also be used on the secondary CMM.

Examples

```
-> swlog output flash-file-size 256
```

Release History

Release 8.1.1; command was introduced.

Related Commands

swlog clear	Clears the files that store switch logging data.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.

MIB Objects

```
systemSwitchLoggingGroup
   systemSwitchLoggingFileSize
```

swlog clear

Clears the files that store switch logging data.

swlog clear

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command when the switch logging display is too long due to some of the data being old or out of date.
- This command can also be used on the secondary CMM.

Examples

```
-> swlog clear
```

Release History

Release 8.1.1; command was introduced.

Related Commands

swlog output	Enables or disables switch logging output to the console, file, or data socket.
show log swlog	Displays stored switch logging information from flash.
show swlog	Displays switch logging information.

MIB Objects

```
systemSwitchLoggingGroup
   systemSwitchLoggingClear
```

show log swlog

Displays stored switch logging information.

show log swlog

show log swlog [timestamp *mm/dd/yyyy hh:mm:ss***] [slot** *num***]**

Syntax Definitions

num	The slot number to display the logging information for. Currently not supported.
start_time	Specify the starting time for the switch logging information to be displayed. Use the format ***mm/dd/yyyy hh:mm:ss*** where ***mm*** represents the month, ***dd*** is the day, ***yyyy*** is the year, ***hh*** is the hour, ***mm*** is the minutes and ***ss*** is the seconds. Use four digits to specify the year.

Default

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the switch logging display is too long, you may use the **swlog clear** command to clear all of the switch logging information.
- The use of **grep** and the **timestamp** parameter can be used to filter the log files.

Examples

```
-> show log swlog timestamp 09/30/2011 13:27:00
Displaying file contents for '/flash/swlog.6'
Displaying file contents for '/flash/swlog.5'
<output truncated>

Sep 30 13:27:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!

-> show log swlog | grep ChassisSupervisor
Displaying file contents for '/flash/swlog.6'
Displaying file contents for '/flash/swlog.5'
<output truncated>

Sep 28 13:25:15 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!

Sep 30 13:26:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!

Sep 30 13:27:16 Chassis6900 local0.info swlogd: ChassisSupervisor fan & temp Mgr
info(5) Alert: PS1 airFlow unknown yet- duplicated 5 times!
```

Release History

Release 8.1.1; command was introduced.

Related Commands

swlog	Enables or disables switch logging.
swlog appid	Adds or removes a filter level for a specified subsystem.
swlog output	Enables or disables switch logging output to the console, file, or data socket.
swlog clear	Clears the files that store switch logging data.
show swlog	Displays switch logging information.

show swlog

Displays switch logging information (e.g., switch logging status, log devices, application IDs with non-default severity level settings).

show swlog [library | dying-gasp-station |appid {all | *string***}]**

Syntax Definitions

library	The slot number to display the logging information for.
dying-gasp-station	The status of configured dying gasp station.
string	The name of the appid to display.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command can also be used on the secondary CMM.

Examples

```
-> show swlog
Operational Status                : Running,
File Size per file                : 125K bytes,
Log Device                        : console flash socket,
Log Device                        : ipaddr 1.2.3.4 vrf mgt(1),
Syslog FacilityID                 : local0(16),
Remote command-log                : Disabled,
Hash Table entries age limit      : 60 seconds,
Switch Log Preamble               : Enabled,
Switch Log Debug                  : Disabled,
Switch Log Duplicate Detection    : Enabled,
Console Display Level             : info

-> show swlog dying-gasp-station
Operational Status : Running,
Log Device         : ipaddr 10.135.34.45 remote command-log
Syslog FacilityID  : local0(16)
```

output definitions

Application ID	The Application ID (subsystem) for which the Severity Level is not set to the info (6) default setting.
Operational Status	Displays whether switch logging is enabled or disabled.
File Size per file	The maximum file size of the switch log file.

output definitions

Log Device	Which devices are the switch log messages being sent to.
Log Device	Which devices are the switch log messages being sent to.
Syslog FacilityID	Syslog FacilityID
Remote command-log	Status of remote command logging.
Hash Tables entries age limit	The elapsed time for duplicate entries.
Switch Log Preamble	Status of displaying message preamble on console.
Switch Log Debug	Status of swlog debug.
Switch Log Duplicate Detection	Status of duplicate detection.
Console Display Level	The console severity level of the above-referenced Application ID.

Release History

Release 8.1.1; command was introduced.

Related Commands

swlog	Enables or disables switch logging.
swlog appid	Defines the level at which switch logging information will be filtered for the specified application.
swlog output	Enables or disables switch logging output to the console, file, or data socket.
show log swlog	Displays stored switch logging information from flash.

MIB Objects

```
systemSwitchLoggingHostVrfName
```

44 Health Monitoring Commands

The Health Monitoring function monitors the consumable resources of the switch (for example, bandwidth usage, CPU usage) and provides a single integrated resource for a Network Management System (NMS). This function monitors the switch, and at fixed intervals, collects the current values for each resource being monitored. Users specify resource threshold limits and traps are sent to an NMS if a value falls above or below a user-specified threshold.

The Health Monitoring commands comply with RFC1212.

MIB information for the Health Monitoring commands is as follows:

Filename: AlcatelIND1Health.mib
Module: healthMIB

A summary of the available commands is listed here:

health threshold
health interval
show health configuration
show health
show health all

health threshold

Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage, CPU usage, and chassis temperature.

Input traffic, output/input traffic, memory usage, and CPU usage thresholds specify the maximum percentage for each resource that may be consumed before a trap is sent to the user. The temperature threshold specifies the maximum operating temperature, in Celsius, allowed within the chassis before a trap is sent.

health threshold {rx *percent* **| txrx** *percent* **| memory** *percent* **| cpu** *percent***}**

Syntax Definitions

rx	Specifies the maximum input (RX) traffic threshold.
txrx	Specifies the maximum output/input (TX/RX) traffic threshold.
memory	Specifies the maximum RAM memory usage threshold.
cpu	Specifies the maximum CPU usage threshold.
percent	The new threshold value for the corresponding resource (**rx**, **txrx**, **memory**, **cpu**). The valid range is 0–100 percent.
degrees	The new threshold value, in Celsius, for the chassis temperature threshold (0–100).

Defaults

parameter	default
percentage	80
degrees	50

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When a resource falls back below the configured threshold, an additional trap is sent to the user. This indicates that the resource is no longer operating beyond its configured threshold limit.
- Changing a threshold value sets the value for all levels of the switch (the switch, module, and port). You cannot set different threshold values for each level.
- For detailed information on each threshold type, refer to page 44-5, or refer to the “Diagnosing Switch Problems” chapter in the *OmniSwitch AOS Release 8 Network Configuration Guide*.
- To view the current health threshold values, use the **show health configuration** command.

Examples

```
-> health threshold rx 85
-> health threshold txrx 55
-> health threshold memory 95
-> health threshold cpu 85
```

Release History

Release 8.1.1; command introduced.

Related Commands

show health configuration	Displays the current health threshold settings.

MIB Objects

```
HealthThreshInfo
   healthThreshDeviceRxLimit
   healthThreshDeviceTxRxLimit
   healthThreshDeviceMemoryLimit
   healthThreshDeviceCpuLimit
```

health interval

Configures the sampling interval between health statistics checks. The sampling interval is the time interval between polls of the consumable resources of the switch to see if it is performing within set thresholds.

health interval *seconds*

Syntax Definitions

seconds	Sampling interval (in seconds). Valid entries are 1, 2, 3, 4, 5, 6, 10, 12, 15, 20, 30.

Defaults

parameter	default
seconds	5

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Decreasing the polling interval may impact switch performance.

Examples

```
-> health interval 6
```

Release History

Release 8.1.1; command introduced.

Related Commands

show health	Displays the current health sampling interval.

MIB Objects

```
HealthThreshInfo
   healthSamplingInterval
```

show health configuration

Displays current health configuration settings.

show health configuration

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show health configuration
Rx Threshold                  :  80
TxRx Threshold                :  80
Cpu Threshold                 :  80
Memory Threshold              :  80
Sampling Interval (Secs)      :  10
```

output definitions

Rx Threshold	The current device input (RX) threshold. This value displays the maximum percentage of total bandwidth allowed for *incoming traffic* on the switch. The total bandwidth is defined as the Ethernet port capacity for all NI modules currently operating in the switch, in Mbps. For example, a chassis with 48 100Base-T Ethernet ports installed has a total bandwidth of 4800 Mbps. The default value is 80 percent and can be changed using the **health threshold** command.
TxRx Threshold	The current device output/input (TX/RX) threshold. This value displays the maximum percentage of total bandwidth allowed for *all incoming and outgoing traffic*. As with the RX threshold described above, the total bandwidth is defined as the Ethernet port capacity for all the NI modules currently operating in the switch, in Mbps. The default value is 80 percent and can be changed using the **health threshold** command.
Memory Threshold	Displays the current memory usage threshold. Memory usage refers to the total amount of RAM memory currently used by switch applications. The default value is 80 percent and can be changed using the **health threshold** command.

output definitions (continued)

CPU Threshold	Displays the current CPU usage threshold. CPU usage refers to the total amount of CPU processor capacity currently used by switch applications. The default value is 80 percent and can be changed using the **health threshold** command.
Sampling Interval	Displays the sampling interval time period in seconds. The default value is 5 seconds. Sampling interval can be changed using the **health interval** command.

Release History

Release 8.1.1; command introduced.

Related Commands

health threshold	Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage, CPU usage, and chassis temperature.
health interval	Configures the sampling interval between health statistics checks.

MIB Objects

```
HealthThreshInfo
   healthThreshDeviceRxLimit
   healthThreshDeviceTxRxLimit
   healthThreshDeviceTempLimit
   healthThreshDeviceMemoryLimit
   healthThreshDeviceCpuLimit
```

show health

Displays the health statistics for the switch. Statistics are displayed as percentages of total resource capacity and represent data taken from the last sampling interval.

show health [port *chassis//slot/port* **| slot** *chassis/slot***] [statistics]**

Syntax Definitions

chassis/slot/port	The chassis ID, slot, and port number (3/1/1) for a specific port.
chassis/slot	The chassis ID and slot number (3/1) for a specific slot.
statistics	Optional command syntax. It displays the same information as the **show health** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If no slot or port information is specified, the aggregate health statistics for all ports is displayed.

Examples

```
-> show health

CMM                  Current    1 Min    1 Hr   1 Day
Resources                       Avg      Avg    Avg
--------------------+---------+-------+------+-------
CPU                        0      0       0      0
Memory                    30      30     24     24

-> show health port 4/1/3
Port 1/1/1                     1 Min  1 Hr   1 Hr
Resources        Limit  Curr   Avg    Avg    Max
----------------+-------+-----+-------+-----+-------
Receive          80     01     01     01     01
Transmit/Receive 80     01     01     01     01
```

Receive	Traffic received by the switch.
Transmit/Receive	Traffic transmitted and received by the switch.
Memory	Switch memory.
CPU	Switch CPU.
Temperature Cmm	CMM Chassis Temperature.
Temperature Cmm Cpu	CMM CPU Temperature.
Limit	Currently configured device threshold levels (percentage of total available bandwidth or temperature measured in degrees Celsius).
Curr	Current device bandwidth usage or temperature (measured in degrees Celsius).
1 Min Avg	Average device bandwidth usage or temperature (measured in degrees Celsius) over a 1-minute period.
1 Hr Avg	Average device bandwidth usage or temperature (measured in degrees Celsius) over a 1-hour period.
1 Hr Max	Maximum device bandwidth usage or temperature (measured in degrees Celsius) over a 1-hour period (the maximum of the 1 minute averages).

Release History

Release 8.1.1; command introduced.

Related Commands

show health all	Displays health statistics for a specified resource on *all* NIs currently operating in the chassis.

MIB Objects

```
healthModuleTable
   healthModuleSlot
   healthModuleRxLatest
   healthModuleRx1MinAvg
   healthModuleRx1HrAvg
   healthModuleRx1HrMax
   healthModuleRxTxLatest
   healthModuleRxTx1MinAvg

   healthModuleMemory1HrAvg
   healthModuleMemory1HrMax
   healthModuleCpuLatest
   healthModuleCpu1MinAvg
   healthModuleCpu1HrAvg
   healthModuleCpu1HrMax
```

show health all

Displays health statistics for a specified resource on all *active NI modules* installed in the chassis.

show health all {memory | cpu | rx | txrx}

Syntax Definitions

memory	Displays the RAM memory health statistics for all active NI modules in the switch.
cpu	Displays the CPU health statistics for all active NI modules.
rx	Displays the health statistics for traffic *received* on all active NI modules.
txrx	Displays the health statistics for traffic both *transmitted and received* on all active NI modules.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show health all memory

* - current value exceeds threshold

                                 1 Min  1 Hr  1 Hr
Memory             Limit   Curr   Avg    Avg   Max
-----------------+-------+------+------+-----+----
01                   80     40     40    40    40
02                   80     40     40    40    40
03                   80     40     40    40    40
04                   80     40     40    40    40
05                   80     40     40    40    40
06                   80     40     40    40    40
07                   80     40     40    40    40
13                   80     40     40    40    40
```

output definitions

Memory (Cpu, TXRX, RX)	A list of all currently-active NI modules (i.e., active slots) on the switch. The column header corresponds with the resource keyword entered. For example, if **show health all cpu** is entered, **Cpu** is used as the column header.
Limit	Current usage threshold for the specified resource type, on the corresponding slot (in percent). The usage threshold refers to the maximum amount of the resource's total bandwidth that can be used by switch applications before a notification is sent to the user. The default value for all resource types is 80 percent. This threshold can be changed using the **health threshold** command.
Curr	Current usage of the resource on the corresponding slot, in percent (the amount of the total resource bandwidth actually being used by the switch applications).
1 Min Avg	Average usage of the resource on the corresponding slot over a one minute period.
1 Hr Avg	Average usage of the resource on the corresponding slot over a one hour period.
1 Hr Max	The highest average hourly usage for the resource on the corresponding slot.

Release History

Release 8.1.1; command introduced.

Related Commands

show health	Displays the health statistics for the switch.
health threshold	Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage, CPU usage, and chassis temperature.

   healthModuleCpu1HrMax
```

45 Ethernet OAM Commands

Service provider networks are large and complex with a wide user base, and they often involve different operators that must work together in order to provide end-to-end services to enterprise customers. Operations, Administration, and Maintenance (OAM) provides service assurance over a converged network that service providers are looking for in an Ethernet network. Ethernet OAM addresses areas such as availability, mean time to repair and more. Ethernet OAM focuses on two main areas that are most in need by service providers and are rapidly evolving in the standards bodies, Service OAM and Link OAM. These two OAM protocols have unique objectives but are complementary to each other. Service OAM provides monitoring and troubleshooting of end-to-end Ethernet service instances, while Link OAM allows a provider to monitor and troubleshoot an individual Ethernet link.

MIB information for the Ethernet OAM commands is as follows:

Filename: AlcatelIND1Eoam.MIB
Module: Alcatel-IND1-ETHERNET-OAM-MIB

Filename: IETF_802_1ag.MI
Module: IEEE8021-CFM-MIB

A summary of the available commands is listed here:

EthOAM vlan Configuration Commands	**ethoam vlan**
EthOAM Domain Configuration Commands	**ethoam domain** **ethoam domain mhf** **ethoam domain id-permission**
EthOAM Management Association Configuration Commands	**ethoam association** **ethoam association mhf** **ethoam association id-permission** **ethoam association ccm-interval** **ethoam association endpoint-list** **clear ethoam statistics**
EthOAM Default-Domain Configuration Commands	**ethoam default-domain level** **ethoam default-domain mhf** **ethoam default-domain id-permission** **ethoam default-domain primary-vlan**
EthOAM Management Point Configuration Commands	**ethoam endpoint** **ethoam endpoint admin-state** **ethoam endpoint rfp** **ethoam endpoint ccm** **ethoam endpoint priority** **ethoam endpoint lowest-defect-priority**

ethoam vlan

Creates an association between Primary VID and Non-Primary VID(s).

ethoam vlan {*vlanid-list***} primary-vlan {***vlan-id***}**

no ethoam vlan {*vlanid-list***}**

Syntax Definitions

vlanid-list	VLAN Identifier List e.g. ‘10 30-40’ or ‘10’
vlan-id	VLAN Identifier e.g. ‘20’

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Each VLAN ID specified must be created before creating any association.
- Each VLAN ID specified must be between 1 and 4094.
- Each VLAN ID specified must be static.
- A Non-Primary VID can only be associated with single Primary VID only.
- Once Primary VID is associated with Non-Primary VID, then it can not be configured as Non-Primary VID. Its association must be removed before it is configured as Non-Primary VID.
- This CLI shall trigger Automip for this VLAN, if either ‘mhf’ is enabled for MA or default-MD with primary VLAN same as the primary VLAN of this VLAN.
- If the VLAN is deleted using VLAN CLI (no vlan <vid>) and VLAN is non-primary, then the entry for this VLAN in the VLAN table will be deleted. This shall in turn delete all MEPs and MIPs associated with it. If the deleted VLAN is primary VLAN, then all its associated VLAN entries in the VLAN table shall be deleted. This shall in turn delete all MAs on this deleted VLAN.
- Use the **no** form of this command to dissociate Primary VID from the Non-Primary VID(s).

Examples

```
-> ethoam vlan 10 primary-vlan 20
-> ethoam vlan 11-15 primary-vlan 20
-> ethoam vlan 30 40-50 primary-vlan 20
-> no ethoam vlan 10
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam vlan	Displays the Ethernet OAM statistics of all the Management Domains configured on the bridge.

MIB Objects

```
dot1agCfmVlanTable
   dot1agCfmVlanComponentId
   dot1agCfmVlanVid
   dot1agCfmVlanPrimaryVid
   dot1agCfmVlanRowStatus
```

ethoam domain

Creates an Ethernet domain with a specific name.

ethoam domain *name* **format {none | dnsname | mac-address-uint | string} level** *num*

no ethoam domain *name*

Syntax Definitions

name	Specifies the domain name used while creating the management domain for which this management association is created.
none	This format is supported for the inter-op with ITU-T Y.1731.
string	Character String.
mac-address-unit	MAC address + 2-octet (unsigned) integer.
dnsname	Domain Name like string, globally unique text string derived from a DNS name.
num	MD Level and it ranges from 0 to 7

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Maximum domain length is 43.
- Use format as ‘none’ for inter-op with ITU-T Y.1731.
- Domain name is unique in a system.
- Deletion of MD shall result in the deletion of all MAs, MEPs and MIPs configured in it.

Examples

```
-> ethoam domain MD format none level 3
-> ethoam domain MD1 format string level 4
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam	Displays the information of all the Management Domains (MD) configured on the bridge.
show ethoam domain	Displays the information of a specific Management Domain configured on the bridge.

MIB Objects

```
dot1agCfmMdTable
   dot1agCfmMdName
   dot1agCfmMdFromat
   dot1agCfmMdLevel
```

ethoam domain mhf

Configure the Message Handling Function (MHF) value for MD entry.

ethoam domain *name* **mhf {none** | **explicit** | **default}**

Syntax Definitions

name	Specifies the domain name used while creating the management domain for which this management association is created.
none	No MHFs can be created.
default	MHFs can be created.
explicit	MHFs can be created only if a MEP is created at some lower MD Level.

Defaults

parameter	default
none | explicit | default	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Domain must be created before it is modified.

Examples

```
-> ethoam domain MD mhf default
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam	Displays the information of all the Management Domains (MD) configured on the bridge.

MIB Objects

```
dot1agCfmMdTable
   dot1agCfmMdName
   dot1agCfmMdMhfCreation
```

ethoam domain id-permission

Configures the ID-permission value for MD entry.

ethoam domain *name* **id-permission {none | chassisid}**

Syntax Definitions

name	Specifies the domain name used while creating the management domain for which this management association is created.
none	Sender ID TLV is not to be sent.
chassisid	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.System name shall be filled as Chassis ID.

Defaults

parameter	default
none | chassisid	**none**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Domain must be created before it is modified.

Examples

```
-> ethoam domain MD id-permission chassisid
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam default-domain configuration	Displays the values of scalar Default-MD objects.
show ethoam domain	Displays the information of a specific Management Domain configured on the bridge.

MIB Objects

```
dot1agCfmMdTable
   dot1agCfmMdName
   dot1agCfmMdIdPermission
```

ethoam association

Creates Maintenance Association (MA) entry.

ethoam association *ma_name* **format {vpnid | unsignedint | string | primaryvid | icc-based} domain** *md_name* **primary-vlan** *vlan-id*

no ethoam association *ma_name* **domain** *md_name*

Syntax Definitions

ma_name	Association name for the created Ethernet OAM Association.
vpnid	As specified in RFC 2685 VPN ID.
unsignedint	2-octet unsigned integer.
string	Character String.
primaryvid	Primary VLAN ID (12 bits represented in a 2-octet integer).
icc-based	This format is supported for inter-op with ITU-T.
md_name	Specifies the domain name used while creating the management domain for which this management association is created.
vlan-id	Primary VLAN Identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Maximum association name is name 44 minus the length of its domain name.
- Use format as ‘icc-based’ to inter-op with ITU-T Y.1731.
- Domain must be created before the creation of MA.
- VLAN must be created before the creation of MA.
- VLAN specified must be a primary VID.
- VLAN ID specified must be between 1 and 4094.
- Deletion of MA shall result in the deletion of MIPs and MEPs (on primary and non-primary VLAN) configured in it.

Examples

```
-> ethoam association MA format string domain MD primary-vlan 100
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam domain association	Displays the information of a specified MA in a Management Domain configured on the bridge.

MIB Objects

```
dot1agCfmMaNetTable
   dot1agCfmMaNetFormat
   dot1agCfmMaNetName
   dot1agCfmMaNetRowStatus
dot1agCfmMaCompTable
   dot1agCfmMaComponentId
   dot1agCfmMaCompPrimaryVid
   dot1agCfmMaCompRowStatus
```

ethoam association mhf

Configures the MIP Half Function (MHF) value for MA Entry.

ethoam association *ma_name* **domain** *md_name* **mhf {none | default | explicit | defer}**

Syntax Definitions

ma_name	Association name for the created Ethernet OAM Association.
md_name	Specifies the domain name used while creating the management domain for which this management association is created.
none	No MHFs can be created.
default	MHFs can be created.
explicit	MHFs can be created only if a MEP is created at some lower MD Level.
defer	The creation of MHFs is determined by the corresponding MD object 'dot1agCfmMdMhfCreation'.

Defaults

parameter	default
none | explicit | default | defer	**defer**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- MA must be created before it is modified.
- On modification of 'mhf' for any MA, Automip shall also be invoked for all VLANS associated with this primary VID.

Examples

```
-> ethoam association MA domain MD mhf-creation defer
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam domain association	Displays the information of a specified MA in a Management Domain configured on the bridge.
show ethoam default-domain	Displays the information of the default MA.

MIB Objects

```
dot1agCfmMaNetTable
   dot1agCfmMaNetName
dot1agCfmMaCompTable
   dot1agCfmMaCompMhfCreation
```

ethoam association id-permission

Configure id-permission value for MA Entry.

ethoam association *ma_name* **domain** *md_namemd_name* **id-permission {none | chassisid | defer}**

Syntax Definitions

md_name	Association name for the created Ethernet OAM Association.
ma_namema_name	Specifies the domain name used while creating the management domain for which this management association is created.
none	Sender ID TLV is not to be sent.
chassisid	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.
defer	The contents of the Sender ID TLV are determined by the corresponding MD object ‘dot1agCfmMdIdPermission’.

Defaults

parameter	default
none |chassisid | defer	**defer**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

MA must be created before it is modified.

Examples

```
-> ethoam association MA domain MD id-permission defer
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam domain association	Displays the information of a specified MA in a Management Domain configured on the bridge.
show ethoam domain	Displays the information of a specific Management Domain configured on the bridge.

MIB Objects

```
dot1agCfmMaNetTable
   dot1agCfmMaNetName
dot1agCfmMaCompTable
   dot1agCfmMaCompMIdPermission
```

ethoam association ccm-interval

Modifies the Continuity Check Message (CCM) transmission interval of an Ethernet OAM Maintenance Association.

ethoam association *association_name* **domain {***domain_name* | *mac_address***} ccm-interval {interval-invalid | interval100ms | interval1s** | **interval10s** | **interval1m** | **interval10m}**

Syntax Definitions

ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain** command on page 45-5.
interval-invalid	Specifies that no CCMs are sent by a MEP
interval100ms	Specifies the CCMs are sent every 100 milli seconds.
interval1s	Specifies that CCMs are sent every 1 second.
interval10s	Specifies that CCMs are sent every 10 seconds.
interval1m	Specifies that CCMs are sent every minute.
interval10m	Specifies that CCMs are sent every 10 minutes.

Defaults

parameter	default
interval-invalid | **interval100ms** | **interval1s** | **interval10s** | **interval1m** | **interval10m**	**interval10s**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The *ma_name* should be unique amid all those used by or available to the service provider within a domain.

Examples

```
-> ethoam association MA domain MD ccm-interval interval10s
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam domain	Displays the information of a specific Management Domain configured on the bridge.

MIB Objects

```
dot1agCfmMaNetTable
   dot1agCfmMaNetName
dot1agCfmMaCompTable
   dot1agCfmMaCompMIdPermission
```

ethoam association endpoint-list

Modifies the MEP list of an Ethernet OAM Maintenance Association.

ethoam association *ma_name* **domain {***md_name* | *mac_add***} endpoint-list** *mep_id***[**-*mep_id2***]**

no ethoam association *ma_name* **domain {***md_name* | *mac_add***} endpoint-list** *mep_id***[**-*mep_id2***]**

Syntax Definitions

ma_name	Name of the Ethernet OAM Association. Up to 48 (minus domain name length) characters may be used.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain** command on page 45-5
mac_add	Specifies the CFM system MAC address.
mep_id	Specifies the MEP number.
mep_id2	Last MEP number in a range of MEPs to configure.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the MEP list.
- Note that only the MEP that is associated with the MEP list of the MA can be configured locally on the bridge or monitored remotely.
- The *ma_name* should be unique within a domain.

Examples

```
-> ethoam association MA domain MD endpoint-list 100-200
-> no ethoam association MA domain MD endpoint-list 100-200
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam domain association	Displays the information of a specified MA in a Management Domain configured on the bridge.

MIB Objects

```
dot1agCfmMdTable
    dot1agCfmMdName
dot1agCfmMaNetTable
    dot1agCfmMaNetName
Dot1agCfmMaMepList
    dot1agCfmMaMepListIdentifier
    dot1agCfmMaMepListRowStatus
```

clear ethoam statistics

Clear statistics for all MEPs or for a particular MEP.

clear ethoam statistics [domain *md_name* **association** *ma_name* **endpoint** *mep-id***]**

Syntax Definitions

md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain** command on page 45-5
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus domain name length) characters may be used.
mep-id	MEP Identifier. Valid Range is 1-8191.

Defaults

By default, statistics for all MEPs are cleared.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the optional **domain**, **association**, and **endpoint** keywords to clear statistics for a specific MEP.

Examples

```
-> clear ethoam statistics
-> clear ethoam statistics domain MD association MA endpoint 10
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam statistics	Displays the statistics of all the MAs and matching MEPs for all the MDs.

MIB Objects

```
dot1agCfmMdTable
      dot1agCfmMdName
  dot1agCfmMaNetTable
      dot1agCfmMaNetName
  dot1agCfmMepTable
      dot1agCfmMepIdentifier
      alaCfmMepClearStats
  alaCfmGlobalClearStats
```

ethoam default-domain level

Configures the effective level of all default domain entries with the level value set to **no level**.

ethoam default-domain level {*num***}**

no ethoam default-domain

Syntax Definitions

num	The MD level. The valid range is 0-7.

Defaults

Default value is 0.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ethoam default-domain level 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam default-domain configuration	Displays the values of scalar Default-MD objects.

MIB Objects

```
Dot1agCfmDefaultMdLevel
```

ethoam default-domain mhf

Configure the effective MHF value for all default domain entries with MHF value set to **defer**.

ethoam default-domain mhf {none | default | explicit}

no ethoam default-domain

Syntax Definitions

none	No MHFs can be created.
default	MHFs can be created.
explicit	MHFs can be created only if a MEP is created at some lower MD Level. Defaults

Defaults

Default value is none.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ethoam default-domain mhf default
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam default-domain configuration	Displays the values of scalar Default-MD objects.

MIB Objects

```
dot1agCfmDefaultMdDefMhfCreation
```

ethoam default-domain id-permission

Configures the effective ID permission value for all default domain entries with the ID permission value set to **defer**.

ethoam default-domain id-permission {none | chassisid}

no ethoam default-domain

Syntax Definitions

none	Sender ID TLV is not to be sent.
chassisid	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.

Defaults

Default value is none.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ethoam default-domain id-permission chassisid
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam default-domain configuration	Displays the default domain configuration.

MIB Objects

```
dot1agCfmDefaultMdDefIdPermission
```

ethoam default-domain primary-vlan

Configures the default domain settings for the specified primary VLAN.

ethoam default-domain primary-vlan {*vlan-id***} [level {no-level | *num*}] [mhf {none | default | explicit | defer}] [id-permission {none | chassisid | defer}]**

no ethoam default-domain

Syntax Definitions

vlan-id	VLAN Identifier.
no-level	MD level is inherited from the default domain level.
num	MD Level. Valid range is 0 to 7.
none	No MHFs can be created.
default	MHFs can be created.
explicit	MHFs can be created only if a MEP is created at some lower MD Level.
defer	MHF defers to the default domain MHF value.
none	Sender ID TLV is not to be sent.
chassisid	Chassis ID Length, Chassis ID Subtype and Chassis ID TLV are to be present.
defer	ID permission defers to the default domain ID permission value.

Defaults

parameter	default
no-level | *num*	**no-level**
none | **explicit** | **default** | **defer**	**defer**
none | **chassisid** | **defer**	**defer**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

On modification of MHF for any primary VID, Automip is invoked for all VLANS associated with this primary VID.

Examples

```
-> ethoam default-domain primary-vlan 10 id-permission chassid level 3 mhf default.
-> ethoam default-domain primary-vlan 10 id-permission chassid
-> ethoam default-domain primary-vlan 10 level 3
-> ethoam default-domain primary-vlan 10 mhf default
-> ethoam default-domain primary-vlan 10 level 3 mhf default
```

Release History

Release 8.1.1; command was introduced..

Related Commands

show ethoam default-domain	Displays the information of all the default MD.

MIB Objects

```
dot1agCfmDefaultMdTable
   dot1agCfmDefaultMdComponentId
   dot1agCfmDefaultMdPrimaryVid
   dot1agCfmDefaultMdLevel
```

ethoam endpoint

Creates a Maintenance End Point (MEP) and virtual MEP.

ethoam endpoint *mep-id* **domain** *md_name* **association** *ma_name* **direction { up | down }**
{port {*chassis//slot/port* **| virtual | linkagg** *agg_id***} [primary-vlan** *vlan_id***]**

no ethoam endpoint *mep-id* **domain** *md_name* **association** *ma_name*

Syntax Definitions

mep_id	Specifies the Maintenance Association End Point. The valid range is 1–8191.
md_name	Specifies the domain name used while creating the management domain for which this management association is created.
ma_name	Association name for the created Ethernet OAM Association.
up	For UP MEP.
down	For DOWN MEP.
chassis	The chassis identifier.
slot/port	Physical slot and port number on which MEP needs to be created.
virtual	Keyword for creating virtual MEP.
agg_id	Linkagg Identifier on which MEP needs to be created.
vlan_id	VLAN identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a maintenance endpoint.
- The *mep_id* must be unique amid all those used by or available to the service provider in the specified MA.
- The direction for virtual MEP must always be up.
- For creating a virtual MEP the value of port must be given the keyword “virtual”.

Examples

```
-> ethoam endpoint 10 domain MD association MA direction up port 1/1
-> ethoam endpoint 10 domain MD association MA direction down linkagg 1
-> ethoam endpoint 10 domain MD association MA direction down linkagg 1 vlan 10
-> ethoam endpoint 1 domain md1 association ma1 direction up port virtual primary-
vlan 100
-> no ethoam endpoint 10 domain MD association MA
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam domain association end-point	Displays the information of a specific MEP in a Management Domain configured on the bridge.

MIB Objects

   dot1agCfmMepIdentifier
   dot1agCfmMepDirection
   dot1agCfmMepIfIndex
   dot1agCfmMepPrimaryVid
```

ethoam endpoint admin-state

Configures the administrative state of MEP.

ethoam endpoint *mep_id* **domain {***md_name* | *mac_address***} association** *ma_name* **admin-state {enable | disable}**

Syntax Definitions

mep_id	Specifies the Maintenance Association End Point. The valid range is 1–8191.
md_name	Specifies the domain name used while creating the management domain for which this management association is created.
mac_address	Specifies the CFM system MAC address.
ma_name	Association name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
enable	Administratively enables MEP.
disable	Administratively disables MEP.

Defaults

The default value is disable.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The *mep_id* specified must already exist in the switch configuration.

Examples

```
-> ethoam endpoint 100 domain MD association MA admin-state enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam domain association end-point	Displays the information of a specific MEP in a Management Domain configured on the bridge.

MIB Objects

```
Dot1agCfmMep
   dot1agCfmMepIndex
   dot1agCfmMepIdentifier
   dot1agCfmMepDirection
   dot1agCfmMepPortNumber
   dot1agCfmMepMacAddress
   dot1agCfmMepAdminStatus
   dot1agCfmMepFngState

ethoam endpoint rfp

Enables or disables the Remote Fault Propagation (RFP) on MEP.

ethoam endpoint *mep_id* **domain {***md_name* | *mac_address***} association** *ma_name* **rfp {enable | disable}**

Syntax Definitions

mep_id	Specifies the Maintenance Association End Point. The valid range is 1–8191.
md_name	Specifies the domain name used while creating the management domain for which this management association is created.
mac_address	Specifies the CFM system MAC address.
ma_name	Association name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
enable	Administratively enables RFP on MEP.
disable	Administratively disables RFP on MEP.

Defaults

The default value of RFP is disable.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The *mep_id* specified must already exist in the switch configuration.
- The domain and association must be created before RFP can be enabled.
- The MEP must be an UP MEP. If down MEP is specified, CLI returns with an error.
- The admin state of the MEP must be enabled in order to report faults.
- RFP cannot be enabled on virtual UP MEP since it is not associated with a physical interface.
- It is recommended that if RFP is enabled on a port, then any other violation feature (Link Monitoring or Link Fault Propagation) should not be configured.
- It is recommended that if RFP is enabled on a port, then automatic recovery is disabled for that port.
- If Link Monitoring is configured on a RFP enabled port, then the wait-to-restore timer must be less than the CCM interval.

Examples

```
-> ethoam endpoint 1 domain md1 association ma1 rfp enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam domain association end-point	Displays the information of a specific MEP in a Management Domain configured on the bridge.

   dot1agCfmRfpEnabled
```

ethoam endpoint ccm

Configures the MEP to generate Continuity Check Messages (CCM).

ethoam endpoint *mep_id* **domain {***md_name* | *mac_address***} association** *ma_name* **ccm {enable | disable}**

Syntax Definitions

mep_id	Specifies the Maintenance Association End Point. The valid range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
mac_address	Specifies the CFM system MAC address.
ma_name	Name of the Ethernet OAM association. Up to 48 (minus the domain name length) characters may be used.
enable	Enables MEP to generate CCMs.
disable	Disables MEP to generate CCMs.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The *mep_id* should be unique amid all those used by or available to the service provider in the specified MA.

Examples

```
-> ethoam endpoint 100 domain MD association MA ccm enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam domain association end-point	Displays the information of a specific MEP in a Management Domain configured on the bridge.

```

ethoam endpoint priority

Configures the priority values for CCMs and Linktrace Messages (LTMs) transmitted by a MEP.

ethoam endpoint *mep_id* **domain {***md_name* | *mac_address***} association** *ma_name* **priority** *ccm_ltm_priority*

Syntax Definitions

mep_id	Specifies the Maintenance Association End Point. The valid range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain** command on page 45-5.
mac_address	Specifies the CFM system MAC address.
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
ccm_ltm_priority	Priority value for CCMs and LTMs transmitted by the MEP. The valid range is 0–7.

Defaults

parameter	default
ccm_ltm_priority	7

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The *mep_id* should be unique amid all those used by or available to the service provider in the specified MA.

Examples

```
-> ethoam endpoint 100 domain MD association MA priority 6
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ethoam endpoint lowest-defect-priority

Configures the lowest priority fault alarm for the lowest priority defect for an MEP.

ethoam endpoint *mep_id* **domain {***md_name* | *mac_address***} association** *ma_name* **lowest-defect-priority** *lowest_defect_priority*

Syntax Definitions

mep_id	Specifies the Maintenance Association End Point. The valid range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain** command on page 45-5.
mac_address	Specifies the CFM system MAC address.
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
lowest_defect_priority	The lowest defect priority that can generate a Fault alarm. Possible values are **xcon**, **rem-err-xcon**, **no-defect**, **mac-rem-err-xcon**, **err-xcon**, and **all-defect**.

Defaults

parameter	default
lowest_defect_priority	**mac-rem-err-xcon**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The *mep_id* should be unique amid all those used by or available to the service provider in the specified MA.

Examples

```
-> ethoam endpoint 100 domain esd.alcatel-lucent.com association alcatel-sales
lowest-defect-priority all-defect
```

ethoam linktrace

Enables the maintenance entity to initiate transmitting Link Trace Messages (LTM).

ethoam linktrace {target-macaddress *mac_address* **| target-endpoint** *t_mepid***} source-endpoint** *s_mepid* **domain {***md_name* | *mac_address***} association** *ma_name* **[flag [fdb-mpdb | fdbonly]] [hop-count** *hop_count***]**

Syntax Definitions

mac_address	Target MAC address to be transmitted.
t_mepid	Specifies the MEP for which the Loopback message is targeted.
s_mepid	Specifies the MEP that transmits the Loopback message. The valid range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
domain *mac_address*	Specifies the CFM system MAC address.
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
fdbonly	Specifies that only the MAC addresses learned in a bridge's active data forwarding table will be used to decide the egress port.
hop_count	Indicates the number of hops remaining in this LTM. Each bridge that handles the LTM decreases the value by 1. This decreased value is returned to the LTM. The valid range is 1–2^32.

Defaults

parameter	default
flag	**fdbonly**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command allows an operator to generate a LTM for the specified MEP.
- This command signals the MEP that it should transmit a Linktrace message and detect the presence or lack of the corresponding Linktrace messages.

Examples

```
-> ethoam linktrace target-macaddress 10:aa:ac:12:12:ad source 4 domain MD
association flag fdbonly hop-count 32
Transaction Id: 6943
-> ethoam linktrace target-endpoint 15 source 4 domain MD association
Transaction Id: 6934
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam domain	Displays the information of a specified Management Domain configured on the bridge.

   dot1agCfmMepTransmitLtmTargetIsMepId
   dot1agCfmMepTransmitLtmTtl
   dot1agCfmMepTransmitLtmResult
   dot1agCfmMepTransmitEgressIdentifier
```

ethoam loopback

Initiates the transmission of loopback messages from the specified source MEP to the specified target MEP or MAC address. Also triggers the source MEP to detect the presence or lack of a corresponding loopback reply from the target.

ethoam loopback {target-endpoint *t_mepid* **| target-macaddress** *mac_add***} source-endpoint** *s_mepid* **domain** *md_name* **association** *ma_name* **[number** *num***] [data** *string***] [vlan-priority** *vlan_priority***] [drop-eligible {true | false}]**

Syntax Definitions

t_mepid	Specifies the MEP for which the Loopback message is targeted. The valid range is 1-8191.
mac_add	Target MAC address to be transmitted.
s_mepid	Specifies the MEP that transmits the Loopback message. The valid range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain**.
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.
num	Number of loopback messages. Valid range is 1–10.
string	Specifies the amount of data to be included in the Data Type Length Value (TLV), if the Data TLV is selected to be sent. The valid range is 1–255.
vlan_priority	VLAN Priority. Valid range is 0–7.
true	Sets the drop eligibility bit in the VLAN tag to true.
false	Sets the drop eligibility bit in the VLAN tag to false.

Defaults

parameter	default
num	1
vlan_priority	CCM priority
drop-eligible {true | false}	**true**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Source and target MEP-ID, MD and MA must already exist before loopback is initiated.
- If data TLV is not set, then it is not sent in the loopback message.

Examples

```
-> ethoam loopback target-endpoint 10 source-endpoint 20 domain MD association MA
number 3
Reply from 00:0E:B1:6B:43:89: bytes=64 seq=0 time=100ms

```

ethoam fault-alarm-time

Configures the timeout value for the Fault Notification Generation Alarm time that specifies the time interval during which one or more defects should be detected before the fault alarm is issued.

ethoam fault-alarm-time *centiseconds* **endpoint** *endpoint_id* **domain {***md_name* **|** *mac_address***} association** *ma_name*

no ethoam fault-alarm-time endpoint *endpoint_id* **domain {***md_name* **|** *mac_address***} association** *ma_name*

Syntax Definitions

centiseconds	The Fault Notification Generation Alarm timeout value, in centi seconds. The valid range is 250–1000.
endpoint_id	Specifies the MEP of a specific MA. The valid range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam domain** command on page 45-5.
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.

Defaults

parameter	default
centiseconds	250

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to restore the Fault Notification Generation Alarm timeout value to the default value.
- The Fault Notification Generation Alarm timeout value is configurable per MEP.

Examples

```
-> ethoam fault-alarm-time 500 endpoint 100 domain esd.alcatel-lucent.com
association alcatel_sales
-> no ethoam fault-alarm-time endpoint 100 domain esd.alcatel-lucent.com
association alcatel_sales
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam domain association end-point	Displays the information of a specific MEP in a Management Domain configured on the bridge.

MIB Objects

```
Dot1agCfmMep
   dot1agCfmMepFngAlarmTime
```

ethoam fault-reset-time

Configures the timer value for the Fault Notification Generation Reset time that specifies the time interval during which the fault alarm is re-enabled to process faults. The fault alarm will only be re-enabled if no new faults are received during this time interval.

ethoam fault-reset-time *centiseconds* **endpoint** *endpoint_id* **domain {***mac_address* | *md_name***} association** *ma_name*

no ethoam fault-reset-time endpoint *endpoint_id* **domain {***mac_address* | *md_name***} association** *ma_name*

Syntax Definitions

centiseconds	The Fault Notification Generation Reset timer value, in centi seconds. The valid range is 250–1000.
mep_id	Specifies the MEP of a specific MA. The valid range is 1–8191.
md_name	Specifies the domain name. For more information on the different formats of the domain name, refer to **ethoam vlan** command on page 45-3.
ma_name	Name of the Ethernet OAM Association. Up to 48 (minus the domain name length) characters may be used.

Defaults

parameter	default
centiseconds	1000

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to restore the Fault Notification Generation Reset timeout value to the default value.
- The Fault Notification Generation Reset timer value is configurable per MEP.

Examples

```
-> ethoam fault-reset-time 250 end-point 100 domain esd.alcatel-lucent.com
association alcatel_sales
-> no ethoam fault-reset-time end-point 100 domain esd.alcatel-lucent.com
association alcatel_sales
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ethoam fault-alarm-time	Configures the timeout value for the Fault Notification Generation Alarm time.
show ethoam domain association end-point	Displays the information of a specific MEP in a Management Domain configured on the bridge.

MIB Objects

```

   dot1agCfmMepFngResetTime
```

ethoam one-way-delay

Initiates a one-way-delay measurement (1DM) to determine the one-way frame delay (latency) and delay variation (jitter) between two MEPs.

ethoam one-way-delay {target-endpoint *t_mepid* **| target-macaddress** *mac_address***} source-endpoint** *s_mepid* **domain** *md_name* **association** *ma_name* **[vlan- priority** *vlan_priority***]**

Syntax Definitions

t_mepid	Target MEP-ID. Valid Range 1-8191.
mac_address	Target MAC-Address.
s_mepid	Source MEP-ID. Vaild Range 1-8191.
md_name	The maintenance domain name.
ma_name	The maintenance association name.
vlan_priority	VLAN Priority. Valid Range is 0-7.

Defaults

parameter	default
vlan_priority	7

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Source MEP-ID, MD and MA must be created before initiating 1DM.
- When **target-endpoint** is specified then entry must be present in the RMEP table, no matter if its status is RMEP_OK or RMEP_FAILED, before initiating 1DM. So **target-macaddress** can be used to bypass such a restriction.
- Although the OmniSwitch implementation of Ethernet frame delay measurement (ETH-DM) is compliant with ITU-T Y.1731, delay measurement can be performed for both ITU-T Y.1731 and IEEE 802.1ag MEPs.
- If the 1DM is initiated with a **target-macaddress** and an egress port is found for this MAC address, then the 1DM frames are transmitted from that port. Otherwise, 1DM frames are flooded in the MEP's VLAN.
- One-way delay measurement requires NTP clock synchronization between the sending and receiving MEPs.

Examples

```
-> ethoam one-way-delay target-endpoint 10 source-endpoint 12 domain MD association
MA vlan-priority 4
-> ethoam one-way-dealy target-macaddress 00:e0:b1:6a:52:4c source-endpoint 12
domain MD association MA vlan-priority 4
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam one-way-delay	Displays the one-way-delay and jitter parameters for all entries or for the MAC address of a specific MEP.

    alaCfmMepOWDTMacAddress
    alaCfmMepOWDTMepIdentifier
    alaCfmMepOWDTPriority
```

ethoam two-way-delay

Initiate a two-way-delay measurement to determine the round-trip latency and jitter between two MEPs. The initiating MEP sends delay measurement message (DMM) frames to the receiving MEP. The receiving MEP responds with delay measurement reply (DMR) frames.

ethoam two-way-delay {target-endpoint *t_mepid* **| target-macaddress** *mac_address***} source-endpoint** *s_mepid* **domain** *md_name* **association** *ma_name* **[vlan- priority** *vlan_priority***]**

Syntax Definitions

t_mepid	Target MEP-ID. Valid Range 1-8191.
mac_address	Target MAC-Address.
s_mepid	Source MEP-ID. Vaild Range 1-8191.
md_name	The maintenance domain name.
ma_name	The maintenance association name.
vlan_priority	VLAN Priority. Valid Range is 0-7.

Defaults

parameter	default
vlan-priority	7

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Source MEP-ID, MD and MA must be created before initiating a two-way delay measurement.
- When **target-endpoint** is specified then entry must be present in the RMEP table, no matter if the status is RMEP_OK or RMEP_FAILED, before initiating two-way-delay. So **target-macaddress** can be used to bypass such a restriction.
- The CLI console will pause until all DMRs are received or maximum of 3 seconds to ensure that all the DMRs have been returned. If the operation fails, then the appropriate message is displayed. If the operation is successful, no message is displayed.
- If the DMM is initiated by UP MEP with a **target-macaddress** and the egress port is found for this MAC address, then DMM frames are transmitted from that port. Otherwise, DMM frames are flooded in the MEP's VLAN.
- Two-way delay measurement does *not* require NTP clock synchronization on the sending and receiving MEPs.
- Although the OmniSwitch implementation of Ethernet frame delay measurement (ETH-DM) is compliant with ITU-T Y.1731, delay measurement can be performed for both ITU-T Y.1731 and IEEE 802.1ag MEPs.

- This command initiates an on-demand OAM performance measurement. To set up continuous two-way delay measurement, see the “Service Assurance Agent Commands” chapter for information about how to configure a SAA for continuous two-way frame delay measurement.

Examples

```
-> ethoam two-way-delay target-endpoint 10 source-endpoint 12 domain MD associa-
tion MA vlan-priority 4
Reply from 00:0E:B1:6B:43:89 delay=2584us jitter=282us
-> ethoam two-way-delay target-macaddress 00:e0:b1:6a:52:4c source-endpoint 12
domain MD association MA vlan-priority 4
Reply form 00:E0:B1:6A:52:4C: delay=2584us jitter=282us
```

Release History

Release 8.1.1; command was introduced.

Related Commands

```

show ethoam

Displays the information of all the Management Domains (MD) configured on the bridge.

show ethoam

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays all the MAs for all the MDs.

Examples

```
-> show ethoam
System Configuration
  Ethernet OAM system mac address: 00:D0:95:EC:84:B0,
  Number of Maintenance Domains: 1
    Maintenance Domain: esd.alcatel-lucent.com
        Maintenance Association: alcatel-sales
```

output definitions

Ethernet OAM system mac address	The MAC address of the Ethernet OAM system.
Number of Maintenance Domains	The number of maintenance domains configured on the bridge.
Maintenance Domain	The name of the maintenance domain.
Maintenance Association	The name of the maintenance association.

Release History

Release 8.1.1; command was introduced.

Related Commands

ethoam domain	Creates an Ethernet domain with a specific name.

```

show ethoam domain

Displays the information of a specific Management Domain configured on the bridge.

show ethoam domain *md_name*

Syntax Definitions

md_name	Specifies the domain name used while creating the management domain for which this management association is created.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ethoam domain MD
Total number of MAs configured in this MD = 1
MD Attributes
  MD-Format : string,
  MD-Level : level-3,
  MD-MHFstatus : mhfNone,
  MD-IdPermission : sendIdNone
    Maintenance Association : MA
      MA-Format : string,
      Primary Vlan : 199,
      Associated Vlan-list : none,
      Total Number of Vlans : 1,
      MA-MHFstatus : mhfNone,
      MA-IdPermission : sendIdNone,
      CCM-interval : interval10s,
      MEP-List(MEP-Id) : 10
```

output definitions

MD-level	The level at which the MD was created.
MD-MHFstatus	Indicates whether the maintenance entity can create MHFs for this MD. Options include **none, explicit,** or **default**.
Maintenance Association	The name of the maintenance association.
Vlan	The VLAN ID monitored by this MA. If the MA is not attached to any VLAN, 0 will be displayed.
MA-MHFstatus	Indicates whether the maintenance entity can create MHFs for this MA. Options include **none, explicit,** or **default**.

output definitions (continued)

CCM-interval	The interval between the CCM transmissions.
MEP-Id	Indicates the Maintenance End Point.

Release History

Release 8.1.1; command was introduced.

Related Commands

Fault Alarm Time : 250,
Fault Reset Time : 1000,
Lowest PrDefect Allowed : DEF_MAC_REM_ERR_XCON,
Highest PrDefect Present : DEF_NONE
```

output definitions

Admin State	Indicates the administrative state **(up** or **down**) of the MEP.
Direction	The direction of the MEP.

output definitions (continued)

Slot/Port	The slot/port number of the Bridge port to which the MEP is attached. If the value is virtual, it indicates a virtual port.
MAC Address	The MAC address of the MEP.
Fault Notification	Indicates the current state of the MEP Fault Notification Generator State Machine, which can be **FNG_RESET**, **FNG_DEFECT**, **FNG_REPORT_DEFECT**, **FNG_DEFECT_REPORTED**, or **FNG_DEFECT_CLEARING**.
RFP Status	Indicates the status of the RFP.
CCM Enabled	Indicates whether the MEP generates CCMs (**enabled**) or not (**disabled**).
CCM Linktrace Priority	Indicates the priority value for CCMs and LTMs transmitted by the MEP.
CCM Not Received	Indicates if CCMs are not being received (**true**) or received (**false**) from at least one of the configured remote MEPs.
CCM Error defect	Indicates if a stream of erroneous CCMs is being received (**true**) or not (**false**) from a MEP in this MA.
CCM Xcon defect	Indicates if a stream of CCMs is being received (**true**) or not (**false**) from a MEP that belongs to another MA.
MEP RDI Received	Indicates that any other MEP in this MA is transmitting the RDI bit. Options include **true** or **false**.
MEP Last CCM Fault	The last-received CCM that triggered a MA fault.
MEP Xcon Last CCM Fault	The last-received CCM that triggered a cross-connect fault.
MEP Error Mac Status	Indicates a port status TLV. Options include **true** or **false**.
MEP Lbm NextSeqNumber	The next Transaction Identifier or Sequence Number to be sent in an LBM.
MEP Ltm NextSeqNumber	The next Transaction Identifier or Sequence Number to be sent in an LTM.
Fault Alarm Time	The time interval during which one or more defects should be detected before the fault alarm is issued
Fault Reset Time	The time interval during which the fault alarm is re-enabled to process faults
Lowest PrDefect Allowed	The lowest priority defect that allowed to generate fault alarm.
Highest PrDefect Present	The highest priority defect since the MEPs Fault Notification Generator in reset state.

Release History

Release 8.1.1; command was introduced.

Related Commands

ethoam endpoint	Creates an Ethernet OAM Maintenance End Point in the specified MA.
ethoam endpoint admin-state	Configures the administrative state of MEP.

show ethoam default-domain configuration

Displays the level, MHF, and ID permission values for the default domain.

show ethoam default-domain configuration

Syntax Definitions

N/A

Defaults

N/A.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ethoam default-domain configuration
Level : 3,
MHF-Creation : mhfdefault,
ID-Permission : sendIdnone
```

output definitions

Level	The level assigned to the default domain. Configured through the **ethoam default-domain level** command.
MHF-creation	Indicates the MHF value for a VLAN that is part of the default MD Options include **none**, **explicit**, or **default**. Configured through the **ethoam default-domain mhf** command.
ID-Permission	The ID permision of the default domain. Configured through the **ethoam default-domain id-permission** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

show ethoam default-domain	Displays the primary VLAN configuration for the default domain.

```

show ethoam default-domain

Displays all the default MD information for all the primary VLANs or for a specific primary VLAN.

show ethoam default-domain [primary-vlan *vlan_id***]**

Syntax Definitions

vlan_id	The primary VLAN ID.

Defaults

By default, the default MD information for all primary VLANs is displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the *vlan_id* parameter with this command to view information about the default MD for a specific primary VLAN.

Examples

```
-> show ethoam default-domain

Primary-Vlan   Mhf-creation    Level      Id-Permission Status
--------------+-------------+-----------+--------------+--------
      1        mhfDefer       no-level    sendIdDefer    true
      10       mhfDefault         3       sendIdNone     true

-> show ethoam default-domain primary-vlan 10
Primary-Vlan   Mhf-creation    Level      Id-Permission  Status
--------------+-------------+-----------+--------------+--------
      10        mhfDefault        3       sendIdNone     true
```

output definitions

Primary Vlan	The primary VLAN ID of the default MD.
Mhf-creation	The primary VLAN ID MHF value (**none**, **explicit**, or **default**).
Level	The primary VLAN level (**no-level**, **0–7**).
Id-Permission	The primary VLAN ID permission (**none**, **chassid**, or **defer**).

Release History

Release 8.1.1; command was introduced.

Related Commands

ethoam default-domain primary-vlan	Modifies the default domain for the specified primary VLAN.

show ethoam remote-endpoint domain

Displays the information of all remote MEPs learned as a part of the CCM message exchange.

show ethoam remote-endpoint domain *md_name* **association** *ma_name* **end-point** *s_mepid* **[remote-mep** *r_mepid***]**

Syntax Definitions

md_name	Specifies the domain name.
ma_name	Specifies the name of the Ethernet OAM Association.
s_mepid	Specifies the MEP of a specific MA. The valid range is 1–8191.
r_mepid	The remote MEP. The valid range is 1–8191.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ethoam remote-endpoint domain MD association MA endpoint 10
Legends: PortStatusTlv: 1 = psBlocked, 2 = psUp, 0 = psNoTlv
         InterfaceStatusTlv: 1 = ifUp, 2 = ifDown, 4 = ifUnknown, 0=ifNoTlv

RMEP-ID RMEP     OkFailed  Mac Address    port I/f   RDI   Ch-id  Ch-id
        Status    Time                   Tlv  Tlv  value Subtype

  30   RMEP_OK   334600 00:E0:B1:6E:41:64  2   1   false LCL-ASND DUT-2
```

output definitions

MEP-ID	Indicates the Maintenance End Point.
RMEP Status	The operational state of the remote MEP Remote State machines for this MEP, which can be **RMEP_IDLE**, **RMEP_START**, **RMEP_FAILED**, or **RMEP_OK**.
OkFailed Time	The time (SysUpTime) when the Remote MEP state machine last entered either the **RMEP_FAILED** or **RMEP_OK**.
MacAddress	The MAC address of the remote MEP.

output definitions (continued)

Port Status Tlv	The MAC status TLV last received.
I/f Status Tlv	The interface status TLV last received.

```
Note: - Output shown above is not accurate as it is adjusted to display it in the
single row. Following are modified:
P/S Tlv - Port Status Tlv
I/F Tlv - I/F Status Tlv
Ch-id Subtype - Chassis ID Subtype
Ch-id - Chassis ID
LCL-ASND - LOCALLY_ASSIGNED
```

show ethoam cfmstack

Displays the contents of CFM Stack Managed Object, which determines the relationships among MEPs and MIPs on a specific bridge port.

show ethoam cfmstack {port *chassis//slot/port* **| virtual | linkagg** *agg_num***}**

Syntax Definitions

chassis/slot/port	The chassis ID, slot, and port number (3/1/1) for a specific port.
virtual	Virtual port.
agg_num	The aggregate ID for which the contents of the configured MEP or MIP will be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ethoam cfmstack port 1/3
Up MHF Configured:

  Maintenance Domain: esd.alcatel-lucent.com,
  MD-level: 3

Down MHF Configured:
  Vlan-id: 100,
  Direction: down,
  MAC-Address: 00:D0:95:F6:33:DA,
  Maintenance Association: alcatel-sales,
  Maintenance Domain: esd.alcatel-lucent.com,
  MD-level: 3

-> show ethoam cfmstack port virtual
MEP-Id 32 - Vlan 30:
  Direction: up,
  MAC-Address: 00:E0:B1:A5:F2:34,
  Maintenance Association: MA4,
  Maintenance Domain: MD4,
  MD-level: 4
```

output definitions

Vlan-id	The VLAN ID to which the MEP is attached.
Direction	Indicates the direction (**Inward** or **Outward)** of the Maintenance Point (MP) on the Bridge port.
MAC-Address	The MEP ID configured on this port.
Maintenance Domain	The name of the maintenance domain.
Maintenance Association	The name of the maintenance association.
MD-level	The MD level at which the MD was created.

Release History

show ethoam linktrace-reply

Displays the content of the Linktrace reply (LTR) returned by a previously transmitted LTM. This command displays the LTR based on the transaction identifier or sequence number of the LTM for which the LTR is to be displayed.

show ethoam linktrace-reply domain *md_name* **association** *ma_name* **endpoint** *s_mepid* **tran-id** *num*

Syntax Definitions

md_name	Specifies the domain name.
ma_name	Name of the Ethernet OAM Association.
s_mepid	Specifies the MEP for which LTR is to be displayed. The valid range is 1–8191.
num	Specifies the Transaction ID or sequence number returned from a previously transmitted LTM.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- "LTM operation successful. Target is reachable." – This message suggests that LTM has reached the target and all the expected LTRs have been received.
- "LTM operation unsuccessful. Target not reachable." – This message suggests that LTM is successfully initiated but the target is not reachable.
- "LTM operation unsuccessful. Target is reachable." – This message suggest that Target is reachable but at least one of the LTR from intermediate hop is not received.
- "LTM operation in progress." – This message suggests that LTM operation is in progress. This message will appear if show CLI is fired before LTM Time-out time.
- "LTM Timed out."- This message suggests that either LTM is not initiated properly or when none of the expected LTRs is received in LTM Time-out duration which is 5 seconds.

Examples

```
-> show ethoam linktrace-reply domain MD association MA endpoint 10 tran-id 1256
LTM operation successful. Target is reachable.
Ttl : 63,
  LTM Forwarded : yes,
  Terminal MEP : no,
  Last Egress Identifier : 00-00:00:D0:95:EA:79:62,
  Next Egress Identifier : 00-00:00:D0:95:EA:9E:BA,
  Relay Action : RLY_FDB,
  Chassis ID Subtype : LOCALLY_ASSIGNED,
```

```

  Egress Action : EGR_NONE,
  Egress Mac : 00:00:00:00:00:00,
  Egress Port ID Subtype : NONE,
  Egress Port ID : none
```

output definitions

Ttl	Time to live field for the returned LTR.
LTM Forwarded	Indicates whether the LTM was forwarded or not.
Terminal MEP	Indicates whether the MP reported in the reply Ingress/Egress TLV is a MEP.
Last Egress Identifier	Identifies the MEP linktrace initiator that originated, or the responder that forwarded, the LTM to which this LTR is the response.
Next Egress Identifier	Identifies the linktrace responder that transmitted this LTR, and can forward the LTM to the next hop.
Relay Action	Indicates how the dataframe targeted by the LTM would be passed to Egress bridge port. Options include **RLY_HIT**, **RLY_FDB**, or **RLY_MPDB**.
Ingress Action	Indicates how the dataframe targeted by the LTM would be received on the receiving MP. Options include **ING_NONE**, **ING_OK**, **ING_DOWN**, **ING_BLOCKED**, or **ING_VID**.
Ingress Mac	The MAC address returned in the ingress MAC address field.
Egress Action	Indicates how the dataframe targeted by the LTM would be passed through Egress bridge port. Options include **ING_NONE**, **ING_OK**, **ING_DOWN**, **ING_BLOCKED**, or **ING_VID**.
Egress Mac	The MAC address returned in the egress MAC address field.

Release History

Release 8.1.1; command was introduced.

Related Commands

ethoam linktrace	Enables the maintenance entity to initiate transmitting of Link Trace Messages (LTM).

show ethoam linktrace-tran-id

Displays the transaction identifiers returned by previously generated LTMs from a specified MEP.

show ethoam linktrace-tran-id domain {*md_name* | *mac_address***} association** *ma_name* **endpoint** *mep_id*

Syntax Definitions

md_name	Specifies the domain name.
mac_address	Specifies the CFM system MAC address.
ma_name	Name of the Ethernet OAM Association.
mep_id	Specifies the MEP for which LTR is to be displayed. The valid range is 1-8191.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ethoam linktrace-tran-id domain esd.alcatel-lucent.com association alcatel-
sales endpoint 3
S.No   Transaction Id
-------+----------------------
      1    13357,
      2    13358,
      3    13359,
```

output definitions

S.No	Indicates the sequence number.
Transaction Id	Indicates the Transaction Identifier returned from a previously transmitted LTM.

Release History

Release 8.1.1; command was introduced.

Related Commands

ethoam linktrace	Enables the maintenance entity to initiate transmitting of Link Trace Messages (LTM).

MIB Objects

show ethoam config-error

Displays the configuration error for a specified VLAN and port or linkagg.

show ethoam config-error [vlan *vlan_id***] [{port** *chassis//slot/port* **| linkagg** *agg_id***}]**

Syntax Definitions

vlan_id	VLAN Identifier.
chassis/slot/port	The chassis ID, slot, and port number (3/1/1) for a specific port.
agg_id	Logical Linkagg Identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ethoam config-error
Vlan    Port   Error-type
------+------+------------
10     1/1/2    CFMleak
10     1/1/10   CFMleak
30     1/1/2    CFMleak

cli> show ethoam config-error vlan 10
vlan    port   error-type
------+------+------------
10     1/1/2    CFMleak
10     1/1/10   CFMleak

cli> show ethoam config-error port 1/2
vlan    port   error-type
------+------+------------
10     1/1/2    CFMleak
30     1/1/2    CFMleak

cli> show ethoam config-error vlan 10 port 1/2
vlan    port   error-type
------+------+------------
10     1/1/2    CFMleak
```

output definitions

vlan	VLAN identifier number.
port	Chassis, slot, and port number.
error-type	Type of an error.

Release History

Release 8.1.1; command was introduced.

Related Commands

ethoam linktrace	Enables the maintenance entity to initiate transmitting of Link Trace Messages (LTM).

MIB Objects

```
dot1agCfmConfigErrorListTable
   dot1agCfmConfigErrorListVid
   dot1agCfmConfigErrorListIfIndex
   dot1agCfmConfigErrorListErrorType
```

show ethoam one-way-delay

Displays the one-way ETH-DM delay (latency) and jitter parameters either for all entries or for a specified MAC address for a particular source MEP-ID.

show ethoam one-way-delay domain *md_name* **association** *ma_name* **endpoint** *s_mepid* **[mac-address** *mac_address***]**

Syntax Definitions

md_name	Specifies the domain name used while creating the management domain for which this management association is created.association Physical slot and port.
ma_name	Association name for the created Ethernet OAM Association.
s_mepid	Source MEP-ID. Valid Range 1-8191.
mac_address	MAC-Address of the remote MEP.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Dash (‘-‘) in the output in Jitter column signifies that the value can not be calculated as the previous delay value is unknown. This will happen only when 1DM is received for the first time.
- Maximum entries that Delay Result table can store are 1024. After that, the oldest entry is deleted from the table whenever a new entry is required.

Examples

```
-> show ethoam one-way-delay domain MD association MA endpoint 10
Legend: Jitter: - = undefined value

Remote Mac address            Delay (us)  Jitter (us)
--------------------------+-------------+--------------------------------

```

show ethoam two-way-delay

Displays the two-way ETH-DM delay and jitter parameters for a specific remote MAC-Address or for all the MAC-Addresses for which two-way-delay was initiated for a particular source MEP-ID.

show ethoam two-way-delay domain *md_name* **association** *ma_name* **endpoint** *s_mepid* **[mac-address** *mac_address***]**

Syntax Definitions

md_name	Specifies the domain name used while creating the management domain for which this management association is created.association Physical slot and port.
ma_name	Association name for the created Ethernet OAM Association.
s_mepid	Source MEP-ID. Vaild Range 1-8191.
mac_address	MAC-Address of the remote MEP.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If ‘0’ appears in the output in RMEP-ID column signifies that the DMM was initiated with target-macaddress. As multiple RMEPs can have same mac-address.
- If a dash (‘-‘) appears in the output in Jitter column signifies that the value can not be calculated as the previous delay value is unknown, i.e. if only one reply for DMM (DMR) is received and this was the first time DMM was initiated from the MEP, then jitter will not be calculated.
- Maximum entries that Delay Result table can store are 1024. After that, the DMM request shall be rejected if a new entry needs to be created for the MEP. If entry for the MEP already exists in the table, that entry shall be updated with the new one.

Examples

```
-> show ethoam two-way-delay domain MD association MA endpoint 10 mac-address
00:d0:95:ef:44:44
Legend: Jitter: - = undefined value
      : RMEP-ID: 0 = two-way-delay was initiated with target mac-address

Remote Mac address  RMEP-ID   Delay (us)     Jitter (us)
------------------+--------+-------------+-------------
 00:d0:95:ef:44:44   12         2369          1258
```

```
-> show ethoam two-way-delay domain MD association MA endpoint 10 remote-mep 0
Legend: Jitter: - = undefined value
      : RMEP-ID: 0 = two-way-delay was initiated with target mac-address

Remote Mac address  RMEP-ID  Delay (us)  Jitter (us)
------------------+--------+-------------+-----------
 00:d0:95:ef:66:88    0         5896   282
 00:d0:95:ef:88:88    0         2584   1856

-> show ethoam two-way-delay domain MD association MA endpoint 10 remote-mep 15
Legend: Jitter: - = undefined value
      : RMEP-ID: 0 = two-way-delay was initiated with target mac-address

Remote Mac address  RMEP-ID  Delay (us)  Jitter (us)
------------------+--------+-------------+-----------
 00:d0:95:ef:66:55   15         2736     -

-> show ethoam two-way-delay domain MD association MA endpoint 10
Legend: Jitter: - = undefined value
      : RMEP-ID: 0 = two-way-delay was initiated with target mac-address

Remote Mac address  RMEP-ID  Delay (us)  Jitter (us)
------------------+--------+-------------+-----------
 00:d0:95:ef:44:44   12         2369  1258
 00:d0:95:ef:66:88    0         5896   282
 00:d0:95:ef:88:88    0         2584   1856
 00:d0:95:ef:66:55   15         2736     -
```

output definitions

Remote Mac address	Remote MAC address.
RMEP-ID	Value of RMEP-ID
Delay	Physical slot and port number.
Jitter	Type of an error.

Release History

Release 8.1.1; command was introduced.

Related Commands

ethoam two-way-delay	Initiate two-way-delay messages from a particular MEP to an RMEP using target-endpoint or target-MAC address.

```

46 VLAN Stacking Commands

The VLAN Stacking feature provides a method for tunneling multiple customer VLANs (CVLAN) through a service provider network using one or more service provider VLANs by way of 802.1Q double tagging or VLAN Translation. This feature enables service providers to provide their customers with Transparent LAN Services (TLS). This service is multipoint in nature to support multiple customer sites or networks distributed over the edges of a service provider network.

MIB information for the VLAN Stacking commands is as follows:

Filename: AlcatelIND1VlanStacking.MIB
Module: Alcatel-IND1-VLAN-STACKING-MIB

Filename: AlcatelIND1VlanManager.MIB
Module: Alcatel-IND1-VLAN-MGR-MIB

A summary of the available commands is listed here:

VLAN Stacking Service Mode	**ethernet-service svlan** **ethernet-service uni-profile** **ethernet-service service-name** **ethernet-service nni** **ethernet-service svlan nni** **ethernet-service sap** **ethernet-service sap uni** **ethernet-service sap cvlan** **ethernet-service sap-profile** **ethernet-service sap sap-profile** **ethernet-service uni-profile** **ethernet-service uni uni-profile** **show ethernet-service vlan** **show ethernet-service** **show ethernet-service sap** **show ethernet-service** **show ethernet-service nni** **show ethernet-service uni** **show ethernet-service uni-profile** **show ethernet-service sap-profile**

ethernet-service svlan

Creates a VLAN Stacking VLAN (SVLAN) for tunneling customer traffic.

ethernet-service svlan {*svlan_id***[-***svlan_id2***]} [admin-state {enable | disable}] [stp {enable | disable}] [name** *description***]**

no ethernet-service svlan {*svlan_id* **[-***svlan_id2***]}**

Syntax Definitions

svlan	Creates an SVLAN for tunneling customer traffic.
svlan_id	The VLAN ID number identifying the SVLAN.
[-*svlan_id2***]**	The last VLAN ID number in a range of SVLANs that you want to specify (for example 10-12 specifies VLANs 10, 11, and 12).
enable	Enables the SVLAN administrative status.
disable	Disables the SVLAN administrative status, which blocks all ports bound to that SVLAN.
stp enable	Enables the SVLAN Spanning Tree status for the service provider network topology.
stp disable	Disables the SVLAN Spanning Tree status for the service provider network topology.
description	An alphanumeric string. Use quotes around the string if the VLAN name contains multiple words with spaces between them (for example, “Alcatel-Lucent Engineering”).

Defaults

By default, the Spanning Tree status is enabled in both the **per-vlan** and **flat** mode when the SVLAN is created

parameter	default
enable | disable	**enable**
stp enable | disable	**enable**
description	VLAN ID number

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete an SVLAN or a range of SVLANs. Note that SVLAN port associations are also removed when the SVLAN is deleted.
- This command does not work if the *svlan_id* specified already exists as a standard VLAN..

Note. Spanning Tree status for an SVLAN only applies to the Spanning Tree topology calculations for the service provider network. This status is not applied to customer VLANs (CVLANs) and does not affect the customer network topology.

Examples

```
-> ethernet-service svlan 1001-1005 admin-state enable name “Customer ABC”
-> ethernet-service svlan 1001-1005 stp enable
-> no ethernet-service svlan 1001
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ethernet-service vlan	Displays a list of SVLANs configured from the switch

MIB Objects

```
vlanTable
   vlanNumber
   vlanDescription
   vlanType
   vlanAdmStatus
   vlanStatus
```

ethernet-service service-name

Creates a VLAN Stacking service and associates the service with an SVLAN. A service can be carried only on a single SVLAN. All traffic within the associated service is carried on the SVLAN.

ethernet-service service-name *service_name* **svlan** *svlan_id*

no ethernet-service service-name *service_name* **svlan** *svlan_id*

Syntax Definitions

service_name	The name of the VLAN Stacking service; an alphanumeric string. Use quotes around string if the service name contains multiple words with spaces between them (for example, “Alcatel-Lucent Engineering”).
svlan_id	The VLAN ID number that identifies an existing SVLAN to associate with the VLAN Stacking service.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a VLAN Stacking service. Note that when a service is removed, the SVLAN association with that service is also removed.
- If the VLAN Stacking service is associated with a Service Access Point (SAP), then remove the SAP associations before attempting to remove the VLAN Stacking service.
- Each VLAN Stacking service is associated with one SVLAN. Specifying an additional VLAN ID for an existing service is not allowed.

Examples

```
-> ethernet-service service-name Marketing svlan 10
-> no ethernet-service service-name Marketing svlan 10
```

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service svlan	Creates an SVLAN for customer traffic, a management VLAN for provider traffic for multicast traffic.

MIB Objects

```
alaEServiceTable
   alaEServiceID
   alaEServiceSVLAN
   alaEServiceRowStatus
```

ethernet-service nni

Configures a switch port or link aggregate as a VLAN Stacking Network Network Interface (NNI) and optionally specifies the vendor TPID value and the legacy BPDU processing status for a VLAN Stacking Network Network Interface (NNI).

ethernet-service nni {port *chassis/slot/port***[-***port2***] | linkagg** *linkagg_id***[-***linkagg_id2***]} [tpid** *tpid_value***] [[stp | mvrp] legacy-bpdu {enable | disable}]**

no ethernet-service nni {port *chassis/slot/port***[-***port2***] | linkagg** *linkagg_id***[-***linkagg_id2***]}**

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*linkagg_id***[-***linkagg_id2***]**	The link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (5-10).
tpid_value	Specifies the TPID value of the port.
enable	Enables the specified legacy BPDU support.
disable	Disables the specified legacy BPDU support.

Defaults

parameter	default
tpid_value	0x8100
stp legacy-bpdu enable | disable	**disable**
mvrp legacy-bpdu enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to revert the VLAN Stacking NNI port or link aggregate back to a conventional switch port or aggregate.
- When this command is used, the default VLAN for the NNI port is changed to a VLAN reserved by the switch for applications such as VLAN Stacking. The reserved VLAN cannot be configured using standard VLAN management commands.
- NNI ports can be 802.1q tagged with normal VLANs. In this case, the TPID of the packets tagged with a normal VLAN must always be 0x8100 (regardless the TPID of the NNI port). This allows NNI port to carry regular 802.1q tagged traffic as well as SVLAN tagged traffic.
- Enable legacy BPDU support only on VLAN Stacking network ports that are connected to legacy BPDU switches. Enabling legacy BPDU between AOS switches can cause flooding or an unstable network.

- If legacy BPDU is enabled on a network port while at same time BPDU flooding is enabled on user ports, make sure that tagged customer BPDUs are not interpreted by intermediate switches in the provider network.
- Note that if the peer switch connected to the VLAN Stacking network port supports the Provider MAC address (STP, 802.1ad/D6.0 MAC), then enabling legacy BPDU support is not required on the network port. Refer to the following table to determine the type of STP MAC used:

STP	
Customer MAC	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x00}
Provider MAC address (802.1ad/D6.0)	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x08}
Provider MAC address (Legacy MAC)	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x00}

- STP legacy BPDU are supported only when the **flat** Spanning Tree mode is active on the switch.

Examples

```
-> ethernet-service 10 nni port 1/1/3-5
-> ethernet-service 255 nni port 2/1/10-15 tpid 88a8
-> ethernet-service 500 nni port 1/13-5 stp legacy-bpdu enable
-> no ethernet-service 10 nni port 1/1/3
-> no ethernet-service 255 nni linkagg 12-15
```

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service svlan nni	Associates a switch port or link aggregate with a SVLAN.

MIB Objects

```
alaEServicePortTable
   alaEServicePortID
   alaEServicePortType
   alaEServicePortVendorTpid
   alaEServicePortLegacyStpBpdu
   alaEServicePortRowStatus
```

ethernet-service svlan nni

Associates a NNI port with a SVLAN. A network port connects to another provider bridge and carries both customer and provider traffic.

ethernet-service svlan {*svlan_id***[-***svlan_id2***]} nni {port** *chassis/slot/port***[-***port2***] | linkagg***linkagg_id***[-***linkagg_id2***]}**

no ethernet-service svlan {*svlan_id***[-***svlan_id2***]} nni {port** *chassis/slot/port***[-***port2***]** | **linkagg***linkagg_id* **[-***linkagg_id2***]}**

Syntax Definitions

svlan_id	The VLAN ID number identifying the SVLAN.
[-*svlan_id2***]**	The last VLAN ID number in a range of SVLANs that you want to specify (for example 10-12 specifies VLANs 10, 11, and 12).
*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*linkagg_id***[-***linkagg_id2***]**	The link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (5-10).

Defaults

NA

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an association between an NNI port and an SVLAN.
- Only SVLAN IDs are accepted with this command. This SVLAN ID specified must already exist in the switch configuration.
- This command only applies to ports or link aggregates configured as VLAN Stacking NNI ports.
- NNI ports can be tagged with normal VLANs. This allows NNI ports to carry regular 802.1q tagged traffic as well as SVLAN tagged traffic.

Examples

```
-> ethernet-service svlan 10 nni port 1/1/3
-> ethernet-service svlan 255 nni port 2/1/10-15
-> ethernet-service svlan 500 nni linkagg 31-35
-> no ethernet-service svlan 10 nni port 1/1/3
-> no ethernet-service svlan 255 nni port 2/1/12
```

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service svlan	Creates an SVLAN for tunneling customer traffic.
ethernet-service nni	Configures a switch port or link aggregate as a VLAN Stacking NNI.

MIB Objects

```
alaEServiceNniSvlanTable
   alaEServiceNniSvlanNni
   alaEServiceNniSvlanSvlan
   alaEServiceNniSvlanRowStatus
```

ethernet-service sap

Creates a VLAN Stacking Service Access Point (SAP) and associates the SAP with a VLAN Stacking service.

ethernet-service sap *sap_id* **service-name** *service_name*

no ethernet-service sap *sap_id*

Syntax Definitions

sap_id	The SAP ID number identifying the service instance.
service_name	The name of the service to associate with this SAP.

Defaults

The “default-sap-profile” profile is automatically associated with the SAP ID when the SAP is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a VLAN Stacking SAP. When a SAP is deleted, all port and CVLAN associations with the SAP are also deleted.
- The service name specified with this command must already exist in the switch configuration. Use the **ethernet-service service-name** command to create a service to associate with the SAP.
- Each SAP ID is associated with only one service; however, it is possible to associate one service with multiple SAP IDs.

Examples

```
-> ethernet-service sap 10 service-name CustomerA
-> no ethernet-service sap 11
```

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service service-name	Creates a VLAN Stacking service and associates the service with an SVLAN.
ethernet-service sap-profile	Creates a VLAN Stacking SAP profile.
ethernet-service sap sap-profile	Associates a SAP profile with a SAP ID.

MIB Objects

```
alaEServiceSapTable
   alaEServiceSapID
   alaEServiceSapServiceID
   alaEServiceSapProfile
   alaEServiceSapRowStatus
```

ethernet-service sap uni

Configures the switch port as a VLAN Stacking User Network Interface (UNI) and associates the port with a VLAN Stacking Service Access Point (SAP). A UNI port is a customer facing port on which traffic enters the SAP.

ethernet-service sap {*sap_id***} uni {port** *chassis/slot/port***[-***port2***]** | **linkagg** *linkagg_id***[-***linkagg_id2***]}**

no ethernet-service sap {*sap_id***} uni {port** *chassis/slot/port***[-***port2***]** | **linkagg** *linkagg_id***[-***linkagg_id2***]}**

Syntax Definitions

sap_id	The SAP ID number identifying the service instance.
*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*linkagg_id***[-***linkagg_id2***]**	The link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (5-10).

Defaults

A switch port or a link aggregate becomes a VLAN Stacking UNI port by default when the port or link aggregate is associated with a VLAN Stacking SAP.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove an association between a UNI port and a SAP. Note that when the last SAP association is removed, the UNI port converts back to a conventional switch port.
- Only fixed ports can be configured as UNI ports.
- The SAP ID specified with this command must already exist. Use the **ethernet-service sap** command to create a SAP.
- When this command is used, the default VLAN for the UNI port is changed to a reserved VLAN and all customer traffic received is dropped until the type of traffic for the port is configured using the **ethernet-service sap cvlan** command.

Examples

```
-> ethernet-service sap 10 uni port 1/1/3
-> ethernet-service sap 10 uni port 2/1/10-15
-> ethernet-service sap 10 uni linkagg 31-40
-> no ethernet-service sap 10 uni port 1/1/10-15
-> no ethernet-service sap 10 uni linkagg 31
```

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service sap	Creates a VLAN Stacking SAP and associates the SAP with a VLAN Stacking SAP profile and service.
ethernet-service sap sap-profile	Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.
ethernet-service uni uni-profile	Associates a VLAN Stacking UNI profile with a UNI port.

MIB Objects

```
alaEServiceSapUniTable
   alaEServiceSapUniSap
   alaEServiceSapUniUni
   alaEServiceSapUniRowStatus
```

ethernet-service sap cvlan

Associates customer VLAN (CVLAN) traffic with a VLAN Stacking Service Access Point (SAP). The parameter values configured with this command are applied to frames received on all SAP UNI ports and determines the type of customer traffic that is accepted on the UNI ports and processed by the service.

ethernet-service sap {*sap_id***} cvlan {all** | *cvlan_id* **|** *cvlan_id1-cvlan_id2* | **untagged}**

no ethernet-service sap {*sap_id***} cvlan {all** | *cvlan_id* **|** *cvlan_id1-cvlan_id2* | **untagged}**

Syntax Definitions

sap_id	The SAP ID number.
all	Applies the SAP profile to tagged and untagged frames.
cvlan_id	Applies the SAP profile to frames tagged with this CVLAN ID.
cvlan_id1-cvlan_id2	Applies the SAP profile to frames tagged with a CVLAN ID that falls within this range of CVLAN IDs (for example, 10-12 specifies frames tagged with CVLAN 10, 11, or 12).
untagged	Applies the SAP profile only to untagged frames.

Defaults

By default, no CVLAN traffic is associated with the SAP ID when the SAP is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a CVLAN ID or the designation for **all** or **untagged** frames from the SAP. Note that when the last CVLAN parameter is deleted from a SAP configuration, the SAP is not automatically deleted.
- The **all** and **untagged** parameters are configurable in combination with a CVLAN ID. For example, if **untagged** and a CVLAN ID are associated with the same SAP ID, then the SAP profile is applied to only untagged traffic *and* traffic tagged with the specified CVLAN ID. All other traffic is dropped.
- The SAP ID specified with this command must already exist. Use the **ethernet-service sap** command to create a SAP.
- Configuring the **all** and **untagged** parameters for the same SAP is not allowed. Specify only one of these two parameters per SAP.
- Either the **all** or **untagged** parameters can be configured for the SAP. In such an instance, the default VLAN for the UNI ports associated with the SAP is changed to the VLAN assigned to the SAP related service.
- Only one SAP, with the **all** or **untagged** option, is allowed per UNI. For example, if UNI port 1/17 is part of SAP 10 and SAP 20 and SAP 10 is configured for **all** traffic, then only **untagged** parameter or a CVLAN ID is allowed for SAP 20.

- If you do not specify **all** or **untagged** options with a UNI, then the default VLAN 4095 is set for the UNI and all untagged, untagged control traffic and unmatched tag traffic is dropped.

Examples

```
-> ethernet-service sap 10 cvlan 200
-> ethernet-service sap 10 cvlan all
-> ethernet-service sap 11 cvlan 100-150
-> ethernet-service sap 11 cvlan untagged
-> no ethernet-service sap 10 cvlan 200
-> no ethernet-service sap 10 cvlan all
-> no ethernet-service sap 10 cvlan 100-150
```

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service sap	Creates a VLAN Stacking Service Access Point (SAP) and associates the SAP with a VLAN Stacking service.

MIB Objects

```
alaEServiceSapCvlanTable
   alaEServiceSapCvlanSapId
   alaEServiceSapCvlanCvlan
   alaEServiceSapCvlanMapType
   alaEServiceSapRowStatus
```

ethernet-service sap-profile

Creates a profile for a VLAN Stacking Service Access Point (SAP). Profile attributes are used to define traffic engineering policies that are applied to traffic serviced by the SAP.

ethernet-service sap-profile *sap_profile_name* **[bandwidth not-assigned] [[shared | not-shared] ingress-bandwidth** *mbps* **] [cvlan-tag {preserve | translate}] priority [not-assigned | map-inner-to-outer-p | map-dscp-to-outer-p | fixed** *value***][egress-bandwidth** *mbps***]**

no ethernet-service sap-profile *sap_profile_name*

Syntax Definitions

sap_profile_name	An alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, "Alcatel-Lucent Engineering").
bandwidth not-assigned	Specifies that the SAP profile does not allocate switch resources to enforce bandwidth requirements. Applies only when the profile specifies the default ingress bandwidth value (zero).
shared	Shares the ingress bandwidth limit across all SAP ports and CVLANs.
not shared	Applies the ingress bandwidth limit to individual SAP ports and CVLANs; bandwidth is not shared.
ingress bandwidth *mbps*	The maximum amount of bandwidth allowed for traffic received on SAP ports, in megabits per second. This parameter can only be used with the **shared** option or **not-shared** option.
preserve	Retains the customer VLAN ID (inner tag) and double tags the frame with the SVLAN ID (outer tag).
translate	Replaces the customer VLAN ID with the SVLAN ID.
priority not-assigned	Specifies that the SAP profile is not assigned with a priority value or priority mapping.
map-inner-to-outer-p	Maps the customer VLAN (inner tag) priority bit value to the SVLAN (outer tag) priority bit value.
map-dscp-to-outer-p	Maps the customer VLAN (inner tag) DSCP value to the SVLAN (outer tag) priority bit value.
fixed *value*	Sets the SVLAN (outer tag) priority bit to the specified value.
egress-bandwidth *mbps*	The maximum amount of bandwidth allowed for traffic sent on SAP ports, in megabits per second.

Defaults

parameter	default
shared | not shared	**shared**
mbps	0
preserve | translate	**preserve**
not-assigned | map-inner-to-outer-p | map-dscp-to-outer-p | fixed *value*	**fixed** 0

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a SAP profile.
- If a profile is not specified when a SAP is created, a default profile (default-sap-profile) is automatically associated with the SAP.
- Use the **ethernet-service sap sap-profile** command to associate a profile to a VLAN Stacking SAP.
- Only one SAP profile name is associated with each SAP ID; however, it is possible to associate the same SAP profile name to multiple SAP IDs.
- Configure the **ingress-bandwidth** or **egress-bandwidth** parameters to define rate limiting values for the SAP.

Examples

```
-> ethernet-service sap-profile video1 egress-bandwidth 10 cvlan-tag translate
priority map-inner-to-outer-p
-> ethernet-service sap-profile voice1 not-shared ingress-bandwidth 10 cvlan-tag
preserve
-> ethernet-service sap-profile voice2 shared ingress-bandwidth 10
-> no ethernet-service sap-profile video1
```

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service sap	Creates a VLAN Stacking SAP and associates the SAP with a service.
ethernet-service sap sap-profile	Associates a SAP profile with a SAP ID.
show ethernet-service sap-profile	Displays the profile attribute configuration for a SAP profile.

MIB Objects

```

   alaEServiceSapProfileFixedPriority
   alaEServiceSapProfileBandwidthShare
   alaEServiceSapRowStatus
```

ethernet-service sap sap-profile

Associates a VLAN Stacking Service Access Point (SAP) with a SAP profile. This command is also used to change an existing SAP profile association.

ethernet-service sap *sap_id* **sap-profile** *sap_profile_name*

no ethernet-service sap *sap_id*

Syntax Definitions

sap_id	The SAP ID number.
sap_profile_name	The name of the SAP profile to associate with this SAP ID.

Defaults

The “default-sap-profile” profile is automatically associated with the SAP ID when the SAP is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command along with the SAP ID to remove the SAP profile.
- If a profile association already exists for the specified SAP ID, the current profile is replaced with the profile specified with this command.
- To change the profile associated with the SAP back to the default profile, enter “default-sap-profile” with this command.
- Do not specify a service name; doing so returns an error message. This command is only for associating an existing profile to a VLAN Stacking SAP.

Examples

```
-> ethernet-service sap 10 sap-profile CustomerC
-> ethernet-service sap 11 sap-profile CustomerD
-> ethernet-service sap 11 sap-profile default-sap-profile
```

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service sap	Creates a VLAN Stacking SAP and associates the SAP with a VLAN Stacking SAP profile and service.
ethernet-service sap-profile	Creates a VLAN Stacking SAP profile.

MIB Objects

```
alaEServiceSapTable
   alaEServiceSapID
   alaEServiceSapProfile
   alaEServiceSapRowStatus
```

ethernet-service uni-profile

Creates a User Network Interface (UNI) profile that is used to specify how to process control packets ingressing on UNI ports.

ethernet-service uni-profile *uni-profile-name* **[l2-protocol {stp | 802.1x | 802.1ab | 802.3ad | mvrp | amap} {peer | discard | tunnel}**

no ethernet-service uni-profile *uni-profile-name*

Syntax Definitions

uni-profile-name	Alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, “Alcatel-Lucent Engineering”).
stp	Specifies how Spanning Tree BPDU is processed on the UNI port.
802.1x	Specifies how 802.1x control frames are processed on the UNI port.
802.1ab	Specifies how 802.1ab control frames are processed on the UNI port.
802.3ad	Specifies how 802.3ad and 802.3ah control frames are processed on the UNI port.
mvrp	Specifies how Multicast VLAN Registration Protocol packets are processed on the UNI port.
amap	Specifies how Alcatel Management Adjacency Protocol packets must be processed on the UNI port.
peer	Allows the UNI port to participate in the specified protocol.
discard	Discards the specified PDU.
tunnel	Tunnels the specified PDU across the provider network.

Defaults

parameter	default
stp	**tunnel**
mvrp	**tunnel**
amap	**tunnel**
802.1x	**tunnel**
802.3ad	**tunnel**
802.1ab	**tunnel**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a UNI profile.
- Remove any UNI profile associations with UNI ports before attempting to modify or delete the profile.
- Up to five unique UNI profile combinations, including the default profile, are allowed per switch. If a profile has the same processing settings as any other profile, then it is not considered unique.
- Not all of the protocol parameters are currently supported with the **peer**, **tunnel**, and **discard** parameters. Use the following table to determine the parameter combinations that are supported:

	peer	discard	tunnel
stp	no	yes	yes
802.1x	yes	yes	yes
802.3ad	yes	yes	yes
802.1ab	yes	yes	yes
mvrp	no	yes	yes
amap	no	yes	yes

- If a user-configured UNI profile is *not* associated with a UNI port, then the default profile (default-uni-profile) is used to process control packets ingressing on the port.
- A uni-profile cannot be modified if it is associated with a UNI. The uni-profile cannot be deleted unless the associations are deleted.

Examples

```
-> ethernet-service uni-profile uni_1 l2-protocol stp mvrp discard
-> no ethernet-service uni-profile uni_1
```

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service uni uni-profile	Associates a VLAN Stacking UNI profile with a UNI port.
ethernet-service sap uni	Configures the switch port as a VLAN Stacking UNI and associates the port with a VLAN Stacking Service Access Point (SAP).
show ethernet-service uni	Displays the profile associations for VLAN Stacking UNI ports.
show ethernet-service uni-profile	Displays the profile attribute configuration for VLAN Stacking UNI profiles.

MIB Objects

```

   alaEServiceUNIProfileRowStatus
```

ethernet-service uni uni-profile

Associates a VLAN Stacking User Network Interface (UNI) profile with a UNI port.

ethernet-service uni {port *chassis/slot/port***[-***port2***] | linkagg** *linkagg_id***[-***linkagg_id2***]} uni-profile** *uni-profile-name*

no ethernet-service uni-profile *uni-profile-name*

Syntax Definitions

*chassis/slot/port***[-***port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*linkagg_id***[-***linkagg_id2***]**	The link aggregate ID. Use a hyphen to specify a range of link aggregate IDs (5-10).
uni_profile_name	Alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, “Alcatel-Lucent Engineering”).

Defaults

The default profile (default-uni-profile) is used to process control packets ingressing on a UNI port. This profile is assigned at the time a port is configured as a VLAN Stacking UNI.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command along with the **uni-profile** name to delete the uni-profile.
- This UNI specified with this command must already exist in the switch configuration.
- To change the profile associated with a UNI port, use this command and specify a different profile name than the one currently associated with the port. The last profile associated with the port, is the profile that is applied to UNI port traffic.
- To change the profile associated with a UNI port back to the default profile, enter “default-uni-profile” with this command.

Examples

```
-> ethernet-service uni port 1/1/3 uni-profile uni_1
-> ethernet-service uni linkagg 1-5 uni-profile uni_2
-> ethernet-service uni port 2/1/10-15 uni-profile default-uni-profile
-> no ethernet-service uni-profile uni_1
```

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service sap sap-profile	Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.
ethernet-service sap uni	Configures the switch port as a VLAN Stacking UNI and associates the port with a VLAN Stacking Service Access Point (SAP).

MIB Objects

```
alaEServicePortTable
   alaEServicePortID
   alaEServicePortType
   alaEServicePortUniProfile
   alaEServiceSapUniRowStatus
```

show ethernet-service vlan

Displays a list of SVLANs configured on the switch.

show ethernet-service vlan [*svlan_id***-[***svlan_id2***]]**

Syntax Definitions

svlan_id	The VLAN ID number identifying the SVLAN.
-svlan_id2	The last VLAN ID number in a range of SVLANs that you want to specify (for example 10-12 specifies VLANs 10, 11, and 12).

Defaults

By default, all SVLANs are displayed if an SVLAN or range of SVLANs are not specified with this command.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Specify a single SVLAN ID or a range of SVLAN IDs to display configuration information for the specific SVLANs.

Examples

```
-> show ethernet-service vlan

  vlan           Type     name
+--------+------------+------------------------+
  4010     svlan          Customer ABC
  4020     mgmt           Provider Management
  4021     svlan          Customer XYZ

-> show ethernet-service vlan 1001

Name                    : VLAN 1001,
Type                    : Service Vlan,
Administrative State    : enabled,
Operational State       : disabled,
IP Router Port          : disabled,
IP MTU                  : 1500

-> show ethernet-service vlan 1000-1004

vlan  type   admin  oper   ip    mtu   name
-----+------+-----+-----+-----+-------+------------
1000   vstk   Ena   Dis  Dis   1500   VLAN 1000
1001   vstk   Ena   Dis  Dis   1500   VLAN 1001
1002   vstk   Ena   Dis  Dis   1500   VLAN 1002
1003   vstk   Ena   Dis  Dis   1500   VLAN 1003
1004   vstk   Ena   Dis  Dis   1500   VLAN 1004
```

output definitions

vlan	The SVLAN ID number identifying the instance.
type	The type of SVLAN.
admin	The administrative state of the VLAN. (**Ena** or **Dis**).
oper	The operation status of the VLAN (**Ena** or **Dis**).
ip	The status of the IP router port (**Ena** or **Dis**).
mtu	The IP MTU value configured for the VLAN.
name	The user-defined text description for the SVLAN. By default, the SVLAN ID is specified for the description.

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service svlan	Creates a VLAN Stacking VLAN (SVLAN) for tunneling customer traffic, a management SVLAN for provider traffic application uses to distribute multicast traffic.
show ethernet-service	Displays configuration information for VLAN Stacking Ethernet services.

MIB Objects

```
vlanTable
   vlanNumber
   vlanDescription
   vlanSvlanTrafficType
```

show ethernet-service

Displays configuration information for VLAN Stacking Ethernet services.

show ethernet-service [service-name *service_name* | **svlan** *svlan_id***]**

Syntax Definitions

service_name	The name of an existing VLAN Stacking service. Use quotes around string if the service name contains multiple words with spaces between them (for example, “Alcatel-Lucent Engineering”).
svlan_id	The VLAN ID number that identifies an existing SVLAN .

Defaults

By default, all services are displayed if a service name or SVLAN ID is not specified with this command.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enter the name of a service to display configuration information for a specific service.
- Enter an SVLAN ID to display configuration information for all services that are associated with a specific SVLAN.

Examples

```
-> show ethernet-service

Service Name : VideoOne
    SVLAN   : 300
    NNI(s)  : 2/1/1, 3/1/2
    SAP Id  : 20
        UNIs        : 1/1/1, 1/1/2
        CVLAN(s)    : 10, 20
        sap-profile : sap-video1
    SAP Id  : 30
        UNIs        : 1/1/3
        CVLAN(s)    : untagged, 40
        sap-profile : sap-video2

Service Name : CustomerABC
    SVLAN   : 255
    NNI(s)  : 1/1/22
    SAP Id  : 10
        UNIs        : 2/1/10, 2/1/11
        CVLAN(s)    : 500, 600
        sap-profile : default-sap-profile
```

```
-> show ethernet-service service-name CustomerABC

Service Name : CustomerABC
    SVLAN   : 255
    NNI(s)  : 1/1/22
    SAP Id  : 10
        UNIs        : 2/1/10, 2/1/11
        CVLAN(s)    : 500, 600
        sap-profile : default-sap-profile

-> show ethernet-service svlan 300

Service Name : VideoOne
    SVLAN   : 300
    NNI(s)  : 2/1/1, 3/1/2
    SAP Id  : 20
        UNIs        : 1/1/1, 1/1/2
        CVLAN(s)    : 10, 20
        sap-profile : sap-video1
    SAP Id  : 30
        UNIs        : 1/1/3
        CVLAN(s)    : 30, 40
        sap-profile : sap-video2
```

output definitions

Service Name	The name of the VLAN Stacking service.
SVLAN	Displays the SVLAN ID associated with the service. **Note.** SVLAN appears as the field name if the VLAN ID is an SVLAN.
NNI(s)	VLAN Stacking Network Network Interface ports associated with the service to tunnel SVLAN customer traffic.
SAP Id	The ID number for the VLAN Stacking Service Access Point that is applied to the service.
UNIs	VLAN Stacking User Network Interface ports that receive customer traffic.
CVLAN(s)	Customer VLAN IDs ingressing on UNI ports.
sap-profile	The name of the SAP profile associated with the SAP.

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service service-name	Creates a VLAN Stacking service and associates the service with an SVLAN.
show ethernet-service vlan	Displays a list of all or a range of configured SVLANs or the parameters of a specified SVLAN.

show ethernet-service sap

Displays configuration information for VLAN Stacking Service Access Points (SAP).

show ethernet-services sap [*sap_id***]**

Syntax Definitions

sap_id	The SAP ID number identifying the service instance.

Defaults

By default, all SAPs are displayed if a SAP ID is not specified with this command.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Specify a single SAP ID to display configuration information for a specific SAP.

Examples

```
-> show ethernet-services sap

   SAP Id  : 10
        UNIs        : 2/1/10, 2/1/11
        CVLAN(s)    : 500, 600
        sap-profile : default-sap-profile

    SAP Id  : 20
        UNIs        : 1/1/1, 1/1/2
        CVLAN(s)    : 10, 20
        sap-profile : sap-video1

    SAP Id  : 30
        UNIs        : 1/13
        CVLAN(s)    : 30, 40
        sap-profile : sap-video2

-> show ethernet-service sap 10

 SAP Id  : 10
        UNIs        : 2/1/10, 2/1/11
        CVLAN(s)    : 500, 600
        sap-profile : default-sap-profile
```

output definitions

SAP Id	The ID number for the VLAN Stacking Service Access Point that is applied to the service.
UNIs	VLAN Stacking User Network Interface ports that receive customer traffic.
CVLAN(s)	Customer VLAN IDs ingressing on UNI ports.
sap-profile	The name of the SAP profile associated with the SAP.

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service sap	Creates a VLAN Stacking Service Access Point (SAP) and associates the SAP with a VLAN Stacking SAP profile and service.
show ethernet-service	Displays configuration information for VLAN Stacking Ethernet services.
show ethernet-service sap-profile	Displays the profile attribute configuration for SAP profiles.

MIB Objects

alaEServiceSapTable
   alaEServiceSapID
alaEServiceSapUniTable
   alaEServiceSapUniUni
alaEServiceSapCvlanTable
   alaEServiceSapCvlanCvlan
   alaEServiceSapCvlanMapType
alaEServiceSapProfileTable
   alaEServiceProfileID
```

show ethernet-service

Displays configuration information for a VLAN Stacking service port.

show ethernet-service port {*chassis/slot/port* | **linkagg** *linkagg_id***}**

Syntax Definitions

chassis/slot/port	The chassis ID, slot, and port number (3/1/1) for a specific port.
linkagg_id	The link aggregate ID.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Specifying a chassis/slot/port or link aggregate ID number is required with this command.

Examples

```
-> show ethernet-service port 1/1/10

Interface : 1/1/10
Port Type   : UNI
    UNI Profile   : default-uni-profile
    Default SVLAN : 4095

Service Name : svlan_service
    SVLAN   : 20
    NNI(s)  : No NNIs configured
    SAP Id  : 1
        UNIs        : 1/1/10
        CVLAN(s)    : 200
        sap-profile : translate_profile

-> show ethernet-service port 1/1/22

Interface : 1/1/22
Port Type : NNI

Service Name : CustomerABC
    SVLAN   : 255
    NNI(s)  : 1/1/22
    SAP Id  : 10
        UNIs        : 2/1/10, 2/1/11
        CVLAN(s)    : 500, 600
        sap-profile : default-sap-profile
```

```
Service Name : Video-Service
    SVLAN   : 300
    NNI(s)  : 1/1/22, 3/1/2
    SAP Id  : 20
        UNIs        : 1/1/1, 1/1/2
        CVLAN(s)    : 10, 20
        sap-profile : sap-video1
    SAP Id  : 30
        UNIs        : 1/1/3
        CVLAN(s)    : 30, 40
        sap-profile : sap-video2
```

output definitions

Interface	The chassis ID, slot, and port number or link aggregate ID for the specified interface.
Port Type	The type of VLAN Stacking port (**UNI** or **NNI**).
Service Name	The name of the VLAN Stacking service.
SVLAN	Displays the SVLAN ID associated with the service. Note that SVLAN appears as the field name if the VLAN ID is an SVLAN.
NNI(s)	VLAN Stacking Network Network Interface ports associated with the service to tunnel SVLAN customer traffic.
SAP Id	The ID number for the VLAN Stacking Service Access Point that is applied to the service.
UNIs	VLAN Stacking User Network Interface ports that receive customer traffic.
CVLAN(s)	Customer VLAN IDs ingressing on UNI ports.
sap-profile	The name of the SAP profile associated with the SAP.

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service svlan nni	Configures the switch port as a VLAN Stacking NNI port and associates the port with a customer SVLAN, management SVLAN.
ethernet-service sap uni	Configures the switch port as a VLAN Stacking UNI and associates the port with a VLAN Stacking SAP.
show ethernet-service	Displays configuration information for VLAN Stacking Ethernet services.

MIB Objects

show ethernet-service nni

Displays configuration information for VLAN Stacking Network Network Interface (NNI) ports.

show ethernet-service nni [port *chassis/slot/port* | **linkagg** *linkagg_id***]**

Syntax Definitions

chassis/slot/port	The chassis ID, slot, and port number (3/1/1) for a specific port.
linkagg_id	The link aggregate ID.

Defaults

By default, all NNI ports are displayed if a slot/port or link aggregate ID number is not specified.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Specify a chassis/slot/port or link aggregate ID number to display information for a single port or link aggregate ID.

Examples

```
-> show ethernet-service nni

  Port     TPID         Legacy BPDU
                      stp         mvrp
--------+--------+----------------------+
  1/1/22    0x8100    Disable     Disable
  1/1/23    0x8100    Disable     Disable

-> show ethernet-service nni 1/23

  Port     TPID         Legacy BPDU
                      stp         mvrp
--------+--------+----------------------+
  1/1/23    0x8100    Disable     Disable
```

output definitions

Port	The chassis/slot/port number or link aggregate ID for the NNI port.
TPID	The vendor TPID value configured for the NNI port.
stp	Whether or not Spanning Tree legacy BPDU processing is enabled for the NNI port.
mvrp	Whether or not MVRP legacy BPDU processing is enabled for the port.

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service svlan nni	Configures the switch port as a VLAN Stacking NNI port and associates the port with a customer SVLAN, management SVLAN.
ethernet-service nni	Configures the vendor TPID value and the legacy BPDU processing status for a VLAN Stacking Network Network Interface (NNI).
show ethernet-service	Displays configuration information for VLAN Stacking Ethernet services.

MIB Objects

```
alaEServicePortTable

   alaEServicePortVendorTpid
   alaEServicePortLegacyStpBpdu
   alaEServicePortLegacyGvrpBpdu
```

show ethernet-service uni

Displays a list of UNI ports configured for the switch and the profile association for each port.

show ethernet-service uni [port *chassis/slot/port* | **linkagg** *linkagg_id***]**

Syntax Definitions

chassis/slot/port	The chassis ID, slot, and port number (3/1/1) for a specific port.
linkagg_id	The link aggregate ID number.

Defaults

By default, profile information for all UNI ports is displayed if a slot/port or link aggregate ID number is not specified.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Specify a slot/port or link aggregate ID number to display information for a single slot/port or link aggregate ID.

Examples

```
-> show ethernet-service uni

    Port    UNI Profile
---------+--------------------+
     1/1/1   uni-profile-default
     1/1/2   multi-site
     1/1/3   multi-site

-> show ethernet-service uni port 1/1/3

    Port    UNI Profile
---------+--------------------+
     1/1/3   multi-site
```

output definitions

Port	The slot/port number or link aggregate ID for the UNI port.
UNI Profile	The UNI profile associated with the port.

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service sap sap-profile	Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.
ethernet-service uni uni-profile	Associates a VLAN Stacking UNI profile with a UNI port.
show ethernet-service uni-profile	Displays the profile attribute configuration for VLAN Stacking User Network Interface (UNI) profiles.

MIB Objects

```
alaEServiceUniProfileTable
   alaEServicePortID
   alaEServicePortProfileID
```

show ethernet-service uni-profile

Displays the profile attribute configuration for VLAN Stacking User Network Interface (UNI) profiles.

show ethernet-service uni-profile [*uni-profile-name***]**

Syntax Definitions

uni-profile-name	An alphanumeric string. Use quotes around the string if the profile name contains multiple words with spaces between them (for example, “Alcatel-Lucent Engineering”).

Defaults

By default, all UNI profiles are displayed if a UNI profile name is not specified with this command.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Specify a UNI profile name to display attributes for a single UNI profile.

Examples

```
-> show ethernet-service uni-profile

  Profile Name     Stp    802.1x   802.3ad    802.1AB    MVRP     AMAP
+---------------+-------+--------+---------+----------+--------+---------+
uprofile-video1   tunnel   drop      peer      drop     tunnel     drop
```

output definitions

Profile Name	The name of the UNI profile.
Stp	Indicates how Spanning Tree traffic control packets are processed.
802.1x	Indicates how IEEE 802.1x control packets are processed.
802.3ad	Indicates how IEEE 802.3ad control packets are processed.
802.1AB	Indicates how IEEE 802.1AB control packets are processed.
MVRP	Indicates how the Multiple VLAN Registration Protocol packets are processed.
AMAP	Indicates how Alcatel-Lucent Mapping Adjacency Protocol packets are processed.

Release History

Release 8.1.1; command introduced.

Related Commands

ethernet-service sap sap-profile	Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.
ethernet-service uni uni-profile	Associates a VLAN Stacking UNI profile with a UNI port.
show ethernet-service uni	Displays the profile associations for VLAN Stacking User Network Interface (UNI) ports.

   alaEServiceUNIProfileMvrpTreatment
   alaEServiceUNIProfileAmapTreatment
```

show ethernet-service sap-profile

Displays the profile attribute configuration for VLAN Stacking Service Access Point (SAP) profiles.

show ethernet-service sap-profile *sap_profile_name*

Syntax Definitions

sap_profile_name	An alphanumeric string. Use quotes around the string if the profile name contains multiple words with spaces between them (for example, “Alcatel-Lucent Engineering”).

Defaults

By default, all SAP profiles are displayed if a SAP profile name is not specified with this command.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Specify a SAP profile name to display attributes for a single SAP profile.
- The ingress bandwidth value is displayed in megabytes.

Examples

```
-> show ethernet-service sap-profile

      Profile Name   Ingr/Egr     Ingr Bw    Inner Tag   Priority   Priority
                        Bw        Sharing      Option    Mapping     Value

------------------+-----------+-----------+-----------+----------+-----------

default-sap-profile     0/0       Enable      Preserve     fixed       0
map_pbit                0/0       Enable      Preserve     in-out      P

-> show ethernet-service sap-profile sap-video1

   Profile Name       Ingr/Egr    Ingr Bw       Inner Tag  Priority   Priority
                       Bw         Sharing       Option     Mapping     Value
-------------------+----------+-------------+-----------+----------+------------
sap-video1             20         Disable     Preserve     NA         NA
```

output definitions

Profile Name	The name of the SAP profile.
Ingr/Egr Bw	**Ingress Egress Bandwidth** - The maximum amount of ingress and egress bandwidth to allow for SAP ports.

output definitions

Ingr Bw Sharing	**Ingress Bandwidth Sharing -** The status of bandwidth sharing (**enable**, **disable,** or **NA**). If enabled, the ingress bandwidth value is shared across all SAP ports and CVLANs. If disabled, the bandwidth value is not shared and applied to individual SAP ports and CVLANs.
Inner Tag Option	Indicates how the CVLAN tag is processed (**translate** or **preserve**). If set to **preserve**, the CVLAN tag is retained and the SVLAN is added to the frame. If set to **translate**, the CVLAN tag is changed to the SVLAN tag.
Priority Mapping	Indicates how the priority value is configured for the SVLAN (**NA**, **in-out** or **fixed**). If set to **in-out**, the CVLAN priority value is mapped to the SVLAN. If set to fixed, a user-specified priority value is used for the SVLAN priority.
Priority Value	Indicates the priority value mapped to the SVLAN (**NA**, default 0, a number, **P**, or **DSCP**). A number indicates a fixed, user-specified value is used; **P** indicates the CVLAN 802.1p bit value is used; **DSCP** indicates the CVLAN DSCP value is used.

47 Service Manager Commands

The Alcatel-Lucent OmniSwitch supports Shortest Path Bridging MAC (SPBM), as defined in the IEEE 802.1aq standard. SPB-M uses the Provider Backbone Bridge (PBB) network model to encapsulate (using IEEE 802.1ah headers) and tunnel customer traffic through the network backbone. The shortest path trees (SPTs) upon which the PBB network infrastructure operates are determined using a version of the Intermediate System-to-Intermediate System (IS-IS) link state protocol that supports TLV extensions for SPB (ISIS-SPB).

The SPBM network topology consists of two layers: the backbone infrastructure (control plane) layer and the services (data plane) layer. ISIS-SPB builds the backbone layer by defining loop-free, SPTs through the backbone network. The service layer is based on the PBB framework as defined in the IEEE 802.1ah standard. SPBM supports the 802.1ah MAC-in-MAC method for data encapsulation. SPBM services transport the encapsulated traffic over the ISIS-SPB infrastructure.

The OmniSwitch Service Manager application provides the ability to configure and manage a service-based architecture consisting of the following logical entities that are required to provision a service:

- **Service Instance Identifier (I-SID)**. A backbone service instance that will tunnel the encapsulated data traffic through the PBB network. The I-SID is bound to a SPB backbone VLAN (BVLAN) ID and a Service Manager SPB service ID when the service is created.
- **Access Port**. A port or link aggregate configured as an SPB access port. This type of port defines the point at which traffic from other provider networks or directly from customer networks enters the PBB network. The access port is also associated with a Layer 2 profile that specifies how to process protocol control frames received on the port
- **Service Access Point (SAP).** A SAP is a logical service entity (also refered to as a virtual port) that binds an access port to an SPB service ID and specifies the type of customer traffic ((untagged, single-tagged, double-tagged, or all) to encapsulate and tunnel through the PBB network.
- **Service Distribution Points (SDPs)**. A SDP provides a logical point at which customer traffic is directed from one PE to another PE through a one-way service tunnel.

Once the SPB service-based architecture is defined, the following service components are dynamically created by the OmniSwitch. No user-configuration is required.

- **Service Distribution Point (SDP)**—A SDP provides a logical point at which customer traffic is directed from one backbone edge switch to another. SDPs are used to set up distributed services, which consist of at least one SAP on a local node, one SAP on a remote node, and an SDP binding the service on both nodes.
- **Mesh SDP**—A mesh SDP represents the binding of a SPB service instance to an SDP. The SDP then distributes the service connectivity to other backbone edge switches through the ISIS-SPB shortest path trees.

This chapter documents the Command Line Interface (CLI) commands used to configure and verify the SPB service-based architecture. For commands used to configure and verify the ISIS-SPB backbone, see Chapter 8, "Shortest Path Bridging Commands."

MIB information for the Service Manager commands is as follows:

Filename: AlcatelIND1ServiceMgr.MIB
Module: alcatelIND1ServiceMgrMIB

A summary of the available commands is listed here:

Service Commands	**service spb** **service spb description** **service spb stats** **service spb admin-state** **service spb multicast-mode** **service spb vlan-xlation** **service stats**
Service Access Port Commands	**service l2profile** **service access** **service access l2profile** **service access vlan-xlation**
Service Access Point (SAP) Commands	**service spb sap** **service spb sap description** **service spb sap trusted** **service spb sap admin-state** **service spb sap stats**
Clear Commands	**clear service spb counters**
Show Commands	**show service l2profile** **show service access** **show service** **show service spb ports** **show service spb sap** **show service sdp** **show service mesh-sdp** **show service spb debug-info** **show service spb counters**

service spb

Configures a Shortest Path Bridging (SPB) service and associates that service with a backbone service instance identifier (I-SID) and BVLAN. A SPB service connects multiple customer sites together across a provider-managed core network by creating a virtual zero-hop, Layer 2 switched domain.

service spb *service_id* **isid** *instance_id* **bvlan** *bvlan_id*

no service spb {*service_id* | **all} [bvlan** *bvlan_id***]**

Syntax Definitions

service_id	A unique numerical value to identify a specific SPB service. The valid service ID range is 1–32767.
instance_id	A service instance identifier (I-SID) that is used to identify the SPB service in a provider backbone bridge (PBB) network. The valid range is 256–16777214.
bvlan_id	The VLAN ID number of an existing SPB BVLAN.
all	Specifies all SPB services.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- To remove a SPB service, administratively disable the service then use the **no** form of this command and specify the service ID of the disabled service. Use the **all** parameter to remove all SPB services from the bridge configuration.
- To remove SPB services from a specific BVLAN, use the **no** form of this command with the optional **bvlan** parameter.
- SPB services created with this command are considered static services, which are identified by a service ID number between 1 and 32767 (the valid range for this command). If the SPB service was dynamically created by another OmniSwitch feature, such as Universal Network Profiles (UNP), a service ID number between 32768 and 65534 is automatically assigned to the dynamic service.
- A SPB service provides E-LAN connectivity for customer traffic and is identified by an I-SID. Services are bound to service access ports (SAPs) on the access side. On the network side they are automatically bound to service distribution points by the ISIS-SPB protocol.
- Each SPB service is basically a Virtual Forwarding Instance (VFI) that is capable of learning customer MAC addresses from the access side (SAPs) and from the network side (Mesh SDP) and then switching the traffic based on this information.

Examples

```
-> service spb 1 isid 1000 bvlan 4001
-> no service spb 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

service spb description	Configures a description for the specified SPB service.
service spb stats	Configures the statistics collection status for the specified SPB service.
service spb admin-state	Configures the administrative status of the specified SPB service.
service spb multicast-mode	Configures the multicast replication mode for the specified SPB service.
service spb vlan-xlation	Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified SPB service.
show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcBaseInfoTable
   alaSvcId
   alaSvcType
   alaSvcIsid
   alaSvcBVlan
```

service spb description

Configures a description for the specified SPB service.

service spb *service_id* **description** *desc_info*

service spb *service_id* **no description**

Syntax Definitions

service_id	An existing SPB service ID number.
desc_info	An ASCII text string up to 160 characters in length.

Defaults

By default, a description is not added when the SPB service is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the description from the specified service ID.
- This command adds or modifies a description for an existing SPB service. However, the **description** parameter is also used to specify a description at the time the service is created.

Examples

Adding or modifying a description for an existing SPB service:

```
-> service spb 100 description "SPB Service for ISID 1234"
-> service spb 10 description SPB1-CustA
-> service spb 10 no description
```

Configuring a new service with a description:

```
-> service spb 100 isid 1234 bvlan 3000 description "SPB Service for ISID 1234"
```

Release History

Release 8.1.1; command was introduced.

Related Commands

service spb	Configures a SPB service.
service spb stats	Configures the statistics collection status for the specified SPB service.
service spb admin-state	Configures the administrative status of the specified SPB service.
service spb multicast-mode	Configures the multicast replication mode for the specified SPB service.
service spb vlan-xlation	Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified SPB service.
show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcBaseInfoTable
   alaSvcId
   alaSvcDescription
```

service spb stats

Configures ingress and egress statistics collection for packets flowing through the service access point (SAP) or service distribution point (SDP) bindings associated with the specified SPB service.

service spb {*service_id* **| all} stats {enable | disable}**

Syntax Definitions

service_id	An existing SPB service ID number.
all	Specifies all SPB services.
enable	Administratively enables statistics gathering for the service.
disable	Administratively disables statistics gathering for the service.

Defaults

By default, statistics collection is disabled when the service is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command configures statistics collection for an existing SPB service. However, the **stats {enable | disable}** parameter is also used to specify the status at the time the service is created.
- SPB statistics collection is not active unless the statistics collection capability is enabled for the Switch Manager application on the local switch. To enable this capability, use the **service stats** command before administratively enabling statistics collection for SPB services.

Examples

Configuring statistics collection for an existing SPB service:

```
-> service spb 100 stats enable
-> service spb all stats enable
-> service spb 100 stats disable
-> service spb all stats disable
```

Configuring statistics collection for a new SPB service:

```
-> service spb 200 isid 2345 bvlan 3000 stats enable
-> service spb 300 isid 3456 bvlan 2000 stats disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

service spb	Configures a SPB service.
service spb description	Configures a description for the specified SPB service.
service spb admin-state	Configures the administrative status of the specified SPB service.
service spb multicast-mode	Configures the multicast replication mode for the specified SPB service.
service spb vlan-xlation	Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified SPB service.
show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcBaseInfoTable
   alaSvcId
   alaSvcStatsAdminStatus
```

service spb admin-state

Configures the administrative status of the specified SPB service.

service spb {*service_id* **| all} admin-state {enable | disable}**

Syntax Definitions

service_id	An existing SPB service ID number.
all	Specifies all SPB services.
enable	Administratively enables the service.
disable	Administratively disables the service.

Defaults

By default, the administrative status is disabled when the service is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Disable the administrative status of the service and any associated service access points (SAPs) and service distribution points (SDPs) before attempting to remove a SPB service.
- Disabling the administrative status does not remove the SPB service configuration from the bridge.
- This command configures the administrative status for an existing SPB service. However, the **admin-state {enable | disable}** parameter is also used to specify the status at the time the service is created.

Examples

Configuring the status for an existing SPB service:

```
-> service spb 100 admin-state enable
-> service spb all admin-state enable
-> service spb 100 admin-state disable
-> service spb all admin-state disable
```

Configuring the status for a new SPB service:

```
-> service spb 200 isid 2345 bvlan 3000 admin-state enable
-> service spb 300 isid 3456 bvlan 2000 admin-state disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

service spb	Configures a SPB service.
service spb description	Configures a description for the specified SPB service.
service spb stats	Configures the statistics collection status for the specified SPB service.
service spb multicast-mode	Configures the multicast replication mode for the specified SPB service.
service spb vlan-xlation	Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified SPB service.
show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcBaseInfoTable
   alaSvcId
   alaSvcAdminStatus
```

service spb multicast-mode

Configures the multicast replication mode for the specified SPB service.

service spb {*service_id* **| all} multicast-mode {head-end | tandem}**

Syntax Definitions

service_id	An existing SPB service ID number.
all	Specifies all SPB services.
head-end	Specifies the head-in replication mode for the service.
tandem	Specifies the tandem replication mode for the service.

Defaults

By default, the service is configured to use the head-end mode.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When a SPB service is configured to use the head-in mode, a non-unicast packet received on an SPB access port is replicated once for each receiver in the provider backbone bridge (PBB) network using its unicast base MAC (BMAC) address.
- When a SPB service is configured to use the tandem mode, a non-unicast packet received on an SPB access port is replicated once at each node using the multicast group address.
- Make sure that the same multicast mode is used across all nodes for a given BVLAN. Tandem nodes and head-end nodes cannot communicate with each other.
- This command configures the multicast mode for an existing SPB service. However, the **multicast-mode {head-end | tandem}** parameter is also used to specify the status at the time the service is created.

Examples

Configuring the status for an existing SPB service:

```
-> service spb 100 multicast-mode tandem
-> service spb 150 multicast-mode head-end
```

Configuring the status for a new SPB service:

```
-> service spb 200 isid 2345 bvlan 3000 multicast-mode tandem
```

Release History

Release 8.1.1; command was introduced.

Related Commands

service spb	Configures a SPB service.
service spb description	Configures a description for the specified SPB service.
service spb stats	Configures the statistics collection status for the specified SPB service.
service spb admin-state	Configures the administrative status of the specified SPB service.
service spb vlan-xlation	Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified SPB service.
show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcBaseInfoTable
   alaSvcId
   alaSvcMulticastMode
```

service spb vlan-xlation

Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified SPB service.

service spb {*service_id* **| all} vlan-xlation {enable | disable}**

Syntax Definitions

service_id	An existing SPB service ID number.
all	Specifies all SPB services.
enable	Enables VLAN translation for the service.
disable	Disables VLAN translation for the service.

Defaults

By default, VLAN translation is disabled when the service is created.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Enabling translation at the service level is only applicable if the corresponding access ports for the SAPs also have VLAN translation enabled.
- This command configures the VLAN translation status for an existing SPB service. However, the **vlan-xlation {enable | disable}** parameter is also used to specify the status at the time a service is created.

Examples

Configuring the status for an existing SPB service:

```
-> service spb 100 vlan-translation enable
-> service spb all vlan-translation enable
-> service spb 100 vlan-translation disable
-> service spb all vlan-translation disable
```

Configuring the status for a new SPB service:

```
-> service spb 200 isid 2345 bvlan 3000 vlan-translation enable
-> service spb 300 isid 3456 bvlan 2000 vlan-translation disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

service spb	Configures a SPB service.
service spb description	Configures a description for the specified SPB service.
service spb stats	Configures the statistics collection status for the specified SPB service.
service spb admin-state	Configures the administrative status of the specified SPB service.
service spb multicast-mode	Configures the multicast replication mode for the specified SPB service.
service access vlan-xlation	Configures the status of VLAN Translation for the specified access port.
show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcBaseInfoTable
   alaSvcId
   alaSvcSapVlanXlation
```

service stats

Configures the statistics collection capability for the Service Manager application. When enabled, this capability is available only for the Shortest Path Bridging (SPB) feature. When disabled, this capability is available only for the Application Monitoring and Enforcement (AppMon) feature.

service stats {enable | disable}

Syntax Definitions

enable	Enables Service Manager statistics collection.
disable	Disables Service Manager statistics collection.

Defaults

By default, statistics collection is enabled for the Service Manager application.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Disabling the Service Manager statistics collection capability is required to allow the switch to gather statistics for the AppMon feature.
- When enabled for Service Manager use, the **service spb stats** command is still required to administratively enable or disable statistics collection for one or more SPB services.

Examples

The following command enables stats for AppMon:

```
-> service stats disable
```

The following command enables stats for SPB:

```
-> service stats enable
```

Release History

Release 8.2.1; command was introduced.

Related Commands

service spb stats	Configures the statistics collection status for the specified SPB service.
show service	Displays the service configuration for the bridge.

MIB Objects

```
alaSvcMgrSysTable
   alaSvcMgrStatsAdminState
```

service l2profile

Configures a Layer 2 profile that is applied to an access (customer facing) port. This profile is used to specify how to process Layer 2 control frames ingressing on the access port.

service l2profile *profile-name* **[stp | 802.1x | 802.1ab | 802.3ad | gvrp | mvrp | amap | pdu | vlan | uplink] [peer | discard | tunnel]**

no service l2profile *profile-name*

Syntax Definitions

profile-name	Alphanumeric string of up to 32 characters. Use quotes around string if the profile name contains multiple words with spaces between them (e.g., “Alcatel-Lucent Engineering”).
stp	Specifies how to process Spanning Tree BPDU.
802.1x	Specifies how to process 802.1x control frames.
802.1ab	Specifies how to process 802.1ab control frames.
802.3ad	Specifies how to process 802.3ad control frames.
gvrp	Specifies how to process GARP VLAN Registration Protocol packets.
mvrp	Specifies how to process Multiple VLAN Registration Protocol packets.
amap	Specifies how to process Alcatel-Lucent Management Adjacency Protocol packets.
peer	Allows the access port to participate in the specified protocol. Control packets are not sent to the network side of the node.
discard	Discards the specified PDU.
tunnel	Tunnels the specified PDU across the provider network.

Defaults

If no parameters are specified with this command, the new profile inherits all the following protocol settings from the default profile (**def-access-profile**):

parameter	default
stp	**tunnel**
802.1x	**discard**
802.1ab	**discard**
802.3ad	**peer**
gvrp	**tunnel**
mvrp	**tunnel**
amap	**discard**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete a Layer 2 profile. Removing the **def-access-profile** is not allowed.
- Remove any profile associations with access ports before attempting to modify or delete the profile.
- Not all of the control protocols are currently supported with the **peer**, **tunnel**, and **discard** parameters. Use the following table to determine the parameter combinations that are supported:

Protocol	Reserved MAC	peer	discard	tunnel
STP	01-80-C2-00-00-00	no	yes	yes
802.1x	01-80-C2-00-00-03	no	yes	yes
802.1ab	01-80-C2-00-00-0E	no	yes	yes
802.3ad	01-80-C2-00-00-02	yes	no	no
GVRP	01-80-C2-00-00-21	no	yes	yes
MVRP	—	no	yes	yes
AMAP	00-20-DA-00-70-04	no	yes	no

- If a user-configured Layer 2 profile is *not* associated with an access port, then the **def-access-profile** is used to process control packets ingressing on the port.

Examples

```
-> service l2profile sap_1_profile stp discard
-> no service l2profile sap_1_profile
-> service l2profile DropL2
-> service l2profile DropL2 stp discard gvrp discard 802.1ab discard
```

Release History

Release 8.1.1; command was introduced.

Related Commands

service access	Configures a switch port or link aggregate as an access port.
service access l2profile	Assigns a Layer 2 profile to the specified service access port.
show service l2profile	Displays the Layer 2 profile configuration information for the bridge.

MIB Objects

```
alaServiceMgrPortProfileTable
   alaServiceMgrPortProfileID
   alaServiceMgrPortProfileStpBpduTreatment
   alaServiceMgrPortProfile8021xTreatment
   alaServiceMgrPortProfile8021ABTreatment
   alaEServiceUNIProfileGvrpTreatment
   alaServiceMgrPortProfileAmapTreatment
   alaServiceMgrPortProfile8023ADTreatment
```

service access

Configures a switch port or link aggregate as an access port for customer traffic.

service access {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} [description** *port_description***]**

service access {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} [no description]**

no service access {port *slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]}**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of ID numbers (5-10).
port_description	An alphanumeric string (1–128 characters).

Defaults

parameter	default
port_description	No description

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to revert the port mode back to the default mode (network).
- Access ports are required to configure a Service Access Point (SAP). A SAP is the point at which customer traffic enters and exits the provider service. SAPs are not configured on network ports

Examples

```
-> service access port 1/1/3
-> service access linkagg 10
-> service access port 1/1/6 description "Voice Access Port"
-> service access port 2/1/6 description "L3 VPN Loopback Port"
-> service access linkagg 100 description "Server Access Port"
-> service access port 2/1/6 no description
-> no service access port 1/1/3
-> no service access linkagg 10
```

Release History

Release 8.1.1; command was introduced.

Related Commands

service l2profile	Configures a Layer 2 profile that is used to specify how to process Layer 2 control frames ingressing on the access port.
service access l2profile	Assigns a Layer 2 profile to the specified service access port.
show service l2profile	Displays the Layer 2 profile configuration information for the bridge.
show service access	Displays the access (customer-facing) port configuration for the bridge.

MIB Objects

```
alaServiceMgrPortTable
   alaServiceMgrPortID
   alaServiceMgrPortMode
   alaServiceMgrPortLinkStatus
   alaServiceMgrPortSapType
   alaServiceMgrSapCount
```

service access l2profile

Assigns an existing Layer 2 profile to the specified service access port. This profile determines how Layer 2 protocol frames ingressing on the access port are processed.

service access {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} l2profile {default |** *profile_name***}**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of ID numbers (5-10).
default	Assigns the default profile to the specified port.
profile_name	The name of an existing Layer 2 profile.

Defaults

By default, the default Layer 2 profile (**def-access-profile**) is assigned when a port is configured as a service access port.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **default** parameter with this command to revert the associated profile back to the default profile settings.
- Specify only ports or link aggregates that are configured as service access ports. This command does not apply to network ports.
- Specify a profile name that already exists in the switch configuration.

Examples

```
-> service access port 1/1/3 l2profile sap_1_profile
-> service access linkagg 10 l2profile sap_1_profile
-> service access port 1/1/3 l2profile default
-> service access linkagg 10 l2profile default
```

Release History

Release 8.1.1; command was introduced.

```

service access vlan-xlation

Configures the status of egress VLAN translation for all the service access points (SAPs) associated with the specified access port.

service access {port *chassis/slot/port***[**-*port2***]** | **linkagg** *agg_id***[**-*agg_id2***]} vlan-xlation {enable | disable}**

Syntax Definitions

*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of ID numbers (5-10).
enable	Enables VLAN translation for the specified port.
disable	Disables VLAN translation for the specified port.

Defaults

By default, VLAN translation is disabled when a port or link aggregate is configured as an access port.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Specify only ports or link aggregates that are configured as service access ports. This command does not apply to SPB interfaces (network ports).
- Enabling VLAN translation on a access port implicitly enables translation for all SAPs associated with that port. However, translation must also be enabled for the services associated with these SAPs. This ensures that all SAPs associated with a service will apply VLAN translation.

Examples

```
-> service access port 1/1/3 vlan-xlation enable
-> service access linkagg 10 vlan-xlation enable
-> service access port 1/1/3 vlan-xlation disable
-> service access linkagg 10 vlan-xlation disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

service access	Configures a switch port or link aggregate as an access port.
service spb vlan-xlation	Configures the status of egress VLAN translation for the specified SPB service.
show service access	Displays the access (customer-facing) port configuration for the switch.

MIB Objects

```
alaServiceMgrPortTable
   alaServiceMgrPortID
   alaServiceMgrPortMode
   alaServiceMgrPortVlanXlation
```

service spb sap

Configures a Service Access Point (SAP) by associating a SAP ID with a SPB service. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

service spb *service_id* **sap {port** *chassis/slot/port* **| linkagg** *agg_id***} [:0 | :all | :***qtag* | | **:***outer_qtag.inner_qtag***]**

service spb *service_id* **no sap {port** *chassis/slot/port* | **linkagg** *agg_id***} [:0 | :all | :***qtag* | **:***outer_qtag.inner_qtag***]**

Syntax Definitions

service_id	An existing SPB service ID number.
chassis/slot/port	The chassis ID, slot, and port number (3/1/1) of a service access port.
agg_id	The link aggregate ID number of a service access link aggregate.
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
:qtag	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP.
:outer_qtag.inner_qtag	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.

Defaults

parameter	default
:0 | :all | :*qtag* | *:outer_qtag.inner_qtag*	**:0** (null - untagged traffic)

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove a a SAP.
- The **:all** (wildcard) parameter is also configurable as the inner tag value for double-tagged packets (for example, “10:all” specifies double-tagged packets with an outer tag equal to 10 and an inner tag with any value).
- Specify only ports or link aggregates that are configured as service access ports (see **service access**). This command does not apply to network ports.
- Configuring SAPs with different encapsulation types for the same access port is allowed.

Examples

```
-> service spb 100 sap port 1/1/1:0
-> service spb 100 sap port 1/1/1:50
-> service spb 100 sap port 2/1/10:100.200
-> service apb 100 sap port 2/1/10:500.all
-> service spb 100 sap linkagg 5:10
-> service spb 200 sap port 2/1/1:20.30
-> service spb 200 sap linkagg 9:all
-> service spb 100 no sap 2/1/10:100.200
-> service spb 200 no sap linkagg 9:all
```

Release History

Release 8.1.1; command was introduced.

Related Commands

service spb sap description	Configures a description for the specified SAP ID.
service spb sap trusted	Configures the trust mode for the specified SAP ID.
service spb sap admin-state	Configures the administrative status for the specified SAP ID.
service spb sap stats	Configures statistics collection for the specified SAP ID.
show service spb ports	Displays SAP configuration information for the specified service.

MIB Objects

```
alaSapBaseInfoTable
   alaSapPortId
   alaSapEncapValue
   alaSapSvcId
```

service spb sap description

Configures a description for the specified Service Access Point (SAP) ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

service spb *service_id* **sap {port** *chassis/slot/port* **| linkagg** *agg_id***} [:0 | :all | :***qtag* | **:***outer_qtag.inner_qtag***] description** *desc_info*

service spb *service_id* **no sap {port** *chassis/slot/port* | **linkagg** *agg_id***} [:0 | :all | :***qtag* | **:***outer_qtag.inner_qtag***] no description**

Syntax Definitions

service_id	An existing SPB service ID number.
chassis/slot/port	The chassis ID, slot, and port number (3/1/1) of a service access port.
agg_id	The link aggregate ID number of a service access link aggregate.
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
:qtag	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP.
:outer_qtag.inner_qtag	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
desc_info	An ASCII text string up to 160 characters in length.

Defaults

By default, a description is not added when the SAP is created.

parameter	default
:0 | :all | :*qtag* | *:outer_qtag.inner_qtag*	**:0** (null - untagged traffic)

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to remove the description from the specified SAP.
- Specify the SPB service ID number associated with the specified SAP ID (access port/encapsulation).

Examples

```
-> service spb 10 sap port 1/1/2:10 description “CE1 to SPB10 SAP”
-> service spb 13 linkagg 20:100.200 description “CE2 to SPB13 SAP”
```

```
-> service spb 10 sap port 1/1/2:10 no description
-> service spb 13 linkagg 20:100.200 no description
```

Release History

Release 8.1.1; command was introduced.

Related Commands

service spb sap	Configures a SAP by associating a SAP ID with a SPB service.
service spb sap trusted	Configures the trust mode for the specified SAP ID.
service spb sap admin-state	Configures the administrative status for the specified SAP ID.
service spb sap stats	Configures statistics collection for the specified SAP ID.
show service spb ports	Displays SAP configuration information for the specified service.

MIB Objects

```
alaSapBaseInfoTable
   alaSapPortId
   alaSapEncapValue
   alaSapDescription
   alaSapSvcId
```

service spb sap trusted

Configures the trust mode for the specified Service Access Port (SAP) ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

A trusted SAP can accept 802.1p values in incoming packets; an untrusted SAP will set any 802.1p values to zero in incoming packets, unless an 802.1p value is configured with this command.

service spb *service_id* **sap {port** *chassis/slot/port* **| linkagg** *agg_id***} [:0 | :all | :***qtag* | **:***outer_qtag.inner_qtag***] trusted**

service spb *service_id* **sap {port** *chassis/slot/port* **| linkagg** *agg_id***} [:0 | :all | :***qtag* | **:***outer_qtag.inner_qtag***] no trusted priority** *value*

Syntax Definitions

service_id	An existing SPB ID number.
chassis/slot/port	The chassis ID, slot, and port number (3/1/1) of a service access port.
agg_id	The link aggregate ID number of a service access link aggregate.
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
:qtag	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP.
:outer_qtag.inner_qtag	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
trusted	Allows the SAP to use the priority value obtained from tagged packets ingressing on the SAP port. Untagged packets use the default port priority value.
value	The priority value to set. Values range from 0 (lowest priority) to 7 (highest priority). This is the priority assigned to tagged and untagged packets ingressing on an untrusted SAP.

Defaults

By default, the SAP is trusted with the priority set to best effort (zero). These default values are set when a port is configured as an access port and then associated with the SAP.

parameter	default
:0 | :all | :*qtag* | *:outer_qtag.inner_qtag*	**:0** (null - untagged traffic)

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no trusted** form of this command with the **priority** *value* parameter to configure a priority value to assign to packets ingressing on the SAP.
- Specify the SPB service ID number associated with the specified SAP ID (access port/encapsulation).
- Administratively disabling the SAP is not required to change the trust mode for the SAP.
- When the trust mode is changed from untrusted to trusted, the priority value is automatically set to the default best effort priority value (zero).
- Note that untagged Layer 2 control packets (for example, BPDU, GVRP, and AMAP) are always tunneled (if enabled) through the provider backbone bridge (PBB) network with the default EXP bits set to 7, so that they can arrive at the destination bridge at the highest COS queue of 7. As a result, trusted and untrusted SAPs configured on the access ports will not affect the Layer 2 control packets ingressing on the access ports.
- Configuring the trust mode on an access port is not allowed. These settings are configured for the SAP to which the access port is associated.

Examples

```
-> service spb 10 sap port 1/1/2:10 trusted
-> service spb 13 linkagg 20 trusted
-> service spb 10 sap port 1/1/2:10 no trusted priority 7
-> service spb 13 linkagg 20 no trusted
```

Release History

Release 8.1.1; command was introduced.

Related Commands

service spb sap	Configures a SAP by associating a SAP ID with a SPB service.
service spb sap description	Configures a description for the specified SAP ID.
service spb sap admin-state	Configures the administrative status for the specified SAP ID.
service spb sap stats	Configures statistics collection for the specified SAP ID.
show service spb ports	Displays SAP configuration information for the specified service.

MIB Objects

```

   alaSapPortId
   alaSapEncapValue
   alaSapTrusted
   alaSapPriority
   alaSapSvcId
```

service spb sap admin-state

Configures the administrative status for the specified Service Access Point (SAP) ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

service spb *service_id* **sap {port** *chassis/slot/port* **| linkagg** *agg_id***} [:0 | :all | :***qtag* **|** ***:outer_qtag.inner_qtag*****] admin-state {enable | disable}**

Syntax Definitions

service_id	An existing SPB ID number.
chassis/slot/port	The chassis ID, slot, and port number (3/1/1) of a service access port.
agg_id	The link aggregate ID number of a service access link aggregate.
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
:qtag	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP.
:outer_qtag.inner_qtag	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
enable	Enables the administrative status of the SAP.
disable	Disables the administrative status of the SAP.

Defaults

By default, the administrative status of the SAP is disabled.

parameter	default
:0 | :all | :*qtag* | *:outer_qtag.inner_qtag*	**:0** (null - untagged traffic)

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Specify the SPB service ID number associated with the specified SAP ID (access port/encapsulation).
- Disabling the SAP administrative status does not remove the SAP configuration from the bridge.
- If an access port goes down, all SAPs associated with that port are operationally taken down as well.

Examples

```
-> service spb 10 sap port 1/1/2:10 admin-state enable
-> service spb 13 linkagg 20 admin-state enable
```

```
-> service spb 10 sap port 1/1/2:10 admin-state disable
-> service spb 13 linkagg 20 admin-state disable
```

Release History

Release 8.1.1; command was introduced.

```

service spb sap stats

Configures ingress and egress statistics collection for packets flowing through the specified SAP ID. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

service spb *service_id* **sap {port** *chassis/slot/port* **| linkagg** *agg_num***} [:0 | :all | :***qtag1* **|** ***:outer_qtag.inner_qtag*****] stats {enable | disable}**

Syntax Definitions

service_id	An existing SPB ID number.
chassis/slot/port	The chassis ID, slot, and port number (3/1/1) of a service access port.
agg_id	The link aggregate ID number of a service access link aggregate.
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
:qtag	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP.
:outer_qtag.inner_qtag	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
enable	Enables statistics collection for the SAP.
disable	Disables statistics collection for the SAP.

Defaults

By default, statistics collection is disabled for the SAP.

parameter	default
:0 | :all | :*qtag* | *:outer_qtag.inner_qtag*	**:0** (null - untagged traffic)

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Specify the SPB service ID number associated with the specified SAP ID (access port/encapsulation).

Examples

```
-> service spb 100 sap port 1/1/2:10 stats enable
-> service spb 101 sap linkagg 20:all stats enable
-> service spb 100 sap port 1/1/2:10 stats disable
-> service spb 101 sap linkagg 20:all stats disable
```

Release History

Release 8.1.1; command was introduced.

```

show service l2profile

Displays the Layer 2 profile configuration information for the bridge. This type of profile is applied to access (customer-facing) ports and specifies how to process Layer 2 protocol frames ingressing on such ports.

show service l2profile [*profile_name***]**

Syntax Definitions

profile_name	An existing Layer 2 profile name. Use quotes around string if the profile name contains multiple words with spaces between them (e.g., “Alcatel-Lucent Engineering”).

Defaults

By default, all profiles are displayed if a profile name is not specified with this command.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the *profile-name* parameter to display information for a specific profile. Entering a profile name is case sensitive.
- If there are no profiles configured for the bridge, this command still displays the information for the default profile (def-access-profile). This profile is applied to access ports that were not associated with a specific profile.

Examples

```
-> show service l2profile
Profile Name: def-access-profile,
STP     : tunnel,    802.1X  : drop,      802.3AD : peer,     802.1AB : drop,
GVRP    : tunnel,    AMAP    : drop,      MVRP    : tunnel

Profile Name: DropL2,
STP     : drop,      802.1X  : drop,      802.3AD : drop,     802.1AB : drop,
GVRP    : drop,      AMAP    : drop,      MVRP    : tunnel

->show service l2profile DropL2
Profile Name: DropL2,
STP     : drop,      802.1X  : drop,      802.3AD : drop,     802.1AB : drop,
GVRP    : drop,      AMAP    : drop,      MVRP    : tunnel
```

output definitions

Profile Name	The name of the Layer 2 profile.
Stp	Indicates how Spanning Tree traffic control packets are processed.
802.1x	Indicates how IEEE 802.1x control packets are processed.
802.3ad	Indicates how IEEE 802.3ad control packets are processed.

output definitions

802.1AB	Indicates how IEEE 802.1AB control packets are processed.
GVRP	Indicates how GARP VLAN Registration Protocol packets are processed.
AMAP	Indicates how Alcatel-Lucent Mapping Adjacency Protocol packets are processed.
MVRP	Indicates how Multiple VLAN Registration Protocol packets are processed.

Release History

Release 8.1.1; command was introduced.

Related Commands

service l2profile	Configures a Layer 2 profile that is applied to a service access port.
service access l2profile	Assigns an existing Layer 2 profile to the specified service access port

   alaServiceMgrPortProfileMvrpTreatment
```

show service access

Displays the access (customer-facing) port configuration for the bridge.

show service access [port *chassis/slot/port* | **linkagg** *agg_id***]**

Syntax Definitions

chassis/slot/port	The chassis ID, slot, and port number (3/1/1) of a service access port.
agg_id	The link aggregate ID number of a service access link aggregate.

Defaults

By default, all service access ports are displayed if a port or link aggregate number is not specified.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **port** *slot/port* and **linkagg** *agg-id* parameters to display the configuration for a specific port or link aggregate.

Examples

```
-> show service access
Port       Link  SAP     SAP     Vlan
Id        Status Type    Count   Xlation L2Profile
---------+------+-------+-------+-------+-----------------------------------
1/1/11      Up     Manual  100     N       def-access-profile
1/1/12      Up     Manual  100     N       def-access-profile
1/1/13      Down   Manual  100     N       def-access-profile
1/1/14      Down   Manual  100     N       def-access-profile

Total Access Ports: 4

-> show service access port 1/1/14
Port       Link  SAP     SAP     Vlan
Id        Status Type    Count   Xlation L2Profile
---------+------+-------+-------+-------+-----------------------------------
1/1/14      Down   Manual  100     N       def-access-profile

Total Access Ports: 4
```

output definitions

Port Id	The access port number or link aggregate ID number.
Link Status	The status of the link connection to the access port (**Up** or **Down**).
SAP Type	Whether or not the SAP associate with the access port was created statically or dynamically (**Manual** or **Dynamic**).

output definitions

SAP Count	The number of service access points (SAPs) that are associated with the access port.
VLAN Xlation	Whether or not VLAN translation is enabled on the access port.
L2Profile	The name of the Layer 2 profile associated with the access port. Configured through the **service l2profile** command.

Release History

Release 8.1.1; command was introduced.

Related Commands

service access	Configures a switch port or link aggregate as a service access port.
show service l2profile	Displays the Layer 2 profile configuration for the bridge.

MIB Objects

```
alaServiceMgrPortTable
   alaServiceMgrPortID
   alaServiceMgrPortLinkStatus
   alaServiceMgrPortSapType
   alaServiceMgrPortSapCount
   alaServiceMgrPortVlanXlation
   alaServiceMgrPortPortProfileID
```

show service

Displays the service configuration for the bridge.

show service [spb]

Syntax Definitions

spb	Displays Shortest Path Bridging (SPB) services.

Defaults

By default, all services are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **spb** parameter to display additional information about SPB services.
- The service ID is a unique number that identifies a specific SPB service. Information associated with the service ID is displayed.

Examples

```
-> show service
Legend: * denotes a dynamic object

```

output definitions

ServiceId	The service ID number.
Svc Type	The type of service (only SPB is supported).
Adm	The administrative state of the service (**Up** or **Down**).
Opr	The operational state of the service (**Up** or **Down**).
Stats	Whether or not statistics collection is enabled for the service.
SAP Count	The number of service access points (SDPs) associated with this SPB service.
Bind Count	The number of service distribution points (SDPs) bound to this SPB service.
Description	An optional description configured for the service.
ISID	The service instance identifier that identifies the SPB service instance within the provider backbone bridging (PBB) network.
BVLAN	The VLAN ID number for the base VLAN to which the SPB service is mapped.
Mcast Mode	The multicast replication mode (**Headend** or **Tandem**) for the service.

Release History

Release 8.1.1; command was introduced.

```

show service spb ports

Displays the virtual ports associated with the specified SPB service.

show service spb *service_id* **ports**

Syntax Definitions

service_id	An existing SPB service ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A virtual port represents a Service Access Point (SAP) or a Service Distribution Point (SDP) that is associated with the specified SPB service.
- In addition to the virtual port configuration, this command also provides the status and additional configuration information for the SPB service.

Examples

```

```

output definitions

Identifier	The virtual ports (SAPs or SDPs) associated with the service.
Adm	The administrative state of the virtual port (**Up** or **Down**).
Opr	The operational state of the virtual port (**Up** or **Down**).
Stats	Whether or not statistics collection is enabled for the virtual port.
Sap Trusted : Priority	Whether or not the Service Access Point (SAP) virtual port associated with the service is trusted or assigns a priority value.

output definitions

Sdp SystemId : BVlan	The system ID (base MAC) and associated BVLAN for a Service Distribution Point (SDP) virtual port associated with the service.
Intf	The bridge interface (port or link aggregate) of the virtual port (SAP or SDP) that is associated with the service.
Sap Description	The description for the SAP that is associated with the service.
Sdp Systemname	The system name for the SDP bridge that is associated with the service.

Release History

Release 8.1.1; command was introduced.

Related Commands

show service	Displays the service configuration for the bridge.
show service spb sap	Displays the service access point (SAP) configuration for a specific SAP associated with the specified SPB service.

MIB Objects

N/A

show service spb sap

Displays the configuration information for the specified SAP ID associated with the specified service. A SAP ID is comprised of a customer-facing port (referred to as an access port) and an encapsulation value that is used to identify the type of customer traffic to map to the associated service.

show service spb *service_id* **sap {***chassis/slot/port* **| linkagg** *agg_id***} [:0 | :all | :***qtag1* **|** ***:outer_qtag.inner_qtag*****]**

Syntax Definitions

service_id	An existing SPB ID number.
chassis/slot/port	The chassis ID, slot, and port number (3/1/1) of a service access port.
agg_id	The link aggregate ID number of a service access link aggregate.
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
:qtag	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP.
:outer_qtag.inner_qtag	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A Service Access Point (SAP) is a type of virtual port that is associated with the specified SPB service.
- A SAP determines which customer traffic (untagged, single-tagged, or double-tagged) is mapped to the service associated with this SAP.

Examples

```
-> show service spb 1525 sap port 1/1/11:2524
SAP Detailed Info
  SAP Id           : 1/1/11:2524,          Description      : ,
  Admin Status     : Up,                   Oper Status      : Up,
  Stats Status     : No,                   Vlan Translation : No,
  Service Type     : SPB,                  Allocation Type  : Static,
  Trusted          : Yes,                  Priority         : 0,
  Ingress Pkts     : 0,                    Ingress Bytes    : 0,
  Egress Pkts      : 0,                    Egress Bytes     : 0,
  Mgmt Change      : 08/08/2012 05:41:39,  Status Change    : 08/10/2012 21:14:42
```

output definitions

SAP Id	The access port and encapsulation associated with the service.
Description	An optional description configured for the SAP. By default, the description is blank.
Admin Status	The administrative state of the SAP (**Up** or **Down**).
Oper Status	The operational state of the SAP (**Up** or **Down**).
Stats Status	Whether or not statistics collection is enabled for the SAP (**Yes** or **No**).
Vlan Translation	Whether or not VLAN translation is enabled for the SAP (**Yes** or **No).**
Service Type	The type of service associated with this SAP (only SPB supported).
Allocation Type	Whether the service was manually or dynamically created (**Static** or **Dynamic**).
Trusted	Whether or not the SAP is trusted (**Yes** or **No**).
Priority	The 802.1p priority assigned to traffic mapped to this SAP. Applied only when SAP is not trusted and a priority is specified.
Ingress Pkts	The number of packets that have ingressed on this SAP.
Ingress Bytes	The number of bytes that have ingressed on this SAP.
Egress Pkts	The number of packets that have egressed on this SAP.
Egress Bytes	The number of bytes that have egressed on this SAP.
Mgmt Change	The date and time of the last configuration change for this SAP.
Status Change	The date and time of the last operational status change for this SAP.

Release History

Release 8.1.1; command was introduced.

Related Commands

show service	Displays the service configuration for the bridge.
show service spb ports	Displays the virtual ports (SAP and SDPs) associated with the specified SPB service.

MIB Objects

N/A

show service sdp

Displays the Service Distribution Point (SDP) configuration for the bridge. A SDP is a logical entity that directs traffic from one Backbone Edge Bridge (BEB) to another BEB in the Provider Backbone Bridge (PBB) network.

show service sdp [spb]

Syntax Definitions

spb	Displays Shortest Path Bridging (SPB) SDPs.

Defaults

By default, all SDPs are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **spb** parameter to display additional information about SPB SDPs.
- There is no manual configuration of SDPs required. SDPs are automatically created and bound to ISIS-SPB services as needed throughout the PBB network.
- Dynamic SDPs are not saved to the switch configuration file.

Examples

```
-> show service sdp
Legend: * denotes a dynamic object
All SDP Info
SdpId       FarEnd SysId:BVlan    Adm  Oper SvcType

32835*      e8e7.3233.1c81:4002   Up   Up   SPB
```

output definitions

SdpId	The unique SDP identification number that is dynamically generated by ISIS-SPB.
FarEnd SysId:BVlan	The System ID (bridge MAC address) and associated BVLAN of the far-end SPB node of the PBB tunnel defined by this SDP.
Adm	The administrative state of the SDP (**Up** or **Down**).

output definitions

Opr	The operational state of the SDP (**Up** or **Down**).
Svc Type	The type of service bound to the SDP (only SPB is supported).

```

output definitions

SdpId	The unique SDP identification number that is dynamically generated by ISIS-SPB.
FarEnd SysId:BVlan/ GroupMac	The System ID (BMAC) and associated BVLAN of the far-end SPB node of the PBB tunnel defined by this SDP.
SourceId	The shortest path (SP) source ID of the bridge.
Opr	The operational state of the SDP (**Up** or **Down**).
Intf/Isid	The SPB interface (network port) on which ISIS-SPB discovered the neighbor BMAC and BVLAN.
Bind Count	The number of services bound to this SDP.
FarEnd SystemName / PortList	The system name and port list of the far-end SPB node.

Release History

Release 8.1.1; command was introduced.

Related Commands

show service	Displays the service configuration for the bridge.
show service mesh-sdp	Displays the Mesh SDP configuration for the bridge.

MIB Objects

```

show service mesh-sdp

Displays the mesh Service Distribution Point (SDP) binding configuration for the bridge. Once a SDP is established and ISIS-SPB detects a service on the far-end SPB node that also exists on the local node, the SDP (BMAC:BVLAN) is automatically bound to the service instance.

show service mesh-sdp [spb]

Syntax Definitions

spb	Displays Shortest Path Bridging (SPB) mesh SDPs.

Defaults

By default, all mesh SDPs are displayed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **spb** parameter to display additional information about SPB mesh SDPs.
- There is no manual configuration of mesh SDPs required. SDPs are automatically created and bound to ISIS-SPB services as needed throughout the provider backbone bridge (PBB) network.
- Dynamic mesh SDPs are not saved to the switch configuration file.

show service spb debug-info

Displays debug information for the virtual ports associated with the SPB service.

show service spb *service_id* **ports**

Syntax Definitions

service_id	An existing SPB service ID number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A virtual port represents a Service Access Point (SAP) or a Service Distribution Point (SDP) that is associated with the specified SPB service.
- In addition to the virtual port configuration, this command also provides the status and additional configuration information for the SPB service.

Examples

```
-> show service spb 1525 ports
Legend: * denotes a dynamic object

Release History

Release 8.1.1; command was introduced.

Related Commands

show service spb ports	Displays the virtual port (SAP and SDP) configuration for the specified service.
show service	Displays the service configuration for the bridge.
show service access	Displays the service access port configuration for the switch.

MIB Objects

N/A

show service spb counters

Displays the traffic statistics for the specified SPB service and associated virtual ports. A virtual port represents a Service Access Point (SAP) or a Service Distribution Point (SDP) that is bound to the specified SPB service.

show service spb *service_id* **[sap {port** *chassis/slot/port* | **linkagg** *agg_id*}**[:0 | :all | :***qtag* **| :***outer_qtag.inner_qtag***] | mesh-sdp** *sdp_id***] counters**

Syntax Definitions

service_id	An existing SPB service ID number.
chassis/slot/port	The chassis ID, slot, and port number (3/1/1) of a service access port.
agg_id	The link aggregate ID number of a service access link aggregate.
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
:qtag	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP.
:outer_qtag.inner_qtag	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
sdp_id	An existing mesh SDP ID.

Defaults

By default, all statistics counters for the specified service are displayed.

parameter	default
:0 | :all | :*qtag* | *:outer_qtag.inner_qtag*	**:0** (null - untagged traffic)

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **sap** parameter options with this command to display statistics for a specific SAP ID. A SAP ID is comprised of an access port (*slot*/*port* or *agg_id*) and an encapsulation value (**:0**, **:all**, **:***qtag*, or **:***outer_qtag.inner_qtag*) that is used to identify the type of customer traffic to map to the associated service.
- Use the **mesh-sdp** *sdp_id* parameter to display statistics for a specific mesh SDP.

32768:100              34              5678          4321         12345678
```

output definitions

Identifier	The virtual ports (SAPs or SDPs) associated with the service.
Ing Pkts	The number of packets received on the virtual port.
Ing Byte Counts	The ingress packet byte count for the virtual port.
Egr Pkets	The number of packets sent on the virtual port.
Egr Byte Counts	The egress packet byte count for the virtual port.

Release History

Release 8.1.1; command was introduced.

Related Commands

show service	Displays the service configuration for the bridge.
show service spb ports	Displays the virtual ports associated with the specified SPB service.
clear service spb counters	Clears the traffic statistics for the specified SPB service and associated virtual ports.

MIB Objects

```
alaSapBaseInfoTable
alaSdpBindTable
```

clear service spb counters

Clears the traffic statistics for the specified SPB service and associated virtual ports. A virtual port represents a Service Access Point (SAP) or a Service Distribution Point (SDP) that is bound to the specified SPB service.

clear service spb *service_id* **[sap {port** *chassis/slot/port* | **linkagg** *agg_id***}[:0 | :all | :***qtag* **|** ***:outer_qtag.inner_qtag*****] | mesh-sdp** *sdp_id***] counters**

Syntax Definitions

service_id	An existing SPB service ID number.
chassis/slot/port	The chassis ID, slot, and port number (3/1/1) of a service access port.
agg_id	The link aggregate ID number of a service access link aggregate.
:0	Specifies a null encapsulation value for the SAP. Only untagged traffic is mapped to this SAP.
:all	Specifies a wildcard SAP. All tagged traffic that is not classified into another SAP is mapped to the wildcard SAP.
:qtag	Specifies a VLAN ID tag for traffic ingressing on the access port. Only traffic with this tag is mapped to this SAP.
:outer_qtag.inner_qtag	Specifies an outer VLAN ID tag and an inner VLAN tag for traffic ingressing on the access port. Only double-tagged (QinQ) traffic with the specified outer and inner tags is mapped to this SAP.
sdp_id	An existing mesh SDP ID.

Defaults

By default, all statistics counters for the specified service are cleared.

parameter	default
:0 | :all | :*qtag* | *:outer_qtag.inner_qtag*	**:0** (null - untagged traffic)

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **sap** parameter options with this command to clear the statistics for a specific SAP ID. A SAP ID is comprised of an access port (*slot*/*port* or *agg_id*) and an encapsulation value (**:0**, **:all**, **:***qtag*, or **:***outer_qtag.inner_qtag*) that is used to identify the type of customer traffic to map to the associated service.
- Use the **mesh-sdp** *sdp_id* parameter to clear the statistics for a specific mesh SDP.

Examples

```
-> clear service spb 100 counters
-> clear service spb 100 sap 8/1/2 counters
-> clear service spb 100 mesh-sdp counters
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show service spb counters	Displays the traffic statistics for the specified SPB service and associated virtual ports.

MIB Objects

```
alaSapBaseInfoTable
alaSdpBindTable
```

48 CMM Commands

The Chassis Management Module (CMM) CLI commands permit you to manage switch software files on the CMM.

MIB information for the CMM commands is as follows:

Filename: AlcatelIND1Chassis.mib
Module: ALCATEL-IND1-CHASSIS-MIB

Filename: AlcatelIND1ConfigMgr.mib
Module: ALCATEL-IND1-CONFIG-MGR-MIB DEFINITIONS

A summary of available commands is listed here:

reload secondary
reload slot
reload all
reload from
issu from
write memory
issu slot
reload chassis-id
copy running certified
modify running-directory
copy flash-synchro
takeover
show running-directory
show reload
show microcode
show issu status
usb
usb auto-copy
mount
umount
show usb statistics

reload secondary

Reloads the secondary CMM from the ***certified*** directory.

reload [chassis-id *chassis***] secondary [in [***hours***:]** *minutes* **|** **at** *hour***:***minute* **[***month day* | *day month***]]**

reload secondary cancel

Syntax Definitions

chassis	The chassis identifier.
in [*hours***:]** *minutes*	Optional syntax. Schedules a reload of the software to take effect in the time. The time can be specified in minutes or hours and minutes within the next 24 hours.
at *hour***:***minute*	Optional syntax. Schedules a reload of the software to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
month day	*day month*	The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. See examples below for further explanation.
cancel	Cancels a pending time delayed reboot.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Can be issued from both primary or secondary CMM.
- Reloads the secondary CMM only, the Primary CMM remains operational.

Examples

```
-> reload secondary
-> reload secondary in 15:25
-> reload secondary at 15:25 august 10
-> reload secondary at 15:25 10 august
```

Release History

Release 8.1.1; command introduced.

Related Commands

reload from	Reloads both CMMs from the specified directory.

MIB Objects

```
chasEntPhysicalTable
   csEntPhysicalIndex
   chasEntPhysAdminStatus
chasControlRedundantTable
   chasControlDelayedRebootTimer
```

reload all

Reloads both Chassis Management Modules (CMMs) from the ***certified*** directory.

reload [chassis-id *chassis***] all [in [***hours***:]** *minutes* **|** **at** *hour***:***minute* **[***month day* | *day month***]]**

reload all cancel

Syntax Definitions

chassis	The chassis identifier.
in [*hours***:]** *minutes*	Optional syntax. Schedules a reload of all modules to take effect in the specified minutes or hours and minutes within the next 24 hours.
at *hour***:***minute*	Optional syntax. Schedules a reload of all modules to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
month day | *day month*	The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. It is unimportant if the month or day is first. See examples below for further explanation.
cancel	Cancels a pending time delayed reload.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Can be issued from the Primary CMM only.

Examples

```
-> reload all
-> reload all in 1:30
-> reload all at 12:00 july 25
```

Release History

Release 8.1.1; command introduced.

Related Commands

reload slot	Reloads a specific NI module.

MIB Objects

```
chasEntPhysicalTable
   chasEntPhysAdminStatus
   chasGlobalControl
   chasGlobalControlDelayedResetAll
```

reload from

Reloads both CMMs from the specified directory. There is no CMM failover during this reboot, causing a loss of switch functionality during the reboot. All the NIs and the secondary CMM will reload.

reload [chassis-id *chassis***] from** *image-dir* **{rollback-timeout** *minutes* **| no rollback-timeout [in [***hours:***]** *minutes* **| at** *hour:minute***] [redundancy-time** *minutes***]}**

Syntax Definitions

chassis	The chassis identifier.
image-dir	The directory that contains the image files to be loaded onto the switch.
rollback-timeout *minutes*	Sets a timeout period, in minutes. The switch immediately reboots from the specified directory. At the end of this time period, the switch automatically reboots again from the certified directory. The valid range of rollback timeout minutes is 1–15.
no rollback-timeout	Specifies no timeout to rollback. If the command is issued with this keyword, then the switch continues to run from the specified directory until manually rebooted.
in [*hours***:]** *minutes*	Optional syntax. Schedules a reload of the to take effect in the specified minutes or hours and minutes within the next 24 hours.
at *hour***:***minute*	Optional syntax. Schedules a reload to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
redundancy-time *minutes*	Specifies the time period in minutes that the switch must run without failure. If a failure occurs within this time period, the switch will reboot from the **certified** directory.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Can be issued from Primary CMM only.
- This command is used to reload the switch from the specified directory.
- A file verification will be performed before rebooting to ensure all necessary files are present and valid. An error message will be displayed describing any issues found.
- The image directory reload takes place immediately unless a time frame is set using the **in** or **at** keywords.

- If a rollback-timeout is set, the switch reboots again after the set number of minutes, from the **certified** directory. The reboot can be halted by issuing a cancel order as described in the **reload all** command.
- If the **redundancy-time** parameter is entered, any reboot of the Primary CMM prior to the redundancy timer expiring will cause the switch to reboot. If the Primary CMM reboots after the redundancy timer expires, the secondary CMM will take over without a reboot.

Examples

```
-> reload from working rollback-timeout 5
-> reload from working no rollback-timeout
-> reload from working no rollback-timeout in 50
-> reload from working rollback-timeout 10 at 12:50
```

Release History

Release 8.1.1; command introduced.

Related Commands

reload all	Reboots both CMMs from the ***certified*** directory.

MIB Objects

```
chasControlModuleTable
   chasControl
   chasControlVersionMngt
   chasControlActivateTimeout
   chasControlRedundancyTime
   chasControlDelayedActivateTimer
   chasControlWorkingVersion
   chasControlNextRunningVersion
```

reload slot

Reloads the NI in the specified slot using the current running image.

reload slot *chassis/slot*

Syntax Definitions

chassis/slot	The chassis ID and slot number (3/1) to be reloaded.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Can be issued from Primary CMM only.

Examples

```
-> reload slot 1/1
```

Release History

Release 8.1.1; command introduced.

Related Commands

reload from	Reloads both CMMs from the specified directory.

MIB Objects

```
chasEntPhysicalTable
   chasEntPhysAdminStatus
```

reload chassis-id

Reloads the specified chassis id when running in virtual chassis mode.

reload chassis-id *chassis* **[all] [in [***hours***:]** *minutes* **| at** *hour***:***minute* **[***month day* | *day month***]]**

reload chassis-id cancel

Syntax Definitions

chassis	The chassis identifier.
in [*hours***:]** *minutes*	Optional syntax. Schedules a reload of the software to take effect in the time. The time can be specified in minutes or hours and minutes within the next 24 hours.
at *hour***:***minute*	Optional syntax. Schedules a reload of the software to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
month day | *day month*	The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. See examples below for further explanation.
cancel	Cancels a pending time delayed reboot.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Can be issued from both primary or secondary CMM.
- Reloads the secondary CMM only, the Primary CMM remains operational.

Examples

```
-> reload secondary
-> reload secondary in 15:25
-> reload secondary at 15:25 august 10
-> reload secondary at 15:25 10 august
```

Release History

Release 8.1.1; command introduced.

Related Commands

reload from	Reloads both CMMs from the specified directory.

MIB Objects

```
chasEntPhysicalTable
   csEntPhysicalIndex
   chasEntPhysAdminStatus
chasControlRedundantTable
   chasControlDelayedRebootTimer
```

copy certified

Copies the contents of the ***certified*** directory to the specified directory.

copy certified *image-dir* **[make-running-directory]**

Syntax Definitions

image-dir	The directory to which the contents of the ***certified*** directory will be copied.
make-running-directory	Makes the destination directory the new RUNNING DIRECTORY after the configuration is copied.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Using the **make-running-directory** parameter changes the RUNNING DIRECTORY allowing changes to be saved using the **write memory** command.
- This command does not delete any extra files in the target directory.

Examples

```
-> copy certified mydir
-> copy certified mydir make-running-directory
```

Release History

Release 8.1.1; command introduced.

Related Commands

copy flash-synchro	Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

MIB Objects

```
chasControlModuleTable
   chasControlVersionMngt
   chasControlWorkingVersion
```

issu from

Upgrades the system with the images stored in the specified directory with minimal disruption to traffic.

issu from *image-dir* **[redundancy-time** *minutes***]**

Syntax Definitions

image-dir	Specifies the pathname for the directory that contains the image files.
redundancy-time *minutes*	This parameter is not supported with the **issu** command.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The new code must support ISSU with the current running version of code.
- A text file named '*issu_version*' is used to determine ISSU compatibility between code versions. It can be downloaded from the Service and Support website and must be included in the directory along with the new image files.

Examples

```
-> issu from myissu
```

Release History

Release 8.1.1; command introduced.

Related Commands

issu slot	Causes a power-cycle of the NI in the specified slot after an ISSU upgrade.

MIB Objects

```
chasEntModuleTable
   chasControlWorkingVersion
   chasControlRedundancyTime
```

issu slot

Causes a reset of the NI in the specified slot after an ISSU upgrade.

issu slot *slot*

Syntax Definitions

slot	Specifies the slot number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Will return an error if ISSU is not in progress or if the slot has already been reset after the ISSU.

Examples

```
-> issu slot 2
```

Release History

Release 8.1.1; command not supported.

Related Commands

issu from	Upgrades the system with the images stored in the specified directory without disruption to traffic.

MIB Objects

```
chasEntPhysicalTable
   entPhysicalIndex
```

write memory

Copies the current configuration (RAM) to the RUNNING DIRECTORY on the primary CMM.

write memory [flash-synchro]

Syntax Definitions

flash-synchro	Synchronizes the primary and secondary CMM.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used to copy the changes performed using the CLI commands from the running configuration (RAM) to the RUNNING DIRECTORY.
- The **flash-synchro** keyword synchronizes the files between the primary and secondary CMMs by over-writing the contents of the secondary CMM ***certified*** directory with the contents of the primary CMM certified directory.
- This command is only valid if the switch isn't running from the ***certified*** directory. Use the **show running-directory** command to check where the switch is running from.

Examples

```
-> write memory
-> write memory flash-synchro
```

Release History

Release 8.1.1; command introduced.

Related Commands

copy flash-synchro	Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

MIB Objects

```
configManager
   configWriteMemory
```

copy running certified

Copies the current ***running*** directory configuration to the ***certified*** directory on both CMMs.

copy running certified [flash-synchro]

Syntax Definitions

flash-synchro	Synchronizes the primary and secondary CMM.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command is used to overwrite the contents of the ***certified*** directory with the configuration from the ***running*** directory. This should only be done if the ***running*** configuration has been verified.
- The **flash-synchro** keyword synchronizes the files between the primary and secondary CMMs by over-writing the contents of the secondary CMM ***certified*** directory with the contents of the primary CMM ***certified*** directory. In 7.3.1 the flash-synchro functionality is done automatically; entering the **flash-synchro** parameter is no longer required.
- If there is not enough free space, the copy attempt fails and an error message is generated.
- This command does not work if the switch is running from the ***certified*** directory. To view where the switch is running from, see the **show running-directory** command.
- This command may take up to two minutes to complete.

Examples

```
-> copy running certified
```

Release History

Release 8.1.1; command introduced.

Related Commands

copy flash-synchro	Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

MIB Objects

```
chasControlModuleTable
   chasControlVersionMngt
   chasControlWorkingVersion
```

modify running-directory

Changes the RUNNING DIRECTORY to the specified directory.

modify running-directory *image-dir*

Syntax Definitions

image-dir	The directory name to become the new RUNNING DIRECTORY.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command to change the RUNNING DIRECTORY and allow configuration changes to be saved to the new RUNNING DIRECTORY.

Examples

```
-> modify running-directory user-config1
-> write memory
```

Release History

Release 8.1.1; command introduced.

Related Commands

write memory	Copies the running primary RAM version of the CMM software to the RUNNING DIRECTORY.

MIB Objects

```
chasControlModuleTable
   CurrentRunningVersion
```

copy flash-synchro

Copies the ***certified*** directory version of the primary CMM software to the ***certified*** directory of the secondary CMM.

copy flash-synchro

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command is used to synchronize the ***certified*** directories of the primary and secondary CMMs. The two CMMs must be synchronized if a fail over occurs, otherwise switch performance is affected.

Examples

```
-> copy flash-synchro
```

Release History

Release 8.1.1; command introduced.

Related Commands

copy running certified	Copies the RUNNING DIRECTORY configuration to the ***certified*** directory on the primary CMM.

MIB Objects

```
chasControlModuleTable
   chasControlVersionMngt
```

takeover

Forces the current secondary CMM to assume the role of the primary CMM.

takeover *chassis*

Syntax Definitions

chassis	The chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command causes the secondary CMM to take over the functions of the primary CMM. After this command, the old primary CMM is the new secondary CMM.
- Be sure that the secondary CMM has all software (i.e., image and configuration files) required to continue CMM operations, before issuing the **takeover** command.
- For information on synchronizing the primary and secondary CMM software before issuing the **takeover** command, see the **copy flash-synchro** command.

Examples

```
-> takeover
```

Release History

Release 8.1.1; command not supported.

Related Command

reload all	Reboots the switch.

MIB Objects

```
chasEntPhysicalTable
   chasEntPhysAdminStatus
```

show running-directory

Shows the current state of version and configuration management for a CMM.

show running-directory

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Once a switch boots up and is running, it runs either from the ***working, certified***, or a *user-defined* directory. If the switch is running from the ***certified*** directory, changes made to the RUNNING CONFIGURATION using CLI commands, cannot be saved.
- Depending on the switch configuration there may be a small delay before the information is displayed.

Examples

```
-> show running-directory

CONFIGURATION STATUS
  Running CMM              : MASTER-PRIMARY,
  CMM Mode                 : VIRTUAL-CHASSIS MONO CMM,
  Current CMM Slot         : CHASSIS-1 A,
  Running configuration    : CERTIFIED,
  Certify/Restore Status   : CERTIFIED,
SYNCHRONIZATION STATUS
  Flash Between CMMs       : SYNCHRONIZED
  Running Configuration    : SYNCHRONIZED
```

output definitions

Running CMM	The CMM currently controlling the switch, either PRIMARY or SECONDARY.
CMM Mode	Whether there are one or two CMMs installed or Virtual Chassis mode.
Current CMM Slot	The slot of the primary CMM, A or B.
Running Configuration	The current RUNNING DIRECTORY.
Certify/Restore Status	Indicates if the CMM has been certified.
Flash Between CMMs	**SYNCHRONIZED**: Flash between CMMs is identical. **NOT SYNCHRONIZED**: Flash between CMMs is not identical.

output definitions (continued)

Running Configuration	**SYNCHRONIZED**: RUNNING CONFIGURATION has been saved to the RUNNING DIRECTORY. **NOT SYNCHRONIZED**: RUNNING CONFIGURATION has not been saved to the RUNNING DIRECTORY.
Machine State	**SHUTDOWN** - When in VC mode, this indicates the chassis has shut-down due to the 'virtual-chassis shutdown' command or when the chas-sis has shutdown due to a VC error. It is only displayed if the chassis is in the shutdown state.

Release History

Release 8.1.1; command introduced.

Related Commands

reload all	Reboots the switch.
copy flash-synchro	Copies the ***certified*** directory version of the primary CMM software to the ***certified*** directory of the secondary CMM.

MIB Objects

```
chasControlModuleTable
   chasControlSynchronizationStatus
   chasControlCertifyStatus
   chasControlRunningVersion
chasEntPhysicalTable
   chasEntPhysOperStatus
   entPhysicalIndex
chasControlReloadTable
   chasControlReloadStatus
```

show reload

Shows the status of any time delayed reboot(s) that are pending on the switch.

show reload [chassis-id *chassis***] [status | all status]**

Syntax Definitions

chassis	The chassis identifier.
status	Displays if the CMMs are scheduled for a reload.
all status	Displays if all the modules are scheduled for a reload

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- It is possible to preset a reboot on a CMM by using the **reload** command. If this is done, use the **show reload** command to see when the next scheduled reboot is going to occur.
- If the **reload from** command is used, and a rollback timeout is set, the rollback occurs and is shown using the **show reload** command.

Examples

```
-> show reload status
Primary   Control Module Reload Status: No Reboot Scheduled,
Secondary Control Module Reload Status: No Reboot Scheduled
```

Release History

Release 8.1.1; command introduced.

Related Commands

reload secondary	Reboots the primary or secondary CMM to its startup software configuration.
reload from	Immediate primary CMM reboot to the specified software configuration without secondary CMM takeover.

MIB Objects

```
chasControlModuleTable
   chasControlDelayedActivateTimer
chasGlobalControl
   chasGlobalControlDelayedResetAll
```

show microcode

Displays microcode versions installed on the switch.

show microcode [working | certified | loaded | issu | *image-dir***]**

Syntax Definitions

certified	Specifies the ***certified*** directory.
loaded	Specifies the loaded (i.e., currently-active) microcode versions.
working	Specifies the ***working*** directory.
issu	Specifies the ***issu*** directory.
image-dir	Specifies the *user-defined* directory.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If no additional parameters are entered microcode information for the RUNNING CONFIGURATION is displayed.

Examples

```
-> show microcode
Package           Release       Size     Description
------------------+---------------+----------+----------------------------------
Uos.img           8.1.1.403.R01    1828255 Alcatel-Lucent OS
```

output definitions

Package	File name.
Release	Version number.
Size	File size.
Description	File description.

Release History

Release 8.1.1; command introduced.

Related Commands

usb	Displays the archive history for microcode versions installed on the switch.

MIB Objects

N/A

usb

Enables access to the device connected to the USB port.

usb {enable | disable}

Syntax Definitions

N/A

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Must use an Alcatel-Lucent certified USB device.
- If a Alcatel-Lucent certified USB device is connected after enabling the USB interface, the device will be automatically mounted as **/uflash**.
- Once mounted, common file and directory commands can be used for file management.

Examples

```
-> usb enable
-> cp /flash/working/vcboot.cfg /uflash/vcboot.cfg
-> ls /uflash
```

Release History

Release 8.1.1; command was introduced.

Related Commands

usb auto-copy	Allows backup image files from the USB device to be automatically copied to the /flash/working directory on the switch immediately after the USB device is connected

MIB Objects

```
systemServices
   systemServicesUsbEnable
```

usb auto-copy

Allows the image files from the USB device to be automatically copied to the switch immediately after the USB device is connected.

usb auto-copy {enable | disable}

Syntax Definitions

N/A

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the auto-copy is successful the switch will automatically reboot.
- The USB device must contain the proper file structure and image files mentioned below and the USB root directory must contain a signature file named *aossignature*. The *aossignature* file can be a blank text file transferred to the switch.
- This operation will enable all of the image files from the */uflash/6860/working* directory to be copied to the */flash/working* directory.
- If the auto-copy is successful, the auto-copy feature will be disabled before rebooting the switch and must be re-enabled by the administrator for the next auto-copy process to execute. This will prevent running the same auto-copy multiple times.

Examples

```
-> usb auto-copy enable
-> usb auto-copy disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

usb	Enables access to the device connected to the USB interface.

MIB Objects

```
systemServices
   systemServicesUsbAutoCopyEnable
```

mount

Mounts a USB device on /uflash.

mount [/uflash]

Syntax Definitions

/uflash	The name of the file-system to mount.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Once the USB device is mounted most file and directory commands associated with the **/flash** file system can be used with **/uflash** such as: mkdir, rmdir, cd, rm, cp, ls.

Examples

```
-> mount /uflash
-> ls /uflash
```

Release History

Release 8.1.1; command was introduced.

Related Commands

umount	Unmounts the /uflash file system from AOS.

MIB Objects

```
systemServicesAction
   systemServicesArg1
```

umount

Unmounts the /uflash file system from AOS.

umount /uflash

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command unmounts the USB drive and should be used prior to unplugging the USB drive to prevent possible data corruption.

Examples

```
-> umount /uflash
```

Release History

Release 8.1.1; command was introduced.

Related Commands

mount	Mounts the /uflash file system from AOS.

MIB Objects

```
systemServicesAction
   systemServicesArg1
```

show usb statistics

Displays the status USB setting and features.

show usb statistics

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show usb statistics
Filesystem           1K-blocks      Used Available Use% Mounted on
/dev/sdb1               500732    261216    239516  52% /vroot/uflash
   Host scsi6: usb-storage
       Vendor: Alcatel-Lucent
      Product: USB
Serial Number: AA04012700031693
     Protocol: Transparent SCSI
   Transport: Bulk
         usb: enabled
usb auto-copy: disable
auto-copy in progress: No
```

output definitions

usb	Status of USB device interface.
usb auto-copy	Status of USB auto-copy feature.
auto-copy in progress	Is the switch currently in the process of performing an auto-upgrade.

Release History

Release 8.1.1; command was introduced.

Related Commands

usb	Enables access to the device connected to the USB interface.
usb auto-copy	Allows backup files from the USB device to be automatically copied to the switch switch immediately after the USB device is connected.
mount	Mounts the /uflash file system.

MIB Objects

```
systemServices
   systemServicesUsbEnable
   systemServicesUsbAutoCopyEnable
   systemServicesUsbDisasterRecoveryEnable
```

show issu status

Displays the status of ISSU.

show issu status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show issu status
Slot     ISSU-Status
-------+-----------------+
 1       ISSU Pending
 2       ISSU Pending
 3       ISSU Pending

-> show issu status
Slot     ISSU-Status
-------+-----------------+
 1       ISSU Complete
 2       ISSU Complete
 3       ISSU Complete
```

output definitions

Slot	Specifies the slot number.
ISSU-Status	Indicates the ISSU status for a slot: **Pending** - Slot has not been reset; upgrade is not complete. **Complete** - Slot has been reset; upgrade is complete.

Release History

Release 8.1.1; command was introduced.

Related Commands

issu from	Upgrades the system with the images stored in the specified directory without disruption to traffic.

MIB Objects

49 Chassis Management and Monitoring Commands

Chassis Management and Monitoring commands allow you to configure and view hardware-related operations on the switch. Topics include basic system information, as well as Network Interface (NI) module and chassis management.

Additional Information. Refer to your separate *Hardware Users Guide* for detailed information on chassis components, as well as managing and monitoring hardware-related functions.

MIB information for the Chassis Management and Monitoring commands is as follows:

Filename: AlcatelIND1Chassis.mib
Module: ALCATEL-IND1-CHASSIS-MIB

Filename: AlcatelIND1System.MIB
Module: ALCATEL-IND1-SYSTEM-MIB

A summary of available commands is listed here:

Management Commands	**system contact** **system name** **system location** **system date** **system time** **system timezone** **system daylight-savings-time** **update uboot** **update fpga-cpld** **hash-control** **bluetooth**
Monitoring Commands	**show hardware-info** **show chassis** **show cmm** **show slot** **show module** **show module long** **show module status** **show powersupply** **show fan** **show fantray** **show temperature** **show hash-control** **show bluetooth status** **show me** **show mac-range**
Licensing Commands	**license** **show license-info**
OS-BPS Commands	**power-shelf slot bps-connector-priority** **power-shelf shelf bps-mode** **update bps-firmware shelf** **show power-shelf bps-connector-priority** **show power-shelf bps** **show powersupply bps shelf**

system contact

Specifies the administrative contact for the switch. An administrative contact is the person or department in charge of the switch. If a contact is specified, users can easily find the appropriate network administrator if they have questions or comments about the switch.

system contact *text_string*

Syntax Definitions

text_string	The administrative contact being specified for the switch. The system contact can range from 1 to 254 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, **"Jean Smith Ext. 477 jsmith@company.com"**.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> system contact "Jean Smith Ext. 477 jsmith@company.com"
-> system contact engineering-test@company.com
```

Release History

Release 8.1.1; command introduced.

Related Commands

system name	Modifies the current system name of the switch.
system location	Specifies the current physical location of the switch.
license	Displays the basic system information for the switch.

MIB Objects

```
system
   systemContact
```

system name

Modifies the current system name of the switch. The system name can be any simple, user-defined text description for the switch.

system name *text_string*

Syntax Definitions

text_string	The new system name. The system name can range from 1–32 characters in length. No spaces are allowed in the system name.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Spaces are not allowed in the system name.

Examples

```
-> system name OmniSwitch6860
-> system name OS6860
```

Release History

Release 8.1.1; command introduced.

Related Commands

system contact	Specifies the administrative contact of the switch (for example, an individual or a department).
system location	Specifies the current physical location of the switch.
license	Displays the basic system information for the switch.

MIB Objects

```
system
   systemName
```

system location

Specifies the current physical location of the switch. If you need to determine the location of the switch from a remote site, entering a system location can be very useful.

system location *text_string*

Syntax Definitions

text_string	The physical location of the switch. For example, **TestLab**. The system location can range from 1 to 254 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, **"NMS Test Lab"**.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> system location "NMS Test Lab"
-> system location TestLab
```

Release History

Release 8.1.1; command introduced.

Related Commands

system contact	Specifies the administrative contact of the switch (for example, an individual or a department).
system name	Modifies the current system name of the switch.
license	Displays the basic system information for the switch.

MIB Objects

```
system
   systemLocation
```

system date

Displays or modifies the current system date on the switch.

system date [*mm/dd/yyyy***]**

Syntax Definitions

mm/dd/yyyy	The new date being specified for the system. Enter the date in the following format: *mm/dd/yyyy*, where *mm* is the month, *dd* is the day, and *yyyy* is the year. For example, **08/08/2005**.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If you do not specify a new system date in the command line, the current system date is displayed.
- For more information on setting time zone parameters (for example, Daylight Savings Time), refer to the **system timezone** command on page 49-8.

Examples

```
-> system date 08/08/2010
-> system date
08/08/2010
```

Release History

Release 8.1.1; command introduced.

Related Commands

system time	Displays or modifies the current system time on the switch.
system timezone	Displays or modifies the time zone for the switch.

MIB Objects

```
systemServices
   systemServicesDate
```

system time

Displays or modifies the switch current system time.

system time [*hh:mm:ss***]**

Syntax Definitions

hh:mm:ss	The new time being specified for the system. To set this value, enter the current time in 24-hour format, where *hh* is the hour, *mm* is the minutes, and *ss* is the seconds. For example, **14:30:00**.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If you do not specify a new system time in the command line, the current system time is displayed.

Examples

```
-> system time 14:30:00
-> system time
14:30:08
```

Release History

Release 8.1.1; command introduced.

Related Commands

system date	Displays or modifies the current system date on the switch.
system timezone	Displays or modifies the time zone for the switch.

MIB Objects

```
systemServices
   systemServicesTime
```

system timezone

Displays or modifies the time zone for the switch.

system timezone [*timezone_abbrev***]**

Syntax Definitions

timezone_abbrev	Specifies a time zone for the switch and sets the system clock to run on UTC. If you specify a time zone abbreviation, the hours offset from UTC is automatically calculated by the switch.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The configuration must be saved after changing the timezone.
- To display the current time zone for the switch, enter the syntax **system timezone**.
- If the configured timezone supports DST it is automatically enabled and cannot be disabled.
- If the configured timezone does not support DST it is automatically disabled and cannot be enabled.
- Refer to the *OmniSwitch AOS Release 8 Switch Management Guide* for a list of time zone abbreviations.

Examples

```
-> system timezone mst
```

Release History

Release 8.1.1; command introduced.

Related Commands

system date	Displays or modifies the current system date on the switch.
system time	Displays or modifies the current system time on the switch.

MIB Objects

```
systemServices
   systemServicesTimezone
   systemServicesTimezoneStartWeek
   systemServicesTimezoneStartDay
   systemServicesTimezoneStartMonth
   systemServicesTimezoneStartTime
   systemServicesTimezoneOffset
   systemServicesTimezoneEndWeek
   systemServicesTimezoneEndDay
   systemServicesTimezoneEndMonth
   systemServicesTimezoneEndTime
   systemServicesEnableDST
```

system daylight-savings-time

Displays the Daylight Savings Time (DST) setting for the configured timezone.

system daylight-savings-time

Syntax Definitions

N/A

Defaults

parameter	default
Timezone supports DST	enabled
Timezone does not support DST	disabled

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the configured timezone supports DST it is automatically enabled and cannot be disabled.
- If the configured timezone does not support DST it is automatically disabled and cannot be enabled.
- DST will always display as ENABLED, the configured timezone determines its operation.

Examples

```
-> system daylight-savings-time
Daylight Savings Time (DST) is ENABLED.
```

Release History

Release 8.1.1; command introduced.

Related Commands

system time	Displays or modifies the current system time on the switch.
system timezone	Displays or modifies the timezone for the switch.
system date	Displays or modifies the current system date on the switch.

MIB Objects

```
systemServices
   systemServicesTimezone
   systemServicesEnableDST
```

update uboot

Updates the uboot versions of the CMM or NIs. Refer to the Release Notes and/or any available Upgrade Instructions for the new release before performing this type of update on the switch.

update uboot {cmm {all | *chassis/cmm***} | ni {all |** *chassis/ni***} file** *filename***}**

Syntax Definitions

cmm	Specifies that the update is performed for the Chassis Management Module (CMM)**.**
all	Specifies that the update is performed for all CMMs or NIs.
chassis	The chassis identifier.
cmm	The CMM identifier.
ni	The NI number.
filename	Specifies name of the upgrade file.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The update file must be in the /**flash** directory.
- Note that when performing an update, it is important that the correct update file is used. Specifying the wrong file may impact the operation of the switch.
- For the fixed chassis 6860/6860E the CMM and NI identifier should always be 1.

Examples

```
-> update uboot ni all file ubootfile.tar.gz
-> update uboot cmm 1/1 file ubootfile.tar.gz
```

Release History

Release 8.1.1; command introduced.

Related Commands

hash-control	Reloads the specified NI module.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

update fpga-cpld

Updates the FPGA versions of the CMM or NIs. Refer to the Release Notes and/or any available Upgrade Instructions for the new release before performing this type of update on the switch.

update fpga-cpld {cmm {all | *chassis/cmm***} | ni** *chassis/ni***} file** *filename***}**

Syntax Definitions

cmm	Specifies that the update is performed for the Chassis Management Module (CMM)**.**
all	Specifies that the update is performed for all CMMs or NIs.
chassis	The chassis identifier.
cmm	The CMM identifier.
ni	The NI number.
filename	Specifies the name of the upgrade kit.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The upgrade kit must be in the /**flash** directory.
- Note that when performing an update, it is important that the correct update file is used. Specifying the wrong file may impact the operation of the switch.
- For the fixed chassis 6860/6860E the CMM and NI identifier should always be 1.

Examples

```
-> update fpga-cpld ni 1/1 file fgpa_kit
-> update fpga-cpld cmm all file fpga_kit
```

Release History

Release 8.1.1; command introduced.

Related Commands

hash-control	Reloads the specified NI module.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

hash-control

Configures the hash control method on the switch. Depending upon this configuration, hashing algorithm used by various applications for packet forwarding is affected.

hash-control {brief | extended [udp-tcp-port] | load-balance non-ucast {enable | disable}}

hash-control extended no udp-tcp-port

Syntax Definitions

brief	Sets hashing to brief mode.
extended	Sets hashing to extended mode.
udp-tcp-port	Sets extending hashing to use UDP/TCP ports.
enable | disable	Enables or disables the the load balancing of non-unicast traffic on a link aggregate.

Defaults

parameter	default
hash-control	brief
udp-tcp-port	disabled
non-ucast	disabled

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Disabling TCP-UDP port hashing is recommended when Server Load Balancing (SLB) is configured, because SLB dynamically assigns ports.
- The hash control setting also impacts the fabric load balancing for Chassis based products. It is recommended not to set brief hashing mode on Chassis based products.
- Changing the hash control mode affects the hashing algorithm for Link Aggregation, Server Load Balancing and ECMP.
- The hashing mode must be set to extended to enable UDP/TCP port hashing.
- Enabling or disabling the **load-balance non-ucast** option applies to all link aggregates. When this option is disabled (the default), link aggregation load balances only unicast packets; all non-unicast packets are sent through the primary port of the link aggregate.
- When the **load-balance non-ucast** option is enabled, all non-unicast traffic (broadcast, L2 multicast, L3 multicast, and unknown unicast) is load balanced over the link aggregate.

Examples

```
-> hash-control brief
-> hash-control extended
-> hash-control extended udp-tcp-port
-> hash-control extended no udp-tcp-port
-> hash-control load-balance non-ucast enable
-> hash-control load-balance non-ucast disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show hash-control	Displays the current hash control setting for the switch.

MIB Objects

```
alaChasHashMode
alaChasUdpTcpPortMode
alachasNonUCHashControl
```

bluetooth

Enables or disables bluetooth connectivity and configures bluetooth power level.

bluetooth {admin-state [enable | disable] | transmit-power [low | high]}

Syntax Definitions

enable | disable	Enables or disables the bluetooth interface.
low | high	Configures the bluetooth power level to low or high.

Defaults

parameter	default
enable | disable	**enable**
low | high	**low**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command will configure all USB interfaces in a virtual chassis.

Examples

```
-> bluetooth admin-state enable
-> bluetooth transmit-power high
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show bluetooth status	Displays the current bluetooth settings.

MIB Objects

```
systemServices
   systemServicesUsbEnable
   systemServicesBluetoothTxPower
```

license

Activates the license for licensed protocols on the switch.

license {deactivate | apply file *file_name***}**

Syntax Definitions

deactivate	Deactivates the licenses on the switch.
file_name	The name of the license file containing the license keys.

Defaults

By default licensed protocols are not activated on the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When applying licenses to a Virtual Chassis, copy the license keys generated for all the chassis into a single file on the Master chassis. Then apply that file containing all the license keys and reboot the Virtual Chassis.
- The license file can have any name.
- The license file is only used to activate the licensed features and does not need to remain on the switch.
- The switch must be rebooted to reflect the licensed feature set.

Examples

```
-> license apply file /flash/swlicense.dat
The switch will reboot after the license is applied.
Are you sure you want to proceed(Y/N)?Y
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show license-info	Displays all the licensed applications installed on the switch.

MIB Objects

```
alaCapManVcSwLicensingAction
   alaCapManSwLicensingActionArg
```

show system

Displays basic system information for the switch. Information includes a user-defined system description, name, administrative contact, location, object ID, up time, and system services.

show system

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show system
System:
  Description:  Alcatel-Lucent OS6860 8.1.1.999, February 21, 2014.,
  Object ID:    1.3.6.1.4.1.6486.800.1.1.2.1.6.1.2,
  Up Time:      0 days 5 hours 20 minutes and 49 seconds,
  Contact:      Alcatel-Lucent, www.alcatel-lucent.com/enterprise/en,
  Name:         OmniSwitch 6860,
  Location:     NMS_LABORATORY,
  Services:     72,
  Date & Time:  FRI FEB 24 2014  16:21:30 (PST)

Flash Space:
    Primary CMM:
      Available (bytes):  1281716224,
      Comments         :  None
```

output definitions

System Description	The description for the current system. This description shows the current software version and the system date.
System Object ID	The SNMP object identifier for the switch.
System Up Time	The amount of time the switch has been running since the last system reboot.
System Contact	An user-defined administrative contact for the switch. This field is modified using the **system contact** command.
System Name	A user-defined text description for the switch. This field is modified using the **system name** command.

output definitions (continued)

System Location	The user-defined physical location of the switch. This field is modified using the **system location** command.
System Services	The number of current system services.
System Date & Time	The current system date and time. This field is modified using the **system date** and **system time** commands.
Flash Space: Primary CMM: Available (bytes)	The available flash memory space available on the *primary* management module of the switch.
Flash Space: Primary CMM: Comments	Comments regarding the available flash memory space available on the primary management module of the switch, if applicable.

Release History

Release 8.1.1; command introduced.

Related Commands

system contact	Specifies the administrative contact for the switch(for example, an individual or a department).
system name	Modifies the current system name of the switch.
system location	Specifies the current physical location of the switch.

MIB Objects

```
system
   systemContact
   systemName
   systemLocation
```

show hardware-info

Displays the current system hardware information.

show hardware-info

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show hardware-info
Chassis 1
CPU Manufacturer                  : Broadcom
CPU Model                         : ARM
Compact Flash Manufacturer        : Micron Technology
Compact Flash size                : 1997094912 bytes
RAM Manufacturer                  : Other
RAM size                          : 2021900 kB
FPGA version                      : 0.9
U-Boot Version                    : 8.1.1.370.R01
Power Supplies Present            : 1,-
NIs Present                       : 1,-
```

output definitions

Compact Flash Manufacturer	The manufacturer of the flash memory used on the CMM.
Compact Flash sizeshow	The total amount of flash memory (file space) on the CMM. This field specifies the total flash memory size only and does not indicate the amount of memory free or memory used.
RAM size	The total amount of RAM memory on the CMM. This field specifies the total RAM memory only and does not indicate the amount of memory free or memory used.
RAM Manufacturer	The manufacturer of the RAM memory used on the CMM.
FPGA 1 Version	The current FPGA version.
U-Boot Version	The current U-Boot version.

output definitions (continued)

Power Supplies Present	The number of power supplies installed.
NIs Present	The number of NIs installed.

Release History

Release 8.1.1; command introduced.

Related Commands

show chassis	Displays the basic configuration and status information for the switch chassis.
show cmm	Displays the basic hardware and status information for CMM modules running in the chassis.

MIB Objects

   systemHardwareFpgaVersionEntry
   systemHardwareFpgaVersionIndex
```

show chassis

Displays the basic configuration and status information for the switch chassis.

show chassis

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show chassis
Local Chassis ID 1 (Master)
  Model Name:                   OS6860E-P48,
  Module Type:                  0x60e2204,
  Description:                  Chassis,
  Part Number:                  903711-90,
  Hardware Revision:            06,
  Serial Number:                P418003P,
  Manufacture Date:             Oct  8 2013,
  Admin Status:                 POWER ON,
  Operational Status:           UP,
  Number Of Resets:             28,
  MAC Address:                  e8:e7:32:a4:63:21
```

output definitions

Model Name	The factory-set model name for the switch.
Model Type	The factory-set model type for the switch.
Description	The factory-set description for the switch.
Part Number	The Alcatel-Lucent part number for the chassis.
Hardware Revision	The hardware revision level for the chassis.
Serial Number	The Alcatel-Lucent serial number for the chassis.
Manufacture Date	The date the chassis was manufactured.
Admin Status	The current power status of the chassis. Chassis information is obtained from a running CMM. Hence the value is always POWER ON.
Operational Status	The current operational status of the chassis.

output definitions (continued)

Number of Resets	The number of times the CMM has been reset (reloaded or rebooted) since the last cold boot of the switch.
MAC Address	The base MAC address of the chassis.

Release History

Release 8.1.1; command introduced.

Related Commands

show hardware-info	Displays the current system hardware information.
show powersupply	Displays the hardware information and current status for chassis power supplies.
show fan	Displays the current operating status of chassis fans.

MIB Objects

```
chasChassisTable
   chasFreeSlots
   chasPowerLeft
```

show cmm

Displays basic hardware and status information for the CMM.

show cmm [chassis-id *chassis* | **cmm_letter |** *string* **| index]**

Syntax Definitions

chassis	The chassis identifier.
cmm_letter	Specifies the CMM by letter.
string	Specifies the CMM by letter.
index	Specifies the CMM by number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The OmniSwitch 6860/6860E has a single CMM.

```
Chassis ID 1 Module in slot CMM-A
  Model Name:                   OS6860E-P48,
  Module Type:                  0x60e2204,
  Description:                  48 G POE 4 10G,
  Part Number:                  903711-90,
  Hardware Revision:            06,
  Serial Number:                P418003P,
  Manufacture Date:             Oct  8 2013,
  FPGA 1:                       0.7
  Admin Status:                 POWER ON,
  Operational Status:           UP,
  Max Power:                    0,
  CPU Model Type:               N/A,
  MAC Address:                  e8:e7:32:a4:63:21,
```

output definitions

Model Name	The model name of the switch.
Model Type	The model type of the switch.
Description	A factory-defined description of the switch.
Part Number	The Alcatel-Lucent part number for the board.
Hardware Revision	The hardware revision level for the board.
Serial Number	The Alcatel-Lucent serial number for the board.
Manufacture Date	The date the board was manufactured.
FPGA 1	FPGA version.

output definitions (continued)

Admin Status	The current power status of the CMM. Information is obtained from a running CMM. Hence the value is always POWER ON.
Operational Status	The current operational status of the CMM.
Max Power	The maximum power consumption for the CMM.
CPU Model Type	The CPU Model type.
MAC Address	The MAC address assigned to the chassis.

Release History

Release 8.1.1; command introduced.

Related Commands

show chassis	Displays the basic configuration and status information for the switch chassis.
show slot	Displays the basic hardware and status information for Network Interface (NI) modules currently installed in the switch.
show module	Displays the basic information for either a specified module or all the modules installed in the chassis.
show module long	Displays the detailed information for either a specified module or all modules installed in the chassis.
show module status	Displays the basic status information for either a specified module or all modules installed in the chassis.
license	Displays the status and configuration of Switch Fabric Modules (SFMs) on chassis-based switches.

MIB Objects

N/A

show slot

Displays the basic hardware and status information for Network Interface (NI) modules currently installed in the chassis.

show slot [*chassis/slot***]**

Syntax Definitions

chassis/slot	The chassis ID and slot number (3/1).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show slot
Module in chassis 1 slot 1
  Model Name:                   OS6860E-P48,
  Module Type:                  0x60e2204,
  Description:                  48 G POE 4 10G,
  Part Number:                  903711-90,
  Hardware Revision:            06,
  Serial Number:                P418003P,
  Manufacture Date:             Oct  8 2013,
  FPGA 1:                       0.7
  Admin Status:                 POWER ON,
  Operational Status:           UP,
  Max Power:                    0,
  CPU Model Type:               N/A,
  MAC Address:                  e8:e7:32:a4:63:28,
  UBOOT Version:                8.1.1.R01
```

output definitions

Model Name	The model name. For example, OS6860E-P24 indicates a twenty four-port PoE model.
Module Type	Factory defined module type.
Description	A general description of the switch.
Part Number	The Alcatel-Lucent part number for the NI.
Hardware Revision	The hardware revision level for the NI.
Serial Number	The Alcatel-Lucent serial number for the NI printed circuit board (PCB).

output definitions (continued)

Manufacture Date	The date the NI was manufactured.
FPGA 1	The FPGA versions.
Admin Status	The current power status of the NI. Options include POWER ON or POWER OFF.
Operational Status	The operational status of the NI. Options include UP or DOWN. The operational status can be DOWN while the power status is on, indicating a possible software issue.
Max Power	The maximum power consumption for the module.
CPU Model Type	The CPU model type.
UBOOT Version	UBOOT version of the NI.

Release History

Release 8.1.1; command introduced.

Related Commands

hash-control	Reloads the specified NI module.
hash-control	Turns the power on or off for a specified Network Interface (NI) module.
show module	Displays the basic information for either a specified module or all modules installed in the chassis.
show module long	Displays the detailed information for either a specified module or all modules installed in the chassis.
show module status	Displays the basic status information for either a specified module or all modules installed in the chassis.

MIB Objects

```
chasEntPhysOperStatus
```

show module

Displays the basic information for either a specified module or all modules installed in a standalone switch chassis.

show module [chassis-id *chassis* | **cmm_letter |** *string* **| index]**

Syntax Definitions

chassis	The chassis identifier.
cmm_letter	Specifies the CMM by letter.
string	Specifies the CMM by letter.
index	Specifies the CMM by number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show module 1
                                    HW        Mfg
Chassis/Slot     Part-Number      Serial #    Rev    Mfg Date    Model Name
---------------+---------------+------------+----+-------------+----------------
 1/CMM-A        903711-90       P418003P      06   Oct  8 2013   OS6860E-P48
 1/SLOT-1       903711-90       P418003P      06   Oct  8 2013   OS6860E-P48
```

output definitions

Chassis/Slot	The chassis/slot position of the module.
Part-Number	The Alcatel-Lucent part number for the module.
Serial #	The Alcatel-Lucent serial number for the module.
Rev	The hardware revision level for the module.
Date	The date the module was manufactured.
Model Name	The descriptive name for the module.

Release History

Release 8.1.1; command introduced.

Related Commands

show module long	Displays the detailed information for either a specified module or all modules installed in the chassis.
show module status	Displays the basic status information for either a specified module or all modules installed in the chassis.

MIB Objects

N/A

show module long

Displays the detailed information for either a specified module or all the modules installed in a standalone switch chassis.

show module long [cmm_letter | *string* | **index]**

Syntax Definitions

cmm_letter	Specifies the CMM by letter.
string	Specifies the CMM by letter.
index	Specifies the CMM by number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show module long 1
Module in chassis 1 slot 1
  Model Name:                   OS6860E-P48,
  Module Type:                  0x60e2204,
  Description:                  48 G POE 4 10G,

Manufacture Date	The date the NI was manufactured.
FPGA 1	The FPGA versions.
Admin Status	The current power status of the module. Options include POWER ON or POWER OFF.
Operational Status	The operational status of the module. Options include UP or DOWN. The operational status can be DOWN while the power status is on, indicating a possible software issue.
Max Power	The maximum power consumption for the module.
CPU Model Type	The CPU model type.
MAC Address	The MAC address assigned to the module.
UBOOT Version	UBOOT version of the module.

Release History

Release 8.1.1; command introduced.

Related Commands

show module	Displays the basic information for either a specified module or all modules installed in the chassis.
show module status	Displays the basic status information for either a specified module or all modules installed in the chassis.

MIB Objects

N/A

show module status

Displays the basic status information for either a specified module or all modules installed in a standalone switch chassis.

show module status [*cmm_letter* **|** *string* **|** *index***]**

Syntax Definitions

cmm_letter	Specifies the CMM by letter.
string	Specifies the CMM by letter.
index	Specifies the CMM by number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show module status 1
               Operational
Chassis/Slot     Status      Admin-Status       MAC
--------------+-------------+------------+------------------
 1/SLOT-1       UP             POWER ON      e8:e7:32:a4:63:28
```

output definitions

Chassis/Slot	The chassis/slot position of the module.
Operational Status	The operational status of the module. Options include UP or DOWN. For NI and secondary CMM modules, the operational status can be DOWN while the power status is on, indicating a possible software issue.
Admin-Status	The current power status of the module. Options include POWER ON or POWER OFF.
MAC	For the CMM, the base chassis MAC address is displayed. For NI modules, the MAC address for the corresponding NI is displayed.

Release History

Release 8.1.1; command introduced.

Related Commands

show module	Displays the basic information for either a specified module or all the modules installed in the chassis.
show module long	Displays the detailed information for either a specified module or all the modules installed in the chassis.

MIB Objects

N/A

show powersupply

Displays the hardware information and current status for chassis power supplies.

show powersupply [powersave status | total | chassis-id *chassis***]**

Note. For information on the OS-BPS-related **show powersupply bps shelf** command, refer to page 49-56.

Syntax Definitions

powersave status	Displays the status of the power saving functionality.
total	The total number of watts consumed.
chassis	The chassis identifier.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show powersupply
             Total     PS
Chassis/PS   Power     Type     Status   Location
-----------+---------+--------+--------+-----------
 1/1         920       AC       UP       Internal
    Total    920

-> show powersupply total
Chassis  1 (watts):             920
Total Power Consumed (watts):   920
```

output definitions

Chassis/PS	The chassis and power supply identifier.
Total Power	The number of watts provided by this power supply.
PS Type	The type of power supply (AC/DC).
Status	The operational status of the power supply. Options include UP or DOWN.

output definitions (continued)

Location	The location of the power supply. Options include Internal or External or part of a power shelf.
Location	The location of the power supply. Options include Internal or External. Slots 5-8 are for the optional power shelf.

Release History

Release 8.1.1; command introduced.

Related Commands

show chassis	Displays the basic configuration and status information for the switch chassis.

MIB Objects

N/A

show fan

Displays the current operating status of chassis fans.

show fan [chassis-id *chassis* | *index***]**

Syntax Definitions

chassis	The chassis identifier
index	The fan number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guideline

N/A

Examples

```
-> show fan 1
Chassis/Tray | Fan | Functional
-------------+-----+------------
   3/--         1       YES
```

output definitions

Chassis/Tray	The chassis tray ID.
Fan	The fan number describing the fan position.
Status	The current operational status of the corresponding fan.

Release History

Release 8.1.1; command introduced.

Related Commands

show fantray	Displays the current operating chassis ambient temperature, as well as current temperature threshold settings.

MIB Objects

```
N/A
```

show fantray

Displays the current operating status of chassis fantrays.

show fantray [chassis-id *chassis* | *index***]**

Syntax Definitions

chassis	The chassis identifier.
index	The fantray number.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guideline

N/A

Examples

```
-> show fantray
                      | Working |  Fan
Chassis/Tray | Status |  Fans   | Load %
-------------+--------+---------+--------
          1     ON         4        50
```

output definitions

Chassis/Tray	The chassis/Tray ID.
Status	The current operational status of the fantray.
Working Fans	The number of working fans.
Fan Load %	The load of the fantray.

Release History

Release 8.1.1; command introduced.

Related Commands

show fantray	Displays the current operating chassis ambient temperature, as well as current temperature threshold settings.

MIB Objects

N/A

show temperature

Displays the ambient temperature of the current operating chassis, as well as current temperature threshold settings.

show temperature [fabric [*index***] | slot [***index***] | fantray [***index***] | cmm [***index* | *cmm_letter***]]**

Syntax Definitions

index	Specifies the index number.
cmm_letter	Specifies the CMM letter.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show temperature
Chassis/Device | Current |  Range  | Danger | Thresh |  Status
---------------+---------+---------+--------+--------+-----------------
 1/CMMA            54       15-93      93       96     UNDER THRESHOLD
 1/Slot1           54       15-93      93       101    UNDER THRESHOLD
```

output definitions

Chassis/Device	The device being measured (CMM or NI)
Current	The current CPU temperature in Celsius.
Range	The supported threshold range.
Danger	The Danger temperature.
Thresh	The warning temperature threshold, in degrees Celsius. If the switch reaches or exceeds this temperature, the primary switch or CMM TEMP LED displays amber and a warning is sent to the user.
Status	Whether the current temperature has reached the threshold.

Release History

Release 8.1.1; command introduced.

Related Commands

show fan	Shows the hardware information and current status for the chassis fans.

MIB Objects

```
chasChassisTable
   chasHardwareBoardTemp
   chasHardwareCpuTemp
   chasTempRange
   chasTempThreshold
   chasDangerTempThreshold
```

show hash-control

Displays the current hash control settings for the switch.

show hash-control [non-ucast]

Syntax Definitions

non-ucast	Displays the non-ucast has status.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show hash-control
Hash Mode    = brief,
Udp-Tcp-Port = disabled

-> show hash-control non-ucast
Hash Status = Enabled,
Hash Mode : Normal
```

output definitions

Hash Mode	The current Hash Mode.
Udp-Tcp-Port	Status of UDP/TCP hashing.
Non-ucast Hash Status	Status of Non-ucast Hash status.

Release History

Release 8.1.1; command introduced.

Related Commands

hash-control	Configures the hash mode of the switch.

MIB Objects

```
alaChasHashMode
alaChasUdpTcpPortMode
alachasNonUCHashControl
```

show license-info

Displays all the licensed applications installed on the switch.

show license-info

Syntax Definitions

N/A

Defaults

NA

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to verify which licenses are installed on the switch.
- The number of days remaining is only applicable for demo licenses.

Examples

```
->show license-info
                                                          Time (Days)
VC    Device     License            Type                   Remaining
----+--------+--------------+----------------------+-----------
0      0         Advanced         Permanent               NA
```

output definitions

VC	Virtual chassis identifier.
Device	Slot number of NI.
License	Displays the feature license installed on the switch. Advanced, Data Center, U16L
Type	The type of license: Demo or Permanent.
Time (Days) Remaining	Time of days remaining for a demo license. Display as ‘NA’ for permanent licenses.

Release History

Release 8.1.1; command was introduced.

Related Commands

license	Activates the license for licensed protocols on the switch.

MIB Objects

```
alaVcCapManSwLicensingInfoTable
   alaVcLicensedvcSlot
   alaVcLicensedMask
   alaVcLicenseType
   alaVcTimeRemain
```

show bluetooth status

Displays the current bluetooth configuration.

show bluetooth status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guideline

N/A

Examples

```
-> show bluetooth status
Admin Status       : disabled,
Transmit Power     : low,

Chassis      Operational Status
----------+--------------------------
 1          Not Present
```

output definitions

Admin Status	Whether bluetooth is enabled or disabled.
Transmit Power	Whether transmit power is high or low.
Chassis	The chassis identifier.
Operational Status	notPresent - No bluetooth device present. connectionInactive - Bluetooth device present but inactive. connectionActive - Bluetooth device present and active.

Release History

Release 8.1.1; command introduced.

Related Commands

bluetooth	Enables or disables bluetooth connectivity and configures bluetooth power level.

MIB Objects

N/A

show me

Executes an LED blink pattern for 10 seconds that is used by the bluetooth application to identify the connected switch.

show me

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guideline

Use this command in a virtual chassis to identify which switch currently has bluetooth connectivity.

Examples

```
-> show me
The Chassis ID LED will blink for 10 seconds.
```

Release History

Release 8.1.1; command introduced.

Related Commands

bluetooth	Enables or disables bluetooth connectivity and configures bluetooth power level.

MIB Objects

N/A

power-shelf slot bps-connector-priority

This command is used to specify the priority of a connector on the OS-BPS.

power-shelf slot *chassis/slot* **bps-connector-priority** *priority*

Syntax Definitions

chassis/slot	The chassis ID and slot number whose priority will be changed.
priority	Specifies the OS-BPS connector priority. The valid range is 1–8.

Defaults

Connector Index	1	2	3	4	5	6	7	8
Default Priority Value	8	7	6	5	4	3	2	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the OS-BPS needs to reduce power due to a power supply removal or failure it will start with the lowest priority (1) connector (8) and continue in order until it has sufficient power.
- Using the default values listed above, the switch attached to connector 8 would be the first to lose power, then the switch attached to connector 7, etc.
- The higher the priority value the higher the priority. For example, priority 8 is the highest priority and priority 1 is the lowest priority.
- This command only has an effect when the OS-BPS is running in full (N+N) mode. See the **power-shelf shelf bps-mode** command on page 49-50 for more information.

Examples

```
-> power-shelf slot 1/1 bps-connector-priority 2
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show power-shelf bps-connector-priority	This command is used to display the current OS-BPS connector priority.

MIB Objects

```
alaChasBpsChassisId
alaChasBpsConnectorPriority
```

power-shelf shelf bps-mode

This command is used to change the mode (single or full) of the OS-BPS.

power-shelf shelf *number* **bps-mode {single | full}**

Syntax Definitions

number	The power shelf for which the mode is being set.
single	Specifies single mode (N+1).
full	Specifies full mode (N+N).

Defaults

By default, the BPS mode is set to single (N+1).

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Any unit in a stack can be used to change the mode but the OS-BPS will only operate in the last mode that was configured.
- Single mode is an unmanaged power mode. The user must take steps to ensure that the OS-BPS has enough power supplies installed and operating to provide adequate power.
- Full mode is a managed power mode and the OS-BPS will intelligently provide redundant power based on its available power and the connector priority.

Examples

```
-> power-shelf shelf 1 bps-mode single
-> power-shelf shelf 2 bps-mode full
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show powersupply bps shelf	This command is used to display the inventory and status of the OS-BPS power shelf and installed OS-BPS power supplies.

MIB Objects

```
alaChasBpsMode
alaChasBpsShelfId
```

update bps-firmware shelf

This command is used to update the firmware of the OS-BPS.

update bps-firmware shelf *number*

Syntax Definitions

number	The power shelf for which the firmware is being updated.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Contact Service & Support for appropriate firmware file.

Examples

```
-> update bps-firmware shelf 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show powersupply bps shelf	This command is used to display the inventory and status of the OS-BPS power shelf and installed OS-BPS power supplies.

MIB Objects

```
alaChasBpsUpdateFirmware
alaChasBpsShelfId
```

show power-shelf bps-connector-priority

This command is used to display the current OS-BPS connector priority.

show power-shelf bps-connector-priority

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show power-shelf bps-connector-priority
Chassis     Shelf     connector    priority
------      ------    ---------    ---------
 1            1         C1            1
 2            1         C2            8
 3            1         C4            3
 4            1         C8            4
 5            2         C1            6
 6            2         C2            5
 7            2         C3            7
 8            2         C7            8
```

output definitions

Chassis	The chassis number in the stack
Shelf	The OS-BPS ID
connector	The connector ID
priority	The connector priority level

Release History

Release 8.1.1; command was introduced.

Related Commands

power-shelf slot bps-connector-priority	This command is used to specify the priority of a connector on the OS-BPS.

MIB Objects

```
alaChasBpsChassisId
alaChasBpsConnectorShelfId
alaChasBpsConnectorPriority
alaChasBpsConnectorNum
```

show power-shelf bps

Displays OS-BPS power shelf information, including power shelf ID, corresponding serial number, connector ID and chassis ID.

show power-shelf bps

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show power-shelf bps
Shelf     Serial no     connector    chassis
------    ----------    ---------    -------
 1        N288059P         C1           1
 1        N288059P         C2           2
 1        N288059P         C4           3
 1        N288059P         C8           4
 2        N288062P         C1           5
 2        N288062P         C2           6
 2        N288062P         C3           7
 2        N288062P         C7           8
```

output definitions

Shelf	The OS-BPS power shelf ID
Serial no	The serial number for the corresponding shelf
connector	The OS-BPD connector number
chassis	The switch chassis number

Release History

Release 8.1.1; command was introduced.

Related Commands

show powersupply bps shelf	This command is used to display the inventory and status of the OS-BPS power shelf and installed OS-BPS power supplies.

MIB Objects

```
alaChasBpsChassisId
alaChasBpsConnectorShelfId

Module Type:                   0x15000003,
Part Number:                   903198-90,
Hardware Revision:             C,
Serial Number:                 1231000395,
Manufacture Date:              Sun Jul 29 15:00:15 2012,
```

```
Operational Status:             UP,
Power Provision:                450W,
```

output definitions

Shelf	The OS-BPS shelf ID for which information is being displayed
Model Name	The model name for the chassis or power supply
Module Type	The module type of the chassis or power supply
Description	The description for the chassis or power supply
Part Number	The Alcatel-Lucent part number for the chassis or power supply
Hardware Revision	The hardware revision level of the chassis or power supply
Serial Number	The serial number of the chassis or power supply
Manufacture Date	The manufacture date of the chassis or power supply
PoE Total Available Power	The total amount of power available for PoE
System Total Available Power	The total amount of power available for system power
PoE Total Allocation	N+N mode: The total amount of PoE power allocated/granted to the switch(es) N+1 mode: Unspecified (Not Applicable)
System Total Allocation	N+N mode: The total amount of system power allocated/granted to the switch(es) N+1 mode: Unspecified (Not Applicable)
Mode	The mode of the OS-BPS (N+N or N+1)
PoE Voltage	Voltage level of the PoE power supplied to the switches
C_MCU Revision	The C_MCU revision level
M_MCU Revision	The M_MCU revision level
CPLD Revision	The CPLD revision level
Operational Status	The current operational status of the corresponding system or PoE power supply
Power Provision	The total power provided by the corresponding system or PoE power supply

Release History

Release 8.1.1; command was introduced.

Related Commands

show power-shelf bps	Displays OS-BPS power shelf information, including power shelf ID, corresponding serial number, connector ID and chassis ID.

MIB Objects

```
chasEntPhysicalTable
   alaChasBpsPowerSupplyTable
   alaChasBpsTotalPowerAllocTable
   alaChasBpsModeTable
```

show mac-range

Displays the MAC range table.

show mac-range [*index***]**

Syntax Definitions

index	Identifies the MAC range by referring to its position in the MAC range table.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Because the switch currently supports one MAC address range only, index position 1 displays.

Examples

```
-> show mac range

 Mac                    Local/
Range  Row Status       Global   Start Mac Addr     End Mac Addr
-----+----------------+--------+-----------------+-----------------

01     ACTIVE           GLOBAL   08:37:32:6a:79:6e  e8:e7:32:6a:79:8d
```

output definitions

Mac Range	The MAC range index number (1). Because the switch currently supports one MAC address range only, index position 1 displays.
Row Status	The current status of the MAC range. The status **ACTIVE** refers to MAC addresses that are available for allocation to VLAN router ports and other applications.
Local/Global	The Local/Global status for MAC addresses in the range. Local MAC addresses have the local bit set in the first byte of the address. Global MAC addresses (also referred to as *EEPROM* MAC addresses) have the global bit set in the first byte of the address and are stored on the switch's EEPROM. Because the switch's default MAC range is stored on EEPROM, the status GLOBAL displays.
Start Mac Addr	The first MAC address in the MAC address range.
End Mac Addr	The last MAC address in the MAC address range.

Release History

Release 8.1.1; command introduced.

50 Network Time Protocol Commands

The Network Time Protocol (NTP) is used to synchronize the time of a computer client or server to another server or reference time source, such as a radio or satellite receiver. It provides client time accuracies within a millisecond on LANs, and up to a few tens of millisecond on WANs. Typical NTP configurations utilize multiple redundant servers and diverse network paths in order to achieve high accuracy and reliability.

It is important for networks to maintain accurate time synchronization between network nodes. The standard timescale used by most nations of the world is based on a combination of Universal Coordinated Time (UTC) (representing the Earth's rotation about its axis) and the Gregorian Calendar (representing the Earth's rotation about the Sun). UTC time is disseminated by various means, including radio and satellite navigation systems, telephone modems, and portable clocks.

The MIB information for NTP is as follows:

Filename: AlcatelIND1Ntp.mib
Module: alcatelIND1NTPMIB

A summary of available commands is listed here:

ntp server
ntp server synchronized
ntp server unsynchronized
ntp client
ntp broadcast
ntp broadcast-client
ntp broadcast-delay
ntp key
ntp key load
ntp authenticate
ntp master
ntp interface
ntp max-associations
ntp broadcast
ntp peer
ntp vrf-name
show ntp status
show ntp client
show ntp client server-list
show ntp server client-list
show ntp server status
show ntp keys
show ntp peers
show ntp server disabled-interfaces

ntp server

Specifies an NTP server from which the switch will receive updates.

ntp server {*ip_address***} [key** *keyid***] [minpoll** *poll***] [version** *version***] [prefer]**

no ntp server {*ip_address***}**

Syntax Definitions

ip_address	The IP address of the NTP server to be added or deleted to the client's server list.
key id	The key identification number that corresponds to the specified NTP server. The value ranges from 1 to 65534.
poll	It specifies the minimum polling interval for NTP message. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the minimum poll time would be 16 seconds ($2^4 = 16$).The maximum poll interval is fixed at 10 (1,024 s). The minimum poll interval defaults to 6 (64 s), but can be decreased by the minpoll option to a lower limit of 4 (16 s), or increase to the maximum limit of 10.
version	The version of NTP being used. This will be 1, 2, 3, or 4.
prefer	Marks this server as the preferred server. A preferred server's timestamp will be used before another server.

Defaults

Parameter	Default
version	4
prefer	not preferred

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to clear an NTP server from the list of configured servers.
- To configure NTP in the client mode you must first define the NTP servers. Up to 12 NTP servers may be defined.
- Either an IP address or domain name for the specified server can be entered.
- The NTP key identification is an integer. It corresponds to an MD5 authentication key contained in an authentication file (.txt) located on the server. This file must be on both the server and the local switch, and match, for authentication to work. Enter the key identification using the **key** keyword if the server is set to MD5 authentication.

- An authentication key is composed of a 32-bit integer and 32-byte string of characters. The integer format is hexadecimal. For an NTP message to be authenticated the NTP client authentication key must match the key configured at the NTP server. This means the authentication keys must be distributed in advance of configuring the NTP client. If authentication is disabled but authentication key is present, the association will still be unauthenticated.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the minimum poll time would be 16 seconds ($2^4 = 16$). The client will poll the server for a time update when the **minpoll** time is exceeded.
- NTP authentication must be disabled before adding or removing an NTP server.

Examples

```
-> ntp server 1.1.1.1
-> ntp server spartacus
-> ntp server 1.1.1.1 key 1
-> ntp server 1.1.1.1 version 4
-> ntp server spartacus minpoll 5
-> no ntp server 1.1.1.1
```

Release History

Release 8.1.1; command introduced.

Related Commands

ntp client	Enables or disables NTP operation on the switch.

MIB Objects

```
alaNtpConfig
   alaNtpPeerAddressType
   alaNtpPeerType
   alaNtpPeerAuth
   alaNtpPeerMinpoll
   alaNtpPeerVersion
   alaNtpPeerPrefer
   alaNtpPeerAddress
```

ntp server synchronized

Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.

ntp server synchronized

Syntax Definitions

N/A

Defaults

By default, NTP synchronization is enabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The NTP protocol discards the NTP servers that are unsynchronized. However, the unsynchronized NTP servers are used as network time sources.

Examples

```
-> ntp server synchronized
```

Release History

Release 8.1.1; command introduced.

Related Commands

ntp server unsynchronized	Disables an NTP client from invoking tests for NTP server synchronization. This allows the NTP client to synchronize with unsynchronized NTP servers in the network.

MIB Objects

```
alaNtpConfig
   alaNtpPeerTests
```

ntp server unsynchronized

Disables an NTP client from invoking tests for NTP server synchronization. This allows the NTP client to synchronize with unsynchronized NTP servers in the network.

ntp server unsynchronized

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When NTP peer synchronization tests are disabled, the NTP client is able to synchronize with either an NTP peer that is not synchronized with an atomic clock or a network of NTP servers that will finally synchronize with an atomic clock.

Examples

```
-> ntp server unsynchronized
```

Release History

Release 8.1.1; command introduced.

Related Commands

ntp server synchronized	Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.

MIB Objects

```
alaNtpConfig
   alaNtpPeerTests
```

ntp client

Enables or disables NTP time synchronization discipline.

ntp client admin-state {enable | disable}

Syntax Definitions

enable	Enables NTP.
disable	Disables NTP.

Defaults

NTP protocol is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to enable or disable NTP. Before NTP can be enabled, an NTP server must be specified using the **ntp server** command. Up to 12 NTP servers may be defined.
- It is not necessary to specify an NTP server if the NTP client will only receive time updates from NTP broadcast servers.

Examples

```
-> ntp client enable
-> ntp client disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ntp server	Specifies an NTP server from which the switch will receive updates.

MIB Objects

```
alaNtpEnable
```

ntp broadcast-client

Enables or disables the NTP client to receive time updates from NTP broadcast servers.

ntp broadcast-client {enable | disable}

Syntax Definitions

enable	Enables the client broadcast mode.
disable	Disables the client broadcast mode.

Defaults

Broadcast mode is disabled by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Broadcast mode is intended for operation on networks with numerous workstations and where the highest accuracy is not required. In a typical scenario, one or more time servers on the network broadcast NTP messages that are received by NTP hosts. Correct time is determined from this NTP message based on a pre-configured latency or broadcast delay in the order of a few milliseconds.
- In order to configure NTP in broadcast client mode, it is required to define the network server to client broadcast delay.

Examples

```
-> ntp broadcast-client enable
-> ntp broadcast-client disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ntp broadcast-delay	Sets the broadcast delay time in microseconds.

MIB Objects

```
alaNtpBroadcastEnable
```

ntp broadcast-delay

Sets the broadcast delay time in microseconds of received NTP broadcast messages.

ntp broadcast-delay *microseconds*

Syntax Definitions

microseconds	The number of microseconds for the broadcast delay.

Defaults

parameter	default
microseconds	4000

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

When running in the NTP client broadcast mode, a broadcast delay must be set. The broadcast delay is the number of microseconds added to the timestamp received from a broadcast NTP server.

Examples

```
-> ntp broadcast-delay 1000
-> ntp broadcast-delay 10000
```

Release History

Release 8.1.1; command introduced.

Related Commands

ntp broadcast	Enables or disables the client's broadcast mode.

MIB Objects

```
alaNtpBroadcastDelay
```

ntp key

Labels the specified authentication key identification as trusted or untrusted.

ntp key *key* **[trusted | untrusted]**

Syntax Definitions

key	The key number matching an NTP server.
trusted	Signifies that the specified key is trusted and can be used for authentication.
untrusted	Signifies that the specified key is not trusted and cannot be used for authentication. Synchronization will not occur with an untrusted authentication key.

Defaults

By default, all authentication key are untrusted.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Authentication keys are stored in a key file and loaded into memory when the switch boots. The keys loaded into memory are not trusted until this command is used.The location of the file containing set of generated authentication keys is /flash/network/ntp.keys.
- Once the keys are loaded into software (on boot up of the switch), they must be activated by being labeled as trusted. A trusted key will authenticate with a server that requires authentication as long as the key matches the server key.
- New keys must be added manually to the key file. A newly added key will not be loaded into the switch software until the **ntp key load** command is issued, or the switch is rebooted.
- An authentication key is composed of a 32-bit integer and 32-byte string of characters. The integer format is hexadecimal. For an NTP message to be authenticated the NTP client authentication key must match the key configured at the NTP server. This means the authentication keys must be distributed in advance of configuring the NTP client. If authentication is disabled but authentication key is present, the association will still be unauthenticated.
- By default all keys read from the ntp.conf key file are untrusted therefore keys must be set to ‘trusted’ status to allow NTP to use the key for authentication.

Examples

```
-> ntp key 5 trusted
-> ntp key 2 untrusted
```

Release History

Release 8.1.1; command introduced.

Related Commands

ntp key	Sets the public key the switch uses when authenticating with the specified NTP server.
ntp client	Enables or disables NTP operation on the switch.

MIB Objects

```
alaNtpAccessKeyIdTable
   alaNtpAccessKeyIdKeyId
   alaNtpAccessKeyIdTrust
```

ntp key load

Loads the current key file into memory.

ntp key load

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command reloads the key file into the switch memory. This allows for new keys in the key file to be added to the list of keys the switch can use for authentication.
- Newly added keys must be labeled as **trusted** with the **ntp key** command before being used for authentication.
- By default, all authentication keys are untrusted therefore reloading a key file will change any current trusted keys to untrusted status.
- The file ntp.keys is used during the establishment of a set of authentication keys that are used by the NTP protocol. The location of this file is fixed in directory /flash/network.

Examples

```
-> ntp key load
```

Release History

Release 8.1.1; command introduced.

Related Commands

ntp key	Labels the specified authentication key identification as trusted or untrusted.
ntp server	Specifies an NTP server from which this switch will receive updates.

MIB Objects

```
alaNtpAccessRereadkeyFile
```

ntp authenticate

Enables or disables the authentication on a configured NTP server.

ntp authenticate {enable | disable}

Syntax Definitions

enable	Enables authentication for NTP server.
disable	Disables authentication for NTP server.

Defaults

By default, NTP authentication is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to enable or disable authentication for NTP server.
- Before NTP authentication is enabled, NTP operation should be enabled by using **ntp client** command.
- Before enabling the NTP operation, NTP server must be specified using the **ntp server** command.
- NTP authentication must be disabled before adding or removing an NTP server.

Examples

```
-> ntp authenticate enable
-> ntp authenticate disable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ntp status	Displays the information about the current NTP status.

MIB Objects

```
alaNtpAuthenticate
```

ntp master

Specifies the stratum value for unsynchronized switch to act as an authoritative NTP source.

ntp master *stratum-number*

Syntax Definitions

stratum-number	Integer value ranging from 2 to 16

Defaults

Parameter	Default
stratum-number	16

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to synchronize improved clocks with lower strata value if any of the trustworthy NTP sources comes up.
- Use default value of 16 if switch is not synchronized with itself.
- When the switch is synchronized, the stratum number should correspond to peer/server.

Examples

```
-> ntp master 4
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ntp status	Displays current NTP status.

MIB Objects

```
alaNtpConfig
   alaNtpSysStratum
```

ntp interface

Enables or Disables NTP server functionality for an interface.

ntp interface {*interface-ip***} {enable | disable}**

Syntax Definitions

interface-ip	IP address of an interface on which NTP server functionality is to be disabled.
enable	Enables NTP server functionality on an interface.
disable	Disables NTP sever functionality on an interface.

Defaults

By default, NTP server functionality is enabled on all the interfaces.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to enable or disable the incoming NTP request.
- Disabling the NTP server functionality drops the NTP request on an interface and synchronization information is not sent out.

Examples

```
-> ntp interface 10.10.10.1 disable
-> ntp interface 10.10.10.1 enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ntp status	Displays current NTP status.

MIB Objects

```
alaNtpAccessRestrictedTable
   alaNtpAccessRestrictedIpAddress
```

ntp max-associations

Configures the maximum number of associations on the switch.

ntp max-associations {*number***}**

Syntax Definitions

number	Maximum no of client/server and peer associations. Integer value ranging from 0 to 64.

Defaults

By default, 32 associations are allowed on the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to restrict the number of client/server and peer association.
- The command can be used to change the default value of 32 to any value between 0 to 64.
- The command protects the switch from overwhelming with the NTP requests. When the limit is reached, trap is sent to indicate the switch.

Examples

```
-> ntp max-associations 20
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ntp status	Displays current NTP status.

MIB Objects

```
alaNtpConfig
   alaNtpMaxAssociation
```

ntp broadcast

Enables NTP to broadcast synchronized information to all the clients in the subnet in the configured interval.

ntp broadcast {*broadcast-addr***} [version** *version***] [minpoll** *poll interval***]**

no ntp broadcast {*broadcast-addr***}**

Syntax Definitions

broadcast-addr	Subnet for which broadcast updates are regularly sent.
version	NTP version on which the broadcast updates are sent out on the subnet for the clients. Value is 3 or 4.
poll interval	Polling interval for NTP broadcast message. This value is measured in seconds.

Defaults

Parameter	Default
version	4
poll interval	6

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to configure NTP to act in broadcast server mode.
- Use the **no** form of this command to remove the configured broadcast servers.This also disables NTP synchronization information being sent for that broadcast subset.
- The NTP broadcast address needs to defined to enable NTP broadcast mode. A maximum of 3 broadcast addresses can be configured.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered.

Examples

```
-> ntp broadcast 10.145.59.255 version 4 minpoll 5
-> no ntp broadcast 10.145.59.255
```

Release History

Release 8.1.1; command introduced.

Related Commands

ntp broadcast	Enables or disables the client's broadcast mode.
ntp broadcast-delay	Sets the broadcast delay time in microseconds

MIB Objects

```
alaNtpPeerTable
   alaNtpPeerType
   alaNtpPeerVersion
   alaNtpPeerMinpoll
```

ntp peer

Configures NTP to operate in the symmetric active peering mode.This also enables the establishment of an active symmetric association with the specified remote peer.

ntp peer *ip-address* **[key** *key-id***] [version** *version***] [minpoll** *poll interval***]**

no ntp peer *ip-address*

Syntax Definitions

ip-address	IP address of the remote peer.
key-id	Authentication key for the remote peer.
version	NTP packet version to be used for the peer association.
poll interval	Polling interval for NTP broadcast message. Poll interval which when expires, packets will be sent to the peer.

Defaults

Parameter	Default
version	4
poll interval	6

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use **no** form of this command to remove the peers that are configured to act in symmetric active mode.This command deletes the symmetric active association with the remote peer.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered.
- The command should not be used for b(Broadcast), m(Multicast) or r(Reference clock address 127.127.x.x)
- Specifying an IP address with this command is mandatory, but specifying an authentication key is optional. However, if an authentication key is not specified, then peering will not be authenticated.

Examples

```
-> ntp peer 172.18.16.112
-> no ntp peer 172.18.16.112
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ntp peers	Displays current NTP peer association.

MIB Objects

```
alaNtpPeerTable
   alaNtpPeerType
   alaNtpPeerAuth
   alaNtpPeerVersion
   alaNtpPeerMinpoll
```

ntp vrf-name

Sets the VRF to be used for all NTP operations (both client and server).

ntp vrf-name *name*

Syntax Definitions

name	The name of the VRF to be used for all NTP operations.

Defaults

Parameter	Default
name	default

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ntp vrf-name vrf1
```

Release History

Release 8.1.1; command introduced.

Related Commands

show ntp status	Displays the information about the current NTP status.
show ntp client	Displays information about the current client NTP configuration.

MIB Objects

```
alaIpNtpVrfName
```

show ntp status

Displays the information about the current NTP status.

show ntp status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command displays the information about the status of NTP, which is configured along with other global configuration. See the Examples section for more information.
- If the source IP Configuration is done in default or no-loopback0 then the source ip-address will not be displayed in the output of the **show ntp status** command.

Example

```
-> show ntp status
Current time:                   Thu, Jun 14 2012 21:05:46.313 (UTC),
Last NTP update:                -,
Server reference:               0.0.0.0,
Client mode:                    disabled,
Broadcast client mode:          disabled,
Broadcast delay (microseconds): 4000,
Server qualification:           synchronized,
Stratum:                        16,
Maximum Associations Allowed:   32,
Authentication:                 disabled,
Source IP Configuration:        default
VRF Name:                       default
```

output definitions

Current time	The current time for the NTP client.
Last NTP update	The time of the last synchronization with an NTP server.
Server reference	The source of the time signal, which is the address of the NTP server that provided the currently-used time update.
Client mode	Whether the NTP client software is enabled or disabled.
Broadcast client mode	What NTP mode the client is running in, either client or broadcast.
Broadcast delay	The number of microseconds in the advertised broadcast delay time. This field is absent if the client broadcast mode is disabled.

output definitions

Server qualification	Server qualification status.
Stratum	The stratum of the server. The stratum number is the number of hops from a UTC time source.
Max-Association	Maximum association on the switch that restricts the number of client/ server and peer association
Authentication	Whether Authentication is enabled or disabled
Source IP Configuration	Source IP Configuration type which is configured.
Source IP	Source IP address for NTP that send updates to clients. Note: This field is displayed only if the value of "Source IP Configuration" is set to "Preferred".
VRF Name	Name of the VRF.

Release History

Release 8.1.1; command introduced.

Related Command

ntp client	Enables or disables NTP operation on the switch.
ntp server	Specifies an NTP server from which the switch will receive updates
ntp server synchronized	Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.
ntp max-associations	Configures the maximum number of associations on the switch.
ntp master	Specifies the stratum value for unsynchronized switch
ntp broadcast	Enables or disables the client's broadcast mode.
show ntp client	Displays information about the current client NTP configuration.
show ntp client server-list	Displays a list of the servers with which the NTP client synchronizes
show ntp server client-list	Displays the basic server information for a specific NTP server or a list of NTP servers

MIB Objects

```

   alaNtpSrcTp
   alaIpNtpVrfName
```

show ntp client

Displays information about the current client NTP configuration.

show ntp client

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays the current configuration parameters for the NTP client. The display is slightly different depending on what has been configured on the client. See the Examples section for more information.

Examples

```
-> show ntp client
Current time:                   Tue, Jun 26 2012 17:52:47.619 (UTC),
Last NTP update:                (null),
Server reference:               0.0.0.0,
Client mode:                    disabled,
Broadcast client mode:          disabled,
Broadcast delay (microseconds): 4000,
Server qualification:           synchronized
VRF Name:                       default
```

output definitions

Current time	The current time for the NTP client.
Last NTP update	The time of the last synchronization with an NTP server.
Server reference	The source of the time signal, which is the address of the NTP server that provided the currently-used time update.
Client mode	Whether the NTP client software is enabled or disabled.
Broadcast client mode	What NTP mode the client is running in, either client or broadcast.
Broadcast delay	The number of microseconds in the advertised broadcast delay time. This field is absent if the client broadcast mode is disabled.
Server Qualification	Indicates whether the server must be synchronized or not.
VRF Name	Name of the VRF.

Release History

Release 8.1.1; command introduced.

Related Command

ntp client	Enables or disables NTP operation on the switch.

MIB Objects

```
alaNtpLocalInfo
   alaIpNtpVrfName
```

show ntp client server-list

Displays a list of the servers with which the NTP client synchronizes.

show ntp client server-list

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command to display tabular information on the current NTP client to server association status.

Examples

```
-> show ntp client server-list
IP Address       Ver   Key    St     Delay        Offset         Disp
================+===+=======+====+==========+=================+==========
*198.206.181.70    4     0    2     0.167          0.323          0.016
=198.206.181.123   4     0   16     0.000          0.000          0.000
```

output definitions

IP Address	The server IP address. "+" indicates an active peer "-" indicates a pasive peer "=" indicates a client "*" indicates current system peer "^" indicates a broadcast server "`" indicates a broadcast client
Ver	The version of NTP the server is using. Versions 3 and 4 are valid.
Key	The NTP server's public key. This must be accurate and the same as the NTP server, or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
St	The stratum of the server.
Delay	The delay received from the server in its timestamp.
Offset	The offset received from the server in its timestamp.
Disp	The dispersion value received from the server in its timestamp.

Release History

Release 8.1.1; command introduced.

Related Command

ntp client	Enables or disables NTP operation on the switch.

MIB Objects

```
alaNtpPeerListTable
```

show ntp server client-list

Displays the information about the current NTP clients connected to the server.

show ntp server client-list

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command to display the tabular information on the current NTP client connected to the server (switch).

Examples

```
-> show ntp server client-list
IP Address           Ver       Key
------------------+-------+----------
172.23.0.201         4          0
10.255.24.121        4          0
```

output definitions

IP Address	The client IP address.
Ver	The version of NTP the server is using. Versions 3 and 4 are valid.
Key	The NTP server's public key. This must be accurate and the same as the NTP server or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.

Release History

Release 8.1.1; command introduced.

Related Command

show ntp status	Displays information about the current client NTP configuration
ntp client	Enables or disables NTP operation on the switch.

MIB Objects

```
alaNtpClientListTable
   alaNtpPeerListAddress
   alaNtpPeerVersion
   alaNtpPeerAuth
```

show ntp server status

Displays the basic server information for a specific NTP server or a list of NTP servers.

show ntp server status [*ip_address***]**

Syntax Definitions

ip_address	The IP address of the NTP server to be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command displays information on the status of any or all configured NTP servers/peers.
- To display a specific server, enter the command with the server's IP address. To display all servers, enter the command with no server IP address.

Examples

```
-> show ntp server status
IP address         = 172.18.16.147,
Host mode          = server,
Peer mode          = unspec,
Prefer             = no,
Version            = 4,
Key                = 0,
Stratum            = 16,
Minpoll            = 4 (16 seconds),
Maxpoll            = 10 (1024 seconds),
Delay              = 0.000 seconds,
Offset             = 0.000 seconds,
Dispersion         = 0.000 seconds
Root distance      = 0.000,
Precision          = -6,
Reference IP       = 0.0.0.0,
Status             = not configured,
Uptime count       = 28250 seconds,
Reachability       = 0,
Unreachable count  = 5,
Stats reset count  = 27829 seconds,
Packets sent       = 0,
Packets received   = 0,
Duplicate packets  = 0,
Bogus origin       = 0,
Bad authentication = 0,
Bad dispersion     = 0
```

```
IP address         = 198.206.181.139,

Packets sent       = 1,
Packets received   = 1,
Duplicate packets  = 0,
Bogus origin       = 0,
Bad authentication = 0,
Bad dispersion     = 0,
Last Event         = peer changed to reachable,
```

output definitions

IP address	The server IP address.
Host mode	The host mode of this remote association.
Peer mode	The peer mode of this remote association.
Prefer	Whether this server is a preferred server or not. A preferred server is used to synchronize the client before a non-preferred server.
Version	The version of NTP the server is using. Versions 3 and 4 are valid.
Key	The NTP server's public key. This must be accurate and the same as the NTP server, or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
Stratum	The stratum of the server. The stratum number is the number of hops from a UTC time source.
Minpoll	The minimum poll time. The client will poll the server for a time update every time this limit has been exceeded.
Maxpoll	The maximum poll time.
Delay	The delay received from the server in its timestamp.
Offset	The offset received from the server in its timestamp.
Dispersion	The dispersion value received from the server in its timestamp.
Root distance	The total round trip delay (in seconds) to the primary reference source.
Precision	The advertised precision of this association.
Reference IP	The IP address identifying the peer's primary reference source.
Status	The peer selection and association status.
Uptime count	The time period (in seconds) during which the local NTP server was associated with the switch.
Reachability	The reachability status of the peer.
Unreachable count	Number of times the NTP entity was unreachable.
Stats reset count	The time delay (in seconds) since the last time the local NTP server was restarted.
Packets sent	Number of packets sent.
Packets received	Number of packets received.
Duplicate packets	Number of duplicated packets received.
Bogus origin	Number of bogus packets.
Bad authentication	Number of NTP packets rejected for not meeting the authentication standards.
Bad dispersion	Number of bad dispersions.
Last Event	The last event.

Release History

Release 8.1.1; command introduced.

Related Command

ntp client	Enables or disables NTP operation on the switch.

MIB Objects

```
alaNtpPeerListTable
   alaNtpPeerShowStatus
```

show ntp keys

Displays information about all authentication keys.

show ntp keys

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays the information on the current set of trusted authentication keys.

Examples

```
-> show ntp keys
Key       Status
=======+============
1        untrusted
2        untrusted
3        trusted
4        trusted
5        untrusted
6        untrusted
7        trusted
8        trusted
```

output definitions

Key	The key number corresponding to a key in the key file.
Status	Whether the key is trusted or untrusted.

Release History

Release 8.1.1; command introduced.

Related Command

ntp key	Labels the specified authentication key identification as trusted or untrusted.
ntp key load	Loads the current key file into memory.

MIB Objects

```
alaNtpAccessKeyIdTable
```

show ntp peers

Displays the information about the current status on the NTP peer association.

show ntp peers

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use this command to display the tabular information on the current NTP peer association status.

Examples

```
-> show ntp peers
IP Address      Ver    Key   St     Delay       Offset          Disp
--------------+------+-----+-----+----------+--------------+--------------
172.23.0.202     4      0    3      0.300       0.404          0.0024
10.255.24.120    4      0    3      0.016       0.250          0.0017
```

output definitions

IP Address	Peer IP Address
Ver	The version of NTP the server is using. Versions 3 and 4 are valid.
Key	The NTP server's public key. This must be accurate and the same as the NTP server or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
St	The stratum of the server.
Delay	The delay received from the server in its timestamp.
Offset	The offset received from the server in its timestamp.
Disp	The dispersion value received from the server in its timestamp.

Release History

Release 8.1.1; command introduced.

Related Command

ntp client	Enables or disables NTP operation on the switch.
show ntp status	Displays the information about the current NTP status.
show ntp server status	Displays the basic server information for a specific NTP server or a list of NTP servers.

MIB Objects

```

   alaNtpPeerListDispersion
```

show ntp server disabled-interfaces

Displays the ip addresses of the interfaces on which NTP server is not enabled.

show ntp server disabled-interfaces

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command displays ip interfaces on which currently NTP server functionality is disabled.

Examples

```
-> show ntp server disabled-interfaces
IP Address
--------------
172.23.0.202
10.255.24.120
```

output definitions

IP Address	Peer IP Address

Release History

Release 8.1.1; command introduced.

Related Command

show ntp status	Displays the information about the current NTP status.
show ntp server status	Displays the basic server information for a specific NTP server or a list of NTP servers.

MIB Objects

```
alaNtpAccessRestrictedTable

```

51 Session Management Commands

Session Management commands are used to monitor and configure operator sessions including FTP, Telnet, HTTP (WebView), console, Secure Shell, and Secure Shell FTP on the switch. (See the SNMP Commands chapter for SNMP session commands.) Maximum number of concurrent sessions allowed:

	OmniSwitch 6860/6860E
Telnet(v4)	~~6~~
FTP(v4)	~~4~~
SSH + SFTP(v4)	8
HTTP	~~4~~

MIB information for commands in this chapter are as follows:

Filename: AlcatelInd1SessionMgr.mib
Module: AlcatelIND1SessionMgrMIB

Filename: AlcatelIND1AAA.mib
Module: Alcatel-IND1-AAA-MIB

Filename: AlcatelIND1System.mib
Module: Alcatel-IND1ConfigMgr.mib

Filename: AlcatelIND1Ssh.mib
Module: ALCATEL-IND1-SSH-MIB

A summary of the available commands is listed here:

session login-attempt
session login-timeout
session banner
session timeout
session prompt
session xon-xoff
show prefix
user profile save
user profile save global-profile
user profile reset
history
command-log
kill
exit
who
whoami
show session config
show session xon-xoff
more
telnet
ssh
ssh enforce-pubkey-auth
show command-log status
show telnet
show ssh

session login-attempt

Sets or resets the number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

session login-attempt *integer*

Syntax Definitions

integer	The number of times the user can attempt to log in to the switch before the TCP connection is closed. Valid range is 1 to 10.

Defaults

Default is 3 login attempts.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> session login-attempt 5
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show session config	Displays Session Manager information such as banner file name, session timeout value, and default prompt value.
session login-timeout	Sets or resets the amount of time the user can take to accomplish a successful login to the switch.
session timeout	Configures the inactivity timer for a CLI, HTTP (including Web-View), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

MIB Objects

```
sessionMgr
   sessionLoginAttempt
```

session login-timeout

Sets or resets the amount of time the user can take to accomplish a successful login to the switch. If the timeout period is exceeded, the TCP connection is closed by the switch.

session login-timeout *seconds*

Syntax Definitions

seconds	The number of seconds the switch allows for the user to accomplish a successful login. Valid range is from 5 to 600 seconds.

Defaults

Login timeout default is 55 seconds.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> session login-timeout 30
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show session config	Displays Session Manager information such as banner file name, session timeout value, default prompt value, login timer, and login attempt number.
session login-attempt	Sets or resets the number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.
session timeout	Configures the inactivity timer for a CLI, HTTP (including Web-View), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

MIB Objects

```
sessionMgr
   sessionLoginTimeout
```

session banner

Sets or resets the file name of the user–defined banner. The banner is a welcome banner that appears after the user sucessfully logs onto the switch.

session {cli | ftp | http} banner *file_name*

no session {cli | ftp | http} banner

Syntax Definitions

cli	Creates/modifies the CLI banner file name.
ftp	Creates/modifies the FTP banner file name.
http	Creates/modifies the HTTP banner file name.
file_name	Banner file name including the path from the switch's /flash directory. The maximum length of the filename and path is 255 characters.

Defaults

- A default banner is included in one of the switch's image files. It is automatically displayed at login so no configuration is needed.
- The user has the option of defining a custom supplementary banner or of using the default banner.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The **no session banner** command is used to disable a user defined session banner file from displaying when you log onto the switch.
- The **session banner** command is used to configure or modify the banner file *name*. You must use a text editor to edit the file containing the banner text.

Examples

```
-> session cli banner /switch/banner.txt
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show session config	Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

MIB Objects

```
SessionConfigTable
   SessionType
   SessionBannerFileName
```

session timeout

Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

session {cli | http | ftp} timeout *minutes*

Syntax Definitions

cli	Sets the inactivity timeout for CLI sessions.
http	Sets the inactivity timeout for HTTP sessions.
ftp	Sets the inactivity timeout for FTP sessions.
minutes	Inactivity timeout value (in minutes). Valid range 1 to 596523.

Defaults

parameter	default
minutes	4

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The inactivity timer value may be different for each type of interface, such as CLI (Console, Telnet), HTTP (including WebView), and FTP.
- If you change the timer, the new value does not affect current sessions; the new timer is applied to new sessions only.

Examples

```
-> session cli timeout 5
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show session config	Displays Session Manager information, such as banner file name, session timeout value, and default prompt value.

MIB Objects

```
SessionConfigTable
   SessionType
   SessionInactivityTimerValue
```

session prompt

Configures the default CLI prompt for console and Telnet sessions. The prompt is the symbol and/or text that appears on the screen in front of the cursor.

session prompt default [*string*]

Syntax Definitions

string	Prompt string. Maximum length 31 characters.

Defaults

parameter	default
string	->

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The new prompt will not take effect until you log off and back onto the switch.

Examples

```
-> session prompt default -->
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show session config	Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

MIB Objects

```
SessionConfigTable
   SessionType
   sessionDefaultPromptString
```

session xon-xoff

Enables/disables the XON-XOFF protocol on the console port.

session xon-xoff {enable | disable}

Syntax Definitions

enable	Enables XON-XOFF on the console port.
disable	Disables XON-XOFF on the console port.

Defaults

parameter	default
enable | **disable**	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The switch may interpret noise from an RS232 line as Control-S (XOFF). If the **session console xon-xoff** command is enabled, traffic to the console port may be stopped.

Examples

```
-> session xon-xoff enable
-> session xon-xoff disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show session xon-xoff	Displays whether the console port is enabled or disabled for XON-XOFF.

MIB Objects

```
sessionXonXoffEnable
```

show prefix

Shows the command prefix (if any) currently stored by the CLI. Prefixes are stored for command families that support the prefix recognition feature.

show prefix

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Prefixes are stored for command families that support the prefix recognition feature. These command families include AAA, Interface, Link Aggregation, QoS, Spanning Tree, and VLAN Management. Other command families do not store a prefix.

Examples

```
-> show prefix
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show prefix	This command defines the format of the CLI prompt. The prompt can be defined to include the command prefix.

MIB Objects

N/A

user profile save

Saves the user account settings for prompts and the more mode screen setting. These settings will be automatically loaded when the user account logs on.

user profile save

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to save prompt definitions and more mode screen settings for use in future login sessions for the current user account.
- Use the **user profile reset** command to set values to their factory defaults.

Examples

```
-> user profile save
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show prefix	Defines substitute command text for the switch's CLI command keywords.
user profile reset	Resets the alias, prompt and more values to their factory defaults.

MIB Objects

N/A

user profile save global-profile

This command is available only for the user with an administrative profile.

This command can be used to add alias, prompt, and more settings and these settings can be saved as a global profile. These settings are loaded as default settings when any user logs in, irrespective of the user privileges.

user profile save global-profile

Syntax Definitions

global-profile	The administrative user setting that presets a global setting as default to all users at login prompt.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This profile can be reset when by the user by using the **user profile save** and **user profile reset** commands.
- Use this command to save alias definitions, prompt definitions, and more mode screen settings for use in future login sessions for all user accounts.
- The current settings (prompt, more, aliases) for the session are saved in the global profile file **/flash/switch/.profiles/GlobalProfile.txt**. The file can be manually edited by the administrator. The file name must not be changed or deleted.
- If a user profile is configured by the individual user with the **user profile save** command, the global profile is overridden and the user profile settings are loaded at user login.
- Since it is not possible to configure aliases on an existing logged in session. This may require the slave session to log out and log back in for user profiles to be available after a VC takeover.

Examples

```
-> user profile save global-profile

Setting global profile…
```

Release History

Release 8.2.1; command introduced.

Related Commands

more	Enables the more mode for your console screen display.
user profile save	Saves the user account settings for aliases, prompts, and the more mode screen settings. These settings are automatically loaded when the user logs on.
user profile reset	Resets the alias, prompt, and more values to their factory defaults.

MIB Objects

N/A

user profile reset

Resets the alias, prompt, and more values to their factory defaults.

user profile reset

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> user profile reset
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show prefix	Defines substitute command text for the switch's CLI command keywords.
user profile save	Saves the user account settings for aliases, prompts and the more screen.

MIB Objects

N/A

history

Displays commands that you have recently issued to the switch. The commands are displayed in a numbered list.

history *number*

Syntax Definitions

number	The number of commands to display.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> history
1 show cmm
2 show fan
3 show sensor
```

output definitions

Index	The index of the commands for this CLI session and the associated command.

Release History

Release 8.1.1; command was introduced.

Related Commands

!	Recalls commands listed in the history buffer and displays them at the CLI prompt.

MIB Objects

N/A

!

Recalls commands listed in the history buffer and displays them at the CLI prompt.

!{! | *n*}

Syntax Definitions

!	Recalls the last command listed in the history buffer and displays that command at the CLI prompt.
n	Identifies a single command in the history buffer by number and displays that command at the CLI prompt.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You can use the **history** command to list all commands in the history buffer, then use the **!*n*** syntax to issue a single command from the list.
- When you use **!*n*** or **!!** to recall a command in the history buffer list, you must press the Enter key to execute the command.

Examples

```
-> history
1* show ip interface
2 show vlan
3 show arp
4 clear arp
->!2
show vlan
 vlan  type  admin  oper  ip   mtu   name
-----+------+-----+-----+-----+-----+------------
   1   std    Ena   Ena   Dis  1500   VLAN 1
  10   std    Ena   Ena   Ena  1500   VLAN 10
  12   std    Ena   Ena   Ena  1500   VLAN 12
  14   std    Ena   Ena   Ena  1500   VLAN 14
  30   vip    Ena   Ena   Ena  1500   VIP VLAN 30
  40   vip    Ena   Ena   Ena  1500   VIP VLAN 40
4094   mcm    Ena   Ena   Dis  9198   MCM IPC
```

Release History

Release 8.1.1; command was introduced.

Related Commands

history	Sets the number of commands that will be stored in the CLI's history buffer.

MIB Objects

N/A

command-log

Enables or disables command logging on the switch. When command logging is enabled, a **command.log** is automatically created; this file stores a comprehensive CLI command history for all active sessions since the function was *first* enabled.

command-log {enable | disable}

Syntax Definitions

enable	Creates a file called **command.log** in the switch's **/flash** directory. Any configuration commands entered on the command line will be recorded to this file until command logging is disabled.
disable	Disables logging of current session commands to the **command.log** file.

Defaults

parameter	default
enable | disable	disable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The maximum log file size is 66,402 bytes; the file may hold up to 100 commands.

Examples

```
-> command-log enable
-> command-log disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show command-log	Displays the contents of the **command.log** file.
show command-log status	Shows the current status of the command logging function (i.e., enabled or disabled).

MIB Objects

```
sessionCliCommandLogEnable
```

kill

Kills an active session. The command takes effect immediately.

kill *session_number*

Syntax Definitions

session_number	Number of the session you want to kill.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **who** command to obtain the session number variable.
- You cannot kill your own session.
- You cannot kill a connected session where the user has not yet completed the login process. These sessions appear with username “(at login)” when displayed with the **who** command.

Examples

```
-> kill 3
```

Release History

Release 8.1.1; command was introduced.

Related Commands

who	Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP)

MIB Objects

```
SessionMgr
   sessionIndex
   sessionRowStatus
```

exit

Ends the current CLI session. If the CLI session to the switch was via Telnet, the connection is closed.

exit

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> exit
```

Release History

Release 8.1.1; command was introduced.

Related Commands

kill	Kills an active session. The command takes effect immediately.

MIB Objects

```
SessionMgr
   sessionIndex
   sessionRowStatus
```

whoami

Displays the current user session.

whoami

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the **who** command to display all sessions on the switch.

Examples

```
-> whoami
Session number = 5
  User name   = admin,
  Access type = telnet,
  Access port = NI,
  IP address  = 121.251.17.76,
  Read-only domains   = None,
  Read-only families  = ,
  Read-Write domains  = All ,
  Read-Write families = ,
```

output definitions

Session Number	The session number assigned to the user.
User name	User name.
Access type	Type of access protocol used to connect to the switch.
Access port	Switch port used for access during this session.
Ip Address	User IP address.
Read-only domains	The command domains available with the user's read-only access.
Read-only families	The command families available with the user's read-only access.
Read-Write domains	The command domains available with the user's read-write access.
Read-Write families	The command families available with the user's read-write access.

Release History

Release 8.1.1; command was introduced.

Related Commands

who	Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP).
kill	Kills another user's session.

MIB Objects

```
SessionActive
   sessionIndex
   sessionAccessType
   sessionPhysicalPort
   sessionUserName
   sessionUserReadPrivileges
   sessionUserWritePrivileges
   sessionUserProfileNumber
   sessionUserIpAddress
   sessionRowStatus
```

who

Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP).

who

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You can identify your current login session by using IP address.
- This command applies to the following session types: Console, Telnet, SSH, FTP, SFTP, HTTP, HTTPS, SNMP.

Examples

```
-> who
Session number = 0
  User name   = (at login),
  Access type = console,
  Access port = Local,
  IP address  = 0.0.0.0,
  Read-only domains   = None,
  Read-only families  = ,
  Read-Write domains  = None,
  Read-Write families = ,

Session number = 5
  User name   = admin,
  Access type = telnet,
  Access port = NI,
  IP address  = 128.251.17.176,
  Read-only domains   = None,
  Read-only families  = ,
  Read-Write domains  = All ,
  Read-Write families = ,
```

output definitions

Session Number	The session number assigned to the user.
User name	User name.

output definitions (continued)

Access type	Type of access protocol used to connect to the switch.
Access port	Switch port used for access during this session.
Ip Address	User IP address.
Read-only domains	The command domains available with the user's read-only access.
Read-only families	The command families available with the user's read-only access.
Read-Write domains	The command domains available with the user's read-write access.
Read-Write families	The command families available with the user's read-write access.

Possible values for command domains and families are listed here:

Release History

Release 8.1.1; command was introduced.

Related Commands

whoami	Displays current user session.
kill	Kills another user's session.

MIB Objects

```
SessionActive
   sessionIndex
   sessionAccessType
   sessionPhysicalPort
   sessionUserName
   sessionUserReadPrivileges
   sessionUserWritePrivileges
   sessionUserProfileNumber
   sessionUserIpAddress
   sessionRowStatus
```

show session config

Displays session manager configuration information (e.g., default prompt, banner file name, inactivity timer, login timer, and login attempts).

show session config

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Use the configuration commands detailed in this section to modify any of the values displayed.

Examples

```
-> show session config

Cli Default Prompt               = ->
Cli Banner File Name             = ,
Cli Inactivity Timer in minutes  = 60
Ftp Banner File Name             = ,
Ftp Inactivity Timer in minutes  = 60
Http Inactivity Timer in minutes = 60
Login Timer in seconds          = 60
Maximum number of Login Attempts = 2
```

output definitions

Cli Default Prompt	Default prompt displayed for CLI sessions.
Cli Banner File Name	Name of the file that contains the banner information that will appear during a CLI session.
Cli Inactivity Timer in minutes	Inactivity timer value (in minutes) for CLI sessions. The user is logged off when this value is exceeded.
Ftp Banner File Name	Name of the file that contains the banner information that will appear during an FTP session.
Ftp Inactivity Timer in minutes	Inactivity timer value (in minutes) for FTP sessions. The user is logged off when this value is exceeded.
Http Inactivity Timer in minutes	Inactivity timer value (in minutes) for HTTP (including WebView) sessions. The user is logged off when this value is exceeded.

output definitions (continued)

Login Timer in seconds	The amount of time the user can take to accomplish a successful login to the switch. If the timeout period is exceeded, the TCP connection is closed by the switch.
Maximum number of Login Attempts	The number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

Release History

Release 8.1.1; command was introduced.

Related Commands

session prompt	Configures the default CLI prompt for console and Telnet sessions.
session banner	Sets the file name of the user–defined banner.
session timeout	Configures the inactivity timer for a CLI, HTTP (including Web-View), or FTP interface.
session login-attempt	Sets the number of times a user can attempt to log into the switch unsuccessfully before the TCP connection is closed.
session login-timeout	Sets the amount of time the user can take to accomplish a successful login to the switch.

MIB Objects

```
SessionConfigTable
   sessionType
   sessionBannerFileName
   sessionInactivityTimerValue
   sessionDefaultPromptString
```

show session xon-xoff

Displays whether the console port is enabled or disabled for XON-XOFF.

show session xon-xoff

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The switch may interpret noise from an RS232 line as Control-S (XOFF). If the console port is enabled for XON-XOFF (through the **session xon-xoff** command), traffic to the console port may be stopped.

Examples

```
-> show session xon-xoff
XON-XOFF Enabled
```

Release History

Release 8.1.1; command was introduced.

Related Commands

session xon-xoff	Enables/disables the XON-XOFF protocol on the console port.

MIB Objects

```
sessionXonXoffEnable
```

more

Enables the more mode for your console screen display.

more *filename*

Syntax Definitions

filename	The file to display.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This parameter can also be used to pipe output from the CLI.
- This command is case sensitive.

Examples

```
-> more textfile.txt
-> write terminal | more
```

Release History

Release 8.1.1; command was introduced.

Related Commands

MIB Objects

```
SystemServices
   systemServicesArg1
   systemServicesAction
```

telnet

Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

[vrf *name***] telnet {port** [**default** | *service_port*] | **admin-state** [**enable** | **disable**] | *ip_address***}**

Syntax Definitions

name	Name of the VRF.
default	Sets the port back to the default of 23.
service_port	The TCP service port number. Must be 23 or between 20000-20999.
enable | **disable**	Enables or disables telnet access.
ip_address	Specifies the IPv4 or IPv6 address for the Telnet session.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The default directory for Telnet is **/flash**.

Examples

```
-> telnet port 20999
-> telnet admin-state disable
-> telnet 172.17.6.228
-> vrf vrf1 telnet admin-state enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

ssh	Invokes the Secure Shell on the switch. A Secure Shell is used to make a secured connection to a remote system or device.
show telnet	Displays the current configuration specifying the ports the telnet daemons are listening on.

MIB Objects

```
SystemServices
   systemServicesArg1
   systemServicesAction
   alaIpTelnetAdminStatus
```

ssh

Invokes Secure Shell on the switch. Secure Shell is used to make a secured connection to a remote system or device.

[vrf *name***] ssh {port** [**default |** *service_port*] **| admin-state** [**enable | disable**] | *ip_address***}**

Syntax Definitions

name	Name of the VRF.
default	Sets the port back to the default of 23.
service_port	The TCP service port number. Must be 23 or between 20000-20999.
**enable	disable**	Enables or disables telnet access.
ip_address	Specifies the IPv4 or IPv6 address for Secure Shell.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

You must have a valid username and password for the specified host.

Examples

```
-> ssh port 20000
-> ssh admin-state disable
-> ssh 172.155.11.211
login as:

-> vrf vrf1 ssh admin-state enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

telnet	Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.
ssh enforce-pubkey-auth	Invokes Secure Shellv6 on the switch. Secure Shellv6 is used to make a secured connection to an SSHv6 server.
show command-log	Displays the status of Secure Shell, SCP/SFTP on the switch.
show ssh	Displays the current configuration specifying the ports SSH daemons are listening on.

MIB Objects

```
aaaAcctSATable
   aaacsInterface
alaSshConfigGroup
   alaIpSshAdminStatus
```

ssh enforce-pubkey-auth

Enables or disables Secure Shell public key and password authentication. When enabled, password authentication is not allowed.

ssh enforce-pubkey-auth {enable | disable}

Syntax Definitions

enable	Enforces only SSH public key authentication.
disable	Enforces both SSH public key and password authentication.

Defaults

parameter	default
enable | disable	**disable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> ssh enforce-pubkey-auth enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

telnet	Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

MIB Objects

```
alaSshConfigGroup
   alaSshPubKeyEnforceAdminStatus
```

show command-log

Displays the contents of the **command.log** file. This file contains a record of all CLI commands executed on the switch since the command logging function was enabled. For more information on enabling and disabling command logging, refer to page 51-18.

show command-log

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The most recent commands are listed first.
- The command history is archived to the **command.log** file. If this file is removed, the command history will no longer be available. In addition, the **command.log** file has a 66,402 byte capacity. This capacity allows up to 100 commands; if the maximum capacity is reached, only the 100 most recent commands display.

Examples

```
-> show command-log
Command : ip interface Marketing address 17.11.5.2 vlan 255
  UserName : admin
  Date     : FRI JAN 09 00:20:01
  Ip Addr  : 128.251.19.240
  Result   : SUCCESS

Command : ip interface "Distribution" 11.255.14.102 vlan 500 local-proxy-arp
  UserName : admin
  Date     : FRI JAN 09 00:19:44
  Ip Addr  : 128.251.19.240
  Result   : ERROR: Ip Address must not belong to IP VLAN 44 subnet

Command : command-log enable
  UserName : admin
  Date     : FRI JAN 09 00:18:49
  Ip Addr  : 128.251.19.240
  Result   : SUCCESS
```

output definitions

Command	The exact syntax of the command, as entered by the user.
UserName	The name of the user session that entered the command. For more information on different user session names, refer to the **user** command on page 35-43, or the "Managing Switch User Accounts" chapter in the *OmniSwitch AOS Release 8 Switch Management Guide*.
Date	The date and time, down to the second, when the command was entered.
IpAddr	The IP address of the terminal from which the command was entered.
Result	The outcome of the command entry. Options include **SUCCESS** and **ERROR**. For erroneous command entries, the same error details presented by the switch at the time the command was entered are also displayed in the log file.

Release History

Release 8.1.1; command was introduced.

Related Commands

command-log	Enables or disables command logging on the switch.
show command-log status	Shows the current status of the command logging function (i.e., enabled or disabled).

MIB Objects

```
sessionCliCommandLogEnable
```

show command-log status

Shows the current status of the command logging function (i.e., enabled or disabled).

show command-log status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show command-log status
CLI command logging : Enable
```

output definitions

CLI command logging	The current status of command logging on the switch. Options include **Disable** and **Enable**.

Release History

Release 8.1.1; command was introduced.

Related Commands

command-log	Enables or disables command logging on the switch.

MIB Objects

```
sessionCliCommandLogStatus
```

show telnet

Displays the current configuration specifying the ports the telnet daemons are listening on.

[vrf *name***] show telnet**

Syntax Definitions

name	Name of the VRF.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If VRF is specified, the current status of the telnet daemon for the speciifed VRF is displayed.

Examples

```
vrf1::-> show telnet
Telnet Admin-State = Enabled
Telnet Port = 23
```

Release History

Release 8.1.1; command was introduced.

Related Commands

command-log	Enables or disables command logging on the switch.

MIB Objects

```
alaIpTelnetAdminStatus
alaIpTelnetPort
```

show ssh

Displays the current configuration specifying the ports SSH daemons are listening on.

[vrf *name***] show ssh**

Syntax Definitions

name	Name of the VRF.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If VRF is specified, the current status of the SSH daemon for the speciifed VRF is displayed.

Examples

```
vrf1::-> show ssh
Ssh Admin-State = Enabled
Ssh Port = 22
Ssh Enforce-Pubkey-Auth = Disabled
```

Release History

Release 8.1.1; command was introduced.

Related Commands

command-log	Enables or disables command logging on the switch.

MIB Objects

```
alaIpSshAdminStatus
alaIpSshPort
alaIpSshPubKeyEnforceAdminStatus
```

52 File Management Commands

This chapter includes descriptions for CLI commands used to manage files on the switch. Several of these commands are used to create, move, and delete both files and directories in the OmniSwitch flash directory. Other commands allow you to change command privileges and to monitor the memory usage on the switch.

MIB information for the system commands is listed here:

Filename: AlcatelIND1System.mib
Module: ALCATEL-IND1-SYSTEM-MIB

Filename: AlcatelIND1Chassis.mib
Module: ALCATEL-IND1-CHASSIS-MIB

Filename: AlcatelIND1Ssh.mib
Module: ALCATEL-IND1-SSH-MIB

A summary of the available commands is listed here:

File System	**cd**
	pwd
	mkdir
	rmdir
	ls
	rm
	cp
	scp
	mv
	chmod
	freespace
	fsck
	newfs
System Services	**vi**
	tty
	show tty
	tftp
	sftp
	ftp
	show ftp

cd

Changes the current working directory of the switch.

cd [*path***]**

Syntax Definitions

path	Specifies the path to the working directory. If no path is specified, the current directory of the switch is changed to the higher directory level.

Defaults

The default working directory of the switch is **/flash**.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Separate the multiple directory names that are part of the path with a slash (/).

Examples

```
-> cd
-> cd /flash/certified
```

Release History

Release 8.1.1; command introduced.

Related Commands

pwd	Displays the current working directory of the switch.
mkdir	Creates a new directory.
rmdir	Deletes an existing directory.
ls	Displays the contents of a specified directory or the current working directory.
rm	Displays the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices
   systemServicesWorkingDirectory
```

pwd

Displays the current working directory of the switch.

pwd

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The **pwd** command can also be used on the secondary CMM.

Examples

```
-> pwd
/flash
```

Release History

Release 8.1.1; command introduced.

Related Commands

cd	Changes the current working directory of the switch.
mkdir	Creates a new directory.
rmdir	Deletes an existing directory.
ls	Displays the contents of a specified directory or the current working directory.
rm	Displays the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices
   systemServicesWorkingDirectory
```

mkdir

Creates a new directory.

mkdir [*options***] [***path***]** */dirname*

Syntax Definitions

options	Use the '?' on the command line for a list of options.
path	The path or location in which the new directory is to be created. If no path name is specified, the new directory is created in the current directory.
dirname	A user-defined name for the new directory.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Separate the directory names that are part of the path with a slash (/). Refer to the examples below.
- The **mkdir** command can also be used on the secondary CMM.

Examples

```
-> mkdir test_directory
-> mkdir flash/test_directory
-> mkdir
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.

Usage: mkdir [OPTIONS] DIRECTORY...

Create DIRECTORY

Options:
        -m      Mode
        -p      No error if exists; make parent directories as needed
```

Release History

Release 8.1.1; command introduced.

Related Commands

cd	Changes the current working directory of the switch.
pwd	Displays the current working directory of the switch.
rmdir	Deletes an existing directory.
ls	Displays the contents of a specified directory or the current working directory.
rm	Displays the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

rmdir

Deletes an existing directory.

rmdir [*options***]** *dirname*

Syntax Definitions

options	Use the '?' on the command line for a list of options.
dirname	The name of the existing directory to be removed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Separate the directory names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

Examples

```
-> rmdir ./working
-> rmdir flash/working
-> rmdir ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.

Usage: rmdir [OPTIONS] DIRECTORY...

Remove DIRECTORY if it is empty

Options:
        -p|--parents    Include parents
        --ignore-fail-on-non-empty
```

Release History

Release 8.1.1; command introduced.

Related Commands

cd	Changes the current working directory of the switch.
pwd	Displays the current working directory of the switch.
mkdir	Creates a new directory.
ls	Displays the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

ls

Displays the contents of a specified directory or the current working directory.

ls [*options***] [***path/filename***]**

Syntax Definitions

options	Use the '?' on the command line for a list of options.
filename	Specifies the file or directory path.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Separate the multiple directory names that are part of the path with a slash (/).

Examples

```
-> ls
-> ls -l /flash/certified
-> ls ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.

Usage: ls [-1AacCdeFilnpLRrSsTtuvwxXhk] [FILE]...

List directory contents

Options:
        -1      List in a single column
        -A      Don't list . and ..
        -a      Don't hide entries starting with .
        -C      List by columns
        -c      With -l: sort by ctime
        --color[={always,never,auto}]   Control coloring
        -d      List directory entries instead of contents
        -e      List full date and time
        -F      Append indicator (one of */=@|) to entries
        -i      List inode numbers
        -l      Long listing format
        -n      List numeric UIDs and GIDs instead of names
        -p      Append indicator (one of /=@|) to entries
        -L      List entries pointed to by symlinks
        -R      Recurse
        -r      Sort in reverse order
        -S      Sort by file size
        -s      List the size of each file, in blocks
        -T N    Assume tabstop every N columns
```

```
-t      With -l: sort by modification time
-u      With -l: sort by access time
-v      Sort by version
-w N    Assume the terminal is N columns wide
-x      List by lines
-X      Sort by extension
-h      List sizes in human readable format (1K 243M 2G)
```

Release History

Release 8.1.1; command introduced.

Related Commands

cd	Changes the current working directory of the switch.
pwd	Displays the current working directory of the switch.
mkdir	Creates a new directory.
rmdir	Deletes an existing directory.
rm	Displays the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

rm

Permanently deletes an existing file.

rm [*options***] [***path/filename***]**

Syntax Definitions

options	Use the '?' on the command line for a list of options.
filename	Specifies the file or directory path.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.
- Use care when deleting files. Depending on your switch and network configurations, specific configuration and image files must be present for your system to work properly.
- This command can also be used on the secondary CMM.

Examples

```
-> rm test_config_file
-> rm flash/test_config_file
-> rm ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.

Usage: rm [OPTIONS] FILE...

Remove (unlink) FILEs

Options:
        -i      Always prompt before removing
        -f      Never prompt
        -R,-r   Recurse
```

Release History

Release 8.1.1; command introduced.

Related Commands

cp	Copies an existing file or directory.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

cp

Copies an existing file. This command can also copy a directory if the -r keyword is used.

cp [*options***]** *source destination*

Syntax Definitions

options	Use the '?' on the command line for a list of options.
source	The name of the existing file to be copied.
destination	The new user-defined file name for the resulting file copy. If you are copying a file to the same directory as the original, the file name for the copy must be different from the original.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You should verify that the **/flash** directory of your switch has enough available memory to hold the copies of the files and directories created.
- A file can be copied to a new directory location. Copy of a file can also be created in the same directory that contains the original file.
- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

Examples

```
-> cp flash/snapshots/asc.1.snap flash/snapshot/snapshot_copy
-> cp flash/snapshots/asc.1.snap snapshot_copy
-> cp asc.1.snap flash/snapshot/snapshot_copy
-> cp asc.1.snap snapshot_copy
-> cp ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.

Usage: cp [OPTIONS] SOURCE DEST

Copy SOURCE to DEST, or multiple SOURCE(s) to DIRECTORY

Options:
        -a      Same as -dpR
        -R,-r   Recurse
        -d,-P   Preserve symlinks (default if -R)
        -L      Follow all symlinks
```

```
-H      Follow symlinks on command line
-p      Preserve file attributes if possible
-f      Force overwrite
-i      Prompt before overwrite
-l,-s   Create (sym)links
```

Release History

Release 8.1.1; command introduced.

Related Commands

mv	Moves an existing file or directory to a new location.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesArg2
   systemServicesAction
```

scp

Copies an existing file in a secure manner.

scp [*options***]** *user_name@remote_ip_addr:***[***path/***]***source* **[***path/***]***target*

scp [*options***] [***path/***]***source user_name@remote_ip_addr:***[***path/***]***target*

Syntax Definitions

options	Use the '?' on the command line for a list of options.
user_name@remote_ip_addr:	The username along with the IPv4 or IPv6 address of the remote switch.
path/	Specifies the path containing the file to be copied and the path where the file will be copied.
source	The name of the file(s) to be copied.
target	The new user-defined file name for the resulting file copy.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- This command will prompt you to enter the admin password, and the names and the path of the files being copied will be displayed.
- A file may be copied to a new location; you are not required to copy a file to the same directory that contains the original.
- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.

Examples

```
-> scp admin@172.17.11.13:/flash/working/Kos.img /flash/working/Kos.img
admin's password for keyboard-interactive method:

Fetching /flash/working/Kos.img to /flash/working/Kos.img
Connection to 172.17.11.13 closed.

-> scp /flash/working/Kos.img admin@172.17.11.13:/flash/working/Kos.img
admin's password for keyboard-interactive method:

Uploading /flash/working/Kos.img to /flash/working/Kos.img
Connection to 172.17.11.13 closed.

-> scp admin@172.17.11.13:/flash/working/*.img /flash/working
admin's password for keyboard-interactive method:

Fetching /flash/working/K2os.img to /flash/working/K2os.img
Fetching /flash/working/Kadvrout.img to /flash/working/Kadvrout.img
Fetching /flash/working/Kbase.img to /flash/working/Kbase.img
Fetching /flash/working/Keni.img to /flash/working/Keni.img
Fetching /flash/working/Kos.img to /flash/working/Kos.img
Fetching /flash/working/Krelease.img to /flash/working/Krelease.img
Fetching /flash/working/Ksecu.img to /flash/working/Ksecu.img
Connection to 172.17.11.13 closed.
-> scp ?
usage: scp [-1246BCpqrv] [-c cipher] [-F ssh_config] [-i identity_file]
           [-l limit] [-o ssh_option] [-P port] [-S program]
           [[user@]host1:]file1 ... [[user@]host2:]file2
```

Release History

Release 8.1.1; command introduced.

Related Commands

mv	Moves an existing file or directory to a new location.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesArg2
   systemServicesAction
```

mv

Moves an existing file or directory to a new location.

mv [*options***]** *source destination*

Syntax Definitions

options	Use the '?' on the command line for a list of options.
source	The name of the existing file to be copied.
destination	The new user-defined file name for the resulting file copy. If you are copying a file to the same directory as the original, the file name for the copy must be different from the original.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The **mv** command does not make a copy of the file or directory being moved. To copy a file or directory to the current path or to a new location, use the **cp** command.
- Separate the directory names and file names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

Examples

```
-> mv flash/asc.1.snap flash/backup_files/asc.1.snap
-> mv ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.

Usage: mv [OPTIONS] SOURCE DEST
or: mv [OPTIONS] SOURCE... DIRECTORY

Rename SOURCE to DEST, or move SOURCE(s) to DIRECTORY

Options:
        -f      Don't prompt before overwriting
        -i      Interactive, prompt before overwrite
```

Release History

Release 8.1.1; command introduced.

Related Commands

rm	Renames an existing file or directory.
cp	Copies an existing file or directory.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesArg2
   systemServicesAction
```

chmod

Changes the write privileges for a specified file.

chmod {+w | -w} [*path/***]***file*

Syntax Definitions

+w	Enables read-write privileges for the file.
-w	Disables write privileges for the file—i.e., the file becomes read-only.
path/	The path containing the file for which privileges are being changed.
file	The name of the file for which read-write privileges are being changed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

This command can also be used on the secondary CMM.

Examples

```
-> chmod +w vlan.config
-> chmod -w flash/backup_configs/vlan.config
```

Release History

Release 8.1.1; command introduced.

Related Commands

freespace	Changes the write privileges for a specified file.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

freespace

Displays the amount of free space available in the **/flash** directory.

freespace [/flash | /uflash]

Syntax Definitions

/flash	The amount of free space is shown for the **/flash** directory.
/uflash	The amount of free space is shown for the **/uflash** directory.

Defaults

N/A

Usage Guidelines

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Examples

```
-> freespace /flash
/flash 3143680 bytes free

-> freespace
/flash 3143680 bytes free
```

Release History

Release 8.1.1; command introduced.

Related Commands

fsck	Performs a file system check, including diagnostic information in the event of file corruption. If the **fsck** command detects a problem with the **/flash** file system, a message is displayed indicating the problem, along with any steps needed to resolve it.

MIB Objects

```
SystemFileSystemTable
   systemFileSystemFreespace
```

fsck

Performs a file system check, including diagnostic information in the event of file corruption.

fsck /uflash {repair | no-repair}

Syntax Definitions

/uflash	Indicates that the file system check will be performed on the **/uflash** directory.
repair	Attempt to repair any problems found.
no-repair	Do not attempt to repair any problems found.

Defaults

This command gives you the option of having the errors repaired automatically.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> fsck /uflash repair

/uflash/  - disk check in progress ..
/uflash/  - Volume is OK

          total # of clusters:  14,773
           # of free clusters:  4,132
            # of bad clusters:  0
              total free space:  8,264 Kb
    max contiguous free space:  5,163,008 bytes
                  # of files:  46
                # of folders:  3
         total bytes in files:  21,229 Kb
             # of lost chains:  0
   total bytes in lost chains:  0
```

Release History

Release 8.1.1; command introduced.

Related Commands

freespace	Displays the amount of free space available in the **/flash** directory.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

newfs

Deletes the complete **/uflash** file system and all files within it, replacing it with a new, empty **/uflash** file system. Use this command when you want to reload all files in the file system or in the unlikely event that the **/uflash** file system becomes corrupt.

newfs /uflash

Syntax Definitions

/uflash	This indicates that the complete file system will be replaced.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- It is recommended that you preserve all required image and configuration files by saving them to a remote host before executing the **newfs** command.
- Do not power-down the switch after running the **newfs** command until you reload all required image and configuration files.

Examples

```
-> newfs /uflash
```

Release History

Release 8.1.1; command introduced.

Related Commands

N/A

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

vi

Launches the switch's Vi text editor. The Vi file editor allows you to view or edit the contents of a specified text file.

vi [*options***] [***path/***]***filename*

Syntax Definitions

options	Use the '?' on the command line for a list of options.
path	The path (i.e., location) containing the file being viewed or edited. If no path is specified, the command assumes the current directory.
filename	The name of the existing file being viewed or edited.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Until you exit the switch's file editor, all keystrokes will be passed to the text editor rather than the switch's command line.
- This command can also be used on the secondary CMM.

Examples

```
-> vi test_config_file
-> vi ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.

Usage: vi [OPTIONS] [FILE]...

Edit FILE

Options:
        -c      Initial command to run ($EXINIT also available)
        -R      Read-only
        -H      Short help regarding available features
```

Release History

Release 8.1.1; command introduced.

Related Commands

tty	Allows you to view the contents of a specified file by invoking the Vi text editor in read-only mode.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
```

tty

Specifies the number of lines and columns to be displayed on the terminal screen while the switch is in the edit file mode.

tty *lines columns*

Syntax Definitions

lines	The number of lines to be displayed on the terminal emulation screen for the current session. Values may range from 10 to 150.
columns	The number of columns to be displayed for each line. One column is the same width as a single text character. Values may range from 20 to 150.

Defaults

parameter	default
lines	24
columns	80

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The number of lines and columns set with this command controls the screen size when the switch is editing or viewing a text file with the **vi** or **tftp** commands.
- The values set with this command do not control the CLI screen when the switch is operating in normal mode.
- This command can also be used on the secondary CMM.

Examples

```
-> tty 10 60
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show tty	Displays current TTY settings.

MIB Objects

```
systemServices
   systemServicesTtyLines
   systemServicesTtyColumns
```

show tty

Displays current TTY settings.

show tty

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Shows the settings made with the **tty** command.
- This command can also be used on the secondary CMM.

Examples

```
-> show tty
lines = 24, columns = 80
```

Release History

Release 8.1.1; command introduced.

Related Commands

tty	Specifies the number of TTY lines and columns to be displayed.

MIB Objects

```
systemServices
   systemServicesTtyLines
   systemServicesTtyColumns
```

tftp

Starts a TFTP client session that enables a file transfer to an TFTP server.

tftp [*options***] *host* [***port***]**

Syntax Definitions

options	Enter a question mark (?) to get a list of options.
host	Specifies the IP address of the TFTP server.
port	Specifies the port for the TFTP transfer.

Defaults

- If a path is not specified with the filename, the current path is used by default (for example, /flash).
- If a local filename is not specified, the remote filename is used by default.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The OmniSwitch supports TFTP client functionality only.
- A TFTP server has no provisions for user authentication.
- When downloading a file to the switch, the file size must not exceed the available flash space.

Examples

```
-> tftp -g -l local_file -r remote_file 198.51.100.100
```

Release History

Release 8.1.1; command was introduced.

Related Commands

cd	Changes the current working directory of the switch.
pwd	Displays the current working directory of the switch.
ls	Displays the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesArg2
   systemServicesArg3
   systemServicesArg4
   systemServicesArg5
   systemServicesAction
```

sftp

Starts an SFTP session. An SFTP session provides a secure file transfer method.

sftp [*options***] {***ip_address***}**

Syntax Definitions

options	Press “Enter” on the command line to get a list of options.
ip_address	Specifies the IPv4 or IPv6 address for the SFTP session.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You must have a valid username and a password for the specified host.
- After logging in, SFTP commands are supported. Some of these commands are defined in the following table:

cd path	Change remote path to ‘path’.
lcd path	Change local directory to ‘path’.
chmod mode path	Change permissions of file ‘path’ to ‘mode’.
help	Display command help information.
get remote-path [local path]	Download a file from the remote path to the local path.
lls [path]	Display local directory listing.
ln oldpath newpath	Creates a symbolic link (symlink) to the remote file.
symlink oldpath newpath	Creates a symbolic link (symlink) to the remote file.
lmkdir path	Create local directory.
lpwd	Print local working directory.
ls [path]	Display remote directory listing.
mkdir path	Create remote directory.
put local-path [remote-path]	Upload file.
pwd	Display remote working directory.
exit	Quit the sftp mode.
quit	Exit the sftp mode.
rename oldpath newpath	Rename a remote file.

rmdir path	Remove remote directory.
rm path	Delete remote file.
version	Show the current SFTP version.
?	Synonym for help. Displays command help information.

Examples

```
-> sftp 12.251.11.122
login as:
-> sftp
usage: sftp [-1Cv] [-B buffer_size] [-b batchfile] [-F ssh_config]
            [-o ssh_option] [-P sftp_server_path] [-R num_requests]
            [-S program] [-s subsystem | sftp_server] host
       sftp [[user@]host[:file [file]]]
       sftp [[user@]host[:dir[/]]]
       sftp -b batchfile [user@]host
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ftp	Starts an FTP session.
ssh	Invokes Secure Shell on the switch. Secure Shell is used to make a secured connection to a remote system or device.

MIB Objects

```
SystemServices
   systemServicesArg1
   systemServicesAction
```

ftp

Starts an FTP session.

[vrf *name***] ftp {port** [**default |** *service_port*] | **admin-state [enable | disable] |** *ip_address***}**

Syntax Definitions

name	The name of the VRF.
default	Sets the port back to the default of 21.
service_port	The TCP service port number. Must be 21 or between 20000-20999.
enable | disable	Enables or disables FTP access.
ip_address	Specifies the IPv4 address for the FTP session.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- You must have a valid username and password for the specified host.
- The default FTP directory is **/flash**.

Examples

```
-> ftp port 20000
-> ftp admin-state disable
-> ftp 172.17.6.228
-> vrf vrf1 ftp admin-state enable
```

Release History

Release 8.1.1; command introduced.

Related Commands

cd	Changes the current working directory of the switch.
pwd	Displays the current working directory of the switch.
ls	Displays the contents of a specified directory or the current working directory.

MIB Objects

```
systemServices
   systemServicesArg1
   systemServicesAction
   alaIpFtpAdminStatus
```

show ftp

Displays the current FTP server settings like the port used for FTP, the FTP server's status in the given VRF.

[vrf *name***] show ftp**

Syntax Definitions

name	The name of the VRF.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show ftp
Ftp Admin-State = Enabled
Ftp Port = 21
```

Release History

Release 8.1.1; command introduced.

Related Commands

ftp	Starts an FTP session.

MIB Objects

```
alaIpFtpAdminStatus
   alaIpFtpPort
```

53 Web Management Commands

The switch can be configured and monitored using WebView, which is a web-based device management tool. Web Management CLI commands allow you to enable/disable web-based management and configure certain WebView parameters, such as Secure Socket Layer (SSL).

MIB information for the Web Management commands is as follows:

Filename: AlcatelInd1WebMgt.mib
Module: alcatelIND1WebMgtMIB

A summary of the available commands is listed here:

webview server
webview access
webview force-ssl
webview http-port
webview https-port
show webview

webview server

Enables or disables the web management server on the switch.

[vrf *name***] webview server {enable | disable}**

Syntax Definitions

name	The name of the VRF.
enable | disable	Enables or disables the web management server on the switch.

Defaults

By default, the WebView server is enabled for the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If the WebView Server is disabled, WebView Access is automatically disabled.
- VRF name must either be ‘default’or a pre-defined VRF (user-defined).

Examples

```
-> webview server enable
-> webview server disable
-> vrf vrf1 webview server enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

webview access	Enables/disables webview access on the switch.
show webview	Displays web management configuration information.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
   alaInd1WebMgtServerStatus
```

webview access

Enables or disables web management access on the switch.

[vrf *name***] webview access {enable | disable}**

Syntax Definitions

name	The name of the VRF.
enable | disable	Enables or disables web management access on the switch.

Defaults

By default, WebView access is enabled on the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If WebView Access is enabled, the WebView Server is automatically enabled.
- VRF name must either be ‘default’or pre-defined VRF (user-defined).

Examples

```
-> webview access enable
-> webview access disable
-> vrf vrf1 webview access enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

webview server	Enables/disables the web server on the switch.
show webview	Displays web management configuration information.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
   alaInd1WebMgtAdminStatus
```

webview force-ssl

Enables/disables Force SSL on the switch. SSL is a protocol that establishes and maintains secure communication between SSL-enabled servers and clients.

webview force-ssl {enable | disable}

Syntax Definitions

enable | disable	Enabling this feature forces the user to use SSL to access the switch when using WebView.

Defaults

By default, force SSL is enabled on the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

The switch contains a self-signed certificate that may prompt a certificate warning.

Examples

```
-> webview force-ssl enable
-> webview force-ssl disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

webview access	Enables/disables webview access on the switch.
show webview	Displays web management configuration information.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
   alaInd1WebMgtSsl
```

webview http-port

Changes the port number for the embedded web management server.

webview http-port {default | port *port***}**

Syntax Definitions

default	Restores the port to its default (80) value.
port	The desired port number for the embedded Web server. The number must be in the range 0 to 65535; well-known port numbers cannot be configured.

Defaults

parameter	default
port	80

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

All WebView sessions must be terminated before entering this command.

Examples

```
-> webview http-port port 1025
-> webview http-port default
```

Release History

Release 8.1.1; command was introduced.

Related Commands

webview access	Enables/disables webview access on the switch.
show webview	Displays web management configuration information.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
   alaIND1WebMgtHttpPort
```

webview https-port

Changes the default secure (HTTPS) port for the embedded web management server.

webview https-port {default | port *port***}**

Syntax Definitions

default	Restores the port to its default (443) value.
port	The desired HTTPS port number. The number must be in the range 0 to 65535; well-known port numbers cannot be configured.

Defaults

parameter	default
port	443

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

All WebView sessions must be terminated before entering this command.

Examples

```
-> webview https-port port 1026
-> webview https https-port default
```

Release History

Release 8.1.1; command was introduced.

Related Commands

webview access	Enables/disables webview access on the switch.
show webview	Displays web management configuration information.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
   alaIND1WebMgtHttpsPort
```

show webview

Displays web management configuration information.

[vrf *name***] show webview**

Syntax Definitions

name	The name of the VRF.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If a VRF name is specified, the enabled/disabled state for WebView Server and WebView Access for the specified VRF is displayed.

Examples

```
-> show webview

WebView Server = Disabled
WebView Access = Disabled
WebView Force-SSL = Enabled
WebView HTTP-Port = 80
WebView HTTPS-Port = 4433

vrf1::-> show webview
WebView Server = Enabled,
WebView Access = Enabled,
WebView Force-SSL = Enabled,
WebView HTTP-Port = 80,
WebView HTTPS-Port = 443
```

output definitions

WebView Server	Indicates whether web management server is enabled or disabled.
WebView Access	Indicates whether web management access is enabled or disabled.
Force SSL	Indicates whether Force SSL is enabled or disabled. If this is enables it means that SSL is forced on an HTTP session and hence HTTPS protocol is negotiated between the client and server.
Web Management Http Port	The port configured for the HTTP connection.
Web Management Https Port	The port configured for a secure HTTP connection (SSL enabled).

Release History

Release 8.1.1; command was introduced.

Related Commands

webview server	Enables/disables web management server on the switch.
webview access	Enables/disables webview access on the switch.
webview force-ssl	Enables/disables SSL on the switch.

MIB Objects

```
alaIND1WebMgtConfigMIBGroup
   alaInd1WebMgtServerStatus
   alaInd1WebMgtAdminStatus
   alaInd1WebMgtSsl
   alaInd1WebMgtHttpPort
   alaInd1WebMgtHttpsPort
```

54 Configuration File Manager Commands

The Configuration Manager feature allows you to configure your switch using an ASCII-based text file. CLI commands may be typed into a text document—referred to as a *configuration file*—and then uploaded and applied to the switch.

MIB information for the Configuration Manager commands is as follows:

Filename: AlcatelIND1System.mib
Module: Alcatel-IND1ConfigMgr.mib

A summary of the available commands is listed here:

configuration apply
configuration error-file-limit
show configuration status
configuration cancel
configuration syntax-check
configuration snapshot
show configuration snapshot
write terminal

configuration apply

Applies a configuration file to the switch. Files may be applied immediately or after a designated timer session. With the timer session option, files are applied either at a scheduled date and time or after a specified period of time (i.e., a countdown) has passed.

configuration apply *filename* **[at** *hh:mm month dd* **[***year***]] | [in** *hh***[***:mm***]] [verbose]**

Syntax Definitions

filename	The name of the configuration text file to be applied to the switch **(e.g., newfile1).**
at *hh:mm* **{***dd month* | *month dd***}** **[***year***]**	Designates a timer session in which a configuration file is applied at a specified date and time in the future. Values for hh range from 00 through 23. Values for mm range from 00 through 59. Values for dd range from 01 through 31. Values for month range from January through December. The switch assumes either the current year or the next calendar year for month and day pairs that precede the current date.
in *hh***[***:mm***]**	Designates a timer session in which the configuration file is applied after a specific amount of time (i.e., a countdown) has passed. Values for *hh* range from 00 through 23. Values for *mm* range from 00 through 59.
verbose	When verbose is entered, information is displayed on your workstation's console as each command in the configuration file is applied.

Defaults

By default, **verbose** error checking is not performed.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The **configuration apply** command only applies settings to the running configuration. The **vcboot.cfg** file does not get overwritten.
- It is recommended that you check all configuration files for syntax errors before applying them to your switch.
- To schedule a timer session in which a file is applied at a specific date and time, enter **at** followed by the hour, minute, month, day, and year. The switch assumes either the current calendar year or the next calendar year for dates beginning January 1.
- To schedule a timer session in which a file is applied after a specific amount of time (i.e., a countdown) has passed, enter **in** followed by the number of hours and minutes.
- Verbose mode is not supported for timer sessions.
- The keyword, **authkey**, along with a related alpha-numeric text string, are automatically included in many snapshot files (e.g., **configuration snapshot all**). The text string following the **authkey** keyword represents a login password that has been encrypted *twice*. (The first encryption occurs when a

password is first created by a user; the second encryption occurs when a configuration snapshot is taken.) This dual encryption further enhances switch security. However, it is important to note that any configuration file (including a generated snapshot) that includes this dual-encrypted password information will result in an error whenever it is applied to the switch via the **configuration apply** command. This is a valid switch function and does not represent a significant problem. If an **authkey**-related error is the *only* error detected, simply remove all **authkey**-related syntax using a text editor. If a new password is required for the switch, include valid password syntax in the configuration file or immediately issue a new password by using the **password** command at the command prompt. For more information on passwords, refer to page 35-46.

Examples

```
-> configuration apply new_configuration at 12:00 15 november
-> configuration apply new_configuration at 12:00 november 15
-> configuration apply newfile1 in 01:30
-> configuration apply my_switch_config in 00:05
-> configuration apply asc.1.snap in 23:00
-> configuration apply aaa_config in 12
-> configuration apply vlan_config verbose
-> configuration apply vlan_config
...
```

Note. When the **configuration apply** command is entered *without* **at** or **in** syntax information, one or more dots "**.**" is displayed in the next line, immediately following the command line. This indicates command progress; each dot represents 256 text lines in the configuration file processed by the configuration apply mechanism.

Release History

Release 8.1.1; command was introduced.

Related Commands

configuration syntax-check	Performs a syntax and authorization check of all CLI commands contained in a configuration file.

MIB Objects

```
alcatelIND1ConfigMgrMIBObjects
   configFileName
   configFileMode
   configFileAction
   configTimerFileName
   configTimerFileTime
```

configuration error-file-limit

Specifies the maximum number of configuration error files allowed in the switch's **/flash** directory. Error files are normally generated when a configuration file is applied to the switch. Error files are identified by their **.err** extension.When the maximum number of **.err** files is exceeded, any new error file will over-write the **.err** file with the oldest timestamp.

configuration error-file-limit *number*

Syntax Definitions

number	Indicate the number of error files allowed in the **/flash** directory. The valid range is from 1 to 25 files.

Defaults

parameter	default
number	1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When the error file limit is set to 1 (the default value), the next error file generated by the switch will replace the existing one.
- When the error file limit is set to a value greater than 1, when a new error file that exceeds the maximum limit is created, the switch will automatically remove the error file with the smallest timestamp.
- The error files generated by the switch have the **.err** extension.
- If you want to save an error file, you may change the file name so that it does not have the **.err** extension, or you can move it from the /flash directory.

Examples

```
-> configuration error-file-limit 2
-> configuration error-file-limit 1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

configuration apply	Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.
configuration cancel	Cancels a pending timer session for a configuration file.

MIB Objects

```
alcatelIND1ConfigMgrMIBObjects
   configErrorFileMaximum
```

show configuration status

Displays whether there is a pending timer session scheduled for a configuration file and indicates whether the running configuration and the saved configuration files are *identical* or *different*. This command also displays the number of error files that will be held in the flash directory.

show configuration status

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- A timer session can be scheduled using the **configuration apply** command. For more information, refer to page 54-2.
- The screen output **File configuration** *</path/filename>***: scheduled at** *dd/mm hh:mm* indicates that a timer session has been scheduled for a later time.
- The output **No file configuration has been scheduled** indicates an idle timer session (i.e., no timer session has been scheduled for a configuration file).
- The output **File configuration is in progress** indicates that a file is currently being applied to the switch.
- The output **File configuration** *</path/filename>***: completed with 2 errors** indicates that the named file was applied to the switch with two recorded errors.
- When the running and saved configurations are the same, the output **Running configuration and saved configuration are identical** will be displayed.
- When the running and saved configurations are the different, the output **Running configuration and saved configuration are different** will be displayed.
- To synchronize the running and saved configuration, use the **issu slot** command.

Examples

```
-> show configuration status
```

Release History

Release 8.1.1; command was introduced.

Related Commands

configuration apply	Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.
configuration cancel	Cancels a pending timer session for a configuration file.
configuration error-file-limit	Specifies the maximum number of configuration error files allowed in the switch's **/flash** directory.
issu slot	Copies the running configuration (RAM) to the working directory.

MIB Objects

```
configTimerFileGroup
   configTimerFileStatus
```

configuration cancel

Cancels a pending timer session for a configuration file.

configuration cancel

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

N/A

Examples

```
-> configuration cancel
```

Release History

Release 8.1.1; command was introduced.

Related Commands

configuration apply	Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.
show configuration status	Displays whether there is a pending timer session scheduled for a configuration file.

MIB Objects

```
configTimerFileGroup
   configTimerClear
```

configuration syntax-check

Performs a syntax and authorization check of all CLI commands contained in a configuration file.

configuration syntax-check *path/filename* **[verbose]**

Syntax Definitions

path/filename	The configuration file being checked for syntax and authorization errors. If a configuration file is located in another directory, be sure to specify the full path. For example, **/flash/working/asc.1.snap**.
verbose	When **verbose** is specified in the command line, all syntax contained in the configuration file is printed to the console, even if no error is detected. When **verbose** is *not* specified in the command line, cursory information (number of errors and error log file name) will be printed to the console *only if a syntax or configuration error is detected*.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- When an error is detected, an error file (**.err**) is automatically generated by the switch. By default, this file is placed in the root **/flash** directory. To view the contents of a generated error file, use the **view** command. For example, **view asc.1.snap.1.err**.
- The syntax, **mac alloc**, is automatically included in many snapshot files (e.g., **configuration snapshot all**). All **mac alloc**-related syntax is valid *during switch boot up only* (i.e., it cannot be applied while the switch is in run-time operation). Because snapshot files are commonly used as configuration files, syntax checks may detect **mac alloc** syntax and issue an error (along with a generated **.err** file). This is a valid switch function and does not represent a significant problem. If a **mac alloc**-related error is the *only* error detected, simply remove the syntax using a text editor, then re-check the file using the **configuration syntax-check** command.
- It is recommended that you check all configuration files for syntax errors before applying them to your switch.

Examples

```
-> configuration syntax-check vlan_file1
..
```

Note. When the **configuration syntax-check** command is entered, one or more dots "**.**" is displayed in the command output. This indicates command progress; each dot represents 256 text lines in the configuration file processed by the syntax check mechanism.

Release History

Release 8.1.1; command was introduced.

Related Commands

configuration apply	Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.
show configuration status	Displays whether there is a pending timer session scheduled for a configuration file.

MIB Objects

```
configFileGroup
   configErrorFileName
   configErrorFileMaximum
   configFileMode
   configFileStatus
```

configuration snapshot

Generates a snapshot file of the switch's non-default current running configuration. A snapshot can be generated for all current network features or for one or more specific network features. A snapshot is a single text file that can be viewed, edited, and reused as a configuration file.

configuration snapshot *feature_list* **[***path/filename***]**

Syntax Definitions

feature_list	The description for the network feature(s) to be included in the snapshot. You may enter more than one network feature in the command line. Use a "?" on the command line to display a list of snapshot-supported features (for example, **configuration snapshot ?**).
path/filename	A user-defined name for the resulting snapshot file. For example, **test_snmp_snap**. You may also enter a specific path for the resulting file. For example, the syntax **/flash/working/test_snmp_snap** places the **test_snmp_snap** file in the switch's **/flash/working** directory.

Defaults

If a file name is not specified, the default file name **asc.#.snap** is used. Here, # indicates the order in which the default file is generated. For example, the first default file name to be generated is **asc.1.snap**, the second default file name to be generated is named **asc.2.snap**, etc. By default, all snapshot files are placed in the root **/flash** directory.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Only current, non-default configuration settings are written to the snapshot file.
- You may enter more than one network feature in the command line. Separate each network feature with a space and no comma. Network features may be entered in any order.
- The snapshot file is automatically placed in the root **/flash** directory unless otherwise specified.

Examples

```
-> configuration snapshot all
-> configuration snapshot new_file1 qos health aggregation
-> configuration snapshot snmp_snapshot snmp
```

Release History

Release 8.1.1; command was introduced.

   configSnapshotRDPSelect
   configSnapshotIPv6Select
```

show configuration snapshot

Displays the switch's current running configuration for all features or for the specified feature(s).

show configuration snapshot [*feature_list***]**

Syntax Definitions

feature_list	Specify the feature(s) for which you want to display the running configuration. List the features separated by a space with no comma. Use a "?" on the command line to display a list of snapshot-supported features (for example, **show configuration snapshot ?**).

Defaults

By default, this command shows configuration information for *all* features.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use this command to view the current configuration for any feature shown in the table.
- Configurations are listed below the name of each feature.
- Features with no current configuration show only the name of the feature.

Examples

```
-> show configuration snapshot
-> show configuration snapshot aaa bridge
! Bridging :

! AAA :
aaa authentication default "local"
aaa authentication console "local"
user "public" read All write All no auth authkey 391b0e74dbd13973d703cceaa4a8e30
```

55 SNMP Commands

This chapter includes descriptions for Trap Manager and SNMP Agent commands. The commands are used for configuring SNMP settings on the switch.

- SNMP station commands can create, modify, or delete an SNMP station. Also included is a show command for monitoring current SNMP station status.
- SNMP trap commands configure SNMP trap settings. Traps can be replayed and filtered. Also, test traps can be generated to verify that individual traps are being correctly handled by the Network Management Station (NMS). The SNMP trap commands set includes show commands for monitoring SNMP trap information.
- SNMP agent commands configure SNMP security levels on the switch. Also includes show commands for monitoring the current SNMP security status.

MIB information for SNMP Community commands is as follows:

Filename: IETFsnmpCommunity.MIB
Module: IETF SNMP-COMMUNITY.MIB

MIB information for Trap Manager commands is a follows:

Filename AlcatelIND1TrapMgr.MIB
Module: ALCATEL-IND1-TRAP-MGR.MIB

MIB information for SNMP Agent commands is a follows:

Filename: AlcatelIND1SNMPAgent.MIB
Module: ALCATEL-IND1-SNMP-AGENT.MIB

A summary of the available commands is listed here:

SNMP station commands	**snmp station** **show snmp station**
SNMP community map commands	**snmp community-map** **snmp community-map mode** **show snmp community-map**
SNMP security commands	**snmp security** **show snmp security** **show snmp statistics** **show snmp mib-family**
SNMP trap commands	**snmp-trap absorption** **snmp-trap to-webview** **snmp-trap replay-ip** **snmp-trap filter-ip** **snmp authentication-trap** **show snmp-trap replay-ip** **show snmp-trap filter-ip** **show snmp authentication-trap** **show snmp-trap config**

snmp station

Adds a new SNMP station; modifies or deletes an existing SNMP station.

snmp station {*ip_address* **|** *ipv6_address***} {[***udp_port***] [***username***] [v1 | v2 | v3] [enable | disable]}**

no snmp station {*ip_address* **|** *ipv6_address***}**

Syntax Definitions

ip_address	The IP address to which SNMP unicast traps will be sent.
ipv6_address	The IPv6 address to which SNMP unicast traps will be sent.
udp_port	A UDP destination port.
username	The user name on the switch or external server used to send traps to the SNMP station(s). The username specified here must match an existing user account name.
v1	Specifies that traps are sent using SNMP version 1.
v2	Specifies that traps are sent using SNMP version 2.
v3	Specifies that traps are sent using SNMP version 3.
enable	Enables the specified SNMP station.
disable	Disables the specified SNMP station.

Defaults

parameter	default
udp_port	162
v1 | v2 | v3	**v3**
enable | disable	**enable**

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the no form of the command to remove an existing SNMP station.
- When adding an SNMP station, you must specify an IP address *plus username parameters*. For example, the syntax **snmp station 1.2.3.4** is not a valid command entry; however, **snmp station 1.2.3.4 username1** is a valid command entry.
- When modifying an SNMP station, you must specify an IP address *plus at least one additional parameter*. For example, the syntax **snmp station 1.2.3.4** is not a valid command entry; however, **snmp station 1.2.3.4 v2** is a valid command entry.
- When the SNMP station is enabled, the switch transmits traps to the specified IP or IPv6 address.

Examples

```
-> snmp station 168.22.2.2 111 username2 v1 disable
-> snmp station 168.151.2.101 "test lab"
-> snmp station 170.1.2.3 username1 enable
-> snmp station 1.1.2.2 v2
-> no snmp station 2.2.2.2
-> snmp station 300::1 enable
-> no snmp station 300::1
```

Release History

Release 8.1.1; command was introduced.

```

snmp community-map

Configures and enables a community string on the switch and maps it to an existing user account name.

snmp community-map *community_string* **{[user** *useraccount_name***] | {enable | disable}}**

no snmp community-map *community_string*

Syntax Definitions

community_string	A community string in the form of a text string. This string must be between 1 and 32 characters.
useraccount_name	A user name in the form of a text string. This name must match a user login account name already configured on the switch or configured remotely on an external AAA server. This user name must be between 1 and 32 characters.
enable	Enables SNMP community string mapping.
disable	Disables SNMP community string mapping.

Defaults

By default, SNMP community map authentication is enabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Community strings configured on the switch are used for v1 and v2c SNMP managers only.
- The user account name must be a current user account recognized by the switch. For a list of current user names use the **show user** command. To create a new user account, use the **user** command.
- There is one to one mapping between each community string and a user account name.
- Privileges attached to the community string are the ones inherited from the user account name that created it.
- The community-map mode must be enabled and the community string carried over each incoming v1 or v2c SNMP request must be mapped to a user account name in order to be processed by the SNMP agent.

Examples

```
-> snmp community-map community1 user testname1
-> snmp community-map community1 enable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

snmp community-map mode	Enables the local community strings database.

MIB Objects

```
SNMPCommunityTable
   snmpCommunityIndex
   snmpCommunitySecurityName
   snmpCommunityStatus
```

snmp community-map mode

Enables the local community strings database.

snmp community-map mode {enable | disable}

Syntax Definitions

enable	Enables SNMP community map database.
disable	Disables SNMP community map database.

Defaults

By default, the community map mode is disabled on the switch.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- The community-map mode must be enabled and the community string carried over each incoming v1 or v2c SNMP request must be mapped to a user account name with SNMP privileges in order to be processed by the SNMP agent.
- When enabled, mapping is contained in the local community strings database populated by using the **snmp community-map** command.

Examples

```
-> snmp community-map mode enable
-> snmp community-map mode disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

snmp community-map	Configures and enables a community string on the switch and maps it to an existing user account name.

MIB Objects

   snmpCommunityIndex
   snmpCommunitySecurityName
   snmpCommunityStatus
```

show snmp community-map

Shows the local community strings database.

show snmp community-map

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guideline

N/A

Examples

```
-> show snmp community-map
Community mode : enabled

status   community string                user name
--------+--------------------------------+--------------------------------
enabled   test_string1                   bb_usename
enabled   test_string2                   rr_usename
disabled  test_string3                   cc_usename
disabled  test_string4                   jj_usename
```

output definitions

Status	The Enabled/Disabled status of the community string.
Community String	The text that defines the community string.
User Name	The user account name.

Release History

Release 8.1.1; command was introduced.

Related Commands

snmp community-map	Configures and enables a community string on the switch and maps it to an existing user account name.

MIB Objects

N/A

snmp security

Configures SNMP security settings.

snmp security {no-security | authentication set | authentication all | privacy set | privacy all | trap-only}

Syntax Definitions

no-security	The switch will accept all SNMP v1, v2, and v3 requests.
authentication set	The switch will accept all requests *except* v1, v2, and non-authenticated v3 set requests. SNMP v1, v2, and non-authenticated v3 set requests will be rejected.
authentication all	The switch will accept all requests *except* v1, v2, and non-authenticated v3 get, get-next, and set requests. SNMP v1, v2, and non-authenticated v3 get, get-next, and set requests will be rejected.
privacy set	The switch will accept *only* authenticated SNMP v3 get, get-next and encrypted v3 set requests. All other requests will be rejected.
privacy all	The switch will accept only encrypted v3 get, get-next, and set requests. All other requests will be rejected.
trap-only	All SNMP get, get-next, and set requests will be rejected.

Defaults

By default, the SNMP security default is set to **privacy all**, which is the highest level of security.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Refer to the table below for a quick-reference list of security parameter and the SNMP request allowances for each parameter.

	v1 set v2 set v3 non-auth set	**v1 get v2 get v3 non-auth get/ get-next**	**v3 auth set**	**v3 auth get/ get-next**	**v3 encryp set**	**v3 encryp get/ get-next**
no-security	accepted	accepted	accepted	accepted	accepted	accepted
authentication set	rejected	accepted	accepted	accepted	accepted	accepted
authentication all	rejected	rejected	accepted	accepted	accepted	accepted
privacy set	rejected	rejected	rejected	accepted	accepted	accepted
privacy all	rejected	rejected	rejected	rejected	accepted	accepted
trap-only	rejected	rejected	rejected	rejected	rejected	rejected

Examples

```
-> snmp security no-security
-> snmp security authentication set
```

```
-> snmp security authentication all
-> snmp security privacy set
-> snmp security trap-only
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show snmp security	Displays the current SNMP security status.

MIB Objects

```
SNMPAgtConfig
   SnmpAgtSecurityLevel
```

show snmp security

Displays the current SNMP security status.

show snmp security

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Refer to the command on page 55-12 for descriptions of the five SNMP security states: no security, authentication set, authentication all, privacy set, privacy all, and trap only.

Examples

```
-> show snmp security
snmp security = no security

-> show snmp security
snmp security = authentication set

-> show snmp security
snmp security = authentication all

-> show snmp security
snmp security = privacy set

-> show snmp security
snmp security = privacy all

-> show snmp security
snmp security = trap only
```

Release History

Release 8.1.1; command was introduced.

Related Commands

snmp security	Configures the SNMP security settings.

output definitions

From RFCxxxx	Displays the RFC number that defines the SNMP MIB objects listed.
MIB Objects	Name of the MIB object listed as an SNMP statistic.
= (integer)	The number of times the MIB object has been reported to the SNMP management station since the last reset.

Release History

Release 8.1.1; command was introduced.

Related Commands

N/A

MIB Objects

N/A

show snmp mib-family

Displays SNMP MIB information. Information includes MIP ID number, MIB table name, and command family.

show snmp mib-family [*table_name***]**

Syntax Definitions

table_name	The name of the MIB table to be displayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- If a table name is not specified in the command syntax, all MIB table names will be displayed.
- If the command family is not valid for the entire MIB table, the command family will be displayed on a per-object basis.
- Table names are case-sensitive. Therefore, use the exact table names from the MIB database.

Examples

```
-> show snmp mib-family trapStationTable
MIP ID   MIB TABLE NAME                          FAMILY
-------+---------------------------------------+--------------------
 73733   trapStationTable                        snmp
```

output definitions

MIP ID	Identification number for the MIP associated with this MIB Table.
MIB Table Name	Name of the MIB table.
Family	Command family to which this MIB table belongs.

Release History

Release 8.1.1; command was introduced.

Related Commands

show snmp-trap filter-ip	Displays the SNMP trap filter information.

MIB Objects

N/A

snmp-trap absorption

Enables or disables the trap absorption function.

snmp-trap absorption {enable | disable}

Syntax Definitions

enable	Enables SNMP trap absorption. When trap absorption is enabled, identical, repetitive traps sent by applications during a pre-configured time period will be absorbed, and therefore not sent to SNMP Manager stations configured on the switch.
disable	Disables SNMP trap absorption.

Defaults

By default, trap absorption is enabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

To view the current trap absorption status, use the **show snmp-trap config** command.

Examples

```
-> snmp-trap absorption enable
-> snmp-trap absorption disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show snmp-trap config	Displays the SNMP trap information. Information includes trap ID numbers and corresponding trap names and families.

MIB Objects

```
trapFilterTable
   trapAbsorption
```

snmp-trap to-webview

Enables the forwarding of traps to WebView.

snmp-trap to-webview {enable | disable}

Syntax Definitions

enable	Enables WebView forwarding. When WebView forwarding is enabled, all traps sent by switch applications are also forwarded to WebView. This allows a WebView session to retrieve the trap history log.
disable	Disables WebView forwarding.

Defaults

By default, WebView forwarding is enabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

To view the current WebView forwarding status, use the **show snmp-trap config** command.

Examples

```
-> snmp-trap to-webview enable
-> snmp-trap to-webview disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show snmp-trap config	Displays the SNMP trap information, including the current status for trap absorption and WebView forwarding.

MIB Objects

```
trapFilterTable
   trapToWebView
```

snmp-trap replay-ip

Replays stored traps from the switch to a specified SNMP station. This command is used to replay (to resend) traps on demand. This is useful in the event when traps are lost in the network.

snmp-trap replay-ip {*ip_address* | *ipv6_address***} [***seq_id***]**

Syntax Definitions

ip_address	The IP address for the SNMP station to which traps will be replayed from the switch.
ipv6_address	The IPv6 address for the SNMP station to which traps will be replayed from the switch.
seq_id	The sequence number from which trap replay will begin. Each trap sent by the switch to an SNMP station has a sequence number. The sequence number reflects the order in which the trap was sent to the SNMP station. For example, the first trap sent to an SNMP station has a sequence number of 1; the second trap has a sequence number of 2, etc. If no sequence number is entered, all stored traps are replayed.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **show snmp station** command on page page 55-5 to display the latest stored sequence number for each SNMP station.
- The switch replays traps in the same order that they were previously sent, beginning from the specified sequence number.
- When traps are replayed, the original dates on which the trap was issued, rather than the current dates are used.
- If the specified sequence number is lower than the oldest trap sequence number stored in the switch, the switch replays all stored traps.
- If the specified sequence number is equal to or greater than the oldest trap sequence number stored, the switch replays all stored traps from the specified sequence number up to the latest sequence number.
- If the specified sequence number is greater than the latest sequence number, no traps are replayed.

Examples

```
-> snmp-trap replay-ip 172.12.2.100
-> snmp-trap replay-ip 300::1
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show snmp station	Displays the current SNMP station status.
show snmp-trap replay-ip	Displays the SNMP trap replay information.

MIB Objects

```
trapStationTable
   trapStation Replay
AlaTrapInetStationEntry
   alaTrapInetStationReplay
   alaTrapInetStationNextSeq
```

snmp-trap filter-ip

Enables or disables SNMP trap filtering. Trap filtering is used to determine whether a trap or group of traps will be sent from the switch to a specified SNMP station.

snmp-trap filter-ip {*ip_address* **|** *ipv6_address***}** *trap_id_list*

no snmp-trap filter-ip {*ip_address* | *ipv6_address***}** *trap_id_list*

Syntax Definitions

ip_address	The IP address for the SNMP station for which trap filtering is being enabled or disabled.
ipv6_address	The IPv6 address for the SNMP station for which trap filtering is being enabled or disabled.
trap_id_list	Specifies the trap(s) for which filtering is being enabled or disabled. Traps must be specified using the numeric trap ID. You can specify more than one trap in the command line; separate each trap ID with a space and no comma.

Defaults

By default, SNMP trap filtering is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- To *enable* trap filtering, use the syntax **snmp-trap filter-ip** *ip_address trap_id_list*.
- To *disable* trap filtering, use the syntax **no snmp-trap filter-ip** *ip_address trap_id_list*.
- When filtering is enabled, the specified trap(s) *will not* be sent to the SNMP station. When filtering is disabled, the specified traps *will* be sent to the SNMP station.
- To display a list of traps and their ID numbers, use the **show snmp-trap config** command.

Examples

```
-> snmp-trap filter-ip 172.1.2.3 1
-> snmp-trap filter-ip 172.1.2.3 0 1 3 5
-> snmp-trap filter-ip 300::1 1 3 4
-> no snmp-trap filter-ip 172.1.2.3 1
-> no snmp-trap filter-ip 172.1.2.3 0 1 3 5
-> no snmp-trap filter-ip 300::1 1 3
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show snmp-trap filter-ip	Displays the current SNMP trap filter status.
show snmp-trap config	Displays the SNMP trap information, including trap ID numbers, trap names, command families, and absorption rate.

MIB Objects

```
trapFilterTable
   trapFilterStatus
alaTrapInetFilterTable
   alaTrapInetFilterStatus
```

snmp authentication-trap

Enables or disables SNMP authentication failure trap forwarding.

snmp authentication-trap {enable | disable}

Syntax Definitions

enable	Enables authentication failure trap forwarding. When enabled, the standard authentication failure trap is sent each time an SNMP authentication failure is detected.
disable	Disables authentication failure trap forwarding.

Defaults

By default, authentication failure trap forwarding is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> snmp authentication-trap enable
-> snmp authentication-trap disable
```

Release History

Release 8.1.1; command was introduced.

Related Commands

show snmp authentication-trap	Displays the current authentication failure trap forwarding status.

MIB Objects

```
snmpGroup
   snmpEnableAuthenTraps
```

show snmp-trap replay-ip

Displays SNMP trap replay information.

show snmp-trap replay-ip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show snmp-trap replay-ip
ipAddress       : oldest replay number
-------------------------------------
199.199.101.200 :       1234
199.199.105.202 :        578
199.199.101.203 :       1638
199.199.101.204 :       2560
```

output definitions

IPAddress	IP address of the SNMP station manager that replayed the trap.
Oldest Replay Number	Number of the oldest replayed trap.

Release History

Release 8.1.1; command was introduced.

Related Commands

snmp-trap replay-ip	Replays stored traps from the switch to a specified SNMP station.

MIB Objects

```
trapStationTable
   snmpStation Replay
AlaTrapInetStationEntry
   alaTrapInetStationReplay
   alaTrapInetStationNextSeq
```

show snmp-trap filter-ip

Displays the current SNMP trap filter status.

show snmp-trap filter-ip

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

To display a list of traps and their ID numbers, use the **show snmp-trap config** command.

Examples

```
-> show snmp-trap filter-ip
ipAddress       : trapId list
--------------------------------------------------------------------------------
199.199.101.200 :    0   1   2   3
199.199.101.201 : no filter
199.199.105.202 :    0   1   2   3   4   5   6   7   8   9  10  11  12  13  14
                    15  16  17  18  19
199.199.101.203 :   20  22  30
199.199.101.204 : no filter
```

output definitions

IPAddress	IP address of the SNMP management station that recorded the traps.
TrapId List	Identification number for the traps being filtered.

Release History

Release 8.1.1; command was introduced.

Related Commands

snmp-trap filter-ip	Enables or disables SNMP trap filtering.
show snmp-trap config	Displays the SNMP trap information, including trap ID numbers, trap names, command families, and absorption rate.

MIB Objects

```
trapFilterTable
   trapFilterEntry
alaTrapInetFilterTable
   alaTrapInetFilterStatus
```

show snmp authentication-trap

Displays the current authentication failure trap forwarding status (i.e., enable or disable).

show snmp authentication-trap

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show snmp authentication-trap
snmp authentication trap = disable
```

trapConfigTable
   trapConfigEntry
```

56 OpenFlow Commands

OpenFlow is a communications interface defined between the control and forwarding layers that is used in a Software Defined Network (SDN). OpenFlow separates the control plane and the data plane in the switch. Traditionally, switches and routers have made decisions on where packets should travel based on rules local to the device. With OpenFlow, only the data plane exists on the switch itself, and all control decisions are communicated to the switch from a central Controller. The OmniSwitch can operate in AOS or OpenFlow mode, including a modified OpenFlow mode known as Hybrid mode.

MIB information for the Web Management commands is as follows:

Filename: ALCATEL-IND1-OPENFLOW-MIB.mib
Module: alcatelIND1OpenflowMIB

A summary of the available commands is listed here:

OpenFlow Commands	**openflow back-off-max** **openflow idle-probe-timeout** **openflow logical-switch** **openflow logical-switch controller** **openflow logical-switch interfaces** **show openflow** **show openflow logical-switch**

openflow back-off-max

Configures the maximum amount of time to wait between Controller connection attempts.

openflow back-off-max *seconds*

Syntax Definitions

seconds	The IP address to which SNMP unicast traps will be sent.

Defaults

parameter	default
seconds	60

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> openflow back-off-max 0
-> openflow back-off-max 32
-> openflow back-off-max 60
```

Release History

Release 8.1.1; command introduced

Related Commands

show openflow	Displays global OpenFlow configuration parameters.

MIB Objects

```
alaOpenflowGlobalBackoffMax
```

openflow idle-probe-timeout

Configures the idle probe timeout value.

openflow idle-probe-timeout *seconds*

Syntax Definitions

seconds	The idle probe timeout value, in seconds (Range = 1 - 60).

Defaults

parameter	default
seconds	15

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

If set to “0”, idle probing is disabled.

Examples

```
-> openflow idle-probe-timeout 0
-> openflow idle-probe-timeout 15
-> openflow idle-probe-timeout 60
```

Release History

Release 8.1.1; command introduced

Related Commands

show openflow	Displays global OpenFlow configuration parameters.

MIB Objects

```
alaOpenflowGlobalIdleProbeTimeout
```

openflow logical-switch

Configures an OpenFlow Logical Switch. An OpenFlow Logical Switch consists of a portion of the switch's resources that are managed by an OpenFlow Controller (or set of Controllers) via the OpenFlow Agent. You can configure up to three (3) OpenFlow Logical Switches.

openflow logical-switch *name* **[admin-state {enable | disable}] [mode {normal | api}] [version {1.0 | 1.3.1}+] [learned-mac-update {enable | disable}] [vlan** *vlan_id***]**

no openflow logical-switch <*name*>

Syntax Definitions

name	The Logical Switch name (up to 32 characters).
admin-state enable	Enables the Logical Switch.
admin-state disable	Disables the Logical Switch.
normal	Configures the Logical Switch to run in Normal Mode.
api	Configures the Logical Switch to run in Hybrid (API) Mode. Only one (1) Logical Switch can be configured in Hybrid Mode.
1.0	Configures the Logical Switch to run OpenFlow Version 1.0.
1.3.1	Configures the Logical Switch to run OpenFlow Version 1.3.1.
learned-mac-update	Not Supported
vlan_id	The Default VLAN for all ports assigned to the Logical Switch. Traffic on this VLAN on these ports will not carry an 802.1q tag. Traffic on all other VLANs on these ports will carry an 802.1q tag. The valid range is 2 - 4093.

Defaults

parameter	default
enable | disable	enable
normal | api	normal
1.0 | 1.3.1	1.0 1.3.1

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the no form of the command to delete an OpenFlow Logical Switch and all Controller/port configurations for that Logical Switch.
- When a Logical Switch is disabled, all Controllers for that Logical Switch are operationally disabled, and flows added by those Controllers are removed.

- In Normal Mode, the switch operates as per the OpenFlow standards. In Hybrid mode, OpenFlow operates as an interface through which the Controller may add over-ride policies to the switch much like QoS. In Hybrid mode, no traffic is forwarded to the Controller(s) and AOS operates normally.
- OpenFlow versions 1.0 and 1.3.1 are both enabled by default. At least one version must be enabled.
- "vlan" is not valid if the configured mode for the Logical Switch is API. An API Logical Switch implicitly operates on all ports, link aggregates, and VLANs not assigned to other OpenFlow Logical Switches.

Examples

```
-> openflow logical-switch vswitch1
-> openflow logical-switch vswitch1 admin-state enable
-> openflow logical-switch vswitch1 mode normal version 1.0 vlan 5
-> no openflow logical-switch vswitch1
```

Release History

Release 8.1.1; command introduced

Related Commands

show openflow logical-switch	Displays information about all of the configured OpenFlow Logical Switches.

MIB Objects

```
alaOpenflowLogicalSwitchTable
   alaOpenflowLogicalSwitch
   alaOpenflowLogicalSwitchAdminState
   alaOpenflowLogicalSwitchMode
   alaOpenflowLogicalSwitchVersions
   alaOpenflowLogicalSwitchVlan
```

openflow logical-switch controller

Configures a Controller for an OpenFlow Logical Switch. You can configure up to three (3) Controllers per Logical Switch.

openflow logical-switch *name* **controller** *ip_address* **[***:port***] admin-state {enable | disable}**

no openflow logical-switch *name* **controller** *ip_address* **[***:port***]**

Syntax Definitions

name	The Logical Switch name (up to 32 characters).
ip_address	The IP address of Controller.
port	The Controller IP Port (1 - 65535).
enable	Enables the connection to the Controller.
disable	Disables the connection to the Controller.

Defaults

parameter	default
port	6633
enable | disable	enable

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Currently, only IPv4 addresses are supported.
- If a Logical Switch cannot connect to any of its Controllers, it runs in “Fail Secure Mode”. All flow aging, etc. continues unaffected while the Controllers are disconnected.

Examples

```
-> openflow logical-switch vswitch1 Controller 1.2.3.4
-> openflow logical-switch vswitch1 Controller 1.2.3.4:6634 admin-state enable
-> no openflow logical-switch vswitch1 Controller 1.2.3.4
```

Release History

Release 8.1.1; command introduced.

Related Commands

show openflow logical-switch	Displays information about all of the configured OpenFlow Logical Switches.

MIB Objects

```
alaOpenflowControllerTable
   alaOpenflowControllerLogicalSwitch
   alaOpenflowControllerIpType
   alaOpenflowControllerIp
   alaOpenflowControllerPort
   alaOpenflowControllerAdminState
```

openflow logical-switch interfaces

Configures a range of interfaces to/from a Logical Switch.

openflow logical-switch *name* **interfaces {port** *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]}**

no openflow logical-switch *name* **interfaces {port** *chassis/slot/port1***[**-*port2***] | linkagg** *agg_id***[**-*agg_id2***]}**

Syntax Definitions

name	The Logical Switch name (up to 32 characters).
*chassis/slot/port***[**-*port2***]**	The chassis ID, slot, and port number (3/1/1) for a specific port. Use a hyphen to specify a range of ports (3/1/1-8).
*agg_id***[**-*agg_id2***]**	The link aggregate ID number. Use a hyphen to specify a range of link aggregate IDs (10-15).

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> openflow logical-switch vswitch1 interfaces port 1/1/1
-> no openflow logical-switch vswitch1 interfaces port 1/1/1
-> openflow logical-switch vswitch2 interfaces linkagg 5
-> no openflow logical-switch vswitch2 interfaces linkagg 5
-> openflow logical-switch vswitch1 interfaces port 1/1/1-8
-> no openflow logical-switch vswitch1 interfaces port 1/1/1-8
```

Release History

Release 8.1.1; command introduced

Related Commands

show openflow logical-switch	Displays information about all of the configured Logical Switches.

MIB Objects

```
alaOpenflowInterfaceTable
   alaOpenflowInterfaceLogicalSwitch
   alaOpenflowInterface
```

show openflow

Displays global OpenFlow configuration parameters.

show openflow

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show openflow
Back-off Max       : 60,
Idle Probe Timeout : 15
```

output definitions

Back-off Max	The configured maximum back off time, in seconds, for Controller connection attempts (Range = 1 - 60, Default = 60).
Idle Probe Timeout	The configured idle probe timeout value, in seconds (Range = 1– 60, Default = 15).

Release History

Release 8.1.1; command introduced

Related Commands

openflow back-off-max	Configures the maximum amount of time allowed for Controller connection attempts.
openflow idle-probe-timeout	Configures the idle probe timeout value.

MIB Objects

```
alaOpenflowGlobalBackoffMax
alaOpenflowGlobalIdleProbeTimeout
```

show openflow logical-switch

Displays information about configured OpenFlow Logical Switches.

show openflow logical-switch [*name* **| controllers | interfaces]**

Syntax Definitions

name	The Logical Switch name (up to 32 characters).
controllers	The controllers assigned to this logical switch.
interfaces	The interfaces assigned to this logical switch.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

Enter a Logical Switch name to display only information about a specific Logical Switch.

Examples

```
-> show openflow logical-switch

                         Admin
       Logical Switch    State  Mode    Versions    VLAN   Ctrlrs   Intf   Flows
-------------------------+-----+------+-----------+------+--------+------+-------
vswitch1                  Ena   Norm   1.0             1       1      4       0
vswitch2                  Dis   Norm   1.0, 1.3.1      5       3      4       2
vswitch3                  Ena   API    1.0, 1.3.1    N/A       1      0       0
```

output definitions

Logical Switch	The Logical Switch name
Admin State	The Logical Switch administrative state (Enabled/Disabled).
Mode	The Logical Switch operational Mode (Normal/API).
Versions	The OpenFlow versions enabled on the Logical Switch (1.0/1.3.1).
VLAN	The default VLAN for all ports assigned to the Logical Switch. Zero (0) indicates no VLAN configured.
Ctrlrs	The number of Controllers configured for the Logical Switch (up to three (3) Controllers can be configured per Logical Switch.
Intf	The number of interfaces (ports and link aggregations) configured for the Logical Switch.
Flows	The number of flows pushed to the Logical Switch by its Controllers.
Controller	The controller IP address and port.

output definitions

Role	Current role of the controller. Equal, Master, or Slave.
Oper State	Current connection state of the controller (invalid, operDisabled, sendError, init, connecting, backoff, exchangingHello, active, idle, disconnected).

Release History

Release 8.1.1; command introduced

Related Commands

openflow logical-switch	Configures an OpenFlow Logical Switch.
openflow logical-switch controller	Configures a Controller for an OpenFlow Logical Switch. You can configure up to three (3) Controllers per Logical Switch.
openflow logical-switch interfaces	Configures a range of interfaces to/from a Logical Switch.

57 DNS Commands

A Domain Name System resolver is an internet service that translates host names into IP addresses. Every time you use a host name, a DNS service must resolve the name to an IP address. You can configure up to three domain name servers. If the primary DNS server does not know how to translate a particular host name, it asks the secondary DNS server (if specified). If this fails, it asks the third DNS server (if specified), until the correct IP address is returned (resolved). If all DNS servers have been queried and the name is still not resolved to an IP address, the DNS resolver will fail and issue an error message.

MIB information for the DNS commands is as follows:

Filename: AlcatelIND1System.mib
Module: ALCATEL-IND1-SYSTEM.MIB

A summary of the available commands is listed here.

ip domain-lookup
ip name-server
ipv6 name-server
ip domain-name
show dns

ip domain-lookup

Enables or disables the DNS resolver.

ip domain-lookup

no ip domain-lookup

Syntax Definitions

N/A

Defaults

By default, the DNS resolver is disabled.

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to disable the DNS resolver.
- You must use the **ip domain-name** command to set a default domain name for your DNS resolver(s) and the **ip name-server** command to specify up to three DNS servers to query on host lookups.
- The **ip domain-lookup** command enables the DNS resolver.

Examples

```
-> ip domain-lookup
-> no ip domain-lookup
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip name-server	Specifies the IP addresses of up to three servers to query on a host lookup.
ipv6 name-server	Specifies the IPv6 addresses of up to three IPv6 DNS servers to query on a host lookup.
ip domain-name	Sets or deletes the default domain name for DNS lookups.
show dns	Displays the current DNS resolver configuration and status.

MIB Objects

```
systemDNS
   systemDNSEnableDnsResolver
```

ip name-server

Specify the IP addresses of up to three servers to query on a host lookup.

ip name-server *server-address1* **[***server-address2* **[***server-address3***]]**

Syntax Definitions

server-address1	The IP address of the primary DNS server to query for host lookup. This is the only address that is required.
server-address2	The IP address of the secondary DNS server to query for host lookup. This server will be queried only if the desired host name or host IP address is not located by the primary DNS server. A second IP address is optional.
server-address3	The IP address of the DNS server with the lower priority. This server will be queried only if the desired host name or IP address is not located by the primary and secondary DNS servers. A third IP address is optional.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Configuration of the DNS resolver to resolve any host query requires that you first set the default domain name with the **ip domain-name** command and enable the DNS resolver function with the **ip domain-lookup** command before you specify the IP addresses of the DNS servers by using the **ip name-server** command.
- You can configure up to three IPv4 DNS servers and three IPv6 DNS servers in a switch.

Examples

```
-> ip name-server 189.202.191.14 189.202.191.15 188.255.19.1
-> ip name-server 10.255.11.66
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip domain-lookup	Enables or disables the DNS resolver.
ip domain-name	Sets or deletes the default domain name for DNS lookups.
show dns	Displays the current DNS resolver configuration and status.

MIB Objects

```
systemDNS
   systemDNSNsAddr1
   systemDNSNsAddr2
   systemDNSNsAddr3
```

ipv6 name-server

Specifies the IPv6 addresses of up to three IPv6 DNS servers to query on a host lookup.

ipv6 name-server *server-ipv6_address1* **[***server-ipv6_address2* **[***server-ipv6_address3***]]**

Syntax Definitions

server-ipv6_address1	The IPv6 address of the primary IPv6 DNS server to query for host lookup. Specifying the primary IPv6 DNS address is mandatory.
server-ipv6_address2	The IPv6 address of the secondary IPv6 DNS server to query for host lookup. This server will be queried only if the desired host name is not able to be resolved by the primary IPv6 DNS server. A second IPv6 address is optional.
server-ipv6_address3	The IPv6 address of the IPv6 DNS server with the lower priority. This server will be queried only if the desired host name is not able to be resolved by both the primary and secondary IPv6 DNS servers. A third IPv6 address is optional.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Configuration of the DNS resolver to resolve any host query requires that you first set the default domain name with the **ip domain-name** command and enable the DNS resolver function with the **ip domain-lookup** command before you specify the IPv6 addresses of the IPv6 DNS servers by using the **ipv6 name-server** command.
- You cannot use multicast, loopback, link-local and unspecified IPv6 addresses for specifying IPv6 DNS servers.
- You can configure up to three IPv6 DNS servers and three IPv4 DNS servers in a switch.

Examples

```
-> ipv6 name-server fec0::2d0:d3:f3fc
-> ipv6 name-server fe2d::2c  f302::3de1:1 f1bc::202:fd40:f3
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip domain-lookup	Enables or disables the DNS resolver.
ip domain-name	Sets or deletes the default domain name for DNS lookups.
show dns	Displays the current DNS resolver configuration and status.

MIB Objects

```
systemDNS
   systemDNSNsIPv6Addr1
   systemDNSNsIPv6Addr2
   systemDNSNsIPv6Addr3
```

ip domain-name

Sets or deletes the default domain name for DNS lookups.

ip domain-name *name*

no ip domain-name

Syntax Definitions

name	The default domain name for host lookups.

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

- Use the **no** form of this command to delete the default domain name.
- Use this command to set the default domain name for DNS lookups.

Examples

```
-> ip domain-name company.com
-> no ip domain-name
```

Release History

Release 8.1.1; command was introduced.

Related Commands

ip domain-lookup	Enables or disables the DNS resolver.

show dns

Syntax Definitions

N/A

Defaults

N/A

Platforms Supported

OmniSwitch 6860, 6860E

Usage Guidelines

N/A

Examples

```
-> show dns
Resolver is       : enabled
domainName        : company.com
IPv4 nameServer(s): 189.202.191.14
                  : 189.202.191.15
                  : 188.255.19.1
IPv6 nameServer(s): fe2d::2c
                  : f302::3de1:1
                  : f1bc::202:fd40:f3
```

output definitions

Resolver is	Indicates whether the DNS resolver is enabled or disabled.
domainName	Indicates the default domain name assigned to the DNS lookups. This value is set using the **ip domain-name** command.
IPv4 nameServer(s)	Indicates the IP address(es) of the IPv4 DNS server(s). These addresses are set using the **ip name-server** command.
IPv6 nameServer(s)	Indicates the IPv6 address(es) of the IPv6 DNS server(s). These addresses are set using the **ipv6 name-server** command.

A Software License and Copyright Statements

This appendix contains Alcatel-Lucent and third-party software vendor license and copyright statements.

Alcatel-Lucent License Agreement

ALCATEL-LUCENT SOFTWARE LICENSE AGREEMENT

IMPORTANT. Please read the terms and conditions of this license agreement carefully before opening this package.

By opening this package, you accept and agree to the terms of this license agreement. If you are not willing to be bound by the terms of this license agreement, do not open this package. Please promptly return the product and any materials in unopened form to the place where you obtained it for a full refund.

1. **License Grant.** This is a license, not a sales agreement, between you (the "Licensee") and Alcatel-Lucent. Alcatel-Lucent hereby grants to Licensee, and Licensee accepts, a non-exclusive license to use program media and computer software contained therein (the "Licensed Files") and the accompanying user documentation (collectively the "Licensed Materials"), only as authorized in this License Agreement. Licensee, subject to the terms of this License Agreement, may use one copy of the Licensed Files on the Licensee's system. Licensee agrees not to assign, sublicense, transfer, pledge, lease, rent, or share their rights under this License Agreement. Licensee may retain the program media for backup purposes with retention of the copyright and other proprietary notices. Except as authorized under this paragraph, no copies of the Licensed Materials or any portions thereof may be made by Licensee and Licensee shall not modify, decompile, disassemble, reverse engineer, or otherwise attempt to derive the Source Code. Licensee is also advised that Alcatel-Lucent products contain embedded software known as firmware which resides in silicon. Licensee may not copy the firmware or transfer the firmware to another medium.

2. **Alcatel-Lucent's Rights.** Licensee acknowledges and agrees that the Licensed Materials are the sole property of Alcatel-Lucent and its licensors (herein "its licensors"), protected by U.S. copyright law, trademark law, and are licensed on a right to use basis. Licensee further acknowledges and agrees that all rights, title, and interest in and to the Licensed Materials are and shall remain with Alcatel-Lucent and its licensors and that no such right, license, or interest shall be asserted with respect to such copyrights and trademarks. This License Agreement does not convey to Licensee an interest in or to the Licensed Materials, but only a limited right to use revocable in accordance with the terms of this License Agreement.

3. **Confidentiality.** Alcatel-Lucent considers the Licensed Files to contain valuable trade secrets of Alcatel-Lucent, the unauthorized disclosure of which could cause irreparable harm to Alcatel-Lucent. Except as expressly set forth herein, Licensee agrees to use reasonable efforts not to disclose the Licensed Files to any third party and not to use the Licensed Files other than for the purpose authorized by this License Agreement. This confidentiality obligation shall continue after any termination of this License Agreement.

4. **Indemnity.** Licensee agrees to indemnify, defend and hold Alcatel-Lucent harmless from any claim, lawsuit, legal proceeding, settlement or judgment (including without limitation Alcatel-Lucent's reasonable United States and local attorneys' and expert witnesses' fees and costs) arising out of or in connection with the unauthorized copying, marketing, performance or distribution of the Licensed Files.

5. **Limited Warranty.** Alcatel-Lucent warrants, for Licensee's benefit alone, that the program media shall, for a period of ninety (90) days from the date of commencement of this License Agreement (referred to as the Warranty Period), be free from defects in material and workmanship. Alcatel-Lucent further warrants, for Licensee benefit alone, that during the Warranty Period the Licensed Files shall operate substantially in accordance with the functional specifications in the User Guide. If during the Warranty Period, a defect in the Licensed Files appears, Licensee may return the Licensed Files to Alcatel-Lucent for either replacement or, if so elected by Alcatel-Lucent, refund of amounts paid by Licensee under this License Agreement. EXCEPT FOR THE WARRANTIES SET FORTH ABOVE, THE LICENSED MATERIALS ARE LICENSED "AS IS" AND ALCATEL-LUCENT AND ITS LICENSORS DISCLAIM ANY AND ALL OTHER WARRANTIES, WHETHER EXPRESS OR IMPLIED, INCLUDING (WITHOUT LIMITATION) ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. SOME STATES DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES SO THE ABOVE EXCLUSIONS MAY NOT APPLY TO LICENSEE. THIS WARRANTY GIVES THE LICENSEE SPECIFIC LEGAL RIGHTS. LICENSEE MAY ALSO HAVE OTHER RIGHTS WHICH VARY FROM STATE TO STATE.

6. **Limitation of Liability.** Alcatel-Lucent's cumulative liability to Licensee or any other party for any loss or damages resulting from any claims, demands, or actions arising out of or relating to this License Agreement shall not exceed the license fee paid to Alcatel-Lucent for the Licensed Materials. IN NO EVENT SHALL ALCATEL-LUCENT BE LIABLE FOR ANY INDIRECT, INCIDENTAL, CONSEQUENTIAL, SPECIAL, OR EXEMPLARY DAMAGES OR LOST PROFITS, EVEN IF ALCATEL-LUCENT HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. SOME STATES DO NOT ALLOW THE LIMITATION OR EXCLUSION OF LIABILITY FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATION OR EXCLUSION TO INCIDENTAL OR CONSEQUENTIAL DAMAGES MAY NOT APPLY TO LICENSEE.

7. **Export Control.** This product is subject to the jurisdiction of the United States. Licensee may not export or reexport the Licensed Files, without complying with all United States export laws and regulations, including but not limited to (i) obtaining prior authorization from the U.S. Department of Commerce if a validated export license is required, and (ii) obtaining "written assurances" from licensees, if required.

8. **Support and Maintenance.** Except as may be provided in a separate agreement between Alcatel-Lucent and Licensee, if any, Alcatel-Lucent is under no obligation to maintain or support the copies of the Licensed Files made and distributed hereunder and Alcatel-Lucent has no obligation to furnish Licensee with any further assistance, documentation or information of any nature or kind.

9. **Term.** This License Agreement is effective upon Licensee opening this package and shall continue until terminated. Licensee may terminate this License Agreement at any time by returning the Licensed Materials and all copies thereof and extracts therefrom to Alcatel-Lucent and certifying to Alcatel-Lucent in writing that all Licensed Materials and all copies thereof and extracts therefrom have been returned or erased by the memory of Licensee's computer or made non-readable. Alcatel-Lucent may terminate this License Agreement upon the breach by Licensee of any term hereof. Upon such termination by Alcatel-

Lucent, Licensee agrees to return to Alcatel-Lucent or destroy the Licensed Materials and all copies and portions thereof.

10. **Governing Law.** This License Agreement shall be construed and governed in accordance with the laws of the State of California.

11. **Severability.** Should any term of this License Agreement be declared void or unenforceable by any court of competent jurisdiction, such declaration shall have no effect on the remaining terms herein.

12. **No Waiver.** The failure of either party to enforce any rights granted hereunder or to take action against the other party in the event of any breach hereunder shall not be deemed a waiver by that party as to subsequent enforcement of rights or subsequent actions in the event of future breaches.

13. **Notes to United States Government Users.** Software and documentation are provided with restricted rights. Use, duplication or disclosure by the government is subject to (i) restrictions set forth in GSA ADP Schedule Contract with Alcatel-Lucent's reseller(s), or (ii) restrictions set forth in subparagraph (c) (1) and (2) of 48 CFR 52.227-19, as applicable.

14.**Third Party Materials.** Licensee is notified that the Licensed Files contain third party software and materials licensed to Alcatel-Lucent by certain third party licensors. Some third party licensors are third part beneficiaries to this License Agreement with full rights of enforcement. Please refer to the section entitled "Third Party Licenses and Notices" on page -4 for the third party license and notice terms.

Third Party Licenses and Notices

Legal Notices applicable to any software distributed alone or in connection with the product to which this document pertains are contained in files within the software itself located at: **/flash/foss**. FOSS (Free and Open Source Software) source code available upon request.
