

**Part No. 060321-10, Rev. C**  
**September 2011**

# **OmniSwitch CLI Reference Guide**

Alcatel-Lucent 

**[www.alcatel-lucent.com](http://www.alcatel-lucent.com)**

---

**This user guide documents AOS Release 7 for the OmniSwitch 10K and OmniSwitch 6900.  
The functionality described in this guide is subject to change without notice.**

# Contents

	<b>About This Guide</b> .....	xxix
	Supported Platforms .....	xxix
	Who Should Read this Manual? .....	xxix
	When Should I Read this Manual? .....	xxix
	What is in this Manual? .....	xxx
	What is Not in this Manual? .....	xxx
	How is the Information Organized? .....	xxx
	Text Conventions .....	xxxi
	Documentation Roadmap .....	xxxii
	Related Documentation .....	xxxiv
	Technical Support .....	xxxv
<b>Chapter 1</b>	<b>Ethernet Port Commands</b> .....	1-1
	interfaces .....	1-3
	interfaces speed .....	1-5
	interfaces crossover .....	1-7
	interfaces duplex .....	1-9
	interfaces alias .....	1-11
	clear interfaces l2-statistics .....	1-12
	interfaces max-frame-size .....	1-13
	interfaces flood-limit .....	1-14
	interfaces ingress-bandwidth .....	1-16
	interfaces pause .....	1-17
	interfaces link-trap .....	1-19
	interfaces ddm .....	1-20
	interfaces ddm-trap .....	1-21
	clear violation .....	1-22
	show interfaces .....	1-23
	show interfaces alias .....	1-27
	show interfaces status .....	1-29
	show interfaces capability .....	1-31
	show interfaces accounting .....	1-33
	show interfaces counters .....	1-36
	show interfaces counters errors .....	1-38
	show interfaces flood-rate .....	1-40
	show interfaces traffic .....	1-42
	show interfaces ingress-rate-limit .....	1-44
	show interfaces ddm .....	1-46
	show transceivers .....	1-49

<b>Chapter 2</b>	<b>UDLD Commands</b> .....	2-1
	udld .....	2-2
	udld port .....	2-3
	udld mode .....	2-5
	udld probe-timer .....	2-7
	udld echo-wait-timer .....	2-9
	clear udld statistics port .....	2-11
	show udld configuration .....	2-12
	show udld configuration port .....	2-14
	show udld statistics port .....	2-16
	show udld neighbor port .....	2-18
	show udld status port .....	2-20
<b>Chapter 3</b>	<b>Source Learning Commands</b> .....	3-1
	mac-learning .....	3-2
	mac-learning vlan static mac-address .....	3-4
	mac-learning vlan multicast mac-address .....	3-6
	mac-learning aging-time .....	3-9
	mac-learning mode .....	3-11
	show mac-learning .....	3-12
	show mac-learning aging-time .....	3-15
	show mac-learning learning-state .....	3-16
	show mac-learning mode .....	3-18
<b>Chapter 4</b>	<b>VLAN Management Commands</b> .....	4-1
	vlan .....	4-2
	vlan members untagged .....	4-4
	vlan members tagged .....	4-6
	vlan mtu-ip .....	4-8
	show vlan .....	4-10
	show vlan members .....	4-13
<b>Chapter 5</b>	<b>High Availability VLAN Commands</b> .....	5-1
	server-cluster .....	5-2
	server-cluster vlan .....	5-4
	server-cluster mac-address .....	5-6
	server-cluster ip .....	5-8
	server-cluster igmp mode .....	5-10
	server-cluster ip-multicast .....	5-12
	server-cluster port .....	5-14
	server-cluster linkagg .....	5-16
	show server-cluster .....	5-18
<b>Chapter 6</b>	<b>Distributed Spanning Tree Commands</b> .....	6-1
	spantree mode .....	6-3
	spantree protocol .....	6-5
	spantree vlan admin-state .....	6-7
	spantree mst region name .....	6-8
	spantree mst region revision-level .....	6-10
	spantree mst region max-hops .....	6-11
	spantree msti .....	6-13
	spantree msti vlan .....	6-15

spantree priority .....	6-17
spantree hello-time .....	6-20
spantree max-age .....	6-22
spantree forward-delay .....	6-24
spantree bpdu-switching .....	6-26
spantree path-cost-mode .....	6-28
spantree pvst+compatibility .....	6-30
spantree auto-vlan-containment .....	6-32
spantree cist .....	6-34
spantree vlan .....	6-36
spantree cist path-cost .....	6-38
spantree msti path-cost .....	6-41
spantree vlan path-cost .....	6-44
spantree cist mode .....	6-47
spantree vlan mode .....	6-49
spantree cist connection .....	6-51
spantree vlan connection .....	6-53
spantree cist admin-edge .....	6-55
spantree vlan admin-edge .....	6-57
spantree cist auto-edge .....	6-59
spantree vlan auto-edge .....	6-61
spantree cist restricted-role .....	6-63
spantree vlan restricted-role .....	6-65
spantree cist restricted-tcn .....	6-67
spantree vlan restricted-tcn .....	6-69
spantree cist txholdcount .....	6-71
spantree vlan txholdcount .....	6-72
show spantree .....	6-73
show spantree cist .....	6-76
show spantree msti .....	6-80
show spantree vlan .....	6-85
show spantree ports .....	6-89
show spantree cist ports .....	6-92
show spantree msti ports .....	6-96
show spantree vlan ports .....	6-102
show spantree mode .....	6-108
show spantree mst .....	6-110
show spantree msti vlan-map .....	6-112
show spantree cist vlan-map .....	6-114
show spantree map-msti .....	6-116

<b>Chapter 7</b>	<b>Link Aggregation Commands .....</b>	<b>7-1</b>
	linkagg static agg size .....	7-3
	linkagg static agg name .....	7-5
	linkagg static agg admin-state .....	7-7
	linkagg static port agg .....	7-8
	linkagg lacp agg size .....	7-10
	linkagg lacp agg name .....	7-13
	linkagg lacp agg admin-state .....	7-15
	linkagg lacp agg actor admin-key .....	7-17
	linkagg lacp agg actor system-priority .....	7-18
	linkagg lacp agg actor system-id .....	7-20

linkagg lacp agg partner system-id .....	7-22
linkagg lacp agg partner system-priority .....	7-24
linkagg lacp agg partner admin-key .....	7-26
linkagg lacp port actor admin-key .....	7-28
linkagg lacp port actor admin-state .....	7-31
linkagg lacp port actor system-id .....	7-33
linkagg lacp port actor system-priority .....	7-35
linkagg lacp agg partner admin-state .....	7-37
linkagg lacp port partner admin system-id .....	7-39
linkagg lacp port partner admin-key .....	7-41
linkagg lacp port partner admin system-priority .....	7-43
linkagg lacp port actor port priority .....	7-45
linkagg lacp port partner admin-port .....	7-47
linkagg lacp port partner admin port-priority .....	7-49
linkagg range .....	7-51
show linkagg .....	7-53
show linkagg port .....	7-58
show linkagg range .....	7-64
<b>Chapter 8</b>	
<b>Multi-Chassis Commands</b> .....	8-1
multi-chassis chassis-id .....	8-2
multi-chassis chassis-id hello-interval ipc-vlan .....	8-4
multi-chassis hello-interval .....	8-6
multi-chassis ipc-vlan .....	8-8
multi-chassis loop-detection .....	8-10
multi-chassis loop-detection transmit-interval .....	8-12
multi-chassis vf-link create .....	8-14
multi-chassis vf-link member-port .....	8-16
multi-chassis vf-link default-vlan .....	8-18
multi-chassis vip-vlan .....	8-20
show multi-chassis status .....	8-22
show multi-chassis loop-detection .....	8-24
show multi-chassis vf-link .....	8-26
show multi-chassis vf-link member-port .....	8-28
show multi-chassis consistency .....	8-30
show multi-chassis consistency linkagg .....	8-33
clear multi-chassis loop-detection .....	8-36
<b>Chapter 9</b>	
<b>Ethernet Ring Protection Commands</b> .....	9-1
erp-ring .....	9-2
erp-ring rpl-node .....	9-5
erp-ring wait-to-restore .....	9-7
erp-ring enable .....	9-8
erp-ring guard-timer .....	9-9
clear erp statistics .....	9-10
show erp .....	9-12
show erp statistics .....	9-15
<b>Chapter 10</b>	
<b>MVRP Commands</b> .....	10-1
mvrp .....	10-2
mvrp port .....	10-3
mvrp linkagg .....	10-5

mvrp maximum-vlan .....	10-7
mvrp registration .....	10-8
mvrp applicant .....	10-10
mvrp timer join .....	10-12
mvrp timer leave .....	10-14
mvrp timer leaveall .....	10-16
mvrp timer periodic-timer .....	10-18
mvrp periodic-transmission .....	10-20
mvrp restrict-vlan-registration .....	10-21
mvrp restrict-vlan-advertisement .....	10-23
mvrp static-vlan-restrict .....	10-25
show mvrp configuration .....	10-27
show mvrp port .....	10-28
show mvrp linkagg .....	10-31
show mvrp timer .....	10-33
show mvrp statistics .....	10-36
show mvrp last-pdu-origin .....	10-39
show mvrp vlan-restrictions .....	10-41
mvrp clear-statistics .....	10-43

<b>Chapter 11</b>	<b>802.1AB Commands</b> .....	11-1
	lldp transmit interval .....	11-2
	lldp transmit hold-multiplier .....	11-3
	lldp transmit delay .....	11-4
	lldp reinit delay .....	11-5
	lldp notification interval .....	11-6
	lldp lldpdu .....	11-7
	lldp notification .....	11-9
	lldp tlv management .....	11-11
	lldp tlv dot1 .....	11-13
	lldp tlv dot3 .....	11-15
	lldp tlv med .....	11-17
	show lldp system-statistics .....	11-19
	show lldp statistics .....	11-21
	show lldp local-system .....	11-23
	show lldp local-port .....	11-25
	show lldp local-management-address .....	11-30
	show lldp remote-system .....	11-31
	show lldp config .....	11-33
	show lldp statistics .....	11-35
	show lldp remote-system med .....	11-37

<b>Chapter 12</b>	<b>IP Commands</b> .....	12-1
	ip interface .....	12-5
	ip interface tunnel .....	12-8
	ip router primary-address .....	12-10
	ip router router-id .....	12-11
	ip static-route .....	12-12
	ip route-pref .....	12-14
	ip default-ttl .....	12-16
	ping .....	12-17
	traceroute .....	12-19

---

ip directed-broadcast .....	12-21
ip service .....	12-22
ip service port .....	12-24
ip redistrib .....	12-26
ip access-list .....	12-28
ip access-list address .....	12-29
ip route-map action .....	12-31
ip route-map match ip address .....	12-33
ip route-map match ipv6 address .....	12-35
ip route-map match ip-next-hop .....	12-37
ip route-map match ipv6-next-hop .....	12-39
ip route-map match tag .....	12-41
ip route-map match ipv4-interface .....	12-43
ip route-map match ipv6-interface .....	12-45
ip route-map match metric .....	12-47
ip route-map match route-type .....	12-49
ip route-map set metric .....	12-51
ip route-map set metric-type .....	12-53
ip route-map set tag .....	12-55
ip route-map set community .....	12-57
ip route-map set local-preference .....	12-59
ip route-map set level .....	12-61
ip route-map set ip-next-hop .....	12-63
ip route-map set ipv6-next-hop .....	12-65
vrf .....	12-67
arp .....	12-69
clear arp-cache .....	12-71
ip dos arp-poison restricted-address .....	12-72
arp filter .....	12-73
clear arp filter .....	12-75
icmp type .....	12-76

show tcp statistics .....	12-132
show tcp ports .....	12-134
show udp statistics .....	12-136
show udp ports .....	12-137
show ip dos config .....	12-138
show ip dos statistics .....	12-140
show vrf .....	12-142

**Chapter 13**

<b>IPv6 Commands .....</b>	<b>13-1</b>
ipv6 interface .....	13-3
ipv6 interface tunnel source destination .....	13-7
ipv6 address .....	13-8
ipv6 address global-id .....	13-10
ipv6 address local-unicast .....	13-11
ipv6 dad-check .....	13-13
ipv6 hop-limit .....	13-14
ipv6 pmtu-lifetime .....	13-15
ipv6 neighbor stale-lifetime .....	13-16
ipv6 neighbor .....	13-17
ipv6 prefix .....	13-19
ipv6 static-route .....	13-21
ipv6 route-pref .....	13-23
ipv6 virtual-source-mac .....	13-25
ping6 .....	13-26
traceroute6 .....	13-28
show ipv6 icmp statistics .....	13-30
show ipv6 interface .....	13-33
show ipv6 pmtu table .....	13-37
show ipv6 neighbors .....	13-38
clear ipv6 neighbors .....	13-40
show ipv6 prefixes .....	13-41
show ipv6 routes .....	13-43
show ipv6 route-pref .....	13-45
show ipv6 router database .....	13-46
show ipv6 tcp connections .....	13-48
show ipv6 tcp listeners .....	13-50
show ipv6 traffic .....	13-52
show ipv6 tunnel configured .....	13-55
show ipv6 tunnel 6to4 .....	13-57
show ipv6 udp ports .....	13-58
show ipv6 information .....	13-60
ipv6 redist .....	13-62
ipv6 access-list .....	13-64
ipv6 access-list address .....	13-65

show ipv6 redist .....	13-67
show ipv6 access-list .....	13-69
ipv6 load rip .....	13-71
ipv6 rip admin-state .....	13-72
ipv6 rip invalid-timer .....	13-73
ipv6 rip garbage-timer .....	13-74
ipv6 rip holddown-timer .....	13-75
ipv6 rip jitter .....	13-76
ipv6 rip route-tag .....	13-77
ipv6 rip update-interval .....	13-78
ipv6 rip triggered-sends .....	13-79
ipv6 rip interface .....	13-80
ipv6 rip interface metric .....	13-82
ipv6 rip interface recv-status .....	13-83
ipv6 rip interface send-status .....	13-84
ipv6 rip interface horizon .....	13-85
show ipv6 rip .....	13-86
show ipv6 rip interface .....	13-88
show ipv6 rip peer .....	13-91
show ipv6 rip routes .....	13-93
<b>Chapter 14</b>	
<b>IPsec commands</b> .....	14-1
ipsec key .....	14-2
ipsec security-key .....	14-4
ipsec policy .....	14-6
ipsec policy rule .....	14-9
ipsec sa .....	14-11
show ipsec policy .....	14-13
show ipsec sa .....	14-15
show ipsec key .....	14-17
show ipsec ipv6 statistics .....	14-19
<b>Chapter 15</b>	
<b>RIP Commands</b> .....	15-1
ip load rip .....	15-2
ip rip admin-state .....	15-3
ip rip interface .....	15-4
ip rip interface admin-state .....	15-6
ip rip interface metric .....	15-8
ip rip interface send-version .....	15-9
ip rip interface recv-version .....	15-11
ip rip interface ingress-filter .....	15-13
ip rip interface ingress-filter .....	15-14
ip rip interface egress-filter .....	15-15
ip rip force-holddowntimer .....	15-16
ip rip host-route .....	15-18
ip rip route-tag .....	15-19
ip rip interface auth-type .....	15-20
ip rip interface auth-key .....	15-21
ip rip update-interval .....	15-22
ip rip invalid-timer .....	15-23
ip rip garbage-timer .....	15-24
ip rip holddown-timer .....	15-25

show ip rip .....	15-26
show ip rip routes .....	15-28
show ip rip interface .....	15-31
show ip rip peer .....	15-33

<b>Chapter 16</b>	<b>BFD Commands</b> .....	16-1
	ip bfd admin-state .....	16-3
	ip bfd transmit .....	16-4
	ip bfd receive .....	16-5
	ip bfd multiplier .....	16-6
	ip bfd echo-interval .....	16-7
	ip bfd interface .....	16-8
	ip bfd interface admin-state .....	16-9
	ip bfd interface transmit .....	16-10
	ip bfd interface receive .....	16-11
	ip bfd interface multiplier .....	16-12
	ip bfd interface echo-interval .....	16-13
	ip ospf bfd-state .....	16-14
	ip ospf bfd-state all-interfaces .....	16-16
	ip ospf interface bfd-state .....	16-17
	ip ospf interface bfd-state drs-only .....	16-18
	ip ospf interface bfd-state all-neighbors .....	16-19
	ip bgp bfd-state .....	16-20
	ip bgp bfd-state all-neighbors .....	16-21
	ip bgp neighbor bfd-state .....	16-22
	vrrp bfd-state .....	16-23
	vrrp track address bfd-state .....	16-24
	show ip bfd .....	16-25
	show ip bfd interfaces .....	16-27
	show ip bfd sessions .....	16-29
	show ip bfd sessions statistics .....	16-31
	ip static-route all bfd-state .....	16-33
	ip static-route bfd-state .....	16-34

<b>Chapter 17</b>	<b>DHCP Relay Commands</b> .....	17-1
	ip helper address .....	17-2
	ip helper vlan address .....	17-4
	ip helper standard .....	17-6
	ip helper per-vlan-only .....	17-7
	ip helper forward-delay .....	17-9
	ip helper maximum-hops .....	17-11
	ip helper agent-information .....	17-13
	ip helper agent-information policy .....	17-15
	ip helper pxe-support .....	17-17
	ip helper boot-up .....	17-18
	ip helper boot-up enable .....	17-19
	ip udp relay port .....	17-20
	ip udp relay service .....	17-22
	ip udp relay service vlan .....	17-24
	show ip helper .....	17-26
	show ip helper statistics .....	17-28
	show ip udp relay .....	17-30

	show ip udp relay statistics .....	17-32
	no ip helper statistics .....	17-34
	ip udp relay no statistics .....	17-36
<b>Chapter 18</b>	<b>VRRP Commands</b> .....	18-1
	vrrp .....	18-3
	vrrp address .....	18-6
	vrrp track .....	18-7
	vrrp track-association .....	18-9
	vrrp trap .....	18-10
	vrrp delay .....	18-11
	vrrp interval .....	18-12
	vrrp priority .....	18-14
	vrrp preempt .....	18-16
	vrrp all .....	18-18
	vrrp set .....	18-20
	vrrp group .....	18-22
	vrrp group all .....	18-24
	vrrp group set .....	18-26
	vrrp group-association .....	18-28
	vrrp3 .....	18-30
	vrrp3 address .....	18-33
	vrrp3 trap .....	18-34
	vrrp3 track-association .....	18-35
	show vrrp .....	18-36
	show vrrp statistics .....	18-39
	show vrrp track .....	18-42
	show vrrp track-association .....	18-44
	show vrrp group .....	18-46
	show vrrp group-association .....	18-48
	show vrrp3 .....	18-50
	show vrrp3 statistics .....	18-53
	show vrrp3 track-association .....	18-55
<b>Chapter 19</b>	<b>OSPF Commands</b> .....	19-1
	ip ospf admin-state .....	19-3
	ip load ospf .....	19-4
	ip ospf asbr .....	19-5
	ip ospf exit-overflow-interval .....	19-6
	ip ospf extlsdb-limit .....	19-7
	ip ospf host .....	19-8
	ip ospf mtu-checking .....	19-10
	ip ospf default-originate .....	19-11
	ip ospf route-tag .....	19-13
	ip ospf spf-timer .....	19-14
	ip ospf virtual-link .....	19-16
	ip ospf neighbor .....	19-19
	ip ospf area .....	19-21
	ip ospf area default-metric .....	19-23
	ip ospf area range .....	19-25
	ip ospf interface .....	19-27
	ip ospf interface admin-state .....	19-28

ip ospf interface area .....	19-29
ip ospf interface auth-key .....	19-30
ip ospf interface auth-type .....	19-31
ip ospf interface dead-interval .....	19-33
ip ospf interface hello-interval .....	19-34
ip ospf interface md5 .....	19-35
ip ospf interface md5 key .....	19-37
ip ospf interface type .....	19-39
ip ospf interface cost .....	19-41
ip ospf interface poll-interval .....	19-42
ip ospf interface priority .....	19-43
ip ospf interface retrans-interval .....	19-44
ip ospf interface transit-delay .....	19-45
ip ospf restart-support .....	19-46
ip ospf restart-interval .....	19-47
ip ospf restart-helper admin-state .....	19-48
ip ospf restart-helper strict-lsa-checking admin-state .....	19-49

# About This Guide

This *OmniSwitch CLI Reference Guide* is a comprehensive resource to all Command Line Interface (CLI) commands available on the OmniSwitch 10K and OmniSwitch 6900 Series switches.

## Supported Platforms

The information in this guide applies only to OmniSwitch 10K and OmniSwitch 6900 switches.

## Who Should Read this Manual?

The audience for this user guide is network administrators and IT support personnel who need to configure, maintain, and monitor switches and routers in a live network. Anyone wishing to gain knowledge on the details of all CLI commands available on the OmniSwitch will benefit from the material in this reference guide. However, advanced users who have already familiarized themselves with the OmniSwitch CLI commands will benefit most from the detailed content in this guide.

## When Should I Read this Manual?

Read this guide whenever you want detailed information on individual CLI commands. Although this guide provides helpful information during any stage of the configuration process, it is a good idea to first familiarize yourself with the software features available on the switch before investigating the detailed command information in this guide.

Overview information, procedures, and live network examples on switch software features can be found in the *Switch Management Guide*, *Network Configuration Guide*, and the *Advanced Routing Configuration Guide*. Once you are familiar with the procedures and base CLI commands in these configuration guides you can obtain more detailed information on the individual commands in this guide.

## What is in this Manual?

This reference guide includes information on every CLI command available in the switch. Command reference information is included for base software commands as well as commands associated with optional software packages, such as Advanced Routing (multicast routing protocols and OSPF). The information provided for each CLI command includes:

- Command description.
- Syntax.
- Description of all keywords and variables included in the syntax.
- Default values.
- Usage guidelines, which include tips on when and how to use the command.
- Examples of command lines using the command.
- Related commands with descriptions.
- Release history, which indicates the release when the command was introduced.
- SNMP information, such as the MIB files related to a set of CLI commands. In addition each CLI command includes the corresponding MIB variables that map to all parameters included in a command.

## What is Not in this Manual?

Primarily a reference, this guide does not provide step-by-step instructions on how to set up particular features on the switch. It also does not provide overview or application examples on software features. For comprehensive information on how to configure particular software features in the switch, consult the appropriate configuration guide.

This guide also does not provide any information on the network management applications, WebView and OmniVista. Further information on WebView and OmniVista can be found in the context-sensitive on-line help available with those applications.

## How is the Information Organized?

Each chapter in this guide includes reference material for all commands related to a single software feature, such as server load balancing or link aggregation. Typically commands in a single chapter will share a common prefix.

## Text Conventions

The following table contains text conventions and usage guidelines for CLI commands as they are documented in this guide.

<b>bold text</b>	Indicates basic command and keyword syntax. Example: <b>show snmp station</b>
<i>italicized text</i>	Indicates user-specific information such as IP addresses, slot numbers, passwords, names, etc. Example: <b>no snmp station</b> <i>ip_address</i>  Italicized text that is not enclosed with straight brackets ([ ]) indicates required information.
[ ] (Straight Brackets)	Indicates optional parameters for a given command. Example: <b>show aaa server</b> [ <i>server_name</i> ] Here, you can enter either of the following options: <b>show aaa server</b>  <b>show aaa server</b> <i>server_name</i> (where <i>server_name</i> is the user-specified server name, e.g., <b>show aaa server myserver1</b> )  Note that this example includes <i>italicized text</i> . The optional parameter in this case is a user-specified server name.
{ } (Curly Braces)	Indicates that the user must choose between one or more parameters. Example: <b>port mirroring {enable   disable}</b> Here, you must choose one of the following: <b>port mirroring enable</b> or <b>port mirroring disable</b>
(Vertical Pipes)	Used to separate parameter choices within a command string. For example, the command string <b>show health threshold [rx   txrx   memory   cpu]</b> separates the choices <b>rx</b> , <b>txrx</b> , <b>memory</b> , and <b>cpu</b> . Examples: <b>show health threshold rx</b> <b>show health threshold txrx</b> <b>show health threshold memory</b> <b>show health threshold cpu</b>
“ ” (Quotation Marks)	Used to enclose text strings that contain spaces. The quotation marks are required input on the command line. Example: <b>vlan 2 “new test vlan”</b>

# Documentation Roadmap

The OmniSwitch user documentation suite was designed to supply you with information at several critical junctures of the configuration process. The following section outlines a roadmap of the manuals that will help you at each stage of the configuration process. Under each stage, we point you to the manual or manuals that will be most helpful to you.

## Stage 1: Using the Switch for the First Time

**Pertinent Documentation:** *OmniSwitch Getting Started Guide*  
*Release Notes*

A hard-copy *OmniSwitch 10K Getting Started Guide* is included with your switch; this guide provides all the information you need to get your switch up and running the first time. It provides information on unpacking the switch, rack mounting the switch, installing NI modules, unlocking access control, setting the switch's IP address, and setting up a password. It also includes succinct overview information on fundamental aspects of the switch, such as hardware LEDs, the software directory structure, CLI conventions, and web-based management.

At this time you should also familiarize yourself with the Release Notes that accompanied your switch. This document includes important information on feature limitations that are not included in other user guides.

## Stage 2: Gaining Familiarity with Basic Switch Functions

**Pertinent Documentation:** *OmniSwitch Hardware Users Guide*  
*OmniSwitch AOS Release 7 Switch Management Guide*

Once you have your switch up and running, you will want to begin investigating basic aspects of its hardware and software. Information about switch hardware is provided in the *OmniSwitch 10K Hardware Guide*. This guide provides specifications, illustrations, and descriptions of all hardware components, such as chassis, power supplies, Chassis Management Modules (CMMs), Network Interface (NI) modules, and cooling fans. It also includes steps for common procedures, such as removing and installing switch components.

This guide is the primary users guide for the basic software features on a single switch. This guide contains information on the switch directory structure, basic file and directory utilities, switch access security, SNMP, and web-based management. It is recommended that you read this guide before connecting your switch to the network.

## Stage 3: Integrating the Switch Into a Network

**Pertinent Documentation:** *OmniSwitch AOS Release 7 Network Configuration Guide*  
*OmniSwitch AOS Release 7 Advanced Routing Configuration Guide*

When you are ready to connect your switch to the network, you will need to learn how the OmniSwitch implements fundamental software features, such as 802.1Q, VLANs, Spanning Tree, and network routing protocols. This guide contains overview information, procedures, and examples on how standard networking technologies are configured on the OmniSwitch.

The guide includes configuration information for networks using advanced routing technologies (OSPF and BGP) and multicast routing protocols (DVMRP and PIM-SM).

**Anytime**

The *OmniSwitch CLI Reference Guide* contains comprehensive information on all CLI commands supported by the switch. This guide includes syntax, default, usage, example, related CLI command, and CLI-to-MIB variable mapping information for all CLI commands supported by the switch. This guide can be consulted anytime during the configuration process to find detailed and specific information on each CLI command.

## Related Documentation

The following are the titles and descriptions of all the related OmniSwitch user manuals:

- *OmniSwitch 10K and OmniSwitch 6900 Getting Started Guides*

Describes the hardware and software procedures for getting an OmniSwitch up and running. Also provides information on fundamental aspects of OmniSwitch software architecture.
- *OmniSwitch 10K and OmniSwitch 6900 Getting Started Guides*

Complete technical specifications and procedures for all OmniSwitch chassis, power supplies, fans, and Network Interface (NI) modules.
- *OmniSwitch CLI Reference Guide*

Complete reference to all CLI commands supported on the OmniSwitch. Includes syntax definitions, default values, examples, usage guidelines and CLI-to-MIB variable mappings.
- *OmniSwitch AOS Release 7 Switch Management Guide*

Includes procedures for readying an individual switch for integration into a network. Topics include the software directory architecture, image rollback protections, authenticated switch access, managing switch files, system configuration, using SNMP, and using web management software (WebView).
- *OmniSwitch AOS Release 7 Network Configuration Guide*

Includes network configuration procedures and descriptive information on all the major software features and protocols included in the base software package. Chapters cover Layer 2 information (Ethernet and VLAN configuration), Layer 3 information (routing protocols, such as RIP and IPX), security options (authenticated VLANs), Quality of Service (QoS), link aggregation, and server load balancing.
- *OmniSwitch AOS Release 7 Advanced Routing Configuration Guide*

Includes network configuration procedures and descriptive information on all the software features and protocols included in the advanced routing software package. Chapters cover multicast routing (DVMRP and PIM-SM), Open Shortest Path First (OSPF), and Border Gateway Protocol (BGP).
- *OmniSwitch Transceivers Guide*

Includes SFP and XFP transceiver specifications and product compatibility information.
- *Technical Tips, Field Notices*

Includes information published by Alcatel-Lucent's Customer Support group.
- *Release Notes*

Includes critical Open Problem Reports, feature exceptions, and other important information on the features supported in the current release and any limitations to their support.

## Technical Support

An Alcatel-Lucent service agreement brings your company the assurance of 7x24 no-excuses technical support. You'll also receive regular software updates to maintain and maximize your Alcatel-Lucent product's features and functionality and on-site hardware replacement through our global network of highly qualified service delivery partners.

With 24-hour access to Alcatel-Lucent's Service and Support web page, you'll be able to view and update any case (open or closed) that you have reported to Alcatel-Lucent's technical support, open a new case or access helpful release notes, technical bulletins, and manuals.

Access additional information on Alcatel-Lucent's Service Programs:

# 1 Ethernet Port Commands

The Ethernet port software is responsible for configuring and monitoring Ethernet ports (10 Mbps, 100 Mbps, 1 Gbps, and 10 Gbps). This includes:

- Performing hardware diagnostics, loading software, and initializing hardware.
- Notifying other software modules in the system when Ethernet links become active or inactive.
- Configuring basic line parameters for Ethernet ports.
- Gathering basic line statistics for Ethernet ports and passing this information to the user interface and configuration manager.

MIB information for the Ethernet Port commands is as follows:

*Filename:* AlcatelIND1Port.mib  
*Module:* alcatelIND1PortMIB

*Filename:* IETF\_ETHERLIKE.mib  
*Module:* EtherLike-MIB

---

A summary of the available commands is listed here.

---

**Interfaces commands**

- interfaces**
- interfaces speed**
- interfaces crossover**
- interfaces duplex**
- interfaces alias**
- clear interfaces l2-statistics**
- interfaces max-frame-size**
- interfaces flood-limit**
- interfaces ingress-bandwidth**
- interfaces pause**
- interfaces link-trap**
- interfaces ddm**
- interfaces ddm-trap**
- clear violation**
- show interfaces alias**
- show interfaces status**
- show interfaces capability**
- show interfaces accounting**
- show interfaces counters**
- show interfaces counters errors**
- show interfaces flood-rate**
- show interfaces traffic**
- show interfaces ingress-rate-limit**
- show interfaces ddm**
- show transceivers**

---

## interfaces

Enables or disables auto negotiation or administrative status on a single port, a range of ports, or an entire Network Interface (NI).

**interfaces** {*slot*/ *slot/port*[-*port2*]} {**admin-state** | **autoneg** } {**enable**|**disable**}

---

### Syntax Definitions

<i>slot</i>	Slot number you want to configure.
<i>port</i>	Port number of the interface you want to configure.
<i>port2</i>	Last port number in a range of ports you want to configure.
<b>admin-state enable</b>	Enables administrative state.
<b>admin-state disable</b>	Disables administrative state.
<b>autoneg enable</b>	Enables auto negotiation.
<b>autoneg disable</b>	Disables auto negotiation.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	enable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If auto negotiation is disabled, auto MDIX, flow control, auto speed, and auto duplex are not accepted. See the [interfaces crossover](#) command on [page 1-7](#) and the [interfaces duplex](#) command on [page 1-9](#) for more information.

### Examples

```
-> interfaces 3 autoneg disable
-> interfaces 3/1 autoneg disable
-> interfaces 3/1-4 autoneg disable
-> interfaces 2/1-5 admin-state enable
```

### Release History

Release 7.1.1; command introduced.

**Related Commands**

<a href="#">show interfaces alias</a>	Displays interface line settings.
<a href="#">show interfaces alias</a>	Displays auto negotiation, speed, duplex, and crossover settings.

**MIB Objects**

esmConfTable  
esmPortCfgAutoNegotiation

---

## interfaces speed

Configures interface line speed.

```
interfaces { slot / slot/port [-port2] } speed { 10 | 100 | 1000 | auto | max {10 | 100 | 1000}}
```

---

### Syntax Definitions

<i>slot</i>	Slot number you want to configure.
<i>port</i>	Port number of the interface you want to configure.
<i>port2</i>	Last port number in a range of ports you want to configure.
<b>auto</b>	The switch automatically sets the line speed to match the attached device (auto-sensing).
<b>10</b>	Sets the interface to 10 Mbps.
<b>100</b>	Sets the interface to 100 Mbps.
<b>1000</b>	Sets the interface to 1 Gigabit.
<b>max 10</b>	Sets the maximum speed to 10 megabits.
<b>max 100</b>	Sets the maximum speed to 100 megabits.
<b>max 1000</b>	Sets the maximum speed to 1000 megabits (1 Gigabit).

### Defaults

---

parameter	default
<b>auto</b>	enable

---

### Platforms Supported

OmniSwitch 10K

### Usage Guidelines

N/A

### Examples

```
-> interfaces 3/1 speed auto
-> interfaces 3 speed 100
-> interfaces 3/1-8 speed auto
```

### Release History

Release 7.1.1; command introduced.

**Related Commands****show interfaces alias**

Displays interface line settings.

**MIB Objects**

esmConfTable

    esmPortCfgSpeed

---

## interfaces crossover

Configures port crossover settings on a single port, a range of ports, or an entire Network Interface (NI).

**interfaces** {*slot*/ *slot/port*[-*port2*]} **crossover** {**auto** | **mdix** | **mdi**}

---

### Syntax Definitions

<i>slot</i>	Slot number you want to configure.
<i>port</i>	Port number of the interface you want to configure.
<i>port2</i>	Last port number in a range of ports you want to configure.
<b>auto</b>	The interface automatically detects the crossover settings.
<b>mdix</b>	Sets the crossover configuration to Media Dependent Interface with Crossover (MDIX), which is the standard for hubs and switches.
<b>mdi</b>	Sets the crossover configuration to Media Dependent Interface (MDI), which is the standard for end stations.

### Defaults

---

parameter	default
<b>auto</b>   <b>mdix</b>   <b>mdi</b>	auto

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If auto negotiation is disabled, then automatic crossover is also disabled. See the [interfaces](#) command for more information.
- You cannot configure crossover settings on fiber ports. These ports use the MDI standard.

## Examples

```
-> interfaces 3 crossover mdi
-> interfaces 3/1 crossover mdix
-> interfaces 3/1-4 crossover auto
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

[show interfaces alias](#)                Displays interface line settings.

## MIB Objects

```
esmConfTable
  esmPortCfgCrossover
```

---

## interfaces duplex

Configures duplex mode. In full duplex mode, the interface transmits and receives data simultaneously. In half duplex mode, the interface can transmit *or* receive data at a given time. Auto duplex setting causes the switch to advertise all available duplex modes (half/full/both) for the port during autonegotiation.

**interfaces** {*slot*/ *slot/port*[-*port2*]} **duplex** {**full** | **half** | **auto**}

---

### Syntax Definitions

<i>slot</i>	Slot number you want to configure.
<i>port</i>	Port number of the interface you want to configure.
<i>port2</i>	Last port number in a range of ports you want to configure.
<b>full</b>	Sets interface to full duplex mode.
<b>half</b>	Sets interface to half duplex mode.
<b>auto</b>	Switch automatically sets both the duplex mode settings to auto-negotiation.

### Defaults

---

parameter	default
<b>full</b>   <b>half</b>   <b>auto</b>	<b>full</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- You can only configure one slot at a time. Repeat the command to configure additional slots.
- Half duplex mode is not supported on Gigabit modules if a port is detected as Gigabit (1000 Mbps).
- Gigabit and 10 Gigabit fiber ports only support full duplex.

### Examples

```
-> interfaces 3/1 duplex auto
-> interfaces 3 duplex half
-> interfaces 3/1-4 auto
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

### [interfaces](#)

Configures interface line speed. Set to **auto** to set speed and duplex mode to auto-sensing.

### [show interfaces alias](#)

Displays interface line settings (e.g., speed, and mode).

## MIB Objects

esmConfTable

esmPortAutoDuplexMode

---

## interfaces alias

Configures a description (alias) for a single port.

**interfaces** *slot/port* **alias** *description*

---

### Syntax Definitions

<i>slot</i>	Slot number you want to configure.
<i>port</i>	Port number of the interface you want to configure.
<i>description</i>	A description for the port, which can be up to 40 characters long. Description tags with spaces must be enclosed within quotes (e.g., "IP Phone").

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- You can only configure one port at time. You cannot configure an alias for multiple ports.
- To remove an alias use a description consisting of two quotes without any spaces (e.g., "").

### Examples

```
-> interfaces 3/1 alias "switch port"  
-> interfaces 2/2 alias "IP Phone"  
-> interfaces 3/1 alias ""
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show interfaces alias](#) Displays port status (up or down) and any aliases for a port.

---

## clear interfaces l2-statistics

Resets all statistics counters.

**clear interfaces** {*slot* | *slot/port*[-*port2*]} **l2-statistics** [**cli**]

---

### Syntax Definitions

<i>slot</i>	Slot number you want to configure.
<i>port</i>	Port number of the interface you want to configure.
<i>port2</i>	Last port number in a range of ports you want to configure.
<b>cli</b>	Clears the CLI statistics only.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> clear interfaces 3/1 l2-statistics
-> clear interfaces 3/2 l2-statistics cli
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[interfaces ddm](#) Displays general interface information, including when statistics were last cleared.

---

## interfaces max-frame-size

Configures the maximum frame size for Gigabit Ethernet interfaces.

**interfaces** {*slot* | *slot/port*[-*port2*]} **max-frame-size** *bytes*

---

### Syntax Definitions

<i>slot</i>	Slot number you want to configure.
<i>port</i>	Port number of the interface you want to configure.
<i>port2</i>	Last port number in a range of ports you want to configure.
<b>max frame</b>	Maximum frame size, in bytes. Valid range is 1518–9216.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>bytes</i> (Gigabit Ethernet Packets)	9216
<i>bytes</i> (Ethernet Packets)	1553

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> interfaces 3/1 max-frame-size 1518
-> interfaces 3 max-frame-size 1518
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[interfaces ddm](#) Displays general interface information (e.g., hardware, MAC address, input errors, and output errors).

### MIB Objects

## interfaces flood-limit

Configures the flood rate settings on a single port, a range of ports, or an entire Network Interface (NI).

**interfaces** {*slot*/ *slot/port*[-*port2*]} **flood-limit** {**bcast**|**mcast**|**uucast**|**all**} **rate** { **pps** *pps\_num*| **mbps** *mbps\_num* | **cap%** *cap\_num* | **enable** | **disable**}

---

### Syntax Definitions

<i>slot</i>	Slot number you want to configure.
<i>port</i>	Port number of the interface you want to configure.
<i>port2</i>	Last port number in a range of ports you want to configure.
<b>bcast</b>	Specifies broadcast flood limit.
<b>mcast</b>	Specifies multicast flood limit.
<b>uucast</b>	Specifies unicast flood limit.
<b>all</b>	Specifies flood limit for all types of traffic.
<i>pps_num</i>	Packets per second.
<i>mbps_num</i>	Megabits per second.
<i>cap_num</i>	Percentage of port's capacity.
<b>enable</b>	Enables flood rate limits.
<b>disable</b>	Disables flood rate limits.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	enable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

## Examples

```
-> interfaces 3 flood-limit all rate cap% 50
-> interfaces 2/1 flood-limit bcast rate mbps 100
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

[show interfaces flood-rate](#) Displays interface flood rate settings.

## MIB Objects

```

```

---

## interfaces ingress-bandwidth

Configures the ingress bandwidth settings on a single port, a range of ports, or an entire Network Interface (NI).

```
interfaces {slot/ slot/port[-port2]} ingress-bandwidth {mbps| enable | disable}
```

---

### Syntax Definitions

<i>slot</i>	Slot number you want to configure.
<i>port</i>	Port number of the interface you want to configure.
<i>port2</i>	Last port number in a range of ports you want to configure.
<b>mbps</b>	Speciifies the ingress bandwidth in mpbs.
<b>enable</b>	Enables ingress bandwidth limiting.
<b>disable</b>	Disables ingress bnadwidth limiting.

### Defaults

---

parameter	default
<b>enable   disable</b>	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> interfaces 3 ingress-bandwidth enable
-> interfaces 3 ingress-bandwidth mbps 30
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show interfaces ingress-rate-limit](#) Displays the ingress-rate-limit set for each interface por.

### MIB Objects

---

## interfaces pause

Configures whether or not the switch will honor flow control PAUSE frames on the specified interface. PAUSE frames are used to temporarily pause the flow of traffic between two connected devices to help prevent packet loss when traffic congestion occurs between switches.

**interfaces slot[/port[-port2]] pause {rx | disable}**

---

### Syntax Definitions

<i>slot</i>	Slot number you want to configure.
<i>port</i>	Port number of the interface you want to configure.
<i>port2</i>	Last port number in a range of ports you want to configure.
<b>rx</b>	Allows interface to honor PAUSE frames from peer switches and temporarily stop sending traffic to the peer. Does not transmit PAUSE frames to peer switches.
<b>disable</b>	Disables flow control on the interface.

### Platforms Supported

OmniSwitch 10K, 6900

### Defaults

By default, flow control is disabled on all switch interfaces.

### Usage Guidelines

- Flow control is only supported on interfaces configured to run in full-duplex mode; half-duplex mode is not supported.
- If both autonegotiation and flow control are enabled on the same local interface, autonegotiation calculates operational flow control settings for that interface. Note that the operational settings override the configured settings as long as autonegotiation and flow control are both enabled for the interface:
- If autonegotiation is disabled, the configured flow control settings are applied to the local interface.

### Examples

```
-> interfaces 4/2 pause rx
-> interfaces 3/1-6 disable
```

### Release History

Release 7.1.1; command introduced.

**Related Commands****clear violation**

Displays interface line settings.

## interfaces link-trap

Enables trap link messages. If enabled, a trap is generated whenever the port changes state.

```
interfaces [slot | slot/port [-port2]] link-trap {enable|disable}
```

---

### Syntax Definitions

<i>slot</i>	Slot number you want to configure.
<i>port</i>	Port number of the interface you want to configure.
<i>port2</i>	Last port number in a range of ports you want to configure.
<b>enable</b>	Port link up/down traps are displayed on the NMS.
<b>disable</b>	Port link up/down traps are not displayed on the NMS.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> interfaces 3/1 link-trap enable
-> interfaces 3 link-trap enable
-> interfaces 3/1-6 link-trap enable
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show interfaces alias](#) Displays interface line settings.

### MIB Objects

```

---

## interfaces ddm

Configures the DDM administrative status.

```
interfaces ddm {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables DDM functionality.
<b>disable</b>	Disables DDM functionality.

### Defaults

---

parameter	default
ddm	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- DDM capability will vary based on the transceiver manufacturer.
- DDM status must be enabled in order to enable traps; traps are enabled separately.

### Examples

```
-> interfaces ddm enable  
-> interfaces ddm disable
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show interfaces ddm](#) Displays the interface DDM status.

### MIB Objects

---

## interfaces ddm-trap

Configures the DDM administrative status or trap capability.

```
interfaces ddm-trap {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables DDM trap functionality.
<b>disable</b>	Disables DDM trap functionality.

### Defaults

---

parameter	default
ddm-trap	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

DDM status must be enabled in order to enable traps; traps are enabled separately.

### Examples

```
-> interfaces ddm-trap enable  
-> interfaces ddm-trap disable
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show interfaces ddm](#) Displays the interface DDM status.

### MIB Objects

```

---

## clear violation

Clears all port violations set by various applications on the switch.

```
clear violation {port slot/port[-port] | linkagg agg_id[-agg_id]}
```

---

### Syntax Definitions

*slot/port[-port]*

Slot and port number to be cleared. Use a hyphen to specify a range of ports.

*agg\_id[-agg\_id]*

The linkagg identifier. Use a hyphen to specify a range of link aggregates.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

All application violations associated with a specific port are cleared when this command is used.

### Examples

```
-> clear violation port 1/3-5  
-> clear violation linkagg 1
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show interfaces](#) Displays interface status.

## show interfaces capability

Displays default auto negotiation, speed, duplex, flow, and cross-over settings for a single port, a range of ports, or all ports on a Network Interface (NI) module.

**show interfaces** [*slot* | *slot/port*[-*port2*]] **capability**

---

### Syntax Definitions

<i>slot</i>	Slot number you want to display.
<i>port</i>	Port number of the interface you want to display.
<i>port2</i>	Last port number in a range of ports you want to display.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Displays defaults settings in two rows of data for each port. The first row of data, identified by the label **CAP**, displays the valid user-defined configuration settings available for the port. The second row, identified by the label **DEF**, displays the default settings for the port.

### Examples

```
-> show interfaces 5/1 capability
Slot/Port  AutoNeg      Pause      Crossover      Speed      Duplex
-----+-----+-----+-----+-----+-----
 5/1  CAP      EN/DIS      EN/DIS      MDI/X/Auto  10/100/1G  Full/Half
 5/1  DEF              EN          EN           Auto         Auto       Auto
```

### output definitions

---

<b>Slot</b>	The slot number.
<b>Port</b>	The port number
<b>AutoNeg</b>	In the row labeled <b>CAP</b> , the field displays the valid auto negotiation configurations for the port. In the row label <b>DEF</b> , the field displays the default auto negotiation settings for the port. The possible values are <b>EN</b> (enabled) or <b>DIS</b> (disabled).
<b>Pause</b>	In the row labeled <b>CAP</b> , the field displays the valid pause configurations for the port. In the row label <b>DEF</b> , the field displays the default pause settings for the port.

*output definitions (continued)*

---

<b>Crossover</b>	In the row labeled <b>CAP</b> , the field displays the valid cross over configurations for the port. In the row label <b>DEF</b> , the field displays the default cross over settings for the port. The possible values are <b>Auto</b> , <b>MDI/X/Auto</b> (MDI/MDIX/Auto), or -- (not configurable and/or not applicable).
<b>Speed</b>	In the row labeled <b>CAP</b> , the field displays the valid line speed configurations for the port. In the row label <b>DEF</b> , the field displays the default line speed settings for the port. The possible values are <b>10/100</b> , <b>100</b> , <b>1G</b> , <b>10/100/1G</b> , <b>10G</b> , or <b>Auto</b> .
<b>Duplex</b>	In the row labeled <b>CAP</b> , the field displays the valid duplex configurations for the port. In the row label <b>DEF</b> , the field displays the default duplex settings for the port. The possible values are <b>Full</b> , <b>Full/Half</b> , or <b>Auto</b> .

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<a href="#">interfaces</a>	Enables and disables auto negotiation.
<a href="#">interfaces crossover</a>	Configures crossover port settings.
<a href="#">interfaces</a>	Configures interface speed.
<a href="#">interfaces duplex</a>	Configures duplex settings.
<a href="#">show interfaces alias</a>	Displays interface line settings.

---

## show interfaces accounting

Displays interface accounting information (e.g., packets received/transmitted and deferred frames received).

**show interfaces** [*slot* | *slot/port*[-*port2*]] **accounting**

---

### Syntax Definitions

<i>slot</i>	Slot number you want to display.
<i>port</i>	Port number of the interface you want to display.
<i>port2</i>	Last port number in a range of ports you want to display.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If no slot/port numbers are entered, accounting information for all slots/ports on the switch is displayed.

### Examples

```
-> show interfaces 1/2 accounting
1/2 ,
  Rx undersize packets      =          0,
  Tx undersize packets      =          0,
  Rx oversize packets       =          0,
  Tx oversize packets       =          0,
  Rx packets 64 Octets      =    3073753,
  Rx packets 65To127 Octets =    678698,
  Rx packets 128To255 Octets =     21616,
  Rx packets 256To511 Octets =    21062,
  Rx packets 512To1023 Octets =         2,
  Rx packets 1024To1518 Octets =        84,
  Rx packets 1519to4095 Octets =         0,
  Rx packets 4096ToMax Octets =         0,
  Rx Jabber frames         =         0
```

### output definitions

---

<b>Rx undersize packets</b>	Number of undersized packets received.
<b>Tx undersize packets</b>	Number of undersized packets transmitted.
<b>Rx oversize packets</b>	Number of oversized packets received.
<b>Tx oversize packets</b>	Number of oversized packets transmitted.
<b>Rx packets Octets</b>	Number of packets received in each listed octet range.

*output definitions (continued)*

---

<b>Rx Jabber frames</b>	Number of jabber packets received (longer than 1518 octets).
<b>Tx deferred frames</b>	Number of packets for which transmission was delayed (Ethernet only).

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<a href="#">interfaces ddm</a>	Displays general interface information (e.g., hardware, MAC address, and input/output errors).

## show interfaces ingress-rate-limit

Displays the ingress-rate-limit set for each interface port.

**show interfaces** [*slot*/ *slot/port*[-*port1*]] **ingress-rate-limit**

---

### Syntax Definitions

*slot* Slot number you want to display.

*port* Port number of the interface you want to display.

*port1* Last port number in a range of ports you want to display.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If the slot number is not specified, then the switch back pressure feature must be enabled or disabled on an entire chassis.

### Examples

```
-> show interfaces 1/1-4 ingress-rate-limit
Slot/ Rate Limit Burst Size Status
Port   (Mbps)      (MB)
-----+-----+-----+-----
1/1     496           19  disable
1/2     496           19  disable
1/3     496           19  disable
1/4     496           19  disable
```

#### *output definitions*

---

<b>Slot/Port</b>	Interface slot and port numbers.
<b>Rate Limit (Mbps)</b>	Rate limit in Megabits.
<b>Burst Size (MB)</b>	Burst size in Megabytes.
<b>Status</b>	Status of rate limiting.

---

## show interfaces ddm

Displays the information for the specified transceivers.

**show interfaces** [*slot* | *slot/port*[-*port1*]] **ddm** [**W-LOW** **W-HIGH** **STATUS** **A-LOW** **A-HIGH** **ACTUAL**]

---

### Syntax Definitions

<i>slot</i>	Display all the transceivers on the specified slot.
<i>num</i>	Display information for the specified transceiver.
<i>port2</i>	Last port number in a range of ports to display.
<b>W-LOW</b>	Display the transceivers Warning Low value.
<b>W-HIGH</b>	Display the transceivers Warning High value.
<b>STATUS</b>	Display the administrative status of DDM.
<b>A-LOW</b>	Display the transceivers Alarm Low value.
<b>A-HIGH</b>	Display the transceivers Alarm High value.
<b>ACTUAL</b>	The real-time values indicated by the transceiver. Values displayed in parentheses indicate the Warning or Alarm value that has been reached.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show interfaces transceiver W-Low
```

```
Slot/Port Temp C Voltage(V) Current(mA) Output(dBm) Input(dBm)
-----+-----+-----+-----+-----+-----+

```

```
-> show interfaces transceiver ddm
```

```

DDM Status      : enable
DDM Trap Status : disable

```

### *output definitions*

---

<b>Slot/Port</b>	Interface slot and port numbers.
<b>Temp C</b>	The transceiver temperature, in degrees centigrade.
<b>Voltage (V)</b>	The transceiver supply voltage, in volts.
<b>Current (mA)</b>	The transceiver transmit bias current, in milliamps.
<b>Output (dBm)</b>	The transceiver output power, in decibels.
<b>Input (dBm)</b>	The transceiver received optical power, in decibels.
<b>DDM Status</b>	The administrative status of DDM.
<b>DDM Trap Status</b>	The administrative status of DDM traps.
<b>Actual</b>	The real-time values indicated by the transceiver. Values displayed in parentheses indicate the Warning or Alarm value that has been reached.
<b>Alarm High (AH)</b>	Indicates the value at which the transceiver's functionality may be affected.
<b>Warning High (WH)</b>	Indicates the transceiver is approaching the High Alarm value.
<b>Warning Low (WL)</b>	Indicates the transceiver is approaching the Low Alarm value.
<b>Alarm Low (AL)</b>	Indicates the value at which the transceiver's functionality may be affected.
<b>N/A</b>	Indicates the transceiver does support DDM.

# 2 UDLD Commands

This chapter describes the CLI commands used to configure the UDLD (UniDirectional Link Detection) protocol. UDLD operates at Layer 2 in conjunction with IEEE 802.3 Layer 1 fault detection mechanism. It is a protocol used for detecting and disabling unidirectional Ethernet fiber or copper connections to avoid interface malfunctions, Spanning Tree loops, media faults, and so on. It operates in two main modes normal and aggressive.

The two basic mechanisms that UDLD follows are:

- Advertises port identity and learns about its neighbors. This information is maintained in a cache table.
- It sends continuous echo messages when fast notifications are required.

MIB information for the UDLD commands is as follows:

*Filename:* AlcatelIND1UDLD.mib  
*Module:* ALCATEL-IND1-UDLD-MIB

A summary of available commands is listed here:

---

**udld**  
**udld port**  
**udld mode**  
**udld probe-timer**  
**udld echo-wait-timer**  
**clear udld statistics port**  
**show udld configuration**  
**show udld configuration port**  
**show udld statistics port**  
**show udld neighbor port**  
**show udld status port**

---

Configuration procedures for UDLD are explained in “Configuring UDLD,” *OmniSwitch 10K Network Configuration Guide*.

## udld

Globally enables or disables UDLD protocol on the switch.

**udld {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Globally enables UDLD on the switch.
<b>disable</b>	Globally disables UDLD on the switch.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The port shutdown by this command can be reset by using the **interfaces admin** command.

### Examples

```
-> udld enable
-> udld disable
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<b>udld port</b>	Enables or disables UDLD status on a specific port or a range of ports.
<b>show udld configuration</b>	Displays the global status of UDLD configuration.
<b>show udld configuration port</b>	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

### MIB Objects

```
alaUdldGlobalStatus
  alaUdldGlobalConfigUdldStatus
```

---

## udld port

Enables or disables UDLD status on a specific port or a range of ports.

**udld port** *slot/port*[-*port2*] {**enable** | **disable**}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>port2</i>	The last port number in a range of ports that you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).
<b>enable</b>	Enables UDLD status on a port.
<b>disable</b>	Disables UDLD status on a port.

### Defaults

parameter	default
<b>enable   disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The UDLD protocol must be enabled before using this command.

### Examples

```
-> udld port 1/3 enable
-> udld port 1/6-10 enable
-> udld port 2/4 disable
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<b>udld</b>	Globally enables or disables UDLD protocol on the switch.
<b>show udld configuration port</b>	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

## MIB Objects

alaUdldPortConfigTable  
    alaUdldPortConfigUdldStatus

---

## udld mode

Configures the operational mode of UDLD on a specific port, a range of ports, or all the ports.

**udld port** [*slot/port*[-*port2*]] **mode** {**normal** | **aggressive**}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>port2</i>	The last port number in a range of ports that you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).
<b>normal</b>	Specifies UDLD operation in the normal mode.
<b>aggressive</b>	Specifies UDLD operation in the aggressive mode.

### Defaults

parameter	default
<b>normal</b>   <b>aggressive</b>	<b>normal</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The UDLD protocol must be enabled before using this command.
- The UDLD protocol is not supported on aggregate ports.
- In case of faulty cable connection, the port which is configured in normal mode of operation is considered to be in the shutdown state.

### Examples

```
-> udld mode aggressive
-> udld mode normal
-> udld port 1/3 mode aggressive
-> udld port 2/4 mode normal
-> udld port 2/9-18 mode aggressive
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

**udld**

Globally enables or disables UDLD protocol on the switch.

**show udld configuration port**

Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

## MIB Objects

alaUdldPortConfigTable

alaUdldPortConfigUdldMode

---

## udld probe-timer

Configures the probe-message advertisement timer on a specific port, a range of ports, or all the ports. Probe-messages are transmitted periodically after this timer expires.

**udld port** [*slot/port*[-*port2*]] **probe-timer** *seconds*

**no udld port** [*slot/port*[-*port2*]] **probe-timer**

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>port2</i>	The last port number in a range of ports that you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).
<i>seconds</i>	The probe-message transmission interval, in seconds.

### Defaults

parameter	default
<i>seconds</i>	15

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to reset the probe-message timer to the default value. Note that it is not necessary to specify the probe-message interval to reset it.
- The UDLD protocol must be enabled before using this command.
- Configure probe-advertisement timer with values varying in a range of 12-18 seconds for better convergence time and to avoid burst of probe advertisements.

### Examples

```
-> udld probe-timer 20
-> udld port 1/3 probe-timer 16
-> udld port 1/8-21 probe-timer 18
-> no udld probe-timer
-> no udld port 1/3 probe-timer
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<b>udld</b>	Globally enables or disables UDLD protocol on the switch.
<b>show udld configuration port</b>	Displays the configuration information for all UDLD ports or for a particular UDLD port on the switch.

## MIB Objects

alaUdldPortConfigTable  
alaUdldPortConfigUdldProbeIntervalTimer

---

## udld echo-wait-timer

Configures the echo based detection timer on a specific port, a range of ports, or all the ports. This is known as link detection period.

**udld port** [*slot/port*[-*port2*]] **echo-wait-timer** *seconds*

**no udld port** [*slot/port*[-*port2*]] **echo-wait-timer**

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>port2</i>	The last port number in a range of ports that you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).
<i>seconds</i>	The echo based detection period, in seconds.

### Defaults

parameter	default
<i>seconds</i>	8

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to reset the echo based detection timer to the default value. Note that it is not necessary to specify the echo based timer to reset it.
- The UDLD protocol must be enabled before using this command.
- An echo message is expected in reply from the neighbor within this time duration, otherwise, the port is considered as faulty.

### Examples

```
-> udld echo-wait-timer 9
-> udld port 1/5 echo-wait-timer 12
-> udld port 1/7-16 echo-wait-timer 12
-> no udld echo-wait-timer
-> no udld port 1/3 echo-wait-timer
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

# 3 Source Learning Commands

The Source Learning capability of OmniSwitch is responsible for creating, updating, and deleting source and destination MAC Address entries in the MAC Address Table. This chapter includes descriptions of Source Learning commands used to create or delete static MAC addresses, define the aging time value for static and dynamically learned MAC addresses, and display MAC Address Table entries and statistics.

MIB information for Source Learning commands is as follows:

*Filename:* AlcatelInd1MacAddress.mib  
*Module:* ALCATEL-IND1-MAC-ADDRESS-MIB

A summary of the available commands is listed here:

---

**mac-learning**  
**mac-learning vlan static mac-address**  
**mac-learning vlan multicast mac-address**  
**mac-learning aging-time**  
**mac-learning mode**  
**show mac-learning**  
**show mac-learning aging-time**  
**show mac-learning mode**

---

## mac-learning

Configures the status of source MAC address learning on a single port, a range of ports, or on a link aggregate of ports.

**mac-learning** {port *slot/port* / linkagg *linkagg*} {enable | disable}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>linkagg</i>	Specifies the link aggregate ID number.
<b>enable</b>	Enables source learning.
<b>disable</b>	Disables source learning.

### Defaults

By default, source learning is enabled on all ports.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Configuring source learning is not supported on Learned Port Security (LPS) and Universal Network Profile (UNP) ports, as well as individual ports that are members of a link aggregate.
- When port-based source learning is configured for a link aggregate ID, it affects all the ports that are members of the link aggregate.
- When MAC learning is disabled on a port or link aggregate, dynamic learning of MAC addresses is stopped.
- Static MAC addresses associated with a port or link aggregate are *not* cleared when source learning is disabled. Also, new static MAC address configurations are allowed on ports or link aggregates even when source learning is disabled on them.
- Disabling source learning on a port or link aggregate is useful on a ring configuration where switch A does not have to learn MAC addresses from switch B or for a Transparent LAN Service, where service provider does not require the MAC addresses of the Customer network.

### Examples

```
-> mac-learning port 1/2 enable  
-> mac-learning linkagg 10 disable
```

### Release History

Release 7.1.1; command added.

## Related Commands

### [show mac-learning](#)

Displays Source Learning status of and individual port or link aggregate ports on a switch.

## Related MIB Objects

```
slMacAddressTable  
slMacLearningControlTable  
  slMacLearningControlEntry  
  slMacLearningControlStatus
```

---

## mac-learning vlan static mac-address

Configures a static destination unicast MAC address. The configured MAC address is assigned to a fixed switch port or link aggregate ID and VLAN. If the destination of the data packets received on the VLAN ports is the configured MAC address, then they are forwarded to the specific MAC address port.

**mac-learning vlan** *vlan\_id* {**port** *slot/port* | **linkagg** *linkagg\_id*} **static mac-address** *mac\_address* [**bridging** | **filtering**]

**no mac-learning** {**vlan** *vlan\_id* [**port** *slot/port* | **linkagg** *linkagg\_id*]} {**static** | **dynamic**} [**mac-address** *mac\_address*]

---

### Syntax Definitions

<i>vlan_id</i>	VLAN ID number.
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>linkagg_id</i>	Enter a link aggregate ID number. See <a href="#">Chapter 7, “Link Aggregation Commands.”</a>
<b>static</b>	Specifies a permanent static MAC address that is retained even after the switch reboots.
<b>dynamic</b>	Specifies a dynamic MAC address that is removed when the switch reboots.
<i>mac_address</i>	Enter the destination MAC Address to add to the MAC Address Table (for example, 00:00:39:59:f1:0c).
<b>bridging</b>	Specifies that all packets to or from this MAC address are bridged.
<b>filtering</b>	Specifies that all packets to or from this MAC address are filtered or dropped.

### Defaults

parameter	default
<b>bridging</b>   <b>filtering</b>	bridging

### Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Use the **no** form of this command to remove a static or dynamic MAC address from the Source Learning MAC Address Table.
- The specified **port** or link aggregate ID mentioned along with the **linkagg** keyword must already belong to the specified VLAN. Use the **vlan members untagged** command to assign a port or link aggregate ID to a VLAN before you configure the static MAC address. Only the traffic from other ports associated with the same VLAN is directed to the static MAC address **port**.
- Select the **filtering** parameter to set up a denial of service to block potential hostile attacks. Traffic sent to or from a filtered MAC address is dropped. Select the **bridging** parameter for regular traffic flow to or from the MAC address.
- The destination MAC addresses are maintained in the Source Learning MAC address table.
- If a packet received on a port associated with the same VLAN contains a source address that matches a static MAC address, then the packet is discarded.
- Use the **mac-learning aging-time** command to set the aging time value for all static and dynamically learned MAC addresses. This is the value applied to static MAC addresses defined using the **mac-learning timeout** form of this command.

## Examples

```
-> mac-learning vlan 10 port 1/10 static mac-address 00:00:39:59:f1:0c bridging
-> no mac-learning vlan 14 port 1/14 static
-> no mac-learning vlan 12 port 1/12 dynamic
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<b>mac-learning aging-time</b>	Configures aging time, in seconds, for static and dynamically learned MAC addresses.
<b>show mac-learning</b>	Displays Source Learning MAC Address Table information.
<b>show mac-learning aging-time</b>	Displays the current aging time value for the Source Learning MAC Address Table.

## MIB Objects

```
sLMacAddressTable
  sLMacAddress
  sLMacAddressManagement
  sLMacAddressDisposition
```

---

## mac-learning vlan multicast mac-address

Configures a static multicast MAC address and assigns the address to one or more egress ports. Packets received on ports associated with the specified VLAN that contain a destination MAC address that matches the static multicast address are forwarded to the specified egress ports. Static multicast MAC addresses are maintained in the Source Learning MAC address table.

**mac-learning vlan** *vlan\_id* { **port** *slot/port* | **linkagg** *linkagg\_id* } **multicast mac-address** *multicast\_address* [**group** *group\_id*]

**no mac-learning** { **vlan** *vlan\_id* [**port** *slot/port* | **linkagg** *linkagg\_id* ] } { **multicast** [*mac-address* *multicast\_address* ] }

---

### Syntax Definitions

<i>vlan_id</i>	VLAN ID number.
<i>slot/port</i>	The egress slot and port combination that is assigned to the static multicast MAC address.
<i>linkagg_id</i>	Enter a link aggregate ID number. See <a href="#">Chapter 7, “Link Aggregation Commands.”</a>
<i>multicast_address</i>	Enter the destination multicast MAC Address to add to the MAC Address Table (for example, 01:00:39:59:f1:0c).
<i>group_id</i>	<i>This keyword cannot be user defined.</i>

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a static multicast MAC address from the Source Learning MAC Address Table. Note that if no parameters are specified with this form of the command, then all static multicast addresses are removed.
- Note that a MAC address is considered a multicast MAC address if the least significant bit of the most significant octet of the address is enabled. For example, MAC addresses with a prefix of 01, 03, 05, 13, and so on, are multicast MAC addresses.
- If a multicast prefix value is not present, then the address is treated as a regular MAC address and not allowed when using the **mac-learning vlan multicast mac-address** command. Also note that multicast addresses within the following ranges are not supported:

```
01:00:5E:00:00:00 to 01:00:5E:7F:FF:FF
01:80:C2:XX.XX.XX
33:33:XX:XX:XX:XX
```

- The configured (static) multicast MAC address is assigned to a fixed switch port or link aggregate ID and VLAN.
- In addition to configuring the same static multicast address for multiple ports within a given VLAN, it is also possible to use the same multicast address across multiple VLANs.
- To specify different ports and different ranges of ports use 2 or more instances of the **port** parameter along with the port numbers or a range of port numbers.
- To specify different link aggregates and different ranges of link aggregates, use 2 or more instances of the **linkagg** parameter along with the link aggregate IDs or a range of link aggregate IDs.
- The specified **port** or link aggregate ID must already belong to the specified VLAN. Use the **vlan port default** command to assign a port or link aggregate ID to a VLAN before you configure the static MAC address. Only traffic from other ports associated with the same VLAN is directed to the static multicast MAC address **port**.
- If the **configuration snapshot** or **write memory** command is entered after a static multicast MAC address is configured, the resulting ASCII file or **boot.cfg** file includes the “**group group\_id**” as the additional syntax for the **mac-learning static-multicast** command. The “**group group\_id**” indicates the number of the multicast group that the switch has assigned to the multicast MAC address for the given VLAN association. Each multicast address – VLAN association is treated as a unique instance and assigned a group number specific to that instance.
- Note that if the port assigned to a multicast MAC address is down or administratively disabled when the **configuration snapshot** or **write memory** command is used, the multicast MAC address is not saved to the resulting ASCII file or **boot.cfg** file.

## Examples

```
-> mac-learning vlan 355 port 4/2 multicast mac-address 02:00:39:59:f1:0c
-> mac-learning vlan 255 port 1/12 multicast mac-address 01:00:00:3a:44:11
-> mac-learning vlan 1500 port 1/10 multicast mac-address 03:00:00:3a:44:12
-> mac-learning vlan 455 linkagg 10 linkagg 12 multicast mac-address
04:00:00:3a:44:13
-> no mac-learning vlan 1500 port multicast mac-address 03:00:00:3a:44:12
-> no mac-learning vlan 455 linkagg 10 multicast mac-address 04:00:00:3a:44:13
-> no mac-learning multicast mac-address
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

[show mac-learning](#)

Displays Source Learning MAC Address Table information.

**MIB Objects**

```
s1MacAddressTable  
  s1MacAddress  
  s1MacAddressManagement  
  s1MacAddressDisposition
```

---

## mac-learning aging-time

Configures aging time, in seconds, for static and dynamically learned MAC addresses. When a MAC address has aged beyond the aging-time value, the MAC address is discarded.

**mac-learning aging-time** {*seconds* | **default**}

**no mac-learning aging-time**

---

### Syntax Definitions

*seconds* Aging time value (in seconds). Do not use commas in value.

**default** The aging time is set to default value of 300 seconds.

### Defaults

By default, the aging time is set to 300 seconds.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **default** parameter to set the aging-time back to the default value of 300 seconds.
- The aging time value is a global value that applies to all VLANs. Configuring this value on a per VLAN basis is not supported on this platform.
- Note that an inactive MAC address can take up to twice as long as the aging time value specified to be removed from the MAC address table. For example, if an aging time of 60 seconds is specified, the MAC address ages out any time between 60 and 120 seconds of inactivity.
- The MAC address table aging time is also used as the timeout value for the Address Resolution Protocol (ARP) table. This timeout value determines how long the switch retains dynamically learned ARP table entries.

### Examples

```
-> mac-learning aging-time 1200  
-> no mac-learning aging-time
```

### Release History

Release 7.1.1; command introduced.

**Related Commands****show mac-learning**

Displays Source Learning MAC Address Table information.

**show mac-learning aging-time**

Displays the current aging time value for the Source Learning MAC Address Table.

**MIB Objects**

slMacAddressAgingTable

slMacAgingValue

---

## mac-learning mode

Enables or disables the distributed MAC source learning mode for the chassis.

**mac-learning mode [centralized | distributed]**

---

### Syntax Definitions

**centralized** Enables centralized MAC source learning mode.

**distributed** Enables distributed MAC source learning mode.

### Defaults

By default, distributed MAC source learning mode is disabled for the chassis.

### Platforms Supported

OmniSwitch 10K

### Usage Guidelines

- After the distributed MAC mode is either enabled or disabled using this command, immediately save the switch configuration using the **write memory** command and then reboot the switch.

### Examples

```
-> mac-learning mode centralized  
-> mac-learning mode distributed
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

**show mac-learning mode** Displays the current status of the distributed MAC source learning mode.

### MIB Objects

```
s1MacAddressTable  
    s1DistributedMacMode
```

---

## show mac-learning

Displays Source Learning MAC Address Table information.

```
show mac-learning [summary] [multicast | static | dynamic] [vlan vlan_id [-vlan_id2]] [slot slot | port slot/port] [linkagg linkagg] [mac-address mac_address]
```

---

### Syntax Definitions

<b>summary</b>	Displays summary of all the parameters.
<b>multicast</b>	Display all the static multicast MAC addresses information contained in the MAC address table.
<b>static</b>	Display static MAC addresses with a permanent status.
<b>dynamic</b>	Display dynamically learned MAC addresses.
<i>vlan_id</i> [- <i>vlan_id2</i> ]	A contiguous range of VLAN ID numbers (for example, 5-10).
<i>slot</i>	Enter the slot number for a module to specify that the command must include all ports on that module (for example, 6 specifies all ports on the module found in slot 6 of the switch chassis).
<i>slot/port</i>	Enter the slot number and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>linkagg</i>	Enter a link aggregate ID number. See <a href="#">Chapter 7, “Link Aggregation Commands.”</a>
<i>mac_address</i>	Enter a MAC Address (for example, 00:00:39:59:f1:0c).

### Defaults

By default, information is displayed for all MAC addresses contained in the table.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Note that only one VLAN entry - a single VLAN ID or a range of VLAN IDs is allowed with this command. Multiple VLAN entries are not accepted.
- If a static MAC address is configured on a port link that is down or disabled, an asterisk appears to the right of the MAC address in the **show mac-learning** command display. The asterisk indicates that this is an invalid MAC address. When the port link comes up, however, the MAC address is then considered valid and the asterisk no longer appears next to the address in the display.

## Examples

```
-> show mac-learning summary
```

```
Mac Address Table Count:
  Permanent Address Count      = 0,
  Dynamic Learned Address Count = 16,
  Static Multicast Address Count = 0,
  Total MAC Address In Use     = 16
```

```
-> show mac-learning
```

Legend: Mac Address: \* = address not valid

Vlan	Mac Address	Type	Protocol	Operation	Interface
1	00:00:00:00:00:01	learned	0800	bridging	8/ 1
1	00:d0:95:6a:73:9a	learned	aaaa0003	bridging	10/23

Total number of Valid MAC addresses above = 2

```
-> show mac-learning vlan 10-15
```

Legend: Mac Address: \* = address not valid

Vlan	Mac Address	Type	Protocol	Operation	Interface
10	00:00:00:00:00:01	learned	0800	bridging	1/2
10	00:d0:95:6a:73:9a	learned	aaaa0003	bridging	1/2
11	00:d0:95:a3:e0:0d	learned	---	bridging	1/3
11	00:d0:95:a3:e5:09	learned	---	bridging	1/3
11	00:d0:95:a3:e7:75	learned	---	bridging	1/4
12	00:d0:95:a3:ed:f7	learned	---	bridging	2/1
12	00:d0:95:a8:2a:b6	learned	---	bridging	2/1
12	00:d0:95:ad:e3:cc	learned	---	bridging	2/1
13	00:d0:95:ae:3b:f6	learned	---	bridging	2/8
13	00:d0:95:b2:3d:fa	learned	---	bridging	2/8

Total number of Valid MAC addresses above = 14

### output definitions

<b>VLAN</b>	Vlan ID number associated with the MAC address and the slot/port.
<b>Mac Address</b>	MAC address that is currently learned or statically assigned.
<b>Type</b>	MAC address management status: <b>dynamic</b> or <b>static</b> .
<b>Protocol</b>	Protocol type for the MAC address entry. Note that if the hardware source learning mode is active for the port, this field is blank.
<b>Operation</b>	The disposition of the MAC address: <b>bridging</b> (default) or <b>filtering</b> .
<b>Interface</b>	The slot number for the module and the physical port number on that module that is associated with the static or dynamically learned MAC address. If the interface is a link aggregate ID, zero is displayed as the slot number (for example, 0/29).

## Release History

Release 7.1.1; command introduced.

## Related Commands

**show mac-learning aging-time** Displays the current aging time value for the Source Learning MAC Address Table.

## MIB Objects

```
sLMacAddressTable  
  sLMacAddress  
  sLMacAddressManagement  
  sLMacAddressDisposition  
  sLMacAddressProtocol
```

---

## show mac-learning aging-time

Displays the current aging time value for the Source Learning MAC Address Table.

```
show mac-learning aging-time
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Note that the aging time is the same for all VLANs because it is not configurable on a per-VLAN basis. The aging time value on this platform is a global parameter that applies to all VLANs.

### Examples

```
-> show mac-learning aging-time
```

```
Mac Address Aging Time (seconds) = 300
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show mac-learning](#) Displays Source Learning MAC Address Table information.

### MIB Objects

```
s1MacAddressAgingTable
```

```
    s1MacAgingValue
```

---

## show mac-learning learning-state

Displays the source learning status of a VLAN, port or link aggregate.

```
show mac-learning learning-state [vlan vlan[-vlan2] / port slot/port | linkagg linkagg]
```

---

### Syntax Definitions

<i>vlan</i>	The VLAN ID number.
<i>-vlan2</i>	The last VLAN ID in a range of VLAN IDs.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>linkagg</i>	Specifies the link aggregate identifier.

### Defaults

By default, the source learning status for all switch ports and link aggregates is displayed.

### Platforms Supported

OmniSwitch 10K

### Usage Guidelines

- Use the **port** or **linkagg** keywords along with the port ID and link aggregate ID to display the source learning status for a specific port or link aggregate ID.
- Use the **vlan** keyword along with the VLAN ID or a range of VLAN IDs to display the source learning status for the specified VLAN or range of VLANs.
- Output display for a range of port IDs is supported with this command. However, output display for a range of link aggregate IDs is not supported.
- When the source learning status is configured for a link aggregate ID, it affects all the ports that are members of the link aggregate. However, source learning status cannot be configured on individual ports which are members of the link aggregate.

### Example

```
-> show mac-learning learning-state

port  mac-learning
-----+-----
1/1   disabled
1/2   enabled
1/3   disabled

-> show mac-learning learning-state port 1/2

port  mac-learning
-----+-----
1/2   enabled
```

```
-> show mac-learning learning-state linkagg 10
```

```
port    mac-learning
-----+-----
0/10    disabled
```

#### *output definitions*

---

<b>port</b>	The slot/port number for a switch port or a link aggregate ID number. If the interface is a link aggregate ID, zero is displayed as the slot number (for example, 0/29).
<b>mac-learning</b>	The source learning status of the port or link aggregate ( <b>enabled</b> or <b>disabled</b> ). Configured through the <b>mac-learning</b> command.

---

```
-> show mac-learning learning-state vlan 1-5
```

```
      Vlan      Learning State
-----+-----
          1      Enabled
          5      Enabled
```

#### *output definitions*

---

<b>Vlan</b>	The VLAN ID numbers of the VLANs that are active.
<b>Learning State</b>	The MAC learning state of the VLANs.

---

## Release History

Release 7.1.1; command introduced

## Related Commands

**mac-learning** Configures the status of source MAC address learning on a single port, a range of ports or on a link aggregate of ports.

## Related MIB Objects

```
s1MacAddressTable
s1MacLearningControlTable
  s1MacLearningControlEntry
  s1MacLearningControlStatus
```

---

## show mac-learning mode

Displays the current status (enabled or disabled) of the distributed MAC source learning mode.

**show mac-learning mode**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A.

### Examples

```
-> show mac-learning mode
MAC Learning Mode Configuration = CENTRALIZED
New Configured MAC Learning Mode After Reboot = DISTRIBUTED

-> show mac-learning mode
MAC Learning Mode Configuration = DISTRIBUTED
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[mac-learning mode](#) Enables or disables the distributed MAC source learning mode.

### MIB Objects

```

# 4 VLAN Management Commands

VLAN management software handles VLAN configuration and the reporting of VLAN configuration changes to other switch tasks. A VLAN defines a broadcast domain that contains physical ports and can span across multiple switches. All switches contain a default VLAN 1. Physical switch ports are initially assigned to VLAN 1 until they are statically or dynamically assigned to other VLANs.

This chapter includes descriptions of VLAN management commands used to create, modify or remove VLANs. These commands allow you to enable or disable Spanning Tree Protocol (STP), add or remove virtual router interfaces, statically assign physical switch ports to a default VLAN, and display VLAN configuration information.

MIB information is as follows:

*Filename:* AlcatelIND1VlanManager.mib  
*Module:* ALCATEL-IND1-VLAN-MGR-MIB

A summary of the available commands is listed here:

---

[vlan](#)  
[vlan members untagged](#)  
[vlan members tagged](#)  
[vlan mtu-ip](#)  
[show vlan](#)  
[show vlan members](#)

---

## vlan

Creates a new VLAN with the specified VLAN ID (VID) and an optional description.

```
vlan vlan_id [admin-state {enable | disable}] [name description]
```

```
no vlan vlan_id
```

---

### Syntax Definitions

<i>vlan_id</i>	A numeric value that uniquely identifies an individual VLAN. This value becomes the VLAN ID for the new VLAN.
<b>enable</b>	Enable VLAN administrative status.
<b>disable</b>	Disable VLAN administrative status.
<b>description</b>	An alphanumeric string. Optional name description for the VLAN ID.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete a VLAN from the configuration.
- All VLAN ports and routers are detached before the VLAN is removed. If the VLAN deleted is a default VLAN on the port, the port returns to default VLAN 1.
- If the VLAN deleted is not a default VLAN, then the ports are directly detached from the VLAN.
- A VLAN is not operationally active until at least one of the member ports of the VLAN is active and can forward traffic.
- Note that specifying multiple VLAN IDs and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range of VLAN ID entries (for example, vlan 10-15).
- When a VLAN is administratively disabled, static port assignments are retained but traffic is not forwarded from these ports.
- The description can be any alphanumeric string. Enclose the description in double quotes if it contains more than one word with space in between.

## Examples

```
-> vlan 200 name "Corporate VLAN"  
-> vlan 720 admin-state disable  
-> no vlan 1020
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">vlan members untagged</a>	Statically assigns ports to a VLAN.
<a href="#">show vlan</a>	Displays a list of existing VLANs.
<a href="#">show vlan members</a>	Displays VLAN port assignments.

## MIB Objects

```
vlanTable  
  vlanNumber  
  vlanDescription  
  vlanAdmStatus  
  vlanOperStatus  
  vlanStatus
```

---

## vlan members untagged

Configures a new default VLAN for a single port or an aggregate of ports. The VLAN specified with this command is referred to as the *configured default VLAN* for the port.

```
vlan vlan_id [-vlan_id2] members {port slot/port[-port1] | linkagg linkagg_id[-linkagg_id2]} untagged
```

```
no vlan vlan_id [-vlan_id2] members {port slot/port[-port1] | linkagg_id linkagg_id[-linkagg_id2]}
```

---

### Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number of the VLAN to assign as the default VLAN configured for the port.
<i>slot/port</i> [- <i>port1</i> ]	The slot number for the module and the physical port number (for example, 3/1 specifies port 1 on slot 3) or a range of physical port numbers on that module (for example, 3/1-16).
<i>linkagg_id</i> [- <i>linkagg_id2</i> ]	The link aggregate ID number or range of IDs to be assigned to the specified VLAN.

### Defaults

VLAN 1 is the default VLAN for all ports.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a port or link aggregate from its configured default VLAN and restore VLAN 1 as the default VLAN.
- The VLAN ID and link aggregate ID specified with this command must already exist in the switch configuration.
- This command configures the port or link aggregate to send and receive untagged packets for the specified VLAN ID, which becomes the default VLAN of the port.
- Every switch port or link aggregate has only one configured default VLAN. The 802.1Q tagged ports, however, can have additional VLAN assignments, which are often referred to as *secondary* VLANs.

### Examples

```
-> vlan 20 members port 4/1-24 tagged
-> vlan 20 members linkagg 2-4 untagged
-> no vlan 1-4 members port 4/1-24
-> no vlan 20 members linkagg 2-4
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">vlan</a>	Creates a VLAN.
<a href="#">vlan members tagged</a>	Configures a port to accept 802.1q-tagged packets for a specific VLAN.
<a href="#">show vlan</a>	Displays list of existing VLANs.
<a href="#">show vlan members</a>	Displays VLAN port assignments.

## MIB Objects

vpaTable  
  vpaVlanNumber  
  vpaIfIndex  
  vpaType  
  vpaState  
  vpaStatus

---

## vlan members tagged

Configures a port or link aggregate ID to send and receive 802.1q-tagged packets with the specified VLAN ID.

**vlan** *vlan\_id*[-*vlan\_id2*] **members** {**port** *slot/port*[-*port2*] | **linkagg** *linkagg\_id*[-*linkagg\_id2*]} **tagged**

**no vlan** *vlan\_id*[-*vlan\_id2*] **members** {**port** *slot/port*[-*port2*] | **linkagg** *linkagg\_id*[-*linkagg\_id2*]}

---

### Syntax Definitions

<i>vlan_id</i>	The VLAN ID number for a preconfigured VLAN that will handle the 802.1Q-tagged traffic for this port. The valid range is 1–4094.
<i>slot</i>	The slot number for the 802.1Q tagging.
<i>port</i>	The port number for the 802.1Q tagging.
<i>-port2</i>	The last port number in a range of ports.
<i>linkagg_id</i>	The link aggregation ID, which allows you to configure 802.1Q tagging on an aggregate of ports. The valid range is 1 to 31.
<i>-linkagg_id2</i>	The last link aggregate ID in a range.

### Defaults

By default, all ports are untagged (they only carry untagged traffic for the default VLAN to which the port belongs).

### Platforms Supported

OmniSwitch 10K

### Usage Guidelines

- Use the **no** form of this command to delete 802.1Q tagging on a port or an aggregate of ports.
- The VLAN ID and link aggregate ID specified with this command must already exist in the switch configuration.
- A port or link aggregate cannot be tagged with its own default VLAN ID.

### Examples

```
-> vlan 2 members port 3/1 tagged
-> vlan 100 members port 4/1-10
-> vlan 100 members linkagg 10
-> vlan 100 members linkagg 1-4
-> no vlan 2 members port 3/1
```

### Release History

Release 7.1.1; command introduced.

---

## vlan mtu-ip

Configures the maximum transmission unit (MTU) packet size allowed for all ports associated with a VLAN. This value is configured on a per VLAN basis, so all IP interfaces assigned to the VLAN apply the same MTU value to packets sent on VLAN ports.

**vlan** *vlan\_id* **mtu-ip** *size*

---

### Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number of the VLAN to assign as the default VLAN configured for the port.
<i>size</i>	Packet size value specified in bytes.

### Defaults

By default, the MTU size is set to 1500 bytes (the standard Ethernet MTU size).

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The MTU size applies to traffic sent on all switch ports that are associated with the specified VLAN regardless of the port speed (for example, 10/100 Ethernet, gigabit Ethernet). Therefore, assign only ports that are capable of handling the MTU size restriction to the VLAN. If the VLAN MTU size is greater than 1500, do not assign 10/100 Ethernet ports to the VLAN.
- By default, packets that exceed the MTU size are dropped. To enable MTU discovery and fragmentation, use the **icmp type** command to enable the “frag needed but DF bit set” control (for example, **icmp type 3 code 4 enable**).
- The maximum MTU size value for a Multi-chassis MCM-IPC VLAN is 9198.

### Examples

```
-> vlan 200 mtu-ip 1000
-> vlan 1503 mtu-ip 9198
```

### Release History

Release 7.1.1; command introduced.

**Related Commands**

<a href="#">vlan</a>	Creates a VLAN.
<a href="#">icmp type</a>	Configures a port to accept 802.1q-tagged packets for a specific VLAN.
<a href="#">show vlan</a>	Displays list of existing VLANs.

**MIB objects**

vlanTable  
vlanMtu

---

## show vlan

Displays a list of VLANs configured on the switch.

**show vlan** [*vlan\_id*]

---

### Syntax Definitions

*vlan\_id*                                      VLAN ID number.

### Defaults

By default, a list of all VLANs is displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Specify a VLAN ID with this command to display information about a specific VLAN.
- Note that specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (for example, show vlan 10-15). Note that only one VLAN entry - a single VLAN ID or a range of VLAN IDs is allowed with this command. Multiple entries are not accepted.

### Examples

-> show vlan

```

vlan  type  admin oper  ip   mtu   name
-----+-----+-----+-----+-----+-----+-----
   1   std    Ena   Dis   Dis  1500  Finance IP
  10  unpd    Ena   Dis   Dis  1500  UNP-DYN-VLAN
  11   std    Ena   Dis   Dis  1500  VLAN 11

```

### output definitions

---

<b>vlan</b>	The numerical VLAN ID. Use the <b>vlan</b> command to create or remove VLANs.
<b>type</b>	The type of VLAN ( <b>mtp</b> , <b>ipc</b> , <b>std</b> , <b>vip</b> , <b>unpd</b> ).
<b>admin</b>	VLAN administrative status: <b>Ena</b> specifies that VLAN functions are enabled; <b>Dis</b> specifies that VLAN functions are disabled. Use the <b>vlan</b> command to change the VLAN administrative status.
<b>oper</b>	VLAN operational status: <b>Ena</b> (enabled) or <b>Dis</b> (disabled). The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (for example router interfaces, Spanning Tree) are applied to ports and traffic flow. A VLAN must have an enabled administrative status before it can become operationally enabled.

*output definitions (continued)*

---

<b>ip</b>	IP router interface status: <b>Ena</b> (IP interface exists for the VLAN) or <b>Dis</b> (no IP router interface exists for the VLAN). Use the <b>ip interface</b> command to define an IP router interface for a VLAN.
<b>mtu</b>	Maximum Transmission Unit: Size of largest data packet that the VLAN port can transmit. Configured through the <b>vlan mtu-ip</b> command.
<b>name</b>	The user-defined text description for the VLAN. By default, the VLAN ID is displayed if the VLAN description is not specified. Configured through the <b>vlan</b> command.

---

```
-> show vlan 10
Name                : UNP-DYN-VLAN,
Type                : UNP Dynamic Vlan,
Administrative State : enabled,
Operational State   : disabled,
IP Router Port      : disabled,
IP MTU              : 1500
```

*output definitions*

---

<b>Name</b>	The user-defined text description for the VLAN. By default, the VLAN ID is displayed if the VLAN description is not specified.
<b>Type</b>	The type of VLAN ( <b>MTP Vlan, IPC Vlan, Standard Vlan, VIP Vlan, UNP Dynamic VLAN</b> )
<b>Administrative State</b>	VLAN administrative status: <b>enabled</b> VLAN functions are enabled; <b>disabled</b> specifies that VLAN functions are disabled. Use the <b>vlan</b> command to change the VLAN administrative status.
<b>Operational State</b>	VLAN operational status: <b>Ena</b> (enabled) or <b>Dis</b> (disabled). The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (for example router interfaces, Spanning Tree) are applied to ports and traffic flow.
<b>IP Router Port</b>	IP router port status: <b>Ena</b> (IP interface exists for the VLAN) or <b>Dis</b> (no IP router interface exists for the VLAN). Use the <b>ip interface</b> command to define an IP router interface for a VLAN.
<b>IP MTU</b>	Maximum Transmission Unit: Size of largest data packet that the VLAN port can transmit.

---

**Release History**

Release 7.1.1; command introduced.

## Related Commands

[show vlan members](#)

Displays VLAN port assignments.

vlanMgrVlan

vlanTable

    vlanNumber

    vlanDescription

    vlanAdmStatus

    vlanOperStatus

    vlanStatus

---

## show vlan members

Displays VLAN port associations (VPAs) for all VLANs, a specific VLAN, or for a specific port.

```
show vlan [vlan_id [-vlan_id2]] members [port [slot/port[-port2]/ linkagg linkagg_id [-linkagg_id2]]
```

---

### Syntax Definitions

<i>vlan_id</i>	VLAN ID number.
<i>-vlan_id2</i>	The last VLAN ID in a range of VLAN IDs.
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example 3/1 specifies port 1 on slot 3).
<i>linkagg_id</i>	Enter the link aggregate ID number to assign to the specified VLAN.
<i>linkagg_id2</i>	The last link aggregate ID in a range of IDs to be assigned to a specified VLAN.

### Defaults

If no parameters are specified with this command, a list of all VLANs and their assigned ports is displayed by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the *vlan\_id* is specified without a *slot/port* or *linkagg\_id*, then all port assignments for that VLAN are displayed.
- If the *slot/port* or *linkagg\_id* is specified without a *vlan\_id*, then all VLAN assignments for that port are displayed.
- If both the *vlan\_id* and *slot/port* or *linkagg\_id* are specified, then information only for that VLAN and *slot/port* or link aggregate ID is displayed.
- Note that specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (for example, show vlan 10-15 port). Note that only one VLAN entry - a single VLAN ID or a range of VLAN IDs is allowed with this command. Multiple entries are not accepted.

## Examples

```
-> show vlan members
vlan  port      type      status
+-----+-----+-----+-----+
  1    1/1      default   inactive
  2    1/2      default   blocking
      11/4     qtagged   forwarding
  3    1/2      qtagged   blocking
      11/4     default   forwarding
      2/5      dynamic   forwarding
```

```
-> show vlan 10 members
port  type      status
+-----+-----+-----+
 1/1  default   forwarding
 1/2  qtagged   forwarding
```

```
-> show vlan members port 3/2
vlan  type      status
+-----+-----+-----+
  1   default   forwarding
  2   qtagged   forwarding
  5   dynamic   blocking
  3   qtagged   blocking
```

```
-> show vlan 1-11 members port 1/3
type      : default,
status     : inactive,
vlan admin : enabled,
vlan oper  : disabled,
```

### output definitions

<b>vlan</b>	Numerical VLAN ID. Identifies the VLAN assignment of the port.
<b>port</b>	The slot number for the module and the physical port number on that module (for example 3/1 specifies port 1 on slot 3).
<b>type</b>	The type of VPA: <b>default</b> (configured default VLAN assignment for the port), <b>qtagged</b> (802.1Q tagged secondary VLAN assignment for the port), <b>mirror</b> (port is mirroring the VLAN assignment of another port), <b>dynamic</b> (configured dynamic VLAN assignment for the port).
<b>status</b>	The VPA status: <b>inactive</b> (port is not active), <b>forwarding</b> (traffic is forwarding on this VPA), <b>blocking</b> (traffic is not forwarding on this VPA)
<b>vlan admin</b>	VLAN administrative status: <b>enabled</b> enables VLAN functions to operate; <b>disabled</b> disables VLAN functions without deleting the VLAN. Use the <b>vlan</b> command to change the VLAN administrative status.
<b>vlan oper</b>	VLAN operational status: <b>enabled</b> or <b>disabled</b> . The operational status remains disabled until an active port is assigned to the VLAN. When the operational status is enabled, then VLAN properties (for example router interfaces, Spanning Tree) are applied to ports and traffic flow. A VLAN must have an enabled administrative status before it can become operationally enabled.

# 5 High Availability VLAN Commands

High availability (HA) VLANs send traffic intended for a single destination MAC address to multiple switch ports. The OmniSwitch HA VLAN feature provides an elegant and flexible way to connect server cluster nodes directly to the ingress network. This involves multicasting the service requests on the configured ports. The multicast criteria is configurable based on destination MAC and destination IP address. Egress ports can be statically configured on a server cluster or they can be registered by IGMP reports. The HA VLAN server-cluster feature multicasts the incoming packets based on the server cluster configuration on the ports associated with the server cluster.

An HAVLAN is configured by specifying the match criteria, a VLAN and a port list. Match criteria is used to identify the incoming traffic that has to be processed by the HA VLAN server-clusters. The specified VLAN is an ingress and egress VLAN in the case of a L2 server-cluster. In the case of a L3 server-cluster, the VLAN is not configured explicitly, but the IP address specified in the match criteria determines the VLAN. The port list specifies the egress switch ports within the VLAN. The cluster is connected to these switch ports.

There are typically two modes of implementation of server clusters in HA VLAN.

**Layer 2** - The server cluster is attached to a L2 switch on which the frames destined to the cluster MAC address are to be flooded on all interfaces.

**Layer 3** - The server cluster is attached to a L3 switch on which the frames destined to the server cluster IP address are to be routed to the server cluster IP and then flooded on all interfaces.

For more information, see the application examples in Chapter 28, “Configuring High Availability VLANs” in the *OmniSwitch AOS Release 7 Network Configuration Guide*.

MIB information is as follows:

*Filename:* AlcatelIND1VlanManager.mib  
*Module:* ALCATEL-IND1-VLAN-MGR-MIB

*Filename:* AlcatelIND1MacAddress.mib  
*Module:* ALCATEL-IND1-MAC-ADDRESS-MIB

A summary of the available commands is listed here:

---

**server-cluster**  
**server-cluster vlan**  
**server-cluster mac-address**  
**server-cluster ip**  
**server-cluster igmp mode**  
**server-cluster ip-multicast**  
**server-cluster port**  
**show server-cluster**

---

## server-cluster

Configures a cluster with an ID, name, mode and the administrative state.

**server-cluster** *cluster-id* [**name** *cluster-name*] [**mode** {**L2** | **L3**}] [**admin-state** {**enable**|**disable**}]

**no server-cluster** *cluster-id*

---

### Syntax Definitions

<i>cluster-id</i>	A numerical identifier of the cluster. The valid range is 1–32.
<i>cluster-name</i>	Specifies a name (up to 32 characters) to represent the cluster.
<b>L2</b>	Specifies L2 for the cluster mode.
<b>L3</b>	Specifies L3 for the cluster mode.
<b>enable</b>	Enables the administrative state of the cluster.
<b>disable</b>	Disables the administrative state of the cluster.

### Defaults

parameter	default
<b>mode</b>	<b>L2</b>
<b>admin-state</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use **no** form of this command to remove the cluster ID from the switch configuration.
- Once the cluster mode is set, the mode cannot be changed.
- Use the **admin-state disable** parameter option to disable an existing cluster before attempting to modify any of the cluster parameters.

### Examples

```
-> server-cluster 1
-> server-cluster 1 mode l2
-> server-cluster 1 name l2_cluster mode l2
-> server-cluster 2 name l3_cluster mode l3
-> no server-cluster 1
```

### Release History

Release 7.2.1; command was introduced.

## Related Commands

<b>vlan</b>	Creates and deletes VLANs.
<b>server-cluster mac-address</b>	Configures a MAC address, VLAN of the specified cluster.
<b>server-cluster port</b>	Configures the specified IP, ARP entry to a given cluster and/or a multi-cast IP.
<b>show server-cluster</b>	Displays the clusters configured in the system.

## MIB Objects

```
alaHAVlanClusterTable  
  alaHAVlanClusterId  
  alaHAVlanClusterName  
  alaHAVlanClusterAdminStatus  
  alaHAVlanClusterMode  
  alaHAVlanClusterRowStatus
```

---

## server-cluster vlan

Configures a VLAN assignment for the specified cluster. This command is used to assign VLANs to an L2 cluster.

```
server-cluster cluster-id vlan vlan_id
```

---

### Syntax Definitions

<i>cluster-id</i>	The numerical identifier of an existing server cluster.
<i>vlan</i>	The VLAN identifier to assign to the cluster. The valid range is 1–4094.

### Defaults

NA

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- If the specified VLAN ID does not exist in the switch configuration, the cluster will remain operationally disabled.
- Modifying the existing VLAN assignment for a cluster is only allowed when the cluster is administratively disabled.

### Examples

```
-> server-cluster 1 vlan 10  
-> server-cluster 5 vlan 10  
-> server-cluster 6 mac-address 00 :11 :22 :33 :44 :55
```

### Release History

Release 7.2.1; command was introduced.

## Related Commands

<b>server-cluster ip</b>	Configures the specified IP, ARP entry to a given cluster.
<b>server-cluster port</b>	Configures the specified IP, ARP entry to a given cluster and/or a multi-cast IP.
<b>show server-cluster</b>	Displays the clusters configured in the system.
<b>show mac-learning</b>	Displays Source Learning MAC Address Table information.

## MIB Objects

```
alaHAVlanClusterTable  
  alaHAVlanClusterId  
  alaHAVlanClusterVlan  
  alaHAVlanClusterMacAddress  
  alaHAVlanClusterRowStatus
```

---

## server-cluster mac-address

Configures a MAC address assignment for the specified cluster. This command is used to assign a MAC address to an L2 cluster.

**server-cluster** *cluster-id* **mac-address** *mac-address*

---

### Syntax Definitions

*cluster-id*                      The numerical identifier of an existing server cluster.

*mac-address*                    The MAC address of the cluster.

### Defaults

NA

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- Modifying the existing MAC address assignment for a cluster is only allowed when the cluster is administratively disabled.
- The MAC address that is assigned to a cluster can be a unicast, L2 multicast, or IP multicast address. However reserved multicast MAC addresses cannot be assigned to the cluster.

### Examples

```
-> server-cluster 1 vlan 10 mac-address 00 :11 :22 :33 :44
-> server-cluster 5 vlan 10
-> server-cluster 5 mac-address 01:
-> server-cluster 6 mac-address 00 :11 :22 :33 :44 :55
```

### Release History

Release 7.2.1; command was introduced.

## Related Commands

<a href="#">server-cluster ip</a>	Configures the specified IP, ARP entry to a given cluster.
<a href="#">server-cluster port</a>	Configures the port or linkagg to be assigned to a specific cluster.
<a href="#">show server-cluster</a>	Displays the clusters configured in the system.
<a href="#">show mac-learning</a>	Displays Source Learning MAC Address Table information.

## MIB Objects

```
alaHAVlanClusterTable  
  alaHAVlanClusterId  
  alaHAVlanClusterVlan  
  alaHAVlanClusterMacAddress  
  alaHAVlanClusterRowStatus
```

---

## server-cluster ip

Configures an IP address and ARP entry for the specified cluster. This command is used to assign an IP address to an L3 cluster.

```
server-cluster cluster-id ip ip-address [ mac-address {static mac-address | dynamic}]
```

---

### Syntax Definitions

<i>cluster-id</i>	The numerical identifier of an existing server cluster.
<i>ip-address</i>	The unicast IP address to assign to the cluster.
<i>mac-address</i>	The MAC address for the static ARP entry.
<b>dynamic</b>	Dynamically resolve the ARP entry for the cluster.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- A cluster can be assigned an IP address an ARP entry MAC address. Each cluster should have a unique IP address.
- Reserved MAC address cannot be configured as an ARP.
- Modifying the existing IP address parameters for a cluster is only allowed when the cluster is administratively disabled.

### Examples

```
-> server-cluster 1 ip 10.135.33.203 mac-address static 00 :11 :22 :33 :44
-> server-cluster 3 ip 10.135.33.205 mac-address dynamic
-> server-cluster 5 ip 10.135.33.207
-> server-cluster 6 mac-address dynamic
-> server-cluster 7 mac-address static 00 :11 :22 :33 :44
```

### Release History

Release 7.2.1; command was introduced.

## Related Commands

<a href="#">server-cluster mac-address</a>	Configures a MAC address of the specified cluster.
<a href="#">server-cluster port</a>	Configures the port or linkagg to be assigned to a specific cluster.
<a href="#">show server-cluster</a>	Displays the clusters configured in the system.

## MIB Objects

```
alaHAVlanClusterTable  
  alaHAVlanClusterId  
  alaHAVlanClusterIfIndex  
  alaHAVlanClusterInetAddressType  
  alaHAVlanClusterInetAddress  
  alaHAVlanClusterMacAddressType  
  alaHAVlanClusterMacAddress  
  alaHAVlanClusterMulticastStatus  
  alaHAVlanClusterMulticastInetAddressType  
  alaHAVlanClusterMulticastInetAddress  
  alaHAVlanClusterRowStatus
```

---

## server-cluster igmp mode

Configures the IGMP mode status for specified cluster.

```
server-cluster cluster-id igmp-mode {enable | disable}
```

---

### Syntax Definitions

<i>cluster-id</i>	The numerical identifier of an existing server cluster.
<b>enable</b>	Enables IGMP mode for cluster ports.
<b>disable</b>	Disables IGMP mode for cluster ports.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- When the IGMP mode is enabled for the cluster, the port list is dynamically learned using the IGMP protocol for the configured IP multicast address.
- For HA VLAN IGMP to work, IGMP must be enabled globally on the switch using the command **ip multicast admin-state enable** command.

### Examples

```
-> server-cluster 4 igmp-mode enable  
-> server-cluster 4 igmp-mode disable
```

### Release History

Release 7.2.1; command was introduced.

### Related Commands

<a href="#">server-cluster ip</a>	Configures the specified IP, ARP entry to a given cluster.
<a href="#">show server-cluster</a>	Displays the clusters configured in the system.

### MIB Objects

```
alaHAVlanClusterTable  
  alaHAVlanClusterId  
  alaHAVlanClusterIfIndex  
  alaHAVlanClusterInetAddressType  
  alaHAVlanClusterInetAddress
```

---

```
alaHAVlanClusterMacAddressType  
alaHAVlanClusterMacAddress  
alaHAVlanClusterMulticastStatus  
alaHAVlanClusterMulticastInetAddressType  
alaHAVlanClusterMulticastInetAddress  
alaHAVlanClusterRowStatus
```

---

## server-cluster ip-multicast

Configures a multicast IP address for the specified cluster. This command configures an IP multicast address for an L3 cluster.

```
server-cluster cluster-id ip-multicast ipm-address
```

---

### Syntax Definitions

<i>cluster-id</i>	The numerical identifier of an existing server cluster.
<i>ipm-address</i>	The multicast IP address to assign to the cluster.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- The cluster ID specified with this command must already exist in the switch configuration.
- A cluster can be assigned an IP address an ARP entry MAC address. Each cluster should have a unique IP-address. IP address is configurable only for L3 clusters
- Cluster parameters like IP, multicast IP and MAC address can be modified only when the cluster admin status is disabled.

### Examples

```
-> server-cluster 2 ip-multicast 226.0.0.12  
-> server-cluster 4 ip-multicast 226.0.0.14
```

### Release History

Release 7.2.1; command was introduced.

### Related Commands

<a href="#">server-cluster</a>	Configures cluster parameters to create or modify a cluster ID.
<a href="#">show server-cluster</a>	Displays the clusters configured in the system.

### MIB Objects

```
alaHAVlanClusterTable  
  alaHAVlanClusterId  
  alaHAVlanClusterIfIndex  
  alaHAVlanClusterInetAddressType  
  alaHAVlanClusterInetAddress  
  alaHAVlanClusterMacAddressType
```

---

```
alaHAVlanClusterMacAddress  
alaHAVlanClusterMulticastStatus  
alaHAVlanClusterMulticastInetAddressType  
alaHAVlanClusterMulticastInetAddress  
alaHAVlanClusterRowStatus
```

---

## server-cluster port

Configures a port assignment for the port list of the specified cluster.

```
server-cluster cluster-id port {slot/port[-port2] | all}
```

```
no server-cluster cluster-id port {slot/port[-port2] | all}
```

---

### Syntax Definitions

<i>cluster-id</i>	The numerical identifier of an existing server cluster.
<i>slot/port</i>	The slot and port number to assign to the cluster port list. Use a hyphen to specify a range of ports (1/15-20).
all	Assigns all of the ports that belong to the associated VLAN and NOT all ports on the NI. This parameter applies only to L3 clusters.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove a port from the specified cluster port list.
- The cluster ID specified with this command must already exist in the switch configuration.
- Using a port list is not valid for a cluster operating with IGMP mode enabled.
- The **all** parameter does not apply to L2 clusters.

### Examples

```
-> server-cluster 1 port 1/21
-> server-cluster 2 port 1/21-23
-> server-cluster 5 port all
-> no server-cluster 1 port 1/21
-> no server-cluster 2 port 1/21-23
-> no server-cluster 3 port all
```

### Release History

Release 7.2.1; command was introduced.

## Related Commands

<a href="#">server-cluster</a>	Configures cluster parameters to create or modify a cluster ID.
<a href="#">show server-cluster</a>	Displays the clusters configured in the system.
<a href="#">show mac-learning</a>	Displays Source Learning MAC Address table information.
<a href="#">show vlan</a>	Displays a list of existing VLANs.
<a href="#">show vlan members</a>	Displays VLAN port assignments.

## MIB Objects

```
alaHAVlanClusterPortTable  
  alaHAVlanClusterId  
  alaHAVlanClusterPortIfIndex  
  alaHAVlanClusterPortRowStatus
```

---

## server-cluster linkagg

Configures a link aggregate assignment for the port list of the specified cluster.

```
server-cluster cluster-id linkagg agg_id[-agg_id2]
```

```
no server-cluster cluster-id linkagg agg_id[-agg_id2]
```

---

### Syntax Definitions

<i>cluster-id</i>	The numerical identifier of an existing server cluster.
<i>agg_id</i> [- <i>agg_id2</i> ]	The link aggregate ID number to assign to the cluster port list. Use a hyphen to specify a range of IDs (10-15).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove a link aggregate ID from the specified cluster port list.
- The cluster ID and link aggregate ID specified with this command must already exist in the switch configuration.
- Using a port list is not valid for a cluster operating with IGMP mode enabled.

### Examples

```
-> server-cluster 3 linkagg 1  
-> server-cluster 4 linkagg 1-3  
-> no server-cluster 3 linkagg 1
```

### Release History

Release 7.2.1; command was introduced.

## Related Commands

<a href="#">server-cluster</a>	Configures cluster parameters to create or modify a cluster ID.
<a href="#">show server-cluster</a>	Displays the clusters configured in the system.
<a href="#">show mac-learning</a>	Displays Source Learning MAC Address table information.
<a href="#">show vlan</a>	Displays a list of existing VLANs.
<a href="#">show vlan members</a>	Displays VLAN port assignments.

## MIB Objects

```
alaHAVlanClusterPortTable  
  alaHAVlanClusterId  
  alaHAVlanClusterPortIfIndex  
  alaHAVlanClusterPortRowStatus
```

---

## show server-cluster

Displays the cluster configuration information for the switch.

```
show server-cluster [cluster-id [port]]
```

---

### Syntax Definitions

<i>cluster-id</i>	The numerical identifier of an existing server cluster.
<b>port</b>	Displays the ports and/or link aggregates assigned to a specific cluster.

### Defaults

Displays a list of all server clusters configured for the switch.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Specify a cluster ID with this command to display information for a single cluster.
- Use the **port** parameter with the *cluster-id* parameter to display information about the ports assigned to the specified cluster.
- Operational flag indicates the reason the cluster is down.
- An asterisk (\*) is displayed to indicate invalid cases as shown in the command example.

### Examples

```
-> show server-cluster 1
Cluster Id       : 1,
Cluster Name     : L2-cluster,
Cluster Mode     : L2,
Cluster Mac-Address : 01:10:11:22:33:44,
Cluster Vlan     : 12,
Administrative State: Enabled,
Operational State : Disabled,
Operational Flag  : VPA is not forwarding
```

```
-> show server-cluster 2
Cluster Id       : 2,
Cluster Name     : -,
Cluster Mode     : L3,
Cluster IP       : 10.135.33.203,
Cluster Mac-Address : 01:10:11:22:33:44,
Cluster Mac Type  : Dynamic,
IGMP-Mode        : Disabled,
Cluster Multicast IP: -,
Administrative State: Enabled,
Operational State : Enabled,
Operational Flag  : -
```

```
-> show server-cluster 3
Cluster Id       : 3,
Cluster Name     : L3-cluster,
Cluster Mode     : L3,
Cluster IP       : 10.135.33.203,
Cluster Mac Type : Dynamic,
Cluster Mac-Address : 01:00:5e:00:11:22,
IGMP-Mode       : Enabled,
Cluster Multicast IP: 225.0.1.2,
Administrative State: Disabled,
Operational State : Disabled,
Operational Flag  : No IGMP reports received
```

### output definitions

<b>Cluster ID</b>	The numerical identifier of a cluster.
<b>Cluster Name</b>	The name representing the cluster.
<b>Cluster Mode</b>	Displays the cluster mode as <b>L2</b> or <b>L3</b> .
<b>Cluster IP</b>	The IP address associated with the cluster.
<b>Cluster Mac Type</b>	The type of cluster, <b>Static</b> or <b>Dynamic</b> .
<b>Cluster Mac-Address</b>	The MAC address associated with the cluster.
<b>IGMP-mode</b>	Specifies the status of IGMP-mode, <b>Enabled</b> or <b>Disabled</b> .
<b>Cluster Multicast IP</b>	The multicast IP address associated with the cluster.
<b>Administrative State</b>	Specifies the administrative status of the cluster, <b>Enabled</b> or <b>Disabled</b> .
<b>Operational State</b>	Specifies the operational status of the cluster, <b>Enabled</b> or <b>Disabled</b> .
<b>Operational Flag</b>	Specifies the reason the cluster is operationally down.

```
-> show server-cluster
```

Legend: \* = not valid

Cluster	Mode	Vlan	Mac Address	Ip Address	IGMP Address	Name
* 10	L2	100	01:10:11:22:33:44	-	-	cluster1
11	L2	100	01:10:11:22:33:44	-	-	cluster2

# 6 Distributed Spanning Tree Commands

The Spanning Tree Algorithm and Protocol (STP) is a self-configuring algorithm that maintains a loop-free topology while providing data path redundancy and network scalability. Based on the IEEE 802.1D standard, the Alcatel-Lucent STP implementation distributes the Spanning Tree load between the primary management module and the network interface modules. This functionality improves network robustness by providing a Spanning Tree that continues to respond to BPDUs and port link up and down states in the event of a fail over to a backup management module or switch.

In addition to a distributed architecture, this implementation also provides the following Spanning Tree features:

- Automatic configuration of a physical topology into a single Spanning Tree to ensure that there is only one data path between any two switches.
- Fault tolerance within the network topology. The Spanning Tree is reconfigured in the event of a data path or bridge failure or when a new switch is added to the topology.
- Support for four Spanning Tree protocols: 802.1D (STP), 802.1W (RSTP), and 802.1Q 2005 (MSTP).
- A *flat* Spanning Tree operating mode. If STP or RSTP is used, this mode applies a single STP instance across all VLANs. If MSTP is used, this mode applies a single STP instance to each Multiple Spanning Tree Instance (MSTI), which identifies a set of VLANs.
- A *per-VLAN* Spanning Tree operating mode that applies a single STP instance for each defined VLAN on the switch.
- An STP topology that includes 802.1Q tagged ports and link aggregate logical ports in the calculation of the physical topology.

MIB information for Distributed Spanning Tree commands is as follows:

*Filename:* AlcatelIND1VlanSTP.MIB  
*Module:* STP-MGMT-MIB

A summary of the available commands is listed here:

<b>Bridge commands</b>	<ul style="list-style-type: none"> <li>spantree mode</li> <li>spantree protocol</li> <li>spantree priority</li> <li>spantree hello-time</li> <li>spantree max-age</li> <li>spantree forward-delay</li> <li>spantree bpdu-switching</li> <li>spantree path-cost-mode</li> <li>spantree vlan admin-state</li> <li>spantree auto-vlan-containment</li> <li>show spantree</li> <li>show spantree cist</li> <li>show spantree msti</li> <li>show spantree vlan</li> <li>show spantree mode</li> </ul>
<b>Port commands</b>	<ul style="list-style-type: none"> <li>spantree cist</li> <li>spantree vlan</li> <li>spantree priority</li> <li>spantree cist path-cost</li> <li>spantree msti path-cost</li> <li>spantree vlan path-cost</li> <li>spantree cist mode</li> <li>spantree vlan mode</li> <li>spantree cist connection</li> <li>spantree vlan connection</li> <li>spantree cist admin-edge</li> <li>spantree vlan admin-edge</li> <li>spantree cist auto-edge</li> <li>spantree vlan auto-edge</li> <li>spantree cist restricted-role</li> <li>spantree vlan restricted-role</li> <li>spantree cist restricted-tcn</li> <li>spantree vlan restricted-tcn</li> <li>spantree cist txholdcount</li> <li>spantree vlan txholdcount</li> <li>show spantree ports</li> <li>show spantree cist ports</li> <li>show spantree msti ports</li> <li>show spantree vlan ports</li> </ul>
<b>MST region commands</b>	<ul style="list-style-type: none"> <li>spantree mst region name</li> <li>spantree mst region revision-level</li> <li>spantree mst region max-hops</li> <li>show spantree mst</li> </ul>
<b>MST instance commands</b>	<ul style="list-style-type: none"> <li>spantree msti</li> <li>spantree msti vlan</li> <li>show spantree msti vlan-map</li> <li>show spantree cist vlan-map</li> <li>show spantree map-msti</li> </ul>
<b>PVST+ commands</b>	<ul style="list-style-type: none"> <li>spantree pvst+compatibility</li> </ul>

## spantree mode

Selects the flat Spanning Tree or per-VLAN Spanning Tree operating mode for the switch. These modes are exclusive; however, it is not necessary to reboot the switch when the STP modes are changed.

**spantree mode** {flat | per-vlan}

---

### Syntax Definitions

<b>flat</b>	One Spanning Tree instance per switch.
<b>per-vlan</b>	One Spanning Tree instance for each VLAN configured on a switch.

### Defaults

By default, the Spanning Tree mode for the switch is set to per-VLAN.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The Multiple Spanning Tree Protocol (MSTP), as defined in the IEEE 802.1Q 2005 standard, is only supported on switches operating in the flat Spanning Tree mode.
- If standard STP or RSTP is used when the switch is running in the flat mode, a single STP instance is applied across all VLANs. For example, if a port belonging to VLAN 10 and a port belonging to VLAN 20 connect to the same switch together, then STP blocks one of these ports.
- If MSTP is used when the switch is running in the flat mode, a single STP instance is applied to each Multiple Spanning Tree Instance (MSTI). Each MSTI represents a set of VLANs.
- Flat Spanning Tree mode supports fixed (untagged) and 802.1Q tagged ports in each VLAN. However, Bridge Protocol Data Units (BPDUs) are always untagged.
- If the per-VLAN mode is selected, a single Spanning Tree instance is enabled for each VLAN configured on the switch. For example, if there are five VLANs configured on the switch, then there are five separate Spanning Tree instances. In essence, a VLAN is a virtual bridge that has its own bridge ID and configurable STP parameters, such as protocol, priority, hello time, max-age, and forward delay.
- When operating in per-VLAN mode, 802.1Q tagged ports participate in an 802.1Q Spanning Tree instance that allows the Spanning Tree to extend across tagged VLANs. As a result, a tagged port can participate in more than one Spanning Tree instance; one for each VLAN that the port carries.
- If a VLAN contains both fixed and tagged ports and the switch is operating in per-VLAN Spanning Tree mode, then a hybrid of the two Spanning Tree instances (single and 802.1Q) is applied. If a VLAN appears as a tag on a port, then the BPDU for that VLAN are also tagged. However, if a VLAN appears as the configured default VLAN for the port, then BPDU are not tagged and the single Spanning Tree instance applies.
- Regardless of which mode the switch is running in, it is possible to administratively disable the Spanning Tree status for an individual VLAN (see [Chapter 4, “VLAN Management Commands”](#)).

---

**Note.** Active ports associated with such a VLAN are excluded from any Spanning Tree calculations and remain in a forwarding state.

---

## Examples

```
-> spantree mode flat
-> spantree mode per-vlan
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">spantree protocol</a>	Selects the Spanning Tree protocol for the specified instance.
<a href="#">spantree bpdu-switching</a>	Enables the switching of Spanning Tree BPDU on a VLAN that has Spanning Tree disabled.
<a href="#">show spantree</a>	Displays VLAN Spanning Tree parameter values.

## MIB Objects

```
vStpTable
  vStpNumber
  vStpMode
```

---

## spantree protocol

Configures the Spanning Tree protocol for the flat mode Common and Internal Spanning Tree (CIST) instance or for an individual VLAN instance.

```
spantree [cist | vlan vlan_id] protocol {stp | rstp | mstp}
```

---

### Syntax Definitions

<b>cist</b>	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
<i>vlan_id</i>	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
<b>stp</b>	IEEE 802.1D standard Spanning Tree Algorithm and Protocol.
<b>rstp</b>	IEEE 802.1W Rapid Spanning Tree Protocol.
<b>mstp</b>	IEEE 802.1Q 2005 Multiple Spanning Tree Protocol. This protocol is not supported on a per-VLAN basis.

### Defaults

By default, the Spanning Tree protocol is set to RSTP.

parameter	default
<b>cist   vlan <i>vlan_id</i></b>	<b>cist</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the optional **cist** or **vlan** parameter is not specified with this command, the protocol is set for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active.

---

**Note.** Selecting MSTP is only an option for the flat mode CIST instance and is required to configure Multiple Spanning Tree Instances (MSTI).

---

- MSTP is only active when the switch is operating in the flat Spanning Tree mode. STP and RSTP are active when the switch is operating in either the flat or per-VLAN Spanning Tree mode.
- Deleting all existing MSTIs is required before changing the protocol from MSTP to STP or RSTP.

---

**Note.** When the protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values. However, if the path cost mode was set to 32-bit prior to the protocol change, the path cost is *not* reset to the default value. See the [spantree path-cost-mode](#) command page for more information.

---

## Examples

```
-> spantree protocol mstp
-> spantree cist protocol mstp
-> spantree vlan 5 protocol rstp
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">spantree mode</a>	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
<a href="#">show spantree</a>	Displays the Spanning Tree instance configuration.

## MIB Objects

vStpInsTable
  vStpInsNumber
  vStpInsMode
  vStpInsProtocolSpecification
```

---

## spantree vlan admin-state

Enables or disables the Spanning Tree status for a VLAN.

```
spantree vlan vlan_id [-vlan_id2] admin-state {enable | disable}
```

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	An existing VLAN ID number. Use a hyphen to specify a range of VLANs (10-15).
<b>enable</b>	Enables Spanning Tree for the specified VLAN.
<b>disable</b>	Disables Spanning Tree for the specified VLAN.

### Defaults

By default, the Spanning tree status is enabled for a VLAN instance.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

VLAN Spanning Tree instances are only active when the switch is running in the per-VLAN mode. However, configuring the VLAN Spanning Tree status is allowed in both modes (per-VLAN and flat).

### Examples

```
-> spantree vlan 850-900 admin-state enable
-> spantree vlan 720-750 admin-state disable
-> spantree vlan 500 admin-state disable
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">vlan</a>	Creates a VLAN.
<a href="#">show vlan</a>	Displays a list of existing VLANs.
<a href="#">show vlan members</a>	Displays VLAN port assignments.

### MIB Objects

```
vlanTable
  vlanNumber
  vlanAdmStatus
  vlanOperStatus
  vlanStatus
```

---

## spantree mst region name

Defines the name for a Multiple Spanning Tree (MST) region. One of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

**spantree mst region name** *name*

**no spantree mst region name**

---

### Syntax Definitions

*name* An alphanumeric string. Use quotes around string if the name contains multiple words with spaces between them (for example “Alcatel-Lucent Marketing”).

### Defaults

By default, the MST region name is left blank.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove the MST region name.

---

**Note.** It is not necessary to specify the region name to remove it.

---

- To change the existing region, use this command with a string value that is different than the existing region name.
- Specifying an MST region name is allowed regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values, such as region name, only apply when the switch is operating in the flat Spanning Tree mode and using MSTP.

### Examples

```
-> spantree mst region name SalesRegion
-> spantree mst region name "Alcatel-Lucent Marketing"
-> no spantree mst region name
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<b>spantree mst region revision-level</b>	Defines the revision level for an MST region.
<b>spantree mst region max-hops</b>	Defines the maximum number of hops for the MST region.
<b>spantree msti</b>	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
<b>spantree msti vlan</b>	Defines an association between a range of VLANs and a single MSTI.

## MIB Objects

vStpMstRegionTable  
    vStpMstRegionNumber  
    vStpMstRegionConfigName

---

## spantree mst region revision-level

Defines the revision level for a Multiple Spanning Tree (MST) region. One of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

**spantree mst region revision-level** *rev\_level*

---

### Syntax Definitions

*rev\_level*                                      A numeric value that identifies the MST region revision level for the switch.

### Defaults

By default, the MST revision level is set to zero.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

An MST region revision level can be assigned to the MST region regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values, such as revision level, only apply when the switch is operating in the flat Spanning Tree mode, using the MSTP.

### Examples

```
-> spantree mst region revision-level 1000
-> spantree mst region revision-level 2000
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">spantree mst region name</a>	Defines the name for an MST region.
<a href="#">spantree mst region max-hops</a>	Defines the maximum number of hops for the MST region.
<a href="#">spantree msti</a>	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
<a href="#">spantree msti vlan</a>	Defines an association between a range of VLANs and a single MSTI.

### MIB Objects

```
vStpMstRegionTable
  vStpMstRegionNumber
  vStpMstRegionConfigRevisionLevel
```

---

## spantree mst region max-hops

Configures the maximum number of hops that are authorized to receive Multiple Spanning Tree (MST) regional information. Use this command to assign the maximum number of hops a BPDU is allowed to traverse, before it is discarded and related information is aged out.

```
spantree mst region max-hops max_hops
```

---

### Syntax Definitions

*max\_hops* A numeric value that designates the maximum number of hops.

### Defaults

By default, the maximum number of hops is set to 20.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The value configured with this command is a regional value that applies to all instances and is used to determine the size of the region.
- The maximum hop count value is the initial value of the “remaining hops” parameter in the MST BPDU that originates from the bridge that is serving as the root bridge for the region. Each bridge that in turn receives the MST BPDU decrements the “remaining hops” count value by one and passes the new value along to the next bridge. When the count reaches 0, the BPDU is discarded.
- Specifying an MST maximum hop count is allowed regardless of which Spanning Tree operating mode or protocol is currently active on the switch. However, MST configuration values only apply when the switch is operating in the flat Spanning Tree mode and using the MSTP.

### Examples

```
-> spantree mst region max-hops 40
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<code>spantree mst region name</code>	Defines the name for an MST region.
<code>spantree mst region revision-level</code>	Defines the revision level for an MST region.
<code>spantree msti</code>	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.
<code>spantree msti vlan</code>	Defines an association between a range of VLANs and a single MSTI.

## MIB Objects

```
vStpMstRegionTable  
  vStpMstRegionNumber  
  vStpMstRegionMaxHops
```

---

## spantree msti

Defines a Multiple Spanning Tree Instance (MSTI) number. This number identifies an association between a range of VLANs and a single Spanning Tree instance. In addition, it is possible to assign an optional name to the MSTI for further identification.

**spantree msti** *msti\_id* [**name** *name*]

**no spantree msti** *msti\_id* [**name**]

---

### Syntax Definitions

<i>msti_id</i>	A numeric MSTI ID number. A range of VLANs is associated to an MSTI ID number.
<i>name</i>	An alphanumeric string. Use quotes around string if the name contains multiple words with spaces between them (for example “Alcatel-Lucent Marketing”).

### Defaults

By default, a flat mode Common and Internal Spanning Tree (CIST) instance always exists. The MSTI ID number for this instance is 0.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove the MSTI from the switch configuration.
- Use the **no** form of this command along with the **name** parameter to remove the optional MSTI name from the specified instance. The instance itself is not removed; only the name.
- There is always one CIST per switch. Initially all VLANs are associated with the CIST instance.
- Creating an MSTI is allowed when the switch is operating in either the per-VLAN or flat Spanning Tree mode, as long as MSTP is the selected flat mode protocol. The MSTI configuration, however, is not active unless the switch is running in the flat mode.

### Examples

```
-> spantree msti 10
-> spantree msti 20 name BldgOneST10
-> no spantree msti 20 name
-> no spantree msti 10
```

### Release History

Release 7.1.1; command introduced.

  vStpMstInstanceVlanBitmapDeletion  
  vStpMstInstanceVlanBitmapState
```

---

## spantree msti vlan

Defines an association between a range of VLANs and a single Multiple Spanning Tree Instance (MSTI). The MSTI-to-VLAN mapping created with this command is one of three attributes (name, revision level, and a VLAN to MST instance association table) that defines an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same attribute values are all considered part of the same MST region. Currently each switch can belong to one MST region at a time.

```
spantree msti msti_id vlan vlan_id[-vlan_id2]
```

```
no spantree msti msti_id vlan vlan_id[-vlan_id2]
```

---

### Syntax Definitions

<i>msti_id</i>	A numeric MSTI identification number. A range of VLANs are associated to an MSTI ID number.
<i>vlan_id</i>	A VLAN ID number.
[ <i>vlan_id2</i> ]	The last VLAN ID in a range of VLAN IDs.

### Defaults

By default, all VLANs are associated with the flat mode Common and Internal Spanning Tree (CIST) instance, which is also known as MSTI 0.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a VLAN or a range of VLANs from the specified MSTI association.
- Note that the VLAN ID specified with this command does not have to already exist in the switch configuration. This command maps VLAN IDs to MSTIs, but does not create VLANs.
- A VLAN is associated with only one MSTI at a time, but it is possible to move a VLAN from one MSTI to another. In addition, it is also possible to assign only one VLAN to an MSTI; a range of VLANs is not required.
- To associate multiple VLANs in a single command, use a hyphen to specify a range of VLAN IDs and a space to separate multiple VLAN IDs and/or ranges (for example 100-115 122 135 200-210).
- Configuring an MSTI-to-VLAN mapping is allowed when the switch is operating in either the per-VLAN or flat Spanning Tree mode, as long as MSTP is the selected flat mode protocol. The MSTI configuration, however, is not active unless the switch is running in the flat mode.

### Examples

```
-> spantree msti 10 vlan 100-115
-> spantree msti 20 vlan 122
-> no spantree msti 10 vlan 100-115
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<b>spantree mst region name</b>	Defines the name for an MST region.

<b>spantree mst region max-hops</b>	Defines the maximum number of hops for the MST region.
<b>spantree msti</b>	Defines a MSTI number that identifies an association between a range of VLANs and a Spanning Tree instance.

## MIB Objects

```
vStpMstVlanAssignmentTable  
  vStpMstVlanAssignmentVlanNumber  
  vStpMstVlanAssignmentEntry  
  vStpMstVlanAssignmentMstiNumber
```

---

## spantree priority

Configures the bridge priority value for the Common and Internal Spanning Tree (CIST) instance, a Multiple Spanning Tree Instance (MSTI), or a VLAN instance. This command is also used to configure the priority value for a port or link aggregate associated with the CIST, an MSTI, or a VLAN.

```
spantree [cist | msti msti_id | vlan vlan_id] [port slot/port[-port2] / linkagg linkagg_id[-linkagg_id2]]
priority priority
```

---

### Syntax Definitions

<b>cist</b>	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
<i>msti_id</i>	An existing MSTI ID number. If MSTI 0 is specified, the priority applies to the CIST instance. This parameter is configurable in both modes (flat or per-VLAN) but only if the flat mode protocol is set to MSTP.
<i>vlan_id</i>	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id[-linkagg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>priority</i>	A bridge or port priority value. The valid range for the bridge priority is 0–65535. The valid range for the port priority is 0–15. If MSTP is the active flat mode protocol, enter a value that is a multiple of 4096 (for example, 4096, 8192, 12288).

### Defaults

- By default, the bridge priority value is set to 32768 for the CIST, an MSTI, and a VLAN instance.
- By default, the port or link aggregate priority value is set to 7.

parameter	default
<b>cist</b> / <b>msti</b> <i>msti_id</i> / <b>vlan</b> <i>vlan_id</i>	<b>cist</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The bridge priority is used to determine which bridge the Spanning Tree algorithm designates as the root bridge. The port priority value is used to determine the most favorable port when a bridge has multiple ports with the same path cost to the root bridge.
- The lower the bridge or port priority number assigned, the higher the priority that is associated with the bridge or port.

- If none of the optional instance parameters (**cist**, **msti**, or **vlan**) or **port** and **linkagg** parameters are specified with this command, the bridge priority is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the **cist**, **msti**, and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified priority values are not applied unless the supporting mode (flat for CIST/MSTI or per-VLAN for a VLAN instance) is active.
- To configure the bridge priority with this command, specify the instance (**cist**, **msti**, or **vlan**) and the priority value; do not specify a port number or link aggregate ID.
- The bridge priority value for an MSTI is calculated by adding the configured priority value to the Spanning Tree instance number. For example, if the priority value of MSTI 10 equals 32768 (the default), then the Spanning Tree priority value advertised for this instance is 32770 (32768 + 10).
- When the protocol is changed to/from MSTP, the bridge priority for the flat mode CIST instance is reset to the default value.
- The bridge priority specifies the priority value for the first two octets of the Bridge ID (eight octets long). The remaining six octets of the Bridge ID contain a dedicated bridge MAC address. In regards to the priority for an MSTI, only the four most significant bits are used.
- To configure the port priority with this command, specify the instance (**cist**, **msti**, or **vlan**), a port number or link aggregate ID that is associated with that instance, and the priority value.
- The port priority value configured with this command is only applied to the specified instance. As a result, a single port can have different priority values for each instance. For example, in flat mode, port 1/24 can have a priority value of 7 for MSTI 2 and a priority value of 5 for MSTI 3.
- The port priority specifies the value of the priority field contained in the first byte of the port ID. The second byte contains the physical switch port number.

## Examples

The following command examples set the bridge priority for the specified instance:

```
-> spantree priority 8192
-> spantree cist priority 8192
-> spantree vlan 2 priority 32679
-> spantree msti 1 priority 2500
ERROR: Valid bridge priority values are multiples of 4096: 0, 4096,
      8192, 12288, 16384 ... 61440
-> spantree msti 1 priority 8192
```

The following command examples set the port priority for the specified instance:

```
-> spantree port 1/10 priority 10
-> spantree cist port 1/10 priority 10
-> spantree cist linkagg 10 priority 1
-> spantree vlan 200 port 2/1 priority 15
-> spantree vlan 2 linkagg 5 priority 2
-> spantree msti 2 port 1/24 priority 5
-> spantree msti 3 linkagg 6-8 priority 10
```

## Release History

Release 7.1.1; command introduced.

  vStpInsNumber  
  vStpInsMode  
  vStpInsPriority  
  vStpInsBridgeAddress
```

---

## spantree hello-time

Configures the Spanning Tree hello time value for the flat mode Common and Internal Spanning Tree (CIST) instance or for a per-VLAN mode VLAN instance. This value specifies the amount of time, in seconds, between each transmission of a BPDU on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root.

**spantree** [**cist** | **vlan** *vlan\_id*] **hello-time** *seconds*

---

### Syntax Definitions

<b>cist</b>	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
<i>vlan_id</i>	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
<i>seconds</i>	Specifies the Hello time value in seconds. The valid range is 1–10.

### Defaults

By default, the bridge hello time value is set to 2 seconds.

parameter	default
<b>cist</b>   <b>vlan</b> <i>vlan_id</i>	<b>cist</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Lowering the Hello Time interval improves the robustness of the Spanning Tree Algorithm. Increasing the Hello Time interval lowers the overhead of the Spanning Tree Algorithm.
- If the optional **cist** or **vlan** parameter is not specified with this command, the hello time is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the **cist** and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified hello time value is not applied unless the supporting mode (flat for CIST or per-VLAN for a VLAN instance) is active.
- Note that for Multiple Spanning Tree Instances (MSTI), the hello time value is inherited from the CIST instance and is not a configurable parameter.

### Examples

```
-> spantree hello-time 5
-> spantree cist hello-time 5
-> spantree vlan 10 hello-time 3
```

## Release History

  vStpInsMode  
  vStpInsBridgeHelloTime

---

## spantree max-age

Configures the bridge maximum age time value for the flat mode Common and Internal Spanning Tree (CIST) instance or for a per-VLAN mode VLAN instance. This value is the amount of time, in seconds, that the Spanning Tree Protocol information learned from the network on any port is retained. This information is discarded when it ages beyond the maximum age value.

```
spantree [cist | vlan vlan_id] max-age seconds
```

---

### Syntax Definitions

<b>cist</b>	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
<i>vlan_id</i>	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
<i>seconds</i>	Max-age time in seconds. The valid range is 6–40.

### Defaults

By default, the bridge maximum age time value is set to 20 seconds.

---

<b>parameter</b>	<b>default</b>
<b>cist</b>   <b>vlan</b> <i>vlan_id</i>	<b>cist</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- A low maximum age time causes the Spanning Tree Algorithm to reconfigure more often.
- If the optional **cist** or **vlan** parameter is not specified with this command, the maximum age time is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the **cist** and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified maximum age time value is not applied unless the supporting mode (flat for CIST or per-VLAN for a VLAN instance) is active.
- Note that for Multiple Spanning Tree Instances (MSTI), the maximum age time value is inherited from the CIST instance and is not a configurable parameter.

### Examples

```
-> spantree max-age 10
-> spantree cist max-age 10
-> spantree vlan 10 max-age 30
```

## Release History

Release 7.1.1; command introduced.

    vStpInsNumber

    vStpInsBridgeMaxAge

---

## spantree forward-delay

Configures the bridge forward delay time for the flat mode Common and Internal Spanning Tree (CIST) instance or for a per-VLAN mode VLAN instance. This value is the amount of time, in seconds, that determines how fast a port changes its Spanning Tree state until it reaches a forwarding state. The forward delay time specifies how long a port stays in the listening and learning states, which precede the forwarding state.

**spantree** [**cist** | **vlan** *vlan\_id*] **forward-delay** *seconds*

---

### Syntax Definitions

<b>cist</b>	The CIST instance (also known as MSTI 0). This parameter is configurable in both modes (flat or per-VLAN).
<i>vlan_id</i>	An existing VLAN ID number. This parameter is configurable in both modes (flat or per-VLAN).
<i>seconds</i>	Forward delay time, in seconds. The valid range is 4–30.

### Defaults

By default, the bridge forward delay time value is set to 15 seconds.

parameter	default
<b>cist</b>   <b>vlan</b> <i>vlan_id</i>	<b>cist</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- A low forward delay time can cause temporary loops in the network, because data may get forwarded before the reconfiguration message has reached all nodes on the network.
- The forward delay time is also used to age out all dynamic MAC address entries in the forwarding table (MAC address table) when a topology change occurs.
- If the optional **cist** or **vlan** parameter is not specified with this command, the forward delay time is configured for the CIST instance by default. This is true regardless of which mode (flat or per-VLAN) is active for the switch.
- Although the **cist** and **vlan** parameters are configurable in both the flat and per-VLAN mode, the specified forward delay time value is not applied unless the supporting mode (flat for CIST or per-VLAN for a VLAN instance) is active.
- Note that for Multiple Spanning Tree Instances (MSTI), the forward delay time is inherited from the CIST instance and is not a configurable parameter.

## Examples

```
-> spantree forward-delay 30
-> spantree cist forward-delay 30
-> spantree vlan 5 forward-delay 10
```

## Release History

---

## spantree bpdu-switching

Enables or disables the switching of Spanning Tree BPDU for VLAN and CIST instances if the switch is running in the per-VLAN mode.

```
spantree {vlan vlan_id | cist} bpdu-switching {enable | disable}
```

---

### Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<b>enable</b>	Enables BPDU switching for the specified instance.
<b>disable</b>	Disables BPDU switching for the specified instance.

### Defaults

By default, BPDU switching is disabled for VLAN or CIST instance.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Specifying the BPDU switching status for a VLAN does not depend on the current VLAN Spanning Tree status. For example, setting the BPDU switching status to enabled is allowed on a VLAN that also has Spanning Tree enabled.
- Use the **vlan** parameter along with the *vlan\_id* to enable or disable BPDU switching for a particular VLAN.
- Use the **cist** parameter to enable or disable BPDU switching for the CIST instance.

### Examples

```
-> spantree mode flat
-> spantree bpdu-switching enable
-> spantree bpdu-switching disable
-> spantree cist bpdu-switching enable
-> spantree cist bpdu-switching disable

-> spantree mode per-vlan
-> spantree vlan 10 bpdu-switching enable
-> spantree vlan 10 bpdu-switching disable
```

### Release History

Release 7.1.1; command introduced.

---

## spantree path-cost-mode

Configures the automatic selection of a 16-bit path cost for STP/RSTP ports and a 32-bit path cost for MSTP ports or sets all path costs to use a 32-bit value.

**spantree path-cost-mode {auto | 32bit}**

---

### Syntax Definitions

<b>auto</b>	The port path cost value is automatically set depending on which protocol is active on the switch (32-bit for MSTP, 16-bit for STP/RSTP).
<b>32bit</b>	Specifies that a 32-bit value is used for the port path cost value regardless of which protocol is active on the switch.

### Defaults

By default, the path cost mode is set to **auto**.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- All path cost values, except those for MSTIs, are reset to the default path cost value when this mode is changed.
- When connecting a switch running in the 32-bit path cost mode to a switch running in the 16-bit mode, the 32-bit switch has a higher path cost value and thus an inferior path cost to the 16-bit switch. To avoid this, use the **spantree path-cost-mode** command to change the 32-bit switch to a 16-bit switch.
- Note that when the protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values. The exception to this is if the path cost mode is set to 32-bit prior to the protocol change, the path cost is not reset to its default value

### Examples

```
-> spantree path-cost-mode 32bit  
-> spantree path-cost-mode auto
```

### Release History

Release 7.1.1; command introduced.

---

## spantree pvst+compatibility

Enables or disables PVST+ mode on the switch, port or link aggregate enabling them to operate with Cisco switches.

**spantree pvst+compatibility** {port *slot/port*] | linkagg *linkagg\_id*} {enable | disable | auto}

---

### Syntax Definitions

<b>enable</b>	Enables the PVST+ mode.
<b>disable</b>	Disables the PVST+ mode.
<b>auto</b>	IEEE BPDUs are used until a PVST+ BPDU is detected.
<i>slot/port</i>	Specifies the slot number for the module and the physical port number or a range of ports on that module (for example, 3/1 specifies port 1 on slot 3).
<i>linkagg_id</i>	Link aggregate ID number.

### Defaults

PVST+ is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- In order to handle PVST+ mode, the ports must be configured in per-VLAN mode.
- Specify **pvst+compatibility enable** to enable all the ports on the switch to handle PVST+ BPDUs.
- Initially, a port sends or receive IEEE BPDUs. Once a PVST+ BPDU is received, the port sends and receives only PVST+ BPDUs for tagged VLANs and IEEE BPDUs for default VLANs.

### Examples

```
-> spantree pvst+compatibility enable
-> spantree pvst+compatibility disable
-> spantree port 1/3 pvst+compatibility enable
-> spantree port 2/2 pvst+compatibility auto
-> spantree linkagg 2 pvst+compatibility enable
```

### Release History

---

## spantree auto-vlan-containment

Enables or disables Auto VLAN Containment (AVC). When enabled, AVC prevents a port that has no VLANs mapped to an Multiple Spanning Tree Instance (MSTI) from becoming the root port for that instance. Such ports are automatically assigned an infinite path cost value to make them an inferior choice for root port.

```
spantree [msti msti_id] auto-vlan-containment {enable | disable}
```

---

### Syntax Definitions

<i>msti_id</i>	An existing MSTI ID number. A range of VLANs are associated to an MSTI ID number.
<b>enable</b>	Enables automatic VLAN containment.
<b>disable</b>	Disables automatic VLAN containment.

### Defaults

By default, automatic VLAN containment is disabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The AVC feature is not active for any MSTI until it is globally enabled. To globally enable this feature, use the **spantree auto-vlan-containment** command but do not specify an *msti\_id*.
- When AVC is globally enabled, it is active for all MSTIs. To disable AVC for a single instance, specify the *msti\_id* for the instance and use the **disable** form of this command.
- Use the **enable** form of this command and specify an *msti\_id* to enable AVC for an instance that was previously disabled.
- An administratively set port path cost takes precedence and prevents AVC configuration of the path cost. However, if the port path cost is administratively set to zero, then the path cost is reset to the default value.
- Note that when AVC is disabled, a port assigned to a VLAN that is not mapped to a specific instance, can become the root port for that instance and cause a loss of connectivity between other VLANs.
- AVC does not have any effect on root bridges.

### Examples

```
-> spantree auto-vlan-containment enable
-> spantree auto-vlan-containment disable
-> spantree msti 1 auto-vlan-containment disable
-> spantree msti 1 auto-vlan-containment enable
```

## Release History

---

## spantree cist

Enables or disables the Spanning Tree status on a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance.

```
spantree cist {port slot/port[-port2] | linkagg linkagg_id[-linkagg_id2]} {enable | disable}
```

---

### Syntax Definitions

<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id[-linkagg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<b>enable</b>	Enables Spanning Tree on the specified port for the CIST instance.
<b>disable</b>	Disables Spanning Tree on the specified port for the CIST instance.

### Defaults

By default, the Spanning Tree status is enabled on eligible ports.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command only applies to the CIST instance regardless of which Spanning Tree operating mode (flat or per-VLAN) or protocol is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the Spanning Tree status configured for the port is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- When the Spanning Tree status is disabled on a port, the port is set to a forwarding state for the specified instance.
- Physical ports that are reserved for link aggregation do not participate in the Spanning Tree Algorithm. Instead, the algorithm is applied to the aggregate logical link (virtual port) that represents a collection of physical ports.

### Examples

```
-> spantree cist port 4/1 enable
-> spantree cist port 4/2-5 disable
-> spantree cist linkagg 16 disable
-> spantree cist linkagg 22-26 enable
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

    vStpInsPortNumber

    vStpInsPortEnable

---

## spantree vlan

Enables or disables the Spanning Tree status on a port or a link aggregate of ports for the specified VLAN instance.

```
spantree vlan vlan_id [-vlan2] {port slot/port[-port2] | linkagg linkagg_id[-linkagg_id2]} {enable | disable}
```

---

### Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<i>slot/port</i> [- <i>port2</i> ]	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id</i> [- <i>linkagg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<b>enable</b>	Enables Spanning Tree on the specified port for the specified instance.
<b>disable</b>	Disables Spanning Tree on the specified port for the specified instance.

### Defaults

By default, the Spanning Tree status is enabled on eligible ports.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which Spanning Tree operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the Spanning Tree status configured for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- When the Spanning Tree status is disabled on a port, the port is set to a forwarding state for the specified instance.
- If STP is disabled on a VLAN in the per-VLAN mode, the port Spanning Tree status is ignored and all active ports associated with the VLAN are put in a forwarding state and not included in the Spanning Tree Algorithm. Note that when this occurs, ports will *not* bridge BPDU unless the BPDU switching status for the VLAN is enabled.
- Physical ports that are reserved for link aggregation do not participate in the Spanning Tree Algorithm. Instead, the algorithm is applied to the aggregate logical link (virtual port) that represents a collection of physical ports.

### Examples

```
-> spantree vlan 2 port 4/1 enable  
-> spantree vlan 2 port 4/2-5 disable
```

```
-> spantree vlan 3 linkagg 16 disable
-> spantree vlan 3 linkagg 22-25 disable
```

  vStpInsPortEnable
```

---

## spantree cist path-cost

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance. This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

```
spantree cist {port slot/port[-port2] / linkagg linkagg_id[-linkagg_id2]} path-cost path_cost
```

---

### Syntax Definitions

<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id[-linkagg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>path_cost</i>	Path cost value. The valid range is 0 - 65535 for 16-bit, 0–200000000 for 32-bit.

### Defaults

By default, the path cost is set to zero.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command only applies to the port path cost value for the CIST instance regardless of which operating mode (flat or per-VLAN) or protocol is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the specified path cost value is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- Use the [spantree path-cost-mode](#) command to automatically select the path cost value based on the active Spanning Tree protocol (16-bit for STP and RSTP, 32-bit for MSTP) or to use a 32-bit path cost value regardless of which protocol is active.
- If a 32-bit path cost value is in use and the *path\_cost* is set to zero, the following recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
10 MB	2,000,000
100 MB	200,000
1 GB	20,000
10 Gbps	2,000

- Is a 16-bit path cost value is in use and the *path\_cost* is set to zero, the following IEEE 802.1D recommended default path cost values based on link speed are used:

<b>Link Speed</b>	<b>IEEE 802.1D Recommended Value</b>
4 Mbps	250
10 Mbps	100
16 Mbps	62
100 Mbps	19
1 Gbps	4
10 Gbps	2

- If a 32-bit path cost value is in use and the *path\_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used:

<b>Link Speed</b>	<b>Aggregate Size (number of links)</b>	<b>Default Path Cost Value</b>
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

- If a 16-bit path cost value is in use and the *path\_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used. Note that for Gigabit ports the aggregate size is not applicable in this case:

<b>Link Speed</b>	<b>Aggregate Size (number of links)</b>	<b>Default Path Cost Value</b>
10 Mbps	2	60
	4	40
	8	30
100 Mbps	2	12
	4	9
	8	7

---

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
1 Gbps	N/A	3
10 Gbps	N/A	1

---

### Examples

```
-> spantree cist port 4/1 path-cost 19
-> spantree cist port 4/2-5 path-cost 19
-> spantree cist linkagg 16 path-cost 12000
-> spantree cist linkagg 17-20 path-cost 12000
```

### Release History

### MIB Objects

```
vStpInsPortTable
  vStpInsPortNumber
  vStpInsPortPathCost
```

---

## spantree msti path-cost

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the specified flat mode Multiple Spanning Tree Instance (MSTI). This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

```
spantree msti msti_id {port slot/port[-port2] | linkagg linkagg_id[-linkagg_id2]} path-cost path_cost
```

---

### Syntax Definitions

<i>msti_id</i>	An existing MSTI ID number. If MSTI 0 is specified, the priority applies to the CIST instance.
<i>slot/port</i> [- <i>port2</i> ]	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id</i> [- <i>linkagg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>path_cost</i>	Path cost value. The valid range is 0 - 65535 for 16-bit, 0–200000000 for 32-bit.

### Defaults

By default, the path cost is set to zero.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command only applies to the specified MSTI regardless of which operating mode (flat or per-VLAN) is active for the switch. However, if MSTP is not the selected flat mode protocol, the path cost value for any MSTI is not configurable.
- Note that if zero is entered for the *msti\_id* value, the specified path cost value is applied to the CIST instance.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- The path cost value configured with this command is only applied to the specified instance. As a result, a single port can have a different path cost for each instance. For example, in flat mode, port 1/24 can have a path cost of 20000 for MSTI 2 and a path cost of 35000 for MSTI 3.
- If the switch is running in per-VLAN mode when this command is used, the specified path cost value is not active for the specified MSTI until the operating mode for the switch is changed to the flat mode.
- When MSTP is the active protocol on the switch, only a 32-bit path cost value is used. Using a 16-bit path cost value is not an option.

- If zero is entered for the *path\_cost* value, then the following recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
10 MB	2,000,000
100 MB	200,000
1 GB	20,000
10 Gbps	2,000

- If the *path\_cost* value for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

## Examples

```
-> spantree msti 0 port 4/1 path-cost 35000
-> spantree msti 0 port 1/20-24 path-cost 12000
-> spantree msti 2 linkagg 10 path-cost 20000
-> spantree msti 2 linkagg 10-12 path-cost 65000
```

## Release History

## spantree vlan path-cost

Configures the Spanning Tree path cost value for a port or a link aggregate of ports for the specified VLAN instance. This value is the contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops.

```
spantree vlan vlan_id {port slot/port[-port2] / linkagg linkagg_id [-linkagg_id2]} path-cost path_cost
```

---

### Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<i>slot/port</i> [- <i>port2</i> ]	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id</i> [- <i>linkagg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<i>path_cost</i>	Path cost value. The valid range is 0 - 65535 for 16-bit, 0–200000000 for 32-bit.

### Defaults

By default, the path cost is set to zero.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified path cost for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- Note that when the Spanning Tree protocol is changed to/from MSTP, the bridge priority and port path cost values for the flat mode CIST instance are reset to their default values.
- Use the [spantree path-cost-mode](#) command to automatically select the path cost value based on the active Spanning Tree protocol (16-bit for STP and RSTP, 32-bit for MSTP) or to use a 32-bit path cost value regardless of which protocol is active.
- If a 32-bit path cost value is in use and the *path\_cost* is set to zero, the following IEEE 802.1S recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1S Recommended Value
10 MB	2,000,000
100 MB	200,000

Link Speed	IEEE 802.1D Recommended Value
1 GB	20,000
10 Gbps	2,000

- If a 16-bit path cost value is in use and the *path\_cost* is set to zero, the following IEEE 802.1D recommended default path cost values based on link speed are used:

Link Speed	IEEE 802.1D Recommended Value
4 Mbps	250
10 Mbps	100
16 Mbps	62
100 Mbps	19
1 Gbps	4
10 Gbps	2

- If a 32-bit path cost value is in use and the *path\_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 MB	2	1,200,000
	4	800,000
	8	600,000
100 MB	2	120,000
	4	80,000
	8	60,000
1 GB	2	12,000
	4	8,000
	8	6,000
10 GB	2	1,200
	4	800
	8	600

- If a 16-bit path cost value is in use and the *path\_cost* for a link aggregate is set to zero, the following default values based on link speed and link aggregate size are used. Note that for Gigabit ports the aggregate size is not applicable in this case:

Link Speed	Aggregate Size (number of links)	Default Path Cost Value
10 Mbps	2	60
	4	40
	8	30
100 Mbps	2	12
	4	9
	8	7
1 Gbps	N/A	3
10 Gbps	N/A	1

### Examples

```
-> spantree vlan 200 port 4/1 path-cost 4
-> spantree vlan 200 port 4/2-5 path-cost 4
-> spantree vlan 300 linkagg 16 path-cost 200000
-> spantree vlan 500 linkagg 24-28 path-cost 20000
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

  vStpInsPortNumber
  vStpInsPortPathCost
```

## spantree cist mode

Configures manual mode (forwarding or blocking) or dynamic mode to manage the state of a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST) instance. Dynamic mode defers the management of the port state to the Spanning Tree algorithm.

**spantree cist {port slot/port[-port2] / linkagg linkagg\_id[-linkagg\_id2]} mode {forwarding | dynamic | blocking}**

---

### Syntax Definitions

<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id[-linkagg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<b>forwarding</b>	Sets the port state to forwarding.
<b>dynamic</b>	Port state is determined by the Spanning Tree algorithm.
<b>blocking</b>	Sets the port state to blocking.

### Defaults

By default, the port Spanning Tree mode is set to dynamic.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command only applies to the port Spanning Tree mode for the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the specified port mode is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- Ports manually configured to operate in a forwarding or blocking state do not participate in the Spanning Tree algorithm.
- When port state is manually set to forwarding or blocking, the port remains in that state until it is changed using this command.

### Examples

```
-> spantree cist port 4/1 mode forwarding
-> spantree cist port 4/2-5 mode forwarding
-> spantree cist linkagg 10 mode blocking
-> spantree cist linkagg 15-20 mode forwarding
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

### **spanree mode**

Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

### **spanree vlan mode**

Configures the Spanning Tree mode for a port or a link aggregate of ports for the specified VLAN instance.

## MIB Objects

vStpInsPortTable

    vStpInsPortNumber

    vStpInsPortManualMode

---

## spantree vlan mode

Configures Manual mode (forwarding or blocking) or Dynamic mode to manage the state of a port or a link aggregate of ports for the specified VLAN instance. Dynamic mode defers the management of the port state to the Spanning Tree algorithm.

```
spantree vlan vlan_id {port slot/port[-port2] | linkagg linkagg_id [-linkagg_id2]} mode {dynamic | blocking | forwarding}
```

---

### Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<i>slot/port</i> [- <i>port2</i> ]	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id</i> [- <i>linkagg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<b>dynamic</b>	Port state is determined by Spanning Tree algorithm.
<b>blocking</b>	Sets port state to blocking.
<b>forwarding</b>	Sets port state to forwarding.

### Defaults

By default, the port Spanning Tree mode is set to dynamic.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified mode for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- Ports manually configured to operate in a forwarding or blocking state do not participate in the Spanning Tree algorithm.
- When port state is manually set to forwarding or blocking, the port remains in that state until it is changed using this command.

### Examples

```
-> spantree vlan 255 port 4/1-4 mode forwarding
-> spantree vlan 355 port 1/24 mode dynamic
-> spantree vlan 450 linkagg 1 mode dynamic
-> spantree vlan 450 linkagg 1-5 mode dynamic
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

### [spantree mode](#)

Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

### [spantree cist mode](#)

Configures the Spanning Tree mode for a port or a link aggregate of ports for the CIST instance.

## MIB Objects

vStpInsPortTable

    vStpInsPortNumber

    vStpInsPortManualMode

---

## spantree cist connection

Configures the connection type for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

```
spantree cist {port slot/port [-port2] | linkagg linkagg_id [-linkagg_id2]} connection {noptp | ptp | autoptp}
```

---

### Syntax Definitions

<i>slot/port</i> [- <i>port2</i> ]	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id</i> [- <i>linkagg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<b>noptp</b>	Defines port connection type as no point to point link.
<b>ptp</b>	Defines port connection type as point to point link.
<b>autoptp</b>	Specifies that switch software automatically defines connection type as point-to-point or no point-to-point.

### Defaults

By default, the link connection type is set to auto point-to-point.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command only applies to the port connection type for the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in per-VLAN mode when this command is used, the specified port connection type is not active for the CIST instance until the operating mode for the switch is changed to the flat mode.
- A port is considered connected to a point-to-point LAN segment if the port belongs to a link aggregate of ports or if autonegotiation determines the port must run in full duplex mode or if full duplex mode was administratively set. Otherwise, the port is considered connected to a no point-to-point LAN segment.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point-to-point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

### Examples

```
-> spantree cist port 7/24 connection noptp
-> spantree cist port 7/25-28 connection ptp
-> spantree cist linkagg 5-10 connection autoptp
-> spantree cist linkagg 5-10 connection autoptp
```

## spantree vlan connection

Configures the connection type for a port or a link aggregate of ports for a VLAN instance.

```
spantree vlan vlan_id {port slot/port [-port2] / linkagg linkagg_id [-linkagg_id2]} connection {noptp | ptp | autoptp}
```

---

### Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<i>slot/port</i> [ <i>-port2</i> ]	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id</i> [ <i>-linkagg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-20).
<b>noptp</b>	Defines port connection type as no point-to-point link.
<b>ptp</b>	Defines port connection type as point-to-point link.
<b>autoptp</b>	Specifies that switch software automatically defines connection type as point-to-point or no point-to-point <i>and</i> whether or not the port is an edge port.

### Defaults

By default, the link connection type is set to auto point-to-point.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified connection type for the port is not active for the specified VLAN instance until the operating mode for the switch is changed to the per-VLAN mode.
- A port is considered connected to a point-to-point LAN segment if the port belongs to a link aggregate of ports or if autonegotiation determines the port must run in full duplex mode or if full duplex mode was administratively set. Otherwise, the port is considered connected to a no point-to-point LAN segment.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.

## Examples

```
-> spantree vlan 255 port 7/24 connection noptp
-> spantree vlan 255 port 7/25-27 connection ptp
-> spantree vlan 255 linkagg 3 connection autoptp
-> spantree vlan 255 linkagg 3-7 connection autoptp
```

Configures the administrative edge port status for a port or aggregate of ports for the CIST instance.

### [spantree cist auto-edge](#)

Configures whether or not Spanning Tree automatically determines the operational edge status of a port or an aggregate of ports for the flat mode CIST instance.

## MIB Objects

vStpInsPortTable

    vStpInsPortNumber

    vStpInsPortAdminConnectionType

    vStpInsPortOperConnectionType

---

## spantree cist admin-edge

Configures the administrative edge port status for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

```
spantree cist {port slot/port[-port2] / linkagg linkagg_id[-linkagg_id2]} admin-edge {enable | disable}
```

---

### Syntax Definitions

<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id[-linkagg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs
<b>enable</b>	Enables the administrative edge port status for the specified port-CIST instance.
<b>disable</b>	Disables the administrative edge port status for the specified port-CIST instance.

### Defaults

By default, the administrative edge port status is disabled (off).

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command only applies to the port connection type for the CIST instance regardless of which operating mode (flat or per-VLAN) is active on the switch.
- If the switch is running in the per-VLAN mode when this command is used, the specified edge port status is not active for the CIST instance until the switch is configured to run in the flat Spanning Tree mode.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as a point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point-to-point connection type.

## Examples

```
-> spantree cist linkagg 15 admin-edge enable
-> spantree cist linkagg 4-10 admin-edge enable
-> spantree cist port 8/25 admin-edge disable
-> spantree cist port 2/2-5 admin-edge enable
```

## spantree vlan admin-edge

Configures the administrative edge port status for a port or a link aggregate of ports for a VLAN instance.

```
spantree vlan vlan_id {port slot/port[-port2] | linkagg linkagg_id[-linkagg_id2]} admin-edge {enable | disable}
```

---

### Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<i>slot/port</i> [- <i>port2</i> ]	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id</i> [- <i>linkagg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs
<b>enable</b>	Enables the administrative edge port status for the specified port-VLAN instance.
<b>disable</b>	Disables the administrative edge port status for the specified port-VLAN instance.

### Defaults

By default, the administrative edge port status is disabled (off).

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified edge port status for the port is not active for the VLAN instance until the switch is configured to run in the per-VLAN Spanning Tree mode.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the port connection type is defined as point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on.) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point to point connection type.

## Examples

```
-> spantree vlan 4 linkagg 15 admin-edge enable
-> spantree vlan 5 linkagg 12-14 admin-edge enable
-> spantree vlan 255 port 8/23 admin-edge disable
-> spantree vlan 3 port 2/2-5 admin-edge enable
```

```

---

## spantree cist auto-edge

Configures whether or not Spanning Tree automatically determines the operational edge port status of a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

```
spantree cist {port slot/port[-port2] / linkagg linkagg_id [-linkagg_id2]} auto-edge {enable | disable}
```

---

### Syntax Definitions

<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id[-linkagg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs.
<b>enable</b>	Spanning Tree automatically determines edge port status.
<b>disable</b>	Spanning Tree does not automatically determine edge port status.

### Defaults

By default, automatic edge port status configuration is enabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command only applies to the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the per-VLAN mode when this command is used, the specified edge port status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the connection type of the port is defined as point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on.) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevents the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point to point connection type.

### Examples

```
-> spantree cist linkagg 15 auto-edge enable
-> spantree cist linkagg 10-12 auto-edge disable
-> spantree cist port 8/23 auto-edge disable
-> spantree cist port 2/2-5 auto-edge enable
```

```
spantree vlan vlan_id {port slot/port[-port2] | linkagg linkagg_id [-linkagg_id2]} auto-edge {enable | disable}
```

---

### Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<i>slot/port</i> [- <i>port2</i> ]	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id</i> [- <i>linkagg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs.
<b>enable</b>	Spanning Tree automatically determines edge port status.
<b>disable</b>	Spanning Tree does not automatically determine edge port status.

### Defaults

By default, automatic edge port status configuration is enabled (on).

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified edge port status for the port is not active for the VLAN instance until the switch is running in the per-VLAN Spanning Tree mode.
- The administrative edge port status is used to determine if a port is an edge or non-edge port when automatic edge port configuration (**auto-edge**) is disabled for the port. However, if **auto-edge** is enabled for the port, then the administrative status is overridden.
- Rapid transition of a designated port to forwarding can only occur if the connection type of the port is defined as point to point or an edge port. Rapid transition of an alternate port role to a root port role is not affected by the port connection type definition.
- Configure ports that connect to a host (PC, workstation, server, and so on.) as edge ports to avoid unnecessary topology changes when these ports go active. This also prevent the flushing of learned MAC addresses on these ports if a topology change occurs as a result of another non-edge port going active. If an edge port receives a BPDU, it operationally reverts back to a no point to point connection type.

## Examples

```
-> spantree vlan 255 port 8/23 auto-edge disable
-> spantree vlan 4 port 2/2-10 auto-edge enable
-> spantree vlan 100 linkagg 10 auto-edge disable
-> spantree vlan 200 linkagg 1-5 auto-edge enable
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">spantree mode</a>	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
<a href="#">spantree cist auto-edge</a>	Configures whether or not Spanning Tree automatically determines the operational edge status of a port or aggregate of ports for the flat mode CIST instance.

## MIB Objects

```
vStpInsPortTable
  vStpInsPortNumber
  vStpInsPortAutoEdge
```

---

## spantree cist restricted-role

Configures the restricted role status for a port or a link aggregate of ports. Enabling this parameter blocks the port from becoming the Root Port, even if it is the most likely candidate for root. Once a root port is selected, the restricted port is selected as an Alternate Port.

```
spantree cist {port slot/port[-port2] | linkagg linkagg_id[-linkagg_id2]} restricted-role {enable | disable}
```

---

### Syntax Definitions

<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id[-linkagg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs
<b>enable</b>	Enables the restricted role status for the specified port.
<b>disable</b>	Disables the restricted role status for the specified port.

### Defaults

By default, the restricted role status for the port is disabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When running in flat mode, this is a per-port setting and is applicable to any CIST or MSTI instances configured on that port.
- Enabling the restricted role status is used by network administrators to prevent bridges external to the core region of the network from influencing the Spanning Tree topology.
- Note that enabling the restricted role status for a port may impact connectivity within the network.

### Examples

```
-> spantree cist linkagg 15-20 restricted-role enable
-> spantree cist port 8/23 restricted-role disable
-> spantree cist port 8/24-27 restricted-role disable
-> spantree cist linkagg 10 restricted-role disable
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

### **spantree mode**

Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

### **spantree vlan restricted-role**

Configures the restricted role status for a port or aggregate of ports for the per-VLAN mode VLAN instance.

## MIB Objects

    vStpInsPortNumber

    vStpInsPortRestrictedRole

---

## spantree vlan restricted-role

Configures the restricted role status for a port or a link aggregate of ports for the specified VLAN instance. Enabling this parameter blocks the port from becoming the Root Port, even if it is the most likely candidate for root. Once a Root Port is selected, the restricted port is selected as an Alternate Port.

```
spantree vlan vlan_id {port slot/port[-port2] / linkagg linkagg_id[-linkagg_id2]} restricted-role {enable | disable}
```

---

### Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<i>slot/port</i> [- <i>port2</i> ]	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id</i> [- <i>linkagg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs
<b>enable</b>	Enables the restricted role status for the specified port-VLAN instance.
<b>disable</b>	Disables the restricted role status for the specified port-VLAN instance.

### Defaults

By default, the restricted role status for the port is disabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Enabling the restricted role status is used by network administrators to prevent bridges external to the core region of the network from influencing the Spanning Tree topology.
- Note that enabling the restricted role status for a port may impact connectivity within the network.
- This command only applies to the VLAN instance specified by the VLAN ID regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified restricted role status for the port is not active for the VLAN instance until the switch is running in the per-VLAN Spanning Tree mode.

### Examples

```
-> spantree vlan 3 linkagg 15 restricted-role enable
-> spantree vlan 255 port 8/23 restricted-role enable
-> spantree vlan 255 port 8/24-27 restricted-role enable
-> spantree vlan 255 linkagg 11-15 restricted-role enable
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

### **spantree mode**

Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

### **spantree cist restricted-role**

Configures the restricted role status for a port or aggregate of ports for the flat mode CIST instance.

## MIB Objects

vStpInsPortTable

    vStpInsPortNumber

    vStpInsPortRestrictedRole

---

## spantree cist restricted-tcn

Configures the restricted TCN status for a port or a link aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST). When this parameter is enabled, the port does not propagate topology changes and notifications to/from other ports.

```
spantree cist {port slot/port[-port2] | linkagg linkagg_id[-linkagg_id2]} restricted-tcn {enable | disable}
```

---

### Syntax Definitions

<i>slot/port[-port2]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id[-linkagg_id2]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs.
<b>enable</b>	Enables the restricted TCN status for the specified port-CIST instance.
<b>disable</b>	Disables the restricted TCN status for the specified port-CIST instance.

### Defaults

By default, the restricted TCN status for the port is disabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Enabling the restricted TCN status is used by network administrators to prevent bridges external to the core region of the network from causing unnecessary MAC address flushing in that region.
- Note that enabling the restricted TCN status for a port may impact Spanning Tree connectivity.
- This command only applies to the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the per-VLAN mode when this command is used, the specified restricted TCN status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.

### Examples

```
-> spantree cist linkagg 15 restricted-tcn enable
-> spantree cist port 8/23 restricted-tcn disable
-> spantree cist port 2/2-4 restricted-tcn enable
-> spantree cist linkagg 10-14 restricted-tcn disable
```

## spantree vlan restricted-tcn

Configures the restricted TCN status for a port or a link aggregate of ports for the specified VLAN instance. When this parameter is enabled, the port does not propagate topology changes and notifications to/from other ports.

```
spantree vlan vlan_id {port slot/port [-port2] / linkagg linkagg_id [-linkagg_id2]} restricted-tcn {enable | disable}
```

---

### Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<i>slot/port</i> [- <i>port2</i> ]	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>linkagg_id</i> [- <i>linkagg_id2</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs.
<b>enable</b>	Enables the restricted TCN status for the specified port-VLAN instance.
<b>disable</b>	Disables the restricted TCN status for the specified port-VLAN instance.

### Defaults

By default, the restricted TCN is set to disable.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Enabling the restricted TCN status is used by network administrators to prevent bridges external to the core region of the network from causing unnecessary MAC address flushing in that region.
- Note that enabling the restricted TCN status for a port may impact Spanning Tree connectivity.
- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified restricted TCN status for the port is not active for the VLAN instance until the switch is running in the per-VLAN Spanning Tree mode.

### Examples

```
-> spantree vlan 2 linkagg 15 restricted-tcn enable
-> spantree vlan 2 linkagg 16-20 restricted-tcn enable
-> spantree vlan 255 port 8/23 restricted-tcn disable
-> spantree vlan 255 port 8/24-27 restricted-tcn disable
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

### [spantree mode](#)

Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.

### [spantree cist restricted-tcn](#)

Configures the restricted TCN status for a port or aggregate of ports for the flat mode Common and Internal Spanning Tree (CIST).

## MIB Objects

    vStpInsPortNumber

    vStpInsPortRestrictedTcn

---

## spantree cist txholdcount

This command is used to rate limit the transmission of BPDU through a given port for the flat mode Common and Internal Spanning Tree (CIST) instance.

**spantree cist txholdcount** *value*

---

### Syntax Definitions

*value* A numeric value that controls the transmission of BPDU through the port. The valid range is 1–10.

### Defaults

By default, the **txholdcount** value is set to 3.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command only applies to the CIST instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the per-VLAN mode when this command is used, the specified **txholdcount** status for the port is not active for the CIST instance until the switch is running in the flat Spanning Tree mode.

### Examples

```
-> spantree cist txholdcount 5
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

- [spantree mode](#) Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
- [spantree vlan txholdcount](#) Configures the BPDU transmission rate limit for the specified VLAN instance.

## spantree vlan txholdcount

This command is used to rate limit the transmission of BPDU through a given port for the VLAN instance.

```
spantree vlan vlan_id txholdcount {value}
```

---

### Syntax Definitions

<i>vlan_id</i>	An existing VLAN ID number.
<i>value</i>	A numeric value that controls the transmission of BPDU through the port. The valid range is 1–10.

### Defaults

By default, the **txholdcount** value is set to 3.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command only applies to the specified VLAN instance regardless of which operating mode (flat or per-VLAN) is active for the switch.
- If the switch is running in the flat mode when this command is used, the specified **txholdcount** status for the port is not active for the VLAN instance until the switch is running in the per-VLAN Spanning Tree mode.

### Examples

```
-> spantree vlan 3 txholdcount 6
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">spantree mode</a>	Selects the Spanning Tree operating mode (flat or per-VLAN) for the switch.
<a href="#">spantree cist txholdcount</a>	Configures the BPDU transmission rate limit for the CIST instance.

### MIB Objects

```
vStpInsTable  
    vStpInsBridgeTxHoldCount
```

---

## show spantree

Displays Spanning Tree bridge information for the flat mode Common and Internal Spanning Tree (CIST) instance or the per-VLAN mode VLAN instances.

**show spantree**

---

### Syntax Definitions

NA

### Defaults

NA

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the switch is operating in the per-VLAN mode, this command displays a list of VLAN instances.
- If the switch is operating in the flat mode and the protocol is STP or RSTP, this command displays the single flat mode instance.
- If the switch is operating in the flat mode and the protocol is set to MSTP, this command displays a list of MSTIs, including MSTI 0 (also known as the CIST).

### Examples

```
-> spantree mode flat
-> spantree protocol rstp
-> show spantree
```

```
Spanning Tree Path Cost Mode : 32 BIT
Bridge STP Status Protocol Priority(Prio:SysID)
-----+-----+-----+-----+
      1      ON      RSTP   32768 (0x8000:0x0000)
```

#### *output definitions*

<b>Spanning Tree Path Cost Mode</b>	The Spanning Tree path cost mode for the switch ( <b>32 BIT</b> or <b>AUTO</b> ). Configured through the <b>spantree path-cost-mode</b> command.
<b>Bridge</b>	The CIST instance, referred to as bridge 1 when either STP (802.1D) or RSTP (802.1W) is the active protocol.
<b>STP Status</b>	The Spanning Tree state for the CIST instance ( <b>ON</b> or <b>OFF</b> ).
<b>Protocol</b>	The Spanning Tree protocol applied to the instance ( <b>STP</b> or <b>RSTP</b> ). Configured through the <b>spantree protocol</b> command.
<b>Priority</b>	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the <b>spantree priority</b> command.

---

```

-> spantree mode flat
-> spantree protocol mstp

-> show spantree
Spanning Tree Path Cost Mode : AUTO
Msti STP Status Protocol Priority (Prio:SysID)
-----+-----+-----+-----+-----
    0      ON      MSTP   32768 (0x8000:0x0000)
    2      ON      MSTP   32770 (0x8000:0x0002)
    3      ON      MSTP   32771 (0x8000:0x0003)

```

**output definitions**

---

<b>Spanning Tree Path Cost Mode</b>	The Spanning Tree path cost mode for the switch ( <b>32 BIT</b> or <b>AUTO</b> ) Configured through the <b>spantree path-cost-mode</b> command.
<b>Msti</b>	The Multiple Spanning Tree Instance (MSTI) instance number. Configured through the <b>spantree msti</b> command. Note that MSTI 0 also represents the CIST instance that is always present on the switch.
<b>STP Status</b>	The Spanning Tree state for the MSTI ( <b>ON</b> or <b>OFF</b> ).
<b>Protocol</b>	The Spanning Tree protocol applied to this instance. Configured through the <b>spantree protocol</b> command.
<b>Priority</b>	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the <b>spantree priority</b> command.

---

```

-> spantree mode per-vlan
-> show spantree

## show spantree cist

Displays the Spanning Tree bridge configuration for the flat mode Common and Internal Spanning Tree (CIST) instance.

**show spantree cist**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guideline

This command displays Spanning Tree bridge information for the flat mode CIST instance regardless of which mode (per-VLAN or flat) is active on the switch. Note that minimal information is displayed when this command is used in the per-VLAN mode, as the CIST is not active in this mode. See second example below.

### Examples

```
-> spantree mode flat
-> show spantree cist
Spanning Tree Parameters for Cist

```

### *output definitions*

---

<b>Spanning Tree Status</b>	The Spanning Tree state for the instance ( <b>ON</b> or <b>OFF</b> ).
<b>Protocol</b>	The Spanning Tree protocol applied to the CIST ( <b>STP</b> , <b>RSTP</b> , or <b>MSTP</b> ). Configured through the <b>spantree protocol</b> command.
<b>Mode</b>	The Spanning Tree operating mode for the switch ( <b>per-vlan</b> or <b>flat</b> ). Configured through the <b>spantree mode</b> command.
<b>Auto-Vlan-Containment</b>	The auto VLAN containment status for the instance ( <b>Enabled</b> or <b>Disabled</b> ). AVC prevents a port that has no VLANs mapped to a Multiple Spanning Tree Instance (MSTI) from becoming the root port for that instance. Configured through the <b>spantree auto-vlan-containment</b> command.
<b>Priority</b>	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the <b>spantree priority</b> command.
<b>Bridge ID</b>	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
<b>CST Designated Root</b>	The bridge identifier for the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
<b>Cost to CST Root</b>	The cost of the path to the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
<b>Next CST Best Cost</b>	The cost of the next best root port for the flat mode CIST instance. This field only appears when MSTP is active on the switch.
<b>Designated Root</b>	The bridge identifier for the root of the Spanning Tree for this instance.
<b>Cost to Root Bridge</b>	The cost of the path to the root for this Spanning Tree instance.
<b>Root Port</b>	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
<b>Next Best Root Cost</b>	The cost of the next best root port for this Spanning Tree instance.
<b>Next Best Root Port</b>	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.
<b>Tx Hold Count</b>	The count to limit the transmission of BPDU through the port.

*output definitions (continued)*

---

<b>Topology Changes</b>	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
<b>Topology age</b>	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance ( <b>hh:mm:ss</b> or <b>dd days and hh:mm:ss</b> ).
<b>Max Age</b>	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. Configured through the <b>spantree max-age</b> command.
<b>Forward Delay</b>	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. Configured through the <b>spantree forward-delay</b> command.
<b>Hello Time</b>	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. Configured through the <b>spantree hello-time</b> command.
<b>System Max Age</b>	The Max Age value for the root bridge.
<b>System Forward Delay</b>	The Forward Delay value for the root bridge.
<b>System Forward Delay</b>	The Forward Delay value for the root bridge.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<b>show spantree</b>	Displays the Spanning Tree bridge configuration for the flat mode CIST instance or a per-VLAN mode VLAN instance, depending on which mode is active for the switch.
<b>show spantree msti</b>	Displays the Spanning Tree bridge configuration for an MSTI regardless of which mode (per-VLAN or flat) is active on the switch.
<b>show spantree vlan</b>	Displays the Spanning Tree bridge configuration for a VLAN instance regardless of which mode (per-VLAN or flat) is active on the switch.

## show spantree msti

Displays Spanning Tree bridge information for a Multiple Spanning Tree Instance (MSTI).

```
show spantree msti [msti_id]
```

---

### Syntax Definitions

*msti\_id* An existing MSTI ID number.

### Defaults

By default, displays information for all MSTIs.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If an *msti\_id* number is *not* specified, this command displays the Spanning Tree status, protocol, and priority values for all MSTIs.
- This command displays Spanning Tree bridge information for an MSTI regardless of which mode (per-VLAN or flat) is active for the switch.
- Note that minimal information is displayed when this command is used in the per-VLAN mode, as MSTIs are not active in this mode. In addition, this command fails if MSTP is not the selected flat mode protocol.
- Note that MSTI 0 also represents the CIST instance that is always present on the switch. To view the CIST instance using this command, specify zero (0) for the *msti\_id* number.

### Examples

```
-> spantree mode flat
-> spantree protocol mstp
-> show spantree msti
```

```

### *output definitions*

<b>Spanning Tree Path Cost Mode</b>	The Spanning Tree path cost mode for the switch ( <b>32 BIT</b> or <b>AUTO</b> ) Configured through the <b>spantree path-cost-mode</b> command.
<b>Msti</b>	The Multiple Spanning Tree Instance (MSTI) number. MSTI 0 represents the CIST. Configured through the <b>spantree msti</b> command.
<b>STP Status</b>	The Spanning Tree state for the instance ( <b>ON</b> or <b>OFF</b> ).
<b>Protocol</b>	The Spanning Tree protocol applied to the instance ( <b>STP</b> , <b>RSTP</b> , or <b>MSTP</b> ). This value is not configurable for an MSTI. Configured through the <b>spantree protocol</b> command.
<b>Mode</b>	The Spanning Tree operating mode for the switch ( <b>per-vlan</b> or <b>flat</b> ). Configured through the <b>spantree mode</b> command.
<b>Priority</b>	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the <b>spantree priority</b> command.
<b>Bridge ID</b>	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
<b>CST Designated Root</b>	The bridge identifier for the root of the flat mode CIST instance. This field only appears when MSTP is active on the switch.
<b>Cost to CST Root</b>	The cost of the path to the root for the flat mode CIST instance. This field only appears when MSTP is active on the switch.
<b>Next CST Best Cost</b>	The cost of the next best root port for the flat mode CIST instance. This field only appears when MSTP is active on the switch.
<b>Designated Root</b>	The bridge identifier for the root of the Spanning Tree for this instance.
<b>Cost to Root Bridge</b>	The cost of the path to the root for this Spanning Tree instance.
<b>Root Port</b>	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.

*output definitions (continued)*

---

<b>Next Best Root Cost</b>	The cost of the next best root port for this Spanning Tree instance.
<b>Next Best Root Port</b>	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.
<b>TxHoldCount</b>	The count to limit the transmission of BPDU through the port.
<b>Topology Changes</b>	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
<b>Topology age</b>	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance ( <b>hh:mm:ss</b> or <b>dd days and hh:mm:ss</b> ).
<b>Max Age</b>	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. MSTIs inherit this value from the CIST instance.
<b>Forward Delay</b>	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. MSTIs inherit this value from the CIST instance.
<b>Hello Time</b>	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. MSTIs inherit this value from the CIST instance.
<b>System Max Age</b>	The Max Age value for the root bridge.
<b>System Forward Delay</b>	The Forward Delay value for the root bridge.
<b>System Forward Delay</b>	The Forward Delay value for the root bridge.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<a href="#">show spantree</a>	Displays the Spanning Tree bridge configuration for the flat mode CIST instance or a per-VLAN mode VLAN instance, depending on which mode is active for the switch.

## show spantree vlan

Displays Spanning Tree bridge information for a per-VLAN mode VLAN instance.

```
show spantree vlan [vlan_id]
```

---

### Syntax Definitions

*vlan\_id*                                An existing VLAN ID number.

### Defaults

By default, displays information for all VLAN instances.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If a *vlan\_id* number is *not* specified, this command displays the Spanning Tree status, protocol, and priority values for all VLAN instances.
- Specify a *vlan\_id* number with this command to display Spanning Tree bridge information for a specific VLAN instance.
- This command displays Spanning Tree bridge information for a VLAN instance regardless of which mode (per-VLAN or flat) is active on the switch. Note that minimal information is displayed when this command is used in the flat mode, as VLAN instances are not active in this mode.

### Examples

```
-> spantree mode per-vlan
-> show spantree vlan
  Spanning Tree Path Cost Mode : AUTO
  Vlan STP Status Protocol Priority
-----+-----+-----+-----
   1      ON      STP   32768 (0x8000)

```

### *output definitions*

<b>Spanning Tree Path Cost Mode</b>	The Spanning Tree path cost mode for the switch ( <b>32 BIT</b> or <b>AUTO</b> ). Configured through the <b>spantree path-cost-mode</b> command.
<b>Vlan</b>	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the <b>vlan</b> commands
<b>STP Status</b>	The Spanning Tree state for the instance ( <b>ON</b> or <b>OFF</b> ).
<b>Protocol</b>	The Spanning Tree protocol applied to the VLAN instance ( <b>STP</b> or <b>RSTP</b> ). Note that MSTP is not supported for a VLAN instance. Configured through the <b>spantree protocol</b> command.
<b>Mode</b>	The Spanning Tree operating mode for the switch ( <b>per-vlan</b> or <b>flat</b> ). Configured through the <b>spantree mode</b> command.
<b>Priority</b>	The Spanning Tree bridge priority for the instance. The lower the number, the higher the priority. Configured through the <b>spantree priority</b> command.
<b>Bridge ID</b>	The bridge identifier for this Spanning Tree instance. Consists of the bridge priority value (in hex) concatenated with the dedicated bridge MAC address.
<b>Designated Root</b>	The bridge identifier for the root of the Spanning Tree for this instance.
<b>Cost to Root Bridge</b>	The cost of the path to the root for this Spanning Tree instance.
<b>Root Port</b>	The port that offers the lowest cost path from this bridge to the root bridge for this Spanning Tree instance.
<b>Next Best Root Cost</b>	The cost of the next best root port for this Spanning Tree instance.
<b>Next Best Root Port</b>	The port that offers the next best (second lowest) cost path to the root bridge for this Spanning Tree instance.

*output definitions (continued)*

---

<b>Tx Hold Count</b>	The count to limit the transmission of BPDU through the port.
<b>Topology Changes</b>	The number of topology changes detected by this Spanning Tree instance since the management entity was last reset or initialized.
<b>Topology age</b>	The amount of time (in hundredths of seconds) since the last topology change was detected by this Spanning Tree instance ( <b>hh:mm:ss</b> or <b>dd days and hh:mm:ss</b> ).
<b>Max Age</b>	The amount of time (in seconds) that Spanning Tree Protocol information is retained before it is discarded. Configured through the <b>spantree max-age</b> command.
<b>Forward Delay</b>	The amount of time (in seconds) that a port remains in the Listening state and then the Learning state until it reaches the forwarding state. This is also the amount of time used to age out all dynamic entries in the Forwarding Database when a topology change occurs. Configured through the <b>spantree forward-delay</b> command.
<b>Hello Time</b>	The amount of time (in seconds) between the transmission of Configuration BPDUs on any port that is the Spanning Tree root or is attempting to become the Spanning Tree root. Configured through the <b>spantree hello-time</b> command.
<b>System Max Age</b>	The Max Age value for the root bridge.
<b>System Forward Delay</b>	The Forward Delay value for the root bridge.
<b>System Forward Delay</b>	The Forward Delay value for the root bridge.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<b>show spantree</b>	Displays the Spanning Tree bridge configuration for the flat mode CIST instance or a per-VLAN mode VLAN instance, depending on which mode is active for the switch.
<b>show spantree cist</b>	Displays the Spanning Tree bridge configuration for the CIST instance regardless of which mode (per-VLAN or flat) is active on the switch.
<b>show spantree msti</b>	Displays the Spanning Tree bridge information for an MSTI when the switch is operating in the per-VLAN or flat Spanning Tree mode.

## show spantree ports

Displays Spanning Tree port information.

**show spantree ports** [**forwarding** | **blocking** | **active** | **configured**]

---

### Syntax Definitions

<b>forwarding</b>	Displays Spanning Tree operational port parameters for ports that are forwarding for the specified instance.
<b>blocking</b>	Displays Spanning Tree operational port parameters for ports that are blocked for the specified instance.
<b>active</b>	Displays a list of active ports associated with the specified instance.
<b>configured</b>	Displays Spanning Tree administrative port parameters for all ports associated with the specified instance.

### Defaults

parameter	default
<b>forwarding</b>   <b>blocking</b>   <b>active</b>   <b>configured</b>	all ports

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the switch is operating in the per-VLAN mode, this command displays port information for the VLAN instances.
- If the switch is operating in the flat mode and the protocol is STP or RSTP, this command displays port information for the single flat mode instance.
- If the switch is operating in the flat mode and the protocol is set to MSTP, this command displays port information for the MSTIs, including MSTI 0 (also known as the CIST).

### Examples

```
-> spantree mode flat
-> spantree protocol rstp
-> show spantree ports
```

```
Bridge Port  Oper Status  Path Cost  Role
-----+-----+-----+-----+-----

### *output definitions*

#### **Bridge, Msti, or Vlan**

The CIST instance, referred to as bridge 1 when either STP (802.1D) or RSTP (802.1W) is the active protocol in the flat mode. The MSTI number when MSTP is the active protocol in the flat mode. The VLAN ID number when STP or RSTP is the active protocol in the per-VLAN mode.

#### **Port**

The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).

#### **Oper Status**

The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, learning, and forwarding.

*output definitions (continued)*

---

<b>Path Cost</b>	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the <a href="#">spantree msti path-cost</a> or <a href="#">spantree vlan path-cost</a> command.
<b>Role</b>	The role of the port for this Spanning Tree instance. Possible port roles are: <b>root</b> , <b>designated</b> , <b>alternate</b> , and <b>backup</b> .

---

## show spantree cist ports

Displays Spanning Tree port information for the flat mode Common and Internal Spanning Tree (CIST) instance.

**show spantree cist ports** [**forwarding** | **blocking** | **active** | **configured**]

---

### Syntax Definitions

<b>forwarding</b>	Displays Spanning Tree operational port parameters for ports that are forwarding for the CIST instance.
<b>blocking</b>	Displays Spanning Tree operational port parameters for ports that are blocked for the CIST instance.
<b>active</b>	Displays a list of active ports associated with the specified instance.
<b>configured</b>	Displays Spanning Tree administrative port parameters for the CIST instance.

### Defaults

parameter	default
<b>forwarding</b>   <b>blocking</b>   <b>active</b>   <b>configured</b>	all ports

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command displays Spanning Tree port information for the flat mode CIST instance regardless of which mode (per-VLAN or flat) is active for the switch.
- Note that minimal information is displayed when this command is used in the per-VLAN mode, as the CIST is not active in this mode.

### Examples

```
-> show spantree cist ports
```

```

### output definitions

<b>Port</b>	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
<b>Oper St</b>	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, listening, learning, and forwarding.
<b>Path Cost</b>	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the <a href="#">spantree vlan path-cost</a> command.
<b>Desig Cost</b>	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
<b>Role</b>	The role of the port for this Spanning Tree instance. Possible port roles are: <b>root</b> , <b>designated</b> , <b>alternate</b> , and <b>backup</b> .
<b>Prim. Port</b>	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
<b>Op Cnx</b>	Operational connection type: <b>PTP</b> , <b>NPT</b> , or <b>NS</b> (nonsignificant). Shows the current operational state of the port connection type. See the <a href="#">spantree vlan connection</a> command for more information.
<b>Op Edg</b>	Operational connection type: <b>EDG</b> . Shows the current operational state of the port connection type. See the <a href="#">spantree vlan connection</a> command for more information.
<b>Desig Bridge ID</b>	The bridge identifier for the designated bridge for this port segment.

-> show spantree cist ports configured

```

### output definitions

<b>Port</b>	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
<b>Port Pri</b>	The Spanning Tree priority for the port. The lower the number, the higher the priority.
<b>Adm St</b>	The Spanning Tree administrative status of the port: <b>enabled</b> or <b>disabled</b> .
<b>Man. Mode</b>	The manual mode setting for the port: <b>yes</b> indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; <b>no</b> indicates that the Spanning Tree Algorithm is managing the port state. Configured through the <b>spantree vlan path-cost</b> command.
<b>Config Cost</b>	The configured path cost value for this port. Configured through the <b>spantree vlan path-cost</b> command.
<b>Adm Cnx</b>	The administrative connection type: <b>PTP</b> , <b>NPT</b> , or <b>AUT</b> . Configured through the <b>spantree vlan connection</b> command.
<b>Adm Edg</b>	The edge port administrative status: <b>yes</b> indicates that the port is an admin edge port; <b>no</b> indicates that the port is not an admin edge port. Configured through the <b>spantree vlan connection</b> command.
<b>Aut Edg</b>	The edge port automatic status: <b>yes</b> indicates that the port is an automatic edge port; <b>no</b> indicates that the port is not an automatic edge port. Configured through the <b>spantree cist auto-edge</b> or <b>spantree vlan auto-edge</b> command.
<b>Rstr Tcn</b>	The restricted TCN capability: <b>yes</b> indicates that the port supports the restricted TCN capability; <b>no</b> indicates that the port does not support the restricted TCN capability. Configured through the <b>spantree cist restricted-tcn</b> or <b>spantree vlan restricted-tcn</b> command.
<b>Rstr Role</b>	The restricted role port status: <b>yes</b> indicates that the port is a restricted role port; <b>no</b> indicates that the port is not a restricted role port. Configured through the <b>spantree cist restricted-role</b> or <b>spantree vlan restricted-role</b> command.

### Release History

Release 7.1.1; command introduced.

## Related Commands

### [show spantree ports](#)

Implicit command for displaying Spanning Tree port information for the flat mode CIST instance or a per-VLAN mode VLAN instance.

### [show spantree msti ports](#)

Displays Spanning Tree port information for an MSTI when the switch is operating in the per-VLAN or flat Spanning Tree mode.

## show spantree msti ports

Displays Spanning Tree port information for a flat mode Multiple Spanning Tree Instance (MSTI).

**show spantree msti** [*msti\_id*] **ports** [**forwarding** | **blocking** | **active** | **configured**]

---

### Syntax Definitions

<i>msti_id</i>	An existing MSTI ID number.
<b>forwarding</b>	Displays Spanning Tree operational port parameters for ports that are forwarding for the CIST instance.
<b>blocking</b>	Displays Spanning Tree operational port parameters for ports that are blocked for the CIST instance.
<b>active</b>	Displays a list of active ports associated with the specified instance.
<b>configured</b>	Displays Spanning Tree administrative port parameters for the CIST instance.

### Defaults

parameter	default
<i>msti_id</i>	all MSTIs
<b>forwarding</b>   <b>blocking</b>   <b>active</b>   <b>configured</b>	all ports

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If an *msti\_id* number is *not* specified, this command displays the Spanning Tree port operational status, path cost, and role values for all associated MSTIs.
- This command displays Spanning Tree port information for an MSTI regardless of which mode (per-VLAN or flat) is active on the switch.
- Note that minimal information is displayed when this command is used in the per-VLAN mode, as MSTIs are not active in this mode. In addition, if MSTP is not the selected flat mode protocol, this command fails.
- The **configured** keyword is only available when an instance number is specified with this command. In addition, this keyword cannot be used in combination with either the **forwarding** or **blocking** keywords.
- Note that MSTI 0 also represents the CIST instance that is always present on the switch. To view the CIST instance using this command, specify zero (0) for the *msti\_id* number.

**Examples**

-&gt; show spantree msti ports

### output definitions

<b>Msti</b>	The Multiple Spanning Tree Instance (MSTI) number. MSTI 0 represents the CIST. Configured through the <a href="#">spantree msti</a> command.
<b>Port</b>	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
<b>Oper St</b>	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, listening, learning, and forwarding.
<b>Path Cost</b>	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the <a href="#">spantree msti path-cost</a> command.
<b>Desig Cost</b>	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
<b>RSTR Role/ Root Guard</b>	The role of the port for this Spanning Tree instance. Possible port roles are: <b>root</b> , <b>designated</b> , <b>alternate</b> , <b>master</b> , and <b>backup</b> .
<b>Prim. Port</b>	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
<b>Op Cnx</b>	Operational connection type: <b>PTP</b> , <b>NPT</b> , or <b>NS</b> (nonsignificant). Shows the current operational state of the port connection type. See the <a href="#">spantree vlan connection</a> command for more information.

*output definitions (continued)*

<b>Op Edg</b>	Operational connection type: <b>EDG</b> . Shows the current operational state of the port connection type. See the <b>spantree vlan connection</b> command for more information.
<b>Desig Bridge ID</b>	The bridge identifier for the designated bridge for this port segment.
<b>PVST+ Cfg</b>	Indicates the current PVST+ port configuration (auto, enable or disable).
<b>PVST+ Stat</b>	Indicates the current status of the PVST+ mode (On or Off).

*output definitions*

<b>Port</b>	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (for example, 0/31).
<b>Port Pri</b>	The Spanning Tree priority for the port. It is a numeric value and the lower the number, the higher the priority. Configured through the <b>spantree priority</b> command.
<b>Adm St</b>	The Spanning Tree administrative status of the port: <b>enabled</b> - ENA or <b>disabled</b> - DIS.
<b>Man. Mode</b>	The manual mode setting for the port: <b>yes</b> indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; <b>no</b> indicates that the Spanning Tree Algorithm is managing the port state. Configured through the <b>spantree vlan path-cost</b> command.
<b>Config Cost</b>	The configured path cost value for this port. Configured through the <b>spantree msti path-cost</b> command.
<b>Adm Cnx</b>	The administrative connection type: <b>PTP</b> , <b>NPT</b> , or <b>AUT</b> . Configured through the <b>spantree vlan connection</b> command.
<b>Adm Edg</b>	The edge port administrative status: <b>yes</b> indicates that the port is an admin edge port; <b>no</b> indicates that the port is not an admin edge port. Configured through the <b>spantree vlan connection</b> command.

---

*output definitions (continued)*

---

<b>Aut Edg</b>	The edge port automatic status: <b>yes</b> indicates that the port is an automatic edge port; <b>no</b> indicates that the port is not an automatic edge port. Configured through the <b>spantree cist auto-edge</b> or <b>spantree vlan auto-edge</b> command.
<b>Rstr Tcn</b>	The restricted TCN capability: <b>yes</b> indicates that the port supports the restricted TCN capability; <b>no</b> indicates that the port does not support the restricted TCN capability. Configured through the <b>spantree cist restricted-tcn</b> or <b>spantree vlan restricted-tcn</b> command.
<b>Rstr Role</b>	The restricted role port status: <b>yes</b> indicates that the port is a restricted role port; <b>no</b> indicates that the port is not a restricted role port. Configured through the <b>spantree cist restricted-role</b> or <b>spantree vlan restricted-role</b> command.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<b>show spantree ports</b>	Displays Spanning Tree port information for the flat mode CIST instance or a per-VLAN mode VLAN instance.
<b>show spantree cist ports</b>	Displays Spanning Tree port information for a CIST instance when the switch is operating in the per-VLAN or flat Spanning Tree mode.
<b>show spantree vlan ports</b>	Displays Spanning Tree port information for a VLAN when the switch is operating in the per-VLAN or flat Spanning Tree mode.

## show spantree vlan ports

Displays Spanning Tree port information for a VLAN instance.

**show spantree vlan** [*vlan\_id*[-*vlan\_id2*]] **ports** [**forwarding** | **blocking** | **active** | **configured**]

---

### Syntax Definitions

<i>vlan_id</i> [- <i>vlan_id2</i> ]	An existing VLAN ID number. Use a hyphen to specify a range of VLAN IDs (10-15)
<b>forwarding</b>	Displays Spanning Tree operational port parameters for ports that are forwarding for the CIST instance.
<b>blocking</b>	Displays Spanning Tree operational port parameters for ports that are blocked for the CIST instance.
<b>active</b>	Displays a list of active ports associated with the specified instance.
<b>configured</b>	Displays Spanning Tree administrative port parameters for the CIST instance.

### Defaults

parameter	default
<i>vlan_id</i>	all VLAN instances
<b>forwarding</b>   <b>blocking</b>   <b>active</b>   <b>configured</b>	all ports

### Platforms Supported

OmniSwitch 6400, 6850, 6855, 9000, 9000E

### Usage Guidelines

- If a *vlan\_id* number is *not* specified, this command displays the Spanning Tree port operational status, path cost, and role values for all VLAN instances.
- Specifying a range of VLAN IDs is also allowed. Use a hyphen to indicate a contiguous range (e.g., **show spantree vlan 10-15 ports**). Note that only one VLAN entry—a single VLAN ID or a range of VLAN IDs—is allowed with this command. Multiple entries are not accepted.
- This command displays Spanning Tree port information for a VLAN instance regardless of which mode (per-VLAN or flat) is active for the switch.
- Note that minimal information is displayed when this command is used in the flat mode, as VLAN instances are not active in this mode.
- The **configured** keyword is only available when a VLAN ID is specified with this command. In addition, this keyword cannot be used in combination with either the **forwarding** or **blocking** keywords.

**Examples**

```
-> show spantree vlan ports
```

**output definitions**

<b>Vlan</b>	The VLAN ID associated with the VLAN Spanning Tree instance. Configured through the <b>vlan</b> commands
<b>Port</b>	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (e.g., 0/31).
<b>Oper St</b>	The port operational state as defined by application of the Spanning Tree Protocol. Possible port operational states include: disabled, blocking, listening, learning, and forwarding.
<b>Path Cost</b>	The contribution of this port to the path cost towards the Spanning Tree root bridge that includes this port. Path cost is a measure of the distance of the listed port from the root bridge in the number of hops. Configured through the <b>spantree vlan path-cost</b> command.
<b>Desig Cost</b>	The path cost of the Designated Port of the segment connected to this port. If this is the root bridge or the Spanning Tree status of the port is administratively disabled, this value is 0.
<b>Role</b>	The role of the port for this Spanning Tree instance. Possible port roles are: <b>root</b> , <b>designated</b> , <b>alternate</b> , <b>master</b> , and <b>backup</b> .
<b>Prim. Port</b>	The slot number for the module and the physical port number on that module for the primary port associated with this Spanning Tree instance. This information is only available if the port role is backup.
<b>Op Cnx</b>	Operational connection type: <b>PTP</b> , <b>NPT</b> , or <b>NS</b> (nonsignificant). Shows the current operational state of the port's connection type. See the <b>spantree vlan connection</b> command for more information.
<b>Op Edg</b>	Operational connection type: <b>EDG</b> . Shows the current operational state of the port's connection type. See the <b>spantree vlan connection</b> command for more information.
<b>Desig Bridge ID</b>	The bridge identifier for the designated bridge for this port's segment.

### output definitions

<b>Port</b>	The slot number for the module and the physical port number or a logical port. If the slot number is 0, then the port number refers to a link aggregate logical port number (e.g., 0/31).
<b>Port Pri</b>	The Spanning Tree priority for the port (0–15). The lower the number, the higher the priority. Configured through the <b>spantree priority</b> command.
<b>Adm St</b>	The Spanning Tree administrative status of the port: <b>enabled</b> or <b>disabled</b> . Configured through the <b>spantree vlan</b> command to enable or disable Spanning Tree on a port.

*output definitions (continued)*

---

<b>Man. Mode</b>	The manual mode setting for the port: <b>yes</b> indicates that the blocking or forwarding state of the port was manually set and the port does not participate in the Spanning Tree Algorithm; <b>no</b> indicates that the Spanning Tree Algorithm is managing the port state. Configured through the <b>spantree vlan mode</b> command.
<b>Config Cost</b>	The configured path cost value for this port. Configured through the <b>spantree vlan path-cost</b> command.
<b>Adm Cnx</b>	The administrative connection type: <b>PTP</b> , <b>NPT</b> , or <b>AUT</b> . Configured through the <b>spantree vlan path-cost</b> command.
<b>Adm Edg</b>	The edge port administrative status: <b>yes</b> indicates that the port is an admin edge port; <b>no</b> indicates that the port is not an admin edge port. Configured through the <b>spantree vlan connection</b> command.
<b>Aut Edg</b>	The edge port automatic status: <b>yes</b> indicates that the port is an automatic edge port; <b>no</b> indicates that the port is not an automatic edge port. Configured through the <b>spantree cist auto-edge</b> or <b>spantree vlan auto-edge</b> command.
<b>Rstr Tcn</b>	The restricted TCN capability: <b>yes</b> indicates that the port supports the restricted TCN capability; <b>no</b> indicates that the port does not support the restricted TCN capability. Configured through the <b>spantree cist restricted-tcn</b> or <b>spantree vlan restricted-tcn</b> command.
<b>Rstr Role/Root Guard</b>	The restricted status of the port: <b>Yes</b> indicates that the port is restricted from becoming the root; <b>No</b> indicates that the port is not restricted from becoming the root. Configured through the <b>spantree cist restricted-role</b> or <b>spantree vlan restricted-role</b> command.
<b>PVST+ Cfg</b>	The type of BPDU used on the port: <b>AUTO</b> indicates that IEEE BPDUs are used until a PVST+ BPDU is detected; <b>ENA</b> indicates that PVST+ BPDUs are used; <b>DIS</b> indicates that IEEE BPDUs are used. Configured through the <b>spantree pvst+compatibility</b> command.
<b>PVST+ Stat</b>	Indicates whether or not the PVST+ interoperability status is enabled ( <b>ENA</b> ) or disabled ( <b>DIS</b> ) for the port. Configured through the <b>spantree pvst+compatibility</b> command.

---

**Release History**

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">show spantree ports</a>	Displays Spanning Tree port information for the flat mode CIST instance or a per-VLAN mode VLAN instance.

## show spantree mode

Displays the current global Spanning Tree mode parameter values for the switch.

**show spantree mode**

---

### Syntax Definition

NA

### Defaults

NA

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The global parameters for spanning tree can be activated or configured using the related commands.

### Examples

```
-> show spantree mode
```

```
Spanning Tree Global Parameters
  Current Running Mode   : Per VLAN,
  Current Protocol       : N/A (Per VLAN),
  Path Cost Mode         : 32 BIT,
  Auto Vlan Containment : N/A
  Cisco PVST+ mode      : Disabled
  Vlan Consistency check : Disabled
```

### *output definitions*

---

<b>Current Running Mode</b>	The spantree mode active on the switch. ( <b>Flat</b> or <b>Per VLAN</b> )
<b>Current Protocol</b>	The spantree protocol active on the switch.
<b>Path Cost Mode</b>	The path cost mode value configured on the switch. ( <b>AUTO</b> or <b>32 BIT</b> )
<b>Auto Vlan Containment</b>	The Auto VLAN containment mode configured on the switch ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Cisco PVST+ mode</b>	The PVST+ mode configured on the switch ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Vlan Consistency check</b>	Specifies if VLAN consistency check is <b>Enabled</b> or <b>Disabled</b> on the switch.

---

## Related Commands

<b>spantree mode</b>	Assigns a flat Spanning Tree or per-VLAN Spanning Tree operating mode for the switch.
<b>spantree protocol</b>	Configures the Spanning Tree protocol for the flat mode Common and Internal Spanning Tree (CIST) instance or for an individual VLAN instance if the switch is running in the per-VLAN mode.
<b>spantree path-cost-mode</b>	Configures the automatic selection of a 16-bit path cost for STP/RSTP ports and a 32-bit path cost for MSTP ports or sets all path costs to use a 32-bit value.
<b>spantree pvst+compatibility</b>	Enables or disables PVST+ mode on the switch, port or link aggregate enabling them to operate with Cisco switches.
<b>spantree auto-vlan-containment</b>	Enables or disables Auto VLAN Containment (AVC).

## Release History

Release 7.1.1; command introduced.

vStpBridge
  vStpPathCostMode
vStpMstRegionTable
  vStpBridgeModePVST
vStpBridge
  vStpBridgeAutoVlanContainment
```

---

## show spantree mst

Displays the Multiple Spanning Tree (MST) information for a MST region or the specified port or link aggregate on the switch.

**show spantree mst** {**region** | **port** *slot/port* / **linkagg** *linkagg\_id*}

---

### Syntax Definitions

*slot/port* Specifies the slot number for the module and the physical port number on that module.

*linkagg\_id* Link aggregate ID number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Three MST region attributes (configuration name, revision level, and configuration digest) define an MST region as required by the IEEE 802.1Q 2005 standard. Switches that share the same values for these attributes are all considered part of the same region. Currently each switch can belong to one MST region at a time.
- This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.
- Specify the port number or link aggregate ID along with the **port** or **linkagg** keyword to get information related to the specified port or link aggregate.

### Examples

```
-> show spantree mst region
```

```
Configuration Name   = Region 1
Revision Level       = 0
Configuration Digest = 0xac36177f 50283cd4 b83821d8 ab26de62
Revision Max hops    = 20
Cist Instance Number = 0
```

```
-> show spantree mst port 1/2
```

MST	Role	State	Pth	Cst	Edge	Boundary	Op	Cnx	Vlans
0	DIS	DIS		0	NO	YES	NS		1
12	DIS	DIS		0	NO	YES	NS		

```
-> show spantree mst linkagg 4
```

```
MST  Role  State Pth Cst  Edge Boundary Op Cnx Vlans
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
  0  DESG   FORW      6000  NO   NO   NS   1
  1  DESG   FORW      0    NO   NO   NS
  2  DESG   FORW      0    NO   NO   NS
```

### output definitions

<b>Configuration Name</b>	An alphanumeric string that identifies the name of the MST region. Use the <b>spantree mst region name</b> command to define this value.
<b>Revision Level</b>	A numeric value that identifies the MST region revision level for the switch.
<b>Configuration Digest</b>	An MST region identifier consisting of a 16 octet hex value (as per the IEEE 802.1Q 2005 standard) that represents all defined MSTIs and their associated VLAN ranges. Use the <b>spantree msti</b> and <b>spantree msti vlan</b> commands to define VLAN to MSTI associations.
<b>Revision Max hops</b>	The number of maximum hops authorized for region information. Configured through the <b>spantree mst region max-hops</b> command.
<b>Cist Instance Number</b>	The number of the CIST instance, which is currently zero as there is only one region per switch. Therefore, only one CIST exists per switch. Note that this instance is also known as the flat mode instance and is known as bridge 1 when using STP or RSTP.

### Release History

Release 7.1.1; command introduced.

### Related Commands

<b>show spantree msti vlan-map</b>	Displays the range of VLANs associated to the specified MSTI.
<b>show spantree cist vlan-map</b>	Displays the range of VLANs associated to the CIST instance.
<b>show spantree map-msti</b>	Displays the MSTI that is associated to the specified VLAN

### MIB Objects

```
vStpMstRegionTable
  vStpMstRegionNumber
  vStpMstRegionConfigDigest
  vStpMstRegionConfigName
  vStpMstRegionConfigRevisionLevel
  vStpMstRegionCistInstanceNumber
  vStpMstRegionMaxHops
```

## show spantree msti vlan-map

Displays the range of VLANs associated with the specified Multiple Spanning Tree Instance (MSTI).

**show spantree msti [*msti\_id*] vlan-map**

---

### Syntax Definitions

*msti\_id* An existing MSTI ID number.

### Defaults

By default, the VLAN to MSTI mapping is displayed for all MSTIs.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If an *msti\_id* is not specified, then the VLAN to MSTI mapping for all defined MSTIs is displayed.
- This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.
- Initially all VLANs are associated with the flat mode CIST instance.

### Examples

```
-> show spantree msti vlan-map
```

```
Cist
Name          :
VLAN list     : 1-9,14-4094
```

```
Msti 1
Name          :
VLAN list     : 10-11
```

```
Msti 2
Name          :
VLAN list     : 12-13
```

```
-> show spantree msti 2 vlan-map
```

```
Msti 2
Name          : MS1,
VLAN list     : 12-13
```

### output definitions

---

<b>Cist Instance</b>	Identifies MSTI VLAN mapping information for the CIST instance.
<b>Msti</b>	The MSTI ID number that identifies an association between a Spanning Tree instance and a range of VLANs.

*output definitions (continued)*

---

<b>Name</b>	An alphanumeric value that identifies an MSTI name. Use the <a href="#">spantree msti</a> command to define an MSTI name.
<b>VLAN list</b>	The range of VLAN IDs that are associated with this MSTI.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<a href="#">show spantree mst</a>	Displays the MST region information for the switch.
<a href="#">show spantree cist vlan-map</a>	Displays the range of VLANs associated to the CIST instance.
<a href="#">show spantree map-msti</a>	Displays the MSTI that is associated to the specified VLAN

**MIB Objects**

---

## show spantree cist vlan-map

Displays the range of VLANs associated with the flat mode Common and Internal Spanning Tree (CIST) instance.

**show spantree cist vlan-map**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.

### Examples

```
-> show spantree cist vlan-map
```

```
Cist
Name           : CIST1,
VLAN list      : 1-9,14-4094
```

### *output definitions*

---

<b>Name</b>	An alphanumeric value that identifies the name of the CIST. Use the <b>spantree msti</b> command to define a name for this instance.
<b>VLAN list</b>	The range of VLAN IDs that are associated with the CIST instance.

---

### Release History

Release 7.1.1; command introduced.

### Related Commands

<b>show spantree mst</b>	Displays the MST region information for the switch.
<b>show spantree msti vlan-map</b>	Displays the range of VLANs associated to the specified MSTI.
<b>show spantree map-msti</b>	Displays the MSTI that is associated to the specified VLAN

  vStpMstInstanceNumber  
  vStpMstInstanceName  
  vStpMstInstanceVlanBitmapState
```

---

## show spantree map-msti

Displays the Multiple Spanning Tree Instance (MSTI) that is associated to the specified VLAN.

```
show spantree [vlan vlan_id] map-msti
```

---

### Syntax Definitions

*vlan\_id* An existing VLAN ID number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is available when the switch is operating in either the per-VLAN or flat Spanning Tree mode.
- Initially all VLANs are associated with the flat mode CIST instance.

### Examples

```
-> show spantree map-msti
```

```
Vlan   Msti/Cist(0)
-----+-----
   200     1
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

# 7 Link Aggregation Commands

Link aggregation combines multiple physical links between two switches into one logical link. The aggregate group operates within Spanning Tree as one virtual port and can provide more bandwidth than a single link. It also provides redundancy. If one physical link in the aggregate group goes down, link integrity is maintained.

There are two types of aggregate groups: static and dynamic. Static aggregate groups are manually configured on the switch with static links. Dynamic groups are set up on the switch but they aggregate links as necessary according to the Link Aggregation Control Protocol (LACP).

The dynamic aggregation software is compatible only with the following IEEE standard:

802.3ad — Aggregation of Multiple Link Segments

MIB information for the link aggregation commands is as follows:

*Filename:* AlcatelIND1LAG.MIB  
*Module:* ALCATEL-IND1-LAG-MIB

---

A summary of available commands is listed here:

---

<b>Static link aggregates</b>	<b>linkagg static agg size</b> <b>linkagg static agg name</b> <b>linkagg static agg admin-state</b> <b>linkagg static port agg</b>
<b>Dynamic link aggregates</b>	<b>linkagg lacp agg size</b> <b>linkagg lacp agg name</b> <b>linkagg lacp agg admin-state</b> <b>linkagg lacp agg actor admin-key</b> <b>linkagg lacp agg actor system-priority</b> <b>linkagg lacp agg actor system-id</b> <b>linkagg lacp agg partner system-id</b> <b>linkagg lacp agg partner system-priority</b> <b>linkagg lacp agg partner admin-key</b> <b>linkagg lacp port actor admin-key</b> <b>linkagg lacp port actor admin-state</b> <b>linkagg lacp port actor system-id</b> <b>linkagg lacp port actor system-priority</b> <b>linkagg lacp agg partner admin-state</b> <b>linkagg lacp port partner admin system-id</b> <b>linkagg lacp port partner admin-key</b> <b>linkagg lacp port partner admin system-priority</b> <b>linkagg lacp port actor port priority</b> <b>linkagg lacp port partner admin-port</b> <b>linkagg lacp port partner admin port-priority</b>
<b>Static and dynamic</b>	<b>linkagg range</b> <b>show linkagg range</b> <b>show linkagg</b> <b>show linkagg port</b>

---

## linkagg static agg size

Creates a static aggregate group between two switches. A static aggregate group contains static links.

**linkagg static agg** *agg\_num1* [-*agg\_num2*] **size** *size* [**name** *name*] [**admin-state** {**enable** | **disable**}] [**multi-chassis active**]

**no linkagg static agg** *agg\_num1* [-*agg\_num2*]

---

### Syntax Definitions

<i>agg_num1</i>	The number corresponding to the static aggregate group.
<i>-agg_num2</i>	The last link aggregate ID in a range of link aggregate IDs.
<i>size</i>	The maximum number of links allowed in the aggregate group.
<i>name</i>	The name of the static aggregate group. Can be any alphanumeric string. Spaces must be contained within quotes (for example, "Static Group 1").
<b>enable</b>	Specifies that the static aggregate group is active and is able to aggregate links.
<b>disable</b>	Specifies that the static aggregate group is inactive and not able to aggregate links.
<b>multi-chassis active</b>	Specifies that the multi-chassis link aggregate feature should be activated on the static aggregate group between the two switches.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	enable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a static aggregate group or a range of static aggregate groups from the configuration.
- If the static aggregate has any attached ports you must delete the attached ports with the **no** form of the **linkagg static port agg** command before you remove the static link aggregate ID. Delete the attached ports using the **no linkagg static port** command.
- Use the **multi-chassis active** parameter to activate a static link aggregate group between multiple switch chassis. This parameter is used only in a multi-chassis link aggregation (MC-LAG) configuration.
- Use the **linkagg lacp agg size** command to create a dynamic aggregation (LACP) group.

## Examples

```
-> linkagg static agg 3-10 size 8
-> linkagg static agg 4 size 2 admin-state disable
-> linkagg static agg 4 size 2 multichassis-active
-> no linkagg static agg 3-10
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

### [show linkagg](#)

Displays information about static and dynamic (LACP) link aggregate groups.

## MIB Objects

```
alclnkaggAggTable
  alclnkaggAggNumber
  alclnkaggAggSize
  alclnkaggAggLacpType
  alclnkaggAggName
  alclnkaggAggAdminState
  alclnkAggPeerRangeOperMax
```

---

## linkagg static agg name

Configures a name for an existing static aggregate group.

**linkagg static agg** *agg\_num1* [-*agg\_num2*] **name** *name*

**no linkagg static agg** *agg\_num1* [-*agg\_num2*] **name**

---

### Syntax Definitions

<i>agg_num1</i>	The number corresponding to the static aggregate group.
<i>-agg_num2</i>	The last link aggregate ID in a range of link aggregate IDs.
<i>name</i>	The name of the static aggregation group, can be an alphanumeric string. Spaces must be contained within quotes (for example, "Static Group 1").

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a name from a static aggregate or from a range of static aggregates.
- You must assign names to static link aggregate IDs individually.
- To specify a range of link aggregates, use hyphen between the first and last link aggregate IDs of the range. A range of link aggregate IDs can be used only with the **no** form of this command.

### Examples

```
-> linkagg static agg 2 name accounting  
-> no linkagg static agg 2-10 name
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

[linkagg static agg size](#)

Creates a static aggregate group.

[show linkagg](#)

Displays information about static and dynamic (LACP) aggregate groups.

## MIB Objects

alclnkaggAggTable

    alclnkaggAggNumber

    alclnkaggAggName

---

## linkagg static agg admin-state

Enables or disables the administrative state of a static link aggregation group.

**linkagg static agg** *agg\_num1*[-*agg\_num2*] **admin-state** {**enable** | **disable**}

---

### Syntax Definitions

<i>agg_num1</i>	The number corresponding to the static aggregate group.
- <i>agg_num2</i>	The last link aggregate ID in a range of link aggregate IDs.
<b>enable</b>	Specifies that the static aggregate group is active and is able to aggregate links.
<b>disable</b>	Specifies that the static aggregate group is inactive and not able to aggregate links.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	enable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

When the administrative state is set to **disable**, the static aggregate group is disabled.

### Examples

```
-> linkagg static agg 2 admin-state disable
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">linkagg static agg size</a>	Creates a static aggregate group.
<a href="#">show linkagg</a>	Displays information about static and dynamic (LACP) aggregate groups.

### MIB Objects

```
alclnkaggAggTable
  alclnkaggAggNumber
  alclnkaggAggAdminState
```

---

## linkagg static port agg

Configures a slot and port for a static aggregate group.

**linkagg static port** *slot/port[-port2]* **agg** *agg\_num*

**no linkagg static port** *slot/port[-port2]*

---

### Syntax Definitions

<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
<i>-port2</i>	The last port number in a range of port IDs.
<i>agg_num</i>	The number corresponding to the static aggregate group.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove one or more ports from a static aggregate group.
- A port can belong to only one aggregate group.
- Ports that belong to the same static aggregate group need not be configured sequentially and can be on any Network Interface (NI).
- To specify a range of link aggregates, use hyphen between the first and last link aggregate IDs of the range. A range of link aggregate IDs can be used only with the **no** form of this command.

### Examples

```
-> linkagg static port 2/1-5 agg 4  
-> no linkagg static port 2/1-5
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

**linkagg static agg size**

Creates a static aggregate group.

**show linkagg port**

Displays information about link aggregation ports.

## MIB Objects

alclnkaggAggPortTable

alclnkaggAggPortGlobalPortNumber

alclnkaggAggPortLacpType

alclnkaggAggPortSelectedAggNumber

---

## linkagg lacp agg size

Creates a dynamic aggregate group that uses the Link Aggregation Control Protocol (LACP) to establish and maintain link aggregation. The **size** parameter is required to create the link aggregate group.

```
linkagg lacp agg agg_num1 [-agg_num2] size size
    [name name]
    [admin-state {enable | disable}]
    [actor admin-key actor_admin_key]
    [actor system-priority actor_system_priority]
    [actor system-id actor_system_id]
    [partner system-id partner_system_id]
    [partner system-priority partner_system_priority]
    [partner admin-key partner_admin_key]
    [multi-chassis active]
```

```
no linkagg lacp agg agg_num1 [-agg_num2] size size
```

---

### Syntax Definitions

<i>agg_num1</i>	The number corresponding to the dynamic aggregate group.
<i>-agg_num2</i>	The last link aggregate ID in a range of link aggregate IDs.
<i>size</i>	The maximum number of links that can belong to the aggregate.
<i>name</i>	The name of the dynamic aggregate group. can be an alphanumeric string. Spaces must be contained within quotes (for example, "Dynamic Group 1").
<b>enable</b>	Specifies that the dynamic aggregate group is active and is able to aggregate links.
<b>disable</b>	Specifies that the dynamic aggregate group is inactive and not able to aggregate links.
<i>actor_admin_key</i>	The administrative key value associated with the dynamic aggregate group.
<i>actor_system_priority</i>	The priority of the dynamic aggregate group.
<i>actor_system_id</i>	The MAC address of the dynamic aggregate group on the switch.
<i>partner_system_id</i>	The MAC address of the aggregate group of the remote system which is attached to the aggregate group of the switch .
<i>partner_system_priority</i>	The priority of the remote system to which the aggregation group is attached.
<i>partner_admin_key</i>	The administrative key for the remote partner of the aggregation group.
<b>multi-chassis active</b>	Specifies that the multi-chassis link aggregate feature should be activated on the dynamic aggregate group between the two switches.

## Defaults

parameter	default
enable   disable	enable

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Use the **no** form of this command to remove a dynamic aggregate group from the configuration.
- You must disable the group with the **linkagg lacp agg admin-state** command before you can delete a dynamic link aggregate group.
- Optional parameters for the dynamic aggregate group can be configured when the aggregate is created. The dynamic aggregate group can be modified after the optional parameters are assigned.
- Use the **multi-chassis active** parameter to activate a dynamic link aggregate group between multiple switch chassis. This parameter is used only in a multi-chassis link aggregation (MC-LAG) configuration.
- Use the **linkagg static agg size** command to create static aggregate groups. See [page 7-3](#) for more information about this command.

## Examples

```
-> linkagg lacp agg 2-5 size 4
-> linkagg lacp agg 3 size 2 admin-state disable actor system-priority 65535
-> no linkagg lacp agg 2-5 size 4
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

### [show linkagg](#)

Displays information about static and dynamic (LACP) aggregate groups.

## MIB Objects

```
alclnkaggAggTable
  alclnkaggAggNumber
  alclnkaggAggSize
  alclnkaggAggLacpType
  alclnkaggAggName
  alclnkaggAggAdminState
  alclnkaggAggActorAdminKey
  alclnkaggAggActorSystemPriority
  alclnkaggAggActorSystemID
  alclnkaggAggPartnerSystemID
  alclnkaggAggPartnerSystemPriority
```

alclnkaggAggPartnerAdminKey

---

## linkagg lacp agg name

Configures a name for a dynamic aggregate group.

**linkagg lacp agg** *agg\_num* **name** *name*

**no linkagg lacp agg** *agg\_num1* [-*agg\_num2*] **name**

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the dynamic aggregate group.
<i>-agg_num2</i>	The last link aggregate ID in a range of link aggregate IDs.
<i>name</i>	The name of the dynamic aggregate group. Can be an alphanumeric string. Spaces must be contained within quotes (for example, "Dynamic Group 1").

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a name from a single or a range of dynamic aggregate groups simultaneously.
- Assign names to individual dynamic link aggregate groups separately.

### Examples

```
-> linkagg lacp agg 2 name finance  
-> no linkagg lacp agg 2-5 name
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

[linkagg lacp agg size](#)

Creates a dynamic aggregate group.

[show linkagg](#)

Displays information about static and dynamic (LACP) aggregate groups.

## MIB Objects

alclnkaggAggTable

alclnkaggAggNumber

alclnkaggAggName

---

## linkagg lacp agg admin-state

Configures the administrative state of a dynamic aggregate group or a range of dynamic aggregate groups.

**linkagg lacp agg** *agg\_num1* [-*agg\_num2*] **admin-state** {**enable** | **disable**}

---

### Syntax Definitions

<i>agg_num1</i>	The number corresponding to the dynamic aggregate group.
- <i>agg_num2</i>	The last link aggregate ID in a range of link aggregate IDs.
<b>enable</b>	Specifies that the dynamic aggregate group is active and is able to aggregate links.
<b>disable</b>	Specifies that the operation of a dynamic aggregate group cannot be performed.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable</b>   <b>disable</b>	enable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When the administrative state is set to **disable**, the operation of a dynamic aggregation (LACP) group cannot be performed.
- You can also enable or disable the admin-state for a range of link aggregate IDs simultaneously, using this command.

### Examples

```
-> linkagg lacp agg 2 admin-state disable  
-> linkagg lacp agg 2-10 admin-state disable
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

---

## linkagg lacp agg actor admin-key

Configures the administrative key associated with a dynamic aggregate group.

```
linkagg lacp agg agg_num1 [-agg_num2] actor admin-key actor_admin_key
```

```
no linkagg lacp agg agg_num1 [-agg_num2] actor admin-key
```

---

### Syntax Definitions

<i>agg_num1</i>	The number corresponding to the dynamic aggregate group.
<i>-agg_num2</i>	The last link aggregate ID in a range of link aggregate IDs.
<i>actor_admin_key</i>	The administrative key value associated with the dynamic aggregate group.

### Defaults

parameter	default
<i>actor_admin_key</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to remove an actor admin key from a dynamic aggregate group.

### Examples

```
-> linkagg lacp agg 3-5 actor admin-key 2
-> no linkagg lacp agg 3-5 actor admin-key
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">linkagg lacp agg size</a>	Creates a dynamic aggregate group.

```

---

## linkagg lacp agg actor system-priority

Configures the priority of the dynamic aggregate group.

**linkagg lacp agg** *agg\_num1* [-*agg\_num2*] **actor system-priority** *actor\_system\_priority*

**no linkagg lacp agg** *agg\_num1* [-*agg\_num2*] **actor system-priority**

---

### Syntax Definitions

<i>agg_num1</i>	The number corresponding to the link aggregate group.
- <i>agg_num2</i>	The last link aggregate ID in a range of link aggregate IDs.
<i>actor_system_priority</i>	The priority of the dynamic aggregate group of the switch in relation to other aggregate groups.

### Defaults

parameter	default
<i>actor_system_priority</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to return the value to its default.
- Ports with the same system priority value can join the same dynamic aggregate group.
- To assign or remove the actor system-priority for a series of link aggregate IDs, specify the range of link aggregate IDs with the **agg** keyword. Use a hyphen to separate the first and last link aggregate IDs of a range.

### Examples

```
-> lacp linkagg 3 actor system-priority 100
-> no lacp linkagg 3 actor system-priority
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

[linkagg lacp agg size](#)

Creates a dynamic aggregate group.

---

## linkagg lacp agg actor system-id

Configures the MAC address of a dynamic aggregate group on the switch.

**linkagg lacp agg** *agg\_num1* [-*agg\_num2*] **actor system-id** *actor\_system\_id*

**no linkagg lacp agg** *agg\_num1* [-*agg\_num2*] **actor system-id**

---

### Syntax Definitions

<i>agg_num1</i>	The number corresponding to the dynamic aggregate group.
- <i>agg_num2</i>	The last link aggregate ID in a range of link aggregate IDs.
<i>actor_system_id</i>	The MAC address of the dynamic aggregate group on the switch in the hexadecimal format <i>xx:xx:xx:xx:xx:xx</i> .

### Defaults

parameter	default
<i>actor_system_id</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove the MAC address assignment (actor system ID) from a dynamic link aggregate or a range of dynamic link aggregates simultaneously.
- You can configure the MAC address for a range of dynamic link aggregate IDs simultaneously. Use a hyphen to separate the first and last link aggregate IDs of a range along with this command.

### Examples

```
-> linkagg lacp agg 2 actor system-id 00:20:da:81:d5:b0
-> no linkagg lacp agg 3-10 actor system-id
-> no linkagg lacp agg 11 actor system-id
```

### Release History

Release 7.1.1; command introduced.

---

## linkagg lacp agg partner system-id

Configures the MAC address of the dynamic aggregate group of the remote system that is attached to the dynamic aggregate group of the local switch.

**linkagg lacp agg** *agg\_num1* [-*agg\_num2*] **partner system-id** *partner\_system\_id*

**no linkagg lacp agg** *agg\_num1* [-*agg\_num2*] **partner system-id**

---

### Syntax Definitions

<i>agg_num1</i>	The number corresponding to the dynamic aggregate group on the switch.
- <i>agg_num2</i>	The last link aggregate ID in a range of link aggregate IDs.
<i>partner_system_id</i>	The MAC address of the dynamic aggregate group of the remote switch in the hexadecimal format <i>xx:xx:xx:xx:xx:xx</i> .

### Defaults

parameter	default
<i>partner_system_id</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a partner system ID from a dynamic aggregate group or a range of groups assigned with the same partner system IDs together.
- The *partner\_system\_id* and the *partner\_system\_priority* together specify the priority of the remote system.
- You can configure a partner system ID for a range of dynamic link aggregate IDs simultaneously. Use a hyphen to separate the first and last link aggregate IDs of a range along with this command.

### Examples

```
-> linkagg lacp agg 2 partner system-id 00:20:da4:32:81
-> linkagg lacp agg 2-10 partner system-id 00:20:da4:32:82
-> no linkagg lacp agg 2-10 partner system-id
```

### Release History

Release 7.1.1; command introduced.

## linkagg lacp agg partner system-priority

Configures the priority of the dynamic aggregate group of the remote system which is attached to the dynamic aggregate group of the local switch.

**linkagg lacp agg** *agg\_num1* [-*agg\_num2*] **partner system-priority** *partner\_system\_priority*

**no linkagg lacp agg** *agg\_num1* [-*agg\_num2*] **partner system-priority**

---

### Syntax Definitions

<i>agg_num1</i>	The number corresponding to the dynamic aggregate group.
- <i>agg_num2</i>	The last link aggregate ID in a range of link aggregate IDs.
<i>partner_system_priority</i>	The priority of the dynamic aggregate group of the remote system which is attached to the dynamic aggregate group of the local switch.

### Defaults

parameter	default
<i>partner_system_priority</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to return to the priority value to its default.
- The *partner\_system\_id* and the *partner\_system\_priority* together specify the priority of the remote system.
- You can apply the partner system-priority to a range of link aggregate IDs simultaneously. Use a hyphen to separate the first and last link aggregate IDs of a range after the **agg** keyword.

### Examples

```
-> linkagg lacp agg 3 partner system-priority 65535
-> linkagg lacp agg 3-6 partner system-priority 65535
-> no linkagg lacp agg 3-6 partner system-priority
```

### Release History

## linkagg lacp agg partner admin-key

Configures the administrative key for the remote partner of the dynamic aggregation group.

```
linkagg lacp agg agg_num1[-agg_num2] partner admin-key partner_admin_key
```

```
no linkagg lacp agg agg_num1[-agg_num2] partner admin-key
```

---

### Syntax Definitions

<i>agg_num1</i>	The number corresponding to the dynamic aggregate group.
- <i>agg_num2</i>	The last link aggregate ID in a range of link aggregate IDs.
<i>partner_admin_key</i>	The administrative key for the remote partner of the dynamic aggregation group.

### Defaults

parameter	default
<i>partner_admin_key</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a partner admin-key from a dynamic aggregate group.
- The partner admin-key can be assigned for a range of dynamic link aggregate IDs simultaneously.

### Examples

```
-> linkagg lacp agg 3-5 partner admin-key 3  
-> no linkagg lacp agg 3-10 partner admin-key
```

### Release History

Release 7.1.1; command introduced.

## linkagg lacp port actor admin-key

Configures an actor administrative key for a port, which allows the port to join a dynamic aggregate group.

```
linkagg lacp port slot/port[-port2] actor admin-key actor_admin_key
  [actor admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default]
  [expire] | none}]
  [actor system id actor_system_id]
  [actor system priority actor_system_priority]
  [partner admin system id partner_admin_system_id]
  [partner admin-key partner_admin_key]
  [partner admin system priority partner_admin_system_priority]
  [partner admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default]
  [expire] | none}]
  [actor port priority actor_port_priority]
  [partner admin port partner_admin_port]
  [partner admin port priority partner_admin_port_priority]

no linkagg lacp port slot/port[-port2] [actor admin-state {[active] [timeout] [aggregate] [synchronize]
[collect] [distribute] [default] [expire] | none}]
  [actor system id actor_system_id]
  [actor system priority actor_system_priority]
  [partner admin system id partner_admin_system_id]
  [partner admin-key partner_admin_key]
  [partner admin system priority partner_admin_system_priority]
  [partner admin-state {[active] [timeout] [aggregate] [synchronize] [collect] [distribute] [default]
  [expire] | none}]
  [actor port priority actor_port_priority]
  [partner admin port partner_admin_port]
  [partner admin port priority partner_admin_port_priority]
```

---

### Syntax Definitions

<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
<i>-port2</i>	The last port number in a range of slot/port IDs.
<i>actor_admin_key</i>	The administrative key associated with this dynamic aggregate group.
<b>actor admin-state</b>	See the <a href="#">linkagg lacp port actor admin-state</a> command.
<i>actor_system_id</i>	The MAC address of this dynamic aggregate group on the switch.
<i>actor_system_priority</i>	The priority of the dynamic aggregate group.
<i>partner_admin_system_id</i>	The MAC address of the dynamic aggregate group of the remote switch.
<i>partner_admin_key</i>	The administrative key for the remote partner of the dynamic aggregation group.

<i>partner_admin_system_priority</i>	The priority of the remote system to which the dynamic aggregation group is attached.
<b>partner admin-state</b>	See the <a href="#">linkagg lacp agg partner admin-state</a> command.
<i>actor_port_priority</i>	The priority of the actor port.
<i>partner_admin_port</i>	The administrative state of the partner port.
<i>partner_admin_port_priority</i>	The priority of the partner port.

## Defaults

parameter	default
[active] [timeout] ....	active, timeout, aggregate

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Use the **no** form of this command to remove a slot and port from a dynamic aggregate group.
- A port can belong to only one aggregate group.
- Ports that belong to a dynamic link aggregate must be configured to the same link speed.
- Ports that belong to the same dynamic aggregate group need not be configured sequentially and can be on any Network Interface (NI).

## Examples

```
-> linkagg lacp agg 3/1 actor admin-key 0
-> no linkagg lacp agg 3/1 actor admin-key
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

alclnkaggAggPortPartnerAdminPortPriority
```

---

## linkagg lacp port actor admin-state

Configures the system administrative state of the slot and port for the dynamic aggregate group on the local switch. The state values correspond to bits in the actor state octet in the LACPDU frame.

```
linkagg lacp port slot/port[-port2] actor admin-state {[active] [timeout] [aggregate] [synchronize]
[collect] [distribute] [default] [expire] | none}
```

```
no linkagg lacp port slot/port[-port2] actor admin-state {[active] [timeout] [aggregate] [synchronize]
[collect] [distribute] [default] [expire] | none}
```

---

### Syntax Definitions

<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
<i>-port2</i>	The last port number in a range of port IDs.
<b>active</b>	Specifies that bit 0 in the actor state octet is enabled. When this bit is set, the dynamic aggregate group is able to exchange LACPDU frames. By default, this value is set.
<b>timeout</b>	Specifies that bit 1 in the actor state octet is enabled. When this bit is set, a short timeout is used for LACPDU frames. When this bit is disabled, a long timeout is used for LACPDU frames. By default, this value is set.
<b>aggregate</b>	Specifies that bit 2 in the actor state octet is enabled. When this bit is set, the system considers this port to be a potential candidate for aggregation. If this bit is not enabled, the system considers the port to be individual (it can only operate as a single link). By default, this value is set.
<b>synchronize</b>	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 3) is set by the system, the port is allocated to the correct dynamic aggregation group. If this bit is not set by the system, the port is not allocated to the correct dynamic aggregation group.
<b>collect</b>	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 4) is set by the system, incoming LACPDU frames are collected from the individual ports that make up the dynamic aggregate group.
<b>distribute</b>	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 5) is set by the system, distributing outgoing frames on the port is disabled.
<b>default</b>	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 6) is set by the system, it indicates that the actor is using the defaulted partner information administratively configured for the partner.

<b>expire</b>	Specifying that this keyword has no effect because the system always determines its value. When this bit (bit 7) is set by the system, the actor cannot receive LACPDU frames.
<b>none</b>	Resets all administrative states to their default configurations.

## Defaults

parameter	default
[active] [timeout] ...	active, timeout, aggregate

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Use the **no** form of this command to restore the LACPDU bit settings to their default configuration.
- When the actor admin-state is set to **none**, all bit values are restored to their default configurations.

## Examples

```
-> linkagg lacp port 4/2 actor admin-state synchronize collect distribute
-> no linkagg lacp port 4/2 actor admin-state synchronize collect
-> linkagg lacp port 4/2 actor admin-state none
```

## Release History

Release 7.1.1; command introduced.

## MIB Objects

```
alclnkaggAggPortTable
  alclnkaggAggPortGlobalPortNumber
  alclnkaggAggPortActorAdminState
```

## linkagg lacp port actor system-id

Configures the system ID (i.e., MAC address) for the local port associated with a dynamic aggregate group.

**linkagg lacp port** *slot/port[-port2]* **actor system-id** *actor\_system\_id*

**no linkagg lacp port** *slot/port[-port2]* **actor system-id**

---

### Syntax Definitions

<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
<i>-port2</i>	The last port number in a range of port IDs.
<i>actor_system_id</i>	The MAC address of the dynamic aggregate group on the switch in the hexadecimal format <i>xx:xx:xx:xx:xx:xx</i> .

### Defaults

parameter	default
<i>actor_system_id</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove the actor system ID from a slot and port or a range of slot and ports associated with a dynamic aggregate group.
- Configure the system ID for a range of local ports simultaneously. Use a hyphen to separate the first and last port IDs of a range after the **port** keyword.

### Examples

```
-> linkagg lacp port 3/1-10 actor system-id 00:20:da:06:ba:d3
-> no linkagg lacp port 3/1-10 actor system-id
```

### Release History

alclnkaggAggPortAdminSystemPriority

---

## linkagg lacp port actor port priority

Configures the priority for an actor port.

```
linkagg lacp port slot/port[-port2] actor port-priority actor_port_priority
```

```
no linkagg lacp port slot/port[-port2] actor port-priority
```

---

### Syntax Definitions

<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
<i>-port2</i>	The last port number in a range of port IDs.
<i>actor_port_priority</i>	The priority of the actor port.

### Defaults

---

parameter	default
<i>actor_port_priority</i>	0

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to remove an *actor\_port\_priority* value from a slot and port or a range of slot and ports associated with a dynamic aggregate group.

### Examples

```
-> linkagg lacp port 2/1-5 actor port-priority 100  
-> no linkagg lacp port 2/1-5 actor port-priority
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

[linkagg lacp agg size](#)

Creates a dynamic aggregate group.

[show linkagg port](#)

Displays information about ports associated with a particular aggregate group or all aggregate groups.

## linkagg lacp port partner admin-port

Configures the administrative status of a partner port.

**linkagg lacp port** *slot/port*[-*port2*] **partner admin-port** *partner\_admin\_port*

**no linkagg lacp port** *slot/port*[-*port2*] **partner admin-port**

---

### Syntax Definitions

<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port that the switch initially uses as the Spanning Tree virtual port for this aggregate.
<i>-port2</i>	The last port number in a range of port IDs.
<i>partner_admin_port</i>	The administrative state of the partner port.

### Defaults

parameter	default
<i>partner_admin_port</i>	0

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to remove a *partner\_admin\_port* value from a slot and port or a range of slot and ports associated with a dynamic aggregate group.

### Examples

```
-> linkagg lacp port 2/1-5 partner admin-port 255
-> no linkagg lacp port 2/1-5 partner admin-port
```

### Release History

Release 7.1.1; command introduced.

---

## linkagg range

Modifies the range of standard and MC-LAG link aggregation identifiers.

**linkagg range local** {*agg\_num-agg\_num* / none} **peer** {*agg\_num-agg\_num* / none} **multi-chassis** {*agg\_num-agg\_num* / none}

---

### Syntax Definitions

<i>agg_num</i>	The first or last identifier in the range.
<b>local</b>	The range of standard local aggregate identifiers.
<b>peer</b>	The range of standard peer aggregate identifiers.
<b>multi-chassis</b>	The range of MC-LAG aggregate identifiers.
<b>none</b>	No aggregate identifiers range is specified.

### Defaults

parameter	default
<b>local</b>	0-47
<b>peer</b>	48-95
<b>multi-chassis</b>	96-127

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command in conjunction with the MC-LAG feature to change the maximum number of MC-LAG link aggregates that can be configured.
- The switch must be rebooted for the ranges to take affect.
- The maximum number of combined standard and MC-LAG link aggregates is 128.

### Examples

```
-> linkagg range local 0-9 peer 10-19 multi-chassis 20-127
-> linkagg range local none peer none multi-chassis 0-127
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

**show linkagg range**                      Displays the link aggregate ranges.

## MIB Objects

  alclnkAggMcLagRangeConfiguredMin  
  alclnkAggMcLagRangeConfiguredMax
```

---

## show linkagg

Displays information about static and dynamic (LACP) aggregate groups.

```
show linkagg {agg [agg_num1 [-agg_num2]}
```

---

### Syntax Definitions

*agg\_num1* Specifies the aggregate group. Configured through the **linkagg static agg size** or **linkagg lacp agg size** command.

*-agg\_num2* The last link aggregate ID in a range of link aggregate IDs.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If no aggregation number is specified, information for all aggregate groups is displayed. If an aggregate number is specified, only the information about the relevant aggregate group is displayed. The fields included in the display depend on whether the aggregate group is a static or dynamic.
- Use the **show linkagg port** command to display information about aggregate group ports.

### Examples

No aggregate group is specified:

```
-> show linkagg
```

Number	Aggregate	SNMP Id	Size	Admin State	Oper State	Att/Sel Ports
1	Static	40000001	8	ENABLED	UP	2 2
2	Dynamic	40000002	4	ENABLED	DOWN	0 0
3	Dynamic	40000003	8	ENABLED	DOWN	0 2
4	Dynamic	40000004	8	ENABLED	UP	3 3
5	Static	40000005	2	DISABLED	DOWN	0 0

Output fields are defined here:

#### *output definitions*

---

<b>Number</b>	The aggregate group number.
<b>Aggregate</b>	The type of aggregate group, which can be <b>Static</b> or <b>Dynamic</b> .
<b>SNMP Id</b>	The SNMP ID associated with the aggregate group.
<b>Size</b>	The number of links in this aggregate group.

*output definitions (continued)*

---

<b>Admin State</b>	The current administrative state of the aggregate group, which can be <b>ENABLED</b> or <b>DISABLED</b> . You can modify this parameter with the <a href="#">linkagg static agg admin-state</a> command (see <a href="#">page 7-7</a> ) for static aggregate groups and with the <a href="#">linkagg lacp agg admin-state</a> command (see <a href="#">page 7-15</a> ) for dynamic aggregate groups.
<b>Oper State</b>	The current operational state of the aggregate group, which can be <b>UP</b> or <b>DOWN</b> .
<b>Att Ports</b>	The number of ports actually attached to this aggregate group.
<b>Sel Ports</b>	The number of ports that could possibly attach to the aggregate group.

---

A static aggregate is specified:

```
-> show linkagg agg 5
Static Aggregate
  SNMP Id           : 40000005,
  Aggregate Number  : 5,
  SNMP Descriptor   : Omnichannel Aggregate Number 5 ref 40000005 size 2,
  Name              : AGG5,
  Admin State       : ENABLED,
  Operational State : DOWN,
  Aggregate Size    : 2,
  Number of Selected Ports : 0,
  Number of Reserved Ports : 0,
  Number of Attached Ports : 0,
  Primary Port      : NONE
```

Output fields are defined here:

*output definitions*

---

<b>SNMP Id</b>	The SNMP ID associated with this static aggregate group.
<b>Aggregate Number</b>	The group number.
<b>SNMP Descriptor</b>	The standard MIB name for this static aggregate group.
<b>Name</b>	The name of this static aggregate group. You can modify this parameter with the <a href="#">linkagg static agg name</a> command (see <a href="#">page 7-5</a> ).
<b>Admin State</b>	The administrative state of this static aggregate group, which can be <b>ENABLED</b> or <b>DISABLED</b> . You can modify this parameter with the <a href="#">linkagg static agg admin-state</a> command (see <a href="#">page 7-7</a> ).
<b>Operational State</b>	The operational state of this static aggregate group, which can be <b>UP</b> or <b>DOWN</b> .
<b>Aggregate Size</b>	The number of links configured for this static aggregate group.
<b>Number of Selected Ports</b>	The number of ports that could possibly attach to this static aggregate group.
<b>Number of Reserved Ports</b>	The total number of ports reserved for use in link aggregation by this static aggregate group. ( <b>Note:</b> This field is not relevant for static aggregate groups.)

*output definitions (continued)*

---

<b>Number of Attached Ports</b>	The number of ports actually attached to this static aggregate group.
<b>Primary Port</b>	The port number of the first port to join this static aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.

---

A dynamic aggregate group is specified:

```
-> show linkagg agg 1-2
```

```
Dynamic Aggregate
  SNMP Id           : 40000002,
  Aggregate Number  : 2,
  SNMP Descriptor   : Dynamic Aggregate Number 2 ref 40000002 size 4,
  Name              : AGG 2,
  Admin State       : ENABLED,
  Operational State : DOWN,
  Aggregate Size    : 4,
  Number of Selected Ports : 0,
  Number of Reserved Ports : 0,
  Number of Attached Ports : 0,
  Primary Port      : NONE,
LACP
  MACAddress        : [00:1f:cc:00:00:00],
  Actor System Id   : [00:20:da:81:d5:b0],
  Actor System Priority : 50,
  Actor Admin Key   : 120,
  Actor Oper Key    : 0,
  Partner System Id : [00:20:da:81:d5:b1],
  Partner System Priority : 70,
  Partner Admin Key : 220,
  Partner Oper Key  : 0
```

Output fields are defined here:

*output definitions*

---

<b>SNMP Id</b>	The SNMP ID associated with this dynamic aggregate group.
<b>Aggregate Number</b>	The group number of this dynamic aggregate group.
<b>SNMP Descriptor</b>	The standard MIB name for this dynamic aggregate group.
<b>Name</b>	The name of this dynamic aggregate group. You can modify this parameter with the <b>linkagg lacp agg name</b> command (see <a href="#">page 7-13</a> ).
<b>Admin State</b>	The administrative state of this dynamic aggregate group, which can be <b>ENABLED</b> or <b>DISABLED</b> . You can modify this parameter with the <b>linkagg lacp agg admin-state</b> command (see <a href="#">page 7-15</a> ).
<b>Operational State</b>	The operational state of this dynamic aggregate group, which can be <b>UP</b> or <b>DOWN</b> .
<b>Aggregate Size</b>	The number of links configured for this dynamic aggregate group.
<b>Number of Selected Ports</b>	The number of ports available to this dynamic aggregate group.
<b>Number of Reserved Ports</b>	The total number of ports reserved for use in link aggregation by this dynamic aggregate group.
<b>Number of Attached Ports</b>	The number of ports actually attached to this dynamic aggregate group.

*output definitions (continued)*

---

<b>Primary Port</b>	The port number of the first port to join this dynamic aggregate group. If the first port to join the aggregate group is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.
<b>MACAddress</b>	The MAC address associated with the primary port.
<b>Actor System Id</b>	The MAC address of this dynamic aggregate group. You can modify this parameter with the <b>linkagg lacp agg actor system-id</b> command (see <a href="#">page 7-20</a> ).
<b>Actor System Priority</b>	The priority of this dynamic aggregate group. You can modify this parameter with the <b>linkagg lacp agg actor system-priority</b> command (see <a href="#">page 7-18</a> ).
<b>Actor Admin Key</b>	The administrative key associated with this dynamic aggregate group. You can modify this parameter with the <b>linkagg lacp agg actor admin-key</b> command (see <a href="#">page 7-17</a> ).
<b>Actor Oper Key</b>	The operational key associated with this dynamic aggregate group.
<b>Partner System Id</b>	The MAC address of the remote dynamic aggregate group. You can modify this parameter with the <b>linkagg lacp agg partner system-id</b> command (see <a href="#">page 7-22</a> ).
<b>Partner System Priority</b>	The priority of the remote system to which this dynamic aggregation group is attached. You can modify this parameter with the <b>linkagg lacp agg partner system-priority</b> command (see <a href="#">page 7-24</a> ).
<b>Partner Admin Key</b>	The administrative key for the remote partner of the dynamic aggregation . You can modify this parameter with the <b>linkagg lacp agg partner admin-key</b> command (see <a href="#">page 7-26</a> ).
<b>Partner Oper Key</b>	The operational key of the remote system to which the dynamic aggregation group is attached.

---

---

## show linkagg port

Displays information about link aggregation ports.

```
show linkagg {agg agg_num1 [-agg_num2]} port [slot/port]
```

---

### Syntax Definitions

<i>agg_num1</i>	The number corresponding to the link aggregate group.
<i>-agg_num2</i>	The last link aggregate ID in a range of link aggregate IDs.
<i>slot</i>	The slot number for this aggregate.
<i>port</i>	The port number for this aggregate.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If no slot/port is specified, the information for all slots/ports is displayed.
- If a particular slot or port is specified, the fields displayed depend upon whether the port belongs to a static aggregate group or a dynamic (LACP) aggregate group.
- If only a link aggregate or a range of link aggregates are specified along with the **agg** keyword, the port and related information for only the specified link aggregate IDs are displayed.
- If multi-chassis feature is activated on the switch, the show command displays the link aggregates as MC-Static and MC-Dynamic as shown in the second example.

### Examples

```
-> show linkagg port
```

```
Slot/Port Aggregate  SNMP Id   Status   Agg  Oper Link Prim
-----+-----+-----+-----+-----+-----+-----+-----
  2/1   Static           2001  ATTACHED    1  UP   UP   YES
```

Multi-chassis active:

```
-> show linkagg port
```

```
Slot/Port Aggregate  SNMP Id   Status   Agg  Oper Link Prim
-----+-----+-----+-----+-----+-----+-----+-----
  2/1   MC-Static           2001  ATTACHED    1  UP   UP   YES
```

```
-> show linkagg agg 1-5 port
```

Slot/Port	Aggregate	SNMP Id	Status	Agg Oper	Link Prim
1/16	Static	2016	CONFIGURED	1 UP	UP YES
1/17	Static	2017	CONFIGURED	2 UP	UP NO
3/1	Static	3001	CONFIGURED	3 UP	UP NO
3/2	Static	3045	CONFIGURED	4 UP	UP NO
3/3	Static	3069	CONFIGURED	5 UP	UP NO

Output fields are defined here:

#### *output definitions*

<b>Slot/Port</b>	The slot/port associated with the aggregate group.
<b>Aggregate</b>	The type of aggregate group associated with the port, either <b>Static</b> or <b>Dynamic</b> .
<b>SNMP Id</b>	The SNMP ID associated with the aggregate group.
<b>Status</b>	The current status of the port, which can be <b>CONFIGURED</b> , <b>PENDING</b> , <b>SELECTED</b> , or <b>RESERVED</b> .
<b>Agg</b>	The number of the aggregate groups associated with this port.
<b>Oper</b>	The operational status of the port.
<b>Link</b>	The physical link status of the port.
<b>Prim</b>	Specifies if the port is the primary port of the aggregate. The primary port is the lowest numbered port in a link aggregate.

A port that belongs to a static aggregate is specified:

```
-> show linkagg port 4/1
```

```
Static Aggregable Port
SNMP Id           : 4001,
Slot/Port         : 4/1,
Administrative State : ENABLED,
Operational State  : DOWN,
Port State        : CONFIGURED,
Link State        : DOWN,
Selected Agg Number : 2,
Port position in the aggregate: 0,
Primary port      : NONE
```

Output fields are defined here:

#### *output definitions*

<b>SNMP Id</b>	The SNMP ID associated with this port.
<b>Slot/Port</b>	The slot and port number.
<b>Administrative State</b>	The current administrative state of this port, which can be <b>ENABLED</b> or <b>DISABLED</b> .
<b>Operational State</b>	The current operational state of the port, which can be <b>UP</b> or <b>DOWN</b> .
<b>Port State</b>	The current operational state of the port, which can be <b>CONFIGURED</b> , <b>PENDING</b> , <b>SELECTED</b> , or <b>RESERVED</b> .

*output definitions (continued)*

---

<b>Link State</b>	The current operational state of the link from this port to its remote partner, which can be <b>UP</b> or <b>DOWN</b> .
<b>Selected Agg Number</b>	The number associated with the static aggregate group to which the port is attached.
<b>Port position in the aggregate</b>	The rank of this port within the static aggregate group.
<b>Primary Port</b>	The port number of the first port to join this static aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.

---

A port that belongs to a static link aggregate is specified:

```
-> show linkagg agg 1
```

```
Static Aggregate
SNMP Id           : 40000001,
Aggregate Number  : 1,
SNMP Descriptor   : Omnichannel Aggregate Number 1 ref 40000001 size 4,

```

Output fields are defined here:

### *output definitions*

---

<b>SNMP Id</b>	The SNMP ID associated with this port.
<b>Slot/Port</b>	The slot and port number.
<b>Administrative State</b>	The current administrative state of this port, which can be <b>ENABLED</b> or <b>DISABLED</b> .
<b>Operational State</b>	The current operational state of the port, which can be <b>UP</b> or <b>DOWN</b> .
<b>Port State</b>	The current operational state of the port, which can be <b>CONFIGURED</b> , <b>PENDING</b> , <b>SELECTED</b> , or <b>AGGREGATED</b> .
<b>Link State</b>	The current operational state of the link from this port to its remote partner, which can be <b>UP</b> or <b>DOWN</b> .
<b>Selected Agg Number</b>	The number associated with the dynamic aggregate group to which the port is attached.
<b>Primary Port</b>	The port number of the first port to join this dynamic aggregate group. If the first port to join the aggregate is no longer part of the aggregate group, the switch automatically assigns another port in the aggregate group to be the primary port.
<b>Actor System Priority</b>	The actor system priority of this port. You can modify this parameter with the <a href="#">linkagg lacp port actor system-priority</a> command (see <a href="#">page 7-35</a> ).
<b>Actor System Id</b>	The actor system ID (i.e., MAC address) of this port. You can modify this parameter with the <a href="#">linkagg lacp port actor system-id</a> command (see <a href="#">page 7-33</a> ).
<b>Actor Admin Key</b>	The actor administrative key value for this port. You can modify this parameter with the <a href="#">linkagg lacp port actor admin-key</a> command (see <a href="#">page 7-28</a> ).
<b>Actor Oper Key</b>	The actor operational key associated with this port.
<b>Partner Admin System Priority</b>	The administrative priority of the remote system to which this port is attached. You can modify this parameter with the <a href="#">linkagg lacp port partner admin system-priority</a> command (see <a href="#">page 7-43</a> ).
<b>Partner Oper System Priority</b>	The operational priority of the remote system to which this port is attached.
<b>Partner Admin System Id</b>	The administrative MAC address associated with the system ID of a remote partner. This value is used along with Partner Admin System Priority, Partner Admin Key, and Partner Admin Port Priority to manually configure aggregation. You can modify this parameter with the <a href="#">linkagg lacp port partner admin system-id</a> command (see <a href="#">page 7-39</a> ).

*output definitions (continued)*

---

<b>Partner Oper System Id</b>	The MAC address that corresponds to the system ID of the remote partner.
<b>Partner Admin Key</b>	The administrative value of the key for the remote partner. This value is used along with Partner Admin System Priority, Partner Admin System, Partner Admin Port, and Partner Admin Port Priority to manually configure aggregation. You can modify this parameter with the <b>linkagg lacp port partner admin-key</b> command (see <a href="#">page 7-41</a> ).
<b>Partner Oper Key</b>	The current operational value of the key for the protocol partner.
<b>Attached Agg ID</b>	The ID of the aggregate group that the port has attached itself to. A value of zero indicates that the port is not attached to an aggregate group.
<b>Actor Port</b>	The port number locally assigned to this port.
<b>Actor Port Priority</b>	The actor priority value assigned to the port. You can modify this parameter with the <b>linkagg lacp port actor port priority</b> command (see <a href="#">page 7-45</a> ).
<b>Partner Admin Port</b>	The administrative value of the port number for the protocol partner. This value is used along with Partner Admin System Priority, Partner Admin System ID, Partner Admin Key, and Partner Admin Port Priority to manually configure aggregation. You can modify this parameter with the <b>linkagg lacp port partner admin-port</b> command (see <a href="#">page 7-47</a> ).
<b>Partner Oper Port</b>	The operational port number assigned to the port by the protocol partner of the port.
<b>Partner Admin Port Priority</b>	The administrative port priority of the protocol partner. This value is used along with Partner Admin System Priority, Partner Admin System ID, and Partner Admin Key to manually configure aggregation. You can modify this parameter with the <b>linkagg lacp port partner admin port-priority</b> command (see <a href="#">page 7-49</a> ).
<b>Partner Oper Port Priority</b>	The priority value assigned to the this port by the partner.
<b>Actor Admin State</b>	The administrative state of the port. You can modify this parameter with the <b>linkagg lacp port actor admin-state</b> command (see <a href="#">page 7-31</a> ).
<b>Actor Oper State</b>	The current operational state of the port.
<b>Partner Admin State</b>	The administrative state of the partner port. You can modify this parameter with the <b>linkagg lacp agg partner admin-state</b> command (see <a href="#">page 7-37</a> ).
<b>Partner Oper State</b>	The current operational state of the partner port.

---

## show linkagg range

Displays information about the configured or operational link aggregate range identifiers for standard and MC-LAG link aggregates.

**show linkagg range [operation | config]**

---

### Syntax Definitions

**operation**                      Displays the operational ranges.

**config**                            Displays the configured ranges.

### Defaults

By default, both the operational and configured ranges are shown.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **operation** parameter to display only the operational link aggregate identifiers.
- Use the **config** parameter to display only the configured link aggregate identifiers.
- A chassis reboot is required for the configured values to become operational.

### Examples

```
-> show linkagg range
```

	Operational		Configured	
	Min	Max	Min	Max
Local	0	127	0	0
Peer	0	127	0	0
Multi-Chassis	0	127	0	127

#### *output definitions*

---

<b>Operational Min/Max</b>	The currently operational ranges.
<b>Configured Min/Max</b>	The currently configured ranges.
<b>Local</b>	The local link aggregate identifiers.
<b>Peer</b>	The peer link aggregate identifiers.
<b>Multi-Chassis</b>	The MC-LAG link aggregate identifiers.

---

### Release History

Release 7.1.1; command introduced.

# 8 Multi-Chassis Commands

Multi-Chassis Link Aggregation (MC-LAG) enables dual homing of any standards based edge switches to two or more aggregation switches without running the Spanning Tree protocols between the edge and aggregation devices. The feature operates in a mode whereby all ports that are members of the multi-chassis aggregates are actively forwarding traffic. The overall system provides fast fail-over with a bound convergence time for all cases when edge uplinks fail.

MIB information for the Multi-Chassis commands is as follows:

*Filename:* ALCATEL-IND1-MULTI-CHASSIS-MIB.mib  
*Module:* alcatelIND1MultiChassisMIB

A summary of available commands is listed here:

---

**multi-chassis chassis-id**  
**multi-chassis chassis-id hello-interval ipc-vlan**  
**multi-chassis hello-interval**  
**multi-chassis ipc-vlan**  
**multi-chassis loop-detection**  
**multi-chassis loop-detection transmit-interval**  
**multi-chassis vf-link create**  
**multi-chassis vf-link member-port**  
**multi-chassis vf-link default-vlan**  
**multi-chassis vip-vlan**  
**show multi-chassis status**  
**show multi-chassis loop-detection**  
**show multi-chassis vf-link**  
**show multi-chassis vf-link member-port**  
**show multi-chassis consistency**  
**show multi-chassis consistency linkagg**  
**clear multi-chassis loop-detection**

---

## multi-chassis chassis-id

Assigns a globally unique chassis identifier to the switch and enables the switch to operate in multi-chassis mode.

**multi-chassis chassis-id** *chassis\_id*

**no multi-chassis chassis-id** *chassis\_id*

---

### Syntax Definitions

*chassis\_id* Chassis identifier within the multi-chassis operational range [1 - 2]. The chassis identifier must be globally unique within the set of switches configured to operate together providing multi-chassis services.

### Defaults

parameter	default
<i>chassis_id</i>	0 (standalone or no multi-chassis operation allowed)

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- A globally unique chassis identifier within the range [1 - 2] must be assigned through the management interface for the multi-chassis feature to be operational. If the chassis identifier is equal to “0” then the switch operates in standalone mode.
- Two switches that have the same chassis identifier are not allowed to operate in multi-chassis mode. If a duplicate chassis identifier is configured, the multi-chassis functionality will remain in a “down” operational state.
- All the multi-chassis related configuration commands become inactive when the **no multi-chassis chassis-id** command is executed on the switch. When a **write memory** operation is performed, all the multi-chassis related configuration is removed.
- A switch reboot or reset is required for the configured chassis identifier parameter to become operational. In other words, any configuration to the chassis identifier is implemented only after the next reset of the switch.

### Examples

```
-> multi-chassis chassis-id 1
-> no multi-chassis chassis-id 1
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

- show multi-chassis status** Displays the configured and operational parameters related to the multi-chassis feature on the switch.
- show multi-chassis consistency** Displays the system level mandatory consistency parameters of both the local and peer switches.

## MIB Objects

```
multiChassisConfig  
  multiChassisConfigChassisId
```

---

## multi-chassis chassis-id hello-interval ipc-vlan

Configures the multi-chassis feature parameters on the switch. A chassis identifier within the range [1 - 2] must be configured in order for the multi-chassis feature to become operational. Optionally, the multi-chassis control VLAN and hello interval may be configured. The multi-chassis control VLAN and hello interval must be configured with the same values on the switches that will operate in multi-chassis mode.

**multi-chassis chassis-id** *chassis\_id* [**hello-interval** *interval*][ **ipc-vlan** *vlan*]

---

### Syntax Definitions

<i>chassis_id</i>	Chassis identifier within the multi-chassis operational range [1 - 2]. The chassis identifier must be globally unique within the set of switches configured to operate together providing multi-chassis services.
<i>interval</i>	Time interval, in seconds, at which multi-chassis control hello messages are to be sent to the peer switch within the range [1 - 10].
<i>vlan</i>	Multi-chassis control VLAN used for all multi-chassis control communication between the peer switches within the range [2 - 4094].

### Defaults

parameter	default
<i>chassis_id</i>	0 (standalone or no multi-chassis operation allowed)
<i>interval</i>	1 second
<i>vlan</i> (Multi-chassis control VLAN)	4094

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The hello interval and multi-chassis control VLAN parameters must match between switches configured to operate in multi-chassis mode for the feature to be operational.
- A switch reboot or reset is required for the configured hello interval and multi-chassis control VLAN parameters to become operational. In other words, any configuration to these parameters are implemented only after the next reset of the switch.
- The VLAN configured as multi-chassis control VLAN is shown as a different VLAN type.
- The IPC-VLAN is shown as a different VLAN type.
- No front-panel ports (user ports) can be manually configured as members of the multi-chassis control VLAN and that VLAN cannot be disabled.
- Spanning tree configuration commands are not allowed on the multi-chassis control VLAN.
- VLAN 1 is not allowed to be configured as the multi-chassis control VLAN.

## Examples

```
-> multi-chassis chassis-id 1 hello-interval 5 ipc-vlan 4000
-> multi-chassis chassis-id 2 ipc-vlan 1000 hello-interval 10
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">multi-chassis chassis-id</a>	Assigns a globally unique chassis identifier to the switch and enables or disables the switch to operate in multi-chassis mode.

vlanTable
  vlanEntry
```

---

## multi-chassis hello-interval

Configures the multi-chassis hello interval parameter on the switch. The hello interval must be configured with the same values on the switches that will operate in multi-chassis mode.

**multi-chassis hello-interval** *interval*

---

### Syntax Definitions

*interval* Time interval, in seconds, at which multi-chassis control hello messages are to be sent to the peer switch within the range [1 - 10].

### Defaults

parameter	default
<i>interval</i>	1 second

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command can be executed only if a valid multi-chassis chassis identifier within the range [1 - 2] is configured on the switch.
- The hello interval parameter must match between switches configured to operate in multi-chassis mode for the feature to be operational.
- A switch reboot or reset is required for the configured hello interval parameters to become operational. In other words, any configuration to these parameters are implemented only after the next reset of the switch.

### Examples

```
-> multi-chassis hello-interval 2
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

- multi-chassis chassis-id** Assigns a globally unique chassis identifier to the switch and enables or disables the switch to operate in multi-chassis mode.
- multi-chassis ipc-vlan** Configures the IPC-VLAN parameter, which is used for multi-chassis control communication, on the local switch.
- show multi-chassis status** Displays the configured and operational parameters related to the multi-chassis feature on the switch.
- show multi-chassis consistency** Displays the system level mandatory consistency parameters of both the local and peer switches.

## MIB Objects

```
multiChassisConfig  
  multiChassisConfigHelloInterval
```

---

## multi-chassis ipc-vlan

Configures the multi-chassis control VLAN on the switch. The multi-chassis control VLAN must be configured with the same values on the switches that will operate in multi-chassis mode.

**multi-chassis ipc-vlan** *vid*

---

### Syntax Definitions

*vlan* Multi-chassis control VLAN used for all multi-chassis control communication between the peer switches within the range [2 - 4094].

### Defaults

parameter	default
<i>vlan</i> (Multi-chassis control VLAN)	4094

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines.

- This command can be executed only if a valid multi-chassis chassis identifier within the range [1 - 2] is configured on the switch at that time.
- The multi-chassis control VLAN parameter must match between switches configured to operate in multi-chassis mode for the feature to be operational.
- A switch reboot or reset is required for the configured multi-chassis control VLAN parameters to become operational. In other words, any configuration to these parameters are implemented only after the next reset of the switch.
- The VLAN configured as multi-chassis control VLAN is shown as a different VLAN type.
- No front-panel ports (user ports) can be manually configured as members of the multi-chassis control VLAN and that VLAN cannot be disabled.
- Spanning tree configuration commands are not allowed on the multi-chassis control VLAN.
- VLAN 1 is not allowed to be configured as the multi-chassis control VLAN.

### Examples

```
-> multi-chassis ipc-vlan 4094
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

- multi-chassis chassis-id** Assigns a globally unique chassis identifier to the switch and enables or disables the switch to operate in multi-chassis mode.
- multi-chassis hello-interval** Configures the multi-chassis hello interval parameter on the switch.
- show multi-chassis status** Displays the configured and operational parameters related to the multi-chassis feature on the switch.
- show multi-chassis consistency** Displays the system level mandatory consistency parameters of both the local and peer switches.

## MIB Objects

multiChassisConfig  
multiChassisConfigIpcVlan

---

## multi-chassis loop-detection

Configures the multi-chassis loop-detection function on the switch that is used to detect loops and automatically disable offending ports where the loop-detection control packets originated by the local switch are received.

**multi-chassis loop-detection {enable|disable}**

---

### Syntax Definitions

<b>enable</b>	Enables loop-detection operation.
<b>disable</b>	Disables loop-detection operation.

### Defaults

Loop-detection is enabled by default on switches that operate in multi-chassis mode, i.e. whose operational chassis identifier is within the range [1 -2]. The feature is disabled by default on switches that operate in standalone mode, i.e. whose operational chassis identifier is "0".

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command can be executed only if a valid multi-chassis chassis identifier within the range [1 - 2] is configured on the switch at that time.
- It is recommended to keep the default settings, whereby loop-detection is enabled, when configuring the multi-chassis feature on an existing network.
- The user must be aware that the neighbor switches in the network may learn the proprietary MAC addresses used as source addresses for the loop detection control packets. Some of the Alcatel-Lucent switches, notably the OS10K switches, are aware of the MAC address range used and they will not learn these addresses in order to limit MAC address table size. Nevertheless, other vendor switches will typically learn these addresses at the rate of one MAC address per VLAN.

### Examples

```
-> multi-chassis loop-detection enable
-> multi-chassis loop-detection disable
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

**show multi-chassis loop-detection**

.Displays the configured and operational parameters related to the multi-chassis loop-detection feature on the switch.

**multi-chassis loop-detection transmit-interval**

Configures the loop-detection transmit interval, which determines the time interval between the transmission of successive loop-detection packets on each VLAN active on the switch.

## MIB Objects

multiChassisConfig  
multiChassisConfigLoopDetectionAdminStatus

---

## multi-chassis loop-detection transmit-interval

Configures the loop-detection transmit interval, which determines the time interval between the transmission of successive loop-detection packets on each VLAN active on the switch.

**multi-chassis loop-detection transmit-interval** *interval*

---

### Syntax Definitions

*interval*

Transmit interval, in seconds, which determines the time interval between the transmission of successive loop-detection packets on each VLAN active on the switch within the range [1 - 10].

### Defaults

parameter	default
<i>interval</i>	1 second

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command can be executed only if a valid multi-chassis chassis identifier within the range [1 - 2] is configured on the switch at that time.
- It is advised to use greater transmit intervals as the number of VLANs configured on the switch increases to minimize the amount of bandwidth consumed by the loop-detection control packets. For example, if someone has thousands of VLANs configured on the switch, one should set the transmit interval to a number close to or equal to 10 seconds instead of using the default value, i.e. 1 second.

### Examples

```
-> multi-chassis loop-detection transmit-interval 2  
-> multi-chassis loop-detection transmit-interval 3
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

**show multi-chassis loop-detection**

Displays the configured and operational parameters related to the multi-chassis loop-detection feature on the switch.

**multi-chassis loop-detection**

Configures the multi-chassis loop-detection function on the switch.

## MIB Objects

```
multiChassisConfig  
  multiChassisLoopDetectionTransmitInterval
```

---

## multi-chassis vf-link create

Configures a virtual fabric link between two peer switches to enable them to operate in multi-chassis mode.

**multi-chassis vf-link create**

**no multi-chassis vf-link**

---

### Syntax Definitions

NA

### Defaults

NA

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command can be executed only if a valid multi-chassis chassis identifier within the range [1 - 2] is configured on the switch at that time.
- Although the switch supports runtime configuration of the virtual fabric link and its member ports, it is recommended to configure the virtual fabric link at the same time the chassis identifier is configured and before rebooting the switches in multi-chassis mode.

### Examples

```
-> multi-chassis vf-link create
-> no multi-chassis vf-link
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

**MIB Objects**

```
multiChassisLinkTable  
  multiChassisLinkIfIndex  
  multiChassisLinkOperStatus  
  multiChassisLinkActivePortNum  
  multiChassisLinkRowStatus
```

---

## multi-chassis vf-link member-port

Adds a port to the list of member ports of the virtual fabric link.

**multi-chassis vf-link member-port** *slot/port*

**no multi-chassis vf-link member-port** *slot/port*

---

### Syntax Definitions

*slot/port*

Slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

NA

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command can be executed only if a valid multi-chassis chassis identifier within the range [1 - 2] is configured on the switch at that time.
- The maximum number of interfaces that can be configured as virtual fabric link members is 8.
- Currently, only XNI-U32 module ports support the virtual fabric link operation. Ports on other types of modules are not eligible to become virtual fabric link member ports.
- The virtual fabric link must consist of interfaces capable of operating individually at 10 Gbps and full-duplex mode. If an interface is operationally down when the interface is configured, the configuration is accepted. However, when the interface becomes operationally up, the system will perform a capability check and if these conditions are not met, the configuration will be removed and the condition logged through a sys log message and management SNMP trap.
- Although the switch supports runtime configuration of the virtual fabric link and its member ports, it is recommended to configure the virtual fabric link at the same time the chassis identifier is configured and before rebooting the switches in multi-chassis mode.
- The virtual fabric link member ports become operational only when a switch comes up running in the multi-chassis mode. In other words, runtime configuration of a chassis identifier on a switch currently operating in standalone mode does not activate the member ports.
- For resiliency reasons, it is recommended configuring at least 4 interfaces as virtual fabric link members. An ideal set up would be to have two interfaces configured per network interface card. Within each network interface card, using an interface in the lower port range (i.e. ports 1 through 16) and one interface in the upper port range (i.e. ports 17 through 32) is recommended.
- In order to ensure the integrity and stability of the virtual fabric link, it is recommended to physically distribute the cables and fibers that form the virtual fabric link member ports on separate paths compared to the other user interfaces.

## Examples

```
-> multi-chassis vf-link member-port 3/1  
-> no multi-chassis vf-link member-port 3/2
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">multi-chassis vf-link create</a>	Configures a virtual fabric link between two peer switches to enable them to operate in multi-chassis mode.
<a href="#">multi-chassis vf-link default-vlan</a>	Configures the default VLAN on the virtual fabric link.

```

---

## multi-chassis vf-link default-vlan

Configures the default VLAN on the virtual fabric link.

**multi-chassis vf-link default-vlan** *vlan*

**no multi-chassis vf-link default-vlan** *vlan*

---

### Syntax Definitions

*vlan* VLAN to be configured as the default VLAN on the virtual fabric link in the range [1 - 4094].

### Defaults

parameter	default
<i>vlan</i> (Virtual fabric-link default-vlan)	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command can be executed only if a valid multi-chassis chassis identifier within the range [1 - 2] is configured on the switch at that time.
- When no configuration is explicitly provided, the default or untagged VLAN on the virtual fabric link is VLAN 1.
- A VLAN must be created in advance using the **vlan** command to allow the VLAN as the default VLAN on the virtual fabric link.
- If the VLAN currently configured as the default VLAN on the virtual fabric link is removed using VLAN management command ( `vlan vid` ) its configured value is reset to the default value corresponding to VLAN 1.

### Examples

```
-> vlan 2 admin-state enable
-> multi-chassis vf-link default-vlan 2
-> no multi-chassis vf-link default-vlan
-> no vlan 2
```

### Release History

Release 7.1.1; command introduced.

```

---

## multi-chassis vip-vlan

Creates a virtual IP VLAN, which is a special type of VLAN used to provide the underlying LAN infrastructure for the support of basic IP/Layer 3 services on a multi-chassis link aggregation group.

**multi-chassis vip-vlan** *vlan*

**no multi-chassis vip-vlan** *vlan*

---

### Syntax Definitions

*vlan* VLAN to be created as a virtual IP VLAN within the range [1 - 4094].

### Defaults

NA

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command can be executed only if a valid multi-chassis chassis identifier within the range [1 - 2] is configured on the switch at that time.
- The virtual IP VLANs are distinguished from the others by a distinct type of VLAN by using the VLAN management show commands.
- The only ports that can be configured as members of a virtual IP VLAN are the multi-chassis link aggregates. In other words, ordinary aggregates or physical ports cannot be configured as members of this type of VLAN.
- As a result of the previous behavior, a standard IP interface cannot be configured on a non-VIP VLAN if any of the members of such VLAN are a multi-chassis aggregate group. In terms of network topology that basically means that a VLAN that performs IP routing cannot span several switches throughout the entire network if any of its member ports is a multi-chassis aggregate. This aspect must be taken into account while design the network topology and, especially, while migrating existing networks towards a multi-chassis topology.
- The IP interfaces configured on a virtual IP VLAN have limited functionality. Routing protocols and VRRP cannot be configured on such IP interfaces.
- IPv6 interfaces cannot be configured on a virtual IP VLAN in this release (7.1.1.R01).
- IP interfaces configured on virtual IP VLANs have a special meaning and for each interface the user must configure two distinct IP addresses. One of these addresses is called the management address and it is used by each switch within a multi-chassis system to provide management services. Each switch has its own unique IP address. The other address is called virtual IP address and it will be used for supporting routing of packets terminated on the multi-chassis switches. Unlike the management address, the virtual IP address must be the same on the peer switches operating in multi-chassis mode.

## Examples

```
-> multi-chassis vip-vlan 3  
-> no multi-chassis vip-vlan 3
```

Hello Interval  1s           1s
IPC VLAN        4904         4094
```

Output fields are defined here:

#### *output definitions*

---

<b>Operational</b>	Operational parameters are the parameters that are currently being used by the system.
<b>Configured</b>	Often time, within the scope of the multi-chassis feature, the term " <b>configured</b> " is commonly used to identify parameters that have been configured, but that will be implemented after the next switch reset.
Chassis ID	Chassis identifier within the multi-chassis operational range [1 - 2]. The chassis identifier must be globally unique within the set of switches configured to operate together providing multi-chassis services.
Chassis Role	The chassis role determines which of the switches operating in multi-chassis mode is the master of the combined system. The role information can be used by various software components as needed.
Status	The current status of the multi-chassis feature, which can be <b>Down</b> , <b>Up</b> , or <b>Inconsistent</b> .

**output definitions**

---

Hello Interval	Time interval, in seconds, at which multi-chassis control hello messages are to be sent to the peer switch within the range [1 - 10]..
IPC VLAN	Multi-chassis control VLAN used for all multi-chassis control communication between the peer switches within the range [2 - 4094].

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<b>multi-chassis chassis-id</b>	Assigns a globally unique chassis identifier to the switch and enables or disables the switch to operate in multi-chassis mode.

## show multi-chassis vf-link

Displays a summary of the configured and operational parameters related to the virtual fabric link on the switch.

**show multi-chassis vf-link**

---

### Syntax Definitions

NA

### Defaults

NA

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

NA

### Examples

```
-> show multi-chassis vf-link
VFLink ID  Oper      Primary Port  Config Port  Active Port  Def Vlan
-----+-----+-----+-----+-----+-----
0          Up        1/2          4            4            5
```

Output fields are defined here:

#### *output definitions*

VFLink ID	Virtual Fabric Link identifier. Currently a single virtual fabric link with identifier equal to zero is supported.
Oper	The current status of the Virtual Fabric Link, which can be <b>Disabled</b> , <b>Down</b> or <b>Up</b> . The <b>Disabled</b> state occurs whenever the multi-chassis feature is disabled because the operational chassis identifier currently effective is the standalone chassis identifier, i.e. zero.
Primary Port	Identifies the primary port of the virtual fabric link. This concept is relevant because all the non-unicast traffic (i.e. broadcast, multicast and unknown unicast) is distributed across ports of the network interface module that hosts the virtual fabric link's primary port.
Config Port	Number of physical ports configured as virtual fabric link member ports in the range [0 - 8].
Active Port	Number of physical ports that are operational or active members of the virtual fabric link in the range [0 - 8].
Def Vlan	Default VLAN on the virtual fabric link within the range [1 - 4094].

## Release History

Release 7.1.1; command introduced.

## Related Commands

<b>multi-chassis vf-link create</b>	Configures a virtual fabric link between two peer switches to enable them to operate in multi-chassis mode.
<b>multi-chassis vf-link member-port</b>	Adds a port to the list of member ports of the virtual fabric link.
<b>multi-chassis vf-link default-vlan</b>	Configures the default VLAN on the virtual fabric link.
<b>show multi-chassis vf-link member-port</b>	Displays detailed information about the configured and operational parameters related to the virtual fabric link member ports on the switch.

## MIB Objects

```
multiChassisLinkTable
  multiChassisLinkIfIndex
  multiChassisLinkOperStatus
  multiChassisLinkPrimaryPort
  multiChassisLinkConfigPortNum
  multiChassisLinkActivePortNum
vlanTable
  vlanEntry
```

---

## show multi-chassis vf-link member-port

Displays detailed information about the configured and operational parameters related to the virtual fabric link member ports on the switch.

**show multi-chassis vf-link member-port** [*slot/port*]

---

### Syntax Definitions

*slot/port*

Specify the slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

NA

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

NA

### Examples

```
-> show multi-chassis vf-link member-port
VFLink ID  Slot/Port  Oper      Is Primary
-----+-----+-----+-----
0           1/1        Up        No
0           1/2        Up        Yes
0           1/17       Up        No
0           1/18       Up        No
```

```
-> show multi-chassis vf-link member-port 3/1
VFLink ID  Slot/Port  Oper      Is Primary
-----+-----+-----+-----
0           1/2        Up        Yes
```

Output fields are defined here:

#### *output definitions*

---

VFLink ID	Virtual Fabric Link identifier. Currently a single virtual fabric link with identifier equal to zero is supported.
Slot/Port	The slot/port that defines each of the physical ports that are members of the virtual fabric link.

*output definitions*

---

Oper	The current status of each virtual fabric link member port, which can be <b>Disabled</b> , <b>Down</b> or <b>Up</b> . The <b>Disabled</b> state occurs whenever the multi-chassis feature is disabled because the operational chassis identifier currently effective is the standalone chassis identifier, i.e. zero.
Is Primary	Specifies whether a physical port is the primary port of the virtual fabric link. It may assume the values <b>Yes</b> or <b>No</b> .

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<b>multi-chassis vf-link create</b>	Configures a virtual fabric link between two peer switches to enable them to operate in multi-chassis mode.
<b>multi-chassis vf-link member-port</b>	Adds a port to the list of member ports of the virtual fabric link.
<b>multi-chassis vf-link default-vlan</b>	Configures the default VLAN on the virtual fabric link.
<b>show multi-chassis vf-link</b>	Displays a summary of the configured and operational parameters related to the virtual fabric link on the switch.

## show multi-chassis consistency

Displays the system level mandatory consistency parameters of both the local and peer switches.

**show multi-chassis consistency**

---

### Syntax Definitions

NA

### Defaults

NA

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

NA

### Examples

```
-> show multi-chassis consistency
Consistency          Local      Peer      Status
-----+-----+-----+-----
Chassis-ID           1          2         OK
Hello-Interval       1          1         OK
IPC-VLAN              4094      4094      OK
STP-Path-Cost-Mode   Auto       Auto       OK
STP-Mode              Per-VLAN   Per-VLAN   OK
```

Output fields are defined here:

#### *output definitions*

---

<b>Consistency</b>	Provides a list of global mandatory consistency parameters for the local and remote switches operating in multi-chassis mode.
<b>Local</b>	Value of a given consistency parameter on the local switch.
<b>Peer</b>	Value of a given consistency parameter on the peer switch.

*output definitions*

<b>Status</b>	Specifies the overall status of a consistency parameter within the entire multi-chassis system comprised by the individual switches. The possible values are <b>OK</b> , <b>NOK</b> or <b>N/A</b> . or If there is a mismatch of any of the parameters listed in this command or if the chassis identifier of the two switches is the same, the multi-chassis operational status will not become Up. In this case the "Status" column shown in this output will indicate which parameter has a problem. The N/A value in the "Peer" column indicates that the information is unavailable from the peer. This will always be the case when the multi-chassis operational status is <b>Down</b> .
Chassis ID	Globally unique chassis identifier. The valid range for the multi-chassis operational range is [1 - 2], whereas the value for standalone operation is zero.
Hello Interval	Time interval, in seconds, at which multi-chassis control hello messages are to be sent to the peer switch within the range [1 - 10].
IPC VLAN	Multi-chassis control VLAN used for all multi-chassis control communication between the peer switches within the range [2 - 4094].
STP-Path-Cost-Mode	Specifies the STP path cost mode whose possible values are Auto and 32Bit.
STP-Mode	Specifies the STP mode whose possible values are <b>Per-VLAN</b> and <b>Flat</b>

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<a href="#">spantree mode</a>	Assigns a flat Spanning Tree or per-vlan Spanning Tree operating mode for the switch. These modes are exclusive; however, it is not necessary to reboot the switch when the STP modes are changed.
<a href="#">multi-chassis chassis-id</a>	Assigns a globally unique chassis identifier to the switch and enables or disables the switch to operate in multi-chassis mode.
<a href="#">multi-chassis hello-interval</a>	Configures the multi-chassis hello interval parameter on the switch.
<a href="#">multi-chassis ipc-vlan</a>	Configures the IPC-VLAN parameter, which is used for multi-chassis control communication, on the local switch.
<a href="#">show multi-chassis status</a>	Displays the configured and operational parameters related to the multi-chassis feature on the switch.
<a href="#">show multi-chassis consistency</a>	Displays the system level mandatory consistency parameters of both the local and peer switches.

```

---

## show multi-chassis consistency linkagg

Displays the per-multi-chassis aggregate level optional consistency parameters of both the local and peer switches.

**show multi-chassis consistency linkagg** [*agg\_num* [**vlan-list**] | **vlan-list**]

---

### Syntax Definitions

**agg\_num** The number corresponding to the static or dynamic multi-chassis aggregate group within the range [0-127] and subject to the settings specified through the linkagg range command.

**vlan-list** Lists the local and peer VLANs associated with the aggregate.

### Defaults

NA

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command provides data related to multi-chassis aggregates only. It cannot be used for ordinary aggregates. In order to determine the type of an aggregate and classify this aggregate as a multi-chassis aggregate the user must use the [linkagg range](#) command.
- The user must be aware of the ranges assigned to aggregate identifiers by using the [linkagg range](#) command.
- Mismatches of any of the parameters listed in this command represent network mis-configurations and may cause traffic problems. In this case the "Status" column shown in this output will indicate which parameter has a problem.

### Examples

```
-> show multi-chassis consistency linkagg
```

```

      Local Peer
Linkagg Exist Exist Status
-----+-----+-----+-----
3 Yes    Yes    OK

```

```
-> show multi-chassis consistency linkagg 3
```

```

Consistency      Local              Peer              Status
-----+-----+-----+-----
Chassis-ID       1                    2                  OK

Output fields are defined here:

### output definitions

#### Consistency

Provides a list of per-multi-chassis aggregate optional consistency parameters for the local and remote switches operating in multi-chassis mode.

#### Local/Peer Exist

Specifies if the Link Agg exists on both local and peer chassis.

#### Local/Peer

Value of a given consistency parameter on the local/peer switch.

#### Status

Specifies the overall status of a consistency parameter within the entire multi-chassis system comprised by the individual switches. The possible values are **OK**, **NOK** or **N/A**. or If there is a mismatch of any of the parameters listed in this command or if the chassis identifier of the two switches is the same, the multi-chassis operational status will not become Up. In this case the "Status" column shown in this output will indicate which parameter has a problem. The N/A value in the "Peer" column indicates that the information is unavailable from the peer. This will always be the case when the multi-chassis operational status is **Down**.

#### Chassis-ID

Globally unique chassis identifier. The valid range for the multi-chassis operational range is [1 - 2], whereas the value for standalone operation is zero.

#### Agg-ID

The number corresponding to the static or dynamic multi-chassis aggregate group within the range [0-127].

#### LAG-Type

Defines the aggregate type as static or dynamic, i.e. LACP

#### LACP-System-ID

Specifies the system identifier (MAC address format) used by the LACP protocol.

#### LACP-Priority

Provides the system priority used by the LACP protocol.

#### Default-Vlan

Specifies the value of the default VLAN configured on the multi-chassis aggregate within the range [1 - 4094].

#### VLAN List

Indicates whether other types of VLANs (distinct from the default VLAN) are configured on the multi-chassis aggregate.

#### Local/Peer Count

The number of VLANs on the local/peer chassis.

## Release History

Release 7.1.1; command introduced.

Release 7.2.1; **vlan-list** parameter added.

## Related Commands

# 9 Ethernet Ring Protection Commands

Ethernet Ring Protection (ERP) is a protection switching mechanism for Ethernet ring topologies, such as multi-ring and ladder networks. This implementation of ERP is based on Recommendation ITU-T G.8032 and uses the ring Automatic Protection Switching (APS) protocol to coordinate the prevention of network loops within a bridged Ethernet ring.

Loop prevention is achieved by allowing the traffic to flow on all but one of the links within the protected Ethernet ring. This link is blocked and is referred to as the Ring Protection Link (RPL). When a ring failure condition occurs, the RPL is unblocked to allow the flow of traffic to continue through the ring.

ERP and the Ring Rapid Spanning Tree Protocol (RRSTP) are both used for the prevention of loops in ring-based topologies but have the following differences in their implementation and functionality:

- RRSTP uses a different destination MAC address for each ring, based on the ring ID. ERP uses the same destination MAC address for all ERP protocol frames and identifies the ring based on a unique Service VLAN associated with each ring, which carries the ERP protocol frames.
- When a link failure is detected, RRSTP quickly sets the blocking ports to a forwarding state but relies on MSTP for actual protocol convergence. ERP does not require any support from MSTP. ERP has an inherent mechanism to recover from a failed state once the failed link is active again.
- MSTP determines which ports of a fully active RRSTP ring are blocked. The blocked ports (Ring Protection Link) for an ERP ring is pre-determined and configured by the user.
- RRSTP requires a ring of contiguous RRSTP nodes. ERP allows non-ERP nodes to participate in the ring by using the connectivity monitoring capabilities of Ethernet OAM to alert ERP of a link failure through non-ERP nodes.

MIB information for the Ethernet ring protection command is as follows:

*Filename:* AlcatelIND1Erp.mib  
*Module:* ALCATEL-IND1-ERP-MIB

A summary of available commands is listed here:

---

[erp-ring](#)  
[erp-ring rpl-node](#)  
[erp-ring wait-to-restore](#)  
[erp-ring enable](#)  
[erp-ring guard-timer](#)  
[clear erp statistics](#)  
[show erp](#)  
[show erp statistics](#)  
[show erp statistics](#)

---

## erp-ring

Creates an Ethernet Ring Protection (ERP) ring using the specified ports and service VLAN ID. The service VLAN transmits ERP control traffic, such as Ring Automatic Protection Switching (R-APS) messages, through the ring and the specified level number identifies an APS Management Entity Group (MEG) to which the service VLAN belongs.

```
erp-ring ring_id port1 {slot/port | linkagg agg_num} port2 {slot/port | linkagg agg_num} service-vlan
vlan_id level level_num [guard-timer guard_timer] [wait-to-restore-timer wtr_timer] [enable | disable]
```

```
no erp-ring ring_id
```

---

### Syntax Definitions

<i>ring_id</i>	The ERP ring ID number. The valid range is 1- 2147483647.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_num</i>	The link aggregate ID number.
<i>vlan_id</i>	The service VLAN ID number. The valid range is 1- 4094.
<i>level_num</i>	The MEG level number for the service VLAN. The valid range is 0-7.
<i>guard-timer</i>	The guard timer value, in centi-secs, for the ring node.
<i>wtr-timer</i>	The wait-to-restore timer value, in minutes, for the Ring Protection Link (RPL) node.
<b>enable</b>	Administratively enables the ERP ring.
<b>disable</b>	Administratively disables the ERP ring.

### Defaults

parameter	default
<i>guard_timer</i>	50
<i>wtr_timer</i>	5
<b>enable</b>   <b>disable</b>	disable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a ring from the switch configuration. Note that administratively disabling ring ports is recommended before deleting the ring to avoid creating any network loops. Once the ring is deleted, then ensure that the same ports are administratively enabled under Spanning Tree control.
- The specified ring identification number must be unique within a switch.

- ERP is not supported on mobile ports, mirroring ports, link aggregate member ports, high availability ports, Multicast VLAN receiver ports (ERP is supported on Multicast VLAN sender ports only), VLAN Stacking user network interface (UNI) ports, or RRSTP ring ports.
- If a port is tagged with the service VLAN ID or the service VLAN is the default VLAN for the port, then the port is not eligible to become an ERP ring port.
- Specify an existing VLAN ID for the service VLAN ID. Use the same VLAN ID and level number for the service VLAN on each switch that will participate in the ERP ring.
- If the ERP switch participates in an Ethernet OAM Maintenance Domain (MD), configure the ERP service VLAN to use the same level number that is used for the Ethernet OAM MD.
- Specify a static VLAN ID for the ERP service VLAN; dynamic VLANs are not configurable as service VLANs.
- The service VLAN can belong to only one ERP ring at a time. Up to four rings per switch are allowed.
- The specified service VLAN ID must not participate in a Spanning Tree instance that is associated with non-ERP VLANs. This may require changing the Spanning Tree configuration for the VLAN ID prior to using this command.
- An ERP ring port can belong to only one ERP ring at a time.
- An ERP type NNI-SVLAN binding should be created before establishing an ERP ring on that SVLAN-NNI binding.

## Examples

```
-> erp-ring 1 port1 1/1 port2 2/4 service-vlan 10 level 2 enable
-> erp-ring 2 port1 linkagg 1 port2 2/10 service-vlan 20 level 2
-> erp-ring 3 port1 linkagg 2 port2 linkagg 4 service-vlan 30 level 7
-> no erp-ring 2
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">show erp</a>	Displays the ERP ring configuration for the switch.
<a href="#">show erp statistics</a>	Displays ERP ring statistics.
<a href="#">ethernet-service svlan nni</a>	Creates a NNI-SVLAN binding.

**MIB Objects**

```
alaErpRingId
  alaErpRingServiceVid
  alaErpRingMEGLevel
  alaErpRingStatus
  alaErpRingPort1
  alaErpRingPort2
  alaErpRingWaitToRestore
  alaErpRingGuardTimer
  alaErpRingRowStatus
```

---

## erp-ring rpl-node

Configures a switch as a Ring Protection Link (RPL) node. This command also identifies the ERP port as an RPL connection port. The RPL remains blocked to prevent loops within the ERP ring.

```
erp-ring ring_id rpl-node {port slot/port | linkagg agg_num}
```

```
no erp-ring ring_id rpl-node
```

---

### Syntax Definitions

<i>ring_id</i>	An existing ERP ring ID number. The valid range is 1- 2147483647.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_num</i>	The link aggregate ID number.

### Defaults

NA

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove the RPL designation for the specified ring.
- The RPL node can be configured only when the ring is disabled; RPL configuration applied to the ring while it is enabled will be rejected.
- The specified ERP ring ID must already exist in the switch configuration.
- This command applies only to ERP ring ports; ports not configured as ERP ring ports are not eligible to become RPL ports.
- Only one of the two ring ports configured for the switch can be designated as an RPL node port.

### Examples

```
-> erp-ring 1 rpl-node port 2/1  
-> erp-ring 2 rpl-node linkagg 2  
-> no erp-ring 2 rpl-node
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

<a href="#">erp-ring</a>	Configures an ERP ring.
<a href="#">erp-ring wait-to-restore</a>	Configures the wait-to-restore timer value for the Ring Protection Link (RPL) node.
<a href="#">show erp</a>	Displays the ERP ring configuration for the switch.

**MIB Objects**

```
alaErpRingId  
  alaErpRingPortIfIndex  
  alaErpRingPortType
```

---

## erp-ring wait-to-restore

Configures the wait-to-restore timer value for the Ring Protection Link (RPL) switch. This timer determines the number of minutes the RPL switch waits before returning the RPL ports to a blocked state after the ERP ring has recovered from a link failure.

```
erp-ring ring_id wait-to-restore wtr_timer
```

```
no erp-ring ring_id wait-to-restore
```

---

### Syntax Definitions

<i>ring_id</i>	An existing ERP ring ID number. The valid range is 1- 2147483647.
<i>wtr_timer</i>	The number of minutes to wait before restoring the RPL to a blocked state. The valid range is 1-12.

### Defaults

By default, the wait-to-restore timer value is set to 5 minutes.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to set the timer back to the default setting of 5 minutes.
- The specified ERP ring ID must already exist in the switch configuration.
- This command applies only on a switch that serves as the RPL node for the ERP ring.

### Examples

```
-> erp-ring 1 wait-to-restore 6  
-> no erp-ring 1 wait-to-restore
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">erp-ring</a>	Configures an ERP ring.
<a href="#">erp-ring rpl-node</a>	Configures a Ring Protection Link (RPL) port connection.
<a href="#">show erp</a>	Displays the ERP ring configuration for the switch.

### MIB Objects

```
alaErpRingId  
  alaErpRingWaitToRestoreTimer
```

---

## erp-ring enable

Enables or disables an ERP ring identified by the specified ring ID. This command applies to enabling or disabling existing ERP rings.

**erp-ring** *ring\_id* {**enable** / **disable**}

---

### Syntax Definitions

*ring\_id* An existing ERP ring ID number. The valid range is 1- 2147483647.

### Defaults

By default, ERP rings are disabled when they are created.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The specified ring ID must already exist in the switch configuration.
- Enabling a ring is also allowed at the time the ring is created.

### Examples

```
-> erp-ring 1 enable  
-> erp-ring 1 disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">erp-ring</a>	Configures an ERP ring.
<a href="#">show erp</a>	Displays the ERP ring configuration for the switch.

### MIB Objects

```
alaErpRingId  
  alaErpRingStatus
```

---

## erp-ring guard-timer

Configures the guard timer value for the specified ERP ring node. The guard timer is used to prevent ring nodes from receiving outdated Ring Automatic Protection Switching (R-APS) messages. During the amount of time determined by this timer, all received R-APS messages are ignored by the ring protection control process.

**erp-ring** *ring\_id* **guard-timer** *guard\_timer*

**no erp-ring** *ring\_id* **guard-timer**

---

### Syntax Definitions

*ring\_id* An existing ERP ring ID number. The valid range is 1–2147483647.

*guard\_timer* The guard timer value. The valid range is 1–200 centi-secs.

### Defaults

parameter	default
<i>guard_timer</i>	50

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to set the timer back to the default value of 50 centi-secs.
- The specified ring ID must already exist in the switch configuration.

### Examples

```
-> erp-ring 1 guard-timer 10
-> no erp-ring 1 guard-timer
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[erp-ring](#) Configures an ERP ring.

[show erp](#) Displays the ERP ring configuration for the switch.

### MIB Objects

alaErpRingId  
alaErpRingGuardTimer

---

## clear erp statistics

Clears ERP statistics for all rings, a specific ring, or a specific ring port.

**clear erp statistics** [**ring** *ring\_id* [**port** *slot/port* | **linkagg** *agg\_num*]]

---

### Syntax Definitions

<i>ring_id</i>	An existing ERP ring ID number. The valid range is 1- 2147483647.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_num</i>	The link aggregate ID number.

### Defaults

By default, statistics are cleared for all ERP rings in the switch configuration.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Enter a ring ID to clear the statistics for a specific ring.
- Enter a ring ID and a ring port number or link aggregate ID to clear the statistics for a specific port or link aggregate.
- The specified ring ID must already exist in the switch configuration.
- The specified port must belong to the ring identified by the ring ID.

### Examples

```
-> clear erp statistics
-> clear erp statistics ring 5
-> clear erp statistics ring 5 port 1/2
-> clear erp statistics ring 5 linkagg 10
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">erp-ring</a>	Configures an ERP ring.

## show erp

Displays the ERP configuration information for all rings, a specific ring, or for a specific ring port.

**show erp** [**ring** *ring\_id*] [**port** *slot/port* | **linkagg** *agg\_num*]

---

### Syntax Definitions

<i>ring_id</i>	An existing ERP ring ID number. The valid range is 1- 2147483647.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_num</i>	The link aggregate ID number.

### Defaults

By default, configuration information is displayed for all ERP rings in the switch configuration.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Enter a ring ID to display the configuration for a specific ring.
- Enter a ring port number or a link aggregate ID to display the configuration for a specific port or link aggregate.
- The specified ring ID must already exist in the switch configuration.

### Examples

```
-> show erp
```

```
Legends: * - Inactive Configuration
          WTR - Wait To Restore
          MEG - Maintenance Entity Group
```

Ring ID	Ring Port1	Ring Port2	Ring Status	Serv VLAN	WTR Timer (min)	Guard Timer (csec)	MEG Level	Ring State	Ring Node
1	1/15	1/1	enabled	4094	3	50	2	idle	rpl
2	6/7	4/1	enabled	4093	1	50	1	idle	rpl
3	4/7	6/1	enabled	4092	1	50	3	idle	rpl
4	4/8	6/23	enabled	4091	5	50	4	idle	non-rpl

```
Total number of rings configured = 4
```

```
-> show erp ring 1
```

```
Legend: * - Inactive Configuration
```

```
Ring Id           : 1,
Ring Port1       : 1/15,
```

```

Ring Port2           : 1/1,
Ring Status          : enabled,
Service VLAN         : 4094,
WTR Timer (min)     : 3,
Guard Timer (centi-sec) : 50,
MEG Level            : 2,
Ring State           : idle,
Ring Node Type       : rpl,
RPL Port             : 1/1,
Last State Change    : SUN DEC 25 06:50:17 2016 (sysUpTime 00h:01m:31s)

```

**output definitions**

---

<b>Ring ID</b>	The ERP ring ID number.
<b>Ring Ports</b>	The slot and port number of the ring ports.
<b>Ring Status</b>	The ring status ( <b>enabled</b> or <b>disabled</b> ).
<b>Service VLAN</b>	The Service VLAN ID.
<b>WTR Timer</b>	The wait-to-restore timer value in minutes for RPL node.
<b>Guard Timer</b>	The guard timer value in centi-secs for the ring node.
<b>MEG Level</b>	The Service VLAN Management Entity Group (MEG) level.
<b>Ring State</b>	Indicates the state of the ring.
<b>Ring Node Type</b>	Indicates the type of the ring node.
<b>Last State Change</b>	Indicates the time when the last state change occurred.

---

```

-> show erp port 1/15
Legend: * - Inactive Configuration

```

```

Ring-Id : 1
  Ring Port Status   : forwarding,
  Ring Port Type     : non-rpl,

```

```

-> show erp port 1/1
Legend: * - Inactive Configuration

```

```

Ring Id : 1
  Ring Port Status   : blocking,
  Rint Port Type     : RPL,
  Ethoam Event       : enabled,
  Rmepid             : 10

```

**output definitions**

---

<b>Ring ID</b>	The ERP ring ID number.
<b>Ring Port Status</b>	The status of the ring port ( <b>blocking</b> or <b>forwarding</b> ).
<b>Ring Port Type</b>	The type of ring port ( <b>RPL</b> or <b>non-RPL</b> ).
<b>Ethoam Event</b>	Indicates whether or not the ring port will accept Ethernet OAM loss of connectivity events ( <b>enabled</b> or <b>disabled</b> ).
<b>Rmepid</b>	The remote Ethernet OAM MEP ID number from which this port accepts loss of connectivity events. This field displays only when the ring port is configured to receive such events.

## show erp statistics

Displays the ERP statistics for all rings, a specific ring, or a specific ring port.

```
show erp statistics [ring ring_id [port slot/port | linkagg agg_num]]
```

---

### Syntax Definitions

<i>ring_id</i>	An existing ERP ring ID number. The valid range is 1- 2147483647.
<i>slot/port</i>	The slot number for the module and the physical port number on that module.
<i>agg_num</i>	The link aggregate ID number.

### Defaults

By default, statistics are displayed for all ERP rings in the switch configuration.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Enter a ring ID to display the statistics for a specific ring.
- Enter a ring ID and a ring port number or link aggregate ID to display the statistics for a specific port or link aggregate.
- The specified ring ID must already exist in the switch configuration.
- The specified port must belong to the ring identified by the ring ID.

# 10 MVRP Commands

MVRP (Multiple VLAN Registration Protocol) provides a mechanism for maintaining the contents of Dynamic VLAN Registration Entries for each VLAN, and for propagating the information they contain to other Bridges. MVRP uses MRP (Multiple Registration Protocol) as the underlying mechanism, for the maintenance and propagation of the VLAN information.

MVRP acts as an MRP application, sending and receiving MVRP information encapsulated in an Ethernet frame on a specific MAC address. MVRP allows both end stations and Bridges in a Bridged Local Area Network to issue and revoke declarations relating to membership of VLANs.

A summary of the available commands is listed here:

---

- mvrp**
- mvrp port**
- mvrp maximum-vlan**
- mvrp registration**
- mvrp applicant**
- mvrp timer join**
- mvrp timer leave**
- mvrp timer leaveall**
- mvrp timer periodic-timer**
- mvrp periodic-transmission**
- mvrp restrict-vlan-registration**
- mvrp restrict-vlan-advertisement**
- mvrp static-vlan-restrict**
- show mvrp configuration**
- show mvrp port**
- show mvrp linkagg**
- show mvrp timer**
- show mvrp statistics**
- show mvrp last-pdu-origin**
- show mvrp vlan-restrictions**
- show mvrp vlan-restrictions**
- mvrp clear-statistics**

---

## mvrp

Enables or disables MVRP globally on the switch.

**mvrp {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables MVRP globally on the switch.
<b>disable</b>	Disables MVRP globally on the switch.

### Defaults

By default, MVRP is disabled on the switch.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Disabling MVRP globally deletes all the MVRP learned VLANs.
- MVRP is supported only when the switch is operating in the flat Spanning Tree mode and it is not supported in the per-VLAN mode.

### Examples

```
-> mvrp enable  
-> mvrp disable
```

### Release History

Release 7.2.1; command introduced.

### Related Commands

[show mvrp configuration](#) Displays the global configuration for MVRP.

### MIB Objects

alaMvrpGlobalStatus

---

## mvrp port

Enables or disables MVRP on specific ports on the switch.

```
mvrp port slot/port [- port2] {enable | disable}
```

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group
<b>enable</b>	Enables MVRP on a port.
<b>disable</b>	Disables MVRP on a port.

### Defaults

By default, MVRP is disabled on all the ports.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- MVRP can be enabled on switch ports regardless of whether it is globally enabled on the switch. However, for the port to become an active participant in the MVRP operation, MVRP must be enabled globally on the switch.
- When MVRP is globally enabled on the switch and is not enabled on the port, that port is excluded from the MVRP protocol operation.
- MVRP can be enabled only on fixed ports, 802.1 Q ports, aggregate ports, and VLAN Stacking Network ports. Other ports (mirroring ports, aggregable ports, VLAN Stacking User ports) do not support MVRP.

### Examples

```
-> mvrp port 1/2 enable
-> mvrp port 1/2 disable
-> mvrp port 1/1-10 enable
-> mvrp port 1/1-10 disable
```

### Release History

Release 7.2.1; command introduced.

## Related Commands

### [show mvrp port](#)

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

### [show mvrp statistics](#)

Displays the MVRP statistics for all the ports, aggregates, or specific ports.

## MIB Objects

alaMvrpPortConfigTable  
alaMvrpPortStatus

---

## mvrp linkagg

Enables or disables MVRP on specific aggregates on the switch.

```
mvrp linkagg agg_num [-agg_num2] {enable | disable}
```

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the aggregate group.
<b>enable</b>	Enables MVRP on a port.
<b>disable</b>	Disables MVRP on a port.

### Defaults

By default, mvrp is disabled on all the ports.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- MVRP can be enabled on switch ports regardless of whether it is globally enabled on the switch. However, for the port to become an active participant in the MVRP operation, MVRP must be enabled globally on the switch.
- When MVRP is globally enabled on the switch and is not enabled on the port, that port is excluded from the MVRP protocol operation.
- MVRP can be enabled only on fixed ports, 802.1 Q ports, aggregate ports, and VLAN Stacking Network ports. Other ports (mirroring ports, aggregable ports, mobile ports, VPLS Access ports, VLAN Stacking User ports) do not support MVRP.
- To use the *agg\_num* parameter, the link aggregate group must be created.

### Examples

```
-> mvrp linkagg 10 enable
-> mvrp linkagg 10 disable
-> mvrp linkagg 2-5 enable
-> mvrp linkagg 1-5 disable
```

### Release History

Release 7.2.1; command introduced.

## Related Commands

### [show mvrp port](#)

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

### [show mvrp statistics](#)

Displays the MVRP statistics for all the ports, aggregates, or specific ports.

## MIB Objects

alaMvrpPortConfigTable  
alaMvrpPortStatus

---

## mvrp maximum-vlan

Configures the maximum number of dynamic VLANs that can be created by MVRP.

**mvrp maximum-vlan** *vlan\_limit*

---

### Syntax Definitions

*vlan\_limit*                      The maximum number of VLANs to be created by MVRP. The valid range is 32–4094.

### Defaults

The default value is 256.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- This command can be used even when MVRP is not enabled on the switch. However, MVRP must be enabled on the switch for creating dynamic VLANs.
- If the VLAN limit to be set is less than the current number of dynamically learnt VLANs, then the new configuration takes effect only after the MVRP is disabled and re-enabled on the switch. The VLANs learnt earlier are retained if this operation is not performed.

### Examples

```
-> mvrp maximum-vlan 100
```

### Release History

Release 7.2.1; command introduced.

### Related Commands

- [show mvrp configuration](#)            Displays the global configuration for MVRP.
- [show mvrp vlan-restrictions](#)      Displays the list of VLANS learned through MVRP and their details.

### MIB Objects

alaMvrpMaxVlanLimit

---

## mvrp registration

Configures the MVRP registration mode for specific ports or aggregates.

```
mvrp {port slot/port [- port2] | linkagg agg_num [-agg_num2]} registration {normal | fixed | forbidden}
```

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<b>normal</b>	Specifies that both registration and de-registration of VLANs are allowed. VLANs can be mapped either dynamically (through MVRP) or statically (through management application) on such a port.
<b>fixed</b>	Specifies that only static mapping of VLANs is allowed on the port but de-registration of previously created dynamic or static VLANs is not allowed.
<b>forbidden</b>	Specifies that dynamic VLAN registration or de-registration is not allowed on the port. Any dynamic VLANs created earlier is de-registered.

### Defaults

parameter	default
normal   fixed   forbidden	normal

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 registration forbidden
-> mvrp port 1/5 registration normal
-> mvrp linkagg 10 registration fixed
-> mvrp linkagg 20 registration forbidden
-> mvrp port 2/5-10 registration normal
```

### Release History

Release 7.2.1; command introduced.

## Related Commands

### [show mvrp port](#)

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

### [show mvrp linkagg](#)

Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

## MIB Objects

alaMvrpPortConfigTable

alaMvrpPortConfigRegistrarMode

---

## mvrp applicant

Configures the applicant mode of specific ports on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.

**mvrp** {port *slot/port* [- *port2*] | linkagg *agg\_num* [-*agg\_num2*]} **applicant** {**participant** | **non-participant** | **active**}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<b>participant</b>	Specifies that MVRP PDU exchanges are only allowed when the port is in the STP forwarding state.
<b>non-participant</b>	Specifies that MVRP PDU's are not sent in this mode and PDU's received are processed and learning happens as expected.
<b>active</b>	Specifies that MVRP PDU exchanges are allowed when the port is in the STP forwarding state or STP blocking state. This is applicable for both advertisement and registration.

### Defaults

parameter	default
<b>participant</b>   <b>non-participant</b>   <b>active</b>	<b>active</b>

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 applicant active
-> mvrp port 1/3 applicant participant
-> mvrp port 1/4 applicant non-participant
-> mvrp linkagg 10 applicant active
-> mvrp linkagg 15 applicant participant
-> mvrp linkagg 20 applicant non-participant
```

### Release History

Release 7.2.1; command introduced.

## Related Commands

### [show mvrp port](#)

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

### [show mvrp linkagg](#)

Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

## MIB Objects

alaMvrpPortConfigtable  
alaMvrpPortConfigApplicantMode

---

## mvrp timer join

Specifies the join time interval between transmit opportunities for the dynamically registering VLANs on the switch.

**mvrp** {port *slot/port* [- *port2*] | linkagg *agg\_num* [-*agg\_num2*]} **timer join** *timer-value*

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<i>timer-value</i>	Specifies the value of the join timer in milliseconds. The valid range is 250 milliseconds to 1073741773 milliseconds.

### Defaults

---

parameter	default
<i>timer-value</i>	600 milliseconds

---

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 timer join 600
-> mvrp port 1/2-12 timer join 600
-> mvrp linkagg 3 timer join 600
-> mvrp linkagg 3-6 timer join 600
```

### Release History

Release 7.2.1; command introduced.

## Related Commands

[show mvrp timer](#)

Displays the timer values configured for all the ports or a specific port.

[show mvrp port](#)

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

## MIB Objects

```
alaMvrpPortConfigTable  
  alaMvrpPortConfigJoinTimer  
  alaMvrpPortConfigLeaveTimer  
  alaMvrpPortConfigLeaveAllTimer  
  alaMvrpPortConfigPeriodicTimer
```

---

## mvrp timer leave

Specifies the period of time that the switch has to wait in the Leave state before changing to the unregistered state.

**mvrp** {port *slot/port* [- *port2*] | linkagg *agg\_num* [-*agg\_num2*]} **timer leave** *timer-value*

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<i>timer-value</i>	Specifies the value of the Leave Timer in milliseconds. The valid range is 750 milliseconds to 2147483647 milliseconds.

### Defaults

parameter	default
<i>timer-value</i>	1800 milliseconds

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- Leave timer value must be greater than or equal to twice the Join timer value, plus six times the timer resolution (16.66 milliseconds). Leave timer must be at least be greater than twice the join timer plus 100 milliseconds.
- To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 timer leave 1800
-> mvrp port 1/2-12 timer leave 1800
-> mvrp linkagg 3 timer leave 1800
-> mvrp linkagg 3-6 timer leave 1800
```

### Release History

Release 7.2.1; command introduced.

## Related Commands

[show mvrp timer](#)

Displays the timer values configured for all the ports or a specific port.

[show mvrp port](#)

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

## MIB Objects

```
alaMvrpPortConfigTable  
  alaMvrpPortConfigJoinTimer  
  alaMvrpPortConfigLeaveTimer  
  alaMvrpPortConfigLeaveAllTimer  
  alaMvrpPortConfigPeriodicTime
```

---

## mvrp timer leaveall

Specifies the frequency with which the LeaveAll messages are communicated.

**mvrp** {port *slot/port* [- *port2*] | linkagg *agg\_num* [-*agg\_num2*]} **timer leaveall** *timer-value*

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<i>timer-value</i>	Specifies the value of the LeaveAll Timer in milliseconds. The valid range is 750 milliseconds to 2147483647 milliseconds.

### Defaults

parameter	default
<i>timer-value</i>	30000 milliseconds

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- Leaveall timer value must be greater than or equal to the Leave timer value. It is recommended to have the leaveall timer 15 times greater than the leave timer.
- To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 timer leaveall 30000
-> mvrp port 1/2-12 timer leaveall 30000
-> mvrp linkagg 3 timer leaveall 30000
-> mvrp linkagg 3-6 timer leaveall 30000
```

### Release History

Release 7.2.1; command introduced.

## Related Commands

[show mvrp timer](#)

Displays the timer values configured for all the ports or a specific port.

[show mvrp port](#)

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

## MIB Objects

```
alaMvrpPortConfigTable  
  alaMvrpPortConfigJoinTimer  
  alaMvrpPortConfigLeaveTimer  
  alaMvrpPortConfigLeaveAllTimer  
  alaMvrpPortConfigPeriodicTimer
```

---

## mvrp timer periodic-timer

Specifies the MVRP periodic-timer time interval for the dynamically registering VLANs on the switch.

**mvrp** {port *slot/port* [- *port2*] | linkagg *agg\_num* [-*agg\_num2*]} **timer periodic-timer** *timer-value*

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<i>timer-value</i>	Specifies the value of the Periodic Timer in seconds. The valid range is between 1 to 2147483647 milliseconds.

### Defaults

parameter	default
<i>timer-value</i>	<i>1 second</i>

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.
- To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 timer periodic-timer 1
-> mvrp port 1/2 timer periodic-timer 1
-> mvrp linkagg 3 timer periodic-timer 1
-> mvrp linkagg 3-6 timer periodic-timer 1
```

### Release History

Release 7.2.1; command introduced.

## Related Commands

[show mvrp timer](#)

Displays the timer values configured for all the ports or a specific port.

[show mvrp port](#)

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

## MIB Objects

```
alaMvrpPortConfigTable  
  alaMvrpPortConfigJoinTimer  
  alaMvrpPortConfigLeaveTimer  
  alaMvrpPortConfigLeaveAllTimer  
  alaMvrpPortConfigPeriodicTimer
```

---

## mvrp periodic-transmission

Enables the periodic transmission status on a port or aggregate of ports.

```
mvrp {port slot/port [- port2] | linkagg agg_num [-agg_num2]} periodic-transmission {enable|disable}
```

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<b>enable</b>	Enables periodic transmission status on a port.
<b>disable</b>	Disables periodic transmission status on a port.

### Defaults

By default, periodic-transmission status is disabled on all the ports.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 periodic-transmission enable
-> mvrp port 1/2 periodic-transmission disable
-> mvrp linkagg 10 periodic-transmission enable
-> mvrp linkagg 10 periodic-transmission disable
```

### Release History

Release 7.2.1; command introduced.

### Related Commands

<a href="#">show mvrp port</a>	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
<a href="#">show mvrp linkagg</a>	Displays the MVRP configurations for all link aggregates, including timer values, registration and applicant modes.

### MIB Objects

```
alaMvrpPortConfigTable
  alaMvrpPortConfigPeriodicTransmissionStatus
```

---

## mvrp restrict-vlan-registration

Restricts MVRP processing from dynamically registering the specified VLAN or VLANs on the switch.

```
mvrp {port slot/port [- port2] | linkagg agg_num [-agg_num2]} restrict-vlan-registration vlan vlan_list
```

```
no mvrp {port slot/port [- port2] | linkagg agg_num [-agg_num2]} restrict-vlan-registration vlan vlan_list
```

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<i>vlan_list</i>	The VLAN ID or the VLAN ID range (for example, 1-10).

### Defaults

By default, MVRP dynamic VLAN registrations are not restricted.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to allow registration of dynamic VLAN IDs through MVRP processing.
- If the specified VLAN exists on the switch, the VLAN is mapped to the receiving port.
- To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 restrict-vlan-registration vlan 5
-> no mvrp port 1/2 restrict-vlan-registration vlan 5
-> mvrp linkagg 10 restrict-vlan-registration vlan 6-10
-> no mvrp port 3/1 restrict-vlan-registration vlan 6-10
```

### Release History

Release 7.2.1; command introduced.

## Related Commands

### **show mvrp port**

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

### **show mvrp linkagg**

Displays the MVRP configurations for all link aggregates, including timer values, registration and applicant modes.

## MIB Objects

```
alaMvrpPortRestrictVlanConfigTable  
  alaMvrpPortRestrictRowStatus  
  alaMvrpPortRestrictVlanAttributeType  
  alaMvrpPortRestrictVlanID
```

---

## mvrp restrict-vlan-advertisement

Restricts the advertisement of VLANs on a specific port or an aggregate of ports.

```
mvrp {port slot/port [-port2] | linkagg agg_num [-agg_num2]} restrict-vlan-advertisement  
vlan vlan_list
```

```
no mvrp {port slot/port [-port2] | linkagg agg_num [-agg_num2]} restrict-vlan-advertisement  
vlan vlan_list
```

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<i>vlan_list</i>	The list of VLAN IDs or the VLAN ID range (for example, 1-10).

### Defaults

By default, MVRP VLAN advertisement is not restricted.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- This command affects the MVRP processing only if the applicant mode is set to participant or active.
- Use the **no** form of this command to allow the propagation of VLANs.
- To use the *agg\_num* parameter, the link aggregate group must be created and enabled.

### Examples

```
-> mvrp port 1/2 restrict-vlan-advertisement vlan 5  
-> no mvrp port 1/2 restrict-vlan-advertisement vlan 5  
-> mvrp linkagg 10 restrict-vlan-advertisement vlan 6-10  
-> no mvrp port 1/2 restrict-vlan-advertisement vlan 6-10  
-> no mvrp port 1/1-2 restrict-vlan-advertisement vlan 6-10
```

### Release History

Release 7.2.1; command introduced.

## Related Commands

<b>mvrp applicant</b>	Configures the applicant mode of specific ports on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.
<b>mvrp timer join</b>	Configures the applicant mode of specific link aggregates on the switch. The applicant mode determines whether MVRP PDU exchanges are allowed on a port depending on the Spanning Tree state of the port.
<b>show mvrp port</b>	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
<b>show mvrp linkagg</b>	Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

## MIB Objects

```
alaMvrpPortRestrictVlanConfigTable  
  alaMvrpPortRestrictRowStatus  
  alaMvrpPortRestrictVlanAttributeType  
  alaMvrpPortRestrictVlanID
```

---

## mvrp static-vlan-restrict

Restricts a port from becoming a member of a statically created VLAN or a range of VLANs.

```
mvrp {linkagg agg_num [-agg_num2] | port slot/port [- port2]} static-vlan-restrict vlan vlan_list
```

```
no mvrp {linkagg agg_num [-agg_num2] | port slot/port [- port2]} static-vlan-restrict vlan vlan_list
```

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the aggregate group.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>vlan_list</i>	The list of VLAN IDs or the VLAN ID range (for example, 1-10).

### Defaults

By default, ports are assigned to the static VLAN based on MVRP PDU processing.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- This command applies only to static VLANs and does not apply to dynamic VLANs.
- Use the **no** form of this command to set the specified port and VLAN to the default value.

### Examples

```
-> mvrp port 1/2 static-vlan-restrict vlan 5
-> no mvrp port 1/2 static-vlan-restrict vlan 5
-> mvrp port 1/2 static-vlan-restrict vlan 6-9
-> no mvrp port 1/2 static-vlan-restrict vlan 6-9
-> mvrp linkagg 3 static-vlan-restrict vlan 4-5
-> no mvrp linkagg 3 static-vlan-restrict aggregate vlan 4-5
```

### Release History

Release 7.2.1; command introduced.

## Related Commands

### **show mvrp port**

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

### **show mvrp linkagg**

Displays the MVRP configurations for all the link aggregates, including timer values, registration and applicant modes.

## MIB Objects

```
alaMvrpPortRestrictVlanConfigTable  
  alaMvrpPortRestrictRowStatus  
  alaMvrpPortRestrictVlanAttributeType  
  alaMvrpPortRestrictVlanID  
  alaMvrpPortConfigRegistrationToStaticVlan  
  alaMvrpPortConfigRegistrationToStaticVlanLearn  
  alaMvrpPortConfigRegistrationToStaticVlanRestrict
```

---

## show mvrp configuration

Displays the global configuration for MVRP.

**show mvrp configuration**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

N/A

### Examples

```
-> show mvrp configuration
MVRP Enabled : yes,
Maximum VLAN Limit : 256
```

#### *output definitions*

---

<b>MVRP Enabled</b>	Indicates whether MVRP is globally enabled.
<b>Maximum VLAN Limit</b>	The maximum number of VLANs that can be learned by MVRP in the system.

---

### Release History

Release 7.2.1; command introduced.

### Related Commands

<a href="#">mvrp</a>	Enables or disables MVRP globally on the switch.
<a href="#">mvrp maximum-vlan</a>	Configures the maximum number of dynamic VLANs that can be created by MVRP.

### MIB Objects

```
alaMvrpGlobalStatus
alaMvrpMaxVlanLimit
```

---

## show mvrp port

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

**show mvrp port** {*slot/port* [-*port2*]} [**enable** | **disable**]

---

### Syntax Definitions

*slot/port* The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

**enable** To display only the enabled ports.

**disable** To display only the disabled ports.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

N/A

### Examples

-> show mvrp port enable

```

---

## show mvrp timer

Displays the timer values configured for all the ports or a specific port.

```
show mvrp {port slot/port [- port2] | linkagg agg_num [-agg_num2]} timer {join | leave | leaveall |
periodic-timer}
```

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>agg_num</i>	The number corresponding to the aggregate group.
<b>join</b>	To display only the join timer.
<b>leave</b>	To display only the leave timer.
<b>leaveall</b>	To display only the leaveall timer.
<b>periodic-timer</b>	To display only the periodic-timer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **join**, **leave**, **leaveall**, or **periodic-timer** parameter with this command to view the specific timer values configured on all the ports.
- Use the *agg\_num* or *slot/port* parameter with this command to display the timer values configured for a specific port.

### Examples

```
-> show mvrp timer
```

Port	Join Timer (msec)	Leave Timer (msec)	LeaveAll Timer (sec)	Periodic Timer (msec)
1/1	600	1800	30000	2
1/2	600	1800	30000	5
1/3	600	1800	30000	1
1/4	600	1800	30000	1

```
-> show mvrp port 1/21 timer
```

```
Join Timer (msec) : 600,
Leave Timer (msec) : 1800,
LeaveAll Timer (msec) : 30000,
Periodic-Timer (sec) : 1
```

```
-> show mvrp port 1/21 timer join

Join Timer (msec) : 600

-> show mvrp port 1/21 timer leave

Leave Timer (msec) : 1800

-> show mvrp port 1/21 timer leaveall

LeaveAll Timer (msec) : 30000

-> show mvrp port 1/21 timer periodic-timer

Periodic-Timer (sec) : 1

-> show mvrp timer join

Legend : All timer values are in milliseconds
Port      Join Timer
-----+-----
1/1        600
1/2        600
1/3        600

-> show mvrp timer leaveall

Legend : All timer values are in milliseconds
Port      LeaveAll Timer
-----+-----
1/1        1800
1/2        1800
1/3        1800

-> show mvrp timer leaveall

Legend : All timer values are in milliseconds
Port      LeaveAll Timer
-----+-----
1/1        30000
1/2        30000

```

### *output definitions*

---

<b>Port</b>	Displays the slot/port number.
<b>Join Timer</b>	Displays the value of Join Timer in milliseconds.
<b>Leave Timer</b>	Displays the value of the Leave Timer in milliseconds.

*output definitions (continued)*

---

<b>LeaveAll Timer</b>	Displays the value of the LeaveAll Timer in milliseconds.
<b>Periodic Timer</b>	Displays the value of the Periodic Timer in seconds.

---

**Release History**

Release 7.2.1; command introduced.

**Related Commands**

<b>mvrp timer join</b>	Specifies the join time interval between transmit opportunities for the dynamically registering VLANs on the switch.
<b>mvrp timer leave</b>	Specifies the period of time that the switch has to wait in the Leave state before changing to the unregistered state.
<b>mvrp timer leaveall</b>	Specifies the frequency with which the LeaveAll messages are communicated.
<b>mvrp timer periodic-timer</b>	Specifies the MVRP periodic-timer time interval for the dynamically registering VLANs on the switch.
<b>show mvrp port</b>	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

**MIB Objects**

```
alaMvrpPortConfigTable  
  alaMvrpPortConfigJoinTimer  
  alaMvrpPortConfigLeaveTimer  
  alaMvrpPortConfigLeaveAllTimer  
  alaMvrpPortConfigPeriodicTimer
```

---

## show mvrp statistics

Displays the MVRP statistics for all the ports, aggregates, or specific ports.

```
show mvrp {port slot/port [- port2] | linkagg agg_num [-agg_num2] } statistics
```

---

### Syntax Definitions

*slot/port* The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

*agg\_num* The number corresponding to the aggregate group.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- If no port or link aggregate is specified the MVRP statistics are displayed for all ports.
- Use the *agg\_num* or *slot/port* parameter with this command to display the MVRP statistics for a specific port.

### Examples

```
-> show mvrp port 1/21 statistics
```

```

### *output definitions*

---

<b>New Received</b>	The number of new MVRP messages received on the switch.
<b>Join In Received</b>	The number of MVRP Join In messages received on the switch
<b>Join Empty Received</b>	The number of MVRP Join Empty messages received on the switch.
<b>Leave In Received</b>	The number of MVRP Leave In messages received on the switch.
<b>In Received</b>	The total MVRP messages received on the switch.
<b>Empty Received</b>	The number of MVRP Empty messages received on the switch.
<b>Leave All Received</b>	The number of MVRP Leave All messages received on the switch.

*output definitions (continued)*

---

<b>New Transmitted</b>	The number of new MVRP messages sent by the switch.
<b>Join In Transmitted</b>	The number of MVRP Join In messages sent by the switch.
<b>Join Empty Transmitted</b>	The number of MVRP Join Empty messages sent by the switch.
<b>Leave Transmitted</b>	The number of MVRP Leave messages sent by the switch.
<b>In Transmitted</b>	The number of MVRP In messages sent by the switch.
<b>Empty Transmitted</b>	The number of MVRP empty messages sent by the switch.
<b>LeaveAll Transmitted</b>	The number of Leave All messages sent by the switch.
<b>Failed Registrations</b>	The number of failed registrations.
<b>Total Mrp PDU Received</b>	The number of total MRP PDUs received by the switch.
<b>Total Mrp Msgs Received</b>	The number of total MRP messages received by the switch.
<b>Total Mrp Msgs Transmitted</b>	The number of total MRP messages sent by the switch.
<b>Invalid Msgs Received</b>	The number of invalid messages received by the switch.

---

**Release History**

Release 7.2.1; command introduced.

**Related Commands**

- show mvrp configuration** Clears MVRP statistics for all the ports, an aggregate of ports, or a specific port.
- show mvrp port** Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
- show mvrp linkagg** Displays the MVRP configuration for a specific port or an aggregate of ports.

**MIB Objects**

  alaMvrpPortStatsTotalMsgsTransmitted
  alaMvrpPortStatsInvalidMsgsReceived
  alaMvrpPortFailedRegistrations

```

---

## show mvrp last-pdu-origin

Displays the source MAC address of the last MVRP message received on specific ports or aggregates.

**show mvrp {port slot/port [- port2] | linkagg agg\_num [-agg\_num2]} last-pdu-origin**

---

### Syntax Definitions

*slot/port* The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

*agg\_num* The number corresponding to the aggregate group.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

None

### Examples

```
-> show mvrp port 1/1-3 last-pdu-origin
```

```
Port      Last PDU Origin
-----+-----
1/1       00:d0:95:ee:f4:64
1/2       00:d0:95:ee:f4:65
1/3       00:d0:95:ee:f4:66
```

```
->show mvrp port 1/21 last-pdu-origin
```

```
Port      Last PDU Origin
-----+-----
1/1       00:d0:95:ee:f4:64
```

### output definitions

---

<b>Port</b>	Displays the slot and port number.
<b>Last PDU origin</b>	The source MAC address of the last PDU message received on the specific port.

---

### Release History

Release 7.2.1; command introduced.

## Related Commands

### [show mvrp linkagg](#)

Displays the MVRP configuration for a specific port or an aggregate of ports.

### [show mvrp port](#)

Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.

## MIB Objects

alaMvrpPortStatsTable  
alaMvrpPortLastPduOrigin

---

## show mvrp vlan-restrictions

Displays the VLAN MVRP configuration on a specific port or an aggregate of ports.

**show mvrp {port slot/port [- port2] | linkagg agg\_num [-agg\_num2]} vlan-restrictions**

---

### Syntax Definitions

<i>agg_num</i>	The number corresponding to the aggregate group.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Use the *agg\_num* or *slot/port* parameter with this command to display the MVRP statistics for a specific port.

### Examples

```
-> show mvrp port 1/21 vlan-restrictions
```

VLAN ID	Static Registration	Restricted Registration	Restricted Applicant
1	LEARN	FALSE	FALSE
2	LEARN	FALSE	FALSE
3	LEARN	FALSE	FALSE
4	LEARN	FALSE	FALSE
5	LEARN	FALSE	FALSE
6	LEARN	FALSE	FALSE
7	LEARN	FALSE	FALSE
11	RESTRICT	FALSE	FALSE
12	RESTRICT	FALSE	FALSE
53	LEARN	TRUE	FALSE
55	LEARN	FALSE	TRUE

### output definitions

---

<b>VLAN ID</b>	The VLAN identification number for a preconfigured VLAN that handles the MVRP traffic for this port.
<b>Static Registration</b>	Indicates if the port is restricted ( <b>RESTRICT</b> ) or not restricted ( <b>LEARN</b> ) from becoming a member of the static VLAN.

*output definitions (continued)*

---

<b>Restricted Registration</b>	Indicates if the VLAN is restricted ( <b>TRUE</b> ) or not restricted ( <b>FALSE</b> ) from dynamic registration on the port.
<b>Restricted Applicant</b>	Indicates if the VLAN is restricted for advertisement from the port ( <b>TRUE</b> ) or not ( <b>FALSE</b> ).

---

**Release History**

Release 7.2.1; command introduced.

**Related Commands**

<b>show mvrp port</b>	Displays the MVRP configurations for all the ports, including timer values, registration and applicant modes.
<b>show mvrp linkagg</b>	Displays the MVRP configuration for a specific port or an aggregate of ports.

**MIB Objects**

```
alaMvrpPortConfigTable  
  alaMvrpPortConfigRestrictedRegistrationBitmap  
  alaMvrpPortConfigRestrictedApplicantBitmap  
  alaMvrpPortConfigRegistrationToStaticVlan
```

---

## mvrp clear-statistics

Clears MVRP statistics for all the ports, an aggregate of ports, or a specific port.

**mvrp** [**port** *slot/port* [-*port2*] | **linkagg** *agg\_num* [-*agg\_num2*]] **clear-statistics**

---

### Syntax Definitions

*slot/port* The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

*agg\_num* The number corresponding to the aggregate group.

### Defaults

If no ports are specified, the MVRP statistics are deleted for all the ports.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Use the *agg\_num* or *slot/port* parameter with this command to clear MVRP statistics for a specific port.

### Examples

```
-> mvrp clear-statistics
-> mvrp port 1/2 clear-statistics
-> mvrp linkagg 10 clear-statistics
```

### Release History

Release 7.2.1; command introduced.

### Related Commands

[show mvrp statistics](#) Displays the MVRP statistics for all the ports, aggregates, or specific ports.

### MIB Objects

```
alaMvrpGlobalClearStats
  alaMvrpPortStatsTable
  alaMvrpPortStatsClearStats
```

---

# 11 802.1AB Commands

802.1AB is an IEEE standard for exchanging information with neighboring devices and maintaining a database of it. The information is exchanged as an LLDPDU (Link Layer Discovery Protocol Data Unit) in TLV (Time, Length, Value) format. This chapter details configuring and monitoring 802.1AB on a switch.

Alcatel-Lucent's version of 802.1AB complies with the IEEE 802.1AB-2005 Station and Media Access Control Discovery and ANSI-TIA 1057-2006 Link Layer Discovery Protocol for Media End Point Devices.

MIB information for the 802.1AB commands is as follows:

*Filename:* IEEE\_LLDP\_Base.mib  
*Module:* LLDP-MIB

*Filename:* IEEE\_LLDP\_Dot1.mib  
*Module:* LLDP-EXT-DOT1-MIB

*Filename:* IEEE\_LLDP\_Dot3.mib  
*Module:* LLDP-EXT-DOT3-MIB

A summary of available commands is listed here:

---

**lldp transmit interval**  
**lldp transmit hold-multiplier**  
**lldp transmit delay**  
**lldp reinit delay**  
**lldp notification interval**  
**lldp lldpdu**  
**lldp notification**  
**lldp tlv management**  
**lldp tlv dot1**  
**lldp tlv dot3**  
**lldp tlv med**  
**show lldp system-statistics**  
**show lldp statistics**  
**show lldp local-system**  
**show lldp local-port**  
**show lldp local-management-address**  
**show lldp remote-system**  
**show lldp remote-system med**

---

Configuration procedures for 802.1AB are explained in “Configuring 802.1AB,” *OmniSwitch 10K Network Configuration Guide*.

## lldp transmit interval

Sets the transmit time interval for LLDPDUs.

**lldp transmit interval** *seconds*

---

### Syntax Definitions

*seconds*                      The transmit interval between LLDPDUs, in seconds. The valid range is 5 - 32768.

### Defaults

parameter	default
<i>seconds</i>	30

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The LLDP protocol must be enabled before using this command.

### Examples

```
-> lldp transmit interval 40
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

- [lldp transmit hold-multiplier](#)      Sets the transmit hold multiplier value, which is used to calculate the Time To Live TLV.
- [show lldp local-system](#)              Displays local system information.

### MIB Objects

```
lldpConfiguration  
  lldpMessageTxInterval
```

---

## lldp transmit hold-multiplier

Sets the transmit hold multiplier value, which is used to calculate the Time To Live TLV.

**lldp transmit hold-multiplier** *num*

---

### Syntax Definitions

*num*                                      The transmit hold multiplier value. The valid range is 2-10.

### Defaults

---

parameter	default
<i>num</i>	4

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The LLDP protocol must be enabled before using this command.
- The Time To Live is a multiple of transmit interval and transmit hold multiplier.

### Examples

```
-> lldp transmit hold-multiplier 6
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[lldp transmit interval](#)                 Sets the transmit time interval for LLDPDUs.

[show lldp local-system](#)                Displays local system information.

### MIB Objects

lldpConfiguration  
  lldpMessageTxHoldMultiplier

---

## lldp transmit delay

Sets the minimum time interval between successive LLDPDUs transmitted.

**lldp transmit delay** *seconds*

---

### Syntax Definitions

*seconds*                      The time interval between successive LLDPDUs transmitted, in seconds. The valid range is 1-8192.

### Defaults

parameter	default
<i>seconds</i>	2

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The LLDP protocol must be enabled before using this command.
- The transmit delay is less than or equal to the multiplication of transmit interval and 0.25 (transmit interval \* 0.25).

### Examples

```
-> lldp transmit delay 20
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[lldp transmit interval](#)                      Sets the transmit time interval for LLDPDUs.  
[show lldp local-system](#)                      Displays local system information.

### MIB Objects

lldpConfiguration  
  lldpTxDelay

---

## lldp reinit delay

Sets the time interval that must elapse before the current status of a port is reinitialized after a status change.

**lldp reinit delay** *seconds*

---

### Syntax Definitions

*seconds*                      The number of seconds to reinitialize the ports status after a status change. The valid range is 1-10.

### Defaults

parameter	default
<i>seconds</i>	2

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The LLDP protocol must be enabled before using this command.

### Examples

```
-> lldp reinit delay 4
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[lldp transmit delay](#)                      Sets the minimum time interval between successive LLDPDUs transmitted.

[show lldp local-system](#)                      Displays local system information.

### MIB Objects

```
lldpConfiguration  
  lldpReinitDelay
```

---

## lldp notification interval

Sets the time interval that must elapse before a notification about the local system MIB change is generated.

**lldp notification interval** *seconds*

---

### Syntax Definitions

*seconds*                      The minimum number of seconds for generating a notification-event.  
The valid range is 5-3600.

### Defaults

parameter	default
<i>seconds</i>	5

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The LLDP protocol and notification must be enabled before using this command.
- In a specified interval, it is not possible to generate more than one notification-event.

### Examples

```
-> lldp notification interval 25
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

- [lldp notification](#)                      Specifies the switch to control per port notification status about the remote device change.
- [show lldp local-system](#)                Displays local system information.

### MIB Objects

```
lldpConfiguration  
  lldpNotificationInterval
```

---

## lldp lldpdu

Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.

**lldp {port *slot/port* [-*port* ]| slot *slot* / chassis} lldpdu {tx | rx | tx-and-rx | disable}**

---

### Syntax Definitions

<i>slot/port</i>	Slot number for the module and physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for a specific module.
<b>chassis</b>	Specifies the whole chassis.
<b>tx</b>	Transmits LLDPDUs.
<b>rx</b>	Receives LLDPDUs.
<b>tx-and-rx</b>	Transmits and receives LLDPDUs.
<b>disable</b>	Disables LLDPDUs transmission and reception.

### Defaults

parameter	default
tx   rx   tx-and-rx   disable	tx-and-rx

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The port can be set to receive, transmit, or transmit and receive LLDPDUs using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.

### Examples

```
-> lldp port 1/2 lldpdu tx-and-rx
-> lldp slot 3 lldpdu tx
-> lldp chassis lldpdu disable
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

### **lldp lldpdu**

Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.

### **lldp notification**

Specifies the switch to control per port notification status about the remote device change.

## MIB Objects

lldpPortConfigTable

    lldpPortConfigPortNum

    lldpPortConfigAdminStatus

---

## lldp notification

Specifies the switch to control per port notification status about the remote device change.

**lldp** {port *slot/port*[-*port* ] | slot *slot* / chassis} notification {enable | disable}

---

### Syntax Definitions

<i>slot/port</i>	Slot number for the module and physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for a specific module.
<b>enable</b>	Enables the notification of local system MIB changes.
<b>disable</b>	Disables the notification.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The LLDPDU administrative status must be in the receive state before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.

### Examples

```
-> lldp port 1/2 notification enable
-> lldp slot 1 notification disable
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

### **lldp notification interval**

Sets the time interval that must elapse before a notification about the local system MIB change is generated.

### **lldp lldpdu**

Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.

## MIB Objects

lldpPortConfigTable

    lldpPortConfigPortNum

    lldpPortConfigNotificationEnable

---

## lldp tlv management

Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.

**lldp** {port *slot/port* [-*port* ] | slot *slot* / chassis} **tlv management** {port-description | system-name | system-description | system-capabilities | management-address} {enable | disable}

---

### Syntax Definitions

<i>slot/port</i>	Slot number for the module and physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for a specific module.
<b>port-description</b>	Enables or disables the transmission of port description TLV in LLDPDU.
<b>system-name</b>	Enables or disables the transmission of system name TLV in LLDPDU.
<b>system-description</b>	Enables or disables transmission of system description TLV in LLDPDU.
<b>system-capabilities</b>	Enables or disables transmission of system capabilities TLV in LLDPDU.
<b>management-address</b>	Enables or disables transmission of management address on per port.
<b>enable</b>	Enables management TLV LLDPDU transmission.
<b>disable</b>	Disables management TLV LLDPDU transmission.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.

### Examples

```
-> lldp port 1/2 tlv management port-description enable
-> lldp slot 2 tlv management management-address enable
-> lldp slot 3 tlv management system-name disable
-> lldp chassis tlv management system-capabilities enable
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<b>lldp lldpdu</b>	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.
<b>show lldp local-system</b>	Displays local system information.
<b>show lldp local-port</b>	Displays per port information.
<b>show lldp remote-system</b>	Displays per local port and information of remote system.

## MIB Objects

```
lldpPortConfigTable
  lldpLocPortPortNum
  lldpPortConfigTLVsTxEnable
lldpConfigManAddrTable
  lldpConfigManAddrPortsTxEnable
```

---

## lldp tlv dot1

Specifies the switch to control per port 802.1 TLVs to be incorporated in the LLDPDU.

**lldp** {port *slot/port* [-*port* ] | slot *slot* / chassis} **tlv dot1** {port-vlan | vlan-name} {enable | disable}

---

### Syntax Definitions

<i>slot/port</i>	Slot number for the module and physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for a specific module.
<b>port-vlan</b>	Enables or disables transmission of port VLAN TLV in LLDPDU.
<b>vlan-name</b>	Enables or disables transmission of VLAN name TLV in LLDPDU.
<b>enable</b>	Enables 802.1 TLV LLDPDU transmission.
<b>disable</b>	Disables 802.1 TLV LLDPDU transmission.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.
- If one TLV is included then the other TLV is automatically included when you use this command.

### Examples

```
-> lldp port 5/1 tlv dot1 port-vlan enable
-> lldp slot 3 tlv dot1 vlan-name enable
-> lldp slot 3 tlv dot1 vlan-name disable
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">lldp tlv management</a>	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.
<a href="#">show lldp statistics</a>	Displays per port statistics.
<a href="#">show lldp local-port</a>	Displays per port information.

## MIB Objects

```
lldpPortConfigTable
  lldpPortConfigPortNum
lldpXdot1ConfigPortVlanTable
  lldpXdot1ConfigPortVlanTxEnable
lldpXdot1ConfigVlanNameTable
  lldpXdot1ConfigVlanNameTxEnable
```

---

## lldp tlv dot3

Specifies the switch to control per port 802.3 TLVs to be incorporated in the LLDPDUs.

**lldp** {port *slot/port* [-port ]| slot *slot* / chassis} **tlv dot3 mac-phy** {enable | disable}

---

### Syntax Definitions

<i>slot/port</i>	Slot number for the module and physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for a specific module.
<b>enable</b>	Enables 802.3 TLV LLDPDU transmission.
<b>disable</b>	Disables 802.3 TLV LLDPDU transmission.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command is lost.

### Examples

```
-> lldp port 2/4 tlv dot3 mac-phy enable
-> lldp slot 2 tlv dot3 mac-phy disable
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">lldp tlv management</a>	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.
<a href="#">lldp tlv dot1</a>	Specifies the switch to control per port 802.1 TLVs to be incorporated in the LLDPDUs.
<a href="#">show lldp statistics</a>	Displays per port statistics.

## MIB Objects

```
lldpPortConfigTable
  lldpPortConfigPortNum
lldpXdot3PortConfigTable
  lldpXdot3PortConfigTLVsTxEnable
```

---

## lldp tlv med

Specifies the switch to control per port LLDP-MED (Media Endpoint Device) TLVs to be incorporated in the LLDPDU.

**lldp {port *slot/port* [-*port* ] | slot *slot* / chassis} tlv med {power | capability} {enable | disable}**

---

### Syntax Definitions

<i>slot/port</i>	Slot number for the module and physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for a specific module.
<b>capability</b>	Enables or disables transmission of LLDP-MED capabilities TLV in LLDPDU.
<b>enable</b>	Enables LLDP-MED TLV LLDPDU transmission.
<b>disable</b>	Disables LLDP-MED TLV LLDPDU transmission.

### Defaults

parameter	default
<b>enable   disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The LLDPDU must be enabled and set to transmit before using this command.
- If this command is applied to a slot or chassis, then the existing configuration related to this command will be lost.

### Examples

```
-> lldp 4/4 tlv med power enable
-> lldp 4/3 tlv med capability enable
-> lldp 4 tlv med power disable
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<b>lldp tlv management</b>	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.
<b>lldp tlv dot1</b>	Specifies the switch to control per port 802.1 TLVs to be incorporated in the LLDPDUs.
<b>lldp tlv dot3</b>	Specifies the switch to control per port 802.3 TLVs to be incorporated in the LLDPDUs.

## MIB Objects

```
lldpPortConfigTable  
  lldpPortConfigPortNum  
lldpXMedPortConfigTable  
  lldpXMedPortConfigTLVsTxEnable
```

---

## show lldp system-statistics

Displays system-wide statistics.

**show lldp system-statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show lldp system-statistics
Local LLDP Agent System Statistics:
  Remote Systems Last Change = 0 days 0 hours 3 minutes and 10 seconds,
  Remote Systems MIB Inserts = 2,
  Remote Systems MIB Deletes = 0,
  Remote Systems MIB Drops = 0,
  Remote Systems MIB Age Outs = 0
```

#### *output definitions*

---

<b>Remote Systems Last Change</b>	The last change recorded in the tables associated with the remote system.
<b>Remote Systems MIB Inserts</b>	The total number of complete inserts in the tables associated with the remote system.
<b>Remote Systems MIB Deletes</b>	The total number of complete deletes in tables associated with the remote system.
<b>Remote Systems MIB Drops</b>	The total number of LLDPDUs dropped because of insufficient resources.
<b>Remote Systems MIB Age Outs</b>	The total number of complete age-outs in the tables associated with the remote system.

---

### Release History

Release 7.1.1; command introduced.

## Related Commands

### **lldp notification**

Specifies the switch to control per port notification status about the remote device change.

### **lldp notification interval**

Sets the time interval that must elapse before a notification about the local system MIB change is generated.

## MIB Objects

lldpStatistics

lldpStatsRemTablesLastChangeTime

lldpStatsRemTablesInserts

lldpStatsRemTablesDeletes

lldpStatsRemTablesDrops

lldpStatsRemTablesAgeouts

---

## show lldp statistics

Displays per port statistics.

**show lldp [port slot/port [-port ]] statistics**

---

### Syntax Definitions

*slot/port* Slot number for the module and physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

By default, a list of all lldp ports is displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the slot/port option is not specified, statistics for the chassis is displayed.
- If the statistics are zero they are not displayed.

### Examples

```
-> show lldp statistics
```

Slot/Port	Tx	LLDPDU Rx	Errors	LLDPDU Discards	TLV Unknown	TLV Discards	Device Ageouts
1/23	52	0	0	0	0	0	0
2/47	50	50	0	0	0	0	0
2/48	50	50	0	0	0	0	0

#### output definitions

<b>Slot/Port</b>	Slot number for the module and physical port number on that module.
<b>LLDPDU Tx</b>	The total number of LLDPDUs transmitted on the port.
<b>LLDPDU Rx</b>	The total number of valid LLDPDUs received on the port.
<b>LLDPDU Errors</b>	The total number of invalid LLDPDUs discarded on the port.
<b>LLDPDU Discards</b>	The total number of LLDPDUs discarded on the port.
<b>TLV Unknown</b>	The total number of unrecognized LLDP TLVs on the port.
<b>TLV Discards</b>	The total number of LLDP TLVs discarded on the port.
<b>Device Ageouts</b>	The total number of complete age-outs on the port.

### Release History

Release 7.1.1; command introduced.

## Related Commands

### **lldp lldpdu**

Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.

### **lldp tlv management**

Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show lldp local-system
Local LLDP Agent System Data:
  Chassis ID Subtype      = 4 (MAC Address),
  Chassis ID              = 00:d0:95:e9:c9:2e,
  System Name             = Kite2_Stack_of_2,
  System Description      = 6.3.1.636.R01 Development, September 07, 2007.,
  Capabilites Supported   = Bridge, Router,
  Capabilites Enabled     = Bridge, Router,
  LLDPDU Transmit Interval = 30 seconds,
  TTL Hold Multiplier     = 4,
  LLDPDU Transmit Delay   = 2 seconds,
  Reintialization Delay   = 2 seconds,
  MIB Notification Interval = 5 seconds
  Management Address Type = 1 (IPv4),
  Management IP Address   = 10.255.11.100,
```

#### *output definitions*

---

<b>Chassis ID Subtype</b>	The subtype that describe chassis ID.
<b>Chassis ID</b>	The chassis ID (MAC address).
<b>System Name</b>	The name of the system.
<b>System Description</b>	The description of the system.
<b>Capabilites Supported</b>	The capabilities of the system.
<b>Capabilites Enabled</b>	The enabled capabilities of the system.
<b>LLDPDU Transmit Interval</b>	The LLDPDU transmit interval.
<b>TTL Hold Multiplier</b>	The hold multiplier used to calculate TTL.

*output definitions (continued)*

---

<b>LLDPDU Transmit Delay</b>	The minimum transmit time between successive LLDPDUs.
<b>Reinitialization Delay</b>	The minimum time interval before the reinitialization of local port objects between port status changes.
<b>MIB Notification Interval</b>	The minimum time interval between consecutive notifications of local system MIB change.
<b>Management Address Type</b>	The type of management address used in LLDPDU.
<b>Management IP Address</b>	The management IP address. The loopback0 IP address is configured for the management IP address to be transmitted.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<b>lldp reinit delay</b>	Sets the time interval that must elapse before the current status of a port is reinitialized after a status change.
<b>lldp transmit hold-multiplier</b>	Sets the transmit hold multiplier value, which is used to calculate the Time To Live TLV.
<b>lldp transmit delay</b>	Sets the minimum time interval between successive LLDPDUs transmitted.

---

## show lldp config

Displays the general LLDP configuration information for LLDP ports.

**show lldp { slot | slot/port [-port ]} config**

---

### Syntax Definitions

<i>slot</i>	The slot number for a specific module.
<i>slot/port</i>	Slot number for the module and physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

### Defaults

By default, a list of all LLDP ports with their configuration parameters is displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

### Examples

-> show lldp config

Slot/Port	Admin Status	Notify Trap	Std TLV Mask	Mgmt Address	802.1 TLV	802.3 Mask	MED Mask
2/1	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00
2/2	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00
2/3	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00
2/4	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00
2/5	Rx + Tx	Disabled	0x00	Disabled	Disabled	0x00	0x00

---

#### *output definitions*

<b>Slot/Port</b>	Specifies the LLDP slot and port number.
<b>Admin Status</b>	Specifies the Administrative status of the LLDP port. The options are - Disabled, Rx, Tx, and Rx+Tx.
<b>Notify Trap</b>	Specifies if the Notify Trap feature is disabled or enabled on a particular port
<b>Std TLV Mask</b>	Specifies the standard TLV mask set for the port.
<b>Mgmt Address</b>	Specifies whether transmission of the per port IPv4 management address is enabled or disabled.
<b>802.1 TLV</b>	Specifies whether 802.1 TLV status is enabled or disabled on the LLDP port.

---

*output definitions*

<b>802.3 Mask</b>	Specifies the standard 802.3 mask set for the port.
<b>MED Mask</b>	Specifies the standard MED mask set for the port.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<b>lldp lldpdu</b>	Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.
<b>lldp notification</b>	Specifies the switch to control per port notification status about the remote device change.
<b>lldp tlv management</b>	Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.
<b>lldp tlv dot3</b>	Specifies the switch to control per port 802.3 TLVs to be incorporated in the LLDPDUs.

**MIB Objects**

```
lldpPortConfigTable
  lldpPortConfigPortNum
  lldpPortConfigAdminStatus
  lldpPortConfigNotificationEnable
  lldpLocPortPortNum
  lldpPortConfigTLVsTxEnable
lldpConfigManAddrTable
  lldpConfigManAddrPortsTxEnable
lldpXdot3PortConfigTable
  lldpXdot3PortConfigTLVsTxEnable
```

---

## show lldp statistics

Displays per port statistics.

**show lldp [port slot/port [-port ] slot slot] statistics**

---

### Syntax Definitions

*slot/port* Slot number for the module and physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).

*slot* The slot number for a specific module.

### Defaults

By default, a list of all lldp ports is displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the slot/port option is not specified, statistics for the chassis is displayed.
- If the statistics are zero they are not displayed.

### Examples

-> show lldp statistics

Slot/Port	Tx	LLDPDU Rx	Errors	Discards	TLV Unknown	Device Discards	Ageouts
1/23	52	0	0	0	0	0	0
2/47	50	50	0	0	0	0	0
2/48	50	50	0	0	0	0	0

#### output definitions

---

<b>Slot/Port</b>	Slot number for the module and physical port number on that module.
<b>LLDPDU Tx</b>	The total number of LLDPDUs transmitted on the port.
<b>LLDPDU Rx</b>	The total number of valid LLDPDUs received on the port.
<b>LLDPDU Errors</b>	The total number of invalid LLDPDUs discarded on the port.
<b>LLDPDU Discards</b>	The total number of LLDPDUs discarded on the port.
<b>TLV Unknown</b>	The total number of unrecognized LLDP TLVs on the port.
<b>TLV Discards</b>	The total number of LLDP TLVs discarded on the port.
<b>Device Ageouts</b>	The total number of complete age-outs on the port.

---

### Release History

Release 7.1.1; command introduced.

## Related Commands

### **lldp lldpdu**

Specifies the switch to control the transmission and the reception of LLDPDUs for a particular chassis, a slot, or a port.

### **lldp tlv management**

Specifies the switch to control per port management TLVs to be incorporated in the LLDPDUs.

## show lldp remote-system med

Displays remote system MED information for a single port or all ports on a slot.

```
show lldp [slot/port [-port ] | slot] remote-system [med {network-policy | inventory}]
```

---

### Syntax Definitions

<i>slot/port</i>	Slot number for the module and physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>slot</i>	The slot number for a specific module.
<b>network-policy</b>	Display network-policy TLVs from remote Endpoint Devices
<b>inventory</b>	Display inventory management TLVs from remote Endpoint Devices

### Defaults

By default, a list of all LLDP ports is displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the *slot/port* or *slot* parameter to display information for a specific port or for all ports on a specific module.

### Examples

```
-> show lldp 2/47 remote-system med network-policy
Slot/  Remote  Application      Unknown   Tagged   Vlan   Layer2   DSCP
Port   ID       Type             Policy   Flag    Id     Priority  Value
-----+-----+-----+-----+-----+-----+-----+-----
1/22   1        Voice(01)        Defined  Untagged 345    4         34
1/22   2        Guest Voice(4)   Defined  Untagged 50     3         46
```

#### output definitions

---

<b>Slot/Port</b>	The Slot number to which the remote system entry is associated and the physical port number on that module.
<b>Remote ID</b>	The Index of the Remote Device.
<b>Application Type</b>	The Application type of the peer entity. 1. Voice 2. Voice Signaling 3. Guest Voice 4. Guest Voice Signaling 5. Softphone Voice 6. Video Conferencing 7. Streaming Video 8. Video Signaling

*output definitions (continued)*

---

<b>Unknown Policy Flag</b>	Whether the network policy for the specified application type is currently defined or unknown.
<b>Tagged Flag</b>	Whether the specified application type is using a <b>tagged</b> or an <b>untagged</b> VLAN.
<b>VLAN ID</b>	The VLAN identifier (VID) for the port.
<b>Layer 2 Priority</b>	Layer 2 priority to be used for the specified application type.
<b>DSCP Value</b>	DSCP value to be used to provide Diffserv node behavior for the specified application type.

---

```
-> show lldp 2/47 remote-system med inventory

# 12 IP Commands

This chapter details Internet Protocol (IP) commands for the switch. IP is a network-layer (Layer 3) protocol that contains addressing information and some control information that enables packets to be forwarded. IP is documented in RFC 791 and is the primary network-layer protocol in the Internet protocol suite. Along with the Transmission Control Protocol (TCP), IP represents the heart of the Internet protocols.

IP is enabled on the switch by default and there are few options that can, or need to be, configured. This chapter provides instructions for basic IP configuration commands. It also includes commands for several Layer 3 and Layer 4 protocols that are associated with IP:

- Address Resolution Protocol (ARP)—Used to match the IP address of a device with its physical (MAC) address.
- Internet Control Message Protocol (ICMP)—Specifies the generation of error messages, test packets, and informational messages related to IP. ICMP supports the [ping](#) command used to determine if hosts are online.
- Transmission Control Protocol (TCP)—A major data transport mechanism that provides reliable, connection-oriented, full-duplex data streams. While the role of TCP is to add reliability to IP, TCP relies upon IP to do the actual delivering of datagrams.
- User Datagram Protocol (UDP)—A secondary transport-layer protocol that uses IP for delivery. UDP is not connection-oriented and does not provide reliable end-to-end delivery of datagrams. But some applications can safely use UDP to send datagrams that do not require the extra overhead added by TCP.

The IP commands also include protection from Denial of Service (DoS) attacks. The goal of this feature is to protect a switch from well-known DoS attacks and to notify the administrator or manager when an attack is underway. Also, notifications can be sent when port scans are being performed.

---

**Note.** Packets can be forwarded using IP if all devices are on the same VLAN, or if IP interfaces are created on multiple VLANs to enable routing of packets. However, IP routing requires one of the IP routing protocols: Routing Information Protocol (RIP) or Open Shortest Path First (OSPF). See the following chapters for the appropriate CLI commands: [Chapter 15, “RIP Commands,”](#) [Chapter 19, “OSPF Commands.”](#) For more information on VLANs and RIP see the applicable chapter(s) in the Configuration Guide. For more information on OSPF, see the “Configuring OSPF” chapter in the *OmniSwitch 10K Advanced Routing Configuration Guide*.

---

MIB information for the IP commands is as follows:

*Filename:* IpForward.mib  
*Module:* IpForward

*Filename:* Ip.mib  
*Module:* Ip

*Filename:* AlcatelIND1Ip.mib  
*Module:* alcatelIND1IPMIB

*Filename:* AlcatelIND1Iprm.mib

---

## ip interface

Configures an IP interface to enable IP routing on a VLAN or allow remote access. Without an IP interface, traffic is bridged within the VLAN or across connections to the same VLAN on other switches.

**ip interface** {*name* | **emp**} [{**address** | **vip-address**} *ip\_address*] [**mask** *subnet\_mask*] [**admin-state** [**enable** | **disable**]] [**vlan** *vlan\_id*] [**forward** | **no forward**] [**local-proxy-arp** | **no local-proxy-arp**] [**e2** | **snap**] [**primary** | **no primary**]

**no ip interface** *name*

---

### Syntax Definitions

<i>name</i>	Text string of interface name. Use quotes around string if description contains multiple words with spaces between them (e.g. “Alcatel-Lucent Marketing”). Note that this value is case sensitive.
<b>emp</b>	Modifies the shared EMP port IP address.
<b>address</b> <i>ip_address</i>	An IP host address (e.g. 10.0.0.1, 171.15.0.20) to specify the IP router network.
<b>vip-address</b> <i>ip_address</i>	An IP host address for a Virtual IP (VIP) VLAN. This type of IP address is used only in a Multi-Chassis Link Aggregation (MC-LAG) configuration.
<i>subnet_mask</i>	A valid IP address mask (e.g., 255.0.0.0, 255.255.0.0) to identify the IP subnet for the interface.
<b>enable</b>	Enables the administrative status for the IP interface.
<b>disable</b>	Disables the administrative status for the IP interface.
<i>vlan_id</i>	An existing VLAN ID number (1–4094). Specify a multi-chassis VLAN ID if the IP interface is for a VIP VLAN.
<b>forward</b>	Enables forwarding of IP frames to other subnets.
<b>no forward</b>	Disables forwarding of IP frames. The router interface still receives frames from other hosts on the same subnet.
<b>local-proxy-arp</b>	Enables Local Proxy ARP on the specified interface.
<b>no local-proxy-arp</b>	Disables Local Proxy ARP on the specified interface.
<b>e2</b>	Enter <b>e2</b> or <b>ethernet2</b> to specify Ethernet-II encapsulation.
<b>snap</b>	SNAP encapsulation.
<b>primary</b>	Designates the specified IP interface as the primary interface for the VLAN.
<b>no primary</b>	Removes the configured primary IP interface designation for the VLAN. The first interface bound to the VLAN becomes the primary by default.

## Defaults

parameter	default
<i>ip_address</i>	0.0.0.0
<i>subnet_mask</i>	IP address class
<b>enable   disable</b>	<b>enable</b>
<i>vlan_id</i>	none (unbound)
<b>forward   no forward</b>	<b>forward</b>
<b>local-proxy-arp   no local-proxy-arp</b>	<b>no local-proxy-arp</b>
<b>e2   snap</b>	<b>e2</b>
<b>primary   no primary</b>	First interface bound to a VLAN.

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Use the **no** form of this command to remove an IP interface.
- IP multinetting is supported. As a result, it is possible to configure up to eight IP interfaces per VLAN. Each interface is configured with a different subnet, thus allowing traffic from each configured subnet to coexist on the same VLAN.
- To configure a virtual IP interface for a MC-LAG VLAN (VIP VLAN), use the **vip-address** parameter and specify a multi-chassis VLAN ID for the interface **vlan** parameter.
- Note that when Local Proxy ARP is enabled for any one IP router interface associated with a VLAN, the feature is applied to the entire VLAN. It is not necessary to enable it for each interface. However, if the IP interface that has this feature enabled is moved to another VLAN, Local Proxy ARP is enabled for the new VLAN and must be enabled on another interface for the old VLAN.
- When Local Proxy ARP is enabled, all traffic is routed instead of bridged within the VLAN. ARP requests return the MAC address of the IP router interface. Note that the same MAC address is assigned to each interface configured for a VLAN.
- Local Proxy ARP takes precedence over any switch-wide ARP or Proxy ARP function. It is not necessary to have Proxy ARP configured in order to use Local Proxy ARP. The two features are independent of each other.
- By default, the first interface bound to a VLAN becomes the primary interface for that VLAN. Use the **primary** keyword with this command to configure a different IP interface as the primary.
- To create an IP interface for network management purposes, specify **Loopback0** (case sensitive) as the name of the interface. The Loopback0 interface is not bound to any VLAN, so it always remains operationally active.

## Examples

```
-> ip interface "Marketing"
-> ip interface "Payroll address" 18.12.6.3 vlan 255
```

```
-> ip interface "Human Resources" 10.200.12.101 vlan 500 no forward snap
-> ip interface "Distribution" 11.255.14.102 vlan 500 local-proxy-arp primary
```

## Release History

Release 7.1.1; command introduced

## Related Commands

[show ip interface](#) Displays the status and configuration of IP interfaces.

  alaIpInterfacePrimCfg
  alaIpInterfaceOperState
  alaIpInterfaceOperReason
  alaIpInterfaceRouterMac
  alaIpInterfaceBcastAddr
  alaIpInterfacePrimAct
```

---

## ip interface tunnel

Configures the end points for a GRE or IPIP tunnel.

**ip interface** *name* **tunnel** [**source** *ip\_address*] [**destination** *ip\_address*] [**protocol** {**ipip** | **gre**}]

---

### Syntax Definitions

<i>name</i>	Text string. Use quotes around string if description contains multiple words with spaces between them (e.g. "Alcatel-Lucent Marketing"). Note that this value is case sensitive.
<b>source</b> <i>ip_address</i>	Source IP address of the tunnel.
<b>destination</b> <i>ip_address</i>	Destination IP address of the tunnel.
<b>ipip</b>	Specifies the tunneling protocol as IPIP.
<b>gre</b>	Specifies the tunneling protocol as GRE.

### Defaults

parameter	default
<b>ipip</b>   <b>gre</b>	<b>ipip</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- You can configure an interface as either a VLAN or tunnel interface.

### Examples

```
-> ip interface "tnl-1" tunnel source 23.23.23.1 destination 155.2.2.2 protocol gre
-> ip interface "tnl-1" tunnel source 23.23.23.1 destination 155.2.2.2 protocol
ipip
```

### Release History

Release 7.1.1; command introduced

### Related Commands

[show ip interface](#) Displays the status and configuration of IP interfaces.

### MIB Objects

```
alaIpInterfaceTable
    alaIpInterfaceName
    alaIpInterfaceTunnelSrc
```

```
alaIpInterfaceTunnelDst  
alaIpInterfaceDeviceType
```

---

## ip router primary-address

Configures the router primary IP address. By default, the router primary address is derived from the first IP interface that becomes operational on the router.

**ip router primary-address** *ip\_address*

---

### Syntax Definitions

*ip\_address*                      32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The router primary address must be a valid IP unicast host address.
- The router primary IP address is used by BGP to derive its unique BGP Identifier, if the router router-id is not a valid IP unicast address.
- It is recommended that the primary address be explicitly configured on dual CMM chassis.

### Examples

```
-> ip router primary-address 172.22.2.115
```

### Release History

Release 7.1.1; command introduced

### Related Commands

[ip router router-id](#)                      Configures the router ID for the router.

### MIB Objects

```
alaDcrTmConfig  
  alaDrcTmIpRouterPrimaryAddress
```

---

## ip router router-id

Configures the router ID for the router. By default, the router primary address of the router is used as the router ID. However, if a primary address has not been explicitly configured, the router ID defaults to the address of the first IP interface that becomes operational.

**ip router router-id** *ip\_address*

---

### Syntax Definitions

*ip\_address*                      32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The router ID can be any 32-bit number.
- If the router ID is not a valid IP unicast host address, the BGP identifier is derived from the router primary address.
- It is recommended that the router ID be explicitly configured on dual CMM chassis.
- The router ID is used by OSPF and BGP to uniquely identify the router in the network.

### Examples

```
-> ip router router-id 172.22.2.115
```

### Release History

Release 7.1.1; command introduced

### Related Commands

[ip router primary-address](#)      Configures the router primary IP address.

### MIB Objects

alaDcrTmConfig  
  alaDrcTmIpRouterId

---

## ip static-route

Creates/deletes an IP static route. Static routes are user-defined; they carry a higher priority than routes created by dynamic routing protocols. That is, static routes always have priority over dynamic routes, regardless of the metric value.

**ip static-route** *ip\_address* [**mask** *mask*] **gateway** *gateway*/**follows** *ip\_address* [**metric** *metric*]

**no ip static-route** *ip\_address* [**mask** *mask*] **gateway** *ip\_address*/**follows** *ip\_address* [**metric** *metric*]

---

### Syntax Definitions

<i>ip_address</i>	Destination IP address of the static route.
<i>mask</i>	Subnet mask corresponding to the destination IP address.
<b>gateway</b> <i>ip_address</i>	IP address of the next hop used to reach the destination IP address.
<b>follows</b> <i>ip_address</i>	The recursive static route follows this IP address. The recursive route will use the same gateway/nexthop that is used to reach this host address.
<i>metric</i>	Metric or cost (hop count) for the static route. You can set a priority for the static route by assigning a metric value. The lower the metric value, the higher the priority. Valid range is 1–15.

### Defaults

parameter	default
<i>metric</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Static routes do not age out of the routing tables; however, they can be deleted. Use the **no** form of this command to delete a static route.
- A static route is not active unless the gateway it is using is active.
- The subnet mask is not required if you want to use the natural subnet mask. By default, the switch imposes a natural mask on the IP address.
- Use the **ip static-route** command to configure default route. For example, to create a default route through gateway 171.11.2.1, you would enter: **ip static-route 0.0.0.0 mask 0.0.0.0 gateway 171.11.2.1**.

### Examples

```
-> ip static-route 171.11.1.1 gateway 171.11.2.1
-> ip static-route 0.0.0.0 mask 0.0.0.0 gateway 171.11.2.1
-> ip static-route 171.11.0.0 follows 192.168.10.1
```

## Release History

Release 7.1.1; command introduced

## Related Commands

- |   |   |
|---|---|
| <a href="#">show ip routes</a>          | Displays the IP Forwarding table.         |
| <a href="#">show ip router database</a> | Displays the IP router database contents. |

```

---

## ip route-pref

Configures the route preference of a router.

```
ip route-pref {static | ospf | rip | ebgp | ibgp} value
```

---

### Syntax Definitions

<b>static</b>	Configures the route preference of static routes.
<b>ospf</b>	Configures the route preference of OSPF routes.
<b>rip</b>	Configures the route preference of RIP routes.
<b>ebgp</b>	Configures the route preference of external BGP routes.
<b>ibgp</b>	Configures the route preference of internal BGP routes.
<i>value</i>	Route preference value.

### Defaults

<b>parameter</b>	<b>default</b>
<b>static</b> <i>value</i>	2
<b>ospf</b> <i>value</i>	110
<b>rip</b> <i>value</i>	120
<b>ebgp</b> <i>value</i>	190
<b>ibgp</b> <i>value</i>	200

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Route preference of local routes cannot be changed.

### Examples

```
-> ip route-pref ebgp 20  
-> ip route-pref rip 60
```

### Release History

Release 7.1.1; command introduced

## Related Commands

### `show ip route-pref`

Displays the configured route-preference of a router.

---

## ip default-ttl

Configures the Time To Live value (TTL) for IP packets. The TTL value is the maximum number of hops an IP packet travels before being discarded.

**ip default-ttl** *hops*

---

### Syntax Definitions

*hops* TTL value, in hops. Valid range is 1–255.

### Defaults

parameter	default
<i>hops</i>	64

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This value represents the default value inserted into the TTL field of the IP header for datagrams originating from this switch whenever a TTL value is not supplied by the transport layer protocol.

### Examples

```
-> ip default-ttl 30
```

### Release History

Release 7.1.1; command introduced

### Related Commands

[show ip config](#) Displays IP configuration parameters.

### MIB Objects

IpDefaultTTL

---

## ping

Tests whether an IP destination can be reached from the local switch. This command sends an ICMP echo request to a destination and then waits for a reply. To ping a destination, enter the **ping** command and enter either the IP address or hostname of the destination. The switch pings the destination using the default frame count, packet size, interval, and timeout parameters (6 frames, 64 bytes, 1 second, and 5 seconds respectively). You can also customize any or all of these parameters as described below.

```
ping {ip_address / hostname} [source-interface ip_interface] [count count] [size packet_size] [interval seconds] [timeout seconds] [data-pattern string] [dont-fragment] [tos tos_val]
```

---

### Syntax Definitions

<i>ip_address</i>	IPv4 address of the system to ping.
<i>hostname</i>	DNS name of the system to ping.
<i>count</i>	Number of frames to be transmitted.
<i>packet_size</i>	Size of the data portion of the packet sent for this ping, in bytes. Valid range is 1–65507.
<b>interval</b> <i>seconds</i>	Polling interval. The switch polls the host at time intervals specified in seconds.
<b>timeout</b> <i>seconds</i>	Number of seconds the program waits for a response before timing out.
<b>source-interface</b> <i>ip_interface</i>	IP address to be used as source IP for the ping packets.
<b>data-pattern</b> <i>string</i>	The data pattern to be used in the data field of the ping packets.
<b>dont-fragment</b>	Sets the don't-fragment bit in the IP packet.
<b>tos</b> <i>tos_val</i>	Type of Service field in the IP header.

### Defaults

parameter	default
<i>count</i>	6
<i>packet_size</i>	64
<b>interval</b> <i>seconds</i>	1
<b>timeout</b> <i>seconds</i>	5
<b>dont-fragment</b>	0
<b>tos</b> <i>tos_val</i>	0
<b>data-pattern</b> <i>string</i>	Repeating sequence of ASCII characters 0x4 onwards to 0xff

### Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

If you change the default values they are only applied to the current ping. The next time you use the ping command, the default values are used unless you again enter different values.

## Examples

```
-> ping 10.255.11.242

PING 10.255.11.242: 56 data bytes
64 bytes from 10.255.11.242: icmp_seq=0. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=1. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=2. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=3. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=4. time=0. ms
64 bytes from 10.255.11.242: icmp_seq=5. time=0. ms
----10.255.11.242 PING Statistics----
6 packets transmitted, 6 packets received, 0% packet loss
round-trip (ms) min/avg/max = 0/0/0

-> ping 10.0.0.1 source-interface mgmt
-> ping 10.0.0.1 tos 1
-> ping 10.0.0.1 timeout 10
-> ping 10.0.0.1 interval 10
-> ping 10.0.0.1 dont-fragment
-> ping 10.0.0.1 data-pattern AB
```

## Release History

Release 7.1.1; command introduced

## Related Commands

**traceroute** Finds the path taken by an IP packet from the local switch to a specified destination.

---

## traceroute

Finds the path taken by an IP packet from the local switch to a specified destination. This command displays the individual hops to the destination as well as some timing information.

**traceroute** {*ip\_address* / *hostname*} [**max-hop** *max\_hop\_count*] [**min-hop** *min\_hop\_count*] [**source-interface** *ip\_interface*] [**probes** *probe\_count*] [**timeout** *seconds*] [**port** *port\_number\_value*]

---

### Syntax Definitions

<i>ip_address</i>	IPv4 address of the host whose route you want to trace.
<i>hostname</i>	DNS name of the host whose route you want to trace.
<i>max_hop_count</i>	Maximum hop count for the trace. The valid range is 1–255.
<i>min_hop_count</i>	Minimum hop count for the trace. The valid range is 1–30.
<b>source-interface</b> <i>ip_interface</i>	Source IP interface to be used in the traceroute packets.
<b>probes</b> <i>probe_count</i>	The number of packets (retry) that will be sent for each hop-count. The valid range is 1–10000.
<b>timeout</b> <i>seconds</i>	The time to wait for the response of each probe packet.
<b>port</b> <i>port_number_value</i>	The destination port number to be used in the probing packets.

### Defaults

parameter	default
<b>max-hop</b> <i>max_hop_count</i>	30
<b>min-hop</b> <i>min_hop_count</i>	1
<b>source-interface</b> <i>ip_interface</i>	Outgoing IP interface as per route lookup
<b>probes</b> <i>probe_count</i>	3
<b>timeout</b> <i>seconds</i>	5
<b>port</b> <i>port_number_value</i>	33334

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When using this command, you must enter the name of the destination as part of the command line (either the IP address or host name).

### Examples

```
-> traceroute 128.251.17.224
```

```
traceroute to 128.251.17.224, 30 hops max, 40 byte packets
 1  10.255.11.254 0 ms  0 ms  0 ms
 2  172.23.0.251 0 ms  16.6667 ms  0 ms
```

```
3 128.251.14.253 0 ms 0 ms 0 ms
4 128.251.17.224 0 ms 0 ms 0 ms

-> traceroute 128.251.17.224 max-hop 3
traceroute to 128.251.17.224, 3 hops max, 40 byte packets
 1 10.255.11.254 0 ms 0 ms 0 ms
 2 172.23.0.251 16.6667 ms 0 ms 0 ms
 3 128.251.14.253 0 ms 0 ms 0 ms
-> traceroute 10.0.0.1 source-interface mgmt
-> traceroute 10.0.0.1 min-hop 3
-> traceroute 10.0.0.1 probes 3
-> traceroute 10.0.0.1 timeout 10
-> traceroute 10.0.0.1 port-number 1025
```

## Release History

Release 7.1.1; command introduced

## Related Commands

[show ip routes](#) Displays the IP Forwarding table.

## MIB Objects

N/A

---

## ip directed-broadcast

Enables or disables IP directed broadcasts routed through the switch. An IP directed broadcast is an IP datagram that has all zeros or all 1's in the host portion of the destination address. The packet is sent to the broadcast address of a subnet to which the sender is not directly attached.

**ip directed-broadcast {on | off}**

---

### Syntax Definitions

N/A

### Defaults

The default value is **off**.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Directed broadcasts are used in denial-of-service “smurf” attacks. In a smurf attack, a continuous stream of ping requests are sent from a falsified source address to a directed broadcast address, resulting in a large stream of replies, which can overload the host of the source address. By default, the switch drops directed broadcasts. Typically, directed broadcasts must not be enabled.

### Examples

```
-> ip directed-broadcast off
```

### Release History

Release 7.1.1; command introduced

### Related Commands

<a href="#">show ip interface</a>	Displays the status and configuration of IP interfaces.
<a href="#">show ip routes</a>	Displays the IP Forwarding table.
<a href="#">show ip config</a>	Displays IP configuration parameters.

### MIB Objects

```
alaIpDirectedBroadcast
```

---

## ip service

Enables (opens) or disables (closes) well-known or user-defined TCP/UDP service ports. Selectively enabling or disabling these types of ports provides an additional method for protecting against unauthorized switch access or Denial of Service (DoS) attacks.

**ip service** {**all** | *service\_name* / **port** *service\_port*} **admin-state** {**enable** | **disable**}

---

### Syntax Definitions

<b>all</b>	Configures access to all TCP/UDP ports.
<i>service_name</i>	The name of the TCP/UDP service to enable or disable. (Refer to the table in the “Usage Guidelines” section below for a list of supported service names.)
<i>service_port</i>	A TCP/UDP service port number. Configures access by port number rather than by service name. (Refer to the table in the “Usage Guidelines” section below for a list of well-known port numbers.) If a user-defined port number is specified, the valid range is 20000–20999.
<b>enable</b>	Enables access to the service.
<b>disable</b>	Disables access to the service.

### Defaults

All TCP/UDP ports are open by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command only applies to TCP/UDP service ports opened by default. It does not affect ports that are opened by applications, such as RIP, BGP, etc.
- Use the **all** option with this command to configure access to all well-known TCP/UDP service ports.
- To designate which port to enable or disable, specify either the name of a service or the well-known port number associated with that service. Note that specifying a name and a port number in a single command line is not supported.
- When using service names, it is possible to specify more than one service in a single command line by entering each service name separated by a space. See the examples below.
- When specifying a service port number, note that the **port** keyword is required and that only one port number is allowed in a single command.

- The following table lists the **ip service** command options for specifying TCP/UDP services and also includes the well-known port number associated with each service:

<b>service name</b>	<b>port</b>
<b>ftp</b>	21
<b>ssh</b>	22
<b>telnet</b>	23
<b>http</b>	80
<b>https</b>	443
<b>ntp</b>	123
<b>snmp</b>	161

### Examples

```
-> ip service all admin-state disable
-> ip service ftp admin-state enable
-> ip service port 20000 admin-state enable
```

### Release History

Release 7.1.1; command introduced

### Related Commands

[ip service port](#)

Configures a user-defined TCP/UDP port for the specified service.

[show ip service](#)

Displays the IP service TCP/UDP port configuration and status.

### MIB Objects

```
alaIpServiceTable
  alaIpServiceType
  alaIpServicePort
  alaIpServiceStatus
alaIpPortServiceTable
  alaIpPortServicePort
  alaIpPortServiceStatus
```

---

## ip service port

Configures a user-defined TCP/UDP service port for the specified service.

**ip service** {*service\_name*} **port** {**default** | *service\_port*}

---

### Syntax Definitions

<i>service_name</i>	The name of the TCP/UDP service to enable or disable. (Refer to the table in the “Usage Guidelines” section below for a list of supported service names.)
<i>service_port</i>	A TCP/UDP service port number (Refer to the table in the “Usage Guidelines” section below for a list of supported service names.) Valid range is the default service port number or 20000-20999.
<b>default</b>	Sets the port back to the well-known port for the specified service.

### Defaults

By default, the service uses the well-known TCP/UDP port number for that service.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **default** parameter with this command to set the port for the specified service back to the well-known default port for that service. For example, if the FTP port was previously changed to “20000”, then the **ip service ftp port default** command would set the FTP port back to “21”.
- The following table lists the **ip service port** command options for specifying TCP/UDP services and also includes the default well-known port number associated with each service:

service name	port
<b>ftp</b>	21
<b>ssh</b>	22
<b>telnet</b>	23
<b>http</b>	80
<b>https</b>	443

Note that **ntp** and **snmp** services are not supported with the **ip service port** command.

- Use the **ip service** command to enable or disable the status for a well-known or user-defined TCP/UDP service port.

### Examples

```
-> ip service ftp port 20000
-> ip service ftp port default
```

```
-> ip service telnet port 2003  
-> ip service telnet port default
```

## Release History

Release 7.1.1; command introduced

## Related Commands

[ip service](#)

Enables or disables well-known or user-defined service ports.

[show ip service](#)

## MIB Objects

```
alaIpServiceTable  
  alaIpServiceType  
  alaIpServicePort  
  alaIpServiceStatus
```

---

## ip redist

Controls the conditions for redistributing IPv4 routes between different protocols.

**ip redist** {local | static | rip | ospf | isis | bgp} into {rip | ospf | isis | bgp} route-map *route-map-name* [status {enable | disable}]

**no ip redist** {local | static | rip | ospf | isis | bgp} into {rip | ospf | bgp} [route-map *route-map-name*]

---

### Syntax Definitions

<b>local</b>	Redistributes local routes.
<b>static</b>	Redistributes static routes.
<b>rip</b>	Specifies RIP as the source or destination (into) protocol.
<b>ospf</b>	Specifies OSPF as the source or destination (into) protocol.
<b>isis</b>	Specifies IS-IS as the source or destination (into) protocol.
<b>bgp</b>	Specifies BGP as the source or destination (into) protocol.
<i>route-map-name</i>	Name of an existing route map that controls the redistribution of routes between the source and destination protocol.
<b>enable</b>	Enables the administrative status of the redistribution configuration.
<b>disable</b>	Disables the administrative status of the redistribution configuration.

### Defaults

parameter	default
enable   disable	enable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a route map redistribution configuration. Note that if a route map name is not specified, all route maps associated with the redistribution configuration are removed.
- The source and destination protocols must be loaded and enabled before redistribution occurs.
- If the metric calculated for the redistributed route, as described above, is greater than 15 (RIP\_UNREACHABLE) or greater than the metric of an existing pure RIP route, the new route is not redistributed.
- Use the **ip route-map** commands described in this chapter to create a route map. Refer to the “Configuring IP” chapter in the *OmniSwitch 10K Network Configuration Guide* for more information about how to create a route map.

## Examples

```
-> ip redist rip into bgp route-map rip-to-bgp1
-> ip redist rip into bgp route-map rip-to-bgp2
-> no ip redist rip into bgp route-map rip-to-bgp2
-> ip redist ospf into rip route-map ospf-to-rip
-> ip redist ospf into rip route-map ospf-to-rip disable
```

## Release History

Release 7.1.1; command introduced

```

---

## ip access-list

Creates an access list for adding multiple IPv4 addresses to route maps.

**ip access-list** *access-list-name*

**no ip access-list** *access-list-name*

---

### Syntax Definitions

*access-list-name*                      Name of the access list (up to 20 characters).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to delete the access list.

### Examples

```
-> ip access-list access1  
-> no ip access-list access1
```

### Release History

Release 7.1.1; command introduced

### Related Commands

[ip access-list address](#)                      Adds IPv4 addresses to the specified IPv4 access list.

[show ip access-list](#)                      Displays the details of the access list.

### MIB Objects

```
alaRouteMapAccessListNameTable  
  alaRouteMapAccessListName  
  alaRouteMapAccessListNameIndex  
  alaRouteMapAccessListNameAddressType  
  alaRouteMapAccessListNameRowStatus
```

---

## ip access-list address

Adds multiple IPv4 addresses to the specified IPv4 access list.

**ip access-list** *access-list-name* **address** *address/prefixLen* [**action** {**permit** | **deny**}]  
[**redist-control** {**all-subnets** | **no-subnets** | **aggregate**}]

**no ip access-list** *access-list-name* **address** *address/prefixLen*

---

### Syntax Definitions

<i>access-list-name</i>	Name of the access list.
<i>address/prefixLen</i>	IP address/prefix length to be added to the access list.
<b>permit</b>	Permits the IP address for redistribution.
<b>deny</b>	Denies the IP address for redistribution.
<b>all-subnets</b>	Redistributes or denies all the subnet routes that match the network portion of the IP address as specified by the mask length
<b>no-subnets</b>	Redistributes or denies only those routes that exactly match the IP address and the mask length.
<b>aggregate</b>	Redistributes an aggregate route if there are one or more routes that match or are subnets of this address.

### Defaults

parameter	default
<b>permit</b>   <b>deny</b>	<b>permit</b>
<b>all-subnets</b>   <b>no-subnets</b>   <b>aggregate</b>	<b>all-subnets</b>

### Usage Guidelines

- Use the **no** form of this command to delete the address from the access list.
- The *access-list-name* must exist before you add multiple addresses to the list.
- The **action** parameters (**permit** and **deny**) determine if a route that matches the **redist-control** configuration for the IP address is allowed or denied redistribution.
- The **redist-control** parameters (**all-subnets**, **no-subnets**, and **aggregate**) defines the criteria used to determine if a route matches an address in the access list.
- Note that configuring the combination of **redist-control aggregate** with **action deny** is not allowed.
- Use this command multiple times with the same access list name to add multiple addresses to the existing access list.

## Examples

```
-> ip access-list access1 address 10.0.0.0/8 action permit
-> ip access-list access1 address 11.1.0.0/16 action permit
-> ip access-list access1 address 10.1.1.0/24 redist-control aggregate
-> no ip access-list access1 address 10.0.0.0/8
```

## Release History

Release 7.1.1; command introduced

## Related Commands

<a href="#">ip access-list</a>	Creates an access list for adding multiple IPv4 addresses to route maps.
<a href="#">show ip access-list</a>	Displays the contents of an IPv4 access list.

## MIB Objects

  alaRouteMapAccessListRowStatus
```

---

## ip route-map action

Creates a route map for redistribution and sets the status of the route map to permit or deny.

**ip route-map** *route-map-name* [**sequence-number** *number*] **action** {**permit** | **deny**}

**no ip route-map** *route-map-name* [**sequence-number** *number*]

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<b>permit</b>	Permits route redistribution.
<b>deny</b>	Denies route redistribution.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>number</i>	50
<b>permit</b>   <b>deny</b>	<b>permit</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the entire route map by specifying only the *route-map-name*.
- Use the **no** form of this command to delete a specific sequence in the route map by specifying the **sequence-number**.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- Use this command to change the status of an existing route map to permit or deny.

### Examples

```
-> ip route-map routel sequence-number 10 action permit
-> no ip route-map routel
```

### Release History

Release 7.1.1; command introduced

## Related Commands

**show ip route-map** Displays the configured IP route maps.

```

---

## ip route-map match ip address

Matches the route with the specified IPv4 address or an address defined in the specified IPv4 access list.

**ip route-map** *route-map-name* [**sequence-number** *number*] **match ip-address** {*access-list-name* | *ip\_address/prefixLen*} [**redist-control** {**all-subnets** | **no-subnets** | **aggregate**}] [**permit** | **deny**]

**no ip route-map** *route-map-name* [**sequence-number** *number*] **match ip-address** {*access-list-name* | *ip\_address/prefixLen*} [**redist-control** {**all-subnets** | **no-subnets** | **aggregate**}] [**permit** | **deny**]

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>access-list-name</i>	The name of an IPv4 access list that contains IPv4 addresses to match.
<i>ip_address/prefixLen</i>	The destination IP address along with the prefix length of the routes to be redistributed.
<b>all-subnets</b>	Redistributes all the subnet routes that match the network portion of the IP address as specified by the mask length.
<b>no-subnets</b>	Redistributes only those routes that exactly match the IP address and the mask length.
<b>aggregate</b>	Redistributes an aggregate route if there are one or more routes that match the IP address.
<b>permit</b>	Permits a route based on the IP address or prefix constrained by redist-control.
<b>deny</b>	Denies a route based on the IP address or prefix constrained by redist-control.

### Defaults

parameter	default
<i>number</i>	50
<b>permit</b>   <b>deny</b>	<b>permit</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the **match ip-address redist-control** parameter in the route map.
- Specify either the name of an existing IPv4 access list or an IPv4 address/prefix length with this command.

- Note that configuring the combination of **redist-control aggregate** with **deny** is not allowed.
- Multiple addresses in the same route map sequence are matched using the longest prefix match.
- If the best matching address is type **deny**, then the route is not redistributed. If the best matching address is type **permit** and the route map action is **deny**, the route is not redistributed.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name*, **sequence-number**, and *access-list-name* (if used) must exist before you configure this **match** criteria.

## Examples

```
-> ip route-map 3 match ip-address 10.1.1.1/8 redist-control no-subnets deny
-> no ip route-map 3 match ip-address 10.1.1.1 redist-control no-subnets deny
-> ip route-map route1 sequence-number 10 match ip-address list1
-> no ip route-map route1 sequence-number 10 match ip-address list1
```

## Release History

Release 7.1.1; command introduced

## Related Commands

alaRouteMapTable
  alaRouteMapIndex
  alaRouteMapSequence
  alaRouteMapType
  alaRouteMapValue
  alaRouteMapRowStatus
```

## ip route-map match ipv6 address

Matches the route with the specified IPv6 address or an address defined in the specified IPv6 access list.

**ip route-map** *route-map-name* [**sequence-number** *number*] **match ipv6-address** {*access-list-name* | *ipv6\_address/prefixLen*} [**redist-control** {**all-subnets** | **no-subnets** | **aggregate**}] [**permit** | **deny**]

**no ip route-map** *route-map-name* [**sequence-number** *number*] **match ipv6-address** *ipv6\_address/prefix-Len* [**redist-control** {**all-subnets** | **no-subnets** | **aggregate**}] [**permit** | **deny**]

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map (up to 20 characters).
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>access-list-name</i>	The name of an IPv4 access list that contains IPv4 addresses to match.
<i>ipv6_address/prefixLen</i>	The destination IPv6 address along with the prefix length of the routes to be redistributed.
<b>all-subnets</b>	Redistributes all the subnet routes that match the network portion of the IP address as specified by the mask length.
<b>no-subnets</b>	Redistributes only those routes that exactly match the IP address and the mask length.
<b>aggregate</b>	Redistributes an aggregate route if there are one or more routes that match the IPv6 address.
<b>permit</b>	Permits a route based on the IPv6 address or prefix constrained by <b>redist-control</b> .
<b>deny</b>	Denies a route based on the IPv6 address or prefix constrained by <b>redist-control</b> .

### Defaults

parameter	default
<i>number</i>	50
<b>permit</b>   <b>deny</b>	<b>permit</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the **match ipv6-address redist-control** parameter in the route map.
- Specify either the name of an existing IPv6 access list or an IPv6 address/prefix length with this command.

- Note that configuring the combination of **redist-control aggregate** with **deny** is not allowed.
- Multiple addresses in the same route map sequence are matched using the longest prefix match.
- If the best matching address is type **deny**, then the route is not redistributed. If the best matching address is type **permit** and the route map action is **deny**, the route is not redistributed.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **match** criteria.

## Examples

```
-> ip route-map 3 match ipv6-address 2001::1/64 redist-control no-subnets deny
-> no ip route-map 3 match ipv6-address 2001::1/64 redist-control no-subnets deny
-> ip route-map route1 sequence-number 10 match ipv6-address list1
-> no ip route-map route1 sequence-number 10 match ipv6-address list1
```

## Release History

Release 7.1.1; command introduced

## Related Commands

<a href="#">ip route-map action</a>	Creates a route map for redistribution and sets the status of the route map to permit or deny.

```
alaRouteMapTable
  alaRouteMapIndex
  alaRouteMapSequence
  alaRouteMapType
  alaRouteMapValue
  alaRouteMapRowStatus
```

## ip route-map match ip-nexthop

Matches any routes that have a next-hop router address permitted by the specified access list name or the IP address specified in the route map.

**ip route-map** *route-map-name* [**sequence-number** *number*] **match ip-nexthop**  
{*access-list-name* | *ip\_address/prefixLen* [**permit** | **deny**]}

**no ip route-map** *route-map-name* [**sequence-number** *number*] **match ip-nexthop**  
{*access-list-name* | *ip\_address/prefixLen* [**permit** | **deny**]}

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>access-list-name</i>	The access list that matches the route nexthop IP address.
<i>ip_address/prefixLen</i>	The IP address along with the prefix length that matches any nexthop IP address within the specified subnet.
<b>permit</b>	Permits a route based on the IP nexthop.
<b>deny</b>	Denies a route based on the IP nexthop.

### Defaults

parameter	default
<i>number</i>	50
<b>permit</b>   <b>deny</b>	<b>permit</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the **match ip-nexthop** parameter in the route map.
- If the best matching nexthop is type **deny**, then the route is not redistributed. If the best matching nexthop is type **permit** and the route map action is **deny**, the route is not redistributed.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name*, **sequence-number**, and *access-list-name* must exist before you configure this **match** criteria.

## Examples

```
-> ip route-map routel sequence-number 10 match ip-nexthop list1
-> no ip route-map routel sequence-number 10 match ip-nexthop list1
-> ip route-map routel sequence-number 10 match ip-nexthop 10.0.0.0/8
-> no ip route-map routel sequence-number 10 match ip-nexthop 10.0.0.0/8
```

## Release History

```

---

## ip route-map match ipv6-nexthop

Matches any routes that have an IPv6 next-hop router address permitted by the specified access list name or the IPv6 address specified in the route map.

**ip route-map** *route-map-name* [**sequence-number** *number*] **match ipv6-nexthop**  
{*access-list-name* | *ipv6\_address/prefixLen* [**permit** | **deny**]}

**no ip route-map** *route-map-name* [**sequence-number** *number*] **match ipv6-nexthop**  
{*access-list-name* | *ipv6\_address/prefixLen* [**permit** | **deny**]}

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>access-list-name</i>	The access list that matches the route nexthop IPv6 address.
<i>ipv6_address/prefixLen</i>	The IPv6 address along with the prefix length that matches any nexthop IPv6 address within the specified subnet.
<b>permit</b>	Permits a route based on the IPv6 nexthop.
<b>deny</b>	Denies a route based on the IPv6 nexthop.

### Defaults

parameter	default
<i>number</i>	50
<b>permit</b>   <b>deny</b>	<b>permit</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the **match ipv6-nexthop** parameter in the route map.
- If the best matching nexthop is type **deny**, then the route is not redistributed. If the best matching nexthop is type **permit** but the route map action is **deny**, the route is not redistributed.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name*, **sequence-number**, and *access-list-name* must exist before you configure this **match** criteria.

## Examples

```
-> ip route-map routel sequence-number 10 match ipv6-nexthop list1
-> no ip route-map routel sequence-number 10 match ipv6-nexthop list1
-> ip route-map routel sequence-number 10 match ipv6-nexthop 2001::/64
-> no ip route-map routel sequence-number 10 match ipv6-nexthop 2001::/64
```

## ip route-map match tag

Matches the tag value specified in the route map with the one that the routing protocol learned the route on.

**ip route-map** *route-map-name* [**sequence-number** *number*] **match tag** *tag-number*

**no ip route-map** *route-map-name* [**sequence-number** *number*] **match tag** *tag-number*

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>tag-number</i>	The tag number.

### Defaults

parameter	default
<i>number</i>	50

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the **match tag** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **match** criteria.

### Examples

```
-> ip route-map routel sequence-number 10 match tag 4
-> no ip route-map routel sequence-number 10 match tag 4
```

## ip route-map match ipv4-interface

Matches the IPv4 interface name specified in the route map with the one that the routing protocol learned the route on.

**ip route-map** *route-map-name* [**sequence-number** *number*] **match ipv4-interface** *interface-name*

**no ip route-map** *route-map-name* [**sequence-number** *number*] **match ipv4-interface** *interface-name*

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>interface-name</i>	Specifies the interface name of the outgoing interface of the route.

### Defaults

parameter	default
<i>number</i>	50

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the **match ipv4-interface** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **match** criteria.

### Examples

```
-> ip route-map routel sequence-number 10 match ipv4-interface int4

## ip route-map match metric

Matches the metric value specified in the route map with the actual metric value of the route.

**ip route-map** *route-map-name* [**sequence-number** *number*] **match metric** *metric* [**deviation** *deviation*]

**no ip route-map** *route-map-name* [**sequence-number** *number*] **match metric** *metric* [**deviation** *deviation*]

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>metric</i>	The metric value that matches a specified metric.
<i>deviation</i>	The deviation value. If deviation is included, the route metric can have any value within the range (metric-deviation to metric+deviation).

### Defaults

---

parameter	default
<i>number</i>	50

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the **match metric** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **match** criteria.

### Examples

```
-> ip route-map routel sequence-number 10 match metric 4
-> no ip route-map routel sequence-number 10 match metric 4
```

### Release History

---

## ip route-map match route-type

Matches the specified route type with actual route type of the route.

**ip route-map** *route-map-name* [**sequence-number** *number*] **match route-type** {**internal** | **external** [**type1** | **type2**] | **level1** | **level2**}

**no ip route-map** *route-map-name* [**sequence-number** *number*] **match route-type** {**internal** | **external** [**type1** | **type2**] | **level1** | **level2**}

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<b>internal</b>	Matches OSPF/BGP internal routes.
<b>external</b>	Matches OSPF/BGP external routes.
<b>type1</b>	Matches OSPF external Type-1 routes, which gives the full metric calculation for the complete path including internal as well as external cost.
<b>type2</b>	Matches OSPF external Type-2 routes, which gives the external redistribution metric only to the ASBR.
<b>level1</b>	Matches IS-IS Level-1 routes only.
<b>level2</b>	Matches IS-IS Level-2 routes only.

### Defaults

parameter	default
<i>number</i>	50

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the **match route-type** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **match** criteria.

## Examples

```
-> ip route-map 111 sequence-number 50 match route-type internal  
-> no ip route-map 111 sequence-number 50 match route-type internal
```

## Release History

---

## ip route-map set metric

Configures the metric value of the route being distributed.

**ip route-map** *route-map-name* [**sequence-number** *number*] **set metric** *metric*  
[**effect** {**add** | **subtract** | **replace** | **none**}]

**no ip route-map** *route-map-name* [**sequence-number** *number*] **set metric** *metric*  
[**effect** {**add** | **subtract** | **replace** | **none**}]

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>metric</i>	Configures the metric value of the route being distributed. A value of 0 is not allowed.
<b>add</b>	Adds the configured metric value to the actual metric value.
<b>subtract</b>	Subtracts the configured metric value from the actual metric value.
<b>replace</b>	Replaces the actual metric value with the configured metric value.
<b>none</b>	Redistributes the actual metric value. The configured metric value is ignored. Use any value except 0.

### Defaults

parameter	default
<i>number</i>	50

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the **set metric** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **set** criteria.

### Examples

```
-> ip route-map 111 sequence-number 50 set metric 30 effect add
-> no ip route-map 111 sequence-number 50 set metric 30 effect add
```

### Release History

## ip route-map set metric-type

Configures the metric type for the redistributed route.

```
ip route-map route-map-name [sequence-number number] set metric-type
{internal | external [type1 | type2]}
```

```
no ip route-map route-map-name [sequence-number number] set metric-type
{internal | external [type1 | type2]}
```

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<b>internal</b>	Sets the metric type to internal for routes redistributed into BGP.
<b>external</b>	Sets the metric type to external for routes redistributed into BGP.
<b>type1</b>	Sets the metric type to external type1 for routes redistributed into OSPF, which gives the full metric calculation for the complete path including internal as well as external cost.
<b>type2</b>	Sets the metric type to external type2 for routes redistributed into OSPF, which gives the external redistribution metric only to the ASBR.

### Defaults

parameter	default
<i>number</i>	50

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the **set metric-type** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **set** criteria.

### Examples

```
-> ip route-map 111 sequence-number 50 set metric-type internal
-> no ip route-map 111 sequence-number 50 set metric-type internal
```

## ip route-map set tag

Configures the tag value of the route being distributed.

**ip route-map** *route-map-name* [**sequence-number** *number*] **set tag** *tag-number*

**no ip route-map** *route-map-name* [**sequence-number** *number*] **set tag** *tag-number*

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>tag-number</i>	Configures the tag number.

### Defaults

parameter	default
<i>number</i>	50

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the **set tag** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **set** criteria.

### Examples

```
-> ip route-map 111 sequence-number 50 set tag 23  
-> no ip route-map 111 sequence-number 50 set tag 23
```

## ip route-map set community

Configures the community name of the route being redistributed into BGP.

**ip route-map** *route-map-name* [**sequence-number** *number*] **set community** *community-string*

**no ip route-map** *route-map-name* [**sequence-number** *number*] **set community** *community-string*

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>community-string</i>	Defines a community for an aggregate route. Community names range from 0 to 70 characters.

### Defaults

parameter	default
<i>number</i>	50

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the **set community** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **set** criteria.

### Examples

```
-> ip route-map 111 sequence-number 50 set community 29
-> no ip route-map 111 sequence-number 50 set community 29
```

## ip route-map set local-preference

Configures the local preference value for a route being distributed into BGP.

**ip route-map** *route-map-name* [**sequence-number** *number*] **set local-preference** *value*

**no ip route-map** *route-map-name* [**sequence-number** *number*] **set local-preference** *value*

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>value</i>	Configures the local-preference value for routes being redistributed in to BGP. The value is between 0 and 4294967295.

### Defaults

parameter	default
<i>number</i>	50

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the **set local-preference** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **set** criteria.
- The local preference attribute is used to set preference to an exit point from the local autonomous system (AS).
- If there are multiple exit points from the AS, the local preference attribute is used to select the exit point for a specific route.

### Examples

```
-> ip route-map 111 sequence-number 50 set local-preference 4
-> no ip route-map 111 sequence-number 50 set local-preference 4
```

Displays the configured IP route maps.

## MIB Objects

alaIPRouteMapTable

  alaRouteMapIndex

  alaRouteMapSequence

  alaRouteMapType

  alaRouteMapValue

  alaRouteMapRowStatus

---

## ip route-map set ipv6-next-hop

Configures the IPv6 address of the next hop in a route map.

```
ip route-map route-map-name [sequence-number number] set ipv6-next-hop ipv6_address
```

```
no ip route-map route-map-name [sequence-number number] set ipv6-next-hop ipv6_address
```

---

### Syntax Definitions

<i>route-map-name</i>	The name of the route map.
<i>number</i>	A number that links together the route maps. The range is 1–100.
<i>ipv6_address</i>	IPv6 address of the next hop.

### Defaults

parameter	default
<i>number</i>	50

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the **set ipv6-next-hop** parameter in the route map.
- All route maps having the same name but different sequence numbers are linked together and processed in order of increasing sequence number.
- The *route-map-name* and **sequence-number** must exist before you configure this **set** criteria.

### Examples

```
-> ip route-map 222 sequence-number 50 set ipv6-next-hop 2001::1  
-> no ip route-map 222 sequence-number 50 set ipv6-next-hop 2001::1
```

### Release History

Release 7.1.1; command introduced

## Related Commands

### [ip route-map action](#)

Creates a route map for redistribution and sets the status of the route map to permit or deny.

### [show ip route-map](#)

  alaRouteMapValue

  alaRouteMapRowStatus

---

## vrf

Configures and selects a virtual routing and forwarding (VRF) instance on the switch.

**vrf** [*name* / **default**]

**no vrf** *name*

---

### Syntax Definitions

*name* The alphanumeric name (1–20 characters) assigned to the VRF instance.

**default** Optional. Selects the default VRF instance.

### Defaults

A default VRF instance exists in the switch configuration. All applications that are not VRF aware belong to this instance.

Parameter	Default
<i>name</i> / <b>default</b>	default VRF instance

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete a VRF instance. Note that deleting the default instance is not allowed. In addition, any interfaces configured for a VRF instance are automatically removed when the instance is deleted.
- To return to the default VRF instance from within the context of another instance, enter the **vrf** command with or without the optional **default** parameter (for example, **vrf** or **vrf default**).
- Configuring a VRF instance name is case sensitive. In addition, if the name specified does not exist, a VRF instance is automatically created. As a result, it is possible to accidentally create instances or delete the wrong instance.
- If the name of an existing instance is specified with this command, VRF changes the command prompt to reflect the specified instance name. All CLI commands entered at this point are applied within the context of the active VRF instance.
- It is also possible to configure other instances from within the CLI context of the default VRF instance by entering the **vrf** command followed by the instance name. For example, entering **vrf IpOne ip interface intf100 address 100.1.1.1/24 vlan 100** is applied to the IpOne instance even though IpOne is not the active CLI context.

## Examples

```
-> vrf IpOne  
IpOne: ->
```

```
IpOne: -> vrf IpTwo  
IpTwo: ->
```

```
IpTwo: -> vrf  
->
```

```
IpTwo: -> vrf default  
->
```

```
-> vrf IpOne ip interface intf100 address 100.1.1.1/24 vlan 100  
->
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[show vrf](#) Displays the VRF instance configuration for the switch.

## MIB Objects

```
alaVirtualRouterNameTable  
  alaVirtualRouterName
```

---

## arp

Adds a permanent entry to the ARP table. To forward packets, the switch dynamically builds an ARP Table to match the IP address of a device with its physical (MAC) address. These entries age out of the table when the timeout value is exceeded. This command is used to add a permanent entry to the table. Permanent entries do not age out of the table.

```
arp ip_address hardware_address [alias] [arp-name name] [port slot/port] [linkagg agg_num]
```

```
no arp ip_address [alias]
```

---

### Syntax Definitions

<i>ip_address</i>	IP address of the device you are adding to the ARP table.
<i>hardware_address</i>	MAC address of the device in hexadecimal format (e.g., 00.00.39.59.f1.0c).
<b>alias</b>	<p>Specifies that the switch will act as an alias (or proxy) for this IP address. When the alias option is used, the switch responds to all ARP requests for the specified IP address with its own MAC address.</p> <p>You can also enable the proxy feature for an IP interface using the <b>ip interface</b> command. When enabled, ARP requests return the MAC address of the IP router interface and all traffic within the VLAN is routed.</p>
<i>name</i>	The name to assign to this ARP entry.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete a permanent ARP entry.
- Configuring a permanent ARP entry with a multicast address is also supported. This is done by specifying a multicast address for the *ip\_address* parameter instead of a unicast address. (OS9000 and OS6850 24-port models only)
- Note that using the **arp alias** command is not related to proxy ARP as defined in RFC 925. Instead, **arp alias** is similar to the Local Proxy ARP feature, except that it is used to configure the switch as a proxy for only *one* IP address.
- Because most hosts support the use of address resolution protocols to determine cache address information (called dynamic address resolution), you generally do not need to specify permanent ARP cache entries.
- Only the IP address is required when deleting an ARP entry from the table.

## Examples

```
-> arp 171.11.1.1 00:05:02:c0:7f:11
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[clear arp-cache](#)

Deletes all dynamic entries from the ARP table.

[ip interface](#)

Enables or disables the Local Proxy ARP feature for an IP interface. When enabled, all traffic within the VLAN is routed. ARP requests return the MAC address of the IP router interface.

[show arp](#)

Displays the ARP table.

## MIB Objects

ipNetToMediaTable

- ipNetToMediaIfIndex
- ipNetToMediaNetAddress
- ipNetToMediaPhyAddress
- ipNetToMediaType

alaIpNetToMediaTable

- alaIpNetToMediaPhyAddress
- alaIpNetToMediaProxy

---

## clear arp-cache

Deletes all dynamic entries from the ARP table.

**clear arp-cache**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This commands only clears dynamic entries. If permanent entries have been added to the table, they must be removed using the **no** form of the [ip service](#) command.
- Dynamic entries remain in the ARP table until they time out. The switch uses the MAC Address table timeout value as the ARP timeout value. Use the [mac-learning aging-time](#) command to set the timeout value.

### Examples

```
-> clear arp-cache
```

### Release History

Release 7.1.1; command introduced

### Related Commands

<a href="#">ip service</a>	Adds a permanent entry to the ARP table.
<a href="#">show arp</a>	Displays the ARP table.

### MIB Objects

---

## ip dos arp-poison restricted-address

Adds or deletes an ARP Poison restricted address.

**ip dos arp-poison restricted-address** *ip\_address*

**no ip dos arp-poison restricted-address** *ip\_address*

---

### Syntax Definitions

*ip\_address*                            32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of the command to remove an already configured ARP Poison restricted address.

### Examples

```
-> ip dos arp-poison restricted-address 192.168.1.1
-> no ip dos arp-poison restricted-address 192.168.1.1
```

### Release History

Release 7.1.1; command introduced

### Related Commands

[ip service](#)                            Adds a permanent entry to the ARP table.

```

---

## arp filter

Configures an ARP filter that determines if ARP Request packets containing a specific IP address are processed by the switch or discarded.

**arp filter** *ip\_address* [**mask** *ip\_mask*] [*vlan\_id*] [**sender** | **target**] [**allow** | **block**]

**no arp filter** *ip\_address*

---

### Syntax Definitions

<i>ip_address</i>	The IP address to use for filtering ARP packet IP addresses.
<i>ip_mask</i>	An IP mask that identifies which part of the ARP packet IP address is examined for filtering (e.g. mask 255.0.0.0 filters on the first octet of the ARP packet IP address).
<i>vlan_id</i>	A VLAN ID that specifies that only ARP packets for a specific VLAN are filtered.
<b>sender</b>	The sender IP address in the ARP packet is used for ARP filtering.
<b>target</b>	The target IP address in the ARP packet is used for ARP filtering.
<b>allow</b>	ARP packets that meet filter criteria are processed.
<b>block</b>	ARP packets that meet filter criteria are discarded.

### Defaults

parameter	default
<i>vlan_id</i>	0 (no VLAN)
<i>ip_mask</i>	255.255.255.255
<b>sender</b>   <b>target</b>	<b>target</b>
<b>allow</b>   <b>block</b>	<b>block</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete an ARP filter.
- If there are no filters configured for the switch, all ARP Request packets received are processed.
- Up to 200 filters are allowed on each switch.
- If sender or target IP address in an ARP Request packet does not match any filter criteria, the packet is processed by the switch.
- ARP filtering is generally used in conjunction with the Local Proxy ARP application; however, ARP filtering is available for use on its own and/or with other applications.

## Examples

```
-> arp filter 171.11.1.1
-> arp filter 172.0.0.0 mask 255.0.0.0
-> arp filter 198.0.0.0 mask 255.0.0.0 sender
-> arp filter 198.172.16.1 vlan 200 allow
-> no arp filter 171.11.1.1
```

## Release History

Release 7.1.1; command introduced

## Related Commands

---

## icmp type

Enables or disables a specific type of ICMP message, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

**icmp type** *type* **code** *code* **{{enable | disable} | min-pkt-gap** *gap*

---

### Syntax Definitions

<i>type</i>	The ICMP packet type. This is conjunction with the ICMP code determines the type of ICMP message being specified.
<i>code</i>	The ICMP code type. This is conjunction with the ICMP type determines the type of ICMP message being specified.
<b>enable</b>	Enables the specified ICMP message.
<b>disable</b>	Disables the specified ICMP message.
<i>gap</i>	The number of microseconds required between ICMP messages of this type.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	disabled
<i>gap</i>	0

---

### Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- This command allows the user to enable or disable all types of ICMP messages, and set the minimum packet gap between messages of the specified type.
- While this command can be used to enable or disable all ICMP message, some of the more common ICMP messages have their own CLI commands, as described in the pages below. The following ICMP message have specific commands to enable and disable:

ICMP Message	Command
Network unreachable (type 0, code 3)	<a href="#">icmp unreachable</a>
Host unreachable (type 3, code 1)	<a href="#">icmp unreachable</a>
Protocol unreachable (type 3, code 2)	<a href="#">icmp unreachable</a>
Port unreachable (type 3, code 3)	<a href="#">icmp unreachable</a>
Echo reply (type 0, code 0)	<a href="#">icmp echo</a>
Echo request (type 8, code 0)	<a href="#">icmp echo</a>
Timestamp request (type 13, code 0)	<a href="#">icmp timestamp</a>
Timestamp reply (type 14, code 0)	<a href="#">icmp timestamp</a>
Address Mask request (type 17, code 0)	<a href="#">icmp addr-mask</a>
Address Mask reply (type 18, code 0)	<a href="#">icmp addr-mask</a>

- Enabling **Host unreachable** and **Network unreachable** messages are not recommended as it can cause the switch instability due to high-CPU conditions depending upon the volume of traffic required by these messages.

## Examples

```
-> icmp type 4 code 0 enabled
-> icmp type 4 code 0 min-pkt-gap 40
-> icmp type 4 code 0 disable
```

## Release History

Release 7.1.1; command introduced

## Related Commands

[icmp messages](#) Enables or disables all ICMP messages.  
[show icmp control](#) Allows the viewing of the ICMP control settings.

## MIB Objects

```
alaIcmpCtrlTable
  alaIcmpCtrlType
alaIcmpCtrlTable
  alaIcmpCtrlCode
  alaIcmpCtrlStatus
  alaIcmpCtrlPktGap
```

## icmp unreachable

Enables or disables ICMP messages pertaining to unreachable destinations, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

**icmp unreachable** [**net-unreachable** | **host-unreachable** | **protocol-unreachable** | **port-unreachable**] [{**enable** | **disable**} | **min-pkt-gap** *gap*]

---

### Syntax Definitions

<b>net-unreachable</b>	Sets the unreachable network ICMP message.
<b>host-unreachable</b>	Sets the unreachable host ICMP message.
<b>protocol-unreachable</b>	Sets the unreachable protocol ICMP message.
<b>port-unreachable</b>	Sets the unreachable port ICMP message.
<b>enable</b>	Enables the specified ICMP message.
<b>disable</b>	Disables the specified ICMP message.
<i>gap</i>	The number of microseconds required between ICMP messages of this type.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	disabled
<i>gap</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command enables ICMP messages relating to unreachable destinations. Unreachable networks, hosts, protocols, and ports can all be specified.
- Enabling **host-unreachable** and **net-unreachable** messages are not recommended as it can cause the switch instability due to high-CPU conditions depending upon the volume of traffic required by these messages.
- The unreachable ICMP messages can also be enabled, disabled, and modified using the **icmp type** command. See the **icmp type** command information on the type and code for the unreachable ICMP messages.

### Examples

```
-> icmp unreachable net-unreachable enable
-> icmp unreachable host-unreachable enable
```

```
-> icmp unreachable protocol-unreachable enable
-> icmp unreachable port-unreachable enable
-> icmp unreachable port-unreachable min-pkt-gap 50
```

## Release History

Release 7.1.1; command introduced

## Related Commands

**show icmp control** Allows the viewing of the ICMP control settings.

## MIB Objects

  alaIcmpCtrlPktGap
```

---

## icmp echo

Enables or disables ICMP echo messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

**icmp echo** [**request** | **reply**] {{**enable** | **disable**} | **min-pkt-gap** *gap*}

---

### Syntax Definitions

<b>request</b>	Specifies the echo request ICMP message.
<b>reply</b>	Specifies the echo reply ICMP message.
<b>enable</b>	Enables the specified ICMP message.
<b>disable</b>	Disables the specified ICMP message.
<i>gap</i>	The number of microseconds required between ICMP messages of this type.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>enable</b>
<i>gap</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command sets the ICMP echo messages. An echo request is sent to a destination, and must be responded to with an echo reply message that contains the original echo request.
- Using this command without specifying a request or reply enables, disables, or sets the minimum packet gap for both types.
- The echo ICMP messages can also be enabled, disabled, and modified using the [icmp type](#) command. See the [icmp type](#) command information on the type and code for the echo ICMP messages.

### Examples

```
-> icmp echo reply enable
-> icmp echo enable
-> icmp echo request enable
-> icmp echo request min-pkt-gap 50
```

### Release History

Release 7.1.1; command introduced

## Related Commands

    alaIcmpCtrlPktGap

---

## icmp timestamp

Enables or disables ICMP timestamp messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

**icmp timestamp** [**request** | **reply**] {{**enable** | **disable**} | **min-pkt-gap** *gap*}

---

### Syntax Definitions

<b>request</b>	Specifies timestamp request messages.
<b>reply</b>	Specifies timestamp reply messages.
<b>enable</b>	Enables the specified ICMP message.
<b>disable</b>	Disables the specified ICMP message.
<i>gap</i>	The number of microseconds required between ICMP messages of this type.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable</b>   <b>disable</b>	<b>enable</b>
<i>gap</i>	0

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The data received (a timestamp) in the message is returned in the reply together with an additional timestamp. The timestamp is 32 bits of milliseconds since midnight UT. The Originate timestamp is the time the sender last touched the message before sending it, the Receive timestamp is the time the echoer first touched it on receipt, and the Transmit timestamp is the time the echoer last touched the message on sending it.
- Using this command without specifying a request or reply enables, disables, or sets the minimum packet gap for both types.
- The timestamp ICMP messages can also be enabled, disabled, and modified using the [icmp type](#) command. See the [icmp type](#) command information on the type and code for the timestamp ICMP messages.

### Examples

```
-> icmp timestamp reply enable
-> icmp timestamp enable
-> icmp timestamp request enable
-> icmp timestamp request min-pkt-gap 50
```

## Release History

Release 7.1.1; command introduced

## Related Commands

**show icmp control** Allows the viewing of the ICMP control settings.

  alaIcmpCtrlPktGap
```

---

## icmp addr-mask

Enables or disables ICMP address mask messages, and sets the minimum packet gap. The minimum packet gap is the number of microseconds that must pass between ICMP messages of the same type.

**icmp add-mask** [**request** | **reply**] {{**enable** | **disable**} | **min-pkt-gap** *gap*}

---

### Syntax Definitions

<b>request</b>	Specifies request address mask messages.
<b>reply</b>	Specifies reply address mask messages.
<b>enable</b>	Enables the specified ICMP message.
<b>disable</b>	Disables the specified ICMP message.
<i>gap</i>	The number of microseconds required between ICMP messages of this type.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>enable</b>
<i>gap</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- A gateway receiving an address mask request must return it with the address mask field set to the 32-bit mask of the bits identifying the subnet and network, for the subnet on which the request was received.
- Using this command without specifying a request or reply enables, disable, or set the minimum packet gap for both types.
- The address mask ICMP messages can also be enabled, disabled, and modified using the [icmp type](#) command. See the [icmp type](#) command information on the type and code for the address mask ICMP messages.

### Examples

```
-> icmp addr-mask reply enable
-> icmp addr-mask enable
-> icmp addr-mask request enable
-> icmp addr-mask request min-pkt-gap 50
```

## ip dos scan close-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP or UDP packet is received on a closed port.

**ip dos scan close-port-penalty** *penalty\_value*

---

### Syntax Definitions

*penalty\_value* A penalty value added to the penalty scan value. This value can be any non-negative integer.

### Defaults

parameter	default
<i>penalty_value</i>	10

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command creates a point value that is added to the total port scan penalty value when a TCP or UDP packet is received that is destined for a closed port.

### Examples

```
-> ip dos scan close-port-penalty 25
```

### Release History

Release 7.1.1; command introduced

### Related Commands

[ip dos scan threshold](#) Sets the threshold for the port scan value, at which a DoS attack is recorded.

[ip dos trap](#) Sets whether the switch generates SNMP DoS traps when an attack is detected.

### MIB Objects

alaDoSConfig  
  alaDoSPortScanClosePortPenalty

---

## ip dos scan tcp open-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a TCP packet is received on an open port.

**ip dos scan tcp open-port-penalty** *penalty\_value*

---

### Syntax Definitions

*penalty\_value* A penalty value added to the penalty scan value. This value can be any non-negative integer.

### Defaults

parameter	default
<i>penalty_value</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command creates a point value that is added to the total port scan penalty value when a TCP packet is received that is destined for an open port.
- The switch does not distinguished between a legal TCP packet and a port scan packet.

### Examples

```
-> ip dos scan tcp open-port-penalty 10
```

### Release History

Release 7.1.1; command introduced

### Related Commands

- [ip dos scan threshold](#) Sets the threshold for the port scan value, at which a DoS attack is recorded.
- [ip dos trap](#) Sets whether the switch generates SNMP DoS traps when an attack is detected.

### MIB Objects

alaDoSConfig  
  alaDoSPortScanTcpOpenPortPenalty

---

## ip dos scan udp open-port-penalty

Assigns a penalty value to be added to the Denial of Service penalty scan value when a UDP packet is received on an open port.

**ip dos scan udp open-port-penalty** *penalty\_value*

---

### Syntax Definitions

*penalty\_value*

A penalty value added to the penalty scan value. This value can be any non-negative integer.

### Defaults

parameter	default
<i>penalty_value</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command creates a point value that is added to the total port scan penalty value when a UDP packet is received that is destined for an open port.
- The switch does not distinguished between a legal UDP packet and a port scan packet.

### Examples

```
-> ip dos scan udp open-port-penalty 15
```

### Release History

Release 7.1.1; command introduced

### Related Commands

[ip dos scan threshold](#)

Sets the threshold for the port scan value, at which a DoS attack is recorded.

[ip dos trap](#)

Sets whether the switch generates SNMP DoS traps when an attack is detected.

### MIB Objects

alaDoSConfig

alaDoSPortScanUdpOpenPortPenalty

---

## ip dos scan threshold

Sets the threshold for the port scan value, at which a DoS attack is recorded.

**ip dos scan threshold** *threshold\_value*

---

### Syntax Definitions

*threshold\_value*

A numerical value representing the total acceptable penalty before a DoS attack is noted. This value can be any non-negative integer.

### Defaults

parameter	default
<i>threshold_value</i>	1000

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the total port scan penalty value exceeds this value, a port scan attack is recorded.
- The penalty value is incremented by recording TCP or UDP packets that are bound for open or closed ports. Such packets are given a penalty value, which are added together. The commands for setting the packet penalty value are the [ip dos scan close-port-penalty](#), [ip dos scan tcp open-port-penalty](#), and [ip dos scan udp open-port-penalty](#) commands.

### Examples

```
-> ip dos scan threshold 1200
```

### Release History

Release 7.1.1; command introduced

---

## ip dos trap

Sets whether the switch generates SNMP DoS traps when an attack is detected.

**ip dos trap {enable | disable}**

---

### Syntax Definitions

**enable** Enables the generation of DoS traps.  
**disable** Disables the generation of DoS traps.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command controls whether the switch generates an SNMP trap when a DoS attack is detected. It is assumed a DoS attack has occurred when the port scan penalty threshold is exceeded. This value is set using the [ip dos scan threshold](#) command.

### Examples

```
-> ip dos trap enable  
-> ip dos trap disable
```

### Release History

Release 7.1.1; command introduced

### Related Commands

[ip dos scan threshold](#) Sets the threshold for the port scan value, at which a DoS attack is recorded.  
[show ip dos config](#) Displays the configuration parameters of the DoS scan for the switch.

### MIB Objects

alaDoSConfig  
alaDoSTrapCnt1

---

## ip dos scan decay

Sets the decay speed of the port scan penalty value for the switch when calculating DoS attacks.

**ip dos scan decay** *decay\_value*

---

### Syntax Definitions

*decay\_value*

The decay value amount for reducing the port scan penalty. This value can be any non-negative integer.

### Defaults

parameter	default
<i>decay_value</i>	2

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The port scan penalty value is reduced every minute by dividing by the amount set in using this command. For example, if the decay value is set to 10, every minute the total port scan penalty value is divided by 10.

### Examples

```
-> ip dos scan decay 10
```

### Release History

Release 7.1.1; command introduced

### Related Commands

[ip dos scan threshold](#)

Sets the threshold for the port scan value, at which a DoS attack is recorded.

[show ip dos config](#)

Displays the configuration parameters of the DoS scan for the switch.

### MIB Objects

alaDoSConfig

alaDoSPortScanDecay

---

## show ip traffic

Displays IP datagram traffic and errors.

**show ip traffic**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The statistics show the cumulative totals since the last time the switch was powered on or since the last reset of the switch was executed.
- Packets received on a port that is a member of the UserPorts group are dropped if they contain a source IP network address that does not match the IP subnet for the port. This is done to block spoofed IP traffic. If the UserPorts group function is active and spoofed traffic was detected and blocked, the output display of this command includes statistics regarding the spoofed traffic.
- Note that the presence of spoofing event statistics in the output display of this command indicates that an attack was prevented, not that the switch is currently under attack.
- If statistics for spoofed traffic are not displayed, then a spoofing attempt has not occurred since the last time this command was issued.

### Examples

```
-> show ip traffic
```

```
IP statistics
Datagrams received
  Total                = 621883,
  IP header error      = 0,
  Destination IP error = 51752,
  Unknown protocol     = 0,
  Local discards       = 0,
  Delivered to users   = 567330,
  Reassemble needed    = 0,
  Reassembled          = 0,
```

```

Reassemble failed      =          0

Datagrams sent
  Forwarded            =    2801,
  Generated             =   578108,
  Local discards       =          0,
  No route discards    =          9,
  Fragmented           =    2801,
  Fragment failed      =          0,
  Fragments generated  =          0

```

**output definitions**

---

<b>Total</b>	Total number of input datagrams received including those received in error.
<b>IP header error</b>	Number of IP datagrams discarded due to errors in the IP header (e.g., bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discarded in processing IP options).
<b>Destination IP error</b>	Number of IP datagrams discarded because the IP header destination field contained an invalid address. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported classes (e.g., Class E).
<b>Unknown protocol</b>	Number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
<b>Local discards</b>	Number of IP datagrams received that were discarded, even though they had no errors to prevent transmission (e.g., lack of buffer space). This does not include any datagrams discarded while awaiting reassembly. Typically, this value must be zero.
<b>Delivered to users</b>	Total number of datagrams received that were successfully delivered to IP user protocols (including ICMP).
<b>Reassemble needed</b>	Number of IP fragments received that needed to be reassembled.
<b>Reassembled</b>	Number of IP datagrams received that were successfully reassembled.
<b>Reassemble failed</b>	Number of IP failures detected by the IP reassembly algorithm for all reasons (e.g., timed out, error). This is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
<b>Fragmented</b>	Number of successfully fragmented IP datagrams.
<b>Fragment failed</b>	Number of packets received and discarded by IP because they needed to be fragmented but could not be. This situation could happen if a large packet has the "Don't Fragment" flag set.
<b>Forwarded</b>	Number of IP datagrams forwarded by the switch.
<b>Generated</b>	Total number of IP datagrams that local IP user protocols (including ICMP) generated in response to requests for transmission. This does not include any datagrams counted as "Forwarded."
<b>Local discards</b>	Number of output IP datagrams that were discarded, even though they had no errors to prevent transmission (e.g., lack of buffer space). This number includes datagrams counted as "Forwarded" if the packets are discarded for these reasons.

*output definitions (continued)*

---

<b>No route discards</b>	Number of IP datagrams received and discarded by IP because no route could be found to transmit them to their destination. This includes any packets counted as “Forwarded” if the packets are discarded for these reasons. It also includes any datagrams that a host cannot route because all of its default routers are down.
<b>Fragments generated</b>	The of IP datagram fragments generated as a result of fragmentation.
<b>Routing entry discards</b>	Number of packets received and discarded by IP even though no problems were encountered to prevent their transmission to their destination (e.g., discarded because of lack of buffer space).

---

## show ip interface

Displays the configuration and status of IP interfaces.

**show ip interface** [*name* / **emp** | **vlan** *vlan id*]

---

### Syntax Definitions

<i>name</i>	The name associated with the IP interface.
<b>emp</b>	Displays the configuration and status of the Ethernet Management Port interface.
<i>vlan_id</i>	VLAN ID (displays a list of IP interfaces associated with a VLAN).

### Defaults

By default, all IP interfaces are displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The basic **show ip interface** command displays information about all configured IP interfaces on the switch.
- Use the optional **vlan** parameter to display a list of interfaces configured for the specified VLAN.
- Specify an optional interface *name* to display detailed information about an individual interface.
- Use the optional **emp** parameter to display detailed information about the EMP interface.

### Examples

```
-> show ip interface
Total 13 interfaces
```

Name	IP Address	Subnet Mask	Status	Forward	Device
EMP	172.22.16.115	255.255.255.0	UP	NO	EMP
GMRULE	40.1.1.1	255.255.255.0	DOWN	NO	vlan 40
Loopback	127.0.0.1	255.0.0.0	UP	NO	Loopback
client	60.1.1.1	255.255.255.0	DOWN	NO	vlan 60
gbps	5.5.5.5	255.255.255.0	DOWN	NO	vlan 7
if222	30.1.5.1	255.0.0.0	UP	YES	vlan 222
ldap_client1	173.22.16.115	255.255.255.0	UP	YES	vlan 173
ldap_server1	174.22.16.115	255.255.255.0	UP	YES	vlan 174
radius_client3	110.1.1.101	255.255.255.0	UP	YES	vlan 30
vlan-2	0.0.0.0	0.0.0.0	DOWN	NO	unbound
gre-1	24.24.24.1	255.255.255.0	UP	YES	GRE tunnel
ipip-1	25.25.25.1	255.255.255.0	UP	YES	IPIP tunnel
vlan-23	23.23.23.1	255.255.255.0	UP	YES	vlan 23

*output definitions*

---

<b>Name</b>	Interface name. Generally, this is the name configured for the interface (e.g., Accounting). <b>EMP</b> refers to the Ethernet Management Port. <b>Loopback</b> refers to a loopback interface configured for testing.
<b>IP Address</b>	IP address of the interface. Configured through the <b>ip interface</b> command.
<b>Subnet Mask</b>	IP subnet mask for the interface IP address. Configured through the <b>ip interface</b> command.
<b>Status</b>	Interface status: <ul style="list-style-type: none"> <li>• <b>UP</b>—Interface is ready to pass packets.</li> <li>• <b>DOWN</b>—Interface is down.</li> </ul>
<b>Forward</b>	Indicates whether or not the interface is actively forwarding packets ( <b>YES</b> or <b>NO</b> ).
<b>Device</b>	The type of device bound to the interface: <ul style="list-style-type: none"> <li>• <b>unbound</b>—No device is bound to the interface.</li> <li>• <b>vlan</b>—The VLAN ID that is bound to the interface.</li> <li>• <b>EMP</b>—The Ethernet Management Port is bound to the interface.</li> <li>• <b>Loopback</b>—A loopback interface is configured for testing.</li> <li>• <b>GRE tunnel</b>—GRE tunnel is configured for the interface.</li> <li>• <b>IPIP tunnel</b>—IPIP tunnel is configured for the interface.</li> </ul> Configured through the <b>ip interface</b> command. Note that the <b>GRE tunnel</b> and <b>IPIP tunnel</b> devices are supported only on the OmniSwitch 10K switches.

---

```
-> show ip interface Marketing
Interface Name = Marketing
SNMP Interface Index      = 13600007,

Subnet Mask                = 255.255.0.0,
Broadcast Address         = 172.16.255.255,
Device                    = vlan 200,
Encapsulation              = eth2,
Forwarding                 = disabled,
Administrative State       = enabled,
Operational State          = down,
Operational State Reason   = device-down,
Router MAC                 = 00:d0:95:6a:f4:5c,
Local Proxy ARP            = disabled,
Maximum Transfer Unit      = 1500,
Primary (config/actual)    = no/yes
```

*output definitions*

---

<b>SNMP Interface Index</b>	Interface index.
<b>IP Address</b>	IP address associated with the interface. Configured through the <b>ip interface</b> command.
<b>Subnet Mask</b>	IP subnet mask for the interface. Configured through the <b>ip interface</b> command.
<b>Broadcast Address</b>	Broadcast address for the interface.

*output definitions (continued)*

---

<b>Device</b>	<p>The type of device bound to the interface:</p> <ul style="list-style-type: none"> <li>• <b>unbound</b>—No device is bound to the interface.</li> <li>• <b>vlan</b>—The VLAN ID that is bound to the interface.</li> <li>• <b>EMP</b>—The Ethernet Management Port is bound to the interface.</li> <li>• <b>Loopback</b>—A loopback interface is configured for testing.</li> <li>• <b>GRE tunnel</b>—GRE tunnel is configured for the interface.</li> <li>• <b>IPIP tunnel</b>—IPIP tunnel is configured for the interface.</li> </ul> <p>Configured through the <b>ip interface</b> command.</p> <p>Note that the <b>GRE tunnel</b> and <b>IPIP tunnel</b> devices are supported only on the OmniSwitch 10K switches.</p>
<b>Encapsulation</b>	<p>Displays the IP router encapsulation (<b>eth2</b> or <b>snap</b>) that the interface uses when routing packets. Configured through the <b>ip interface</b> command.</p>
<b>Forwarding</b>	<p>Indicates whether or not IP forwarding is active for the interface (<b>enabled</b> or <b>disabled</b>). Configured through the <b>ip interface</b> command.</p>
<b>Administrative State</b>	<p>Administrative state of the IP interface (<b>enabled</b> or <b>disabled</b>), which is independent of the state of the underlying device. Configured through the <b>ip interface</b> command.</p>
<b>Operational State</b>	<p>Indicates whether or not the interface is active (<b>up</b> or <b>down</b>).</p>
<b>Operation State Reason</b>	<p>Indicates why the operational state of the interface is down:</p> <ul style="list-style-type: none"> <li>• <b>unbound</b>—No device is bound to the interface.</li> <li>• <b>device-down</b>—Device bound to the interface is down.</li> <li>• <b>admin-down</b>—The admin state of the interface is down.</li> <li>• <b>no-such-device</b>—Device does not exist.</li> <li>• <b>no-router-mac</b>—No MAC address available for the interface.</li> <li>• <b>tunnel-src-invalid</b>—The source IP address of the tunnel is invalid.</li> <li>• <b>tunnel-dst-unreachable</b>—The destination IP address of the tunnel is not reachable.</li> </ul> <p>Note that the <b>tunnel-src-invalid</b> and <b>tunnel-dst-unreachable</b> Operational State reasons are supported only on the OmniSwitch 10K switches. These two reasons are only applicable for the <b>GRE tunnel</b> and <b>IPIP tunnel</b> device types.</p> <p>Note that <b>Operational State Reason</b> field is only included in the display output when the operational state of the interface is <b>down</b>.</p>
<b>Router MAC</b>	<p>Switch MAC address assigned to the interface. Note that each interface assigned to the same VLAN shares the same switch MAC address.</p>
<b>Local Proxy ARP</b>	<p>Indicates whether or not Local Proxy ARP is active for the interface (<b>enabled</b> or <b>disabled</b>). Configured through the <b>ip interface</b> command.</p>
<b>Maximum Transfer Unit</b>	<p>The Maximum Transmission Unit size set for the interface. Configured through the <b>ip interface</b> command.</p>
<b>Primary (config/actual)</b>	<p>Indicates if the interface is the configured and/or actual primary interface for the device (VLAN, EMP, Loopback). If the actual status is set to <b>yes</b> and the config status is set to <b>no</b>, the interface is the default interface for the VLAN. Configured through the <b>ip interface</b> command.</p>

---

The following are examples of the output display on OmniSwitch 10K switches:

```
-> show ip interface ipip-1
Interface Name = ipip-1
  SNMP Interface Index      = 13600001,
  IP Address                = 25.25.25.1,
  Subnet Mask               = 255.255.255.0,
  Device                   = IPIP Tunnel,
  Tunnel Source Address     = 23.23.23.1
  Tunnel Destination Address = 23.23.23.2,
  Forwarding                = enabled,
  Administrative State     = enabled,
  Operational State        = up,
  Maximum Transfer Unit    = 1480,
```

```
-> show ip interface gre-1
Interface Name = gre-1
  SNMP Interface Index      = 13600002,
  IP Address                = 24.24.24.1,
  Subnet Mask               = 255.255.255.0,
  Device                   = GRE Tunnel,
  Tunnel Source Address     = 23.23.23.1
  Tunnel Destination Address = 23.23.23.2,
  Forwarding                = enabled,
  Administrative State     = enabled,
  Operational State        = down,
  Operational State Reason  = unbound,
  Maximum Transfer Unit    = 1476,
```

### output definitions

## show ip routes

Displays the IP Forwarding table.

**show ip routes [summary]**

---

### Syntax Definitions

**summary** Displays a summary of routing protocols that appear in the IP Forwarding table.

### Defaults

By default, all routes are displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The IP Forwarding table includes static routes as well as all routes learned through routing protocols (e.g., RIP, OSPF).
- Use the optional **summary** keyword to display a list of routing protocols and the number of routes for each protocol that appear in the IP Forwarding table.

### Examples

```
-> show ip routes
```

```
+ = Equal cost multipath routes
Total 4 routes
```

Dest Address	Subnet Mask	Gateway Addr	Age	Protocol
0.0.0.0	0.0.0.0	10.255.11.254	01:50:33	NETMGMT
10.255.11.0	255.255.255.0	10.255.11.225	01:50:33	LOCAL
127.0.0.1	255.255.255.255	127.0.0.1	01:51:47	LOCAL
212.109.138.0	255.255.255.0	212.109.138.138	00:33:07	LOCAL

```
-> show ip route summary
```

Protocol	Route Count
All	4
Local	3
Netmgmt	1
RIP	0
ISIS	0
OSPF	0
BGP	0
Other	0

*output definitions*

---

<b>Dest Addr</b>	Destination IP address.
<b>Subnet Mask</b>	Destination IP address IP subnet mask.
<b>Gateway Addr</b>	IP address of the gateway from which this address was learned.
<b>Age</b>	Age of the entry. If the entry is less than a day old, it is displayed in <i>hh/mm/ss</i> format. If it is more than a day old, it is displayed in <i>dd/hh</i> format (e.g., a route that is 2 days and 12 hours old is displayed as 2d12h).
<b>Protocol</b>	Protocol by which this IP address was learned (e.g., RIP). NETMGT indicates a static route. LOCAL indicates a local interface.
<b>Route Count</b>	The number of routes that appear in the IP Foredoing table for each protocol type listed.

---

**Release History**

Release 7.1.1; command introduced

**Related Commands**

---

## show ip route-pref

Displays the IPv4 routing preferences of a router.

**show ip route-pref**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip route-pref
  Protocol      Route Preference Value
-----+-----
  Local         1
  Static        2
  OSPF          110
  RIP           100
  EBGP          190
  IBGP          200
```

### Release History

Release 7.1.1; command introduced

```

---

## show ip redist

Displays the IPv4 route map redistribution configuration.

**show ipv6 redist [rip | ospf | bgp]**

---

### Syntax Definitions

<b>rip</b>	Displays route map redistribution configurations that use RIP as the destination (into) protocol.
<b>ospf</b>	Displays route map redistribution configurations that specify OSPF as the destination (into) protocol.
<b>bgp</b>	Displays the route map redistribution configurations that specify BGP as the destination (into) protocol at this time.

### Defaults

By default all route map redistribution configurations are shown.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Specify a destination protocol with this command to display only those configurations that redistribute routes into the specified protocol.

### Release History

Release 7.1.1; command introduced

### Examples

```
-> show ip redist
```

Source Protocol	Destination Protocol	Status	Route Map
RIP	OSPF	Enabled	ipv4rm
BGP	RIP	Enabled	ipv4rm

```
-> show ip redist rip
```

Source Protocol	Destination Protocol	Status	Route Map
BGP	RIP	Enabled	ipv4rm

---

*output definitions*

---

<b>Source Protocol</b>	The protocol from which the routes are learned.
<b>Destination Protocol</b>	The protocol into which the source protocol routes are redistributed.
<b>Status</b>	The administrative status ( <b>Enabled</b> or <b>Disabled</b> ) of the route map redistribution configuration.
<b>Route Map</b>	The name of the route map that is applied with this redistribution configuration.

---

**Related Commands**

**ip redistrib** Controls the conditions for redistributing different IPv6 routes between protocols.

**MIB Objects**

```
alaRouteMapRedistProtoTable  
  alaRouteMapRedistSrcProtoId  
  alaRouteMapRedistDestProtoId  
  alaRouteMapRedistRouteMapIndex

  alaRouteMapRedistRowStatus
```

---

## show ip access-list

Displays the details of the access list.

**show ip access-list** [*access-list-name*]

---

### Syntax Definitions

*access-list-name*                      Name of the access list.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If the *access-list-name* is not specified in this command, all the access lists are displayed.

### Examples

```
-> show ip access-list
```

Name	Address / Prefix Length	Effect	Redistribution Control
al_3	10.0.0.0/8	permit	all-subnets
al_3	11.0.0.0/8	permit	all-subnets
al_4	1.0.0.0/8	permit	no-subnets
al_4	10.0.0.0/8	permit	all-subnets

```
-> show ip access-list al_4
```

Name	Address / Prefix Length	Effect	Redistribution Control
al_4	1.0.0.0/8	permit	no-subnets
al_4	10.0.0.0/8	permit	all-subnets

### output definitions

---

<b>Name</b>	Name of the access list.
<b>Address/Prefix Length</b>	IP address that belongs to the access list.
<b>Effect</b>	Indicates whether the IP address is permitted or denied for redistribution.
<b>Redistribution Control</b>	Indicates the conditions specified for redistributing the matched routes.

---

## Release History

Release 7.1.1; command was introduced

## Related Commands

[ip access-list](#)

Creates an access list for adding multiple IPv4 addresses to route maps.

---

## show ip route-map

Displays the IP route maps configured on the switch.

```
show ip route-map [route-map-name]
```

---

### Syntax Definitions

*route-map-name*                      The name of the specific route map.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If the *route-map-name* is not specified in this command, all the route maps are displayed.

### Examples

```
-> show ip route-map
Route Maps: configured: 1 max: 200
Route Map: Route_map1 Sequence Number: 50 Action permit
  match ip address 10.0.0.0/8 redistrib-control all-subnets permit
  set metric 100 effect replace
```

### Release History

Release 7.1.1; command introduced

## Related Commands

<b>ip route-map action</b>	Creates a route map for redistribution and sets the status of route map to permit or deny.
<b>ip route-map match ip address</b>	Matches the route with the specified IPv4 address or with addresses contained in an IPv4 access list specified by the access list name.
<b>ip route-map match ipv6 address</b>	Matches the route with the specified IPv6 address or with addresses contained in an IPv6 access list specified by the access list name.
<b>ip route-map match ip-nexthop</b>	Matches the routes that have a next-hop router address permitted by the specified access list.
<b>ip route-map match ipv6-nexthop</b>	Matches the routes that have an IPv6 next-hop router address permitted by the specified access list.
<b>ip route-map match tag</b>	Permits or denies a route based on the specified next-hop IP address.
<b>ip route-map match tag</b>	Matches the tag value specified in the route map with the one that the routing protocol learned the route on.
<b>ip route-map match metric</b>	Matches the metric value specified in the route map with the one that the routing protocol learned the route on.
<b>ip route-map match route-type</b>	Matches the specified route type with the one that the routing protocol learned the route on.

## MIB Objects

```

  alaRouteMapRedistRouteMapIndex
alaRouteMapTable
  alaRouteMapIndex
  alaRouteMapSequence
  alaRouteMapType
  alaRouteMapValue
  alaRouteMapRowStatus
```

---

## show ip router database

Displays a list of all routes (static and dynamic) that exist in the IP router database. This database serves as a central repository where routes are first processed for redistribution and where duplicate routes are compared to determine the best route to use. If a route does not appear in the IP router database list, then the switch does not know about it. In the case of dynamically learned routes, this could indicate that the route was never received by the switch.

```
show ip router database [protocol type / gateway ip_address / dest {ip_address/prefixLen | ip_address}]
```

---

### Syntax Definitions

<i>type</i>	Routing protocol type (local, static, OSPF, RIP, or BGP).
<i>ip_address</i>	Destination IP address.
<i>ip_address/prefixLen</i>	The destination IP address along with the prefix length of the routes processed for redistribution.

### Defaults

By default, all routes are displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Command options are not mutually exclusive. You can use them on the same command line to narrow and/or customize the output display of this command. For example, use the **protocol** and **dest** options to display only those routes that are of a specific protocol type and have the specified destination network.
- The IP forwarding table is derived from IP router database processing performed by the switch and contains only unique routes that the switch currently uses. Use the **show ip route** command to view the forwarding table.
- If an expected route does not appear in the IP forwarding table, use the **show ip router database** command to see if the switch knows about the route and/or if a duplicate route with a higher precedence was selected instead.
- The switch compares the protocol of duplicate routes to determine which one to use. Regardless of whether or not a route has a higher priority metric value, protocol determines precedence. Local routes are given the highest level of precedence followed by static, OSFP, RIP, then BGP routes. As a result, a route that is known to the switch does not appear in the IP forwarding table if a duplicate route with a higher protocol precedence exists.
- A list of inactive static routes is also included in the **show ip router database** output display. A route becomes inactive if the interface for its gateway goes down. Inactive routes are unable to get to their destination and further investigation is warranted to determine why their gateway is unavailable.
- Static routes that appear as inactive are not included in the main IP router database listing. If an inactive route becomes active, however, it is removed from the inactive list and added to the active route list.

## Examples

-> show ip router database

Destination	Gateway	Protocol	Metric	VLAN
10.212.31.0/24	10.212.60.27	OSPF	2	44
10.212.31.0/24	10.212.61.27	OSPF	2	43
10.212.59.0/24	10.212.59.17	LOCAL	1	45
10.212.60.0/24	10.212.60.17	LOCAL	1	44
10.212.61.0/24	10.212.61.17	LOCAL	1	43
10.212.62.0/24	10.212.60.27	OSPF	2	44
10.212.62.0/24	10.212.61.27	OSPF	2	43
10.212.63.0/24	10.212.60.27	OSPF	2	44
10.212.63.0/24	10.212.61.27	OSPF	2	43
10.212.66.0/24	10.212.66.17	LOCAL	1	46
143.209.92.0/24	172.28.6.254	STATIC	1	N/A
172.28.6.0/24	172.28.6.2	LOCAL	1	6
172.28.6.0/24	10.212.60.27	OSPF	1	44
172.28.6.0/24	10.212.61.27	OSPF	1	43
172.28.6.0/24	10.212.66.18	OSPF	1	46

Inactive Static Routes

Destination	Gateway	Metric
1.0.0.0/8	8.4.5.3	1

-> show ip router database dest 10.212.62.0/24 protocol ospf

Destination	Gateway	Protocol	Metric	VLAN
10.212.62.0/24	10.212.60.27	OSPF	2	44
10.212.62.0/24	10.212.61.27	OSPF	2	43

Inactive Static Routes

Destination	Gateway	Metric
1.0.0.0/8	8.4.5.3	1

### output definitions

<b>Destination</b>	Destination IP address. Also includes the mask prefix length notation after the address to indicate the subnet mask value. For example, /24 indicates the destination IP address has a 24-bit mask (255.255.255.0).
<b>Gateway</b>	IP address of the gateway from which this route was learned.
<b>Protocol</b>	Protocol by which this IP address was learned: LOCAL, STATIC, OSPF, RIP, BGP).
<b>Metric</b>	RIP metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.
<b>VLAN</b>	The VLAN on which the route was <i>learned</i> , not forwarded. Note that N/A appears in this field for static routes as they are not learned on a VLAN.

**Release History**

Release 7.1.1; command introduced

**Related Commands**

[show ip routes](#) Displays the IP Forwarding table.

---

## show ip emp-routes

Displays the IP routes associated with the Ethernet Management Port (EMP).

**show ip emp-routes**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command displays the routes that are connected to the Ethernet Management Port (EMP).
- The EMP cannot handle routing protocols such as RIP or OSPF.
- The default route for the switch cannot be set up on the EMP.

### Examples

```
-> show ip emp-routes
```

Dest Address	Subnet Mask	Gateway Addr	Age	Protocol
127.0.0.1	255.255.255.255	127.0.0.1	2d 4h	LOCAL
172.17.1.10	255.255.255.255	10.255.11.225	1d 5h	LOCAL

#### *output definitions*

---

<b>Dest Addr</b>	Destination IP address.
<b>Subnet Mask</b>	Destination IP address IP subnet mask.
<b>Gateway Addr</b>	IP address of the gateway from which this address was learned.
<b>Age</b>	Age of the entry. If the entry is less than a day old, it is displayed in <i>hh/mm/ss</i> format. If it is more than a day old, it is displayed in <i>dd/hh</i> format (e.g., a route that is 2 days and 12 hours old is displayed as 2d12h).
<b>Protocol</b>	Protocol by which this IP address was learned (e.g., RIP). NETMGT indicates a static route. LOCAL indicates a local interface.

---

### Release History

Release 7.1.1; command introduced

**Related Commands****ping**

Tests whether an IP destination can be reached from the local switch.

**traceroute**

Finds the path taken by an IP packet from the local switch to a specified destination.

---

## show ip config

Displays IP configuration parameters.

**show ip config**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip config
IP directed-broadcast = OFF,
IP default TTL       = 64
```

#### *output definitions*

---

<b>IP directed-broadcast</b>	Indicates whether the IP directed-broadcast feature is on or off.
<b>IP default TTL</b>	IP default TTL interval.

---

### Release History

Release 7.1.1; command introduced

### Related Commands

<a href="#">ip directed-broadcast</a>	Enables or disables IP directed broadcasts routed through the switch.
<a href="#">ip default-ttl</a>	Sets TTL value for IP packets.

---

## show ip protocols

Displays switch routing protocol information and status.

**show ip protocols**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip protocols
```

```
IP Protocols
```

```
RIP status           = Not Loaded,
OSPF status          = Loaded,
ISIS status          = Not Loaded,
BGP status           = Loaded,
PIM status           = Loaded,
DVMRP status         = Not Loaded,
RIPng status         = Not Loaded,
OSPF3 status         = Loaded,
```

#### *output definitions*

---

<b>RIP status</b>	Whether RIP is loaded or not.
<b>OSPF status</b>	Whether OSPF is loaded or not.
<b>BGP status</b>	Whether BGP is loaded or not.
<b>DVMRP status</b>	Whether DVMRP is loaded or not.
<b>PIMSM status</b>	Whether PIMSM is loaded or not.
<b>RIPng status</b>	Whether RIP is loaded or not.
<b>OSPF3 status</b>	Whether OSPFv3 is loaded or not.

---

### Release History

Release 7.1.1; command introduced

**Related Commands**

- ip router primary-address**      Configures the router primary IP address.  
**ip router router-id**            Configures the router ID for the router.

**MIB Objects**

alaIpRouteSumTable  
  alaIpRouteProtocol

---

## show ip router-id

Displays the primary IP address and router ID of the switch, if configured.

**show ip router-id**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip router-id
Router ID    = 1.1.1.1,
Primary addr = 31.0.0.1
```

#### *output definitions*

---

<b>Router ID</b>	The set routing ID. The router ID is how the router is identified in IP.
<b>Primary addr</b>	The primary interface address the route uses.

---

### Release History

Release 7.1.1; command introduced

### Related Commands

<a href="#">ip router primary-address</a>	Configures the router primary IP address.

---

## show ip service

Displays the current status of TCP/UDP service ports.

**show ip service**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The display output from this command also includes the service port number.

### Examples

```
-> show ip service
```

Name	Port	Status
ftp	21	enabled
ssh	22	disabled
telnet	23	disabled
udp-relay	67	disabled
http	80	disabled
network-time	123	disabled
snmp	161	disabled
avlan-telnet	259	disabled
avlan-http	260	disabled
avlan-secure-http	261	disabled
secure_http	443	enabled
proprietary	1024	disabled
proprietary	1025	disabled

#### *output definitions*

---

<b>Name</b>	Name of the TCP/UDP service.
<b>Port</b>	The TCP/UDP well-known port number associated with the service.
<b>Status</b>	The status of the well-known service port: <b>enabled</b> (port is closed) or <b>disabled</b> (port is open).

---

### Release History

Release 7.1.1; command introduced

## Related Commands

### [ip service](#)

Enables (opens) or disables (closes) well-known TCP/UDP service ports.

## MIB Objects

```

---

## show ip dos arp-poison

Displays the number of attacks detected for configured ARP poison restricted-addresses.

**show ip dos arp-poison**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip dos arp-poison
  IP Address                               Attacks
  -----+-----
  192.168.1.1                               0
  192.168.1.2                               0
  192.168.1.3                               0
```

#### *output definitions*

---

<b>IP Address</b>	The configured ARP Poison restricted-addresses.
<b>Attacks detected</b>	The number of ARP Poison attacks detected for each address.

---

### Release History

Release 7.1.1; command introduced

### Related Commands

**ip dos arp-poison restricted-address** Adds or deletes an ARP Poison restricted address.

### MIB Objects

```
alaDoSArpPoisonTable
  alaDoSArpPoisonIpAddr
  alaDoSArpPoisonDetected
```

---

## show arp

Displays the ARP table. The ARP table contains a listing of IP addresses and their corresponding translations to physical MAC addresses.

**show arp** [*ip\_address* | *hardware\_address*]

---

### Syntax Definitions

*ip\_address* IP address of the entry you want to view.  
*hardware\_address* MAC address of the entry you want to view.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the basic command (**show arp**) to view all of the entries in the table. Enter a specific IP address or MAC address to view a specific entry.

### Examples

```
-> show arp
Total 8 arp entries
Flags (P=Proxy, A=Authentication, V=VRRP)
```

IP Addr	Hardware Addr	Type	Flags	Port	Interface
10.255.11.59	00:50:04:b2:c9:ee	DYNAMIC		3/20	vlan 1
10.255.11.48	00:50:04:b2:ca:11	DYNAMIC		3/20	vlan 1
10.255.11.201	00:10:83:03:e7:e4	DYNAMIC		3/20	vlan 1
10.255.11.14	00:10:5a:04:19:a7	DYNAMIC		3/20	vlan 1
10.255.11.64	00:b0:d0:62:fa:f1	DYNAMIC		3/20	vlan 1
10.255.11.25	00:b0:d0:42:80:24	DYNAMIC		3/20	vlan 1
10.255.11.26	00:b0:d0:42:82:59	DYNAMIC		3/20	vlan 1
10.255.11.254	00:20:da:db:00:47	DYNAMIC		3/20	vlan 1

#### output definitions

---

<b>IP Address</b>	Device IP address.
<b>Hardware Addr</b>	MAC address of the device that corresponds to the IP address.
<b>Type</b>	Indicates whether the ARP cache entries are dynamic or static.
<b>Flags</b>	Indicates the type of entry: <ul style="list-style-type: none"> <li>• P = Proxy</li> <li>• A = Authentication (AVLAN)</li> <li>• V = VRRP</li> </ul>

---

*output definitions (continued)*

---

<b>Port</b>	The port on the switch attached to the device identified by the IP address.
<b>Interface</b>	The interface to which the entry belongs (e.g., VLAN, EMP).

---

**Release History**

Release 7.1.1; command introduced

**Related Commands**

<a href="#">ip service</a>	Adds a permanent entry to the ARP table.
<a href="#">clear arp-cache</a>	Deletes all dynamic entries from the ARP table.

**MIB Objects**

```

  alaIpNetToMediaAuth
```

---

## show arp filter

Displays a list of ARP filters configured for the switch.

**show arp filter** [*ip\_address*]

---

### Syntax Definitions

*ip\_address* IP address of the filter entry you want to view.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If an IP address is not specified with this command, a list of all ARP filters is displayed.
- Enter a specific IP address to view the configuration for an individual filter.

### Examples

```
-> show arp filter
  IP Addr          IP Mask          Vlan   Type      Mode
-----+-----+-----+-----+-----
171.11.1.1        255.255.255.255    0     target   block
172.0.0.0         255.0.0.0         0     target   block
198.0.0.0         255.0.0.0         0     sender   block
198.172.16.1     255.255.255.255   200    target   allow
```

```
-> show arp filter 198.172.16.1
  IP Addr          IP Mask          Vlan   Type      Mode
-----+-----+-----+-----+-----
198.0.0.0         255.0.0.0         0     sender   block
198.172.16.1     255.255.255.255   200    target   allow
```

### output definitions

---

<b>IP Addr</b>	The ARP packet IP address to which the filter is applied.
<b>IP Mask</b>	The IP mask that specifies which part of the IP address to which the filter is applied.
<b>Vlan</b>	A VLAN ID. The filter is applied only to ARP packets received on ports associated with this VLAN.
<b>Type</b>	Indicates which IP address in the ARP packet ( <b>sender</b> or <b>target</b> ) is used to identify if a filter exists for that address.
<b>Mode</b>	Indicates whether or not to <b>block</b> or <b>allow</b> a switch response to an ARP packet that matches the filter.

---

## Release History

## show icmp control

Allows the viewing of the ICMP control settings.

**show icmp control**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use this command to view the status of the various ICMP messages. It is also useful to determine the type and code of the less common ICMP messages.

### Examples

```
-> show icmp control
```

Name	Type	Code	Status	min-pkt-gap(us)
echo reply	0	0	enabled	0
network unreachable	3	0	enabled	0
host unreachable	3	1	enabled	0
protocal unreachable	3	2	enabled	0
port unreachable	3	3	enabled	0
frag needed but DF bit set	3	4	enabled	0
source route failed	3	5	enabled	0
destination network unknown	3	6	enabled	0
destination host unknown	3	7	enabled	0
source host isolated	3	8	enabled	0
dest network admin prohibited	3	9	enabled	0
host admin prohibited by filter	3	10	enabled	0
network unreachable for TOS	3	11	enabled	0
host unreachable for TOS	3	12	enabled	0
source quench	4	0	enabled	0
redirect for network	5	0	enabled	0
redirect for host	5	1	enabled	0
redirect for TOS and network	5	2	enabled	0
redirect for TOS and host	5	3	enabled	0
echo request	8	0	enabled	0
router advertisement	9	0	enabled	0
router solicitation	10	0	enabled	0
time exceeded during transmit	11	0	enabled	0
time exceeded during reassembly	11	1	enabled	0
ip header bad	12	0	enabled	0
required option missing	12	1	enabled	0
timestamp request	13	0	enabled	0

timestamp reply	14	0	enabled	0
information request(obsolete)	15	0	enabled	0
information reply(obsolete)	16	0	enabled	0
address mask request	17	0	enabled	0
address mask reply	18	0	enabled	0

**output definitions**

---

<b>Name</b>	The name of the ICMP message.
<b>Type</b>	The ICMP message type. This along with the ICMP code specify the kind of ICMP message.
<b>Code</b>	The ICMP message code. This along with the ICMP type specify the kind of ICMP message.
<b>Status</b>	Whether this message is <b>Enabled</b> or <b>Disabled</b> .
<b>min-pkt-gap</b>	The minimum packet gap, in microseconds, for this ICMP message. The minimum packet gap is the amount of time that must pass between ICMP messages of like types.

---

**Release History**

Release 7.1.1; command introduced

**Related Commands**

<b>icmp type</b>	Enables or disables a specific type of ICMP message, and sets the minimum packet gap.
<b>icmp unreachable</b>	Enables or disables ICMP messages pertaining to unreachable destinations, and sets the minimum packet gap.
<b>icmp echo</b>	Enables or disables ICMP echo messages, and sets the minimum packet gap.
<b>icmp timestamp</b>	Enables or disables ICMP timestamp messages, and sets the minimum packet gap.
<b>icmp addr-mask</b>	Enables or disables ICMP address mask messages, and sets the minimum packet gap.
<b>icmp messages</b>	Enables or disables all ICMP messages.

---

## show icmp statistics

Displays Internet Control Message Protocol (ICMP) statistics and errors. ICMP is a network layer protocol within the IP protocol suite that provides message packets to report errors and other IP packet processing information back to the source. ICMP generates several kinds of useful messages, including Destination Unreachable, Echo Request and Reply, Redirect, Time Exceeded, and Router Advertisement and Solicitation. If an ICMP message cannot be delivered, no second one is generated. This is to avoid an endless flood of ICMP messages.

**show icmp [statistics]**

---

### Syntax Definitions

**statistics** Optional syntax.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the ICMP Table to monitor and troubleshoot the switch.

### Examples

```
-> show icmp
Messages                Received      Sent
-----+-----+-----
Total                    2105         2105
Error                     0             0
Destination unreachable  0             0
Time exceeded             0             0
Parameter problem        0             0
Source quench             0             0
Redirect                  0             0
Echo request              2105          0
Echo reply                 0            2105
Time stamp request        0             0
Time stamp reply          0             0
Address mask request      0             0
Address mask reply        0             0
```

#### *output definitions*

---

<b>Total</b>	Total number of ICMP messages the switch received or attempted to send. This counter includes all those counted as errors.
<b>Error</b>	Number of ICMP messages the switch sent/received but was unable to process because of ICMP-specific errors (e.g., bad ICMP checksums, bad length).
<b>Destination unreachable</b>	Number of “destination unreachable” messages that were sent/received by the switch.

**output definitions (continued)**

---

<b>Time exceeded</b>	Number of “time exceeded” messages that were sent/received by the switch. These occur when a packet is dropped because the TTL counter reaches zero. When a large number of these occur, it is a symptom that packets are looping, that congestion is severe, or that the TTL counter value is set too low. These messages also occur when all the fragments trying to be reassembled do not arrive before the reassembly timer expires.
<b>Parameter problem</b>	Number of messages sent/received which indicate that an illegal value has been detected in a header field. These messages can indicate a problem in the sending IP software of the host or gateway.
<b>Source quench</b>	Number of messages sent/received that tell a host that it is sending too many packets. A host must attempt to reduce its transmissions upon receiving these messages.
<b>Redirect</b>	Number of ICMP redirect messages sent/received by the switch.
<b>Echo request</b>	Number of ICMP echo messages sent/received by the switch to see if a destination is active and unreachable.
<b>Echo reply</b>	Number of echo reply messages received by the switch.
<b>Time stamp request</b>	Number of time stamp request messages sent/received by the switch.
<b>Time stamp reply</b>	Number of time stamp reply messages sent/received by the switch.
<b>Address mask request</b>	Number of address mask request messages that were sent/received by the switch in an attempt to determine the subnet mask for the network.
<b>Address mask reply</b>	Number of address mask reply messages that were sent/received by the switch.

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show tcp statistics
Total segments received = 235080,
Error segments received = 0,
Total segments sent = 363218,
Segments retransmitted = 38,
Reset segments sent = 97,
Connections initiated = 57185,
Connections accepted = 412,
Connections established = 1,
Attempt fails = 24393,
Established resets = 221
```

#### *output definitions*

---

<b>Total segments received</b>	Total number of segments received, including those received in error. This count includes segments received on currently established connections.
<b>Error segments received</b>	Total number of segments received in error (e.g., bad TCP checksums).
<b>Total segments sent</b>	Total number of segments sent, including those on current connections but excluding those containing only retransmitted octets.
<b>Segments retransmitted</b>	Number of TCP segments transmitted containing one or more previously transmitted octets.
<b>Reset segments sent</b>	Number of TCP segments containing the reset flag.
<b>Connections initiated</b>	Number of connections attempted.
<b>Connections accepted</b>	Number of connections allowed.
<b>Connections established</b>	Number of successful connections.

*output definitions (continued)*

---

<b>Attempt fails</b>	Number of times attempted TCP connections have failed.
<b>Established resets</b>	Number of times TCP connections have been reset from the "Established" or "Close Wait" state to the "Closed" state.

---

## show udp statistics

Displays UDP errors and statistics.

**show udp statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays cumulative statistics since the last time the switch was powered on or since the last reset of the switch.

### Examples

```
-> show udp statistics
Total datagrams received = 214937,
Error datagrams received = 0,
No port datagrams received = 32891,
Total datagrams sent = 211884
```

#### *output definitions*

---

<b>Total datagrams received</b>	Total number of UDP datagrams delivered to UDP applications.
<b>Error datagrams received</b>	Number of UDP datagrams that could not be delivered for any reason.
<b>No port datagrams received</b>	Number of UDP datagrams that could not be delivered for reasons other than lack of application at the destination.
<b>Total datagrams sent</b>	Total number of UDP datagrams sent from this switch.

---

### Release History

Release 7.1.1; command introduced

### Related Commands

[show udp ports](#) Displays the UDP Listener table.

## show udp ports

Displays the UDP Listener table. The table shows the local IP addresses and the local port number for each UDP listener.

**show udp ports**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- An IP address of zero (0.0.0.0) indicates that it is listening on all interfaces.
- This table contains information about the UDP end-points on which a local application is currently accepting datagrams.

### Examples

```
-> show udp port
Local Address      Local Port
-----+-----
 0.0.0.0           67
 0.0.0.0           161
 0.0.0.0           520
```

#### *output definitions*

---

<b>Local Address</b>	Local IP address for this UDP connection.
<b>Local Port</b>	Local port number for this UDP connection.

---

## show ip dos config

Displays the configuration parameters of the DoS scan for the switch.

**show ip dos config**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command allows the user to view the configuration parameters of the DoS scan. The scan keeps a record of the penalties incurred by certain types of packets on TCP and UDP ports. When the set penalty threshold is reached, it is assumed a DoS attack is in progress, and a trap is generated to inform the system administrator.

### Examples

```
-> show ip dos config
```

Dos type	Status
-----+-----	
port scan	ENABLED
tcp sync flood	ENABLED
ping of death	ENABLED
smurf	ENABLED
pepsi	ENABLED
land	ENABLED
teardrop/bonk/boink	ENABLED
loopback-src	ENABLED
invalid-ip	ENABLED
invalid-multicast	ENABLED
unicast dest-ip/multicast-mac	ENABLED
ping overload	DISABLED
arp flood	ENABLED
DoS trap generation	= ENABLED,
DoS port scan threshold	= 1000,
DoS port scan decay	= 2,
DoS port scan close port penalty	= 10,
DoS port scan TCP open port penalty	= 0,
DoS port scan UDP open port penalty	= 0,
Dos MAXimum Ping Rate	= 100
Dos Maximum ARP Request Rate	= 500

*output definitions*

---

<b>DoS trap generation</b>	Displays the status of DoS trap generation. It is either <b>ENABLED</b> or <b>DISABLED</b> . This is set using the <b>ip dos trap</b> command.
<b>DoS port scan threshold</b>	The penalty threshold setting. When enough packets have increased the penalty number to this setting, a trap is generated to warn the administrator that a DoS attack is in progress. This is set using the <b>ip dos scan threshold</b> command.
<b>DoS port scan decay</b>	The decay value for the switch. The penalty value of the switch is decreased by this number every minute. This is set using the <b>ip dos scan decay</b> command.
<b>DoS port scan close port penalty</b>	The penalty value for packets received on closed UDP and TCP ports. The penalty number for the switch is increased by this amount every time a packet is received on a closed UDP or TCP port. This is set using the <b>ip dos scan close-port-penalty</b> command.
<b>DoS port scan TCP open port penalty</b>	The penalty value for packets received on open TCP ports. The penalty number for the switch is increased by this amount every time a packet is received on an open TCP port. This is set using the <b>ip dos scan tcp open-port-penalty</b> command.
<b>DoS port scan UDP open port penalty</b>	The penalty value for packets received on open UDP ports. The penalty number for the switch is increased by this amount every time a packet is received on an open UDP port. This is set using the <b>ip dos scan udp open-port-penalty</b> command.

---

**Release History**

Release 7.1.1; command introduced

**Related Commands**

**show ip dos statistics** Displays the statistics on detected DoS attacks for the switch.

**MIB Objects**

alaDosTable  
alaDoSType

---

## show ip dos statistics

Displays the statistics on detected DoS attacks for the switch.

**show ip dos statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command displays the number of attacks the switch has detected for several types of DoS attacks.
- Just because an attack is detected and reported, doesn't necessarily mean an attack occurred. The switch assumes a DoS attack is underway anytime the penalty threshold is exceeded. It is possible for this threshold to be exceeded when no attack is in progress.

### Examples

```
-> show ip dos statistics
DoS type           Attacks detected
-----+-----
port scan          0
tcp sync flood     0
ping of death      0
smurf              0
pepsi              0
land               0
teardrop/bonk/boink 0
loopback-src       0
invalid-ip         0
invalid-multicast  0
unicast dest-ip/multicast-mac 0
ping overload      0
arp flood          0
```

#### *output definitions*

---

<b>DoS type</b>	The type of DoS attack. The most common seven are displayed.
<b>Attacks detected</b>	The number of attacks noted for each DoS type.

---

### Release History

Release 7.1.1; command introduced

# 13 IPv6 Commands

This chapter details Internet Protocol Version 6 (IPv6) commands for the switch (including RIPng commands). IPv6 (documented in RFC 2460) is designed as a successor to IPv4. The changes from IPv4 to IPv6 fall primarily into the following categories:

**Expanded Routing and Addressing Capabilities** - IPv6 increases the IP address size from 32 bits to 128 bits, to support more levels of addressing hierarchy and a much greater number of addressable nodes, and simpler auto-configuration of addresses. The scalability of multicast routing is improved by adding a "scope" field to multicast addresses.

**Header Format Simplification** - Some IPv4 header fields were dropped or made optional, to reduce the common-case processing cost of packet handling and to keep the bandwidth cost of the IPv6 header as low as possible despite the increased size of the addresses. Even though the IPv6 addresses are four times longer than the IPv4 addresses, the IPv6 header is only twice the size of the IPv4 header.

**Anycast Addressing** - A new type of address called a "anycast address" is defined, to identify sets of nodes where a packet sent to an anycast address is delivered to one of the nodes. The use of anycast addresses in the IPv6 source route allows nodes to control the path on which their traffic flows.

**Improved Support for Options** - Changes in the way IP header options are encoded allows for more efficient forwarding, less stringent limits on the length of options, and greater flexibility for introducing new options in the future.

**Authentication and Privacy Capabilities** - IPv6 includes the definition of extensions which provide support for authentication, data integrity, and confidentiality. This is included as a basic element of IPv6 and will be included in all implementations.

MIB information for the IPv6 and RIPng commands is as follows:

*Filename:* Ipv6.mib  
*Module:* Ipv6-MIB

*Filename:* AlcatelIND1Ipv6.mib  
*Module:* alcatelIND1IPv6MIB

*Filename:* AlcatelIND1Iprmv6.mib  
*Module:* alcatelIND1Iprmv6MIB

*Filename:* AlcatelIND1Ripng.mib  
*Module:* alcatelIND1RipngMIB

A summary of the IPv6 commands is listed here:

---

<b>IPv6</b>	<ul style="list-style-type: none"> <li><b>ipv6 interface</b></li> <li><b>ipv6 address</b></li> <li><b>ipv6 address global-id</b></li> <li><b>ipv6 address local-unicast</b></li> <li><b>ipv6 dad-check</b></li> <li><b>ipv6 hop-limit</b></li> <li><b>ipv6 pmtu-lifetime</b></li> <li><b>ipv6 neighbor stale-lifetime</b></li> <li><b>ipv6 neighbor</b></li> <li><b>ipv6 prefix</b></li> <li><b>ipv6 static-route</b></li> <li><b>ipv6 static-route</b></li> <li><b>ipv6 route-pref</b></li> <li><b>ipv6 virtual-source-mac</b></li> <li><b>ipv6 virtual-source-mac</b></li> <li><b>traceroute6</b></li> <li><b>show ipv6 icmp statistics</b></li> <li><b>show ipv6 interface</b></li> <li><b>show ipv6 pmtu table</b></li> <li><b>show ipv6 neighbors</b></li> <li><b>clear ipv6 neighbors</b></li> <li><b>show ipv6 prefixes</b></li> <li><b>show ipv6 routes</b></li> <li><b>show ipv6 route-pref</b></li> <li><b>show ipv6 router database</b></li> <li><b>show ipv6 tcp listeners</b></li> <li><b>show ipv6 tcp connections</b></li> <li><b>show ipv6 tunnel configured</b></li> <li><b>show ipv6 tunnel 6to4</b></li> <li><b>show ipv6 information</b></li> </ul>

---

## ipv6 interface

Configures an IPv6 interface on a VLAN or IPv6 tunnel.

```

ipv6 interface if_name [vlan vid | tunnel {tid | 6to4}] admin-state [enable | disable]
[base-reachable-time time]
[ra-send {yes | no}]
[ra-max-interval interval]
[ra-managed-config-flag {true | false}]
[ra-other-config-flag {true | false}]
[ra-reachable-time time]
[ra-retrans-timer time]
[ra-default-lifetime time / no ra-default-lifetime]
[ra-min-interval interval | no ra-min-interval]
[ra-clock-skew time]
[ra-send-mtu] {yes | no}
[mtu size]
[retrans-timer time]
[dad-transmits count]
[ra-hop-limit count]

no ipv6 interface if_name

```

---

### Syntax Definitions

<i>if_name</i>	IPv6 interface name.
<b>vlan</b>	Identifies a VLAN interface.
<i>vid</i>	VLAN ID number.
<b>tunnel</b>	Identifies a configured tunnel interface.
<i>tid</i>	Tunnel ID number.
<b>6to4</b>	Identifies the 6to4 tunnel interface.
<b>base-reachable-time</b> <i>time</i>	Base value used to compute the reachable time for neighbors reached through this interface.
<b>ra-send</b>	Specifies whether the router advertisements are sent on this interface.
<b>ra-max-interval</b> <i>interval</i>	Maximum time, in seconds, allowed between the transmission of unsolicited multicast router advertisements in this interface. The range is 4 - 1,800.
<b>ra-managed-config-flag</b>	Value to be placed in the managed address configuration flag field in router advertisements sent on this interface.
<b>ra-other-config-flag</b>	Value to be placed in the other stateful configuration flag in router advertisements sent on this interface.
<b>ra-reachable-time</b> <i>time</i>	Value, in milliseconds, to be placed in the reachable time field in router advertisements sent on this interface. The range is 0 - 3,600,000. The special value of zero indicates that this time is unspecified by the router.

---

<b>ra-retrans-timer</b> <i>time</i>	Value, in milliseconds, to be placed in the retransmit timer field in router advertisements sent on this interface. The value zero indicates that the time is unspecified by the router.
<b>mtu</b> <i>size</i>	The maximum transmission unit for a tunnel interface. Use the <b>vlan</b> command's <b>mtu-ip</b> to set for a VLAN.
<b>retrans-timer</b> <i>time</i>	The amount of time, in milliseconds, between retransmission of a neighbor solicitation during neighbor discovery.
<b>dad-transmits</b> <i>count</i>	The number of neighbor solocitations to send during Duplicate Address Detection.
<b>ra-hop-limit</b> <i>count</i>	The value placed in the current hop limit field of router advertisements sent on this interface.
<b>ra-default-lifetime</b> <i>time</i>	Value, in seconds, to be placed in the router lifetime field in router advertisements sent on this interface. The time must be zero or between the value of "ra-max-interval" and 9,000 seconds. A value of zero indicates that the router is not to be used as a default router. The "no ra-default-lifetime" option will calculate the value using the formula (3 * ra-max-interval).
<b>ra-min-interval</b> <i>interval</i>	Value, in seconds, allowed between the transmission of unsolicited multicast router advertisements on this interface. The interval must be a minimum of 3 and not more than .75 times the value of ra-max-interval. The "no ra-min-interval" option will calculate the value using the formula (.33 * ra-max-interval).
<b>ra-clock-skew</b> <i>time</i>	Value, in seconds. The router advertisement clock skew allows the link propagation delays and poorly synchronized clocks on routers participating in router discover over this interface. The timer differences that fall within the clock skew value are treated as valid times.
<b>enable</b>   <b>disable</b>	Administratively enable or disable the interface.
<b>ra-send-mtu</b>	Specifies whether the MTU option is included in the router advertisements sent on the interface.

## Defaults

parameter	default
<b>ra-send</b>	yes
<b>ra-max-interval</b>	600
<b>ra-managed-config-flag</b>	false
<b>ra-reachable-time</b>	0
<b>ra-retrans-timer</b>	0
<b>ra-default-lifetime</b>	calculated
<b>ra-min-interval</b>	calculated
<b>ra-send-mtu</b>	no
<b>ra-clock-skew</b>	600
<b>base-reachable-time</b>	360
<b>retrans-timer</b>	1000
<b>dad-transmits</b>	1
<b>ra-other-config-flag</b>	false
<b>ra-hop-limit</b>	64

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Use the **no** form of this command to delete an interface.
- When you create an IPv6 interface, it is enabled by default.
- All IPv6 VLAN and tunnel interfaces must have a name.
- When creating an IPv6 interface you must specify a VLAN ID or Tunnel ID. When modifying or deleting an interface, you do not need to specify one of these options unless the name assigned to the interface is being changed. If it is present with a different value from when the interface was created, the command will be in error.
- A default **6to4** tunnel named “tunnel\_6to4” is automatically created. It can only be enabled/disabled or its configuration modified, it cannot be deleted.
- A 6to4 interface cannot send advertisements (**ra-send**).
- To enable IPv6 routing you must first create a VLAN, then create an IPv6 interface on the VLAN. See [Chapter 4, “VLAN Management Commands,”](#) for information on creating VLANs.
- To route IPv6 traffic over an IPv4 network, you must create an IPv6 tunnel using the [ipv6 interface](#) command.

## Examples

```
-> ipv6 interface Test vlan 1
-> ipv6 interface Test_Tunnel tunnel 2
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">show ipv6 interface</a>	Displays IPv6 Interface Table.
<a href="#">show ipv6 tunnel configured</a>	Displays IPv6 Configured Tunnel.
<a href="#">show ipv6 tunnel 6to4</a>	Displays IPv6 6to4 tunnel information.

## MIB Objects

```

---

## ipv6 interface tunnel source destination

Configures the source and destination IPv4 addresses for a configured tunnel.

```
ipv6 interface if_name tunnel {[source ipv4_source] [destination ipv4_destination]}
```

---

### Syntax Definitions

<i>if_name</i>	Name assigned to the tunnel interface.
<i>ipv4_source</i>	Source IPv4 address for the configured tunnel.
<i>ipv4_destination</i>	Destination IPv4 address for the configured tunnel.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **ipv6 interface** command to create an IPv6 tunnel interface.
- A configured tunnel interface cannot be enabled until both its v4 source and destination addresses have been specified.

### Examples

```
-> ipv6 interface Test tunnel 2 source 192.0.2.1 destination 198.51.100.1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>ipv6 interface</b>	Creates an IPv6 tunnel interface.
<b>show ipv6 tunnel configured</b>	Displays IPv6 tunnel information.

### MIB Objects

```
IPv6IfIndex  
  alaIPv6ConfigTunnelv4Source  
  alaIPv6ConfigTunnelv4Dest  
  alaIPv6ConfigTunnelRowStatus
```

---

## ipv6 address

Configures an IPv6 address for an IPv6 interface on a VLAN, configured tunnel, or a 6to4 tunnel. There are different formats for this command depending on the address type.

```
ipv6 address ipv6_address /prefix_length [anycast] {if_name | loopback}
```

```
no ipv6 address ipv6_address [anycast] {if_name | loopback}
```

```
ipv6 address ipv6_prefix eui-64 {if_name | loopback}
```

```
no ipv6 address ipv6_prefix eui-64 {if_name | loopback}
```

---

### Syntax Definitions

<i>ipv6_address</i>	IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask). (3..128).
<b>anycast</b>	Indicates the address is an anycast address.
<b>eui-64</b>	Append an EUI-64 identifier to the prefix.
<i>if_name</i>	Name assigned to the interface.
<b>loopback</b>	Configures the loopback interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete an address.
- You can assign multiple IPv6 addresses to an IPv6 interface.
- No default value for prefix length.
- The “eui” form of the command is used to add or remove an IPv6 address for a VLAN or configured tunnel using an EUI-64 interface ID in the low order 64 bits of the address.

## Examples

```
-> ipv6 address 2001:DB8:4132:86::19A/64 Test_Lab
-> ipv6 address 2002:C633:6489::35/64 Test_6to4
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[show ipv6 interface](#) Displays IPv6 Interface Table.

## MIB Objects

  alaIPv6InterfaceEUI64Address
  alaIPv6InterfaceEUI64AddressPrefixLength
  alaIPv6InterfaceEUI64AddressRowStatus
```

---

## ipv6 address global-id

Automatically generates or allows a new global ID to be entered.

**ipv6 address global-id {generate | *globalID*}**

---

### Syntax Definitions

**generate**

Automatically generates the global ID.

*globalID*

A 5-byte global ID value specified in the form hh:hhh:hhh

### Defaults

By default, the IPv6 global ID is set to all zeros.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Global ID needs to be automatically generated or configured explicitly.
- A 40-bit global identifier is used to make the local IPv6 address prefixes globally unique.
- The global ID will be generated the first time a local unicast address is added through the **ipv6 address local-unicast** command or when the **ipv6 address global-id** command is executed.

### Examples

```
-> ipv6 address global-id generate
-> ipv6 address global-id 32:57a3:8fed
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ipv6 address local-unicast**

Creates a IPv6 local unicast address using the configured global ID.

**ipv6 bgp unicast**

Enables or disables unicast IPv6 updates for the BGP routing process.

**show ip bgp**

Displays the current global settings for the local BGP speaker.

### MIB Objects

alaIPv6GlobalID

---

## ipv6 address local-unicast

Creates a IPv6 local unicast address using the configured global ID.

**ipv6 address local-unicast** [**global-id** *globalID*] [**subnet-id** *subnetID*] {**interface-id** *interfaceID* | **eui-64**} [**prefix-length** *prefixLength*] {*if-name* | **loopback**}

**[no] ipv6 address local-unicast** [**global-id** *globalID*] [**subnet-id** *subnetID*] {**interface-id** *interfaceID* | **eui-64**} [**prefix-length** *prefixLength*] {*if-name* | **loopback**}

---

### Syntax Definitions

<i>globalID</i>	A 5-byte global ID value specified in the form hh:hhh:hhh.
<i>subnetID</i>	A 2-byte Subnet ID specified in the form 0xhhhh. The valid range is 0x0000-0xffff or 0-65535.
<i>interfaceID</i>	An interface identifier specified in the form hhhh:hhh:hhh:hhh.
<b>eui-64</b>	Automatically-generated EUI-64 value to be used for interface identifier.
<i>prefixLength</i>	The number of bits that are significant in the IPv6 address (mask). The valid range is 0-128; however, the default value should rarely be overridden.
<i>if-name</i>	The name assigned to the interface.
<b>loopback</b>	The loopback for the loopback interface.

### Defaults

parameter	default
<i>prefixLength</i>	64

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the local unicast address. However, addresses are normally deleted using the **ipv6 address** command.
- If the global ID value is not explicitly specified, the default global ID set by the **ipv6 address global-id** command is used.
- If the global ID value is explicitly configured using the **ipv6 address local-unicast** command, the address' global ID will not be changed if the **ipv6 address global-id** command is executed.
- The use of a double-colon abbreviation for the interface identifier similar to that used for full IPv6 addresses is allowed.

## Examples

```
-> ipv6 address local-unicast global-id 0073:110:255 subnet-id 23 interface-id  
215:60ff:fe7a:adc0 prefix-length 64 loopback
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**ipv6 address global-id** Automatically generates or allows a new global ID to be entered.

.

**show ipv6 information** Displays IPv6 information.

## MIB Objects

```
alaIPv6LocalUnicastGlobalID  
alaIPv6LocalUnicastSubnetID  
alaIPv6LocalUnicastInterfaceID  
alaIPv6LocalUnicastEUI64  
alaIPv6LocalUnicastPrefixLength
```

---

## ipv6 dad-check

Runs a Duplicate Address Detection (DAD) check on an address that was marked as duplicated.

```
ipv6 dad-check ipv6_address if_name
```

---

### Syntax Definitions

*ipv6\_address* IPv6 address.

*ip\_name* Name assigned to the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The switch performs DAD check when an interface is attached and its VLAN first enters the active state. Use this command to rerun a DAD check on an address that was marked as duplicated.

### Examples

```
-> ipv6 dad-check 2001:db8::1/32 Test_Lab
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

N/A

### MIB Objects

```
alaIPv6InterfaceAddressTable  
  alaIPv6InterfaceAddressDADStatus
```

---

## ipv6 hop-limit

Configures the value placed in the hop limit field in the header of all IPv6 packets that are originated by the switch. It also configures the value placed in the hop limit field in router advertisements.

**ipv6 hop-limit** *value*

**no ipv6 hop-limit**

---

### Syntax Definitions

*value* Hop limit value. The range is 0 - 255.

### Defaults

parameter	default
<i>value</i>	64

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to return the hop limit to its default value.
- Inputting the value 0 (zero) will result in the default (64) hop-limit.

### Examples

```
-> ipv6 hop-limit 64
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 information](#) Displays IPv6 information.

Ipv6DefaultHopLimit

---

## ipv6 pmtu-lifetime

Configures the minimum lifetime for entries in the path MTU Table.

**ipv6 pmtu-lifetime** *time*

---

### Syntax Definitions

*time* Minimum path MTU entry lifetime, in minutes. Valid range is 10–1440.

### Defaults

parameter	default
<i>time</i>	10

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ipv6 pmtu-lifetime 30
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

---

## ipv6 neighbor stale-lifetime

Configures the minimum lifetime for neighbors in the unconfirmed state.

**ipv6 neighbor stale-lifetime** *stale-lifetime*

---

### Syntax Definitions

*stale-lifetime* Minimum lifetime for neighbor entries in the stale state (5–2800).

### Defaults

parameter	default
<i>stale-lifetime</i>	10

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ipv6 neighbor stale-lifetime 1400
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 neighbors](#) Displays IPv6 Neighbor Table.  
[show ipv6 information](#) Displays IPv6 information.

alaIPv6NeighborStaleLifetime

---

## ipv6 neighbor

Configures a static entry in IPv6 Neighbor Table.

**ipv6 neighbor** *ipv6\_address hardware\_address {if\_name} {port slot/port/linkagg num}*

**no ipv6 neighbor** *ipv6\_address {if\_name}*

---

### Syntax Definitions

<i>ipv6_address</i>	IPv6 address that corresponds to the hardware address.
<i>hardware_address</i>	MAC address in hex format (e.g., 00:00:39:59:F1:0C).
<i>if_name</i>	Name assigned to the interface on which the neighbor resides.
<i>slot/port</i>	Slot/port used to reach the neighbor.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to remove an entry from IPv6 Neighbor Table.

### Examples

```
-> ipv6 neighbor 4132:86::203 00:d0:c0:86:12:07 Test port 1/1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

## ipv6 prefix

Configures an IPv6 prefix on an interface. Used for configuring prefixes for router advertisements.

```

ipv6 prefix ipv6_address /prefix_length if_name
[valid-lifetime time]
[preferred-lifetime time]
[on-link-flag {true | false}]
[autonomous-flag {true | false}] if_name
no ipv6 prefix ipv6_address /prefix_length if_name

```

---

### Syntax Definitions

<i>ipv6_address</i>	IPv6 address of the interface.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask). (1...127).
<b>valid-lifetime</b> <i>time</i>	Length of time, in seconds, that this prefix will remain valid, i.e. time until deprecation. A value of 4,294,967,295 represents infinity.
<b>preferred-lifetime</b> <i>time</i>	Length of time, in seconds, that this prefix will remain preferred, i.e. time until deprecation. A value of 4,294,967,295 represents infinity.
<b>on-link-flag</b>	On-link configuration flag. When “true” this prefix can be used for on-link determination.
<b>autonomous-flag</b>	Autonomous address configuration flag. When “true”, indicates that this prefix can be used for autonomous address configuration (i.e., can be used to form a local interface address).
<i>if_name</i>	Name assigned to the interface.

### Defaults

parameter	default
<b>valid-lifetime</b> <i>time</i>	2,592,000
<b>preferred-lifetime</b> <i>time</i>	604,800
<b>on-link-flag</b>	true
<b>autonomous-flag</b>	true

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to delete a prefix.

### Examples

```
-> ipv6 prefix 4132:86::/64 Test
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**show ipv6 prefixes**                      Displays IPv6 prefixes used in router advertisements.

## MIB Objects

  alaIPv6InterfacePrefix  
  alaIPv6InterfacePrefixLength  
  alaIPv6InterfacePrefixValidLifetime  
  alaIPv6InterfacePrefixPreferredLifetime  
  alaIPv6InterfacePrefixonLinkFlag  
  alaIPv6InterfacePrefixAutonomousFlag  
  alaIPv6InterfacePrefixRowStatus
```

---

## ipv6 static-route

Creates/deletes an IPv6 static route. Static routes are user-defined; they carry a higher priority than routes created by dynamic routing protocols. That is, static routes always have priority over dynamic routes, regardless of the metric value.

**ipv6 static-route** *ipv6\_prefix/prefix\_length* **gateway** *ipv6\_address* [*if\_name*] [**metric** *metric*]

**no ipv6 static-route** *ipv6\_prefix/prefix\_length* **gateway** *ipv6\_address* [*if\_name*]

---

### Syntax Definitions

<i>ipv6_prefix</i>	IPv6 network that is the destination of this static route.
<i>/prefix_length</i>	The number of bits (0...128) that are significant in the IPv6 address (mask).
<b>gateway</b> <i>ipv6_address</i>	IPv6 address of the next hop used to reach the destination IPv6 address.
<i>if_name</i>	If the next hop is a link-local address, the name of the interface used to reach it.
<i>metric</i>	Metric or cost (hop count) for the static route. You can set a priority for the static route by assigning a metric value. The lower the metric value, the higher the priority. Valid range is 1–15.

### Defaults

parameter	default
<i>metric</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to remove a static route.

### Examples

```
-> ipv6 static-route 212:95:5::/64 gateway fe80::2d0:95ff:fe6a:f458 v6if-137 metric 3
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**show ipv6 routes**

Displays IPv6 Forwarding Table.

**show ipv6 router database**

Displays a list of all routes (static and dynamic) that exist in the IPv6 router database.

## MIB Objects

```
alaIprmv6StaticRouteTable
  alaIprmv6StaticRouteDest
  alaIprmv6StaticRoutePrefixLength
  alaIprmv6StaticRouteNextHop
  alaIprmv6StaticRouteIfIndex
  alaIprmv6StaticRouteMetric
  alaIprmv6StaticRouteRowStatus
```

---

## ipv6 route-pref

Configures the route preference of a router.

```
ipv6 route-pref {static | ospf | rip | ebgp | ibgp} value
```

---

### Syntax Definitions

<b>static</b>	Configures the route preference of static routes.
<b>ospf</b>	Configures the route preference of OSPF3 routes.
<b>rip</b>	Configures the route preference of RIPng routes.
<b>ebgp</b>	Configures the route preference of external BGP routes.
<b>ibgp</b>	Configures the route preference of internal BGP routes.
<i>value</i>	Route preference value.

### Defaults

<b>parameter</b>	<b>default</b>
<b>static</b> <i>value</i>	2
<b>ospf</b> <i>value</i>	110
<b>rip</b> <i>value</i>	120
<b>ebgp</b> <i>value</i>	190
<b>ibgp</b> <i>value</i>	200

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Route preference of local routes cannot be changed.
- The valid route preference range is 1–255.
- The IPv6 version of BGP is not supported in the current release.

### Examples

```
-> ipv6 route-pref ospf 20  
-> ipv6 route-pref rip 60
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**show ipv6 route-pref**

Displays the configured route preference of a router.

## MIB Objects

```
alaIprmRtPrefTable
  alaIprmRtPrefLocal
  alaIprmRtPrefStatic
  alaIprmRtPrefOspf
  alaIprmRtPrefRip
  alaIprmRtPrefEbgp
  alaIprmRtPrefIbgp
```

---

## ipv6 virtual-source-mac

Configures the source MAC to be used for packets being sent from a VRRP instance.

**ipv6 virtual-source-mac {on | off }**

---

### Syntax Definitions

<b>on</b>	The switch will use the VRRP virtual MAC address for all packets.
<b>off</b>	The switch will use the physical MAC address for all packets except VRRP advertisements.

### Defaults

---

parameter	default
virtual-source-mac	off

---

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use this command to change which MAC address the switch will use as the source MAC when sending packets from a VRRP instance.
- This command has no affect on VRRP advertisements, the VRRP virtual MAC will always be used.

### Examples

```
-> ipv6 virtual-source-mac on  
-> ipv6 virtual-source-mac off
```

### Release History

Release 7.2.1; command was introduced.

### Related Commands

[show ipv6 route-pref](#) Displays the configured route preference of a router.

### MIB Objects

N/A

---

## ping6

Tests whether an IPv6 destination can be reached from the local switch. This command sends an ICMPv6 echo request to a destination and then waits for a reply. To ping a destination, enter the **ping6** command and enter either the destination's IPv6 address or hostname. The switch will ping the destination using the default frame count, packet size, and interval (6 frames, 64 bytes, and 1 second respectively). You can also customize any or all of these parameters as described below.

```
ping6 {ipv6_address / hostname} [if_name] [count count] [size data_size] [interval seconds]
```

---

### Syntax Definitions

<i>ipv6_address</i>	IP address of the system to ping.
<i>hostname</i>	DNS name of the system to ping.
<i>if_name</i>	If the target is a link-local address, the name of the interface used to reach it.
<i>count</i>	Number of packets to be transmitted.
<i>size</i>	Size of the data portion of the packet sent for this ping, in bytes.
<i>seconds</i>	Interval, in seconds, at which ping packets are transmitted.

### Defaults

parameter	default
<i>count</i>	6
<i>size</i>	8
<b>interval</b> <i>seconds</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If you change the default values, they will only apply to the current ping. The next time you use the ping command, the default values will be used unless you again enter different values.
- When the next hop address is a local link address, the name of the interface used to reach the destination must be specified.

### Examples

```
-> ping6 2001:db8:302::44
-> ping6 fe80::2d0:95ff:fe6a:f458 vlanif-23
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****traceroute6**

Finds the path taken by an IPv6 packet from the local switch to a specified destination.

**MIB Objects**

N/A

---

## tracert6

Finds the path taken by an IPv6 packet from the local switch to a specified destination. This command displays the individual hops to the destination as well as some timing information.

**tracert6** {*ipv6\_address* | *hostname*} [*if\_name*] [**max-hop** *hop\_count*] [**dest-port** *port\_number*] [**probe-count** *probe*] [**size** *size*] [**host-names** {*yes/no*}]

---

### Syntax Definitions

<i>ipv6_address</i>	Destination IPv6 address. IPv6 address of the host whose route you want to trace.
<i>hostname</i>	DNS name of the host whose route you want to trace.
<i>if_name</i>	If the target is a link-local address, the name of the interface used to reach it.
<i>hop_count</i>	Maximum hop count for the trace.
<i>port</i>	Specific UDP port destination. By default, the destination port is chosen by tracert6.
<i>size</i>	The initial size for the probe packets. During the trace the packet size will be adjusted downward as path MTU information is received. The default and maximum value is 24,000 bytes with a minimum of 1,280 bytes.
<i>host-names</i>	Specify whether each hop should be shown as an IPv6 address or the host name corresponding to the address.
<i>probe</i>	Number of probes to be sent to a single hop.

### Defaults

parameter	default
<i>hop_count</i>	32
<i>probe</i>	3
<i>host-names</i>	no

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When using this command, you must enter the name of the destination as part of the command line (either the IPv6 address or hostname).
- Use the optional **max-hop** parameter to set a maximum hop count to the destination. If the trace reaches this maximum hop count without reaching the destination, the trace stops.

### Examples

```
-> tracert6 41EA:103::65C3
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[ipv6 virtual-source-mac](#)

Tests whether an IPv6 destination can be reached from the local switch.

## show ipv6 icmp statistics

Displays IPv6 ICMP statistics.

**show ipv6 icmp statistics** [*if\_name*]

---

### Syntax Definitions

*if\_name*                                      Display statistics only for this interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the ICMP table to monitor and troubleshoot the switch.

### Examples

-> show ipv6 icmp statistics

## show ipv6 interface

Displays IPv6 Interface Table.

**show ipv6 interface** [*if\_name* / **loopback**]

---

### Syntax Definitions

*if\_name* Interface name. Limits the display to a specific interface.  
**loopback** Limits display to loopback interfaces.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If you do not specify an interface name, all IPv6 interfaces are displayed.
- Specify an interface name (e.g., VLAN 12) to obtain a more detailed information about a specific interface.

### Examples

-> show ipv6 interface

Name	IPv6 Address/Prefix Length	Status	Device
smbif-5	fe80::2d0:95ff:fe12:f470/64	Active	VLAN 955
	212:95:5::35/64		
	212:95:5::/64

  DAD transmits                 = 1
  Send Router Advertisements    = No
  Maximum RA interval (sec)     = 600
  Minimum RA interval (sec)     = 198
  RA managed config flag       = False
  RA other config flag         = False
  RA reachable time (ms)       = 0
  RA retransmit timer (ms)     = 0
  RA default lifetime (sec)    = 1800
  RA hop limit                  = 64
  RA send MTU option           = No
  RA clock skew (sec)          = 600

```

### *output definitions*

<b>IPv6 interface index</b>	IPv6IfIndex value that should be used in SNMP requests pertaining to this interface.
<b>Administrative status</b>	Administrative status of this interface (Enabled/Disabled).
<b>Operational status</b>	Indicates whether the physical interface is connected to a device (Active/Inactive).
<b>Link-local address</b>	Link-local address assigned to the interface.
<b>Global unicast address(es)</b>	Global unicast address(es) assigned to the interface.
<b>Anycast address(es)</b>	The anycast addresses assigned to the interface.
<b>VRRP address(es)</b>	Addresses assigned to the interface because a VRRP virtual router is active. If (accept) is present, the switch will accept packets destined to the address. If not present, any such packets will be discarded.
<b>Joined group address(es)</b>	Addresses of the multicast groups that this interface has joined.
<b>Maximum Transfer Unit</b>	Interface MTU value.
<b>Neighbor reachable time (sec)</b>	The amount of time that a neighbor reached through this interface will remain in the reachable state.
<b>Base reachable time (sec)</b>	The base reachable time used to calculate the current neighbor reachable time.
<b>Retransmit timer (ms)</b>	The interval at which neighbour solicitations will be retransmitted during the neighbor discovery process.
<b>DAD transmits</b>	The number of neighbour solicitations that will be sent as part of the Duplicate Address Detection process.

*output definitions (continued)*

---

<b>Send Router Advertisements</b>	Indicates if the router sends periodic router advertisements and responds to router solicitations on the interface.
<b>Maximum RA interval (sec)</b>	Maximum time between the transmission of unsolicited router advertisements over the interface.
<b>Minimum RA interval (sec)</b>	Minimum time between the transmission of unsolicited router advertisements over the interface (0.33 * Maximum RA Interval).
<b>RA managed config flag</b>	True/False value in the managed address configuration flag field in router advertisements.
<b>RA other config flag</b>	The True/False value in the other stateful configuration flag field in router advertisements sent over this interface.
<b>RA reachable time (ms)</b>	Value placed in the reachable time field in the router advertisements sent over this interface.
<b>RA retransmit timer (ms)</b>	Value placed in the retransmit timer field in router advertisements sent over this interface.
<b>RA default lifetime (sec)</b>	The value placed in the router lifetime field in the router advertisements sent over this interface.
<b>RA hop limit</b>	The value placed in the current hop limit field in the router advertisements sent over this interface.
<b>RA Send MTU option</b>	Specifies whether the MTU option is included in the router advertisements sent over this interface.
<b>RA clock skew (sec)</b>	The clock skew allowed for router advertisements on this interface.

## show ipv6 pmtu table

Displays the IPv6 Path MTU Table.

**show ipv6 pmtu table**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 pmtu table
```

```
1-PMTU Entry
```

```
PMTU entry minimum lifetime = 10m
```

Destination Address	MTU	Expires
-----+-----+-----		
fe80::02d0:c0ff:fe86:1207	1280	1h 0m

#### *output definitions*

---

<b>Destination Address</b>	IPv6 address of the path's destination.
<b>MTU</b>	Path's MTU.
<b>Expires</b>	Minimum remaining lifetime for the entry.

---

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ipv6 pmtu-lifetime](#) Configures the minimum lifetime for entries in the path MTU Table.

```

---

## show ipv6 neighbors

Displays IPv6 Neighbor Table.

**show ipv6 neighbors** [*ipv6\_prefix/prefix\_length* | *if\_name* | **hw** *hardware\_address* | **static**]

---

### Syntax Definitions

<i>ipv6_prefix/prefix_length</i>	IPv6 prefix. Restricts the display to those neighbors starting with the specified prefix.
<i>if_name</i>	Interface name. Restricts the display to those neighbors reached through the specified interface.
<i>hardware_address</i>	MAC address. Restricts the display to the specified MAC address.
<b>static</b>	Restricts display to statically configured neighbors.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If you do not specify an option (e.g., *if\_name*), all IPv6 neighbors are displayed.

### Examples

```
-> show ipv6 neighbors
Total 2 neighbors
```

```
IPv6 Address           Hardware Address  Reachability Lifetime      Port   Interface
-----+-----+-----+-----+-----+-----
2001:db8:39::11      0a:3f:1e:ac:7b:38 Unconfirmed 39s           1/ 1   vlan-41
fe80::83f:1eff:feac:7b38 0a:3f:1e:ac:7b:38 Confirmed 8m 21s       1/ 1   vlan-41
```

#### output definitions

---

<b>IPv6 Address</b>	The neighbor's IPv6 address.
<b>Hardware Address</b>	The MAC address corresponding to the IPv6 address.
<b>Reachability</b>	The neighbor's reachability: <ul style="list-style-type: none"> <li>• Incomplete</li> <li>• Confirmed</li> <li>• Unconfirmed</li> </ul>
<b>Lifetime</b>	The time the entry will remain in its current state.
<b>Port</b>	The port used to reach the neighbor.
<b>Interface</b>	The neighbor's interface name (e.g., <i>vlan_1</i> )

---

## Release History

Displays IPv6 prefixes used in router advertisements.

**show ipv6 prefixes**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

-> show ipv6 prefixes

Legend: Flags: A = Autonomous Address Configuration, L = OnLink

Name	IPv6 Address/Prefix Length	Valid Lifetime	Preferred Lifetime	Flags	Source
vlan 955	212:95:5::/64	2592000	604800	LA	dynamic
vlan 1002	195:35::/64	2592000	604800	LA	dynamic
6to4tunnel	2002:d423:2323::/64	2592000	604800	LA	dynamic
tunnel 2	137:35:35::/64	2592000	604800	LA	dynamic

### output definitions

---

<b>Name</b>	The interface name. This is usually the VLAN on which the interface is configured.
<b>IPv6 Address/Prefix Length</b>	The IPv6 prefix and prefix length for a Router Advertisement Prefix Option.
<b>Valid Lifetime</b>	Length of time, in seconds, that this prefix will remain valid (i.e., time until deprecation). A value of 4,294,967,295 represents infinity.
<b>Preferred Lifetime</b>	Length of time, in seconds, that this prefix will remain preferred (i.e. time until deprecation). A value of 4,294,967,295 represents infinity.
<b>Flags</b>	<b>L</b> - Prefix can be used for onlink determination. <b>A</b> - Prefix can be used for autonomous address configuration (i.e., can be used to form a local interface address).
<b>Source</b>	<b>config</b> - Prefix has been configured by management. <b>dynamic</b> - Router Advertisements are using interface prefixes.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

## show ipv6 routes

Displays IPv6 Forwarding Table.

**show ipv6 routes** [*ipv6\_prefix/prefix\_length* | **static**]

---

### Syntax Definitions

*ipv6\_prefix/prefix\_length* IPv6 prefix. Restricts the display to those routes starting with the specified prefix.

**static** Restricts display to statically configured routes.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If you do not specify an option (e.g., “static”), all IPv6 interfaces are displayed.

### Examples

-> show ipv6 routes

Legend:Flags:U = Up, G = Gateway, H = Host, S = Static, C = Cloneable, D = Dynamic,  
M = Modified, R = Unreachable, X = Externally resolved, B = Discard,  
L = Link-layer, 1 = Protocol specific, 2 = Protocol specific

Destination Prefix	Gateway Address	Interface	Age	Protocol	Flags
::/0	2002:d468:8a89::137	v6if-6to4-137	18h 47m 26s	Static	UGS

```

---

## show ipv6 route-pref

Displays the IPv6 routing preference of the router.

```
show ipv6 route-pref
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The IPv6 version of BGP is not supported in the current release.

### Examples

```
-> show ipv6 route-pref
  Protocol      Route Preference Value
-----+-----
  Local         1
  Static        2
  OSPF          110
  RIP           120
  EBGP          190
  IBGP          200
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ipv6 route-pref](#) Configures the IPv6 route preference of a router.

---

## show ipv6 router database

Displays a list of all routes (static and dynamic) that exist in the IPv6 router database. This database serves as a central repository where routes are first processed for redistribution and where duplicate routes are compared to determine the best route to use. If a route does not appear in the IPv6 router database list, then the switch does not know about it. In the case of dynamically learned routes, this could indicate that the route was never received by the switch.

**show ipv6 router database** [**protocol** *type* / **gateway** *ipv6\_address* / **dest** *ipv6\_prefix/prefix\_length*]

---

### Syntax Definitions

<i>type</i>	Routing protocol type (local, static, OSPF, RIP, or BGP).
<b>gateway</b> <i>ipv6_address</i>	IPv6 address of the next hop used to reach the destination IPv6 address.
<i>ipv6_prefix</i>	IPv6 network that is the destination of this static route.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask). (0...128).

### Defaults

By default, all routes are displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The IPv6 forwarding table is derived from IPv6 router database processing performed by the switch and contains only unique routes that the switch currently uses. Use the **show ipv6 routes** command to view the forwarding table.
- If an expected route does not appear in the IPv6 forwarding table, use the **show ipv6 router database** command to see if the switch knows about the route and/or if a duplicate route with a higher precedence was selected instead.
- The switch compares the protocol of duplicate routes to determine which one to use. Regardless of whether or not a route has a higher priority metric value, protocol determines precedence. Local routes are given the highest level of precedence followed by static, OSPF, RIP, then BGP routes. As a result, a route that is known to the switch may not appear in the IP forwarding table if a duplicate route with a higher protocol precedence exists.
- A list of inactive static routes is also included in the **show ipv6 router database** output display. A route becomes inactive if the interface for its gateway goes down. Inactive routes are unable to get to their destination and further investigation is warranted to determine why their gateway is unavailable.
- Routes that appear as inactive are not included in the main IP router database listing. If an inactive route becomes active, however, it is removed from the inactive list and added to the active route list.

## Examples

-> show ipv6 router database  
 Legend: + indicates routes in use

Total IPRM IPv6 routes: 5

Destination/Prefix	Gateway Address	Interface	Protocol	Metric
::/0	2002:d468:8a89::137	v6if-6to4-137	Static	1
137:35:35::/64	fe80::2d0:95ff:fe12:f470	v6if-tunnel-137	OSPF	2
195:35::/64	fe80::2d0:95ff:fe12:f470	v6if-to-eagle	OSPF	2
212:95:5::/64	fe80::2d0:95ff:fe12:f470	smbif-5	Local	1
2002::/16	2002:d423:2323::35	v6if-6to4-137	Local	1

Inactive Static Routes:

VLAN	Destination/Prefix	Gateway Address	Metric
1510	212:95:5::/64	fe80::2d0:95ff:fe6a:f458	1

### output definitions

<b>Destination/Prefix</b>	IPv6 destination address and prefix.
<b>Gateway Address</b>	IPv6 address of the gateway used to reach the destination network.
<b>Interface</b>	The device the interface is using (e.g., VLAN 6to4tunnel); or loopback.
<b>Protocol</b>	Protocol by which this IPv6 address was learned: LOCAL, STATIC, OSPF, RIP, BGP).
<b>Metric</b>	RIP metric or cost (hop count) for the route. Indicates a priority for the route. The lower the metric value, the higher the priority.
<b>VLAN</b>	The VLAN on which the route was <i>learned</i> , not forwarded. Note that <b>N/A</b> appears in this field for static routes as they are not learned on a VLAN.

## Release History

Release 7.1.1; command was introduced.

## show ipv6 traffic

Displays IPv6 traffic statistics.

**show ipv6 traffic** [*if\_name*]

---

### Syntax Definitions

*if\_name* Interface name. Restricts the display to the specified interface instead of global statistics.

### Defaults

N/A.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The statistics show the cumulative totals since the last time the switch was powered on, the last reset of the switch was executed or the traffic statistics were cleared using the command.

### Examples

```
-> show ipv6 traffic
```

Message	Current	Previous	Change
-----+-----+-----+-----			
Packets received			
Total	66193	0	66193
Header errors	0	0	0
Too big	0	0	0
No route	0	0	0
Address errors	0	0	0
Unknown protocol	0	0	0
Truncated packets	0	0	0
Local discards	0	0	0
Delivered to users	969	0	969
Reassembly needed	0	0	0
Reassembly failed	0	0	0
Multicast packets	66191	0	66191
Packets sent			
Forwarded	0	0	0
Generated	23	0	23
Local discards	5	0	5
Fragmented	0	0	0
Fragmentation failed	0	0	0
Fragments generated	0	0	0
Multicast packets	34	0	34

*output definitions*

---

<b>Total</b>	Total number of input packets received, including those received in error.
<b>Header errors</b>	Number of input packets discarded due to errors in their IPv6 headers (e.g., version number mismatch, other format errors, hop count exceeded, and errors discovered in processing their IPv6 options).
<b>Too big</b>	Number of input packets that could not be forwarded because their size exceeded the link MTU of the outgoing interface.
<b>No route</b>	Number of input packets discarded because no route could be found to transmit them to their destination.
<b>Address errors</b>	Number of input packets discarded because the IPv6 address in their IPv6 header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., ::0) and unsupported addresses (e.g., addresses with unallocated prefixes).
<b>Unknown protocol</b>	Number of locally-addressed packets received successfully but discarded because of an unknown or unsupported protocol.
<b>Truncated packets</b>	Number of input packets discarded because the packet frame did not carry enough data.
<b>Local discards</b>	Number of input IPv6 packets for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any packets discarded while awaiting re-assembly.
<b>Delivered to users</b>	Total number of packets successfully delivered to IPv6 user protocols (including ICMP).
<b>Reassembly needed</b>	Number of IPv6 fragments received that needed to be reassembled.
<b>Reassembly failed</b>	Number of failures detected by the IPv6 reassembly algorithm (for whatever reason: timed out, errors, etc.).
<b>Multicast packets</b>	Number of multicast packets received.
<b>Forwarded</b>	Number of output packets that this entity received and forwarded to their final destinations.
<b>Generated</b>	Total number of IPv6 packets that local IPv6 user-protocols (including ICMP) supplied to IPv6 in requests for transmission. Note that this counter does not include any packets counted by the Forwarded statistic.
<b>Local discards</b>	Number of output IPv6 packets for which no problem was encountered to prevent their transmission to their destination, but were discarded (e.g., for lack of buffer space). Note that this counter would include packets counted by the Forwarded statistic if any such packets met this (discretionary) discard criterion.
<b>Fragmented</b>	Number of IPv6 packets successfully fragmented.
<b>Fragmentation failed</b>	Number of IPv6 packets discarded because they needed to be fragmented but could not be.
<b>Fragments generated</b>	Number of output packet fragments generated as a result of fragmentation.
<b>Multicast packets</b>	Number of multicast packets transmitted.

---

#### *output definitions*

<b>IPv6 6to4 tunnel</b>	Indicates whether 6to4 tunneling is enabled or disabled on the switch.
<b>Tunnel</b>	Tunnel ID.
<b>IPv6 Address/Prefix Length</b>	IPv6 address associated with the tunnel.
<b>Source IPv4</b>	Source IPv4 address for the tunnel.
<b>Destination IPv4</b>	Destination IPv4 address for the tunnel.

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [ipv6 interface](#)

Configures an IPv6 interface on a VLAN or IPv6 tunnel.

## MIB Objects

```
alaIPv6ConfigTunnelTable  
  alaIPv6Tunnel6to4  
  alaIPv6ConfigTunnelv4Source  
  alaIPv6ConfigTunnelv4Dest
```

---

## show ipv6 tunnel 6to4

Displays IPv6 tunnel information and whether the 6to4 tunnel is enabled.

**show ipv6 tunnel 6to4**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 tunnel 6to4
tunnel_6to4
  Status = Disabled
  IPv6 Address(es):
  Local IPv4 Address(es):
```

### *output definitions*

---

<b>Name</b>	Indicates whether 6to4 tunneling is enabled or disabled on the switch.
<b>Status</b>	Tunnel ID.
<b>IPv6 Address(es)</b>	IPv6 address associated with the tunnel.
<b>Local IPv4 Addresses(es)</b>	Source IPv4 address for the tunnel.

---

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ipv6 interface](#) Configures an IPv6 interface on a VLAN or IPv6 tunnel.

### MIB Objects

```
alaIPv6ConfigTunnelTable
  alaIPv6Tunnel6to4
  alaIPv6ConfigTunnelv4Source
  alaIPv6ConfigTunnelv4Dest
```

---

## show ipv6 udp ports

Displays UDP Over IPv6 Listener Table. This table contains information about UDP/IPv6 endpoints.

**show ipv6 udp ports**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Only endpoints utilizing IPv6 addresses are displayed in this table.

### Examples

-> show ipv6 udp ports

```

Local Address                               Port  Interface
-----+-----+-----
::                                           521

```

#### *output definitions*

---

<b>Local Address</b>	Local IPv6 address for this UDP listener. If a UDP listener accepts packets for any IPv6 address associated with the switch, the value is ::0.
<b>Port</b>	Local Port number for the UDP connection.
<b>Interface</b>	Name of the interface the listener is using or “unknown.”

---

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 routes](#) Displays TCP Over IPv6 Connection Table.

**MIB Objects**

IPv6UdpTable

IPv6UdpEntry

IPv6UdpLocalAddress

IPv6UdpLocalPort

  IPv6UdpIfIndex

---

## show ipv6 information

Displays IPv6 information.

**show ipv6 information**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 information
Default hop limit                = 64
Path MTU entry minimum lifetime (min) = 10
Neighbor stale lifetime (min)    = 10
Local Unicast Global ID         = 70:3302:a472
```

### *output definitions*

---

<b>Default hop limit</b>	The value placed in the hop limit field in router advertisements
<b>Path MTU entry minimum lifetime</b>	Minimum lifetime for entries in the path MTU.
<b>Neighbor stale lifetime</b>	Minimum lifetime for neighbor entries in the stale state.
<b>Local Unicast Global ID</b>	The default global ID value used in unique local unicast addresses. "none" if a global ID has not been configured.

---

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>ipv6 neighbor</b>	Configures a static entry in the IPv6 Neighbor Table.
<b>ipv6 pmtu-lifetime</b>	Configures the minimum lifetime for entries in the path MTU Table.
<b>ipv6 hop-limit</b>	Configures the value placed in the hop limit field in the header of all IPv6 packet.
<b>ipv6 address global-id</b>	Configures the default global ID for unique local unicast addresses

**MIB Objects**

ipv6MibObjects

    Ipv6DefaultHopLimit

alaIPv6ConfigTable

    alaIPv6PMTUMinLifetime

alaIPv6NeighborTable

    alaIPv6NeighborStaleLifetime

---

## ipv6 redist

Controls the conditions for redistributing IPv6 routes between different protocols.

```
ipv6 redist {local | static | rip | ospf | isis | bgp} into {rip | ospf | isis | bgp} route-map route-map-name
[admin-state {enable | disable}]
```

```
no ipv6 redist {local | static | ospf | isis | bgp} into {rip | ospf | isis | bgp} [route-map route-map-name]
```

---

### Syntax Definitions

<b>local</b>	Redistributes local IPv6 routes.
<b>static</b>	Redistributes static IPv6 routes.
<b>rip</b>	Specifies RIP as the source or destination (into) protocol.
<b>ospf</b>	Specifies OSPF as the source or destination (into) protocol.
<b>bgp</b>	This parameter is currently not supported.
<b>isis</b>	This parameter is currently not supported.
<i>route-map-name</i>	Name of an existing route map that will control the redistribution of routes between the source and destination protocol.
<b>enable</b>	Enables the administrative status of the redistribution configuration.
<b>disable</b>	Disables the administrative status of the redistribution configuration.

### Defaults

parameter	default
enable   disable	enable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a route map redistribution configuration. Note that if a route map name is not specified, all route maps associated with the redistribution configuration are removed.
- The source and destination protocols must be loaded and enabled before redistribution occurs.
- The IPv6 version of BGP is not supported in the current release.
- Use the **ip route-map** commands described in the “IP Commands” chapter of this guide to create a route map. Refer to the “Configuring IP” chapter in the *OmniSwitch 10K Network Configuration Guide* for more information about how to create a route map.

## Examples

```
-> ipv6 redist rip into ospf route-map rip-to-ospf1
-> ipv6 redist rip into ospf route-map rip-to-ospf2
-> no ipv6 redist rip into ospf route-map rip-to-ospf2
-> ipv6 redist local into rip route-map local-to-rip
-> ipv6 redist local into rip route-map local-to-rip disable
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[show ipv6 redist](#) Displays the route map redistribution configuration.

## MIB Objects

```
alaRouteMapRedistProtoTable
  alaRouteMapRedistSrcProtoId
  alaRouteMapRedistDestProtoId
  alaRouteMapRedistRouteMapIndex
  alaRouteMapRedistStatus
  alaRouteMapRedistAddressType
  alaRouteMapRedistRowStatus
```

---

## ipv6 access-list

Creates an IPv6 access list that is used to specify multiple IPv6 addresses for a route map configuration.

**ipv6 access-list** *access-list-name*

**no ipv6 access-list** *access-list-name*

---

### Syntax Definitions

*access-list-name*                      Name of the IPv6 access list (up to 20 characters).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to delete the access list.

### Examples

```
-> ipv6 access-list access1  
-> no ipv6 access-list access1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ipv6 access-list address**              Adds IPv6 addresses to an existing IPv6 access list.

**show ipv6 access-list**                Displays the contents of an IPv6 access list.

### MIB Objects

```
alaRouteMapAccessListNameTable  
  alaRouteMapAccessListName  
  alaRouteMapAccessListNameIndex  
  alaRouteMapAccessListNameAddressType  
  alaRouteMapAccessListNameRowStatus
```

---

## ipv6 access-list address

Adds IPv6 addresses to the specified IPv6 access list.

**ipv6 access-list** *access-list-name* **address** *address/prefixLen* [**action** {**permit** | **deny**}]  
[**redist-control** {**all-subnets** | **no-subnets** | **aggregate**}]

**no ipv6 access-list** *access-list-name* **address** *address/prefixLen*

---

### Syntax Definitions

<i>access-list-name</i>	Name of the IPv6 access list (up to 20 characters).
<i>address/prefixLen</i>	IPv6 address along with the prefix length to be added to the access list.
<b>permit</b>	Permits the IPv6 address for redistribution.
<b>deny</b>	Denies the IPv6 address for redistribution.
<b>all-subnets</b>	Redistributes or denies all the subnet routes that match the network portion of the IP address as specified by the mask length.
<b>no-subnets</b>	Redistributes or denies only those routes that exactly match the IP address and the mask length.
<b>aggregate</b>	Redistributes an aggregate route if there are one or more routes that match or are subnets of this address.

### Defaults

parameter	default
<b>permit</b>   <b>deny</b>	<b>permit</b>
<b>all-subnets</b>   <b>no-subnets</b>   <b>aggregate</b>	<b>all-subnets</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the address from the access list.
- The *access-list-name* should exist before you add multiple IPv6 addresses to the IPv6 access list.
- The **action** parameters (**permit** and **deny**) determine if a route that matches the **redist-control** configuration for the IP address is allowed or denied redistribution.
- The **redist-control** parameters (**all-subnets**, **no-subnets**, and **aggregate**) defines the criteria used to determine if a route matches an address in the access list.
- Note that configuring the combination of **redist-control aggregate** with **action deny** is not allowed.

- Use this command multiple times with the same access list name to add multiple addresses to the existing IPv6 access list.

## Examples

```
-> ipv6 access-list access1 address 2001::1/64 action permit
-> ipv6 access-list access1 address 2001::1/64 redist-control aggregate
-> no ipv6 access-list access1 address 2001::1/64
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">ipv6 access-list</a>	Creates an IPv6 access list that is used to specify multiple IPv6 addresses for a route map configuration.
<a href="#">show ipv6 access-list</a>	Displays the contents of an IPv6 access list.

## MIB Objects

```
alaRouteMapAccessListTable
  alaRouteMapAccessListIndex
  alaRouteMapAccessListAddress
  alaRouteMapAccessListAddressType
  alaRouteMapAccessListPrefixLength
  alaRouteMapAccessListAction
  alaRouteMapAccessListRedistControl
  alaRouteMapAccessListRowStatus
```

---

## show ipv6 redist

Displays the IPv6 route map redistribution configuration.

```
show ipv6 redist [rip | ospf | bgp]
```

---

### Syntax Definitions

<b>rip</b>	Displays the route map redistribution configurations that specify RIP as the destination (into) protocol.
<b>ospf</b>	Displays the route map redistribution configurations that specify OSPF as the destination (into) protocol.
<b>bgp</b>	This parameter is not supported.

### Defaults

By default all route map redistribution configurations are shown.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Specify a destination protocol with this command to display only those configurations that redistribute routes into the specified protocol.
- The IPv6 version of BGP is not supported in the current release.

### Release History

Release 7.1.1; command was introduced.

### Examples

```
-> show ipv6 redist
```

Source Protocol	Destination Protocol	Status	Route Map
localIPv6	RIPng	Enabled	ipv6rm
RIPng	OSPFv3	Enabled	ipv6rm

```
-> show ipv6 redist ospf
```

Source Protocol	Destination Protocol	Status	Route Map
RIPng	OSPFv3	Enabled	ipv6rm

---

*output definitions*

---

<b>Source Protocol</b>	The protocol from which the routes are learned.
<b>Destination Protocol</b>	The protocol into which the source protocol routes are redistributed..
<b>Status</b>	The administrative status ( <b>Enabled</b> or <b>Disabled</b> ) of the route map redistribution configuration.
<b>Route Map</b>	The name of the route map that is applied with this redistribution configuration.

---

**Related Commands**

**ipv6 redistrib** Controls the conditions for redistributing IPv6 routes between different protocols.

**MIB Objects**

```
alaRouteMapRedistProtoTable  
  alaRouteMapRedistSrcProtoId  
  alaRouteMapRedistDestProtoId  
  alaRouteMapRedistRouteMapIndex  
  alaRouteMapRedistStatus  
  alaRouteMapRedistAddressType  
  alaRouteMapRedistRowStatus
```

---

## show ipv6 access-list

Displays the contents of the specified IPv6 access list.

**show ip access-list** [*access-list-name*]

---

### Syntax Definitions

*access-list-name*                      Name of the IPv6 access list.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If the *access-list-name* is not specified in this command, all the access lists will be displayed.

### Examples

```
-> show ipv6 access-list
```

Name	Address / Prefix Length	Effect	Redistribution Control
al_3	128::/64	permit	all-subnets
al_4	124::/64	permit	no-subnets

```
-> show ipv6 access-list 4
```

Name	Address / Prefix Length	Effect	Redistribution Control
al_4	124::/64	permit	no-subnets

### output definitions

---

<b>Name</b>	Name of the IPv6 access list.
<b>Address/Prefix Length</b>	IPv6 address that belongs to the access list.
<b>Effect</b>	Indicates whether the IPv6 address is permitted or denied for redistribution.
<b>Redistribution Control</b>	Indicates the conditions specified for redistributing the matched routes.

---

### Release History

Release 7.1.1; command was introduced

## Related Commands

- ipv6 access-list** Creates an IPv6 access list for adding multiple IPv6 addresses to route maps.
- ipv6 access-list address** Adds multiple IPv6 addresses to the IPv6 access list.

## MIB objects

```
alaRouteMapAccessListIndex  
  alaRouteMapAccessListAddressType  
  alaRouteMapAccessListAddress  
  alaRouteMapAccessListPrefixLength  
  alaRouteMapAccessListAction  
  alaRouteMapAccessListRedistControl
```

---

## ipv6 load rip

Loads RIPng into memory. When the switch is initially configured, you must load RIPng into memory to enable RIPng routing.

**ipv6 load rip**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- RIPng will support a maximum of 1,000 routes.
- RIPng will support a maximum of 20 interfaces.
- Use the [ipv6 rip admin-state](#) command to enable RIPng on the switch.

### Examples

```
-> ipv6 load rip
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ipv6 rip admin-state](#)

Enables/disables RIPng routing on the switch.

[show ipv6 rip](#)

Displays RIPng status and general configuration parameters.

### MIB Objects

alaDrcTmConfig

alaDrcTmIPRipngStatus

---

## ipv6 rip admin-state

Enables or disables RIPng on the switch.

**ipv6 rip admin-state** {enable | disable}

---

### Syntax Definitions

N/A

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

RIPng must be loaded on the switch ([ipv6 load rip](#)) to enable RIP on the switch.

### Examples

```
-> ipv6 rip admin-state enable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ipv6 load rip](#)

Loads RIPng into memory.

[show ipv6 rip](#)

Displays RIPng status and general configuration parameters.

### MIB Objects

alaProtocolripng

alaRipngProtoStatus

---

## ipv6 rip invalid-timer

Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.

**ipv6 rip invalid-timer** *seconds*

---

### Syntax Definitions

*seconds* Time, in seconds, that a route will remain in an "Active" state. Valid range is 1 - 300.

### Defaults

parameter	default
<i>seconds</i>	180

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This timer is reset each time a routing update is received.

### Examples

```
-> ipv6 rip invalid-timer 300
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ipv6 rip garbage-timer](#) Configures the RIPng garbage timer value.  
[ipv6 rip holddown-timer](#) Configures the amount of time a route is placed in a holddown state.

### MIB Objects

alaProtocolripng  
alaRipngInvalidTimer

---

## ipv6 rip garbage-timer

Configures the RIPng garbage timer value. When a route in the RIB exceeds the configured Invalid Timer Value, the route is moved to a “Garbage” state in the the RIB. The garbage timer is the length of time a route will stay in this state before it is flushed from the RIB.

**ipv6 rip garbage-timer** *seconds*

---

### Syntax Definitions

*seconds* Time, in seconds, that a route will remain in the RIPng Routing Table before it is flushed from the RIB. Valid range is 0 - 180.

### Defaults

parameter	default
<i>seconds</i>	120

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the [ipv6 rip invalid-timer](#) command to set the Invalid Timer Value.

### Examples

```
-> ipv6 rip garbage-timer 180
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- [ipv6 rip invalid-timer](#) Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.
- [ipv6 rip holddown-timer](#) Configures the amount of time a route is placed in a holddown state.

### MIB Objects

alaProtocolripng  
alaRipngGarbageTimer

---

## ipv6 rip holddown-timer

Configures the amount of time a route is placed in a holddown state. Whenever a route is seen from the same gateway with a higher metric than the route in RIB, the route goes into holddown. This excludes route updates with an INFINITY metric.

**ipv6 rip holddown-timer** *seconds*

---

### Syntax Definitions

*seconds* Time, in seconds, that a route will remain in a holddown state. Valid range is 0 - 120.

### Defaults

parameter	default
<i>seconds</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

While in holddown, the route continues being announced as usual and used in RIB. This interval is used to control route flap dampening.

### Examples

```
-> ipv6 rip holddown-timer 60
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ipv6 rip invalid-timer](#) Configures the amount of time a route remains active in RIB before being moved to the "Garbage" state.

[ipv6 rip garbage-timer](#) Configures the RIPng garbage timer value.

### MIB Objects

alaProtocolripng  
alaRipngHolddownTimer

---

## ipv6 rip jitter

Configures an offset value for RIPng updates. This is the maximum (positive or negative) value that can be used to offset the update interval. For example, with an update interval of 30 seconds, and a jitter value of 5 seconds, the RIPng update packet would be sent somewhere (random) between 25 and 35 seconds from the previous update.

**ipv6 rip jitter** *value*

---

### Syntax Definitions

*value* Time, in seconds, that a routing update is offset. Valid range is 0 to one-half the updated interval value (e.g., if the updated interval is 30, the range would be 0 - 300).

### Defaults

parameter	default
<i>value</i>	5

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

As you increase the number of RIPng interfaces/peers, it is recommended that you increase the Jitter value to reduce the number of RIPng updates being sent over the network.

### Examples

```
-> ipv6 rip jitter 10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ipv6 rip update-interval](#) Configures the RIPng update interval.  
[show ipv6 rip](#) Displays RIPng status and general configuration information.

### MIB Objects

alaProtocolripng  
alaRipngJitter

---

## ipv6 rip route-tag

Configures the route tag value for RIP routes generated by the switch.

**ipv6 rip route-tag** *value*

---

### Syntax Definitions

*value* Route tag value. Valid range is 0 – 65535.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This value does not apply to routes learned from other routers. For these routes, the route tag propagates with the route.

### Examples

```
-> ipv6 rip route-tag 30
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 rip](#) Displays RIPng status and general configuration information.

### MIB Objects

alaProtocolripng  
alaRipngRouteTag

---

## ipv6 rip update-interval

Configures the RIPng update interval. This is the interval, in seconds, that RIPng routing updates will be sent out.

**ipv6 rip update-interval** *seconds*

---

### Syntax Definitions

*seconds* Interval, in seconds, that RIPng routing updates are sent out. Valid range is 0–120.

### Defaults

parameter	default
<i>seconds</i>	30

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use this command, along with the [ipv6 rip jitter](#) command to configure RIPng updates.

### Examples

```
-> ipv6 rip update-interval 30
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ipv6 rip jitter](#) Configures an offset value for RIPng updates.  
[show ipv6 rip](#) Displays RIPng status and general configuration information.

### MIB Objects

alaRipng  
  alaRipngUpdateInterval

---

## ipv6 rip triggered-sends

Configures the behavior of triggered updates.

**ipv6 rip triggered-sends** {all | updated-only | none}

---

### Syntax Definitions

<b>all</b>	All RIPng routes are added to any triggered updates.
<b>updated-only</b>	Only route changes that are causing the triggered update are included in the update packets.
<b>none</b>	RIPng routes are not added to triggered updates.

### Defaults

parameter	default
all   updated-only   none	updated-only

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If set to **all**, all routes are sent in the update, not just route changes, which increases RIPng traffic on the network.
- If set to **none**, no triggered updates are sent, which can cause delays in network convergence.

### Examples

```
-> ipv6 rip triggered-sends none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 rip](#) Displays RIPng status and general configuration information.

### MIB Objects

```
alaProtocolripng
  alaRipngTriggeredSends
```

---

## ipv6 rip interface

Creates or deletes a RIPng interface.

**ipv6 rip interface** *if\_name*

**[no] ipv6 rip interface** *if\_name*

---

### Syntax Definitions

*if\_name* IPv6 interface name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- By default, a RIPng interface is created in the enabled state.
- Routing is enabled on a VLAN when you create a router port. However, to enable RIPng routing, you must also configure and enable a RIPng routing interface on the VLAN's IP router port. For more information on VLANs and router ports, see [Chapter 4, "VLAN Management Commands"](#).
- RIPng will support a maximum of 20 interfaces.

### Examples

```
-> ipv6 rip interface Test_Lab
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ipv6 redist</b>	Loads RIPng into memory.
<b>ipv6 rip admin-state</b>	Enables or disables RIPng on the switch.
<b>ipv6 rip interface recv-status</b>	Configures IPv6 RIPng interface “Receive” status. When this status is set to "enable", packets can be received on this interface.
<b>ipv6 rip interface send-status</b>	Configures IPv6 RIPng interface “Send” status. When this status is set to "enable", packets can be sent on this interface.
<b>show ipv6 rip interface</b>	Displays information for all or specified RIPng interfaces.

## MIB Objects

```
alaRipngInterfaceTable  
    alaRipngInterfaceStatus
```

---

## ipv6 rip interface metric

Configures the RIPng metric or cost for a specified interface. You can set priorities for routes generated by a switch by assigning a metric value to routes generated by that switch's RIPng interface. For example, routes generated by a neighboring switch may have a hop count of 1. However, you can lower the priority of routes generated by that switch by increasing the metric value for routes generated by the RIPng interface.

**ipv6 rip interface** *if\_name* **metric** *value*

---

### Syntax Definitions

*if\_name* IPv6 interface name.

*value* Metric value. Valid range is 1 - 15.

### Defaults

parameter	default
<i>value</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

When you configure a metric for a RIPng interface, this metric cost is added to the metric of the incoming route.

### Examples

```
-> ipv6 rip Test_Lab metric 1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ipv6 rip interface](#) Creates or deletes a RIPng interface.

[show ipv6 rip interface](#) Displays information for all or specified RIPng interfaces.

### MIB Objects

alaRipngInterfaceTable  
  alaRipngInterfaceMetric

---

## ipv6 rip interface recv-status

Configures IPv6 RIPng interface “Receive” status. When this status is set to "enable", packets can be received on this interface. When it is set to "disable", packets will not be received on this interface.

**ipv6 rip interface *if\_name* recv-status {enable | disable}**

---

### Syntax Definitions

*if\_name* IPv6 interface name.  
**enable | disable** Interface “Receive” status.

### Defaults

parameter	default
<b>enable   disable</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

RIPng must be loaded ([ipv6 load rip](#)) and enabled ([ipv6 rip admin-state](#)) on the switch to send or receive packets on the interface.

### Examples

```
-> ipv6 rip interface Test_Lab recv-status disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ipv6 redist](#) Loads RIPng into memory.  
[ipv6 rip admin-state](#) Enables/disables RIPng on the switch.  
[ipv6 rip interface send-status](#) Configures IPv6 RIPng interface “Send” status.

### MIB Objects

alaRipngInterfaceTable  
  alaRipngInterfaceRecvStatus

---

## ipv6 rip interface send-status

Configures IPv6 RIPng interface “Send” status. When this status is set to "enable", packets can be sent from this interface. When it is set to "disable", packets will not be sent from this interface.

```
ipv6 rip interface if_name send-status {enable | disable}
```

---

### Syntax Definitions

*if\_name* IPv6 interface name.

**enable | disable** Interface “Send” status.

### Defaults

parameter	default
enable   disable	enable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

RIPng must be loaded ([ipv6 load rip](#)) and enabled ([ipv6 rip admin-state](#)) on the switch to send or receive packets on the interface.

### Examples

```
-> ipv6 rip interface Test_Lab send-status enable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ipv6 redist](#) Loads RIPng into memory.

[ipv6 rip admin-state](#) Enables/disables RIPng on the switch.

[ipv6 rip interface recv-status](#) Configures IPv6 RIPng interface “Receive” status.

### MIB Objects

alaRipngInterfaceTable  
  alaRipngInterfaceSendStatus

---

## ipv6 rip interface horizon

Configures the routing loop prevention mechanisms.

```
ipv6 rip interface if_name horizon {none | split-only | poison}
```

---

### Syntax Definitions

<i>if_name</i>	IPv6 interface name.
<b>none</b>   <b>split-only</b>   <b>poison</b>	<b>none</b> - Disables loop prevention mechanisms. <b>split-only</b> - Enables split-horizon, without poison-reverse. <b>poison</b> - Enables split-horizon with poison-reverse.

### Defaults

parameter	default
<b>none</b>   <b>split-only</b>   <b>poison</b>	<b>poison</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If set to **none** the route is not sent back to the peer.
- If set to **split-only**, the route received from the peer is sent back with an increased metric.
- If set to **poison** the route received from the peer is sent back with an “infinity” metric.

### Examples

```
-> ipv6 rip interface Test_Lab none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">show ipv6 rip interface</a>	Displays information for all or specified RIPng interfaces.
<a href="#">show ipv6 rip routes</a>	Displays all or a specific set of routes in the RIPng Routing Table.

### MIB Objects

```
alaRipngInterfaceTable
  alaRipngInterfaceHorizon
```

---

## show ipv6 rip

Displays the RIPng status and general configuration parameters.

**show ipv6 rip**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 rip
```

```
Status                = Enabled,
Number of routes      = 10,
Route tag             = 0,
Update interval      = 30,
Invalid interval     = 180,
Garbage interval     = 120,
Holddown interval    = 0,
Jitter interval      = 5,
Triggered Updates    = All Routes,
```

### *output definitions*

---

<b>Status</b>	RIPng protocol status (enabled or disabled).
<b>Number of routes</b>	Number of RIPng routes in Forwarding Information Base (FIB).
<b>Route tag</b>	Route tag value for RIP routes generated by the switch. Default is 0.
<b>Invalid interval</b>	Invalid Timer setting, in seconds.
<b>Garbage interval</b>	Garbage Timer setting, in seconds.
<b>Holddown interval</b>	Holddown Timer setting, in seconds.
<b>Jitter interval</b>	Jitter setting.
<b>Triggered updates</b>	Triggered Updates setting (All Routes, Updated Routes, and None).

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ipv6 rip admin-state</b>	Enables or disables RIPng routing on the switch.
<b>ipv6 rip route-tag</b>	Configures the route tag value for RIP routes generated by the switch.
<b>ipv6 rip update-interval</b>	Configures the Interval, in seconds, so that RIPng routing updates are sent out.
<b>ipv6 rip invalid-timer</b>	Configures the amount of time a route remains active in RIB before being moved to the "garbage" state.
<b>ipv6 rip invalid-timer</b>	Configures the RIPng garbage timer value. Routes move into the garbage collection state because the timer expired or a route update with an INFINITY metric was received.
<b>ipv6 rip holddown-timer</b>	Configures the amount of time a route is placed in a holddown state.
<b>ipv6 rip jitter</b>	Configures an offset value for RIPng updates. This is the maximum (positive or negative) value that can be used to offset the update interval.
<b>ipv6 rip triggered-sends</b>	Configures the behavior of triggered updates.

## MIB Objects

```
alaRipngInterfaceTable  
  alaRipngInterfaceStatus  
  alaRipngRouteTag

## show ipv6 rip interface

Displays information for all or specified RIPng interfaces.

**show ipv6 rip interface** [*if\_name*]

---

### Syntax Definitions

*if\_name* IPv6 interface name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If you do not specify an interface, all IPv6 RIP interfaces are displayed.

### Examples

```
-> show ipv6 rip interface
```

Interface Name	Status	Packets		Metric
		Recvd	Sent	
Test_Lab	Active	12986	12544	1
Test_Lab_2	Active	12556	12552	1

```
-> show ipv6 rip interface if3
```

```
Name = Test_Lab,
IPv6 interface index = 3,
Interface status = Active,
Next Update = 27 secs,
Horizon Mode = Split and Poison-reverse,
MTU size = 1500,
Metric = 1,
Send status = Enabled,
Receive status = Enabled,
Packets received = 12986,
Packets sent = 12544,
```

### output definitions

---

<b>Interface name</b>	Interface name.
<b>IPv6 interface index</b>	IPv6 index of this interface.
<b>Status</b>	Interface status (Active/Inactive).
<b>Packets Recvd</b>	Number of packets received by the interface.

*output definitions (continued)*

---

<b>Packets Sent</b>	Number of packets sent by the interface.
<b>Metric</b>	RIPng metric (cost) configured for the interface.
<b>IPv6 interface index</b>	IPv6 interface index number.
<b>Interface status</b>	Interface status (Active/Inactive).
<b>Next update</b>	Seconds remaining until the next update on this interface.
<b>Horizon mode</b>	Interface Horizon Mode (routing loop prevention mechanisms). Displayed modes are none/split-only/poison-reverse.
<b>MTU size</b>	Maximum transmission size for RIPng packets on the interface.
<b>Send status</b>	Interface "Send" status. When this status is set to "enable", packets can be sent from this interface. When it is set to "disable", packets will not be sent from this interface.
<b>Receive status</b>	Interface "Receive" status. When this status is set to "enable", packets can be received by this interface. When it is set to "disable", packets cannot be received by this interface.
<b>Packets received</b>	Number of packets received by the interface.
<b>Packets sent</b>	Number of packets sent by the interface.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>ipv6 rip interface</b>	IPv6 interface name.
<b>ipv6 rip admin-state</b>	Enables or disables RIPng routing on the switch.
<b>ipv6 rip interface rcv-status</b>	Configures the interface "Receive" status. When this status is set to "enable", packets can be received by this interface. When it is set to "disable", packets cannot be received by this interface.
<b>ipv6 rip interface send-status</b>	Configures the interface "Send" status. When this status is set to "enable", packets can be sent from this interface. When it is set to "disable", packets will not be sent from this interface.
<b>ipv6 rip interface metric</b>	Configures the RIPng metric (cost) for the interface.
<b>ipv6 rip interface horizon</b>	Configures the interface Horizon Mode (routing loop prevention mechanisms).
<b>show ipv6 rip</b>	Displays RIPng status and general configuration parameters (e.g., force holddown timer).

**MIB Objects**

```

  alaRipngInterfaceHorizon  
  alaRipngInterfaceMTU  
  alaRipngInterfaceSendStatus  
  alaRipngInterfaceRecvStatus
```

---

## show ipv6 rip peer

Displays a summary of the observed RIPng peers, or specific information about a peer when a peer address is provided.

**show ipv6 rip peer** [*ipv6\_address*]

---

### Syntax Definitions

*ipv6\_address* IPv6 address of the peer.

### Defaults

N/A.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If you do not specify a peer, all IPv6 RIP peers are displayed.

### Examples

```
-> show ipv6 peer
```

Address	Seen on Interface	Packets Recv	Last Update
fe80::200:39ff:fe1f:710c	vlan172	23	20
fe80::2d0:95ff:fe12:da40	bkbone20	33	2
fe80::2d0:95ff:fe12:da40	vlan150	26	25
fe80::2d0:95ff:fe6a:5d41	nssa23	20	25

```
-> show ipv6 rip peer fe80::2d0:95ff:fe12:da40
```

```
Peer#1 address      = fe80::2d0:95ff:fe12:da40,
Seen on interface   = bkbone20,
Last Update         = 8 secs,
Received packets    = 33,
Received bad packets = 0
Received routes     = 5,
Received bad routes = 0
```

```
Peer#2 address      = fe80::2d0:95ff:fe12:da40,
Seen on interface   = vlan150,
Last Update         = 1 secs,
Received packets    = 27,
Received bad packets = 0
Received routes     = 2,
Received bad routes = 0
```

*output definitions*

---

<b>Address</b>	IPv6 address of the peer.
<b>Seen on Interface</b>	Interface used to reach the peer.
<b>Packets Recvd</b>	Number of packets received from the peer.
<b>Last Update</b>	Number of seconds since the last update was received from the peer.
<b>Peer address</b>	Peer IPv6 address.
<b>Received packets</b>	Number of packets received from the peer.
<b>Received bad packets</b>	Number of bad packets received from the peer.
<b>Received routes</b>	Number of RIPng routes received from the peer.
<b>Received bad routes</b>	Number of bad RIPng routes received from the peer.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<a href="#">show ipv6 rip interface</a>	Displays all or specified RIPng interface status.
<a href="#">show ipv6 rip routes</a>	Displays all or a specific set of routes in RIPng Routing Table.

**MIB Objects**

```
alaRipngPeerTable

```

---

## show ipv6 rip routes

Displays all or a specific set of routes in RIPng Routing Table.

**show ipv6 rip routes** [**dest** <ipv6\_prefix/prefix\_length>] / [**gateway** <ipv6\_addr>] | [**detail** <ipv6\_prefix/prefix\_length>]

---

### Syntax Definitions

<b>dest</b>	Displays all routes whose destination matches the IPv6 prefix/prefix length.
<b>gateway</b>	Displays all routes whose gateway matches the specified IPv6 address.
<b>detail</b>	Displays detailed information about a single route matching the specified destination.
<i>ipv6_addr</i>	IPv6 address.
<i>ipv6_prefix/prefix length</i>	IPv6 address and prefix/prefix length.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If you do not enter one of the optional parameters, all IPv6 RIP routes are displayed.

### Examples

```
-> show ipv6 rip routes
```

Legends: State: A = Active, H = Holddown, G = Garbage

Destination	Gateway	State	Metric	Proto
100::1/128	+fe80::200:39ff:fe1f:710c	A	2	Rip
100::100:1/128	+fe80::200:39ff:fe1f:710c	A	2	Rip
400::/100	+fe80::2d0:95ff:fe12:e050	A	1	Local
900::/100	+fe80::2d0:95ff:fe12:e050	A	1	Local
8900::/100	+fe80::2d0:95ff:fe12:da40	A	2	Rip

# 14 IPsec commands

IPsec is a suite of protocols for securing IPv6 communications by authenticating and/or encrypting each IPv6 packet in a data stream. IPsec provides security services such as Encrypting traffic, Integrity validation, Authenticating the peers, and Anti-replay.

IPsec protocols operate at network layer using appropriate security protocols, cryptographic algorithms, and cryptographic keys. The security services are provided through use of two security protocols, the Authentication Header (AH) and the Encapsulating Security Payload (ESP), and through the use of cryptographic key management procedures and protocols.

There are two modes of IPsec operation: transport mode and tunnel mode. In transport mode, only the data you transfer (payload) in the IPv6 packet is encrypted and/or authenticated and only the payloads that are originated and destined between two intermediate systems are processed with IPsec. In tunnel mode, the entire IPv6 packet with both the data and the message headers is encrypted and/or authenticated. In tunnel mode, all the IPv6 packets that pass through the endpoints are processed by IPsec. The current implementation of IPsec supports only the transport mode.

---

**Note.** The current implementation of IPsec supports only IPv6.

---

The pre-configured Security Policy determines the traffic that is to be rendered with IPsec protection. A Security Association (SA) specifies the actual IPsec actions to be performed (e.g encryption using 3DES, authentication with HMAC-SHA1). A security association is bundle of algorithms and parameters (such as keys) that is being used to encrypt and authenticate a particular flow in one direction. Security Associations can be manually configured or negotiated through IKE. The current implementation of IPsec does not support the negotiation of SA through IKE and SAs need to be configured manually.

A summary of the available commands is listed here:

---

- [ipsec key](#)
- [ipsec security-key](#)
- [ipsec policy](#)
- [ipsec policy rule](#)
- [ipsec sa](#)
- [show ipsec policy](#)
- [show ipsec sa](#)
- [show ipsec key](#)
- [show ipsec ipv6 statistics](#)

---

## ipsec key

Adds, modifies or deletes the authentication and encryption keys for a manually configured IPsec SA.

**ipsec key** *name* {**sa-authentication** | **sa-encryption**} [**encrypted**] *key*

**no ipsec key** *name* {**sa-authentication** | **sa-encryption**}

---

### Syntax Definitions

<i>name</i>	The name of this key (maximum 20 characters).
<b>sa-authentication</b>	Indicates that the key value is used for Authentication Header.
<b>sa-encryption</b>	Indicates that the key value is used for Encapsulated Security Payload.
<b>encrypted</b>	Not user configured, used only by switch in config file.
<i>key</i>	Specifies the key value. The key value can be either in the hexadecimal format or as a string.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The *name* parameter must be same as the name of the manually configured SA that uses this SA authentication and encryption key.
- The length of the key value must match the value that is required by the encryption or authentication algorithm that uses the key. The required key length for the supported algorithm are as follows:

algorithm	key length
3des-cbc	192 bits
aes-cbc	128, 192, or 256 bits
hmac-md5	128 bits
hmac-sha1	160 bits
aes-xcbc-mac	128

- The combination of the key's name and type must be unique.
- The **encrypted** option is used when the key commands are written to the boot.cfg or other snapshot file. This option can not be specified by the user when entering CLI commands.

### Examples

```
-> ipsec key sa_md5_in sa-authentication takd03c9@skL68L%
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

[ipsec sa](#)

Adds, modifies, or deletes a manually configured IPsec Security Association (SA).

[show ipsec key](#)

Displays the keys for the manually configured IPsec SA.

## MIB Objects

AlaIPsecKeyTable

alaIPsecKeyName

alaIPsecKeyType

alaIPsecKeyEncrypted

alaIPsecKey

---

## ipsec security-key

Sets the master security key for the switch. The master security key is used to encrypt and decrypt the configured SA keys.

**ipsec security-key** [*old\_key*] *new\_key*

---

### Syntax Definitions

<i>old_key</i>	The current master security key. The key can be specified either in the hexadecimal format or as a string.
<i>new_key</i>	The new key value. The key can be specified either in the hexadecimal format or as a string.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The *old\_key* parameter must always be specified when you modify an existing key. Setting the key for first time does not require the *old\_key*.
- If the value of the *old\_key* is incorrect, the attempt to set a new key fails.
- While the SA keys can be configured without a master security key; the configured SA keys are written to the configuration file unencrypted, and a warning is logged.
- The security key must be 16 characters or 16 bytes if in hex form (32 hex digits).
- If the master security key is reset using **debug clear ipsec security key** command, the currently configured SA keys are deleted.

### Examples

```
-> ipsec security-key "old key value ab" 0xa38d901bde77af091a2485ce0a14a8cc
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

### [ipsec key](#)

Adds, modifies or deletes the authentication and encryption keys for a manually configured IPsec SA.

## MIB Objects

```
AlaIPsecSecurityKeyTable  
  alaIPsecSecurityKeyCurrent  
  alaIPsecSecurityKeyNew
```

---

## ipsec policy

Adds, modifies, or removes a security policy.

**ipsec policy** *name* [**priority** *priority*] [**source** {*ipv6\_address* [/*prefix\_length*]}] [**port** *port*] [**destination** {*ipv6\_address* [/*prefix\_length*]}] [**port** *port*] [**protocol** {**any** | **icmp6** [**type** *type*]} | **tcp** | **udp** | **ospf** | **vrrp** | **number** *protocol*}] [**in** | **out**] [**discard** | **ipsec** | **none**] [**description** *description*] [**admin-state** {**enable** | **disable**}]

**no ipsec policy** *name*

---

### Syntax Definitions

<i>name</i>	The name for the policy
<i>priority</i>	The priority for the policy. Values may range from 1 to 1000. The higher the value, the higher the priority.
<b>source</b> <i>ipv6_address</i>	Specifies the source address of the IPv6 traffic that is covered by the policy.
<b>source</b> / <i>prefix_length</i>	Specifies the prefix length of the source address of the IPv6 traffic that is covered by the policy.
<b>source</b> <i>port</i>	Specifies the source port of the IPv6 traffic that is covered by the policy. The value 0 can be specified to match packets originated from any port.
<b>destination</b> <i>ipv6_address</i>	Specifies the destination address of the IPv6 traffic that is covered by the policy.
<b>destination</b> / <i>prefix-length</i>	Specifies the prefix length of the destination address of the IPv6 traffic that is covered by the policy.
<b>destination</b> <i>port</i>	Specifies the destination port of the IPv6 traffic that is covered by the policy. The value 0 can be specified to match packets destined to any port.
<b>protocol</b>	Specifies that the particular protocol specific traffic to be covered by the policy (Refer to the table in the “Usage Guidelines“ section below for various protocol options).
<b>in</b>	Specifies that the policy is applied to the inbound IPv6 traffic.
<b>out</b>	Specifies that the policy is applied to the outbound IPv6 traffic.
<b>discard</b>	Specifies the policy to discard the IPv6 packet, if it matches the criteria.
<b>ipsec</b>	Specifies the policy to send the IPv6 packet for IPsec processing, if it matches the criteria.
<b>none</b>	Specifies IPsec should not process the packet.
<i>description</i>	The detailed description of the policy.
<b>admin-state enable</b>	Administratively enables the policy.
<b>admin-state disable</b>	Administratively disables the policy.

## Defaults

parameter	default
<b>priority</b>	100
<i>port</i>	0
<b>any   icmp6   tcp   udp   ospf   vrrp   number</b>	<b>any</b>
<b>icmp6</b> <i>type</i>	not present
<b>discard   ipsec   none</b>	<b>ipsec</b>
<b>admin-state</b>	<b>enable</b>

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- If two policies can cover the same traffic, the policy with the highest priority is applied. If two policies have the same priority, the one configured first has precedence.
- The following table lists the various **protocol** options in this command:

<b>protocol</b>
<b>any</b>
<b>icmp6</b> [ <i>type type</i> ]
<b>tcp</b>
<b>udp</b>
<b>ospf</b>
<b>vrrp</b>
<b>number</b> <i>protocol</i>

The **any** option must be used to apply the policy to all protocol traffic. Otherwise, an upper-layer protocol (or protocol number) may be specified to restrict the policy to the specified protocol traffic. The optional *type* parameter of **icmp6** can also be specified to restrict the policy for certain type of ICMPv6 packets.

- If the **ipsec** option is specified this policy cannot be enabled until at least one rule has been defined. The policy rules specify that IPsec algorithms be applied to the traffic that matches the policy.

## Examples

```
-> ipsec policy tcp_out source 2001:db8:3::12 destination 201:db8:4::a3e protocol
tcp out ipsec description "Outbound TCP traffic" admin-state disable
-> no ipsec policy tcp_out
```

## Release History

```

---

## ipsec policy rule

Adds, modifies, or removes an IPsec rule for a security policy.

**ipsec policy** *name* **rule** *index* [**ah** | **esp**]

**no ipsec policy** *name*

---

### Syntax Definitions

<i>name</i>	The name of the security policy created by using the <b>ipsec policy</b> command.
<i>index</i>	The index of this rule. Values may range from 1 to 10.
<b>ah</b>	Specifies that the rule requires the presence of an Authentication Header (AH).
<b>esp</b>	Specifies that the rule requires the presence of an Encrypted Security Payload header (ESP).

### Defaults

N/A.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

You can use the *index* parameter to specify the order in which the multiple rules for the same security policy is applied to the original payload.

### Examples

```
-> ipsec policy alucent rule 1 ah
-> no ipsec policy alucent
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[ipsec policy](#) Adds, modifies, or removes a security policy.

**MIB Objects**

```

  alaIPsecSecurityPolicyName  
  alaIPsecSecurityPolicyRuleIndex  
  alaIPsecSecurityPolicyRuleProtocol
```

---

## ipsec sa

Adds, modifies, or deletes a manually configured IPsec Security Association (SA).

**ipsec sa** *name* {**esp** | **ah**} [**source** *ipv6\_address* ] [**destination** *ipv6\_address*] [**spi** *spi*] [**encryption** {**null** | **3des-cbc** | **aes-cbc** [**key-size** *key\_length*]}] [**authentication** {**none** | **hmac-md5** | **hmac-sha1** | **aes-xcbc-mac**}] [**description** *description*] [**admin-state** {**enable** | **disable**}]

**no ipsec sa** *name*

---

### Syntax Definitions

<i>name</i>	The name assigned to this IPsec SA.
<b>esp</b>	Specifies the type of security association as ESP.
<b>ah</b>	Specifies the type of security association as AH.
<b>source</b> <i>ipv6_address</i>	Specifies the source address of the IPv6 traffic that is covered by the SA.
<b>destination</b> <i>ipv6_address</i>	Specifies the destination address of the IPv6 traffic that is covered by the SA.
<i>spi</i>	The Security Parameters Index (SPI) for the SA.
<b>encryption</b>	Specifies the encryption algorithm to be used for traffic covered by the SA. This parameter must be used only when the SA type is ESP.
<i>key_length</i>	key length for the specified encryption algorithm.
<b>authentication</b>	Specifies the authentication algorithm to be used for traffic covered by the SA.
<i>description</i>	The detailed description of the SA.
<b>admin-state enable</b>	Administratively enables the SA.
<b>admin-state disable</b>	Administratively disables the SA.

### Defaults

parameter	Defaults
<b>encryption</b>	<b>none</b>
<b>authentication</b>	<b>none</b>
<b>admin-state</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- The **encryption** parameter must be specified with the **none** option, if **ESP** is being used to verify integrity only.
- If **null** is specified as the option for **encryption**, an integrity algorithm must be specified using the **authentication** parameter. .
- To override a default key length in an **encryption** algorithm, the key length must be specified after the protocol name. The key length supported for various algorithm are as follows:

encryption algorithm	key length (in bits)
aes-cbc	128(default), 192, and 256

- For AH SAs, one of the authentication algorithms such as aes-xcbc-mac, hmac-md5 or hmac-sha1 must be specified.

## Examples

```
-> ipsec sa esp_in_1 esp source 2001:db8:3::13d destination 2001:db8:1::24 spi
10392 encryption aes-cbc authentication hmac-sha1
-> no ipsec sa esp_in_1
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

[show ipsec sa](#) Displays information about manually configured IPsec Security Associations.

## MIB Objects

## show ipsec policy

Displays information about the security policies.

**show ipsec policy** [*name*]

---

### Syntax Definitions

*name*                                      The policy name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the *name* parameter to display information about a specific security policy.

### Examples

```
-> show ipsec policy
Name           Source-> Destination           Protocol  Direction  Action  State
-----+-----+-----+-----+-----+-----+-----+-----
ftp-in-drop    ::/0->2001:db8:3::13d         TCP       in         discard active
telnet-in-1    2001:db8::/48->2001:db8:1::24  TCP       in         ipsec  active
telnet-out-1   2001:db8:1::24->2001:db8::/48  TCP       out        ipsec  active
```

#### *output definitions*

---

<b>Name</b>	The name of the security policy.
<b>Source -&gt; Destination</b>	Indicates the source and destination of traffic covered by this policy.
<b>Protocol</b>	Indicates the protocol traffic covered by this policy. The protocol name (TCP) or protocol number (80) is displayed in this field.
<b>Direction</b>	Indicates whether the policy has been applied to the incoming or outgoing traffic.
<b>Action</b>	Indicates the action to be taken on the traffic covered by this policy.
<b>State</b>	Indicates the operational state of this policy.

---

```
-> show ipsec policy telnet-out-1
Name           = telnet-out-1
Source         = 2001:db8:1::24
Destination    = 2001:db8::/48
Protocol       = TCP
Direction      = out
Action         = ipsec
State          = active
Rules:
```

1) esp

2) ah

Description:

Require AH and ESP headers on outgoing telnet traffic.

*output definitions*

---

<b>Name</b>	The name of the security policy.
<b>Source</b>	Indicates the source of the traffic covered by this policy.
<b>Destination</b>	Indicates the destination of the traffic covered by this policy.
<b>Protocol</b>	Indicates the protocol traffic covered by this policy. The protocol name (TCP) or protocol number (80) is displayed in this field.
<b>Direction</b>	Indicates whether the policy has been applied to the incoming or outgoing traffic.
<b>Action</b>	Indicates the action to be taken on the traffic covered by this policy.
<b>State</b>	Indicates the operational state of this policy.
<b>Rules</b>	Indicates the rules specified for this policy.
<b>Description</b>	The description for this policy.

---

## Release History

Release 7.1.1; command introduced.

## Related Commands

[ipsec policy](#) Adds, modifies, or removes a security policy.

```

---

## show ipsec sa

Displays information about manually configured IPsec Security Associations.

**show ipsec sa** [*name* | **esp** | **ah**]

---

### Syntax Definitions

<i>name</i>	The name of the Security Association.
<b>esp</b>	Restricts the display to ESP type SAs.
<b>ah</b>	Restricts the display to AH type SAs.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the *name* parameter to display the information about a specific SA.
- Use **esp** or **ah** option to display the information about their respective type SAs.

### Examples

```
-> show ipsec sa
Name           Type  Source-> Destination[SPI]          State  Encryption
Authentication
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----
telnet-in-esp  ESP  2001:db8::/49->2001:db8:1::24    active aes-cbc(128)
hmac-sha1
telnet-out-esp ESP  2001:db8:1::24->2001:db8::/48    active aes-cbc(128)
hmac-sha1
```

### *output definitions*

---

<b>Name</b>	The SA name.
<b>Type</b>	The SA type: AH or ESP.
<b>Source -&gt; Destination [SPI]</b>	The traffic source, traffic destination, and SPI for this SA.
<b>State</b>	The operational state of this SA.
<b>Encryption</b>	The encryption algorithm used for this SA.
<b>Authentication</b>	The authentication algorithm in use for this SA.

---

```

-> show ipsec sa telnet-in-esp

Name           = telnet-in-esp
Type           = ESP
Source         = 2001:db8::/48
Destination    = 2001:db8:1::24
SPI            = 8920
Encryption     = aes-cbc(128)
Authentication = hmac-shal

State          = active
Description:
  Security association for traffic from 2001:db8::/48 to
  2001:db8:1::24.

```

### output definitions

---

<b>Name</b>	The SA name.
<b>Type</b>	The SA type: AH or ESP.
<b>Source</b>	The traffic source for this SA.
<b>Destination</b>	The traffic destination for this SA.
<b>SPI</b>	The SA's SPI.
<b>Encryption</b>	The encryption algorithm used for this SA.
<b>Authentication</b>	The authentication algorithm used for this SA.
<b>State</b>	The operational state of this SA.
<b>Description</b>	The SA's description.

---

### Release History

Release 7.1.1; command introduced.

### Related Commands

[ipsec sa](#) Adds, modifies, or deletes a manually configured IPsec Security Association (SA).

### MIB Objects

```

AlaIPsecSAConfigTable
  alaIPsecSAConfigName
  alaIPsecSAConfigType

  alaIPsecSAConfigSourceType
  alaIPsecSAConfigDestination
  alaIPsecSAConfigDestinationType
  alaIPsecSAConfigSPI
  alaIPsecSAConfigOperationalState
  alaIPsecSAConfigEncryptionAlgorithm
  alaIPsecSAConfigEncryptionKeyLength
  alaIPsecSAConfigAuthenticationAlgorithm
  alaIPsecSAConfigAuthenticationKeyLength
  alaIPsecSAConfigDescription

```

---

## show ipsec key

Displays the keys for the manually configured IPsec SA.

**show ipsec key [sa-encryption | sa-authentication]**

---

### Syntax Definitions

**sa-encryption**                      Displays the encryption keys.  
**sa-authentication**                 Displays the authentication keys.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The key values are not be displayed due to security reasons.

### Examples

```
-> show ipsec key sa-encryption
Encryption Keys
Name                               Length (bits)
-----+-----
sa_1                               192
sa_2                               160
sa_3                               64

-> show ipsec key sa-authentication
Authentication Keys
Name                               Length (bits)
-----+-----
sa_1                               128
sa_5                               160
```

#### *output definitions*

---

<b>Name</b>	The name of the SA for which the key is used.
<b>Length</b>	The length of the key in bits.

---

### Release History

Release 7.1.1; command introduced.

## Related Commands

### [ipsec key](#)

Adds, modifies or deletes the authentication and encryption keys for a manually configured IPsec SA.

## MIB Objects

AlaIPsecKeyTable

    alaIPsecKeyName

    alaIPsecKey

---

## show ipsec ipv6 statistics

Displays IPsec statistics.

**show ipsec ipv6 statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
Inbound:
  Discarded                = 2787
  Policy violation         = 0
  Authentication Failure   = 0
  No SA found              = 0
Outbound:
  Discarded                = 5135
  No SA found              = 19
```

### *output definitions*

---

<b>Discarded</b>	The number of incoming packets discarded because they matched a discard policy.
<b>Policy violation</b>	The number of incoming packets that don't have the IPsec protection required by a security policy.
<b>Authentication Failure</b>	Authentication of a packet failed.
<b>No SA found</b>	No SA found matching the information present in a packet.

---

# 15 RIP Commands

Routing Information Protocol (RIP) is an Interior Gateway Protocol (IGP) that uses hop count as its routing metric. RIP-enabled switches update neighboring switches by transmitting a copy of their own routing table. The RIP routing table always uses the most efficient route to a destination, that is, the route with the fewest hops and longest matching prefix.

The switch supports RIP version 1 (RIPv1), RIP version 2 (RIPv2), and RIPv2 that is compatible with RIPv1. It also supports simple and MD5 authentication, on an interface basis, for RIPv2.

The RIP commands comply with the following RFCs: RFC1058, RFC2453, RFC1722, RFC1723, and RFC1724.

MIB information for the RIP commands is as follows:

*Filename:* RIPv2.mib

*Module:* rip2

*Filename:* AlcatelIND1Rip.mib

*Module:* alaRipMIB

A summary of the available commands is listed here:

---

**ip load rip**  
**ip rip admin-state**  
**ip rip interface**  
**ip rip interface admin-state**  
**ip rip interface metric**  
**ip rip interface send-version**  
**ip rip interface recv-version**  
**ip rip interface ingress-filter**  
**ip rip interface egress-filter**  
**ip rip force-holddowntimer**  
**ip rip host-route**  
**ip rip route-tag**  
**ip rip interface auth-type**  
**ip rip interface auth-key**  
**ip rip update-interval**  
**ip rip invalid-timer**  
**ip rip garbage-timer**  
**ip rip holddown-timer**  
**show ip rip**  
**show ip rip routes**  
**show ip rip interface**  
**show ip rip peer**

---

## ip load rip

Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.

**ip load rip**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- In simple networks where only IP forwarding is required, you may not want to use RIP. If you are not using RIP, it is best not to load it to save switch resources.
- To remove RIP from switch memory, you must manually edit the **boot.cfg** file. The **boot.cfg** file is an ASCII text-based file that controls many of the switch parameters. Open the file and delete all references to RIP. You must reboot the switch when this is complete.
- Use the **ip rip admin-state** command to enable RIP on the switch.

### Examples

```
-> ip load rip
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>ip rip admin-state</b>	Enables/disables RIP routing on the switch.
<b>show ip rip</b>	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

### MIB Objects

```
alaDrcTmConfig  
  alaDrcTmIPRipStatus
```

---

## ip rip admin-state

Enables/disables RIP on the switch. RIP performs well in small networks. By default, RIP packets are broadcast every 30 seconds, even if no change has occurred anywhere in a route or service. Depending on the size and speed of the network, these periodic broadcasts can consume a significant amount of bandwidth.

**ip rip admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables RIP routing on the switch.
<b>disable</b>	Disables RIP routing on the switch.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- RIP must be loaded on the switch ([ip load rip](#)) to enable RIP on the switch.
- A RIP network can be no more than 15 hops (end-to-end). If there is a 16th hop, that network is identified as infinity and the packet is discarded.

### Examples

```
-> ip rip admin-state enable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip load rip</a>	Loads RIP into the switch memory.
<a href="#">show ip rip</a>	Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

### MIB Objects

```
alaProtocolRip  
  alaRipProtoStatus
```

---

## ip rip interface

Creates/deletes a RIP interface. Routing is enabled on a VLAN when you create a router interface. However, to enable RIP routing, you must also configure and enable a RIP routing interface on the VLAN's IP router interface.

```
ip rip interface {interface_name}
```

```
no ip rip interface {interface_name}
```

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- By default, a RIP interface is created in the disabled state. To enable RIP routing on the interface, you must enable the interface by using the [ip rip interface admin-state](#) command.
- You can create a RIP interface even if an IP router interface has not been configured. However, RIP will not function unless an IP router interface is configured with the RIP interface.
- For more information on VLANs and router ports, see [Chapter 4, "VLAN Management Commands"](#).

### Examples

```
-> ip rip interface rip-1
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip interface</b>	Creates a VLAN router interface.
<b>ip load rip</b>	Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.
<b>ip rip admin-state</b>	Enables/disables RIP routing on the switch.
<b>ip rip interface admin-state</b>	Enables/disables a RIP interface.

## MIB Objects

```
rip2IfConfTable  
    rip2IfConfAddress  
    rip2IfConfStatus
```

---

## ip rip interface admin-state

Enables/disables a RIP interface. By default, a RIP interface is created in the disabled state. After creating a RIP interface, you must use this command to enable the interface.

```
ip rip interface {interface_name} admin-state {enable | disable}
```

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- You must first create a RIP interface by using the [ip rip interface](#) command before enabling the interface.
- You can create a RIP interface even if an IP router interface has not been configured. However, RIP will not function unless an IP router interface is configured with the RIP interface.
- For more information on VLANs and router ports, see [Chapter 4, “VLAN Management Commands”](#).

### Examples

```
-> ip rip interface rip-1 admin-state enable
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">ip interface</a>	Creates a VLAN router interface.
<a href="#">ip load rip</a>	Loads RIP into memory. When the switch is initially configured, you must load RIP into memory before it can be enabled.
<a href="#">ip rip admin-state</a>	Enables/disables RIP routing on the switch.
<a href="#">ip rip interface</a>	Creates/deletes a RIP interface.

## MIB Objects

```
rip2IfConfTable
  rip2IfConfAddress
  rip2IfConfStatus
```

---

## ip rip interface metric

Configures the RIP metric or cost for a specified interface. You can set priorities for routes generated by a switch by assigning a metric value to routes generated by that switch's RIP interface. For example, routes generated by a neighboring switch may have a hop count of 1. However, you can lower the priority of routes generated by that switch by increasing the metric value for routes generated by the RIP interface.

**ip rip interface** {*interface\_name*} **metric** *value*

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*value*                                      Metric value. Valid range is 1–15.

### Defaults

parameter	default
<i>value</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

When you configure a metric for a RIP interface, this metric cost is added to the metric of the incoming route.

### Examples

```
-> ip rip interface rip-1 metric 2
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip rip interface](#)                      Enables/disables RIP on a specific interface.

[show ip rip peer](#)                      Displays active RIP neighbors (peers). An active peer is a switch that has sent a RIP packet within the last 180 seconds.

### MIB Objects

rip2IfConfTable  
    rip2IfConfAddress  
    rip2IfConfDefaultMetric

---

## ip rip interface send-version

Configures the send option for a RIP interface. This defines the type(s) of RIP packets that the interface will send.

```
ip rip interface {interface_name} send-version {none | v1 | v1compatible | v2}
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>none</b>	RIP packets will not be sent by the interface.
<b>v1</b>	Only RIPv1 packets will be sent by the interface.
<b>v1compatible</b>	Only RIPv2 broadcast packets (not multicast) will be sent by the interface.
<b>v2</b>	Only RIPv2 packets will be sent by the interface.

### Defaults

---

parameter	default
none   v1   v2   v1compatible	v2

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Using this command will override RIP default behavior.
- Other devices must be able to interpret the information provided by this command or there will not be proper routing information exchanged between the switch and other devices on the network.

### Examples

```
-> ip rip interface rip-1 send-version v1
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**ip rip interface rcv-version** Configures the receive option for a RIP interface.

**MIB Objects**

```
rip2IfConfTable  
  rip2IfConfAddress  
  rip2IfConfSend
```

---

## ip rip interface recv-version

Configures the receive option for a RIP interface. This defines the type(s) of RIP packets that the interface will accept.

**ip rip interface** {*interface\_name*} **recv-version** {**v1** | **v2** | **both** | **none**}

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>v1</b>	Only RIPv1 packets will be received by the interface.
<b>v2</b>	Only RIPv2 packets will be received by the interface.
<b>both</b>	Both RIPv1 and RIPv2 packets will be received by the interface.
<b>none</b>	Interface ignores any RIP packets received.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>v1   v2   both   none</b>	<b>both</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Using this command will override RIP default behavior.
- Other devices must be able to interpret the information provided by this command or there will not be proper routing information exchanged between the switch and other devices on the network.

### Examples

```
-> ip rip interface rip-1 recv-version both
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**ip rip interface send-version** Configures the send option for a RIP interface.

**MIB Objects**

```
rip2IfConfTable  
  rip2IfConfAddress  
  rip2IfConfReceive
```

---

## ip rip interface ingress-filter

Assigns an ingress route map filter to the specified RIP interface. Received route advertisements are compared against ingress filters. When a prefix matches the corresponding filter, that prefix is accepted on the interface. When a prefix does not match the filter, the prefix is dropped as if it was never received.

**ip rip interface** {*interface\_name*} **ingress-filter** {*filter\_name*}

---

### Syntax Definitions

<i>interface_name</i>	The name of an existing RIP interface.
<i>filter_name</i>	The name of an existing route-map filter.

### Defaults

By default, no such filter is associated with the RIP interface.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- One route-map filter is configurable in each direction (ingress/egress) for each RIP interface.
- Configuring multiple filters in the same direction for a single RIP interface is not supported.

### Examples

```
-> ip route-map ripfilter1 action permit
-> ip route-map ripfilter1 match ip-address 202.5.0.0/16 deny
-> ip rip interface vlan-100 Ingress-filter RipFilter1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>ip rip interface egress-filter</b>	Assigns an egress route map filter to a RIP interface.
<a href="#">show ip rip interface</a>	Displays RIP interface status and configuration.

### MIB Objects

---

## ip rip interface ingress-filter

Assigns an ingress route map filter to the specified RIP interface. Received route advertisements are compared against ingress filters. When a prefix matches the corresponding filter, that prefix is accepted on the interface. When a prefix does not match the filter, the prefix is dropped as if it was never received.

**ip rip interface** {*interface\_name*} **ingress-filter** {*filter\_name*}

---

### Syntax Definitions

*interface\_name*                      The name of an existing RIP interface.  
*filter\_name*                          The name of an existing route-map filter.

### Defaults

By default, no such filter is associated with the RIP interface.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- One route-map filter is configurable in each direction (ingress/egress) for each RIP interface.
- Configuring multiple filters in the same direction for a single RIP interface is not supported.

### Examples

```
-> ip route-map ripfilter1 action permit
-> ip route-map ripfilter1 match ip-address 202.5.0.0/16 deny
-> ip rip interface vlan-100 ingress-filter RipFilter1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip rip interface egress-filter](#)      Assigns an egress route map filter to a RIP interface.  
[show ip rip interface](#)              Displays RIP interface status and configuration.

### MIB Objects

---

## ip rip interface egress-filter

Assigns an egress route map filter to the specified RIP interface. Outbound route advertisements are compared against egress filters. When a prefix matches the corresponding filter, that prefix is sent on the interface. When a prefix does not match the filter, the prefix is dropped as if it did not exist in the RIP RIB.

```
ip rip interface {interface_name} egress-filter {filter_name}
```

---

### Syntax Definitions

<i>interface_name</i>	The name of an existing RIP interface.
<i>filter_name</i>	The name of an existing route-map filter.

### Defaults

By default, no such filter is associated with the RIP interface.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- One route-map filter is configurable in each direction (ingress/egress) for each RIP interface.
- Configuring multiple filters in the same direction for a single RIP interface is not supported.

### Examples

```
-> ip route-map ripfilter1 action permit
-> ip route-map ripfilter1 match ip-address 202.5.0.0/16 deny
-> ip rip interface vlan-100 egress-filter RipFilter1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip rip interface ingress-filter</a>	Assigns an ingress route map filter to a RIP interface.
<a href="#">show ip rip interface</a>	Displays RIP interface status and configuration.

### MIB Objects

---

## ip rip force-holddowntimer

Configures the forced hold-down timer value, in seconds, that defines an amount of time during which routing information regarding better paths is suppressed. A route enters into a forced hold-down state when an update packet is received that indicates the route is unreachable and when this timer is set to a non-zero value. After this timer has expired and if the value is less than 120 seconds, the route enters a hold-down state for the rest of the period until the remainder of the 120 seconds has also expired. During this time the switch will accept any advertisements for better paths that are received.

**ip rip force-holddowntimer** *seconds*

---

### Syntax Definitions

*seconds*                                      The forced hold-down time interval, in seconds. The valid range is 0–120.

### Defaults

parameter	default
<i>seconds</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The forced hold-down timer is not the same as the RIP hold-down timer. The forced hold-down timer defines a separate interval that overlaps the hold-down state. During the forced hold-down timer interval, the switch will not accept *better* routes from other gateways.
- The forced hold-down time interval can become a subset of the hold-down timer (120 seconds) by using this command to set a value less than 120.
- To allow the routing switch to use better routes advertised during the entire hold-down time period, leave the forced hold-down timer set to the default value.

### Examples

```
-> ip rip force-holddowntimer 10
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### `show ip rip`

Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

## MIB Objects

`alaProtocolRip`

`alaRipForceHolddownTimer`

---

## ip rip host-route

Specifies whether or not RIP can add host routes (routes with a 32-bit mask) to the RIP table.

**ip rip host-route**

**no ip rip host-route**

---

### Syntax Definitions

N/A

### Defaults

The default is to enable a default host route.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to prevent RIP from adding host routes to the RIP table.
- When enabled, RIPv1 will interpret an incoming route announcement that contains any 1 bit in the host portion of the IP address as a host route, implying a mask of 255.255.255.255.

### Examples

```
-> ip rip host-route
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip rip routes](#) Displays the RIP Routing Database.

### MIB Objects

```
alaProtocolRip  
  alaRipHostRouteSupport
```

---

## ip rip route-tag

Configures the route tag value for RIP routes generated by the switch.

**ip rip route-tag** *value*

---

### Syntax Definitions

*value* Route tag value. Valid range is 0–2147483647.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Only RIPv2 supports route tags.

### Examples

```
-> ip rip route-tag 0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip rip](#) Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

### MIB Objects

alaRipRedistRouteTag

---

## ip rip interface auth-type

Configures the type of authentication that will be used for the RIP interface. By default, there is no authentication used for RIP. However, you can configure a password for a RIP interface. To configure a password, you must first select the authentication type (simple or MD5), then configure a password.

```
ip rip interface {interface_name} auth-type {none | simple | md5}
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>none</b>	No authentication will be used.
<b>simple</b>	Simple authentication will be used.
<b>md5</b>	MD5 authentication will be used.

### Defaults

---

parameter	default
<b>none   simple</b>	<b>none</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Regardless of which authentication type is used (simple or MD5), both switches on either end of a link must share the same password.

### Examples

```
-> ip rip interface rip-1 auth-type none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip rip interface auth-key](#) Configures the text string that will be used as the password for the RIP interface.

### MIB Objects

```
rip2IfConfTable  
  rip2IfConfAddress  
  rip2IfConfAuthType
```

---

## ip rip interface auth-key

Configures the text string that will be used as the password for the RIP interface. If you configure simple or MD5 authentication, you must configure a text string that will be used as the password for the RIP interface.

```
ip rip interface {interface_name} auth-key string
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>string</i>	16-byte text string.

### Defaults

The default authentication string is a null string.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Regardless of which authentication type is used (simple or MD5), both switches on either end of a link must share the same password.

### Examples

```
-> ip rip interface rip-1 auth-key nms
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip rip interface auth-type</a>	Configures the type of authentication that will be used for the RIP interface.
--	--

### MIB Objects

```
rip2IfConfTable  
  rip2IfConfAddress  
  rip2IfConfAuthKey
```

---

## ip rip update-interval

Configures the time interval during which RIP routing updates are sent out.

**ip rip update-interval** *seconds*

---

### Syntax Definitions

*seconds* The RIP routing update interval, in seconds. The valid range is 1–120.

### Defaults

---

parameter	default
<i>seconds</i>	30

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The update interval value must be less than or equal to one-third the invalid interval value.

### Examples

```
-> ip rip update-interval 45
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip rip](#) Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

### MIB Objects

alaProtocolRip  
alaRipUpdateInterval

---

## ip rip invalid-timer

Configures the RIP invalid timer value that defines the time interval during which a route will remain active in Routing Information Base (RIB) before moving to the invalid state.

**ip rip invalid-timer** *seconds*

---

### Syntax Definition

*seconds*                                      The RIP invalid timer value, in seconds. The valid range is 3–360.

### Defaults

parameter	default
<i>seconds</i>	180

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The invalid time interval value must be three times the update interval value.

### Examples

```
-> ip rip invalid-timer 270
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip rip](#)                                      Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

### MIB Objects

```
alaProtocolRip  
  alaRipInvalidTimer
```

---

## ip rip garbage-timer

Configures the RIP garbage timer value that defines the time interval, which must elapse before an expired route is removed from the RIB.

**ip rip garbage-timer** *seconds*

---

### Syntax Definition

*seconds* The RIP garbage timer value, in seconds. The valid range is 0–180.

### Defaults

parameter	default
<i>seconds</i>	120

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

During the RIP garbage interval, the router advertises the route with a metric of INFINITY (i.e., 16 hops).

### Examples

```
-> ip rip garbage-timer 180
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip rip](#) Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

### MIB Objects

alaProtocolRip  
alaRipGarbageTimer

---

## ip rip holddown-timer

Configures the RIP hold-down timer value that defines the time interval during which a route remains in the hold-down state.

**ip rip holddown-timer** *seconds*

---

### Syntax Definition

*seconds*                                      The hold-down time interval, in seconds. The valid range is 0–120.

### Defaults

parameter	default
<i>seconds</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

When RIP detects a route with higher metric than the route in the RIB, the route with the higher metric goes into the hold-down state. The route updates with a metric of INFINITY are rejected.

### Examples

```
-> ip rip holddown-timer 10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip rip](#)                                      Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

### MIB Objects

```
alaProtocolRip  
  alaRipHolddownTimer
```

---

## show ip rip

Displays the RIP status and general configuration parameters (e.g., forced hold-down timer).

**show ip rip**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip rip
```

```
Status = Enabled
Number of routes = 9
Host Route Support = Enabled
Route Tag = 42
Update interval = 30
Invalid interval = 180
Garbage interval = 120
Holddown interval = 0
Forced Hold-Down Timer = 0
```

#### *output definitions*

---

<b>Status</b>	RIP status ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Number of routes</b>	Number of network routes in the RIP routing table.
<b>Host Route Support</b>	Host route status ( <b>Enabled</b> or <b>Disabled</b> ). Indicates whether or not RIP can add host routes (routes with a 32-bit mask) to the RIP table.
<b>Route Tag</b>	Route tag value for RIP routes generated by the switch. Valid values are 0-2147483647.
<b>Update interval</b>	The RIP routing update interval, in seconds.
<b>Invalid interval</b>	The RIP invalid timer value, in seconds.
<b>Garbage interval</b>	The RIP garbage timer value, in seconds.
<b>Holddown interval</b>	The hold-down time interval, in seconds.
<b>Forced Hold-Down Timer</b>	The forced hold-down time interval, in seconds.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip rip admin-state</b>	Enables/disables RIP routing on the switch.
<b>ip rip force-holddowntimer</b>	Configures the interval during which a RIP route remains in the forced hold-down state.
<b>ip rip update-interval</b>	Configures the time interval during which RIP routing updates are sent out.
<b>ip rip invalid-timer</b>	Configures the RIP invalid timer value that defines the time interval during which a route will remain active in Routing Information Base (RIB) before moving to the invalid state.
<b>ip rip garbage-timer</b>	Configures the RIP garbage timer value that defines the time interval, which must elapse before an expired route is removed from the RIB.

---

## show ip rip routes

Displays the RIP routing database. The routing database contains all of the routes learned through RIP.

**show ip rip routes** [*ip\_address ip\_mask*]

---

### Syntax Definitions

*ip\_address*                      32-bit IP address.

*ip\_mask*                         The mask corresponding to the IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

To view all RIP routes, enter the basic command syntax (**show ip rip routes**). To view a specific route, enter the destination IP address and mask.

### Examples

-> show ip rip routes

Legends: State: A = Active, H = Holddown, G = Garbage

Destination	Gateway	State	Metric	Proto
2.0.0.0/8	+5.0.0.14	A	2	Rip
	4.0.0.7	A	3	Rip
4.0.0.0/8	+5.0.0.14	A	3	Rip
	2.0.0.14	A	3	Rip
5.0.0.0/8	+2.0.0.14	A	2	Rip
	4.0.0.7	A	3	Rip
10.0.0.0/8	+4.0.0.7	A	2	Rip
	5.0.0.14	A	2	Rip
	2.0.0.14	A	2	Rip
22.0.0.0/8	+5.0.0.14	A	2	Rip
	2.0.0.14	A	2	Rip
	4.0.0.7	A	3	Rip
128.251.40.0/24	+4.0.0.7	A	2	Rip
	5.0.0.14	A	3	Rip
	2.0.0.14	A	3	Rip
150.0.0.0/24	+4.0.0.7	A	2	Rip
	5.0.0.14	A	2	Rip
	2.0.0.14	A	2	Rip
152.0.0.0/24	+4.0.0.7	A	2	Rip
	5.0.0.14	A	3	Rip

*output definitions*

---

<b>Destination</b>	Destination network IP address.
<b>Gateway</b>	The Gateway IP address (switch from which the destination address was learned).
<b>State</b>	The associated state of the route, which can be <b>A (Active)</b> , <b>H (Holddown)</b> , or <b>G (Garbage)</b> .
<b>Metric</b>	Metric associated with this network. Generally, this is the RIP hop count (the number of hops from this switch to the destination switch).
<b>Proto</b>	The type of route ( <b>Local</b> , <b>Rip</b> , or <b>Redist</b> ).

---

```
-> show ip rip routes 2.0.0.0 255.0.0.0
```

```
Destination          = 2.0.0.0,
Mask length          = 8,
Gateway(1)           = 5.0.0.14,
  Protocol            = Rip,
  Out Interface       = intf5,
  Metric              = 2,
  Status              = Installed,
  State               = Active,
  Age                 = 19s,
  Tag                 = 0,
Gateway(2)           = 4.0.0.7,
  Protocol            = Rip,
  Out Interface       = intf4,
  Metric              = 3,
  Status              = Not Installed,
  State               = Active,
  Age                 = 12s,
  Tag                 = 0,
```

*output definitions*

---

<b>Destination</b>	Destination network IP address.
<b>Mask length</b>	Length of the destination network IP subnet mask.
<b>Gateway</b>	The Gateway IP address (switch from which the destination address was learned).
<b>Protocol</b>	The type of the route ( <b>Local</b> , <b>Rip</b> , or <b>Redist</b> ).
<b>Out Interface</b>	The RIP interface through which the next hop is reached.
<b>Metric</b>	Metric associated with this network. Generally, this is the RIP hop count (the number of hops from this switch to the destination switch).
<b>Status</b>	The RIP interface status (Installed or Not Installed).
<b>State</b>	The associated state of the route ( <b>Active</b> , <b>Holddown</b> , or <b>Garbage</b> ).
<b>Age</b>	The age of the route in seconds (the number of seconds since this route was last updated or otherwise determined to be correct).
<b>Tag</b>	The associated route tag.

---

## Release History

Release 7.1.1; command was introduced.

## show ip rip interface

Displays RIP interface status and configuration.

**show ip rip interface** [*interface\_name*]

---

### Syntax Definitions

*interface\_name*                      The interface name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Enter an IP address to view a specific interface. Enter the basic **show ip rip interface** command to show status for all interfaces.

### Examples

```
-> show ip rip interface rip-1
```

```
Interface IP Name           = rip-1,
Interface IP Address        = 11.11.11.1
IP Interface Number (VLANId) = 4,
Interface Admin status     = enabled,
IP Interface Status        = enabled,
Interface Config AuthType  = None,
Interface Config AuthKey Length = 0,
Interface Config Send-Version = v2,
Interface Config Receive-Version = both,
Interface Config Default Metric = 1,
Received Packets           = 154,
Received Bad Packets       = 0,
Received Bad Routes        = 0,
Sent Updates                = 8
```

#### *output definitions*

---

<b>Interface IP Name</b>	The IP Interface name.
<b>Interface IP Address</b>	Interface IP address.
<b>IP Interface Number</b>	Interface VLAN ID number.
<b>Interface Admin Status</b>	The RIP administrative status (enabled/disabled).
<b>IP Interface Status</b>	Interface status (enabled /disabled).
<b>Interface Config AuthType</b>	The type of authentication that will be used for the RIP interface (None or Simple).

*output definitions (continued)*

---

<b>Interface Config AuthKey Length</b>	The authentication key length used for the RIP interface.
<b>Interface Config Send-Version</b>	Interface send option (none, v1, v2, and v1 compatible).
<b>Interface Config Receive-Version</b>	Interface receive option (none, v1, v2, and both).
<b>Interface Config Default Metric</b>	Default redistribution metric.
<b>Received Packets</b>	Number of packets received on the interface.
<b>Received Bad Packets</b>	Number of bad packets received and discarded. Normally this value is zero (0).
<b>Received Bad Routes</b>	Number of bad routes received and discarded. Normally this value is zero (0).
<b>Sent Updates</b>	Number of RIP routing table updates sent.

---

**Release History**

Release 7.1.1; command was introduced.

## show ip rip peer

Displays active RIP neighbors (peers). An active peer is a switch that has sent a RIP packet within the last 180 seconds. If a peer does not send a RIP packet (request or response) within 180 seconds, it is aged out and will not be displayed.

**show ip rip peer** [*ip\_address*]

---

### Syntax Definitions

*ip\_address*                      32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

-> show ip rip peer

IP Address	Total Recvd	Bad Packets	Bad Routes	Version	Secs since last update
100.10.10.1	1	0	0	2	3

#### *output definitions*

---

<b>IP Address</b>	Peer IP address.
<b>Total recvd</b>	Total number of RIP packets received from the peer.
<b>Bad Packets</b>	Number of bad packets received from peer.
<b>Bad Routes</b>	Number of bad routes received from peer.
<b>Version</b>	Peer's RIP version as seen on the last packet received.
<b>Secs since last update</b>	Number of seconds since the last packet was received from the peer.

---

### Release History

# 16 BFD Commands

Bidirectional Forwarding Detection (BFD) is a hello protocol, which can be configured to interact with routing protocols for the detection of path failures and can reduce the convergence time in a network. BFD is supported with the BGP, OSPF, VRRP, and Static Routes.

When BFD is configured and enabled, BFD sessions are created and timers are negotiated between BFD neighbors. If a system does not receive a BFD control packet within the negotiated time interval, the neighbor system is considered down. Rapid failure detection notices are then sent to the routing protocol, which initiates a routing protocol recalculation. This process can reduce the time of convergence in a network.

BFD can be operated in two different modes: Asynchronous mode with Echo enabled and Echo-Only mode. Demand mode is not supported.

In Asynchronous mode, the systems continuously send BFD control packets between each other as part of a BFD session. If there are no packets received for a minimum time interval negotiated between the systems, then the neighbor system is considered down.

In Echo mode, a stream of BFD echo packets are transmitted in a forwarding path for which the neighboring system would loop the packets and send them back. If the number of packets transmitted is not echoed back, then the system is declared down. Echo mode can be operated along with Asynchronous mode.

MIB information for the BFD commands is as follows:

*Filename:* ALCATEL-IND1-BFD-MIB  
*Module:* ALCATEL-IND-BFD-MIB

A summary of the available commands is listed here:

---

<b>Global BFD commands</b>	<b>ip bfd admin-state</b> <b>ip bfd transmit</b> <b>ip bfd receive</b> <b>ip bfd multiplier</b> <b>ip bfd echo-interval</b> <b>ip bfd interface</b> <b>show ip bfd</b> <b>show ip bfd sessions</b> <b>show ip bfd sessions statistics</b>
----------------------------	---

---

---

<b>BFD Interface commands</b>	<b>ip bfd interface</b> <b>ip bfd interface admin-state</b> <b>ip bfd interface transmit</b> <b>ip bfd interface receive</b> <b>ip bfd interface multiplier</b> <b>ip ospf bfd-state</b> <b>ip bfd interface echo-interval</b> <b>show ip bfd interfaces</b>
<b>Commands to configure BFD supported protocols</b>	<b>ip ospf bfd-state</b> <b>ip ospf bfd-state all-interfaces</b> <b>ip ospf interface bfd-state</b> <b>ip ospf interface bfd-state drs-only</b> <b>ip ospf interface bfd-state all-neighbors</b> <b>ip bgp bfd-state</b> <b>ip bgp bfd-state all-neighbors</b> <b>ip bgp neighbor bfd-state</b> <b>vrrp bfd-state</b> <b>vrrp track address bfd-state</b> <b>ip static-route all bfd-state</b> <b>ip static-route bfd-state</b>

---

## ip bfd admin-state

Enables or disables the global BFD protocol status for the switch.

```
ip bfd admin-state {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables BFD.
<b>disable</b>	Disables BFD.

### Defaults

By default, BFD is disabled for the switch.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Disabling BFD does not remove the existing BFD configuration from the switch.
- When BFD is disabled, all BFD functionality is disabled for the switch, but configuring BFD is still allowed.
- Configuring BFD global parameters is not allowed when BFD is enabled for the switch.

### Examples

```
-> ip bfd admin-state enable  
-> ip bfd admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip bfd](#) Displays the BFD global status and general configuration parameters.

### MIB Objects

alaBfdGlobalAdminStatus

---

## ip bfd transmit

Configures the global transmit time interval for BFD control packets. This command specifies the minimum amount of time BFD waits between each transmission of control packets.

**ip bfd transmit** *transmit\_interval*

---

### Syntax Definitions

*transmit\_interval*                      The transmit time interval, in milliseconds. The valid range is 100–999.

### Defaults

parameter	default
<i>transmit_interval</i>	300 milliseconds

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The transmit time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd transmit** command does not override the value set for the interface using the **ip bfd interface transmit** command.
- The global transmit time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

### Examples

```
-> ip bfd transmit 500
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- |   |  |
|---|--|
| <a href="#">ip bfd interface transmit</a> | Configures the transmit time interval for a specific BFD interface.  |
| <a href="#">show ip bfd</a>               | Displays the BFD global status and general configuration parameters. |

### MIB Objects

alaBfdGlobalTxInterval

---

## ip bfd receive

Configures the global receive time interval for BFD control packets. This command specifies the minimum amount of time BFD waits to receive control packets before determining there is a problem.

**ip bfd receive** *receive\_interval*

---

### Syntax Definitions

*receive\_interval*                      The receive time interval, in milliseconds. The valid range is 100–999.

### Defaults

parameter	default
<i>receive_interval</i>	300 milliseconds

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The minimum receive time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd receive** command does not override the value set for the interface using the **ip bfd interface receive** command.
- The global receive time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

### Examples

```
-> ip bfd receive 500
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- ip bfd interface receive**                      Configures the receive time interval for a specific BFD interface.
- show ip bfd**                                      Displays the BFD global status and general configuration parameters.

### MIB Objects

alaBfdGlobalRxInterval

---

## ip bfd multiplier

Configures the global BFD detection time multiplier. This command specifies a number that is used to calculate the BFD detection time used in the asynchronous mode. The detection time value that is specified determines how long to wait before declaring that the BFD session is down.

**ip bfd multiplier** *num*

---

### Syntax Definitions

*num* The detection time multiplier number. The valid range is 3–255.

### Defaults

By default, the multiplier value is set to 3.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The global detection time multiplier is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd multiplier** command does not override the value set for the interface using the **ip bfd interface multiplier** command.
- The global detection time multiplier serves as the default multiplier value for a BFD interface. The default multiplier value is overridden when a specific value is configured for the interface.

### Examples

```
-> ip bfd multiplier 5
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip bfd interface multiplier</a>	Configures the detection time multiplier for a BFD interface.
<a href="#">show ip bfd</a>	Displays the BFD global status and general configuration parameters.

### MIB Objects

alaBfdGlobalDetectMult

---

## ip bfd echo-interval

Configures the global BFD echo packet time interval. The echo function is available with the asynchronous mode. Echo packets are transmitted to BFD peers to see if they loop back to the peer from which they originated.

**ip bfd echo-interval** *echo\_interval*

---

### Syntax Definitions

*echo\_interval*                      The echo time interval, in milliseconds. The valid range is 100–999.

### Defaults

parameter	default
<i>echo_interval</i>	300 milliseconds

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The echo packet time interval is also configurable at the BFD interface level. Note that configuring the global value with the **ip bfd echo-interval** command does not override the value set for the interface using the **ip bfd interface echo-interval** command.
- The global echo packet time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.

### Examples

```
-> ip bfd echo-interval 500
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- ip bfd interface echo-interval**    Configures the echo packet time interval for a BFD interface.
- show ip bfd**                      Displays the BFD global status and general configuration parameters.

### MIB Objects

alaBfdGlobalEchoRxInterval

---

## ip bfd interface

Configures a BFD interface.

**ip bfd interface** *if\_name*

**no ip bfd interface** *if\_name*

---

### Syntax Definitions

*if\_name*    The name of an existing IP interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete a BFD interface.
- The interface name must be an existing IP interface name that is configured with an IP address.

### Examples

```
-> ip bfd interface bfd-vlan-101
-> no ip bfd interface bfd-vlan-101
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>ip bfd interface admin-state</b>	Configures the administrative status of a BFD interface.
<b>show ip bfd interfaces</b>	Displays the status and statistics of a BFD interface.
<b>show ip bfd sessions</b>	Displays the status and statistics of the BFD sessions.

### MIB Objects

```
alaBfdIntfTable
  alaBfdIntfAddrType
  alaBfdIntfAddr
  alaBfdIntfIndex
```

## ip bfd interface admin-state

Enables or disables the administrative status of a BFD interface.

**ip bfd interface** *if\_name* **admin-state** {**enable** | **disable**}

---

### Syntax Definitions

<i>if_name</i>	The name of an existing BFD interface.
<b>enable</b>	Enables the BFD interface.
<b>disable</b>	Disables the BFD interface.

### Defaults

By default, a BFD interface is disabled when it is created.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The BFD interface must be enabled to participate in the BFD protocol.

### Examples

```
-> ip bfd interface bfd-vlan-101 admin-state enable
-> ip bfd interface bfd-vlan-101 admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip bfd interface</a>	Creates a BFD interface.
<a href="#">show ip bfd interfaces</a>	Displays the status and statistics of a BFD interface.
<a href="#">show ip bfd sessions</a>	Displays the status and statistics of BFD sessions.

### MIB Objects

```
alaBfdIntfTable
  alaBfdIntfAdminStatus
```

---

## ip bfd interface transmit

Configures the transmit time interval for the BFD interface. This command specifies the minimum amount of time BFD waits between each transmission of control packets from the interface.

```
ip bfd interface if_name transmit transmit_interval
```

---

### Syntax Definitions

<i>if_name</i>	The name of an existing BFD interface.
<i>transmit_interval</i>	The transmit time interval, in milliseconds. The valid range is 100–999.

### Defaults

---

parameter	default
<i>transmit_interval</i>	300 milliseconds

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The global transmit time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface transmit time interval using the **ip bfd interface transmit** command does not change the global value configured with the **ip bfd transmit** command.

### Examples

```
-> ip bfd interface bfd-vlan-101 transmit 500
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip bfd interface</a>	Creates a BFD interface.

<a href="#">show ip bfd interfaces</a>	Displays the status and statistics of a BFD interface.
<a href="#">show ip bfd sessions</a>	Displays the status and statistics of the BFD sessions.

### MIB Objects

```
alaBfdIntfTable  
  alaBfdIntfDesiredMinTxInterval
```

---

## ip bfd interface receive

Configures the receive time interval for the BFD interface. This command specifies the minimum amount of time BFD waits to receive control packets on the interface before determining there is a problem.

**ip bfd interface** *if\_name* **receive** *receive\_interval*

---

### Syntax Definitions

<i>if_name</i>	The name of an existing BFD interface.
<i>receive_interval</i>	The receive time interval, in milliseconds. The valid range is 100–999.

### Defaults

parameter	default
<i>receive_interval</i>	300 milliseconds

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The global receive time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface transmit time interval using the **ip bfd interface receive** command does not change the global value configured with the **ip bfd receive** command.

### Examples

```
-> ip bfd interface bfd-vlan-101 receive 500
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip bfd interface</a>	Creates a BFD interface.
<a href="#">ip bfd receive</a>	Configures a global BFD receive time interval.
<a href="#">show ip bfd interfaces</a>	Displays the BFD interface configuration table.
<a href="#">show ip bfd sessions</a>	Displays the BFD interface configuration table.

### MIB Objects

```
alaBfdIntfTable
  alaBfdReqMinRxInterval
```

---

## ip bfd interface multiplier

Configures the BFD interface detection time multiplier. This command specifies a number that is used to calculate the BFD detection time used in the asynchronous mode. When an interface stops receiving packets from a neighbor, the interface uses the detection time value to determine how long to wait before declaring that the BFD session is down.

**ip bfd interface** *if\_name* **multiplier** *num*

---

### Syntax Definitions

<i>if_name</i>	The name of an existing BFD interface.
<i>num</i>	The detection time multiplier number. The valid range is 3–255.

### Defaults

By default, the multiplier value is set to 3.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The detection time between neighbors is calculated by multiplying the negotiated transmit time interval by the detection time multiplier.

### Examples

```
-> ip bfd interface bfd-vlan-101 multiplier 5
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip bfd interface</a>	Creates a BFD interface.
<a href="#">show ip bfd interfaces</a>	Displays the BFD interface configuration table.
<a href="#">show ip bfd sessions</a>	Displays the BFD interface configuration table.

### MIB Objects

alaBfdIntfTable  
alaBfdIntfDetectMult

---

## ip bfd interface echo-interval

Configures the echo time interval for the BFD interface. The echo function is available with the asynchronous mode. Echo packets are transmitted to BFD peers to see if they loop back to the peer from which they originated.

**ip bfd interface** *if\_name* **echo-interval** *echo\_interval*

---

### Syntax Definitions

<i>if_name</i>	The name of an existing IP interface.
<i>echo_interval</i>	The echo time interval, in milliseconds. The valid range is 100–999.

### Defaults

parameter	default
<i>echo_interval</i>	300 milliseconds

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The global echo time interval serves as the default interval value for a BFD interface. The default interval value is overridden when a specific value is configured for the interface.
- Note that configuring the interface echo time interval using the **ip bfd interface echo-interval** command does not change the global value configured with the **ip bfd echo-interval** command.

### Examples

```
-> ip bfd interface bfd-vlan-101 echo-interval 500
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip bfd interface</a>	Creates a BFD interface.
<a href="#">ip bfd echo-interval</a>	Configures a global BFD echo time interval.
<a href="#">show ip bfd interfaces</a>	Displays the BFD interface configuration table.
<a href="#">show ip bfd sessions</a>	Displays the BFD interface configuration table.

### MIB Objects

```
alaBfdIntfTable
  alaBfdIntfReqMinEchoRxInterval
```

---

## ip ospf bfd-state

Enables or disables the BFD status for the OSPF protocol.

```
ip ospf bfd-state {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables BFD Status.
<b>disable</b>	Disables BFD Status.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- All the status changes on the neighbors are received from the BFD level and the OSPF protocol acts based upon the BFD message.
- Whenever a neighbor goes down, OSPF will inform BFD to remove that neighbor from the BFD active list.

### Examples

```
-> ip ospf bfd-state enable  
-> ip ospf bfd-state disable
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

- ip ospf bfd-state all-interfaces** Enables or disables BFD for all OSPF interfaces configured.
- ip ospf interface bfd-state** Enables or disables BFD for a specific OSPF interface.
- ip ospf interface bfd-state drs-only** Establishes BFD sessions only on neighbors in full state.
- ip ospf interface bfd-state all-neighbors** Establishes BFD sessions with all neighbors of the corresponding interface which are greater than or equal to “2-way” state.

## MIB Objects

alaProtocolospf  
alaOspfBfdStatus

---

## ip ospf bfd-state all-interfaces

Enables or disables BFD for all OSPF interfaces in the switch configuration.

```
ip ospf bfd-state all-interfaces {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables BFD for all the OSPF interfaces.
<b>disable</b>	Disables BFD for all the OSPF interfaces.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The BFD status for OSPF must be enabled before OSPF can interact with BFD.

### Examples

```
-> ip ospf bfd-state all-interfaces enable  
-> ip ospf bfd-state all-interfaces disable
```

### Release History

Release 7.1.1; command was introduced.

```

---

## ip ospf interface bfd-state drs-only

Establishes BFD sessions only with neighbors that are in the full state.

**ip ospf interface** *if\_name* **bfd-state drs-only**

---

### Syntax Definitions

*if\_name*                                      The name of an existing OSPF interface.

### Defaults

By default, BFD is enabled for DR neighbors only.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The specified OSPF interface must be enabled to interact with BFD.
- The BFD status for OSPF must be enabled before OSPF can interact with BFD.

### Examples

```
-> ip ospf interface int1 bfd-state drs-only
```

### Release History

Release 7.1.1; command was introduced.

## ip bgp bfd-state

Enables or disables BFD for the BGP protocol.

```
ip bgp bfd-state {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables BGP.
<b>disable</b>	Disables BGP.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- All the status changes on the neighbors are received from the BFD level and the BGP protocol acts based upon the BFD message.
- Whenever a neighbor goes down, BGP will inform BFD to remove that neighbor from the BFD active list.

### Examples

```
-> ip bgp bfd-state enable  
-> ip bgp bfd-state disable
```

### Release History

Release 7.1.1; command was introduced.

---

## vrrp bfd-state

Enables or disables VRRP with the BFD protocol.

```
vrrp bfd-state {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables BFD for VRRP.
<b>disable</b>	Disables BFD for VRRP.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- BFD support for VRRP is done only for tracking policy configuration for a remote address.
- The BFD status for VRRP must be enabled before VRRP can interact with BFD.

### Examples

```
-> vrrp bfd-state enable  
-> vrrp bfd-state disable
```

### Release History

```

*output definitions*

---

<b>Local discriminator</b>	The local discriminator.
<b>Neighbor IP address</b>	The IP address of the BFD neighbor.
<b>Requested Session Type</b>	The bit map of the session type that is requested. .
<b>Interface IP address</b>	The IP address of the outgoing BFD interface for this session.
<b>Source UDP Port</b>	The unique source UDP port used to send BFD packets for this session.
<b>State</b>	The state of the BFD session.
<b>Session Operating Mode</b>	The current operating mode of the BFD session.
<b>Remote discriminator</b>	The remote discriminator.
<b>Negotiated Tx interval</b>	The negotiated transmit interval.
<b>Negotiated Rx interval</b>	The negotiated receive interval.
<b>Echo Rx interval</b>	The Echo packet receive interval.
<b>Detection Time Multiplier</b>	The BFD Detection Time multiplier number.
<b>Applications Registered</b>	The bit map object of applications that are registered with this BFD session.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

## show ip bfd sessions statistics

Displays the statistics for all BFD sessions, a specific session or a specific slot.

**show ip bfd sessions statistics** *session\_num*

---

### Syntax Definitions

*session\_num*                      The BFD session number. Valid range is 1–1024.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip bfd sessions statistics
Local      Neighbor      Tx      Rx      Echo Tx      Last Down      Up
Discr      Address      Packets  Packets  Packets      Diag Code      Count
-----+-----+-----+-----+-----+-----+-----
1      100.1.1.10      0      0      5772      0      1
2      101.1.1.11      5242     5241     0      0      1

## ip static-route all bfd-state

Enables BFD for all static routes.

**ip static-route all bfd-state {enable| disable}**

---

### Syntax Definitions

<b>enable</b>	Enables BFD.
<b>disable</b>	Disables BFD.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When there are static route configured in the switch, BFD is enabled to track the gateway.
- If the route is not reachable, it will be moved to the inactive database.

### Examples

```
-> ip static-route all bfd-state enable  
-> ip static-route all bfd-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

N/A

### MIB Objects

```
alaIprmConfig  
  alaIprmStaticallbfd
```

---

## ip static-route bfd-state

Enables or disables BFD for a specific static route.

```
ip static-route ipv4_prefix/pfx_length gateway ipv4_host_address bfd-state {enable| disable}
```

---

### Syntax Definitions

<i>ipv4_prefix</i>	The destination IP address.
<i>pfx_length</i>	The prefix length for the destination IP address.
gateway <i>ipv4_host_address</i>	The gateway IP address.
enable	Enables BFD.
disable	Disables BFD.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

BFD is enabled to track the gateway of static routes.

### Examples

```
-> ip static-route 192.100.1.0/24 gateway 100.1.1.10 bfd-state enable
-> ip static-route 192.100.1.0/24 gateway 100.1.1.10 bfd-state disable
```

### Release History

  alaIprmStaticRouteDest
  alaIprmStaticRouteMask
  alaIprmStaticRouteNextHop
  alaIprmStaticRouteBfdStatus
```

---

# 17 DHCP Relay Commands

Bootstrap Protocol (BOOTP) and Dynamic Host Configuration Protocol (DHCP) packets contain configuration information for network hosts. DHCP Relay enables forwarding of BOOTP/DHCP packets between networks. This allows routing of DHCP traffic between clients and servers. It is not necessary to enable DHCP Relay if DHCP traffic is bridged through one network (the clients and servers are on the same physical network).

This chapter includes a description of DHCP Relay commands that are used to define the IP address of DHCP servers, maximum number of hops, and forward delay time. Configure DHCP Relay on the switch where routing of BOOTP/DHCP packets occur. These CLI commands are applicable for all VRF instances.

MIB information for DHCP Relay commands is as follows:

*Filename:* AlcatelIND1UDPRelay.MIB  
*Module:* ALCATEL-IND1-UDP-RELAY-MIB

A summary of the available commands is listed here.

---

**ip helper address**  
**ip helper vlan address**  
**ip helper standard**  
**ip helper per-vlan-only**  
**ip helper forward-delay**  
**ip helper maximum-hops**  
**ip helper agent-information**  
**ip helper agent-information policy**  
**ip helper pxe-support**  
**ip helper boot-up**  
**ip helper boot-up enable**  
**ip udp relay port**  
**ip udp relay service**  
**ip udp relay service vlan**  
**show ip helper**  
**show ip helper statistics**  
**show ip udp relay**  
**show ip udp relay statistics**  
**no ip helper statistics**  
**ip udp relay no statistics**

---

## ip helper address

Adds or deletes a DHCP server IP address. DHCP Relay forwards BOOTP/DHCP broadcasts to and from the specified address. If multiple DHCP servers are used, configure one IP address for each server.

**ip helper address** *ip\_address*

**no ip helper address** [*ip\_address*]

---

### Syntax Definitions

*ip\_address* DHCP server IP address (for example 21.0.0.10).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete an IP address from the DHCP Relay service. If an address is not specified, then all addresses are deleted.
- Using this command enables a Global DHCP Relay service on the switch. When the DHCP Relay is specified by the DHCP server IP address, the service is called Global DHCP.
- When the DHCP Relay is specified by the VLAN number of the DHCP request, the service is referred to as Per-VLAN DHCP.
- Global DHCP and Per-VLAN DHCP are mutually exclusive. You can only configure one or the other.
- Use this command to configure DHCP Relay on switches where packets are routed between IP networks.

### Examples

```
-> ip helper address 75.0.0.10  
-> no ip helper address 31.0.0.20
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<b>ip helper vlan address</b>	Specifies or deletes DHCP Relay based on the VLAN of the DHCP request.
<b>ip helper forward-delay</b>	Sets the forward delay time value. DHCP Relay does not process a client packet unless the packet contains an elapsed boot time value that is equal to or greater than the configured value of the forward delay time.
<b>ip helper maximum-hops</b>	Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse.
<b>show ip helper</b>	Displays current DHCP Relay configuration information.
<b>show ip helper statistics</b>	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

## MIB Objects

```
iphelperTable  
    iphelperService  
    iphelperForwAddr
```

---

## ip helper vlan address

Configures a DHCP Relay service for the specified VLAN. This command is used when a per-VLAN only relay service is active on the switch. It does not apply when a standard relay service is used.

**ip helper vlan** *vlan\_id*[-*vlan\_id2*] **address** *ip\_address*

**no ip helper vlan** *vlan\_id*[-*vlan\_id2*] **address** *ip\_address*

---

### Syntax Definitions

<i>vlan_id</i>	VLAN identification number (for example 3) of the DHCP server VLAN.
<i>vlan_id2</i>	The last VLAN ID number in a contiguous range of VLAN IDs.
<i>ip_address</i>	IP address (for example 21.0.0.10) of the DHCP server VLAN.

### Defaults

If no VLAN identification number is entered, VLAN ID 0 is used by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Specifying multiple VLAN IDs and/or a range of VLAN IDs on the same command line is allowed. Use a hyphen to indicate a contiguous range of VLAN ID entries. (for example, 10-15).
- The **ip helper vlan address** command works only if the **per-vlan-only** forwarding option is active. Use the **ip helper per-vlan-only** command to enable this option.
- Configure DHCP Relay on switches where packets are routed between IP networks.
- The IP interface must be defined for the VLANs before using this command.
- Use the **no** form of this command to delete the DHCP server VLAN from the DHCP Relay.

### Examples

```
-> ip helper vlan 3 address 75.0.0.10
-> ip helper vlan 250-255 address 198.206.15.2
-> no ip helper vlan 3 address 75.0.0.1
-> no ip helper vlan 1601 address 198.206.15.20
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

### [ip helper per-vlan-only](#)

Sets the DHCP Relay forwarding option to process only DHCP packets received from a specific, identified VLAN.

### [show ip helper](#)

Displays current DHCP Relay configuration information.

### [show ip helper statistics](#)

Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

## MIB Objects

iphelperTable

    iphelperService

    iphelperVlan

---

## ip helper standard

Sets the DHCP Relay forwarding option to standard. All DHCP packets are processed by a global relay service.

### ip helper standard

---

#### Syntax Definitions

N/A

#### Defaults

By default, the DHCP Relay forwarding option is set to **standard**.

#### Platforms Supported

OmniSwitch 10K, 6900

#### Usage Guidelines

To process DHCP packets on a per VLAN basis, or to change the DHCP Relay forwarding option from standard to per VLAN, use the [ip helper per-vlan-only](#) command.

#### Examples

```
-> ip helper standard
```

#### Release History

Release 7.1.1; command introduced.

#### Related Commands

[show ip helper](#)

Displays current DHCP Relay configuration information.

[show ip helper statistics](#)

Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

#### MIB Objects

```
iphelperStatTable  
iphelperForwOption
```

---

## ip helper per-vlan-only

Sets the DHCP Relay forwarding option to process only DHCP packets received from a specific, identified VLAN. This option allows each VLAN to have its own relay.

**ip helper per-vlan-only**

---

### Syntax Definitions

N/A

### Defaults

By default, the UDP forwarding option is set to **standard**.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When the forwarding option is set to **per-vlan-only**, the **standard** (global) DHCP relay service is not available. These two types of services are mutually exclusive.
- To process DHCP packets on a per VLAN basis, or to change the DHCP Relay forwarding option from standard to per VLAN, use the **ip helper per-vlan-only** command.
- Using the **per-vlan-only** forwarding option requires you to specify a DHCP server IP address for each VLAN that provides a relay service. The **ip helper vlan address** command performs this function and at the same time enables relay for the specified VLAN.

### Examples

```
-> ip helper per-vlan-only
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<b>ip helper vlan address</b>	Configures a DHCP Relay service for the specified VLAN.
<b>ip helper standard</b>	Sets DHCP Relay forwarding option to standard. All DHCP packets are processed.
<b>show ip helper</b>	Displays current DHCP Relay configuration information.
<b>show ip helper statistics</b>	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

## **MIB Objects**

iphelperStatTable  
iphelperForwOption

---

## ip helper forward-delay

Sets the forward delay time value for the DHCP Relay configuration. The BOOTP/DHCP packet sent from the client contains the elapsed boot time. This is the amount of time, in seconds, since the client last booted. DHCP Relay does not process the packet unless the elapsed boot time value of the client is equal to or greater than the configured value of the forward delay time.

**ip helper forward-delay** *seconds*

---

### Syntax Definitions

*seconds* Forward delay time value in seconds.

### Defaults

By default, the forward delay time is set to three seconds.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The time specified applies to all defined IP helper addresses.
- If a packet contains an elapsed boot time value that is less than the specified forward delay time value, DHCP Relay discards the packet.

### Examples

```
-> ip helper forward-delay 300
-> ip helper forward-delay 120
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">ip helper address</a>	Adds or deletes one or more DHCP server IP addresses to the DHCP Relay configuration.
<a href="#">ip helper maximum-hops</a>	Sets the maximum number of hops value to specify how many relays a BOOTP/DHCP packet can traverse.
<a href="#">show ip helper</a>	Displays current DHCP Relay configuration information.
<a href="#">show ip helper statistics</a>	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

## **MIB Objects**

iphelperStatTable  
iphelperForwDelay

---

## ip helper maximum-hops

Sets the maximum number of hops value for the DHCP Relay configuration. This value specifies the maximum number of relays a BOOTP/DHCP packet is allowed to traverse until it reaches its server destination. Limiting the number of hops that can forward a packet prevents packets from looping through the network.

**ip helper maximum-hops** *hops*

---

### Syntax Definitions

*hops*                                      The maximum number of relays.

### Defaults

By default, the maximum hops value is set to four hops.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If a packet contains a hop count equal to or greater than the *hops* value, DHCP Relay discards the packet.
- The maximum hops value only applies to DHCP Relay and is ignored by other services.

### Examples

```
-> ip helper maximum-hops 1
-> ip helper maximum-hops 10
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">ip helper address</a>	Adds or deletes one or more DHCP server IP addresses to the DHCP Relay configuration.
<a href="#">ip helper forward-delay</a>	Sets the forward delay time value. DHCP Relay does not process a client packet unless the packet contains an elapsed boot time value that is equal to or greater than the configured value of the forward delay time.
<a href="#">show ip helper</a>	Displays current DHCP Relay configuration information.
<a href="#">show ip helper statistics</a>	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

## **MIB Objects**

iphelperStatTable  
iphelperMaxHops

---

## ip helper agent-information

Enables or disables the DHCP relay agent information option (Option-82) feature. When this feature is enabled, local relay agent information is inserted into client DHCP packets when the agent forwards these packets to a DHCP server.

**ip helper agent-information {enable | disable}**

---

### Syntax Definitions

**enable** Enables the relay agent Option-82 feature for the switch.

**disable** Disables the relay agent Option-82 feature for the switch.

### Defaults

By default, this feature is disabled on the switch.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command enables the DHCP Option-82 feature for the entire switch; it is not configurable on a per-VLAN basis.
- When the relay agent receives a DHCP packet that already contains the Option-82 field, the packet is processed based on the agent information policy configured for the switch. This policy is configured using the **ip help agent-information policy** command.

### Examples

```
-> ip helper agent-information enable
-> ip helper agent-information disable
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

**ip helper agent-information policy** Configures a policy to determine how the relay agent handles DHCP packets that already contain the Option-82 field.

**show ip helper** Displays current DHCP Relay configuration information.

**show ip helper statistics** Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

## **MIB Objects**

iphelperAgentInformation

---

## ip helper agent-information policy

Configures a policy that determines how the DHCP relay agent handles the DHCP packets that already contain an Option-82 field.

**ip helper agent-information policy {drop | keep | replace}**

---

### Syntax Definitions

<b>drop</b>	Drop DHCP packets that already contain an Option-82 field.
<b>keep</b>	Keep the existing Option-82 field information and continue to relay the DHCP packet.
<b>replace</b>	Replace the existing Option-82 field information with local relay agent information and continue to relay the DHCP packet.

### Defaults

By default, DHCP packets that already contain an Option-82 field are dropped.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The agent information policy is not applied if the DHCP relay agent receives a DHCP packet from a client that contains a non-zero value for the gateway IP address (giaddr). In this case, the agent does not insert the relay agent information option into the DHCP packet and forwards the packet to the DHCP server.
- Note that if a DHCP packet contains a gateway IP address (giaddr) value that matches a local subnet and also contains the Option-82 field, the packet is dropped by the relay agent.

### Examples

```
-> ip helper agent-information policy drop
-> ip helper agent-information policy keep
-> ip helper agent-information policy replace
```

### Release History

Release 7.1.1; command introduced.

**Related Commands**

<b>ip helper agent-information</b>	Enables the insertion of relay agent information Option-82 into DHCP packets.
<b>show ip helper</b>	Displays current DHCP Relay configuration information.
<b>show ip helper statistics</b>	Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

**MIB Objects**

iphelperAgentInformationPolicy

---

## ip helper pxe-support

Enables or disables relay agent support for Preboot Execution Environment (PXE) devices.

**ip helper pxe-support {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables PXE support.
<b>disable</b>	Disables PXE support.

### Defaults

By default, PXE support is disabled for the switch.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

PXE support is disabled by default and it is a user-configurable option using the **ip helper pxe-support** command.

### Examples

```
-> ip helper pxe-support enable  
-> ip helper pxe-support disable
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show ip helper](#) Displays current DHCP Relay configuration information.

### MIB Objects

iphelperPXESupport

---

## ip helper boot-up

Enables or disables automatic IP address configuration for default VLAN 1 when an unconfigured switch boots up. If enabled, the switch broadcasts a BootP or a DHCP request packet at boot time. When the switch receives an IP address from a BootP/DHCP server, the address is assigned to default VLAN 1.

---

**Note.** Automatic IP address configuration only supports the assignment of a *permanent* IP address to the switch. Make sure that the DHCP server is configured with such an address before using this feature.

---

**ip helper boot-up {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables automatic IP address configuration for default VLAN 1.
<b>disable</b>	Disables automatic IP address configuration for default VLAN 1.

### Defaults

By default, this feature is disabled on the switch.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **ip helper boot-up enable** command to specify BootP or DHCP for the request packet type.
- If an IP router port already exists for VLAN 1, a request packet is not broadcast even if automatic IP address configuration is enabled for the switch.

### Examples

```
-> ip helper boot-up enable
-> ip helper boot-up disable
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

**ip helper boot-up enable** Specifies BootP or DHCP as the type of request packet the switch broadcasts at boot time.

### MIB Objects

```
iphelperStatTable
  iphelperBootupOption
```

---

## ip helper boot-up enable

Specifies the type of packet to broadcast (BootP or DHCP) when automatic IP address configuration is enabled for the switch.

---

**Note.** Automatic IP address configuration only supports the assignment of a *permanent* IP address to the switch. Make sure that the DHCP server is configured with such an address before using this feature.

---

**ip helper boot-up enable {BOOTP | DHCP}**

---

### Syntax Definitions

**BOOTP** Broadcasts a BOOTP formatted request packet.  
**DHCP** Broadcasts a DHCP formatted request packet.

### Defaults

---

parameter	default
BOOTP   DHCP	BOOTP

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command is only valid if automatic IP address configuration is already enabled for the switch.

### Examples

```
-> ip helper boot-up enable DHCP  
-> ip helper boot-up enable BOOTP
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[ip helper boot-up](#) Enables or disables automatic IP configuration for the switch.

### MIB Objects

iphelperStatTable  
iphelperBootupPacketOption

---

## ip udp relay port

Enables or disables UDP port relay for user-defined service ports that are not well-known.

**ip udp relay port** *port\_num* [**description** *description*]

**ip udp relay no port** *port\_num*

---

### Syntax Definitions

*port\_num*                                    A service port number that is not well-known or user-defined.  
*description*                                A description of the user-defined service for the specified port.

### Defaults

By default, relay is enabled on the BOOTP/DHCP well-known ports.

parameter	default
<i>name</i>	UDP port #

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable the user-defined service for the specified port.
- Use the **port** parameter to specify service port numbers that are not well known.

### Examples

```
-> ip udp relay port 54
-> ip udp relay port 54 description "Generic Service"
-> ip udp relay no port 54
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

**ip udp relay service vlan**                Specifies the VLAN to which traffic from the specified UDP service port is forwarded.

**MIB Objects**

```
iphelperxServicePortAssociationTable
  iphelperxServicePortAssociationService
  iphelperxServicePortAssociationPort
  iphelperxServicePortAssociationName
iphelperxPortServiceAssociationTable
  iphelperxPortServiceAssociationService
  iphelperxPortServiceAssociationPort
  iphelperxPortServiceAssociationName
```

---

## ip udp relay service

Enables or disables UDP port relay for generic UDP service ports ( NBNS, NBDD, or other well-known UDP ports).

```
ip udp relay service {TFTP | TACACS | NTP | NBNS | NBDD | DNS} [description description]
```

```
ip udp relay no service {TFTP | TACACS | NTP | NBNS | NBDD | DNS}
```

---

### Syntax Definitions

<b>TFTP</b>	TFTP well-known port 69.
<b>TACACS</b>	TACACS well-known port 65.
<b>NTP</b>	NTP well-known port 123.
<b>NBNS</b>	NBNS well-known ports 137.
<b>NBDD</b>	NBDD well-known port 138.
<b>DNS</b>	DNS well-known port 53.
<i>description</i>	A description of the UDP service.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable UDP Relay for the specified service port.
- The *description* parameter is only used with any of the **service** keywords and provides a user-defined description to identify the port service.
- When UDP Relay is disabled for BOOTP/DHCP, the **ip helper** configuration is *not* retained and all dependant functionality (automatic IP configuration for VLAN 1, Telnet and HTTP client authentication, and so on) is disrupted.
- Up to three types of UDP Relay services are supported at any one time and in any combination.
- If port relay is enabled for the NBDD well-known port, NBNS is not automatically enabled by default.
- Note that when UDP port relay is enabled for NTP, relay cannot forward NTP packets that contain a destination IP address that matches a VLAN router IP address on the switch.

### Examples

```
-> ip udp relay service DNS
-> ip udp relay service DNS description DNS_1
-> ip udp relay no service DNS
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

**ip udp relay service vlan** Specifies the VLAN to which traffic from the specified UDP service port is forwarded.

## MIB Objects

```
iphelperxServicePortAssociationTable  
  iphelperxServicePortAssociationService  
  iphelperxServicePortAssociationPort  
  iphelperxServicePortAssociationName  
iphelperxPortServiceAssociationTable  
  iphelperxPortServiceAssociationService  
  iphelperxPortServiceAssociationPort  
  iphelperxPortServiceAssociationName
```

---

## ip udp relay service vlan

Specifies a VLAN on which traffic destined for a UDP port is forwarded.

**ip udp relay service** {TFTP | TACACS | NTP | NBNS | NBDD | DNS} | **port** *port\_num* [*description*] **vlan** *vlan\_id*[-*vlan\_id2*]

**ip udp relay service** {TFTP | TACACS | NTP | NBNS | NBDD | DNS} | **port** *port\_num* **no vlan** *vlan\_id*[-*vlan\_id2*]

---

### Syntax Definitions

<b>TFTP</b>	TFTP well-known port 69.
<b>TACACS</b>	TACACS well-known port 65.
<b>NTP</b>	NTP well-known port 123.
<b>NBNS</b>	NBNS well-known ports 137.
<b>NBDD</b>	NBDD well-known port 138.
<b>DNS</b>	DNS well-known port 53.
<i>port_num</i>	A user-defined port number.
<i>description</i>	A description of the UDP service.
<i>vlan_id</i>	A numeric value that uniquely identifies an individual VLAN.
<i>-vlan_id2</i>	The last VLAN ID number in a contiguous range of VLAN IDs. Use a hyphen to specify a range of VLANs (for example, 1-5).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove the VLAN association with the UDP service port.
- The UDP port must be created before using this command.
- Use the **service** keyword to define a well-known UDP port. Use the **port** keyword to specify a user-defined port.
- Only specify service port numbers that are *not* well known when using the *port* parameter with this command. For example, do not specify port 53 as it is the well-known port number for the DNS UDP service. Instead, use the **DNS** parameter to enable relay for port 53.
- Specifying a VLAN for the BOOTP/DHCP service does not work if the **per-vlan-only** forwarding option is not active. Use the **ip helper per-vlan-only** command to enable this option.

## Examples

```
-> ip udp relay service DNS vlan 10
-> ip udp relay service DNS vlan 500-550
-> ip udp relay service DNS no vlan 10
-> ip udp relay port 3047 vlan 20
-> ip udp relay port 3047 no vlan 20
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">ip udp relay port</a>	Enables or disables UDP port relay for user-defined service ports that are not well-known.
<a href="#">ip udp relay service</a>	Enables or disables relay for UDP service ports.

## MIB Objects

```
iphelperxPortServiceAssociationTable
  iphelperxPortServiceAssociationService
```

---

## show ip helper

Displays the current DHCP Relay and Relay Agent Information.

**show ip helper**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Displays information for all IP addresses configured.

### Examples

The following example shows the show ip helper command output:

```
-> show ip helper
Ip helper :
  Forward Delay(seconds)           = 300,
  Max number of hops                = 5,
  Relay Agent Information           = Enabled,
  Relay Agent Information Policy    = Keep,
  PXE support                       = Enabled,
  Forward option                   = standard mode,
  Bootup Option                    = Disable,
  Bootup Packet Option             = DHCP
  Forwarding address list (Standard mode):
    128.100.16.1
```

#### *output definitions*

<b>Forward Delay</b>	The current forward delay time (default is three seconds). Use the <a href="#">ip helper forward-delay</a> command to change this value.
<b>Max number of hops</b>	The current maximum number of hops allowed (default is four hops). Use the <a href="#">ip helper maximum-hops</a> command to change this value.
<b>Relay Agent Information</b>	Indicates the status ( <b>Enabled</b> or <b>Disabled</b> ) of the DHCP relay agent information option feature. Configured through the <a href="#">ip helper agent-information</a> command.
<b>Relay Agent Information Policy</b>	The policy configured to determine how the DHCP relay agent handles the DHCP packets that already contain an Option-82 field.

*output definitions*

---

<b>PXE support</b>	Specifies the status ( <b>Enabled</b> or <b>Disabled</b> ) of the relay agent support for PXE devices. By default the PXE support is disabled. Configured through the <b>ip helper pxe-support</b> command.
<b>Forward option</b>	The current forwarding option setting: <b>standard mode</b> .
<b>Bootup Option</b>	Indicates whether or not automatic IP address configuration for default VLAN 1 is done when the switch boots up ( <b>Enabled</b> or <b>Disabled</b> ). Configured through the <b>ip helper boot-up</b> command.
<b>Bootup Packet Option</b>	Indicates if the Bootup Option broadcasts a <b>DHCP</b> or <b>BOOTP</b> packet to obtain an IP address for default VLAN 1. Configured through the <b>ip helper boot-up enable</b> command. Note that this field does not appear if the Bootup Option is disabled.
<b>Forwarding Addresses</b>	IP addresses for DHCP servers that receive BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the <b>ip helper address</b> command to add or remove DHCP server IP addresses from the DHCP Relay configuration.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

**show ip helper statistics** Displays DHCP Relay statistics, including the number of client packets received and transmitted to the DHCP server and packets dropped due to forward delay time and maximum hops violations.

**MIB Objects**

```

iphelperTable
  iphelperService
  iphelperForwAddr
  iphelperForwDelay
  iphelperMaxHops
iphelperAgentInformation
iphelperAgentInformationPolicy
iphelperStatTable
  iphelperBootupOption
  iphelperBootupPacketOption

```

---

## show ip helper statistics

Displays the number of packets DHCP Relay has received, the number of packets dropped due to forward delay and maximum hops violations. It also displays the number of packets processed since the last time these statistics were displayed. It includes statistics that apply to a specific DHCP server, such as the number of packets transmitted to the server and the difference between the number of packets received from a client and the number transmitted to the server.

**show ip helper statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to clear all DHCP Relay statistics.

### Examples

```
-> show ip helper statistics
```

```
Global Statistics :
  Reception From Client :
    Total Count =      12, Delta =      12,
  Forw Delay Violation :
    Total Count =       3, Delta =       3,
  Max Hops Violation :
    Total Count =       0, Delta =       0,
  Agent Info Violation :
    Total Count =       0, Delta =       0,
  Invalid Gateway IP :
    Total Count =       0, Delta =       0,
  Invalid Agent Info From Server :
    Total Count =       0, Delta =       0,
Server Specific Statistics :
  Server 5.5.5.5
    Tx Server :
      Total Count =      9, Delta =      9
```

*output definitions*

---

<b>Reception From Client</b>	Number of packets DHCP Relay has received from the DHCP client.
<b>Forw Delay Violation</b>	Number of packets dropped as a result of forward delay violations. A violation occurs if a client packet contains an elapsed boot time value that is less than the configured DHCP Relay forward delay time value.
<b>Max Hops Violation</b>	Number of packets dropped as a result of maximum hop violations. A violation occurs if a packet contains a hop count equal to or greater than the configured DHCP Relay maximum hops value.
<b>Agent Info Violation</b>	Number of packets dropped as a result of a relay agent information (Option-82) violation. A violation occurs if an Option-82 DHCP packet contains a zero gateway IP address (giaddr) and the relay agent information policy is set to <b>Drop</b> or a DHCP packet has no Option-82 field and contains a non-zero giaddr.
<b>Invalid Gateway IP</b>	Number of packets dropped as a result of a gateway IP violation. A violation occurs if an Option-82 DHCP packet contains a gateway IP address (giaddr) that matches a local subnet address.
<b>Invalid Agent Info From Server</b>	Number of invalid Option-82 DHCP server packets dropped by the relay agent.
<b>Delta</b>	Total number of packets processed since the last time the <b>ip helper statistics</b> were checked during any user session.
<b>Server</b>	DHCP server IP address that receives BOOTP/DHCP packets forwarded by this DHCP Relay service. Use the <b>ip helper address</b> command to add or remove DHCP server IP addresses from DHCP Relay configuration.
<b>Tx Server</b>	Number of packets DHCP Relay has transmitted to the DHCP server.
<b>Delta</b>	The difference between the number of packets received from the client and the number of packets transmitted to the DHCP server since the last time DHCP Relay statistics were checked during any user session.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

**show ip helper** Displays current DHCP Relay configuration information.

**MIB Objects**

  iphelperResetAll
```

---

## show ip udp relay

Displays the VLAN assignments to which the traffic received on the UDP service ports is forwarded. Displays the current configuration for UDP services by service name or by service port number.

**show ip udp relay** [service {TFTP | TACACS | NTP | NBNS | NBDD | DNS} | port *port\_num*]

---

### Syntax Definitions

<b>TFTP</b>	TFTP well-known port 69.
<b>TACACS</b>	TACACS well-known port 65.
<b>NTP</b>	NTP well-known port 123.
<b>NBNS</b>	NBNS well-known port 137.
<b>NBDD</b>	NBDD well-known ports 138.
<b>DNS</b>	DNS well-known port 53.
<i>port_num</i>	A user-specified port that is not a well-known port.

### Defaults

By default, the configuration for all UDP services is shown.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **show ip udp relay** command without the additional parameters to display information related to all the ports.
- Enter a service name with this command along with the **service** parameter to display information about an individual service.
- Mention a port number along with the **port** parameter, to get the UDP relay information for the specific user defined or well-known port.

### Examples

```
-> show ip udp relay
```

Service	Port	VLANs
DNS	53	2 4
TACACS	65	3

### output definitions

---

<b>Service</b>	The active UDP service name.
----------------	------------------------------

*output definitions (continued)*

---

<b>Port</b>	The UDP service port number.
<b>VLANs</b>	The VLAN assigned to the UDP service port that forwards traffic destined for that port. Use the <b>ip udp relay service vlan</b> command to configure this value.

---

```
-> show ip udp relay service DNS
```

```
Service      Port(s)  Description
-----+-----+-----
  4           53      DNS
```

```
-> show ip udp relay port
```

```
Service      Port(s)  Description
-----+-----+-----
  4           54      Generic_Service
  5           66      Tservice
```

```
-> show ip udp relay port 54
```

```
Service      Port(s)  Description
-----+-----+-----
  4           54      Generic_Service
```

*output definitions*

---

<b>Service</b>	The UDP service number. (1 through 7 for well-known service ports and 8 and above for user-defined service ports).
<b>Port(s)</b>	The UDP service port number.
<b>Description</b>	A description of the UDP service.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<b>show ip udp relay statistics</b>	Displays the current statistics for each UDP port relay service.
<b>no ip helper statistics</b>	Displays the VLAN assignments to which the traffic received on the specified UDP service port is forwarded.

**MIB Objects**

```
iphelperTable
  iphelperService
  iphelperVlan
iphelperxPropertiesTable
  iphelperxPropertiesName
  iphelperxPropertiesPort
  iphelperxPropertiesService
```

---

## show ip udp relay statistics

Displays the current statistics for each UDP port relay service. These statistics include the name of the service, the forwarding VLAN(s) configured for that service, and the number of packets the service has sent and received.

**show ip udp relay statistics** [**service** {**TFTP** | **TACACS** | **NTP** | **NBNS** | **NBDD** | **DNS**}] [**port** [*port\_num*]]

---

### Syntax Definitions

<b>TFTP</b>	TFTP well-known port 69.
<b>TACACS</b>	TACACS well-known port 65.
<b>NTP</b>	NTP well-known port 123.
<b>NBNS</b>	NBNS well-known port 137.
<b>NBDD</b>	NBDD well-known ports 138.
<b>DNS</b>	DNS well-known port 53.
<i>port_num</i>	A user-specified port that is not a well-known port.

### Defaults

By default, the statistics for all UDP services is shown.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Enter a service name with the **service** parameter to display information about an individual service.
- Enter a port number with the **port** parameter to display information about an individual service.

### Examples

```
-> show ip udp relay statistics
```

Service	Vlan	Pkts Sent	Pkts Recvd
145		0	0
DNS	2	10	10
	4	15	15
TACACS	3	0	0

```
-> show ip udp relay statistics service tacacs
```

Service	Vlan	Pkts Sent	Pkts Recvd
TACACS	3	0	0

```
-> show ip udp relay statistics port 1776
```

```
Service          Vlan    Pkts Sent  Pkts Recvd
-----+-----+-----+-----
A UDP Protocol   18      2          2
```

### *output definitions*

---

<b>Service</b>	The active UDP service name.
<b>VLAN</b>	The VLAN assigned to the UDP service port that forwards traffic destined for that port. Use the <a href="#">ip udp relay service vlan</a> command to configure this value.
<b>Pkts Sent</b>	The number of packets sent from this service port to the server.
<b>Pkts Recvd</b>	The number of packets received by this service port from a client.

---

### **Release History**

Release 7.1.1; command introduced.

### **Related Commands**

[show ip udp relay](#) Displays current configuration for UDP services by service name or by service port number.

### **MIB Objects**

```
iphelperxStatTable
  iphelperxStatService
  iphelperxStatVlan
  iphelperxStatTxToServer
  iphelperxStatRxFromClient
```

---

## no ip helper statistics

Resets the IP helper statistics for the specified VRF instances.

**no ip helper statistics** [ **global-only** | **server-only** | **address** *ip\_address* / **vlan** *vlan\_id* {**address** *ip\_address*}]

---

### Syntax Definitions

<b>global-only</b>	Specifies that only the global IP helper statistics must be reset.
<b>server-only</b>	Specifies that only the IP helper statistics related to the server must be reset.
<i>ip_address</i>	Specifies the IP address for the flat mode instance.
<i>vlan_id</i>	Specifies the VLAN ID for the per-vlan mode instance.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command works only for VRF instances.
- To reset all the IP helper related statistics, use this command without the additional keywords.
- To reset the IP helper statistics for the flat mode instance, provide the related IP address with the **address** keyword
- To reset the IP helper statistics for the per-vlan mode instance, provide the VLAN ID with the **vlan** keyword and the related IP address with the **address** keyword.

### Examples

```
-> no ip helper statistics
-> no ip helper statistics global-only
-> no ip helper statistics server-only
-> no ip helper statistics address 172.6.5.1
-> no ip helper statistics vlan 20 address 172.6.5.1
```

### Release History

Release 7.1.1; command introduced.

**Related Commands**

**show ip helper statistics**      Displays the current statistics for each UDP port relay service.

**MIB Objects**

```
iphelperStatsTable  
  iphelperResetAllStats  
  iphelperResetSrvStats
```

---

## ip udp relay no statistics

Resets all the generic UDP Relay Service related statistics.

**ip udp relay no statistics**

---

### Syntax Definitions

N/A

### Defaults

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- On applying this command, the UDP relay statistics are cleared and the **show ip udp relay statistics** command display no information.

### Examples

```
-> ip udp relay no statistics
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show ip udp relay statistics](#) Displays the current statistics for each UDP port relay service.

### MIB Objects

```
genericUdpRelayTable  
genericUdpRelayStatReset
```

---

# 18 VRRP Commands

The Virtual Router Redundancy Protocol (VRRP) eliminates the single point of failure in a default route environment. VRRP specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the VRRP/VRRP3 routers on the LAN. The VRRP/VRRP3 router, which controls the IP/IPv6 address associated with a virtual router is called the master router, and forwards packets to that IP/IPv6 address. If the master router becomes unavailable, the highest priority backup router will transition to the master state. The Alcatel-Lucent implementation of VRRP also supports the collective management of virtual routers on a switch.

---

**Note.** VRRP3 does not support the collective management functionality in this release.

---

The VRRP and VRRP3 commands comply with RFC 2787 and RFC 3768, respectively.

MIB information is as follows:

*Filename:* IETF-VRRP.MIB  
*Module:* VRRP-MIB

*Filename:* AlcatelIND1VRRP.MIB  
*Module:* ALCATEL-IND1-VRRP-MIB

*Filename:* AlcatelIND1VRRP3.MIB  
*Module:* ALCATEL-IND1-VRRP3-MIB

---

The VRRP CLI commands are listed here:

---

- vrrp**
- vrrp address**
- vrrp track**
- vrrp track-association**
- vrrp trap**
- vrrp delay**
- vrrp interval**
- vrrp priority**
- vrrp preempt**
- vrrp all**
- vrrp set**
- vrrp group**
- vrrp group all**
- vrrp group set**
- vrrp group-association**
- vrrp3**
- vrrp3 address**
- vrrp3 trap**
- vrrp3 track-association**
- show vrrp**
- show vrrp statistics**
- show vrrp track**
- show vrrp track-association**
- show vrrp group**
- show vrrp group-association**
- show vrrp3**
- show vrrp3 statistics**
- show vrrp3 track-association**

---

## vrrp

Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.

**vrrp** *vrid* *vlan\_id* [**enable** | **disable** | **on** | **off**] [**priority** *priority*] [**preempt** | **no preempt**] [[**advertising**]  
**interval** *seconds*]

**no vrrp** *vrid* *vlan\_id*

---

### Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN on which the virtual router is configured. The VLAN must already be created and available on the switch.
<b>enable</b>	Enables the virtual router. A virtual router may only be enabled if an IP address is configured for the virtual router.
<b>disable</b>	Disables the virtual router. Cannot be combined on the same line with other parameters.
<b>on</b>	Alternate syntax for enabling the virtual router.
<b>off</b>	Alternate syntax for disabling the virtual router.
<i>priority</i>	The priority for this virtual router to become the master router. The range is 1 (lowest priority) to 255 (highest priority). The priority should be set to 255 only if this router is the actual owner of the virtual router's IP address.
<b>preempt</b>	Specifies that a higher priority router may preempt a lower priority master router.
<b>no preempt</b>	Specifies that a higher priority router may not preempt a lower priority master router.
<i>seconds</i>	The interval in seconds after which the master router will send VRRP advertisements. The advertising interval must be same for all VRRP routers configured with the same VRID. The valid range is 1–255 seconds.

## Defaults

parameter	default
<b>enable   disable   on   off</b>	<b>disable (off)</b>
<i>priority</i>	100
<b>preempt   no preempt</b>	<b>preempt</b>
<i>seconds</i>	1

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Use the **no** form of this command to remove a virtual router from the configuration.
- Use the **vrrp address** command to configure an IP address for the virtual router. This must be done before the virtual router can be enabled.
- To disable the virtual router, rather than to remove it, use the **disable** or **off** option. Note that **disable** or **off** cannot be used with any other optional parameter.
- A virtual router must be disabled before it can be modified.
- **Advertising** is an optional command parameter. When prefaced before **interval**, it displays the same information as **vrrp vrid vlan\_id interval**.

Important information about configuring priority:

- A value of 255 indicates that the VRRP router owns the IP address; that is, the router contains the real physical interface to which the IP address is assigned. The system automatically sets this value to 255 if it detects that this router is the IP address owner. If the priority is set to 255 and the virtual router is not the IP address owner, then the priority will be set to the default value of 100. The IP address owner will always be the master router if it is available.
- VRRP routers backing up a virtual router must use priority values from 1 to 255. The default priority value for VRRP routers backing up a virtual router is 100. If you configure more than one backup, their priority values should be different. The **preempt** or **no preempt** setting specifies whether or not a higher priority router may preempt a lower priority master router.

## Examples

```
-> vrrp 23 1 priority 75
-> vrrp 23 1 enable
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[vrrp address](#)

Configures an IP address for a virtual router.

[show vrrp](#)

Displays the virtual router configuration for all virtual routers or for a specific virtual router.

## MIB Objects

alaVrrp3OperTable

alaVrrp3OperAdminState

alaVrrp3OperPriority

alaVrrp3OperPreemptMode

alaVrrp3OperAdvertisementInterval

alaVrrp3OperRowStatus

---

## vrrp address

Configures an IP address for a virtual router.

```
vrrp vrid vlan_id address ipv4Addr
```

```
vrrp vrid vlan_id no address ipv4Addr
```

---

### Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN on which the virtual router is configured.
<i>ipv4Addr</i>	The virtual IP address associated with the specified virtual router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- A virtual router IP address must be configured before the virtual router can be enabled.
- **IP** is an optional command parameter. It displays the same information as **vrrp address**.

### Examples

```
-> vrrp 1 3 address 10.10.3.2  
-> vrrp 1 3 no address 10.10.3.2
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">vrrp</a>	Configures a new VRRP virtual router or modifies an existing one. Used to enable to disable a virtual router.
<a href="#">show vrrp statistics</a>	Displays statistics about VRRP packets for all virtual routers configured on the switch or for a specific virtual router.

### MIB Objects

```
alaVrrp3AssoIpAddrTable  
  alaVrrp3AssoIpAddrRowStatus
```

---

## vrrp track

Creates a new tracking policy or modifies an existing tracking policy.

**vrrp track** *track\_id* [**enable** | **disable**] [**priority** *value*] [**ipv4-interface** *name* / **ipv6-interface** *name* | **port** *slot/port* | **address** *address*]

**no vrrp track** *track\_id*

---

### Syntax Definitions

<i>track_id</i>	The ID of the tracking policy; the range is 1 to 255.
<b>enable</b>	Enables the tracking policy.
<b>disable</b>	Disables the tracking policy.
<i>value</i>	The value to be decremented from the priority value of the virtual router monitoring this tracking policy when the operational state of the tracking policy is down. The valid range is 0–255.
<i>name</i>	The name of the IPv4 or IPv6 interface that this policy will track.
<i>slot/port</i>	The slot/port number that this policy will track.
<i>address</i>	The remote IP or IPv6 address that this policy will track.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>enable</b>
<i>value</i>	25

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a tracking policy.
- Use the **disable** option to disable the tracking policy, rather than removing it from the switch.

## Examples

```
-> vrrp track 2 enable priority 50 ipv4-interface Marketing
-> vrrp track 3 enable priority 60 ipv6-interface Sales
-> vrrp track 3 disable
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">vrrp track-association</a>	Associates a VRRP tracking policy with a virtual router.
<a href="#">show vrrp track</a>	Displays information about tracking policies on the switch.

## MIB Objects

```
alaVRRPTrackTable
  alaVrrpTrackState
  alaVrrpTrackAdminState
  alaVrrpTrackPriority
  alaVrrpTrackEntityType
  alaVrrpTrackEntityVlan
  alaVrrpTrackEntityPort
  alaVrrpTrackEntityIpAddress
  alaVrrpTrackEntityIpv6Interface
  alaVrrpTrackEntityInterface
  alaVrrpTrackRowStatus
```

---

## vrrp track-association

Associates a VRRP tracking policy with a virtual router.

```
vrrp vrid vlan_id track-association track_id
```

```
vrrp vrid vlan_id no track-association track_id
```

---

### Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN ID of the virtual router.
<i>track_id</i>	The ID of the tracking policy associated with the virtual router; the range is 1 to 255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to remove a tracking policy from a virtual router.

### Examples

```
-> vrrp 2 4 track-association 1  
-> vrrp 2 4 no track-association 1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">vrrp</a>	Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.
<a href="#">show vrrp track-association</a>	Displays the tracking policies associated with virtual routers.

### MIB Objects

```
alaVrrpAssoTrackTable  
  alaVrrpAssoTrackId  
  alaVrrpTrackRowStatus
```

---

## vrrp trap

Enables or disables SNMP traps for VRRP.

**vrrp trap**

**no vrrp trap**

---

### Syntax Definitions

N/A

### Defaults

By default, SNMP traps for VRRP are enabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

SNMP traps must be enabled globally on the switch for VRRP traps to actually be sent.

### Examples

```
-> vrrp trap  
-> no vrrp trap
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[snmp-trap filter-ip](#) Enables or disables SNMP trap filtering.

### MIB Objects

```
vrrpOperGroup  
vrrpNotificationCntl
```

---

## vrrp delay

Configures the amount of time allowed for routing tables to stabilize before virtual routers are started.

**vrrp delay** *seconds*

---

### Syntax Definitions

*seconds*

The amount of time after a reboot that virtual routers will wait before they go active; the range is 0 to 180 seconds.

### Defaults

parameter	default
<i>seconds</i>	45 seconds

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use this command to prevent loss of workstation connectivity before a virtual router becomes master.

### Examples

```
-> vrrp delay 50
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[vrrp](#)

Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.

[show vrrp](#)

Displays the virtual router configuration for all virtual routers or for a specific virtual router.

### MIB Objects

alaVRRPStartDelay

---

## vrrp interval

Modifies the default advertising interval value assigned to the virtual routers on the switch.

**vrrp interval** *seconds*

---

### Syntax Definitions

*seconds* The default advertising interval for the virtual routers. The valid range is 1–255 seconds.

### Defaults

parameter	default
<i>seconds</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Modifying the default advertising interval value will affect the value assigned by default to any new virtual routers that are created.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

### Examples

```
-> vrrp interval 50
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>vrrp all</b>	Changes the administrative status of all the virtual routers on the switch.
<b>vrrp set</b>	Sets the new default parameter values to existing virtual routers on the switch.
<b>show vrrp</b>	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

## MIB Objects

alaVrrpv2Config  
  alaVrrpDefaultInterval

---

## vrrp priority

Modifies the default priority value assigned to the virtual routers on the switch.

**vrrp priority** *priority*

---

### Syntax Definitions

*priority* The default priority value for the virtual routers. The valid range is 1–255.

### Defaults

parameter	default
<i>priority</i>	100

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Modifying the default priority value will affect the value assigned by default to any new virtual routers that are created.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using the **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

### Examples

```
-> vrrp priority 50
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

<b>vrrp all</b>	Changes the administrative status of all the virtual routers on the switch.
<b>vrrp set</b>	Sets the new default parameter values to existing virtual routers on the switch.
<b>show vrrp</b>	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

**MIB Objects**

```
alaVrrpv2Config  
  alaVrrpDefaultPriority
```

---

## vrrp preempt

Modifies the default preempt mode assigned to the virtual routers on the switch.

vrrp [preempt | no preempt]

---

### Syntax Definitions

<b>preempt</b>	Specifies that a higher priority router may preempt a lower priority master router by default.
<b>no preempt</b>	Specifies that a higher priority router may not preempt a lower priority master router by default.

### Defaults

---

parameter	default
preempt   no preempt	preempt

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Modifying the default preempt mode will affect the mode assigned by default to any new virtual routers that are created.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using the **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

### Examples

```
-> vrrp preempt
-> vrrp no preempt
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>vrrp all</b>	Changes the administrative status of all the virtual routers on the switch.
<b>vrrp set</b>	Sets the new default parameter values to existing virtual routers on the switch.
<b>show vrrp</b>	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

## MIB Objects

alaVrrpv2Config  
  alaVrrpDefaultPreemptMode

---

## vrrp all

Changes the administrative status of all the virtual routers on the switch.

**vrrp** [**disable** | **enable** | **enable all**]

---

### Syntax Definitions

<b>disable</b>	Disables all the virtual routers on the switch.
<b>enable</b>	Enables the virtual routers that have not previously been disabled individually or collectively through the <b>vrrp group all</b> command.
<b>enable all</b>	Enables all the virtual routers on the switch including those virtual routers that have been disabled individually or collectively through the <b>vrrp group all</b> command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command changes the administrative status of all the virtual routers on the switch by executing a single command.
- This command will not affect the ability to change the administrative status of an individual virtual router.

### Examples

```
-> vrrp disable
-> vrrp enable
-> vrrp enable all
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>vrrp interval</b>	Modifies the default advertising interval value assigned to the virtual routers on the switch.
<b>vrrp priority</b>	Modifies the default priority value assigned to the virtual routers on the switch.
<b>vrrp preempt</b>	Modifies the default preempt mode assigned to the virtual routers on the switch.
<b>vrrp set</b>	Sets the new default parameter values to existing virtual routers on the switch.
<b>show vrrp</b>	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

## MIB Objects

alaVrrpv2Config  
alaVrrpAdminState

---

## vrrp set

Sets the new default parameter values to existing virtual routers on the switch.

```
vrrp set [interval | priority | preempt | all | none] [ override]
```

---

### Syntax Definitions

<b>interval</b>	Sets the VRRP advertisement interval value to the new default value.
<b>priority</b>	Sets the priority value to the new default value.
<b>preempt</b>	Sets the preempt mode to the new default mode.
<b>all</b>	Sets all the parameters value to the new default value.
<b>none</b>	Resets all the parameter values to their default values.
<b>override</b>	Overrides the specified parameters configured value with the new default value.

### Defaults

parameter	default
interval   priority   preempt   all	all

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- All the virtual routers must be disabled before using this command.
- To apply the new default value to the existing virtual routers, you must first disable the virtual routers, then apply the new default value using the **vrrp set** command and enable the virtual routers again.
- If any of the virtual routers are running with their own configured value or group value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual routers, then override the configured value using the **vrrp set** command with the **override** option and enable the virtual routers again.

### Examples

```
-> vrrp set priority
-> vrrp set priority override
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>vrrp interval</b>	Modifies the default advertising interval value assigned to the virtual routers on the switch.
<b>vrrp priority</b>	Modifies the default priority value assigned to the virtual routers on the switch.
<b>vrrp preempt</b>	Modifies the default preempt mode assigned to the virtual routers on the switch.
<b>vrrp all</b>	Changes the administrative status of all the virtual routers on the switch.
<b>show vrrp</b>	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

## MIB Objects

```
alaVrrpv2Config  
  alaVrrpSetParam  
  alaVrrpOverride
```

---

## vrrp group

Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.

**vrrp group** *vrgid* [*interval seconds*] [*priority priority*] [**preempt** | **no preempt**]

**no vrrp group** *vrgid*

---

### Syntax Definitions

<i>vrgid</i>	The virtual router group ID, in the range from 1–255.
<i>seconds</i>	The default advertising interval for the virtual router group. The valid range is 1–255 seconds.
<i>priority</i>	The default priority value for the virtual router group. The valid range is 1–255.
<b>preempt</b>	Specifies that a higher priority router may preempt a lower priority master router by default.
<b>no preempt</b>	Specifies that a higher priority router may not preempt a lower priority master router by default.

### Defaults

parameter	default
<i>seconds</i>	1
<i>priority</i>	100
<b>preempt</b>   <b>no preempt</b>	<b>preempt</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the virtual router group.
- The configuration parameters can be modified at any time, but will not have any effect on the virtual routers in the group until the virtual routers are enabled again. To apply the group default value to the virtual routers in a group, you must first disable the virtual router group, then apply the group default value using the **vrrp group set** command and enable the virtual router group again.
- If any of the virtual routers in the group are running with their configured value, then that value will take priority over the new default value. To override the configured value with the new default value, you must first disable the virtual router group, then override the configured value by using the **vrrp group set** command with the **override** option and enable the virtual router group again.
- When a virtual router group is deleted, the virtual routers assigned to the group become unassigned. However, this does not have any impact on the virtual routers.

## Examples

```
-> vrrp group 25 interval 50 priority 50 no preempt  
-> no vrrp group 25
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">vrrp group all</a>	Changes the administrative status of all the virtual routers in a virtual router group using a single command.
<a href="#">vrrp group set</a>	Sets the new modified default value to all the virtual routers in a virtual router group.
<a href="#">vrrp group-association</a>	Adds a virtual router to a virtual router group.
<a href="#">show vrrp group</a>	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

## MIB Objects

```

  alaVrrpGroupInterval  
  alaVrrpGroupPriority  
  alaVrrpGroupPreemptMode  
  alaVrrpGroupRowStatus
```

---

## vrrp group all

Changes the administrative status of all the virtual routers in a virtual router group using a single command.

**vrrp group *vrgid* [disable | enable | enable all]**

---

### Syntax Definitions

<i>vrgid</i>	The virtual router group ID, in the range from 1–255.
<b>disable</b>	Disables all the virtual routers in the group.
<b>enable</b>	Enables those virtual routers that have not previously been disabled individually in the group.
<b>enable all</b>	Enables all the virtual routers in the group including those virtual routers that have been disabled individually.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If a virtual router in a group is disabled on an individual basis, it can only be reenabled by using the **enable all** option in this command.
- This command will not affect the ability to change the administrative status of an individual virtual router.

### Examples

```
-> vrrp group 25 disable  
-> vrrp group 25 enable  
-> vrrp group 25 enable all
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>vrrp group</b>	Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.
<b>vrrp group set</b>	Sets the new modified default value to all the virtual routers in a virtual router group.
<b>show vrrp</b>	Displays the virtual router configuration for all virtual routers or for a specific virtual router.
<b>show vrrp group</b>	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

## MIB Objects

alaVrrpGroupTable  
  alaVrrpGroupAdminState

---

## vrrp group set

Sets the new modified default value to all the virtual routers in a virtual router group.

**vrrp group *vrgid* set [interval | priority | preempt | all] [override]**

---

### Syntax Definitions

<i>vrgid</i>	The virtual router group ID, in the range from 1–255.
<b>interval</b>	Sets the VRRP advertisement interval value to the new default value.
<b>priority</b>	Sets the priority value to the new default value.
<b>preempt</b>	Sets the preempt mode to the new default mode.
<b>all</b>	Sets all the parameters' value to the new default value.
<b>override</b>	Overrides the parameter's configured value with the group default value.

### Defaults

parameter	default
<b>interval   priority   preempt   all</b>	<b>all</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- All the virtual routers must be disabled before using this command.
- To apply the group default value to the virtual routers in a group, you must disable the virtual router group, then apply the group default value using the **vrrp group set** command and enable the virtual router group again.
- If any of the virtual routers in the group are running with their own configured parameter value, then that value will take priority over the group default value. To override the configured value with the group default value, you must first disable the virtual router group, then override the configured value by using the **vrrp group set** command with the **override** option and enable the virtual router group again.

### Examples

```
->vrrp group 10 set priority
->vrrp group 10 set priority override
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>vrrp group</b>	Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.
<b>vrrp group all</b>	Changes the administrative status of all the virtual routers in a virtual router group using a single command.
<b>show vrrp</b>	Displays the virtual router configuration for all virtual routers or for a specific virtual router.
<b>show vrrp group</b>	Displays the default parameter values for all the virtual router groups or a specific virtual router group.

## MIB Objects

```
alaVrrpGroupTable  
  alaVrrpGroupSetParam  
  alaVrrpGroupOverride
```

---

## vrrp group-association

Adds a virtual router to a virtual router group.

```
vrrp vrid vlan_id group-association vrgid
```

```
vrrp vrid vlan_id no group-association vrgid
```

---

### Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN on which the virtual router is configured. The VLAN must already be created and available on the switch.
<i>vrgid</i>	The virtual router group ID, in the range from 1–255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove the virtual router from the virtual router group.
- A virtual router need not be disabled in order to be added to a virtual router group. However, the virtual router will not adopt the group's default parameter values until it is reenabled.
- A virtual router need not be disabled to be removed from a group.

### Examples

```
-> vrrp 25 1 group-association 10  
-> vrrp 25 1 no group-association 10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show vrrp group-association** Displays the virtual routers that are associated with a group.

**MIB Objects**

alaVrrpAssoGroupTable

    alaVrrpAssoGroupRowStatus

---

## vrrp3

Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.

**vrrp3** *vrid* *vlan\_id* [**enable** | **disable** | **on** | **off**] [**priority** *priority*] [**preempt** | **no preempt**][**accept** | **no accept**] [[**advertising**] **interval** *centiseconds*]

**no vrrp3** *vrid* *vlan\_id*

---

### Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN on which the virtual router is configured. The VLAN must already be created and available on the switch.
<b>enable</b>	Enables the virtual router.
<b>disable</b>	Disables the virtual router. Cannot be combined on the same line with other parameters.
<b>on</b>	Alternate syntax for enabling the virtual router.
<b>off</b>	Alternate syntax for disabling the virtual router.
<i>priority</i>	The priority for this virtual router to become the master router. The range is 1 (lowest priority) to 255 (highest priority). The priority should be set to 255 only if this router is the actual owner of the virtual router's IP address.
<b>preempt</b>	Specifies that a higher priority router may preempt a lower priority master router.
<b>no preempt</b>	Specifies that a higher priority router may not preempt a lower priority master router.
<b>accept</b>	Specifies that the master router, which is not the IPv6 address owner will accept the packets addressed to the IPv6 address owner as its own.
<b>no accept</b>	Specifies that the master router, which is not the IPv6 address owner will not accept the packets addressed to the IPv6 address owner as its own.
<i>centiseconds</i>	The interval in centiseconds after which the master router will send VRRP3 advertisements. The advertising interval must be the same for all VRRP3 routers configured with the same VRID. The valid range is 1–4096 centiseconds.

## Defaults

parameter	default
<b>enable   disable   on   off</b>	<b>disable (off)</b>
<i>priority</i>	100
<b>preempt   no preempt</b>	<b>preempt</b>
<b>accept / no accept</b>	<b>accept</b>
<i>centiseconds</i>	100

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Use the **no** form of this command to remove a virtual router from the configuration.
- Use the **vrrp3 address** command to configure an IPv6 address for the virtual router.
- To disable the virtual router, rather than to remove it, use the **disable** or **off** option. Note that the **disable** or **off** options cannot be used with any other optional parameter.
- A virtual router must be disabled before it can be modified.
- The maximum number of virtual routers supported is based on the 100 centisecond interval. A smaller interval will result in a relatively lesser number of virtual routers.
- The advertising interval cannot be less than 10 centiseconds.
- **Advertising** is an optional command parameter. When prefaced before **interval**, it displays the same information as **vrrp3 vrid vlan\_id interval**.

## Examples

```
-> vrrp3 23 1 priority 75
-> vrrp3 23 1 enable
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[vrrp3 address](#)

Configures an IPv6 address for a virtual router.

[show vrrp3](#)

Displays the virtual router configuration for all virtual routers or for a specific virtual router.

**MIB Objects**

- alaVrrp3OperAcceptMode
- alaVrrp3OperAdvinterval
- alaVrrp3OperRowStatus

---

## vrrp3 address

Configures an IPv6 address for a virtual router.

```
vrrp3 vrid vlan_id address [ipv6Addr | ipv6v4Addr]
```

```
vrrp3 vrid vlan_id no address [ipv6Addr | ipv6v4Addr]
```

---

### Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN on which the virtual router is configured.
<i>address</i>	The virtual IPv6 address associated with the specified virtual router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

**IP** is an optional command parameter. It displays the same information as **vrrp3 address**.

### Examples

```
-> vrrp3 1 3 address 213:100:1::56  
-> vrrp3 1 3 no address 213:100:1::56
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">vrrp3</a>	Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.

### MIB Objects

```
alaVrrp3AssoIpAddrTable  
  alaVrrp3AssoIpAddrRowStatus
```

---

## vrrp3 trap

Enables or disables SNMP traps for VRRP3.

**vrrp3 trap**

**no vrrp3 trap**

---

### Syntax Definitions

N/A

### Defaults

By default, SNMP traps for VRRP3 are enabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

SNMP traps must be enabled globally on the switch for VRRP3 traps to actually be sent.

### Examples

```
-> vrrp3 trap  
-> no vrrp3 trap
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[snmp-trap filter-ip](#) SNMP traps must be enabled with this command.

### MIB Objects

```
alaVrrp3OperGroup  
  alaVrrp3NotificationCntl
```

---

## vrrp3 track-association

Associates a VRRP3 tracking policy with a virtual router.

```
vrrp3 vrid vlan_id track-association track_id
```

```
vrrp3 vrid vlan_id no track-association track_id
```

---

### Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>vlan_id</i>	The VLAN ID of the virtual router.
<i>track_id</i>	The ID of the tracking policy associated with the virtual router; the range is 1 to 255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a tracking policy from a virtual router.
- Use the **vrrp track** command to create a tracking policy for an IPv6 interface.

### Examples

```
-> vrrp3 2 4 track-association 1  
-> vrrp3 2 4 no track-association 1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>vrrp3</b>	Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.
<b>show vrrp3 track-association</b>	Displays the tracking policies associated with VRRP3 virtual routers.

### MIB Objects

```

  alaVrrp3AssoTrackId  
  alaVrrp3TrackRowStatus
```

---

## show vrrp

Displays the virtual router configuration for all virtual routers or for a specific virtual router.

**show vrrp** [*vrid*]

---

### Syntax Definitions

*vrid* The virtual router ID, in the range from 1–255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **show vrrp** command to display information about configuration parameters, which may be set through the **vrrp** command. Use the **show vrrp statistics** command to get information about VRRP packets.

### Examples

The following is an example of the output display on an OmniSwitch 10K, 6900:

```
-> show vrrp
VRRP trap generation: Enabled
VRRP startup delay: 75
```

VRID	VLAN	IP Address(es)	Admin Status	Priority	Preempt	Adv. Interval
1	1	192.168.170.1 192.168.170.2	Enabled	255	Yes	1
2	15	10.2.25.254	Disabled	100	No	1

The following is an example of the output display on an OmniSwitch 10K, 6900:

```
-> show vrrp
VRRP default advertisement interval: 5 seconds
VRRP default priority: 100
VRRP default preempt: Yes
VRRP trap generation: Enabled
VRRP startup delay: 45 (expired)
```

VRID	VLAN	IP Address(es)	Admin Status	Priority	Preempt	Adv. Interval
1	101	192.60.245.240	Enabled	100	Yes	5
2	102	192.60.246.240	Enabled	100	Yes	5

```

-> show vrrp 1
Virtual Router VRID = 1 on VLAN = 1
  Admin Status      = Enabled
  Priority          = 255
  Preempt          = Yes
  Adv. Interval    = 1
  Virtual MAC      = 00-00-5E-00-02-01
  IP Address(es)
    192.168.170.1
    192.168.170.2

```

### *output definitions*

---

<b>VRRP default advertisement interval</b>	The default advertising interval for all virtual routers on the switch.
<b>VRRP default priority</b>	The default priority value for all virtual routers on the switch.
<b>VRRP default preempt</b>	The default preempt mode for all virtual routers on the switch.
<b>VRRP trap generation</b>	Indicates whether or not the VRRP trap generation is enabled or disabled; configured through the <b>vrrp track</b> command.
<b>VRRP startup delay</b>	The amount of time after a reboot that virtual routers will wait before they go active; allows time for routing tables to stabilize. Configured through the <b>vrrp delay</b> command.
<b>VRID</b>	Virtual router identifier. Configured through the <b>vrrp</b> command.
<b>VLAN</b>	The VLAN associated with the VRRP instance. Configured through the <b>vrrp</b> command.
<b>IP Address(es)</b>	The assigned IP addresses. Configured through the <b>vrrp address</b> command.
<b>Admin Status</b>	The administrative status of this virtual router instance; <b>enabled</b> allows the virtual router instance to operate; <b>disabled</b> disables the virtual router instance without deleting it.
<b>Priority</b>	Indicates the VRRP router's priority for the virtual router. For more information about priority, see the <b>vrrp</b> command description on <a href="#">page 18-3</a> .
<b>Preempt</b>	Controls whether a higher priority virtual router will preempt a lower priority master router: <b>preempt</b> indicates that a higher priority virtual router will preempt a lower priority master; <b>no preempt</b> indicates that the first backup router to take over for the master will not be preempted by a virtual router with a higher priority. In either case, the IP address owner will always take over it if is available.
<b>Virtual MAC</b>	Displays the virtual MAC address for the virtual router. The first 5 bytes are always 00-00-5E-00-02. The last byte indicates the VRID. This field displays N/A when the virtual router is in the <b>backup</b> or <b>initialize</b> state.
<b>Adv. Interval</b>	Indicates the time interval, in seconds, between sending advertisement messages. Only the master router sends advertisements.

---

### **Release History**

Release 7.1.1; command was introduced.

## Related Commands

<b>vrrp</b>	Configures a new VRRP virtual router or modifies an existing one. Used to enable or disable a virtual router.
<b>vrrp address</b>	Configures an IP address for a virtual router.
<b>vrrp interval</b>	Modifies the default advertising interval value assigned to the virtual routers on the switch.
<b>vrrp priority</b>	Modifies the default priority value assigned to the virtual routers on the switch.
<b>vrrp preempt</b>	Modifies the default preempt mode assigned to the virtual routers on the switch.
<b>show vrrp statistics</b>	Displays statistics for all virtual routers configured on the switch or for a specific virtual router.

  alaVRRPDefaultInterval  
  alaVRRPDefaultPriority  
  alaVRRPDefaultPreemptMode  
  alaVrrp3AssoIpAddr  
  alaVrrp3OperAdminState  
  alaVrrp3OperPriority  
  alaVrrp3OperPreemptMode  
  alaVrrp3OperAcceptMode
```

---

## show vrrp statistics

Displays statistics about VRRP packets for all virtual routers configured on the switch or for a specific virtual router.

**show vrrp** [*vrid*] **statistics**

---

### Syntax Definitions

*vrid*                                      The virtual router ID, in the range from 1–255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **show vrrp statistics** command to display information about VRRP packets. Use the **show vrrp** command to display information about the virtual router configuration.

### Examples

```
-> show vrrp statistics

  7    2  initialize         0            0              0
```

### output definitions

---

<b>Checksum Errors</b>	The total number of VRRP packets received with an invalid checksum value.
<b>Version Errors</b>	The total number of VRRP packets received with an invalid version number.
<b>VRID Errors</b>	The total number of VRRP packets received with invalid VRIDs.
<b>VRID</b>	The virtual router identifier.
<b>VLAN</b>	The VLAN associated with the VRRP instance.

*output definitions (continued)*

---

<b>State</b>	The operational state of the VRRP router instance; <b>initialize</b> specifies that the interface or VLAN is either disabled or down, or if the startup delay timer has not expired; <b>backup</b> specifies that this instance is monitoring the availability of the master router; <b>master</b> specifies that this instance is functioning as the master router.
<b>UpTime</b>	Time interval (in hundredths of a second) since this virtual router was last initialized.
<b>Become Master</b>	The total number of times this virtual router's state has transitioned from backup to master.
<b>Adv. Rcvd</b>	The total number of VRRP advertisements received by this instance.

---

```
-> show vrrp 1 statistics
Virtual Router VRID = 1 on VLAN = 1
  State = master
  UpTime (1/100th second) = 378890
  Become master = 1
  Advertisements received = 0
  Type errors = 0
  Advertisement interval errors = 0
  Authentication errors = 0
  IP TTL errors = 0
  IP address list errors = 0
  Packet length errors = 0
  Zero priority advertisements sent = 0
  Zero priority advertisements received = 0
```

*output definitions*

---

<b>VRID</b>	The virtual router identifier.
<b>VLAN</b>	The VLAN associated with the VRRP instance.
<b>State</b>	The operational state of this VRRP router instance; <b>initialize</b> specifies that the interface or VLAN is either disabled or down, or the startup delay timer has not expired; <b>backup</b> specifies that this instance is monitoring the availability of the master router; <b>master</b> specifies that this instance is functioning as the master router.
<b>UpTime</b>	Time interval (in hundredths of a second) since this virtual router was last initialized.
<b>Become master</b>	The total number of times this virtual router's state has transitioned from backup to master.
<b>Advertisements received</b>	The total number of VRRP advertisements received by this instance.
<b>Type errors</b>	The total number of VRRP packets received with an invalid value in the VRRP type field.
<b>Advertisement interval errors</b>	The total number of VRRP packets received in which the advertisement interval differs from the one configured for the virtual router.
<b>Authentication errors</b>	The total number of VRRP packets received with an unknown or invalid authentication type.
<b>IP TTL errors</b>	The total number of VRRP packets received with a TTL value other than 255.

*output definitions (continued)*

---

<b>IP address list errors</b>	The total number of VRRP packets in which the IP address list does not match the configured list for the virtual router.
<b>Packet length errors</b>	The total number of VRRP packets received with a length less than the length of the VRRP header.
<b>Zero priority advertisements sent</b>	The total number of VRRP advertisements with a priority of 0 sent by the virtual router.
<b>Zero priority advertisements received</b>	The total number of VRRP advertisements with a priority of 0 received by the virtual router.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>vrrp</b>	Configures a new VRRP virtual router or modifies an existing one. Used to enable to disable a virtual router.
<b>show vrrp</b>	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

---

## show vrrp track

Displays information about tracking policies on the switch.

```
show vrrp track [track_id]
```

---

### Syntax Definitions

*track\_id*                              The ID of the tracking policy for which you want to display information.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Enter the tracking ID to display information about a particular policy; if no tracking policy ID is entered, information for all tracking policies is displayed.

### Examples

```
-> show vrrp track
Track
  ID          Policy           Admin   Oper
             State            State   Pri
-----+-----+-----+-----+-----+
  1    PORT 1/1      Enabled   Up     25
  2    192.10.150.42 Enabled   Down   25
```

#### *output definitions*

---

<b>Track ID</b>	The ID of the tracking policy.
<b>Policy</b>	The slot/port, IP address, or VLAN tracked by the policy.
<b>Admin State</b>	Whether the tracking policy is administratively enabled or disabled.
<b>Oper State</b>	Indicates whether the operating state of the tracking policy is Up or Down.
<b>Pri</b>	The value to be decremented from the priority value of the virtual router monitoring this tracking policy when the operational state of the tracking policy is down.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### vrrp track

Creates a new tracking policy or modifies an existing tracking policy.

## MIB Objects

```
alaVRRPTrackTable  
  alaVrrpTrackState  
  alaVrrpTrackAdminState  
  alaVrrpTrackPriority  
  alaVrrpTrackEntityType  
  alaVrrpTrackEntityVlan  
  alaVrrpTrackEntityPort  
  alaVrrpTrackEntityIpAddress  
  alaVrrpTrackEntityIpv6Interface  
  alaVrrpTrackEntityInterface
```

---

## show vrrp track-association

Displays the tracking policies associated with virtual routers.

**show vrrp** [*vrid*] **track-association** [*track\_id*]

---

### Syntax Definitions

*vrid* The virtual router ID, in the range from 1–255.

*track\_id* The ID of the tracking policy for which you want to display information.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If a track ID is specified, only information about that track ID is displayed. If the virtual router ID and track ID are not specified, information about all virtual routers and their associated tracking policies is displayed.

### Examples

```
-> show vrrp 2 track-association
```

VRID	VLAN	Conf Pri	Cur Pri	Track ID	Policy	Admin State	Oper State	Track Pri
2	1	100	100	1	VLAN 1	Enabled	Up	25
				2	10.255.11.101	Enabled	Up	25

### output definitions

---

<b>VRID</b>	The virtual router identifier.
<b>VLAN</b>	The VLAN ID associated with the virtual router.
<b>Conf Pri</b>	The priority configured for the virtual router through the <b>vrrp</b> command.
<b>Cur Pri</b>	The priority currently being used for the virtual router. If the tracking policy is in effect because the tracked entity is down, the current priority will be equal to the configured priority (Conf Pri) minus the tracking priority (Track Pri). Otherwise the current priority will be equal to the configured priority.
<b>Track ID</b>	The ID of the tracking policy.
<b>Policy</b>	The VLAN, IP address, or slot/port being tracked by this policy.
<b>Admin State</b>	The administrative state of the tracking policy configured through the <b>vrrp track</b> command.

*output definitions (continued)*

---

<b>Oper State</b>	Whether the tracking policy is operational (Up) or not (Down).
<b>Track Pri</b>	The amount to be decremented from the configured virtual router priority when the tracking policy is applied.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

---

## show vrrp group

Displays the default parameter values for all the virtual router groups or for a specific virtual router group.

**show vrrp group** [*vrgid*]

---

### Syntax Definitions

*vrgid*                                 The virtual router group ID, in the range from 1–255.

### Defaults

By default, the default parameter values are displayed for all the virtual router groups.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the *vrgid* parameter with this command to display the default values for a specific virtual router group.

### Examples

```
-> show vrrp group 2
Virtual Router Group GROUPID = 2
  Interval = 11
  Priority = 250
  Preempt Mode = Yes
  3 Associated Virtual Routers
```

#### *output definitions*

---

<b>Group ID</b>	The virtual router group identifier.
<b>Adv Interval</b>	Indicates the time interval, in seconds, between the sending of advertisement messages. Only the master router sends advertisements.
<b>Priority</b>	Indicates the VRRP router's priority for the virtual router group. For more information about priority, see the <a href="#">vrrp</a> command description on <a href="#">page 18-3</a> .
<b>Preempt Mode</b>	Controls whether a higher priority virtual router will preempt a lower priority master; preempt indicates that a higher priority virtual router will preempt a lower priority master; no preempt indicates that the first backup router to take over for the master will not be preempted by a virtual router with a higher priority. In either case, the IP address owner will always take over it if is available.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **vrrp group**

Creates a new virtual router group or modifies the configuration parameters of an existing virtual router group.

### **vrrp group all**

Changes the administrative status of all the virtual routers in a virtual router group using a single command.

## MIB Objects

---

## show vrrp group-association

Displays the virtual routers that are associated with a group.

```
show vrrp group-association [vrgid]
```

---

### Syntax Definitions

*vrgid* The virtual router group ID, in the range from 1–255.

### Defaults

By default, all virtual router group associations are displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the *vrgid* parameter with this command to display the association details of a specific virtual router group.

### Examples

```
-> show vrrp group-association 2
GROUPID VRID  VLAN
-----+-----+-----+
      2     3     2
          4     2
          5     2
```

### *output definitions*

---

<b>GROUPID</b>	The virtual router group identifier.
<b>VRID</b>	The virtual router identifier.
<b>VLAN</b>	The VLAN associated with the VRRP instance. Configured through the <b>vrrp</b> command.

---

### Release History

Release 7.1.1; command was introduced.

**Related Commands****vrrp group-association**

Adds a virtual router to a virtual router group.

---

## show vrrp3

Displays the virtual router configuration for all virtual routers or for a specific virtual router.

**show vrrp3** [*vrid*]

---

### Syntax Definitions

*vrid* The virtual router ID, in the range from 1–255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **show vrrp3** command to display information about configuration parameters, which may be set through the **vrrp3** command. Use the **show vrrp3 statistics** command to get information about VRRP3 packets.

### Examples

```
-> show vrrp3
VRRP trap generation: Enabled
VRRP startup delay: 45 (expired)
```

VRID	VLAN	IPv6 Address(es)	Admin Status	Priority	Preempt	Accept	Adv. Interval
1	101	fe80::200:5eff:fe00:201 1010::30	Enabled	200	No	Yes	100
2	102	fe80::200:5eff:fe00:202 1020::30	Enabled	200	No	Yes	100
3	103	fe80::200:5eff:fe00:203 1030::30	Enabled	200	No	Yes	100
4	104	fe80::200:5eff:fe00:204 1040::30	Enabled	200	No	Yes	100
5	105	fe80::200:5eff:fe00:205 1050::30	Enabled	200	No	Yes	100
6	106	fe80::200:5eff:fe00:206 1060::30	Enabled	200	No	Yes	100
7	107	fe80::200:5eff:fe00:207 1070::30	Enabled	200	No	Yes	100
8	108	fe80::200:5eff:fe00:208 1080::30	Enabled	200	No	Yes	100
9	109	fe80::200:5eff:fe00:209 1090::30	Enabled	200	No	Yes	100
10	110	fe80::200:5eff:fe00:20a 1100::30	Enabled	200	No	Yes	100

*output definitions*

---

<b>VRRP trap generation</b>	Whether or not VRRP trap generation is enabled or disabled.
<b>VRRP startup delay</b>	The amount of time after a reboot that virtual routers will wait before they go active; allows time for routing tables to stabilize.
<b>VRID</b>	Virtual router identifier. Configured through the <b>vrrp3</b> command.
<b>VLAN</b>	The VLAN associated with the VRRP3 instance. Configured through the <b>vrrp3</b> command.
<b>IPv6 Address(es)</b>	The assigned IPv6 addresses. Configured through the <b>vrrp3 address</b> command.
<b>Admin Status</b>	The administrative status of this virtual router instance; <b>enabled</b> allows the virtual router instance to operate; <b>disabled</b> disables the virtual router instance without deleting it.
<b>Priority</b>	Indicates the VRRP3 router's priority for the virtual router. For more information about priority, see the <b>vrrp3</b> command description on <a href="#">page 18-30</a> .
<b>Preempt</b>	Controls whether a higher priority virtual router will preempt a lower priority master: <b>preempt</b> indicates that a higher priority virtual router will preempt a lower priority master; <b>no preempt</b> indicates that the first backup router to take over for the master will not be preempted by a virtual router with a higher priority. In either case the IP address owner will always take over it if is available.
<b>Accept</b>	Displays whether the master router, which is not the IPv6 address owner will accept the packets addressed to the IPv6 address owner as its own.
<b>Virtual MAC</b>	Displays the virtual MAC address for the virtual router when the router is in the <b>master</b> state. The first 5 bytes are always 00-00-5E-00-02. The last byte indicates the VRID. This field displays N/A when the virtual router is in the <b>backup</b> or <b>initialize</b> state.
<b>Adv. Interval</b>	Indicates the time interval, in seconds, between sending advertisement messages. Only the master router sends advertisements.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>vrrp3</b>	Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.
<b>vrrp3 address</b>	Configures an IPv6 address for a virtual router.
<b>show vrrp3 statistics</b>	Displays statistics for all virtual routers configured on the switch or for a specific virtual router.

**MIB Objects**

```
alaVrrp3OperTable  
  alaVrrp3OperAdminState  
  alaVrrp3OperPriority  
  alaVrrp3OperPreemptMode  
  alaVrrp3OperAcceptMode  
  alaVrrp3OperAdvinterval
```

---

## show vrrp3 statistics

Displays statistics about VRRP3 packets for all virtual routers configured on the switch or for a specific virtual router.

**show vrrp3** [*vrid*] statistics

---

### Syntax Definitions

*vrid*                                      The virtual router ID, in the range from 1–255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **show vrrp3 statistics** command to display information about VRRP3 packets. Use the **show vrrp3** command to display information about the virtual router configuration.

### Examples

```
-> show vrrp3 statistics
Checksum    Version    VRID
Errors      Errors      Errors
-----+-----+-----
          0          0          0

VRID VLAN   State    UpTime    Become Master Adv. Rcvd
-----+-----+-----+-----+-----
   1  101 Master      2983         1          0
   2  102 Master    60675         1          0
   3  103 Master    60675         1          0
   4  104 Master    60675         1          0
   5  105 Master    60675         1          0
   6  106 Master    60675         1          0
   7  107 Master    60675         1          0
   8  108 Master    60675         1          0
   9  109 Master    60675         1          0
  10  110 Master    60675         1          0
```

#### output definitions

---

<b>Checksum Errors</b>	The total number of VRRP3 packets received with an invalid checksum value.
<b>Version Errors</b>	The total number of VRRP3 packets received with an invalid version number.
<b>VRID Errors</b>	The total number of VRRP3 packets received with invalid VRIDs.
<b>VRID</b>	The virtual router identifier.

*output definitions (continued)*

---

<b>VLAN</b>	The VLAN associated with the VRRP3 instance.
<b>State</b>	The administrative state of the VRRP3 instance; <b>initialize</b> specifies that the interface or vlan is either disabled or down and the startup delay timer has not expired; <b>backup</b> specifies that this instance is monitoring the availability of the master router; <b>master</b> specifies that this instance is functioning as the master router.
<b>UpTime</b>	Time interval (in hundredths of a second) since this virtual router was last initialized.
<b>Become Master</b>	The total number of times this virtual router's state has transitioned from backup to master.
<b>Adv. Rcvd</b>	The total number of VRRP3 advertisements received by this instance.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>vrrp3</b>	Configures a new VRRP3 virtual router or modifies an existing one. Used to enable or disable a virtual router.
<b>show vrrp3</b>	Displays the virtual router configuration for all virtual routers or for a specific virtual router.

---

## show vrrp3 track-association

Displays the tracking policies associated with VRRP3 virtual routers.

**show vrrp3** [*vrid*] **track-association** [*track\_id*]

---

### Syntax Definitions

<i>vrid</i>	The virtual router ID, in the range from 1–255.
<i>track_id</i>	The ID of the tracking policy for which you want to display information.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If a track ID is specified, only information about that track ID is displayed. If the virtual router ID and track ID are not specified, information about all virtual routers and their associated tracking policies is displayed.

### Examples

```
-> show vrrp3 track-association
      Conf  Cur  Track
VRID VLAN  Pri  Pri  ID      Policy      Admin  Oper  Track
-----+-----+-----+-----+-----+-----+-----+-----+-----+
   1  101  200  200  1  PORT 1/37      Enabled  Up    25
```

### output definitions

---

<b>VRID</b>	The virtual router identifier.
<b>VLAN</b>	The VLAN ID associated with the virtual router.
<b>Conf Pri</b>	The priority configured for the virtual router through the <b>vrrp3</b> command.
<b>Cur Pri</b>	The priority currently being used for the virtual router. If the tracking policy is in effect because the tracked entity is down, the current priority will be equal to the configured priority (Conf Pri) minus the tracking priority (Track Pri). Otherwise the current priority will be equal to the configured priority.
<b>Track ID</b>	The ID of the tracking policy.
<b>Policy</b>	The VLAN, IPv6 address, or slot/port being tracked by this policy.
<b>Admin State</b>	The administrative state of the tracking policy.

*output definitions (continued)*

---

<b>Oper State</b>	Indicates whether the tracking policy is operational (Up) or not (Down).
<b>Track Pri</b>	The amount to be decremented from the configured virtual router priority when the tracking policy is applied.

---

**Release History**

# 19 OSPF Commands

Open Shortest Path First routing (OSPF) is a shortest path first (SPF) or link-state protocol. OSPF is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPF chooses the least-cost path as the best path.

Each participating router distributes its local state (i.e., the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPF allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an *area*. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

Alcatel-Lucent's version of OSPF complies with RFCs 1370, 1850, 2328, 2370, 3101, and 3623.

MIB information for OSPF is as follows:

*Filename:* AlcatelIND1DrcTm.mib  
*Module:* ALCATEL-IND1-DRCTM-MIB

*Filename:* AlcatelIND1Ospf.mib  
*Module:* ALCATEL-IND1-OSPF-MIB

*Filename:* IETF\_OSPF.MIB  
*Module:* OSPF-MIB

The following is a list of the commands for configuring OSPF:

<b>Global OSPF Commands</b>	<b>ip ospf admin-state</b> <b>ip load ospf</b> <b>ip ospf asbr</b> <b>ip ospf exit-overflow-interval</b> <b>ip ospf extlsdb-limit</b> <b>ip ospf host</b> <b>ip ospf mtu-checking</b> <b>ip ospf default-originate</b> <b>ip ospf default-originate</b> <b>ip ospf default-originate</b> <b>ip ospf route-tag</b> <b>ip ospf spf-timer</b> <b>ip ospf virtual-link</b> <b>ip ospf neighbor</b> <b>show ip ospf</b> <b>show ip ospf border-routers</b> <b>show ip ospf ext-lsdb</b> <b>show ip ospf host</b> <b>show ip ospf lsdb</b> <b>show ip ospf neighbor</b> <b>show ip ospf routes</b> <b>show ip ospf routes</b> <b>show ip ospf routes</b> <b>show ip ospf virtual-link</b> <b>show ip ospf virtual-neighbor</b>
<b>OSPF Area Commands</b>	<b>ip ospf area</b> <b>ip ospf area default-metric</b> <b>ip ospf area range</b> <b>show ip ospf area</b> <b>show ip ospf area range</b> <b>show ip ospf area stub</b>
<b>OSPF Interface Commands</b>	<b>ip ospf interface</b> <b>ip ospf interface admin-state</b> <b>ip ospf interface area</b> <b>ip ospf interface auth-key</b> <b>ip ospf interface auth-type</b> <b>ip ospf interface dead-interval</b> <b>ip ospf interface hello-interval</b> <b>ip ospf interface md5</b> <b>ip ospf interface md5 key</b> <b>ip ospf interface type</b> <b>ip ospf interface cost</b> <b>ip ospf interface poll-interval</b> <b>ip ospf interface priority</b> <b>ip ospf interface retrans-interval</b> <b>ip ospf interface transit-delay</b> <b>show ip ospf interface</b>
<b>OSPF Graceful Restart Commands</b>	<b>ip ospf restart-support</b> <b>ip ospf restart-interval</b> <b>ip ospf restart-helper admin-state</b> <b>ip ospf restart-helper strict-lsa-checking admin-state</b> <b>ip ospf restart initiate</b> <b>show ip ospf restart</b>

## ip ospf admin-state

Enables or disables the administration status of OSPF on the router.

```
ip ospf admin-state {enable | disable}
```

---

### Syntax Definitions

<b>enable</b>	Enables OSPF.
<b>disable</b>	Disables OSPF.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The OSPF protocol must be enabled for it to route traffic.

### Examples

```
-> ip ospf admin-state enable  
-> ip ospf admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf](#) Displays OSPF status and general configuration parameters.

### MIB Objects

---

## ip load ospf

Loads the OSPF software on the router.

```
ip load ospf
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Example

```
-> ip load ospf
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

N/A

### MIB Objects

ALADRCTMCONFIG

```
alaDrcTmIPOspfStatus
```

---

## ip ospf asbr

Configures the router as an Autonomous System Border Router (ASBR). A router running multiple protocols or acting as a gateway to other exterior routers is an ASBR. *This command is currently not supported.*

**ip ospf asbr**

**no ip ospf asbr**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Autonomous System Border Routers (ASBRs) are routers that exchange information with routers from another autonomous system (AS).
- The **no** variant of this command removes the ASBR classification of the selected router.

### Examples

```
-> ip ospf asbr
-> no ip ospf asbr
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf](#)

Displays OSPF status and general configuration parameters.

### MIB Objects

```
alaProtocolOspf
  alaOspfAsBdRtr
```

---

## ip ospf exit-overflow-interval

This command sets the overflow interval value.

**ip ospf exit-overflow-interval** *seconds*

---

### Syntax Definitions

*seconds*                                      The number of seconds the router waits before attempting to leave the overflow state.

### Defaults

parameter	default
<i>seconds</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The overflow interval is the time whereby the routing router will wait before attempting to leave the database overflow state; the interval begins upon the routing router's arrival into this state.
- When the routing router leaves the overflow state, it can once again create non-default and external link state advertisements (LSAs) for autonomous systems (AS).
- Note that the router will not leave the overflow state (until it is restarted) when the overflow interval value is set to 0.

### Example

```
-> ip ospf exit-overflow-interval 10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf](#)                                      Displays the OSPF status and general configuration parameters.

### MIB Objects

ospfGeneralGroup  
  ospfExitOverflowInterval

---

## ip ospf extlsdb-limit

Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.

**ip ospf extlsdb-limit** *limit*

---

### Syntax Definitions

*limit*

The maximum number of LSDB entries allowed on the router. The accepted value is any number greater than or equal to 1. If 0 is entered, there is no limit.

### Defaults

parameter	default
<i>limit</i>	-1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command allows you to set a limit to the number of external LSDBs learned by the router. An external LSDB is created when the router learns a link address that exists outside of its Autonomous System (AS).
- When the limit is set, and it is exceeded, older addresses that were previously learned are removed from the routing table to make room for the new external LSDB.

### Example

```
-> ip ospf extlsdb-limit 25
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf](#) Displays OSPF status and general configuration parameters.

### MIB Objects

ospfGeneralGroup  
ospfExtLsdbLimit

---

## ip ospf host

Creates and deletes an OSPF entry for directly attached hosts. Allows for the modification of the host parameters of Type of Service (ToS) and metric.

**ip ospf host** *ip\_address* **tos** *tos* [**metric** *metric*]

**no ip ospf host** *ip\_address* **tos** *tos*

---

### Syntax Definitions

<i>ip_address</i>	The 32-bit IP address in dotted decimal format of the OSPF host. See the example below for more information.
<i>tos</i>	The type of service (ToS) of the specified OSPF host. The valid range is 0- 15. Only ToS value 0 is supported at this time.
<i>metric</i>	The cost metric value assigned to the specified host. The valid range is 0 and up.

### Defaults

---

parameter	default
<i>metric</i>	0

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The **no** variant of this command removes the record of the OSPF host.
- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. ToS routing is the ability to make a forwarding decision based on a destination address and a desired Quality of Service (QoS). ToS routing allows link selection based on QoS when more than one path exists between a source and a destination. A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path

### Examples

```
-> ip ospf host 172.22.2.115 tos 1 metric 10  
-> no ip ospf host 172.22.2.115 tos 1
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**show ip ospf host**

Displays information on configured OSPF hosts.

## MIB Objects

ospfHostTable

ospfHostStatus

ospfHostIpAddress

ospfHostTOS

ospfHostMetric

---

## ip ospf mtu-checking

Enables or disables the use of Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

**ip ospf mtu-checking**

**no ip ospf mtu-checking**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The **no** form of this command disables MTU checking.
- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

### Examples

```
-> ip ospf mtu-checking
-> no ip ospf mtu-checking
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ip ospf** Displays the OSPF status and general configuration parameters.

### MIB Objects

```
alaProtocolOspf
  alaOspfMTUCheck
```

---

## ip ospf default-originate

Configures a default external route into the OSPF routing domain.

```
ip ospf default-originate {only | always} [metric-type {type1 | type2}] [metric value]
```

```
no ip ospf default-originate
```

---

### Syntax Definitions

<b>only</b>	Advertises only when there is a default route in the routing table.
<b>always</b>	Advertises the default route regardless of whether the routing table has a default route.
<b>type1</b>	Sets the external route as type1.
<b>type2</b>	Sets the external route as type2.
<i>value</i>	The metric value. The valid range is 1-65535.

### Defaults

parameter	default
<b>type1   type2</b>	<b>type2</b>
<i>value</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of the command to delete redistributed default routes.

### Examples

```
-> ip ospf default-originate always
-> ip ospf default-originate only metric 10
-> ip ospf default-originate always metric-type type1 metric 5
-> no ip ospf default-originate
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **ip ospf asbr**

Configures the router as an Autonomous System Border Router (ASBR). *This command is currently not supported.*

## MIB Objects

```
alaProtocolOspf  
  alaOspfDefaultOriginate  
  alaOspfDefaultOriginateMetricType  
  alaOspfDefaultOriginateMetric
```

---

## ip ospf route-tag

Configures a tag value for the Autonomous System External (ASE) routes created.

**ip ospf route-tag** *tag*

---

### Syntax Definitions

*tag* The set tag value. The valid range is 0–2,147,483,647.

### Defaults

parameter	default
<i>tag</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command allows you to set a tag value for ASE routes that are learned by this OSPF router. The tag value allows for quick identification.
- OSPF ASE route advertisements contain a tag value field. This field allows the exchange of information between autonomous system border routers (ASBRs).

### Example

```
-> ip ospf route-tag 2
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf](#) Displays OSPF status and general configuration parameters.

alaOspfRedistRouteTag

---

## ip ospf spf-timer

Configures timers for Shortest Path First (SPF) calculation.

```
ip ospf spf-timer [delay delay_seconds] [hold hold_seconds]
```

---

### Syntax Definitions

*delay\_seconds* Specifies time (from 0 to 65535 seconds) between the reception of an OSPF topology change and the start of an SPF calculation.

*hold\_seconds* Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations.

### Defaults

parameter	default
<i>delay_seconds</i>	5
<i>hold_seconds</i>	10

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command allows you to configure the time between SPF calculations. Using the delay timer, you can determine how much time to postpone an SPF calculation after the router receives a topology change. Using the hold timer, you can configure the amount of time that must elapse between consecutive SPF calculations.
- Note that if either of these values is set to 0, there will be no delay in the SPF calculation. This means that SPF calculations will occur immediately upon the reception of a topology change and/or that back-to back SPF calculations can take place with no break in-between the two.

### Example

```
-> ip ospf spf-timer delay 20 hold 35
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****show ip ospf**

```

---

## ip ospf virtual-link

Creates or deletes a virtual link. A virtual link is used to restore backbone connectivity if the backbone is not physically contiguous.

```
ip ospf virtual-link area_id router_id [auth-type {none | simple | md5}] [auth-key key_string]  
[dead-interval seconds] [hello-interval seconds] [retrans-interval seconds] [transit-delay seconds]
```

```
no ip ospf virtual-link area_id router_id
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
<b>none</b>	Sets the virtual link authorization type to no authentication.
<b>simple</b>	Sets the virtual link authorization type to simple authentication. If <b>simple</b> is selected, a key must be specified as well.
<b>md5</b>	Sets the virtual link authorization type to MD5 authentication.
<i>key_string</i>	Sets the virtual link authorization key. The key can be up to 8 ASCII characters. See the example for more details.
<b>dead-interval</b> <i>seconds</i>	Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647.
<b>hello-interval</b> <i>seconds</i>	Sets the virtual link hello interval, which is the time interval between OSPF hellos sent on this virtual link. The valid range is 1–65535.
<b>retrans-interval</b> <i>seconds</i>	Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPF packets. The valid range is 0–3600.
<b>transit-delay</b> <i>seconds</i>	Sets the virtual link transit delay, which is the number of seconds to transmit OSPF packets over this link. The valid range is 0–3600.

## Defaults

parameter	default
<b>none   simple   md5</b>	<b>none</b>
<i>key_string</i>	null string
<b>dead-interval</b> <i>seconds</i>	40
<b>hello-interval</b> <i>seconds</i>	10
<b>retrans-interval</b> <i>seconds</i>	5
<b>transit-delay</b> <i>seconds</i>	1

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- The **no** form of the command deletes the virtual link.
- It is possible to define areas in such a way that the backbone is no longer contiguous. In this case the system administrator can ensure backbone connectivity physically.
- Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.
- If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.
- The **dead-interval** value should be the same for all routers on the same network. This value should be some multiple of the value given for the hello interval.

## Examples

```
-> ip ospf virtual-link 0.0.0.1 172.22.2.115
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 auth-key "techpubs"
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 auth-type simple
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 dead-interval 50
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 hello-interval 20
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 retrans-interval 20
-> ip ospf virtual-link 0.0.0.1 172.22.2.115 transit-delay 50
-> no ip ospf virtual-link 0.0.0.1 172.22.2.115
```

  ospfVirtIfRetransInterval  
  ospfVirtIfTransitDelay
```

---

## ip ospf neighbor

Creates a static neighbor on a non-broadcast interface.

**ip ospf neighbor** *neighbor\_id* {**eligible** | **non-eligible**}

**no ip ospf neighbor** *neighbor\_id*

---

### Syntax Definitions

*neighbor\_id* A unique 32-bit IP address identical to the neighbor's interface address.

**eligible** Sets this router as eligible to be the DR.

**non-eligible** Sets this router as not eligible to be the DR.

### Defaults

parameter	default
<b>eligible</b>   <b>non-eligible</b>	<b>eligible</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- NBMA (Non Broadcast Multi Access), PMP (Point-to-Multipoint), and P2P (Point-to-Point) OSPF non-broadcast modes are supported over Ethernet interfaces (broadcast media).
- Neighboring routers on non-broadcast OSPF networks must be statically configured, because lack of OSPF multicast capabilities prevents using normal OSPF Hello protocol discovery.
- In the case of NBMA interface the static neighbor eligibility for becoming a DR can be configured while it is not necessary for point-to-multipoint and point-to-point interfaces.
- An interface connected to this neighbor must also be configured as a non-broadcast interface, which can be either point-to-multipoint or point-to-point, by using the **ip ospf interface type** command.
- For the correct working of an OSPF NBMA network, a fully meshed network is mandatory. Also, the neighbor eligibility configuration for a router on every other router should match the routers interface priority configuration.

### Examples

```
-> ip ospf neighbor 1.1.1.1 non-eligible
-> no ip ospf neighbor 1.1.1.1
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[ip ospf interface type](#)

Configures the OSPF interface type.

## MIB Objects

ospfNbrTable

ospfNbrPriority

ospfNbmaNbrStatus

---

## ip ospf area

Assigns an OSPF interface to a specified area.

**ip ospf area** *area\_id* [summary {enable | disable}] | [type {normal | stub | nssa}]

**no ip ospf area** *area\_id*

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<b>enable</b>	Enables summarization.
<b>disable</b>	Disables summarization.
<b>normal</b>	Sets the area as a regular OSPF area.
<b>stub</b>	Configures an OSPF area as a stub area.
<b>nssa</b>	Configures an OSPF area as a Not So Stubby Area (NSSA)

### Defaults

parameter	default
enable   disable	enable
normal   stub   nssa	normal

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The **no** form deletes the area.
- The **summary** options are used to enable or disable route summarization for stub and NSSA areas. Stub and NSSA areas will not receive LSA type 3 unless summary is enabled.
- The **type** command allows you to chose what type of area this is going to be.

### Examples

```
-> ip ospf area 0.0.0.1
-> ip ospf area 0.0.0.1 type stub
-> ip ospf area 0.0.0.1 type normal
-> no ip ospf area 0.0.0.1
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**ip ospf area default-metric**

Creates or deletes an OSPF default metric.

**ip ospf area range**

Creates a route summarization instance whereby a range of addresses will be advertised as a single route.

**show ip ospf area**

Displays either all OSPF areas, or a specified OSPF area.

## MIB Objects

ospfAreaTable

ospfImportAsExtern

ospfAreaSummary

ospfAreaId

---

## ip ospf area default-metric

Creates or deletes a default metric for stub or Not So Stubby Area (NSSA) areas. The default metric configures the type of cost metric that a default area border router (ABR) will advertise in the default summary Link State Advertisement (LSA).

**ip ospf area *area\_id* default-metric *tos* [[cost *cost*] | [type {ospf | type 1 | type 2}]**

**no ip ospf area *area\_id* default-metric *tos***

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>tos</i>	Type of service. The valid range is 0–15. Only ToS value 0 is supported at this time.
<i>cost</i>	The numerical cost of this area and ToS. Only 0 is supported in the current release.
<b>ospf</b>	Advertises external routes as OSPF autonomous system external (ASE) routes.
<b>type1</b>	Advertises external routes as a Type 1 (non-OSPF) metric.
<b>type2</b>	Advertises external routes as a Type 2 (calculated weight value from non-OSPF protocol) metric.

### Defaults

parameter	default
<i>tos</i>	0
<b>ospf   type 1   type 2</b>	<b>ospf</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The **no** form deletes the default metric from the specified area.
- The **type** command configures the type of cost metric for the specified ToS. To ensure that internal routers receiving external route advertisements choose the correct route, all border routers advertising a particular external network should be configured to advertise the route using the same metric type. That is, they must all advertise the route using an OSPF, Type 1, or Type 2 metric.

### Examples

```
-> ip ospf area 1.1.1.1 default-metric 0
-> no ip ospf area 1.1.1.1 default-metric 0
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[ip ospf area](#)

Creates or deletes an OSPF area.

[ip ospf area range](#)

Creates a route summarization instance whereby a range of addresses will be advertised as a single route.

[show ip ospf area](#)

Displays either all OSPF areas, or a specified OSPF area.

## MIB Objects

```
ospfStubAreaTable  
  ospfStubAreaId  
  ospfStubTOS  
  ospfStubStatus  
  ospfStubMetric  
  ospfStubMetricType
```

---

## ip ospf area range

Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

```
ip ospf area area_id range {summary | nssa} ip_address subnet_mask
[effect {admatching | noMatching}]
```

```
no ip ospf area area_id range {summary | nssa} ip_address subnet_mask
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<b>summary</b>	Advertises the address range as a summary link state advertisement (LSA).
<b>nssa</b>	Advertises the address range of Not So Stubby Area (NSSA) routes as a Type 5 advertisement.
<i>ip_address</i>	A 32-bit IP address for the range's area.
<i>subnet_mask</i>	A 32-bit subnet mask that determines how many bits of the IP address denote the network number.
<b>admatching</b>	Determines that routes specified falling within the specified range will be advertised.
<b>noMatching</b>	Determines that any route falling within the specified range will not be advertised.

### Defaults

parameter	default
summary   nssa	summary
admatching   noMatching	admatching

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Route summarization is the consolidation of addresses within an area which are advertised as a single route. When network numbers in an area are assigned consecutively, the area border router can be configured, using this command, to advertise a route that aggregates all the individual networks within the range.
- Using this command causes a single route to be advertised, for an address range in the specified area, to other areas.

- An NSSA (Not So Stubby Area) is similar to a stub area. However, where autonomous system (AS) external routes cannot be imported into a stub area, an NSSA will allow the importing of some AS external routes.
- Area ranges, once created, are enabled by default. Classless Inter-Domain Routing (CIDR) can work with OSPF to make route summarization more efficient. This is especially true for the summarization of routes in the global database. OSPF area address ranges can be configured on area border routers

## Examples

```
-> ip ospf area 1.1.1.1 range summary 172.22.2.0 255.255.255.0
-> no ip ospf area 1.1.1.1 range summary 172.22.2.0 255.255.255.0
```

## Release History

---

## ip ospf interface

Creates and deletes an OSPF interface.

**ip ospf interface** {*interface\_name*}

**no ip ospf interface** {*interface\_name*}

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to delete an OSPF interface.
- The interface name cannot contain spaces.

### Examples

```
-> ip ospf interface vlan-101
-> no ip ospf interface vlan-101
```

### Release History

Release 7.1.1; command was introduced.

---

## ip ospf interface admin-state

Enables or disables the administrative status on an OSPF interface.

```
ip ospf interface {interface_name} admin-state {enable | disable}
```

```
no ip ospf interface {interface_name} admin-state {enable | disable}
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>enable</b>	Enables the OSPF interface.
<b>disable</b>	Disables the OSPF interface.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to delete an OSPF interface.
- The OSPF interface must be enabled for it to participate in the OSPF protocol.

### Examples

```
-> ip ospf interface vlan-101 admin-state enable
-> ip ospf interface vlan-101 admin-state disable
-> no ip ospf interface vlan-101 admin-state enable
-> no ip ospf interface vlan-101 admin-state disable
```

### Release History

---

## ip ospf interface area

Configures an OSPF area identifier for this interface.

```
ip ospf interface {interface_name} area area_id
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>area_id</i>	A unique 32-bit value in IP address format.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

An interface must be assigned to an area to become operational.

### Examples

```
-> ip ospf interface vlan-101 area 0.0.0.1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

## ip ospf interface auth-key

Configures an OSPF authentication key for simple authentication on an interface.

```
ip ospf interface {interface_name} auth-key key_string
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>key_string</i>	An authentication key (8 characters maximum).

### Defaults

The default for the authentication key string is a null string.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Sets a password as a simple text string of 8 ASCII characters.
- Must be used in conjunction with the **auth-type** command, described on [page 19-31](#), set to **simple**.

### Examples

```
-> ip ospf interface vlan-101 auth-key pass
```

### Release History

Release 7.1.1; command was introduced.

```

---

## ip ospf interface auth-type

Sets the OSPF interface authentication type. Authentication allows the router to only respond to other routers that have the correct authentication information.

**ip ospf interface** {*interface\_name*} **auth-type** [**none** | **simple** | **md5**]

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>none</b>	No authentication.
<b>simple</b>	Simple, clear text authentication.
<b>md5</b>	MD5 encrypted authentication.

### Defaults

---

parameter	default
<b>none</b>   <b>simple</b>   <b>md5</b>	<b>none</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command to set the type of authentication that the OSPF interface uses to validate requests for route information from other OSPF neighbors on this interface.
- Simple authentication is authentication that uses only a text string as the password. The authentication type **simple** is used in conjunction with the **auth-key** keyword described, on [page 19-30](#).
- MD5 authentication is encrypted authentication that uses an encryption key string and a key identification number. Both of these are necessary as the password. The authentication type **md5** is used in conjunction with the commands described on [page 19-35](#) and [page 19-37](#). One command enables MD5 and the other sets the key identification number.

### Examples

```
-> ip ospf interface vlan-101 auth-type-simple
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****ip ospf interface auth-key**

Sets the password for simple authentication.

**show ip ospf interface**

Displays the status and statistics of an OSPF interface.

**MIB Objects**

ospfIfTable

ospfIfAuthType

---

## ip ospf interface dead-interval

Configures the OSPF interface dead interval.

```
ip ospf interface {interface_name} dead-interval seconds
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>seconds</i>	The dead interval, in seconds. The valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i> (broadcast and point-to-point)	40
<i>seconds</i> (NBMA and point-to-multi-point)	120

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This is the interval, in seconds, after which a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or the multiple of the hello interval.

### Examples

```
-> ip ospf interface vlan-101 dead-interval 50
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- [ip ospf interface hello-interval](#) Configures the OSPF interface hello interval.
- [show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

### MIB Objects

```
ospfIfTable  
ospfIfRtrDeadInterval
```

---

## ip ospf interface hello-interval

Configures the OSPF interface hello interval.

```
ip ospf interface {interface_name} hello-interval seconds
```

---

### Syntax Definitions

*interface\_name* The name of the interface.

*seconds* The hello interval, in seconds. The valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i> (broadcast and point-to-point)	10
<i>seconds</i> (NBMA and point-to-multi-point)	30

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This is the interval between two consecutive hello packets sent out on this interface.

### Examples

```
-> ip ospf interface vlan-101 hello-interval 50
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

### MIB Objects

ospfIfTable  
ospfIfHelloInterval

---

## ip ospf interface md5

Creates and deletes the OSPF interface MD5 key identification number.

**ip ospf interface** {*interface\_name*} **md5** *key\_id* [**enable** | **disable**]

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>key_id</i>	A key identification number. The key identification number specifies a number that allows MD5 encrypted routers to communicate. Both routers must use the same key ID. The valid range is 1–255.
<b>enable</b>	Enables the interface key.
<b>disable</b>	Disables the interface key.

### Defaults

---

parameter	default
<b>enable</b>   <b>disable</b>	<b>enable</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- MD5 authentication can be used to encrypt information sent over the network. MD5 authentication works by using shared secret keys. Keys are used to sign the packets with an MD5 checksum, and they cannot be forged or tampered with. Since the keys are not included in the packet, snooping the key is not possible.
- This command is used in conjunction with the commands described on [page 19-31](#) and [page 19-37](#).
- The **no** variant deletes the key ID number.

### Examples

```
-> ip ospf interface vlan-101 md5 100
-> ip ospf interface vlan-101 md5 10 disable
-> ip ospf interface vlan-101 md5 10 enable
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">ip ospf interface auth-type</a>	Sets the OSPF interface authentication type.

## MIB Objects

```
alaOspfIfMd5Table  
  alaOspfIfMd5IpAddress  
  alaOspfIfMd5KeyId
```

---

## ip ospf interface md5 key

Configures the OSPF key string. This interface MD5 string, along with the key identification number, enables the interface to encode MD5 encryption.

```
ip ospf interface {interface_name} md5 key_id key key_string
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>key_id</i>	The key ID. The valid range is 1–255.
<i>key_string</i>	A key string.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used in conjunction with the commands described above on [page 19-31](#) and [page 19-35](#).
- For MD5 authentication to function properly the same key string must be configured on the neighboring router for that interface.

### Examples

```
-> ip ospf interface vlan-101 md5 100 key 1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip ospf interface auth-type</a>	Sets the OSPF interface authentication type.

```
alaOspfIfMd5Table  
  alaOspfIfMd5IpAddress  
  alaOspfIfMd5KeyId  
  alaOspfIfMd5Key
```

---

## ip ospf interface type

Configures the OSPF interface type.

**ip ospf interface** {*interface\_name*} **type** {**point-to-point** | **point-to-multipoint** | **broadcast** | **non-broadcast**}

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>point-to-point</b>	Sets the interface to be a point-to-point OSPF interface.
<b>point-to-multipoint</b>	Sets the interface to be a point-to-multipoint OSPF interface.
<b>broadcast</b>	Sets the interface to be a broadcast OSPF interface.
<b>non-broadcast</b>	Sets the interface to be NBMA (Non Broadcast Multi Access) OSPF interface.

### Defaults

parameter	default
<b>broadcast</b>   <b>non-broadcast</b>   <b>point-to-point</b>   <b>point-to-multipoint</b>	<b>broadcast</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command sets an interface to be broadcast, non-broadcast, point-to-point, or point-to-multipoint.
- If the type is non-broadcast or point-to-multipoint, static neighbors should be configured.

### Examples

```
-> ip ospf interface vlan-101 type non-broadcast
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **ip ospf neighbor**

Creates a static neighbor on a Non Broadcast Multi Access (NBMA) interface.

### **show ip ospf interface**

Displays the status and statistics of an OSPF interface.

## MIB Objects

ospfIfTable

ospfIfType

---

## ip ospf interface cost

Configures the OSPF interface cost.

```
ip ospf interface {interface_name} cost cost
```

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*cost*                                      The interface cost. The valid range is 0 to 65535.

### Defaults

parameter	default
<i>cost</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The configured interface cost, if any, is used during OSPF route calculations.

### Examples

```
-> ip ospf interface vlan-101 cost 10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf interface](#)                      Displays the status and statistics of an OSPF interface.

### MIB Objects

```
ospfIfMetricTable  
  ospfIfMetricIpAddress  
  ospfIfMetricValue
```

---

## ip ospf interface poll-interval

Configures the OSPF poll interval for a Non Broadcast Multi Access (NBMA) interface.

```
ip ospf interface {interface_name} poll-interval seconds
```

---

### Syntax Definitions

*interface\_name* The name of the interface.

*seconds* The poll interval, in seconds. The valid range is 1–2147483647.

### Defaults

parameter	default
<i>seconds</i>	120

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This parameter configures the larger time interval, in seconds, between hello packets sent to an inactive neighbor.

### Examples

```
-> ip ospf interface vlan-101 poll-interval 500
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

### MIB Objects

```
ospfIfTable  
ospfIfPollInterval
```

---

## ip ospf interface priority

Configures the OSPF interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

```
ip ospf interface {interface_name} priority priority
```

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*priority*                              The interface priority. The valid range is 0–255.

### Defaults

parameter	default
<i>priority</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

### Examples

```
-> ip ospf interface vlan-101 priority 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf interface](#)                      Displays the status and statistics of an OSPF interface.

### MIB Objects

ospfIfRtrPriority

---

## ip ospf interface retrans-interval

Configures the OSPF interface retransmit interval.

```
ip ospf interface {interface_name} retrans-interval seconds
```

---

### Syntax Definitions

*interface\_name* The name of the interface.

*seconds* The retransmit interval, in seconds. The valid range 0–3600.

### Defaults

parameter	default
<i>seconds</i>	5

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The number of seconds between link retransmission of OSPF packets on this interface.

### Examples

```
-> ip ospf interface vlan-101 retrans-interval 500
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

### MIB Objects

ospfIfTable  
ospfIfRetransInterval

---

## ip ospf interface transit-delay

Configures the OSPF interface transit delay.

```
ip ospf interface {interface_name} transit-delay seconds
```

---

### Syntax Definitions

*interface\_name* The name of the interface.

*seconds* The transit delay, in seconds. The valid range is 0–3600.

### Defaults

parameter	default
<i>seconds</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

### Examples

```
-> ip ospf interface vlan-101 transit-delay 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf interface](#) Displays the status and statistics of an OSPF interface.

### MIB Objects

ospfIfTable

ospfIfTransitDelay

---

## ip ospf restart-support

Configures support for the graceful restart feature on an OSPF router.

**ip ospf restart-support {planned-unplanned | planned-only}**

**no ip ospf restart-support**

---

### Syntax Definitions

**planned-unplanned** Specifies support for planned and unplanned restarts.

**planned-only** This parameter is currently not supported.

### Defaults

Graceful restart is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to disable support for the graceful restart feature on an OSPF router.
- The minimum hardware configuration for this command is a redundant CMM configuration.

### Examples

```
-> ip ospf restart-support planned-unplanned
-> no ip ospf restart-support
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ip ospf restart** Displays the OSPF graceful restart related configuration and status.

### MIB Objects

```
alaProtocolOspf
  alaOspfRestartSupport
```

---

## ip ospf restart-interval

Configures the grace period for achieving a graceful OSPF restart.

**ip ospf restart-interval** [*seconds*]

---

### Syntax Definitions

*seconds* The hitless restart timeout interval, in seconds. The valid range is 0–1800.

### Defaults

parameter	default
<i>seconds</i>	120

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch 10K switches with a single CMM.

### Example

```
-> ip ospf restart-interval 600
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

---

## ip ospf restart-helper admin-state

Administratively enables and disables the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart.

**ip ospf restart-helper [admin-state {enable | disable}]**

---

### Syntax Definitions

<b>enable</b>	Enables the capability of an OSPF router to operate in helper mode.
<b>disable</b>	Disables the capability of an OSPF router to operate in helper mode.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch 10K switches with a single CMM.

### Examples

```
-> ip ospf restart-helper admin-state disable
-> ip ospf restart-helper admin-state enable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

## ip ospf restart-helper strict-lsa-checking admin-state

Administratively enables and disables whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router.

**ip ospf restart-helper strict-lsa-checking admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables whether or not a changed LSA will result in termination of graceful restart by a helping router.
<b>disable</b>	Disables whether or not a changed LSA will result in termination of graceful restart by a helping router.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch 10K switches with a single CMM.

### Examples

```
-> ip ospf restart-helper strict-lsa-checking admin-state disable
-> ip ospf restart-helper strict-lsa-checking admin-state enable

Displays the OSPF graceful restart related configuration and status.

## MIB Objects

alaProtocolOspf

alaOspfRestartHelperSupport

---

## ip ospf restart initiate

Initiates a planned graceful restart.

**ip ospf restart initiate**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- You must execute this command on the primary CMM before executing a **takeover** command.
- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch 10K switches with a single CMM.

### Example

```
-> ip ospf restart initiate
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip ospf restart](#) Displays the OSPF graceful restart related configuration and status.

### MIB Objects

## show ip ospf

Displays the OSPF status and general configuration parameters.

**show ip ospf**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used to display the general configuration parameters of the OSPF router.
- See the Related Commands section below to modify the displayed parameters.

### Examples

-> show ip ospf

```

Router Id                = 10.255.11.242,
OSPF Version Number     = 2,
Admin Status            = Enabled,
Area Border Router?    = No,
AS Border Router Status = Disabled,
Route Redistribution Status = Disabled,
Route Tag                = 0,
SPF Hold Time (in seconds) = 10,
SPF Delay Time (in seconds) = 5,
MTU Checking            = Disabled,
# of Routes              = 0,
# of AS-External LSAs   = 0,
# of self-originated LSAs = 0,
# of LSAs received      = 0,
External LSDB Limit     = -1,
Exit Overflow Interval  = 0,
# of SPF calculations done = 0,
# of Incr SPF calculations done = 0,
# of Init State Nbrs    = 0,
# of 2-Way State Nbrs   = 0,
# of Exchange State Nbrs = 0,
# of Full State Nbrs    = 0,
# of attached areas     = 1,
# of Active areas       = 0,
# of Transit areas      = 0,
# of attached NSSAs     = 0

```

*output definitions*

---

<b>Router Id</b>	The unique identification for the router.
<b>OSPF Version Number</b>	The version of OSPF the router is running.
<b>Admin Status</b>	Whether OSPF is currently enabled or disabled on the router.
<b>Area Border Router?</b>	Whether the router status is an area router or not.
<b>AS Border Router Status</b>	Whether the area Autonomous System Border Router status of this router is enabled or disabled.
<b>Route Redistribution Status</b>	Whether route redistribution is enabled or disabled on the router. This is set using the <b>ip ospf default-originate</b> command.
<b>Route Tag</b>	Shows the route tag for this router.
<b>SPF Hold Time</b>	Shows the time in seconds between the reception of an OSPF topology change and the start of a SPF calculation.
<b>SPF Delay Time</b>	Shows the time in seconds between consecutive SPF calculations.
<b>MTU Checking</b>	Shows whether Maximum Transfer Unit checking is enabled or disabled. This is set using the <b>ip ospf mtu-checking</b> command.
<b># of routes</b>	The total number of OSPF routes known to this router.
<b># of AS-External LSAs</b>	The number of external routes learned from outside the router's Autonomous System (AS).
<b># of self-originated LSAs</b>	The number of times a new Link State Advertisement has been sent from this router.
<b># of LSAs received</b>	The number of times a new Link State Advertisement has been received by this router.
<b>External LSDB Limit</b>	The maximum number of entries allowed in the external Link State Database.
<b>Exit Overflow Interval</b>	The number of seconds the router remains in the overflow state before attempting to leave it. This is set using the <b>ip ospf exit-overflow-interval</b> command.
<b># of SPF calculations done</b>	The number of SPF calculations that have occurred.
<b># of Incr SPF calculations done</b>	The number of incremental SPF calculations done.
<b># of Init State Nbrs</b>	The number of neighbors in the initialization state.
<b># of 2-Way State Nbrs</b>	The number of OSPF 2-way state neighbors on this router.
<b># of Exchange State Nbrs</b>	The number of neighbors in the exchange state.
<b># of Full State Nbrs</b>	The number of neighbors in the full state.
<b># of attached areas</b>	The number of areas that are configured on the router.
<b># of Active areas</b>	The number of areas that are active.
<b># of Transit areas</b>	The number of transit areas that are configured on the router.
<b># of attached NSSAs</b>	The number of Not So Stubby Areas that are configured on the router.

---

**Release History**

Release 7.1.1; command was introduced.

## Related Commands

<b>ip ospf admin-state</b>	Enables or disables the administration of OSPF on the router.
<b>ip ospf mtu-checking</b>	Enables or disables the use of Maximum Transfer Unit (MTU) checking.
<b>ip ospf spf-timer</b>	Configures timers for SPF calculation.
<b>ip ospf default-originate</b>	Enables or disables OSPF redistribution
<b>ip ospf asbr</b>	Configures the router as an Autonomous System Border Router (ASBR). <i>This command is currently not supported.</i>
<b>ip ospf extlsdb-limit</b>	Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.
<b>ip ospf exit-overflow-interval</b>	This command sets the overflow interval value.
<b>ip ospf route-tag</b>	Configures a tag value for Autonomous System External (ASE) routes created.
<b>ip router router-id</b>	Configures the router ID for the router.

## show ip ospf border-routers

Displays information regarding all or specified border routers.

**show ip ospf border-routers** [*area\_id*] [*router\_id*] [*tos*] [*gateway*]

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
<i>tos</i>	The Type of Service. The valid range is 0–15. Only ToS value 0 is supported at this time.
<i>gateway</i>	The 32-bit IP address of the gateway for the border router being displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used to display a list of border routers known by this OSPF router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.
- See the related commands sections below to modify the list.

### Examples

```
-> show ip ospf border-routers 10.0.0.0
```

Router Id	Area Id	Gateway	TOS	Metric
10.0.0.0	1.0.0.1	143.209.92.71	1	1

#### output definitions

---

<b>Router ID</b>	The unique identification for the router.
<b>Area ID</b>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
<b>Gateway</b>	The next hop interface on which the border router has been learned.
<b>ToS</b>	The Type of Service. Only ToS value 0 is supported at this time.
<b>Metric</b>	The cost to the border router.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

N/A

**MIB Objects**

```
alaOspfBdrRouterAreaId  
alaOspfBdrRouterId  
alaOspfBdrRouterTos  
alaOspfBdrRouterMetric
```

---

## show ip ospf ext-lsdb

Displays external Link State Advertisements known by this router.

```
show ip ospf ext-lsdb [linkstate-id ls_id] [router-id router_id]
```

---

### Syntax Definitions

<i>ls_id</i>	The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database.
<i>router_id</i>	The Router ID. The ID is a unique 32-bit value such as an IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used to display the external link state database (LSDB) for the OSPF router.
- This command can be used for OSPF debugging purposes, specifically to narrow down sections of attached areas to determine which sections are receiving the specified external LSAs. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.
- See the Related Commands section below to modify the list.

### Examples

```
-> show ip ospf ext-lsdb
```

LS Id	Orig Router-Id	SeqNo	Age	Protocol
198.168.100.100	198.168.100.100	10	100	STATIC

#### output definitions

---

<b>LS Id</b>	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
<b>Orig Router-Id</b>	The router ID of the router that originated the external LSDB.
<b>SeqNo</b>	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
<b>Age</b>	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.
<b>Protocol</b>	The type of protocol, if any.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

### [ip ospf extlsdb-limit](#)

Assigns a limit to the number of External Link-State Database (LSDB) entries that can be learned.

## MIB Objects

ospfExtLsdbTable

ospfExtLsdbLsid

ospfExtLsdbSequence

ospfExtLsdbAge

ospfExtLsdbType

---

## show ip ospf host

Displays information on the configured OSPF hosts.

**show ip ospf host** [*ip\_address*]

---

### Syntax Definitions

*ip\_address*                      A 32-bit IP address for a directly attached host.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used to display general information for OSPF hosts directly attached to this router.
- See the Related Commands section below to modify the list.

### Examples

```
-> show ip ospf host 172.22.2.115
```

Host Address	TOS	Metric	Status	AreaId
143.209.92.12	1	0	Up	0.0.0.0

### output definitions

---

<b>Host Address</b>	A 32-bit IP address for a directly attached host. This can be set using the <b>ip ospf host</b> command.
<b>ToS</b>	The Type of Service traffic from the host is labeled as. ToS is set using the <b>ip ospf host</b> command.
<b>Metric</b>	The metric assigned to the host. Metric is set using the <b>ip ospf host</b> command.
<b>Status</b>	Whether the host is enabled or disabled.
<b>AreaId</b>	The area identification for the host's area.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [ip ospf host](#)

Creates and deletes an OSPF entry for directly attached hosts.

---

## show ip ospf lsdb

Displays LSAs in the Link State Database associated with each area.

```
show ip ospf lsdb [area_id] [rtr | net | netsum | asbrsum] [linkstate-id ls_id] [router-id router_id]
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<b>rtr</b>	Specifies router LSAs.
<b>net</b>	Specifies network LSAs.
<b>netsum</b>	Specifies network summary LSAs.
<b>asbrsum</b>	Specifies Autonomous System Border Router summary LSAs.
<i>ls_id</i>	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
<i>router_id</i>	The Router ID. The ID is a unique 32-bit value such as an IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used to display the Link State Database (LSDB) of the OSPF router. This command can be used for OSPF debugging purposes, specifically to narrow down sections of an area to determine which sections are receiving the specified link state advertisements. You may specify only the parameters from the area LSDB in which you are interested using the optional command parameters.
- You can view link state advertisements by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you must also supply a valid link state ID.

### Examples

```
-> show ip ospf lsdb
  Area Id      Type      LS Id      Orig Router-Id  SeqNo      Age
-----+-----+-----+-----+-----+-----
0.0.0.1      OSPF      198.168.100.100  198.168.100.100  1          100
```

#### output definitions

---

<b>Area Id</b>	The area identification for the area to which the record belongs.
<b>Type</b>	The protocol type from where the route was learned.
<b>LS Id</b>	The Link state ID. The ID is a unique 32-bit value such as an IP address. This number is used as a record in the link state database.

---

*output definitions (continued)*

---

<b>Orig Router-Id</b>	The router ID of the router that originated the external LSDB.
<b>SeqNo</b>	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
<b>Age</b>	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.

---

**Release History**

Release 7.1.1; command was introduced.

---

## show ip ospf neighbor

Displays information on OSPF non-virtual neighbor routers.

```
show ip ospf neighbor [ip_address]
```

---

### Syntax Definitions

*ip\_address* A 32-bit IP address of the neighboring router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used to display all non-virtual neighbors of the OSPF router.
- See the Related Commands section below to modify the list.

### Examples

```
-> show ip ospf neighbor
```

IP Address	Area Id	Router Id	Vlan	State	Mode
1.1.1.1	255.255.255.255	0.0.0.0	0	Down	Static

#### *output definitions*

---

<b>IP Address</b>	The IP address of the neighbor.
<b>Area Id</b>	A unique 32-bit value, such as an IP address, that identifies the neighboring router in the Autonomous System.
<b>Router Id</b>	The unique identification for the neighboring router.
<b>VlanId</b>	The VLAN corresponding to this interface on which the neighbor is reachable.
<b>State</b>	The state of the OSPF neighbor adjacency.
<b>Mode</b>	What type of neighbor, either <b>Dynamic</b> (learned) or <b>Static</b> .

---

```

-> show ip ospf neighbor 1.1.1.1
Neighbor's IP Address           = 1.1.1.1,
Neighbor's Router Id           = 0.0.0.0,
Neighbor's Area Id             = 255.255.255.255,
Neighbor's DR Address          = 0.0.0.0,
Neighbor's BDR Address         = 0.0.0.0,
Neighbor's Priority             = 1,
Neighbor's State               = Down,
Hello Suppressed ?             = No,
Neighbor's type                = Static,
DR Eligible                    = Yes,
# of State Events              = 0,
Mode                           = Slave,
MD5 Sequence Number           = 0,
Time since Last Hello          = 0 sec,
# of Outstanding LS Requests   = 0,
# of Outstanding LS Acknowledgements = 0,
# of Outstanding LS Retransmissions = 0,
Restart Helper Status          = Not Restarting,
Restart Age (in seconds)       = 0 sec,
Last Restart Helper Exit Reason = None

```

### *output definitions*

---

<b>Neighbor's IP Address</b>	The IP address of the neighbor.
<b>Neighbor's Router Id</b>	The identification number for the selected host's record. It is most often the router's IP address.
<b>Neighbor's Area Id</b>	Identifier of the OSPF Area to which the neighbor is attached. 255.255.255.255 shows that this neighbor is not attached to any area.
<b>Neighbor's DR Address</b>	The address of the neighbors Designated Router.
<b>Neighbor's BDR Address</b>	The address of the neighbors Backup Designated Router.
<b>Neighbor's Priority</b>	The priority value for this neighbor becoming the DR.
<b>Neighbor's State</b>	The condition of the OSPF neighbor's state machine.
<b>Hello Suppressed</b>	Whether sending hello messages to this neighbor is suppressed.
<b>Neighbor's type</b>	What type of neighbor this is, either dynamic or static.
<b>DR Eligible</b>	Shows the eligibility status of the static neighbor. If it is configured as "ineligible" during creation of the neighbor, it shows up as <b>No</b> . Otherwise, if configured as Eligible (the default), it shows up as <b>Yes</b> .
<b># of State Events</b>	The number of state events restricted for this neighbor and the local router.
<b>Mode</b>	The role the neighbor has with the local router during DD Exchange, which can be Master or Slave.
<b>MD5 Sequence Number</b>	The sequence number of the MD5 authorization key.
<b>Time since Last Hello</b>	The amount of time (in seconds) since the last HELLO messages was received from this neighbor.
<b># of Outstanding LS Requests</b>	The number of Link State requests to this neighbor that have not received a response from this neighbor.
<b># of Outstanding LS Acknowledgements</b>	Number of Link state Acknowledgements queued up by the local router to be sent to the neighbor.

*output definitions (continued)*

---

<b># of Outstanding LS Retransmissions</b>	The number of Link State updates to the neighbor that need to be retransmitted by the OSPF router.
<b>Restart Helper Status</b>	Indicates whether the router is acting as a hitless restart helper for the neighbor.
<b>Restart Age</b>	The remaining time, in seconds, for the current OSPF hitless restart interval if the router is acting as a restart helper for the neighbor.
<b>Last Restart Helper Exit Reason</b>	The outcome of the last attempt at acting as a hitless restart helper for the neighbor.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

[ip ospf neighbor](#) Creates a static neighbor on a Non Broadcast Multi Access (NBMA) interface.

**MIB Objects**

```
ospfNbrTable
  ospfNbrIpAddr
  ospfNbrRtrId
  ospfNbrOptions
  ospfNbrPriority
  ospfNbrState
  ospfNbrEvents
  ospfNbrHelloSuppressed

  alaOspfNbrRestartHelperStatus
  alaOspfNbrRestartHelperAge
  alaOspfNbrRestartHelperExitReason
```

---

## show ip ospf routes

Displays the OSPF routes known to the router.

**show ip ospf routes** [*ip\_addr mask tos gateway*]

---

### Syntax Definitions

<i>ip_addr</i>	The 32-bit IP address of the route destination in dotted decimal format.
<i>mask</i>	The IP subnet mask of the route destination.
<i>tos</i>	The Type of Service of the route.
<i>gateway</i>	The next hop IP address for this router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If no variables are entered, all routes are displayed. If the variables are entered, then only routes matching the specified criteria are shown. All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

### Examples

-> show ip ospf routes

```

Destination/Mask          Gateway          Metric  Vlan  Type
-----+-----+-----+-----+-----
198.168.100.100          195.5.2.8        0        5    AS-Ext

```

#### output definitions

---

<b>Destination/Mask</b>	The destination address of the route. This can also display the destination IP address mask if it is known.
<b>Gateway</b>	The gateway address of the route.
<b>Metric</b>	The cost of the route.
<b>Vlan</b>	The VLAN number on which the gateway can be routed.
<b>Type</b>	The type of OSPF route.

---

### Release History

## show ip ospf virtual-link

Displays virtual link information. A virtual link is used to connect OSPF backbone routers that are not physically contiguous.

**show ip ospf virtual-link** [*router\_id*]

---

### Syntax Definitions

*router\_id*                                    The router ID of the remote end of the virtual link that is to be viewed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

See the Related Commands section below to modify the list.

### Examples

```
-> show ip ospf virtual-link
```

```
                                State
Transit AreaId      Router-id   Link / Adjacency  AuthType  OperStatus
-----+-----+-----+-----+-----
1.1.1.1             172.17.1.1   P2P / Full       none      up
```

#### *output definitions*

---

<b>Transit AreaId</b>	The area identification for the area assigned to the virtual link.
<b>Router-Id</b>	The destination router identification for the virtual link.
<b>State Link</b>	The state of the virtual link with regards to the local router.
<b>State Adjacency</b>	The state of the virtual link adjacency.
<b>AuthType</b>	The type of authorization employed by the virtual link.
<b>OperStatus</b>	Displays whether the virtual link is enabled or disabled.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

- ip ospf virtual-link**           Creates or deletes a virtual link.  
**show ip ospf virtual-neighbor**   Displays OSPF virtual neighbors.

```

---

## show ip ospf virtual-neighbor

Displays OSPF virtual neighbors. A virtual neighbor is connected to the router through a virtual link rather than a physical one.

**show ip ospf virtual-neighbor** *area\_id* *router\_id*

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies the configured OSPF area in the AS.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used to display all virtual neighbors for the OSPF router.
- See the Related Commands section below to modify the list.

### Examples

```
-> show ip ospf virtual-neighbor 0.0.0.0 10.0.0.1
```

AreaId	RouterId	Priority	Events	RxmtQlen	LastHello	State
0.0.0.0	10.0.0.0	1	10	100	323	INIT

### output definitions

---

<b>AreaId</b>	The area identification for the area of which the virtual neighbor is a part.
<b>RouterId</b>	The router identification of the virtual neighbor.
<b>Priority</b>	The number used to determine whether the virtual neighbor will become the designated router for its area.
<b>Events</b>	The number of OSPF control message sent by the neighbor to the router.
<b>RxmtQlen</b>	The length (in number of packets) of the retransmit queue.
<b>LastHello</b>	The last Hello message sent by the neighbor
<b>State</b>	The current state the virtual neighbor is in relative to the router; this will be INIT, Exchange, or Full.

---

```

-> show ip ospf virtual-neighbor 0.0.0.1 2.0.0.254
Neighbor's IP Address           = 2.0.0.254,

Last Restart Helper Exit Reason = None

```

### *output definitions*

---

<b>Neighbor's IP Address</b>	The IP address of the virtual neighbor.
<b>Neighbor's Router Id</b>	The identification number for the selected host's record. It is most often the router's IP address.
<b>Neighbor's Area Id</b>	Identifier of the OSPF Area to which the virtual neighbor is attached. 255.255.255.255 shows that this virtual neighbor is not attached to any area.
<b>Neighbor's DR Address</b>	The address of the virtual neighbor's Designated Router.
<b>Neighbor's BDR Address</b>	The address of the virtual neighbor's Backup Designated Router.
<b>Neighbor's Priority</b>	The priority value for this virtual neighbor becoming the DR.
<b>Neighbor's State</b>	The condition of the OSPF virtual neighbor's state machine.
<b>Hello Suppressed</b>	Whether sending hello messages to this virtual neighbor is suppressed.
<b>Neighbor's type</b>	What type of virtual neighbor this is, either dynamic or static.
<b>DR Eligible</b>	Shows the eligibility status of the virtual neighbor. If it is configured as "ineligible" during creation of the neighbor, it shows up as <b>No</b> . Otherwise, if configured as Eligible (the default), it shows up as <b>Yes</b> .
<b># of State Events</b>	The number of state events restricted for this virtual neighbor and the local router.
<b>Mode</b>	The role the virtual neighbor has with the local router during DD Exchange, which can be Master or Slave.
<b>MD5 Sequence Number</b>	The sequence number of the MD5 authorization key.
<b>Time since Last Hello</b>	The amount of time (in seconds) since the last HELLO messages was received from this virtual neighbor.
<b>Last DD I_M_MS</b>	The initialize (I), more (M) and master (MS) bits, and Options field Data Description (DD) packet received from the virtual neighbor. This parameter is used to determine whether the next DD packet has been received or not.

*output definitions (continued)*

---

<b># of Outstanding LS Requests</b>	The number of Link State requests to this virtual neighbor that have not received a response from this virtual neighbor.
<b># of Outstanding LS Acknowledgements</b>	Number of Link state Acknowledgements queued up by the local router to be sent to the virtual neighbor.
<b># of Outstanding LS Retransmissions</b>	The number of Link State updates to the virtual neighbor that need to be retransmitted by the OSPF router.
<b>Restart Helper Status</b>	Indicates whether the router is acting as a hitless restart helper for the virtual neighbor.
<b>Restart Age</b>	The remaining time, in seconds, for the current OSPF hitless restart interval if the router is acting as a restart helper for the virtual neighbor.
<b>Last Restart Helper Exit Reason</b>	The outcome of the last attempt at acting as a hitless restart helper for the virtual neighbor.

## show ip ospf area

Displays either all OSPF areas, or a specified OSPF area.

```
show ip ospf area [area_id]
```

---

### Syntax Definitions

*area\_id* A unique 32-bit value in IP address format.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Allows you to view the details of a specified OSPF area.
- Not specifying an OSPF area will display all known areas for the OSPF router.
- See the Related Commands section below for information on modifying an area.

### Examples

```
-> show ip ospf area
```

Area Id	AdminStatus	Type	OperStatus
1.1.1.1	disabled	normal	down
0.0.0.1	disabled	normal	down

```
-> show ip ospf area 0.0.0.0
```

```
Area Identifier            = 1.1.1.1,
Admin Status              = Disabled,
Operational Status       = Down,
Area Type                 = normal,
Area Summary              = Enabled,
Time since last SPF Run   = 00h:00m:27s,
# of Area Border Routers known = 0,
# of AS Border Routers known = 0,
# of LSAs in area        = 0,
# of SPF Calculations done = 0,
# of Incremental SPF Calculations done = 0,
# of Neighbors in Init State = 0,
# of Neighbors in 2-Way State = 0,
# of Neighbors in Exchange State = 0,
# of Neighbors in Full State = 0,
# of Interfaces attached   = 0
Attached Interfaces       = vlan-213
```

*output definitions*

---

<b>Area Identifier</b>	The unique 32-bit value, such as IP address, that identifies the OSPF area in the AS.
<b>Admin Status</b>	Whether the area is enabled or disabled.
<b>Operational Status</b>	Whether the area is active.
<b>Area Type</b>	The area type. This field will be <b>normal</b> , <b>stub</b> , or <b>NSSA</b> .
<b>Area Summary</b>	Whether Area Summary is enabled or disabled.
<b>Time since last SPF Run</b>	The last time the Shortest Path First calculation was performed.
<b># of Area Border Routers known</b>	The number of Area Border Routers in the area.
<b># of AS Border Routers known</b>	The number of Autonomous System Border Routers in the area.
<b># of LSAs</b>	The total number of Link State Advertisements for the Area.
<b># of SPF Calculations</b>	The number of times the area has calculated the Shortest Path.
<b># of Incremental SPF Calculations</b>	The number of incremental Shortest Path First calculations that have been performed in the area.
<b># of Neighbors in Init State</b>	The number of OSPF neighbors that are in initialization.
<b># of Neighbors in 2-Way State</b>	The number of OSPF 2-way state neighbors in this area.
<b># of Neighbors in Exchange State</b>	The number of OSPF neighbors that are currently establishing their status.
<b># of Neighbors in Full State</b>	The number of OSPF neighbors.
<b># of Interfaces attached</b>	The number of OSPF interfaces.
<b>Attached Interfaces</b>	The names of the OSPF interfaces attached to this area.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<a href="#">ip ospf area</a>	Creates or deletes an OSPF area, assigning default metric, cost, and type.

## show ip ospf area range

Displays all or specified route summaries in a given area.

```
show ip ospf area area_id range [{summary | nssa} ip_address ip_mask]
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<b>summary</b>	Specifies that routes are summarized.
<b>nssa</b>	Specifies the Not So Stubby Area (NSSA) routers are summarized.
<i>ip_address</i>	A 32-bit IP address.
<i>ip_mask</i>	A 32-bit subnet mask.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Allows you to view the details of a specified OSPF area range.
- See the Related Commands section below for information on modifying an area.

### Examples

```
-> show ip ospf area 0.0.0.0 range
```

AreaId	Type	Destination	Advertise
0.0.0.0	Summary	192.168.12.1/24	Matching
0.0.0.0	NSSA	143.209.92.71/24	noMatching

#### *output definitions*

---

<b>AreaId</b>	The area identification for the area range.
<b>Type</b>	The type of area the range is associated with.
<b>Destination</b>	The destination address of the range.
<b>Advertise</b>	Shows the filter effect of the range. LSAs in the range are either advertised (Matching) or not advertised (noMatching).

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **ip ospf area range**

Creates a route summarization instance whereby a range of addresses assigned for the route at the area border router will be advertised.

## MIB Objects

---

## show ip ospf area stub

Displays stub default area metrics, if configured.

**show ip ospf area *area\_id* stub**

---

### Syntax Definitions

*area\_id* A unique 32-bit value in IP address format.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip ospf area 0.0.0.1 stub
```

```

      Area Id      TOS      Metric      MetricType
-----+-----+-----+-----
0.0.0.1          1          1          ospf

```

#### *output definitions*

---

<b>Area Id</b>	The identification number of the stub area.
<b>TOS</b>	The Type of Service assignment.
<b>Metric</b>	The metric assignment of the default router in the stub area.
<b>MetricType</b>	The metric type of the stub area. It will be either <b>ospf</b> , <b>type1</b> , or <b>type2</b> .

---

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip ospf area** Creates or deletes an OSPF area.

**MIB Objects**

## show ip ospf interface

Displays OSPF interface information.

**show ip ospf interface** [*interface\_name*]

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Not specifying an interface name displays all known interfaces for the OSPF router.

### Examples

No interface name is specified:

```
-> show ip ospf interface
```

Interface Name	DR Address	Backup DR Address	Admin Status	Oper Status	State
vlan-213	213.10.10.1	213.10.10.254	enabled	up	DR
vlan-215	215.10.10.254	215.10.10.1	enabled	up	BDR

#### *output definitions*

---

<b>Interface Name</b>	The name of the interface.
<b>DR Address</b>	The designated router IP address on this network segment. Make sure you configure a VLAN for the router IP. (See <a href="#">Chapter 4, “VLAN Management Commands,”</a> for more information.)
<b>Backup DR Address</b>	The IP address of the backup designated router.
<b>Vlan</b>	The VLAN to which the interface is assigned.
<b>Admin Status</b>	The current administration status of the interface, either <b>enabled</b> or <b>disabled</b> .
<b>Oper Status</b>	Whether the interface is an active OSPF interface.
<b>State</b>	The current state of the OSPF interface. It will be <b>down</b> , <b>up</b> , <b>dp</b> , <b>dr</b> , or <b>other</b> .

---

The following is an example of MD5 authentication (an interface name is used in this example).

```
-> show ip ospf interface vlan-3
Interface IP Name           = vlan-3
VLAN Id                    = 3,
Interface IP Address       = 100.10.10.2,
Interface IP Mask          = 255.255.255.0,
Admin Status               = Enabled,
Operational Status        = Up,
OSPF Interface State      = BDR,
Interface Type             = Broadcast,
Area Id                   = 0.0.0.2,
Designated Router IP Address = 100.10.10.88,
Designated Router RouterId = 100.10.10.88,
Backup Designated Router IP Address = 100.10.10.2,
Backup Designated Router RouterId = 192.169.1.2,
MTU (bytes)               = 1500,
Metric Cost                = 1,
Priority                   = 1,
Hello Interval (seconds)  = 10,
Transit Delay (seconds)   = 1,
Retrans Interval (seconds) = 5,
Dead Interval (seconds)   = 40,
Poll Interval (seconds)   = 120,
Link Type                  = Broadcast,
Authentication Type       = md5,
#   Id   Key   Status   StartAccept   StopAccept   StartGen   StopGen
-----+-----+-----+-----+-----+-----+-----+-----
1  1     Set   Enabled     0             0             0           0
# of Events                = 2,
# of Init State Neighbors  = 0,
# of 2-Way State Neighbors = 0,
# of Exchange State Neighbors = 0,
# of Full State Neighbors  = 1
```

---

**Note.** See the table of the following page for output definitions.

---

The following is an example of simple authentication (an interface name is used in this example):

```
-> show ip ospf interface vlan-3
Interface IP Name           = vlan-3
VLAN Id                    = 3,
Interface IP Address       = 100.10.10.2,
Interface IP Mask          = 255.255.255.0,
Admin Status               = Enabled,
Operational Status        = Up,
OSPF Interface State      = DR,
Interface Type             = Broadcast,
Area Id                   = 0.0.0.2,
Designated Router IP Address = 100.10.10.2,
Designated Router RouterId = 192.169.1.2,
Backup Designated Router IP Address = 0.0.0.0,
Backup Designated Router RouterId = 0.0.0.0,
MTU (bytes)                = 1500,
Metric Cost                = 1,
Priority                   = 1,
Hello Interval (seconds)   = 10,
Transit Delay (seconds)    = 1,
Retrans Interval (seconds) = 5,
Dead Interval (seconds)    = 40,
Poll Interval (seconds)    = 120,
Link Type                  = Broadcast,
Authentication Type        = simple,
Authentication Key         = Set,
# of Events                 = 3,
# of Init State Neighbors  = 0,
# of Exchange State Neighbors = 0,
# of 2-Way State Neighbors = 0,
# of Full State Neighbors  = 0
```

Output fields when an interface name is specified are described below:

#### *output definitions*

---

<b>Interface IP Name</b>	The name of the VLAN to which the interface is assigned.
<b>VLAN Id</b>	The VLAN to which the interface is assigned.
<b>Interface IP Address</b>	The IP address assigned to the interface.
<b>Interface IP Mask</b>	The IP mask associated with the IP address assigned to the interface.
<b>Admin Status</b>	The current administration status of the interface, either <b>enabled</b> or <b>disabled</b> .
<b>Operational Status</b>	Whether the interface is an active OSPF interface.
<b>OSPF Interface State</b>	The current state of the OSPF interface. It will be <b>down</b> , <b>up</b> , <b>dp</b> , <b>dr</b> , or <b>other</b> .
<b>Interface Type</b>	The OSPF interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint.
<b>Area Id</b>	The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area.
<b>Designated Router IP Address</b>	The designated router IP address.
<b>Designated Router RouterId</b>	The identification number of the designated router.

*output definitions (continued)*

---

<b>Backup Designated Router IP Address</b>	The IP address of the backup designated router.
<b>Backup Designated Router RouterId</b>	The identification number of the backup designated router.
<b>MTU</b>	The Maximum Transfer Unit (in bytes) for the interface.
<b>Metric Cost</b>	The cost added to routes learned on this interface.
<b>Priority</b>	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
<b>Hello Interval</b>	The number of seconds between hello messages sent out on the interface.
<b>Transit Delay</b>	The estimated number of seconds required to transmit a link state update over this interface.
<b>Retrans Interval</b>	The number of seconds the interface waits before resending hello messages.
<b>Dead Interval</b>	The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead.
<b>Poll Interval</b>	The larger time interval, in seconds, between hello messages sent to inactive neighbors.
<b>Link Type</b>	The IP interface type, either <b>broadcast</b> or <b>non broadcast</b> .
<b>Authentication Type</b>	The type of authentication used by this interface, either <b>none</b> , <b>simple</b> , or <b>md5</b> .
<b>#</b>	The indexing of the MD5 key. (This field is only displayed for MD5 authentication.)
<b>Id</b>	A key identifier that identifies the algorithm and MD5 secret key associated with this interface. (This field is only displayed for MD5 authentication.)
<b>Key</b>	Indicates whether the MD5 key has been set or not. (This field is only displayed for MD5 authentication.)
<b>Status</b>	The status of the configured MD5 authentication key. (This field is only displayed for MD5 authentication.)
<b>StartAccept</b>	The time that the OSPF router will start accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.)
<b>StopAccept</b>	The time that the OSPF router will stop accepting packets that have been created with this key. (This field is only displayed for MD5 authentication.)
<b>StartGen</b>	The time that the OSPF router will start using this key for packet generation. (This field is only displayed for MD5 authentication.)
<b>StopGen</b>	The time that the OSPF router will stop using this key for packet generation. (This field is only displayed for MD5 authentication.)
<b>Authentication Key</b>	This field displays whether the authentication key has been configured or not. (This field is only displayed for simple and no authentication.)
<b># of Events</b>	The number of interface state machine events.
<b># of Init State Neighbors</b>	The number of OSPF neighbors in the initialization state.

---

*output definitions (continued)*

---

<b># of 2-Way State Neighbors</b>	The number of OSPF 2-way state neighbors on this interface.
<b># of Exchange State Neighbors</b>	The number of OSPF neighbors in the exchange state.
<b># of Full State Neighbors</b>	The number of OSPF neighbors in the full state. The full state is a neighbor that is recognized and passing data between itself and the interface.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>ip ospf interface</b>	Creates and deletes an OSPF interface.
<b>ip ospf interface auth-key</b>	Configures an OSPF authentication key for simple authentication on an interface.
<b>ip ospf interface dead-interval</b>	Configures the OSPF interface dead interval.
<b>ip ospf interface hello-interval</b>	Configures the OSPF interface hello interval.
<b>ip ospf interface md5</b>	Creates and deletes the OSPF interface MD5 key identification number.
<b>ip ospf interface md5 key</b>	Configures the OSPF key string.
<b>ip ospf interface cost</b>	Configures the OSPF interface cost.
<b>ip ospf interface poll-interval</b>	Configures the OSPF poll interval for a Non Broadcast Multi Access (NBMA) interface.
<b>ip ospf interface priority</b>	Configures the OSPF interface priority.
<b>ip ospf interface retrans-interval</b>	Configures the OSPF interface retransmit interval.
<b>ip ospf interface transit-delay</b>	Configures the OSPF interface transit delay.
<b>ip ospf interface auth-type</b>	Sets the OSPF interface authentication type.
<b>ip ospf interface area</b>	Configures an OSPF interface area.
<b>ip ospf interface type</b>	Configures the OSPF interface type.
<b>ip ospf interface admin-state</b>	Enables or disables the administration status on an OSPF interface.

## show ip ospf restart

Displays the OSPF graceful restart related configuration and status.

**show ip ospf restart**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on OmniSwitch 10K switches with a single CMM.

### Examples

```
-> show ip ospf restart
Restart Support                = Enabled,
Restart Interval (in seconds) = 120,
Restart Status                 = Not Restarting,
Restart Age (in seconds)       = 0,
Last Restart Exit Reason       = None,
Restart Helper Support         = Enabled,
Restart Helper Strict Checking = Enabled,
Restart Helper Mode            = NotHelping
```

### *output definitions*

<b>Restart Support</b>	The administrative status of OSPF graceful restart, which can be <b>Enabled</b> or <b>Disabled</b> .
<b>Restart Interval</b>	The configured OSPF hitless restart timeout interval, in seconds. Use the <b>ip ospf restart-interval</b> command to modify this parameter.
<b>Restart Status</b>	The current status of OSPF graceful restart, which can be <b>Not Restarting</b> , <b>Unplanned Restart</b> (after a CMM takeover), or <b>Planned Restart</b> (before CMM takeover).
<b>Restart Age</b>	The remaining time, in seconds, for the current OSPF graceful restart interval.
<b>Last Restart Exit Reason</b>	The outcome of the last attempt at a graceful restart. If the value is <b>None</b> , then no restart has yet been attempted. If the value is <b>In Progress</b> , then a restart attempt is currently underway. Other possible values include <b>Completed</b> (successfully completed), <b>Timed Out</b> (timed out), and <b>Topology Changed</b> (aborted due to topology change).

*output definitions (continued)*

---

<b>Restart Helper Support</b>	The administrative status of the capability of an OSPF router to operate in helper mode in response to a router performing a graceful restart, which can be <b>Enabled</b> or <b>Disabled</b> . Use the <b>ip ospf restart-helper admin-state</b> command to modify this parameter.
<b>Restart Helper Strict Checking</b>	The administrative status of whether or not a changed Link State Advertisement (LSA) will result in termination of graceful restart by a helping router, which can be <b>Enabled</b> or <b>Disabled</b> . Use the <b>ip ospf restart-helper strict-lsa-checking admin-state</b> command to modify this parameter.
<b>Restart Helper Mode</b>	Whether this OSPF router is operating as a helper to a restarting router.

---

# 20 OSPFv3 Commands

Open Shortest Path First version 3 (OSPFv3) routing is a shortest path first (SPF) or link-state protocol. This protocol is compatible with 128-bit IPv6 address space, while OSPF is compatible with 32-bit IPv4 address space. OSPFv3 is an interior gateway protocol (IGP) that distributes routing information between routers in a single autonomous system (AS). OSPFv3 chooses the least-cost path as the best path.

Each participating router distributes its local state (i.e., the router's usable interfaces and reachable neighbors) throughout the AS by flooding. In a link-state protocol, each router maintains a database describing the entire AS topology. This database is built from the collected link state advertisements of all routers. Each multi-access network that has at least two attached routers has a designated router and a backup designated router. The designated router floods a link state advertisement for the multi-access network and has other special responsibilities.

OSPFv3 allows collections of contiguous networks and hosts to be grouped together. A group, together with the routers having interfaces to any one of the included networks, is called an *area*. Each area runs a separate copy of the basic link-state routing algorithm. This means that each area has its own topological database, as explained in the previous section.

Alcatel-Lucent's version of OSPFv3 complies with RFCs 2740, 1826, 1827, 2553, 2373, 2374, and 2460.

MIB information for OSPFv3 is as follows:

*Filename:* AlcatelIND1DrcTm.mib  
*Module:* ALCATEL-IND1-DRCTM-MIB

*Filename:* AlcatelIND1Ospf3.mib  
*Module:* ALCATEL-IND1-OSPF3-MIB

*Filename:* IETF-OSPF-OSPFv3.MIB  
*Module:* OSPF-OSPFv3-MIB

---

The following is a list of the commands for configuring OSPFv3:

---

<b>Global OSPFv3 Commands</b>	<code>ipv6 ospf admin-state</code> <code>ipv6 load ospf</code> <code>ipv6 ospf host</code> <code>ipv6 ospf mtu-checking</code> <code>ipv6 ospf route-tag</code> <code>ipv6 ospf spf-timer</code> <code>ipv6 ospf virtual-link</code> <code>show ipv6 ospf</code> <code>show ipv6 ospf border-routers</code> <code>show ipv6 ospf host</code> <code>show ipv6 ospf lsdb</code> <code>show ipv6 ospf neighbor</code> <code>show ipv6 ospf routes</code> <code>show ipv6 ospf virtual-link</code>
<b>OSPFv3 Area Commands</b>	<code>ipv6 ospf area</code> <code>show ipv6 ospf area</code>
<b>OSPFv3 Interface Commands</b>	<code>ipv6 ospf interface</code> <code>ipv6 ospf interface admin-state</code> <code>ipv6 ospf interface area</code> <code>ipv6 ospf interface dead-interval</code> <code>ipv6 ospf interface hello-interval</code> <code>ipv6 ospf interface cost</code> <code>ipv6 ospf interface priority</code> <code>ipv6 ospf interface retrans-interval</code> <code>ipv6 ospf interface transit-delay</code> <code>show ipv6 ospf interface</code>

---

## ipv6 ospf admin-state

Enables or disables the OSPFv3 administrative status for the router.

**ipv6 ospf admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables OSPFv3.
<b>disable</b>	Disables OSPFv3.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	<b>enable</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The OSPFv3 protocol should be enabled to route traffic.

### Examples

```
-> ipv6 ospf admin-state enable
-> ipv6 ospf admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ipv6 ospf** Displays OSPFv3 status and general configuration parameters.

### MIB Objects

```
ospfv3GeneralGroup
  ospfv3AdminStat
```

---

## ipv6 load ospf

Loads the OSPFv3 software on the router.

**ipv6 load ospf**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Example

```
-> ipv6 load ospf
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

N/A

### MIB Objects

ALADRCTMCONFIG

alaDrcTmIPOspf3Status

---

## ipv6 ospf host

Creates or deletes an OSPFv3 entry for directly attached hosts.

**ipv6 ospf host** *ipv6\_address* [**area** *area\_id*] [**metric** *metric*]

**no ipv6 ospf host** *ipv6\_address* **area** *area\_id*

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IP address of the OSPF host.
<i>area_id</i>	Area to which the host route belongs.
<i>metric</i>	The cost metric value assigned to the specified host. The valid range is 0–65535.

### Defaults

parameter	default
<i>metric</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove the record of the OSPFv3 host.
- Use this command when multiple paths exist to a host. The specified host must be directly attached to the router. A metric value is the cost of all the hops necessary for a packet to reach its destination. Routers use the metric to determine the best possible path.
- This command allows you to modify the host parameter **metric**.

### Examples

```
-> ipv6 ospf host 2001::1/64 metric 10
-> no ipv6 ospf host 2001::1/64 metric 10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 ospf host](#) Displays information on the configured OSPFv3 hosts.

**MIB Objects**

ospfv3HostTable

- ospfv3HostStatus
- ospfv3HostAreaID
- ospfv3HostAddress
- ospfv3HostMetric

---

## ipv6 ospf mtu-checking

Enables or disables Maximum Transfer Unit (MTU) checking. The MTU limits the size of a transmitted or received packet.

**ipv6 ospf mtu-checking**

**no ipv6 ospf mtu-checking**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to disable MTU checking.
- This command is used to disable the checking for mismatch of the interface MTU while establishing a neighbor adjacency with a router. MTU mismatch occurs when a router receives packets that contain a larger MTU value than that of the interface on which adjacency is being established. The interface MTU is the largest IP datagram size (in bytes) that the interface can accept.

### Examples

```
-> ipv6 ospf mtu-checking  
-> no ipv6 ospf mtu-checking
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ipv6 ospf** Displays the OSPFv3 status and general configuration parameters.

### MIB Objects

```
alaProtocolOspf3  
  alaOspf3MTUCheck
```

---

## ipv6 ospf route-tag

Configures a tag value for the Autonomous System External (ASE) routes created.

**ipv6 ospf route-tag** *tag*

---

### Syntax Definitions

*tag* The set tag value. The valid range is 0–2, 147, 483, 647.

### Defaults

parameter	default
<i>tag</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command allows you to set a tag value for ASE routes that are learned by this OSPF router. The tag value allows for quick identification.
- OSPF ASE route advertisements contain a tag value field. This field allows the exchange of information between autonomous system border routers (ASBRs).

### Examples

```
-> ipv6 ospf route-tag 2
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 ospf](#) Displays OSPFv3 status and general configuration parameters.

### MIB Objects

alaProtocolOspf3  
alaOspf3RedistRouteTag

---

## ipv6 ospf spf-timer

Configures timers for Shortest Path First (SPF) calculation.

```
ipv6 ospf spf-timer [delay delay_seconds] [hold hold_seconds]
```

---

### Syntax Definitions

*delay\_seconds* Specifies time (from 0 to 65535 seconds) between the reception of an OSPF topology change and the start of an SPF calculation.

*hold\_seconds* Specifies the minimum time (from 0 to 65535 seconds) between consecutive SPF calculations.

### Defaults

parameter	default
<i>delay_seconds</i>	5
<i>hold_seconds</i>	10

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command allows you to configure the time interval between SPF calculations.
- Use the delay timer to determine how much time to postpone an SPF calculation after the router receives a topology change.
- Use the hold timer to configure the amount of time that must elapse between consecutive SPF calculations.
- There will be no delay in the SPF calculation if either the delay timer or hold timer is set to 0. The SPF calculations will occur immediately upon the reception of a topology change and/or that back-to back SPF calculations can take place with no break in-between the two.

### Examples

```
-> ipv6 ospf spf-timer delay 20 hold 35
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ipv6 ospf**

Displays the OSPFv3 status and general configuration parameters.

## MIB Objects

```
alaProtocolOspf3  
  alaOspf3TimerSpfDelay  
  alaOspf3TimerSpfHold
```

---

## ipv6 ospf virtual-link

Creates or deletes a virtual link. A virtual link restores the backbone connectivity if the backbone is not physically contiguous.

```
ipv6 ospf virtual-link area area_id router router_id
[dead-interval seconds] [hello-interval seconds] [retrans-interval seconds] [transit-delay seconds]
```

```
no ipv6 ospf virtual-link area area_id router router_id
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
<b>dead-interval</b> <i>seconds</i>	Sets the virtual link dead interval. If no hello packets on this link for the set number of seconds have been received, the virtual neighbor is declared dead. The valid range is 1–2147483647.
<b>hello-interval</b> <i>seconds</i>	Sets the virtual link hello interval, which is the time interval between OSPF hellos sent on this virtual link. The valid range is 1–65535.
<b>retrans-interval</b> <i>seconds</i>	Sets the virtual link retransmit interval. The router waits the set number of seconds before retransmitting OSPF packets. The valid range is 0–3600.
<b>transit-delay</b> <i>seconds</i>	Sets the virtual link transit delay, which is the number of seconds to transmit OSPF packets over this link. The valid range is 0–3600.

### Defaults

parameter	default
<b>dead-interval</b> <i>seconds</i>	40
<b>hello-interval</b> <i>seconds</i>	10
<b>retrans-interval</b> <i>seconds</i>	5
<b>transit-delay</b> <i>seconds</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Use the **no** form of the command to delete the virtual link.
- You can define areas in such a way that the backbone is no longer contiguous. In this case, the system administrator can ensure backbone connectivity physically.
- Virtual links can be configured between any two backbone routers that have an interface to a common non-backbone area. Virtual links belong to the backbone. The protocol treats two routers joined by a virtual link as if they were connected by an unnumbered point-to-point network. The routing protocol traffic that flows along the virtual link uses intra-area routing only.
- If authentication is enabled, both routers at either end of the virtual link must share the same password. Simple authentication refers to the use of only clear-text passwords as an authentication method. MD5 authentication refers to the usage of message digests.
- The **dead-interval** value should be the same for all the routers on the same network. This value should be a multiple of the value provided for the **hello-interval**.

## Examples

```
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 dead-interval 50
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 hello-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 retrans-interval 20
-> ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115 transit-delay 50
-> no ipv6 ospf virtual-link area 0.0.0.1 router 172.22.2.115
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**show ipv6 ospf virtual-link**      Displays the virtual link information.

## MIB Objects

  ospfv3VirtIfTransitDelay
```

---

## ipv6 ospf area

Assigns an OSPFv3 interface to a specified area.

**ipv6 ospf area** *area\_id* [**type** {**normal** | **stub** [**default-metric** *metric*]}]

**no ipv6 ospf area** *area\_id*

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IPv4 address format.
<b>normal</b>	Sets the area as a regular OSPFv3 area.
<b>stub</b>	Configures an OSPFv3 area as a stub area.
<i>metric</i>	Defines the metric to be used for default routes injected into the stub.

### Defaults

---

parameter	default
<b>normal</b>   <b>stub</b>	<b>normal</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to delete the OSPFv3 area.
- The **default-metric** parameter defines the metric to be used for default routes injected into the stub area.

### Examples

```
-> ipv6 ospf area 0.0.0.1
-> ipv6 ospf area 0.0.0.1 stub
-> ipv6 ospf area 0.0.0.1 type normal
-> no ipv6 ospf area 0.0.0.1
```

### Release History

Release 7.1.1; command was introduced.

---

## ipv6 ospf interface

Creates or deletes an OSPFv3 interface.

**ipv6 ospf interface** *interface\_name*

**no ipv6 ospf interface** *interface\_name*

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to delete an OSPFv3 interface.
- The interface name cannot contain spaces.

### Examples

```
-> ipv6 ospf interface vlan-101  
-> no ipv6 ospf interface vlan-101
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ipv6 ospf interface**              Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

ospfv3IfTable  
ospfv3IfIndex

---

## ipv6 ospf interface admin-state

Enables or disables the administration status on an OSPFv3 interface.

**ipv6 ospf interface** *interface\_name* **admin-state** {enable | disable}

**no ipv6 ospf interface** *interface\_name*

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<b>enable</b>	Enables the OSPFv3 interface.
<b>disable</b>	Disables the OSPFv3 interface.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to delete an OSPFv3 interface.
- The OSPFv3 interface must be enabled to participate in the OSPFv3 protocol.

### Examples

```
-> ipv6 ospf interface vlan-101 admin-state enable
-> ipv6 ospf interface vlan-101 admin-state disable
-> no ipv6 ospf interface vlan-101
-> no ipv6 ospf interface vlan-101
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ipv6 ospf interface** Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable
  ospfv3IfIndex
  ospfv3IfAdminStat
```

---

## ipv6 ospf interface area

Configures an OSPFv3 area identifier for this interface.

```
ipv6 ospf interface interface_name area area_id
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>area_id</i>	A unique 32-bit value in IP address format.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

An interface must be assigned to an area to become operational.

### Examples

```
-> ipv6 ospf interface vlan-101 area 0.0.0.1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">show ipv6 ospf area</a>	Displays either all the OSPFv3 areas, or a specified OSPFv3 area.
<a href="#">show ipv6 ospf interface</a>	Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfAreaId
```

---

## ipv6 ospf interface dead-interval

Configures the OSPFv3 interface dead interval.

**ipv6 ospf interface** *interface\_name* **dead-interval** *seconds*

---

### Syntax Definitions

*interface\_name* The name of the interface.

*seconds* The dead interval, in seconds. The valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i> (broadcast and point-to-point)	40
<i>seconds</i> (NBMA and point-to-multi-point)	120

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- After the dead interval, a neighbor on this interface is considered dead if no hello packets have been received from this neighbor.
- This interval should be greater than the hello interval or multiples of the hello interval.

### Examples

```
-> ipv6 ospf interface vlan-101 dead-interval 50
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[ipv6 ospf interface hello-interval](#)

Configures the OSPFv3 interface hello interval.

[show ipv6 ospf interface](#)

Displays the status and statistics of an OSPFv3 interface.

## MIB Objects

ospfv3IfTable

ospfv3IfIndex

ospfv3IfRtrDeadInterval

---

## ipv6 ospf interface hello-interval

Configures the OSPFv3 interface hello interval.

```
ipv6 ospf interface interface_name hello-interval seconds
```

---

### Syntax Definitions

*interface\_name* The name of the interface.

*seconds* The hello interval, in seconds. The valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i> (broadcast and point-to-point)	10
<i>seconds</i> (NBMA and point-to-multi-point)	30

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This is the interval between two consecutive hello packets sent out on this interface.

### Examples

```
-> ipv6 ospf interface vlan-101 hello-interval 50
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ipv6 ospf interface dead-interval](#) Configures the OSPFv3 interface dead interval.

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfHelloInterval
```

---

## ipv6 ospf interface cost

Configures the OSPFv3 interface cost.

```
ipv6 ospf interface interface_name cost cost
```

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*cost*                                      The interface cost. The valid range is 0–65535.

### Defaults

parameter	default
<i>cost</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The configured interface cost (if any) is used during OSPFv3 route calculations.

### Examples

```
-> ipv6 ospf interface vlan-101 cost 10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 ospf interface](#)              Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfMetricValue
```

---

## ipv6 ospf interface priority

Configures the OSPFv3 interface priority. The priority number helps determine the eligibility of this router to become the designated router on the network.

**ip ospf interface** *interface\_name* **priority** *priority*

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

*priority*                              The interface priority. The valid range is 0–255.

### Defaults

parameter	default
<i>priority</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

When two routers attached to a network both attempt to become the designated router, the one with the highest priority becomes the designated router. A router whose router priority is set to 0 is ineligible to become the designated router.

### Examples

```
-> ipv6 ospf interface vlan-101 priority 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 ospf interface](#)              Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

ospfv3IfTable  
    ospfv3IfIndex  
    ospfv3IfRtrPriority

---

## ipv6 ospf interface retrans-interval

Configures the OSPFv3 interface retransmit time interval.

```
ipv6 ospf interface interface_name retrans-interval interval
```

---

### Syntax Definitions

*interface\_name* The name of the interface.

*interval* The retransmit interval, in seconds. The valid range 0–3600.

### Defaults

parameter	default
<i>interval</i>	5

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The number of seconds between link retransmission of OSPFv3 packets on this interface.

### Examples

```
-> ipv6 ospf interface vlan-101 retrans-interval 500
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfRetransInterval
```

---

## ipv6 ospf interface transit-delay

Configures the OSPFv3 interface transit time delay.

```
ipv6 ospf interface interface_name transit-delay delay
```

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>delay</i>	The transit delay, in seconds. The valid range is 0–3600.

### Defaults

---

parameter	default
<i>seconds</i>	1

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The estimated number of seconds required to transmit a link state update over this interface. This command takes into account transmission and propagation delays and must be greater than 0.

### Examples

```
-> ipv6 ospf interface vlan-101 transit-delay 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 ospf interface](#) Displays the status and statistics of an OSPFv3 interface.

### MIB Objects

```
ospfv3IfTable  
  ospfv3IfIndex  
  ospfv3IfTransitDelay
```

---

## show ipv6 ospf

Displays the OSPFv3 status and general configuration parameters.

**show ipv6 ospf**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used to display the general configuration parameters of the OSPFv3 router.
- See the Related Commands section below to modify the displayed parameters.

### Examples

```
-> show ipv6 ospf
```

```
Status = Enabled,
Router ID = 5.5.5.5,
# Areas = 2,
# Interfaces = 4,
Area Border Router = Yes,
AS Border Router = No,
External Route Tag = 0,
SPF Hold (seconds) = 10,
SPF Delay (seconds) = 5,
MTU checking = Enabled,
# SPF calculations performed = 3,
Last SPF run (seconds ago) = N/A,
# of neighbors that are in:
  Full state = 3,
  Loading state = 0,
  Exchange state = 0,
  Exstart state = 0,
  2way state = 0,
  Init state = 0,
  Attempt state = 0,
  Down state = 0,
```

*output definitions*

---

<b>Status</b>	Displays whether OSPFv3 is currently enabled or disabled on the router.
<b>Router Id</b>	The unique identification for the router.
<b># Areas</b>	Number of areas to which the router belongs.
<b># Interface</b>	Number of interfaces participating in OSPF
<b>Area Border Router</b>	Displays whether the router status is an area router or not.
<b>AS Border Router</b>	Displays whether the area Autonomous System Border Router status of this router is enabled or disabled.
<b>External Route Tag</b>	Displays the route tag for this router.
<b>SPF Hold (seconds)</b>	Displays the time in seconds between the reception of an OSPFv3 topology change and the start of a SPF calculation.
<b>SPF Delay (seconds)</b>	Displays the time in seconds between consecutive SPF calculations.
<b>MTU Checking</b>	Displays whether Maximum Transfer Unit checking is enabled or disabled. This is set using the <a href="#">ipv6 ospf mtu-checking</a> command.
<b># SPF calculations performed</b>	Displays the number of SPF calculation performed.
<b>Last SPF run (seconds ago)</b>	N/A
<b>Full state</b>	Displays the number of neighbor routers that are in Full state.
<b>Loading state</b>	Displays the number of neighbor routers that are in Loading state.
<b>Exchange state</b>	Displays the number of neighbor routers that are in Exchange state.
<b>Exstart state</b>	Displays the number of neighbor routers that are in Exstart state.
<b>2way state</b>	Displays the number of neighbor routers that are in 2way state.
<b>Init state</b>	Displays the number of neighbor routers that are in Init state.
<b>Attempt state</b>	Displays the number of neighbor routers that are in Attempt state.
<b>Down state</b>	Displays the number of neighbor routers that are in Down state.

---

**Release History**

Release 7.1.1; command was introduced.

## Related Commands

<b>ipv6 ospf admin-state</b>	Enables or disables the administration of OSPFv3 on the router.
<b>ipv6 ospf mtu-checking</b>	Enables or disables the use of Maximum Transfer Unit (MTU) checking.
<b>ipv6 ospf spf-timer</b>	Configures timers for SPF calculation.
<b>ipv6 ospf route-tag</b>	Configures a tag value for Autonomous System External (ASE) routes created.
<b>ip router router-id</b>	Configures the router ID for the router.

```

---

## show ipv6 ospf border-routers

Displays information regarding all or specified border routers.

**show ipv6 ospf border-routers** [**area** *area\_id*] [**router** *router\_id*]

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<i>router_id</i>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used to display a list of border routers known by this OSPFv3 router.
- By using the optional parameters, you can display the border routers using the specified parameter. For example, to find a router using a router ID of 1.1.1.1, enter the command using the router ID of 1.1.1.1 as a search criteria.
- See the Related Commands sections below to modify the list.

### Examples

```
-> show ipv6 ospf border-routers
```

```
Router ID          Area          Metric  Type
-----+-----+-----+-----
6.6.6.6            0.0.0.0        2      INTRA
6.6.6.6            0.0.0.1        2      INTRA
    fe80::2d0:95ff:fee2:6bda -> pseudo1
    fe80::2d0:95ff:fee2:6bda -> pseudo2
```

#### *output definitions*

---

<b>Router ID</b>	The unique identification for the router.
<b>Area</b>	A unique 32-bit value, such as an IP address, that identifies a neighboring router in the Autonomous System.
<b>Metric</b>	The metric used by the routes.
<b>Type</b>	The type of routes specified (intra or inter).

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

N/A

**MIB Objects**

N/A

---

## show ipv6 ospf host

Displays information on the configured OSPFv3 hosts.

**show ipv6 ospf host** [*ipv6\_address*]

---

### Syntax Definitions

*ipv6\_address*                      A 128-bit IP address for a directly attached host.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used to display general information for OSPFv3 hosts directly attached to this router.
- See the Related Commands section below to modify the list.

### Examples

-> show ipv6 ospf host

```
Area           Metric   Address
-----+-----+-----
0.0.0.1        1       2001::1/64
```

#### *output definitions*

---

<b>Area</b>	A 32-bit IP address for a directly attached host. This can be set using the <b>ipv6 ospf host</b> command.
<b>Metric</b>	The metric assigned to the host. Metric is set using the <b>ipv6 ospf host</b> command.
<b>Address</b>	IPV6 address of the host.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [ipv6 ospf host](#)

Creates or deletes an OSPFv3 entry for directly attached hosts.

## MIB Objects

```
ospfv3HostTable  
  ospfv3HostIpAddress  
  ospfv3HostMetric  
  ospfHostStatus  
  ospfv3HostAreaID
```

---

## show ipv6 ospf lsdb

Displays Link State Advertisements (LSAs) in the Link State Database (LSDB) associated with each area.

```
show ipv6 ospf lsdb [area area_id] [rtr | net | netsum | asbrsum] [linkstate-id ls_id] [router-id router_id]
```

---

### Syntax Definitions

<i>area_id</i>	A unique 32-bit value in IP address format.
<b>rtr</b>	Specifies router LSAs.
<b>net</b>	Specifies network LSAs.
<b>netsum</b>	Specifies network summary LSAs.
<b>asbrsum</b>	Specifies Autonomous System Border Router summary LSAs.
<i>ls_id</i>	The Link state ID. The ID is a unique 32-bit value, such as an IP address. This number is used as a record in the link state database.
<i>router_id</i>	The Router ID. The ID is a unique 32-bit value such as an IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used to display the LSDB of the OSPF router. It can be used for OSPF debugging, specifically to narrow down sections of an area to determine which sections are receiving the specified LSAs. You can specify the parameters of only the area LSDB using the optional command parameters.
- You can view LSAs by specifying either a link state identifier or a router identifier. However, when specifying a router ID, you also need to supply a valid link state ID.

## Examples

```
-> show ipv6 ospf lsdb
```

Area	Type	Link ID	Advertising Rtr	Sequence #	Age
0.0.0.0	Router	0	1.1.1.1	8000020f	1117
0.0.0.0	Router	0	3.3.3.3	80000208	1121
0.0.0.0	Router	0	5.5.5.5	800001f1	1117
0.0.0.0	Router	0	30.30.30.30	800000da	1115

### output definitions

<b>Area</b>	The identification of the area to which the router belongs.
<b>Type</b>	The protocol type from where the route was learned.
<b>Link ID</b>	The Link state ID. The ID is a unique 32-bit value expressed as an IPv6 address. This number is used as a record in the link state database.
<b>Advertising Rtr</b>	The ID of the router that advertises the routes.
<b>Sequence #</b>	The advertisement sequence number (i.e., a value used to identify old and duplicate link state advertisements).
<b>Age</b>	The age of the LSA in seconds. That is, the duration for which this entry has existed in the external database.

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[ipv6 ospf admin-state](#) Displays the OSPFv3 status and general configuration parameters.

## MIB Objects

```
ospfv3AsLsdbTable
  ospfv3AsLsdbAreaId
  ospfv3AsLsdbType
  ospfv3AsLsdbLsid
  ospfv3AsLsdbRouterId
  ospfv3AsLsdbAdvertisement
  ospfv3AsLsdbSequence
  ospfv3AsLsdbAge
```

## show ipv6 ospf neighbor

Displays information on OSPFv3 non-virtual neighbors.

**show ipv6 ospf neighbor** [**router** *ipv4\_address*][**interface** *interface\_name*]

---

### Syntax Definitions

*ipv4\_address*                      A 32-bit router ID of the neighboring router.

*interface\_name*                    The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used to display all non-virtual neighbors of the OSPF router.
- See the Related Commands section below to modify the list.

### Examples

```
-> show ipv6 ospf neighbor
```

Router ID	Area/Transit Area	State	Interface
1.1.1.1	0.0.0.0	FULL	vlan-2071
3.3.3.3	0.0.0.0	FULL	vlan-2071
5.5.5.5	0.0.0.0	FULL	vlan-2071
23.23.23.23	0.0.0.1	FULL	vlan-2055
23.23.23.23	0.0.0.1	FULL	vlan-2056
24.24.24.24	0.0.0.1	FULL	vlan-2065
24.24.24.24	0.0.0.1	FULL	vlan-2066

#### output definitions

---

<b>Router ID</b>	The unique identification for the router.
<b>Area/Transit Area</b>	The area identifier.
<b>State</b>	The state of the OSPF neighbor adjacency.
<b>Interface</b>	The name of the interface.

---

```
-> show ipv6 ospf neighbor router 24.24.24.24
```

Router ID	Area/Transit Area	State	Interface
24.24.24.24	0.0.0.1	FULL	vlan-2070
24.24.24.24	0.0.0.1	FULL	vlan-2073

*output definitions*

---

<b>Router ID</b>	The unique identification for the router.
<b>Area/Transit Area</b>	The area identifier.
<b>State</b>	The state of the OSPF neighbor adjacency.
<b>Interface</b>	The name of the interface.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

N/A

**MIB Objects**

```
ospfv3NbrTable
  ospfNbrAddress
  ospfv3NbrRtrId

  ospfv3NbrHelloSuppressed
```

---

## show ipv6 ospf routes

Displays the OSPFv3 routes known to the router.

**show ipv6 ospf routes** [**prefix** *ipv6\_address\_prefix*][**gateway** *gateway*]

---

### Syntax Definitions

*ipv6\_address\_prefix*            The 128-bit IPv6 address of the route destination in hexadecimal format.

*gateway*                        The next hop IPv6 address for this router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If no variables are entered, all routes are displayed.
- If the variables are entered, then only routes matching the specified criteria are shown.
- All the variables described above must be entered for a route match. If all of the variables are not entered, an error message is returned.

### Examples

```
-> show ipv6 ospf routes
```

Prefix	Path Type	Metric
		1 : 2
::/ 0	INTER	2 : -
fe80::2d0:95ff:fee0:710c -> vlan-2071		
2051::/64	INTRA	2 : -
fe80::2d0:95ff:feac:a59f -> vlan-2055		
fe80::2d0:95ff:feac:a59f -> vlan-2056		
fe80::2d0:95ff:fed7:747e -> vlan-2065		
fe80::2d0:95ff:fed7:747e -> vlan-2066		

#### output definitions

---

<b>Prefix</b>	The destination address of the IPv6 route in the hexadecimal format.
<b>Path Type</b>	The type of routes specified (intra or inter).
<b>Metric</b>	The cost of the route.

---

### Release History

Release 7.1.1; command was introduced.

**Related Commands****ipv6 ospf admin-state**

Displays the OSPFv3 status and general configuration parameters.

**MIB Objects**N/A

---

## show ipv6 ospf virtual-link

Displays virtual link information. A virtual link is used to connect OSPFv3 backbone routers that are not physically contiguous.

**show ipv6 ospf virtual-link** [*router\_id*]

---

### Syntax Definitions

*router\_id*    The router ID of the remote end of the virtual link.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 ospf virtual-link
```

Transit Area	Peer Router ID	Intf State	Nbr State	Cost
0.0.0.1	6.6.6.6	P2P	FULL	2

#### *output definitions*

---

<b>Transit Area</b>	The area identification for the area assigned to the virtual link.
<b>Peer Router ID</b>	The destination router identification for the virtual link.
<b>Intf State</b>	The state of the virtual link with regards to the local router.
<b>Nbr State</b>	The state of the virtual link adjacency.
<b>Cost</b>	The cost metric of the route.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[ipv6 ospf virtual-link](#)

Creates or deletes a virtual link.

## MIB Objects

```
ospfv3VirtIfTable  
  ospfv3VirtIfAreaId  
  ospfv3VirtIfNeighbor  
  ospfv3VirtIfState
```

---

## show ipv6 ospf area

Displays either all OSPFv3 areas, or a specified OSPFv3 area.

**show ipv6 ospf area** [*area\_id*]

---

### Syntax Definitions

*area\_id* A unique 32-bit value in IP address format.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Allows you to view the details of a specified OSPFv3 area.
- If an OSPF area is not specified, all known areas for the OSPFv3 router will be displayed.
- See the Related Commands section below for information on modifying an area.

### Examples

```
-> show ipv6 ospf area
```

Area ID	Type	Stub Metric	Number of Interfaces
0.0.0.0	Normal	NA	2
0.0.0.1	Normal	NA	2

```
-> show ipv6 ospf area 0.0.0.0
```

```
Area Type = Normal,
Area Stub Metric = 0,
# of SPF calculations = 52,
# Interfaces = 3,
# Router LSAs = 2,
# Network LSAs = 3,
# Intra-area-prefix LSAs = 4,
# Inter-area-prefix LSAs = 15,
# Inter-area-router LSAs = 0,
# hosts = 0,
```

### output definitions

---

<b>Area Type</b>	The area type. This field will be <b>normal</b> or <b>stub</b> .
<b>Area Stub Metric</b>	Indicates whether the area is enabled or disabled.
<b># Router LSAs</b>	The total number of Link State Advertisements for the Area.

*output definitions (continued)*

---

<b># Network LSAs</b>	The total number of inter-area Link State Advertisements.
<b># of SPF calculations</b>	The number of times the area has calculated the Shortest Path.
<b># Interfaces</b>	The number of OSPF interfaces.
<b># Intra-area-prefix LSAs</b>	The number of intra-area-prefix LSAs, which associates a list of IPv6 address prefixes with a router by referencing a router-LSA.
<b># Inter-area-prefix LSAs</b>	The number of inter-area-prefix LSAs. Corresponds to Type 3 summary-LSA of OSPF.
<b># Inter-area-router LSAs</b>	The number of inter-area-router LSAs. Corresponds to Type 4 summary-LSA of OSPF.
<b># hosts</b>	The number of directly attached hosts.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

  ospfv3AreaSummary
  ospfv3AreaStatus
```

---

## show ipv6 ospf interface

Displays OSPFv3 interface information.

**show ipv6 ospf interface** [*interface\_name*]

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Not specifying the interface name displays all known interfaces for the OSPFv3 router.

### Examples

```
-> show ipv6 ospf interface
```

Name	DR Router ID	BDR Router ID	Admin Status	Oper Status	State
vlan-2071	5.5.5.5	0.0.0.0	Enabled	Up	DR
vlan-2055	7.7.7.7	5.5.5.5	Enabled	Up	BDR
vlan-2056	7.7.7.7	5.5.5.5	Enabled	Up	BDR

### output definitions

---

<b>Name</b>	The name of the interface.
<b>DR Router ID</b>	The designated router address on this network segment. Make sure you configure a VLAN for the router IP. (See <a href="#">Chapter 4, “VLAN Management Commands,”</a> for more information.)
<b>BDR Router ID</b>	The IP address of the backup designated router.
<b>Vlan</b>	The VLAN to which the interface is assigned.
<b>Admin Status</b>	The current administration status of the interface, either <b>enabled</b> or <b>disabled</b> .
<b>Oper Status</b>	Indicates whether the interface is an active OSPF interface.
<b>State</b>	The current state of the OSPF interface. It will be <b>DR</b> , <b>BDR</b> , <b>other</b> .

---

```

-> show ipv6 ospf interface vlan-2071
Type                               = BROADCAST,
Admin Status                        = Enabled,
IPv6 Interface Status              = Up,
Oper Status                         = Up,
State                               = DR,
Area                               = 0.0.0.0,
Priority                            = 100,
Cost                               = 1,
Designated Router                  = 3.3.3.3,
Backup Designated Router          = 0.0.0.0,
Hello Interval                    = 1,
Router Dead Interval              = 4,
Retransmit Interval               = 5,
Transit Delay                      = 1,
Ifindex                           = 17,
IPv6 'ifindex'                    = 2071,
MTU                               = 1500,
# of attached neighbors            = 0,
Globally reachable prefix #0      = 2071::2/64

```

Output fields when an IP address or interface name is specified are described below:

#### *output definitions*

<b>Type</b>	The OSPF interface type, which can be Broadcast, NBMA, Point-to-Point, or Point-to-Multipoint.
<b>Admin Status</b>	The current administrative status of the interface, either <b>enabled</b> or <b>disabled</b> .
<b>IPv6 Interface Status</b>	The current administrative status of the IPv6 interface, either <b>up</b> or <b>down</b> .
<b>Oper Status</b>	Indicates whether the interface is an active OSPF interface.
<b>State</b>	The current state of the OSPF interface. It will be <b>down</b> , <b>up</b> , <b>dp</b> , <b>dr</b> , or <b>other</b> .
<b>Area</b>	The area identification number to which the interface is assigned. This field is not applicable if an interface has not yet been assigned to an area.
<b>Priority</b>	The priority of the interface with regards to becoming the designated router. The higher the number, the higher the priority.
<b>Cost</b>	The cost added to routes learned on this interface.
<b>Designated Router</b>	The identification number of the designated router.
<b>Backup Designated Router</b>	The identification number of the backup designated router.
<b>Hello Interval</b>	The number of seconds between hello messages sent out on the interface.
<b>Router Dead Interval</b>	The number of seconds the interface waits for hello messages received from a neighbor before declaring the neighbor as dead.
<b>Retransmit Interval</b>	The number of seconds the interface waits before resending hello messages.
<b>Transit Delay</b>	The estimated number of seconds required to transmit a link state update over this interface.

*output definitions (continued)*

---

<b>Ifindex</b>	The unique value assigned to an interface.
<b>IPv6 'ifindex'</b>	The unique value assigned to an IPv6 interface.
<b>MTU</b>	The Maximum Transfer Unit (in bytes) for the interface.
<b># of attached neighbors</b>	The number of OSPFv3 neighbors in the initialization state.
<b>Globally reachable prefix #0</b>	A globally unique IPv6 address.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>ipv6 ospf interface</b>	Creates and deletes an OSPFv3 interface.
<b>ipv6 ospf interface dead-interval</b>	Configures the OSPFv3 interface dead interval.
<b>ipv6 ospf interface hello-interval</b>	Configures the OSPFv3 interface hello interval.
<b>ipv6 ospf interface cost</b>	Configures the OSPFv3 interface cost.
<b>ipv6 ospf interface priority</b>	Configures the OSPFv3 interface priority.
<b>ipv6 ospf interface retrans-interval</b>	Configures the OSPFv3 interface retransmit interval.
<b>ipv6 ospf interface transit-delay</b>	Configures the OSPFv3 interface transit delay.
<b>ipv6 ospf interface area</b>	Configures an OSPFv3 interface area.
<b>ipv6 ospf interface admin-state</b>	Enables or disables the administration status on an OSPFv3 interface.

# 21 BGP Commands

This chapter describes the CLI commands used to configure the BGP (Border Gateway Protocol) and Multiprotocol extensions to BGP. BGP is a protocol for exchanging routing information between gateway hosts in a network of ASs (autonomous systems). BGP is the most common protocol used between gateway hosts on the Internet. The routing table exchanged contains a list of known routers, the addresses they can reach, and a preference metrics associated with the path to each router so that the best available route is chosen.

Multiprotocol Extensions to BGP-4 supports the exchange of IPv6 unicast prefixes, as well as the establishment of BGP peering sessions with BGP speakers identified by their IPv6 addresses.

The Alcatel-Lucent implementation of BGP-4 and Multiprotocol Extensions to BGP-4 complies with the following RFCs: 4271, 2439, 3392, 2385, 1997, 4456, 3065, 4273, 4760, 2545

---

**Note.** In the following document, the BGP terms “peer” and “neighbor” are used interchangeably to mean any BGP speaker known to the local router.

---

MIB information for BGP is as follows:

*Filename:* AlcatelIND1Bgp.MIB  
*Module:* ALCATEL-IND1-BGP-MIB

*Filename:* IETF\_BGP4.MIB  
*Module:* BGP4-MIB

The following table summarizes the available commands:

<b>Global BGP Commands</b>	<pre> ip load bgp ip bgp admin-state ip bgp autonomous-system ip bgp bestpath as-path ignore ip bgp cluster-id ip bgp default local-preference ip bgp fast-external-failover ip bgp always-compare-med ip bgp bestpath med missing-as-worst ip bgp client-to-client reflection ip bgp as-origin-interval ip bgp synchronization ip bgp confederation identifier ip bgp maximum-paths ip bgp log-neighbor-changes ip bgp dampening ip bgp dampening clear show ip bgp show ip bgp statistics show ip bgp dampening show ip bgp dampening-stats show ip bgp path show ip bgp routes </pre>
<b>Aggregate Configuration</b>	<pre> ip bgp aggregate-address ip bgp aggregate-address admin-state ip bgp aggregate-address as-set ip bgp aggregate-address community ip bgp aggregate-address local-preference ip bgp aggregate-address metric ip bgp aggregate-address summary-only show ip bgp aggregate-address </pre>
<b>Network (local route) Configurations</b>	<pre> ip bgp network ip bgp network admin-state ip bgp network community ip bgp network local-preference ip bgp network metric show ip bgp network </pre>

show ipv6 bgp neighbors statistics  
show ipv6 bgp neighbors policy  
show ipv6 bgp neighbors policy
```

---

## ip load bgp

Loads the BGP protocol software into running memory on the router. The image file containing BGP should already be resident in flash memory before issuing this command.

**ip load bgp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command requires that the BGP software be resident in flash memory in the active directory.
- Enter this command in the router's configuration file (boot.cfg) to ensure BGP software is running after a reboot.
- The command does not administratively enable BGP on the router; BGP will be disabled after issuing this command. You must issue the **ip bgp admin-state** to start the BGP protocol.

### Examples

```
-> ip load bgp
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- |                                 |  |
|---------------------------------|--|
| <b>ip bgp autonomous-system</b> | Configures the Autonomous system number for this BGP router. |
| <b>ip bgp admin-state</b>       | Administratively enables or disables BGP.                    |

### MIB Objects

alaDrcTmIPBgpStatus

---

## ip bgp admin-state

Administratively enables or disables BGP. The BGP protocol will not be active until you enable it using this command.

**ip bgp admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables BGP.
<b>disable</b>	Disables BGP.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- You must first load the BGP software into running memory using the [ip load bgp](#) command before initiating this command.
- Many BGP commands require that the protocol be disabled ([ip bgp admin-state](#)) before issuing them.

### Examples

```
-> ip bgp admin-state enable
-> ip bgp admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip load bgp](#) Loads the BGP software.

### MIB Objects

```
alaBgpGlobal
  alaBgpProtoStatus
```

---

## ip bgp autonomous-system

Configures the Autonomous System (AS) number for this router. This number identifies this BGP speaker (this router) instance to other BGP routers. The AS number for a BGP speaker determines whether it is an internal or an external peer in relation to other BGP speakers. BGP routers in the same AS are internal peers while BGP routers in different ASs are external peers. BGP routers in the same AS exchange different routing information with each other than they exchange with BGP routers in external ASs. BGP speakers append their AS number to routes passing through them; this sequence of AS numbers is known as a route's AS path.

**ip bgp autonomous-system** *value*

---

### Syntax Definitions

*value*                                      The AS number. The valid range is 1–65535.

### Defaults

---

parameter	default
<i>value</i>	1

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- A router can belong to only one AS. Do not specify more than one AS value for each router.
- The BGP protocol must be disabled (using the [ip bgp admin-state](#) command) before using this command.

### Examples

```
-> ip bgp autonomous-system 64724
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp admin-state](#)                      Enables and disables the BGP protocol.

### MIB Objects

alaBgpGlobal  
    alaBgpAutonomousSystemNumber

---

## ip bgp bestpath as-path ignore

Indicates whether AS path comparison will be used in route selection. The AS path is the sequence of ASs through which a route has traveled. A shorter AS path is preferred over a longer AS path. The AS path is always advertised in BGP route updates. This command informs BGP to use the length of the AS path as a criteria for determining the best route.

**ip bgp bestpath as-path ignore**

**no ip bgp bestpath as-path ignore**

---

### Syntax Definitions

N/A

### Defaults

This command is enabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable this feature after it has been enabled.
- AS path comparison does not consider the type of links connecting the ASs along the path. In some cases a longer path over very fast connections may be a better route than a shorter path over slower connections. For this reason the AS path should not be the only criteria used for route selection. BGP considers local preference before AS path when making path selections.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

### Examples

```
-> ip bgp bestpath as-path ignore  
-> no ip bgp bestpath as-path ignore
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**ip bgp aggregate-address as-set** Specifies whether AS path aggregation is to be performed or not.

**ip bgp policy aspath-list** Creates or removes an AS path list.

**ip bgp default local-preference** Configures the default local preference (lpref) value to be used when advertising routes.

## MIB Objects

alaBgpGlobal

alaBgpAsPathCompare

---

## ip bgp cluster-id

Configures a BGP cluster ID when there are multiple, redundant, route reflectors in a cluster. This command is not necessary for configurations containing only one route reflector.

**ip bgp cluster-id** *ip\_address*

---

### Syntax Definitions

*ip\_address*                      32-bit IP address that is the Cluster ID of the router acting as a route reflector.

### Defaults

parameter	default
<i>ip_address</i>	0.0.0.0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- In a route-reflection configuration where there are multiple route-reflectors in a cluster, use this command to configure this cluster ID. Configuring multiple route-reflectors enhances redundancy and avoids a single point of failure. When there is only one reflector in a cluster, the router ID of the reflector is used as the cluster-ID.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.
- Using many redundant reflectors in a single cluster places demands on the memory required to store routes for all redundant reflectors' peers.

### Examples

```
-> ip bgp cluster-id 1.2.3.4
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**ip bgp admin-state** Enables and disables BGP.

**ip bgp client-to-client reflection** Enables route reflection and sets this speaker as the route reflector.

## MIB Objects

alaBgpGlobal

alaBgpClusterId

---

## ip bgp default local-preference

Configures the default local preference (lpref) value to be used when advertising routes. A higher local preference value is preferred over a lower value. The local preference value is sent to all BGP peers in the local autonomous system; it is not advertised to external peers.

**ip bgp default local-preference** *value*

---

### Syntax Definitions

*value* The default local preference value for this router. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>value</i>	100

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to restore the default value.
- Unless a route is specifically configured for a different local preference value it will default to value you specify in this command. This value is used for routes learned from external autonomous systems (the local preference value is not advertised in routes received from external peers) and for aggregates and networks that do not already contain local preference values.
- This value is specific to the router so it can compare its own local preference to those received in advertised paths. If other routers belong to the same AS, then they should use the same default local preference value.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

### Examples

```
-> ip bgp default local-preference 200
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**ip bgp aggregate-address local-preference** Sets the local preference for a BGP aggregate.

**ip bgp network local-preference** Sets the local preference for a BGP network.

## MIB Objects

alaBgpGlobal

alaBgpDefaultLocalPref

---

## ip bgp fast-external-failover

Enables fast external failover (FEFO). When enabled, FEFO resets a session when a link to a directly connected external peer is operationally down. The BGP speaker will fall back to Idle and then wait for a connection retry by the external peer that went down.

**ip bgp fast-external-failover**

**no ip bgp fast-external-failover**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable Fast External Failover.
- When enabled, this command allows BGP to take immediate action when a directly connected interface, on which an external BGP session is established, goes down. Normally BGP relies on TCP to manage peer connections. Fast External failover improves upon TCP by resetting connections as soon as they go down.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

### Examples

```
-> ip bgp fast-external-failover
-> no ip bgp fast-external-failover
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[ip bgp neighbor clear](#)

Restarts a BGP peer.

[ip bgp neighbor auto-restart](#)

Enables or disables BGP peer automatic restart.

[ip bgp neighbor timers](#)

Configures the time interval between KEEPALIVE messages sent by this peer and the tolerated hold time interval, in seconds, for messages to this peer from other peers.

## MIB Objects

alaBgpFastExternalFailOver

---

## ip bgp always-compare-med

Enables or disables Multi-Exit Discriminator (MED) comparison between peers in different autonomous systems. The MED value is considered when selecting the best path among alternatives; it indicates the weight for a particular exit point from the AS. A path with a lower MED value is preferred over a path with a higher MED value.

**ip bgp always-compare-med**

**no ip bgp always-compare-med**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable MED comparison for external peers.
- By default, BGP only compares MEDs from the same autonomous system when selecting routes. Enabling this command forces BGP to also compare MEDs values received from external peers, or other autonomous systems.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

### Examples

```
-> ip bgp always-compare-med
-> no ip bgp always-compare-med
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp bestpath med missing-as-worst** Configures the MED parameter when it is missing in a BGP path.

### MIB Objects

```
alaBgpGlobal
  alaBgpMedAlways
```

---

## ip bgp bestpath med missing-as-worst

Configures the MED parameter when it is missing in a BGP path.

**ip bgp bestpath med missing-as-worst**

**no ip bgp bestpath med missing-as-worst**

---

### Syntax Definitions

N/A

### Defaults

By default this command is disabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable missing MEDs as worst.
- This command is used to specify how a missing MED in an external BGP path is to be treated for route selection purposes. The default behavior is to treat missing MEDs as zero (best). This command allows you to treat missing MEDs as worst ( $2^{32}-1$ ) for compatibility reasons.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

### Examples

```
-> ip bgp bestpath med missing-as-worst
-> no ip bgp bestpath med missing-as-worst
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp always-compare-med** Forces BGP to consider MED values from external routes.

### MIB Objects

alaBgpGlobal  
alaBgpMissingMed

---

## ip bgp client-to-client reflection

Enables or disables this BGP speaker (router) to be a route reflector. Route reflectors advertise routing information to internal BGP peers, referred to as *clients*. BGP requires all internal routers to know all routes in an AS. This requirement demands a fully meshed (each router has a direct connection to all other routers in the AS) topology. Route reflection loosens the fully meshed restriction by assigning certain BGP routers as route reflectors, which take on the responsibility of advertising routing information to local BGP peers.

**ip bgp client-to-client reflection**

**no ip bgp client-to-client reflection**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable the speaker as a route reflector.
- In addition to defining this router as the route reflector, this command also enable route reflection for this cluster. After setting this command this reflector will begin using route reflection behavior when communicating to client and non-client peers.
- Once route reflectors are configured, you need to indicate the clients (those routers receiving routing updates from the reflectors) for each route reflector. Use the **ip bgp neighbor route-reflector-client** command to configure clients.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

### Examples

```
-> ip bgp client-to-client reflection
-> no ip bgp client-to-client reflection
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**ip bgp admin-state** Administratively disables BGP in this router.

**ip bgp neighbor route-reflector-client** Configures a BGP peer to be a client to the this route reflector.

## MIB Objects

alaBgpGlobal

alaBgpRouteReflection

---

## ip bgp as-origin-interval

Specifies the frequency at which routes local to the autonomous system are advertised. These advertisements are also referred to as UPDATE messages. This interval applies to advertisements to internal peers.

**ip bgp as-origin-interval** *seconds*

**no ip bgp as-origin-interval**

---

### Syntax Definitions

*seconds* The update interval in seconds. The valid range is 1–65535.

### Defaults

parameter	default
<i>seconds</i>	15

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to reset the feature to the default value.
- A lower value may increase the likelihood of route flapping as route status is updated more frequently.

### Examples

```
-> ip bgp as-origin-interval 15  
-> no ip bgp as-origin-interval
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp neighbor advertisement-interval](#) Set the route advertisement interval for external peers.

### MIB Objects

```
alaBgpGlobal  
  alaBgpAsOriginInterval
```

---

## ip bgp synchronization

Enables or disables synchronization of BGP prefixes with AS-internal routing information. Enabling this command will force the BGP speaker to advertise prefixes only if the prefixes are reachable through AS-internal routing protocols (IGPs like RIP and OSPF).

**ip bgp synchronization**

**no ip bgp synchronization**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable IGP synchronization.
- A BGP router is not supposed to advertise routes learned through internal BGP updates unless those routes are also known by the primary internal routing protocol (e.g, RIP or OSPF). However, requiring all routers in an AS to know all external routes places a heavy burden on routers focusing mainly on Intra-AS routing. Therefore, disabling synchronization avoids this extra burden on internal routers. As long as all BGP routers in an AS are fully meshed (each has a direct connection to all other BGP routers in the AS) then the problem of unknown external router should not be a problem and synchronization can be disabled.
- By default, synchronization is disabled and the BGP speaker can advertise a route without waiting for the IGP to learn it. When the autonomous system is providing transit service, BGP should not propagate IGP paths until the IGP prefixes themselves are known to be reachable through IGP. If BGP advertises such routes before the IGP routers have learned the path, they will drop the packets causing a blackhole.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

### Examples

```
-> ip bgp synchronization  
-> no ip bgp synchronization
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****show ip bgp**

Displays the current global settings for the local BGP speaker.

**MIB Objects**

alaBgpGlobal

    alaBgpIgpSynchStatus

---

## ip bgp confederation identifier

Sets a confederation identification value for the local BGP speaker (this router). A confederation is a grouping of sub-ASs into a single AS. To peers outside a confederation, the confederation appears to be a single AS. Within the confederation multiple ASs may exist and even exchange information with each other as using external BGP (EBGP).

**ip bgp confederation identifier** *value*

---

### Syntax Definitions

*value* The confederation identification value. The valid range is 0–65535.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to restore the default value.
- A value of 0 means this local speaker is not a member of any confederation.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.
- Use this command in conjunction with the **ip bgp confederation neighbor** command to specify those peers that are a members of the same confederation as the local BGP speaker.

### Examples

```
-> ip bgp confederation identifier 3
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**ip bgp autonomous-system** Sets the AS number for this router.

**ip bgp confederation neighbor** Specifies peers that are members of a confederation.

**MIB Objects**

alaBgpGlobal

alaBgpConfedId

---

## ip bgp maximum-paths

Enables or disables support for multiple equal paths. When multipath support is enabled and the path selection process determines that multiple paths are equal when the router-id is disregarded, then all equal paths are installed in the hardware forwarding table. When multipath support is disabled, only the best route entry is installed in the hardware forwarding table.

**ip bgp maximum-paths**

**no ip bgp maximum-paths**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable support for multiple equal cost paths.
- The BGP protocol must be disabled (using the **ip bgp admin-state** command) before using this command.

### Examples

```
-> ip bgp maximum-paths
-> no ip bgp maximum-paths
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ip bgp** Displays the current global settings for the local BGP speaker.

### MIB Objects

```
alaBgpGlobal
  alaBgpMultiPath
```

---

## ip bgp log-neighbor-changes

Enables or disables the logging of peer state changes. If enabled, this logging tracks changes in the state of BGP peers from ESTABLISHED to IDLE and from IDLE to ESTABLISHED. Viewing peer state logging requires that certain debug parameters be set.

**ip bgp log-neighbor-changes**

**no ip bgp log-neighbor-changes**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The BGP protocol must be disabled (using the [ip bgp admin-state](#) command) before using this command.

### Examples

```
-> ip bgp log-neighbor-changes  
-> no ip bgp log-neighbor-changes
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp admin-state](#)                      Disables BGP within the router.

### MIB Objects

```
alaBgpGlobal  
  alaBgpPeerChanges
```

---

## ip bgp dampening

Enables or disables BGP route dampening or the suppression of unstable routes. Route dampening helps to control the advertisement of routes that are going up and then down at an abnormally high rate. Routes that are changing states (available then unavailable) are said to be *flapping*.

**ip bgp dampening** [**half-life** *half\_life* **reuse** *reuse* **suppress** *suppress* **max-suppress-time** *max\_suppress\_time*]

**no ip bgp dampening**

---

### Syntax Definitions

<i>half_life</i>	The half-life duration, in seconds. The valid range is 0–65535.
<i>reuse</i>	The number of route withdrawals set for the re-use value. The valid range is 1–9999.
<i>suppress</i>	The dampening cutoff value. The valid range is 1–9999.
<i>max_suppress_time</i>	The maximum number of seconds a route can be suppressed. The valid range is 0–65535.

### Defaults

parameter	value
<i>half_life</i>	300
<i>reuse</i>	200
<i>suppress</i>	300
<i>max_suppress_time</i>	1800

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable dampening.
- BGP dampening is disabled by default. When enabled, route dampening suppresses routes that are unstable, or “flapping,” and disrupting the network.
- BGP dampening of IPv6 route flaps is currently not supported.
- This command enables dampening and can also be used to change the default times for the dampening variables.
- Use the dampening variables to set penalties, suppression limits, and reuse values for flapping routes.

- The half-life value configures the half-life duration for a reachable route. After the time interval specified in this command, the penalty value for the route will be reduced by half. This command sets the duration in seconds during which the accumulated stability value is reduced by half if the route is considered reachable, whether suppressed or not. A larger value may be desirable for routes that are known for their instability. A larger value will also result in a longer suppression time if the route exceeds the flapping rate.
- The reuse value configures the number of route withdrawals necessary to begin readvertising a previously suppressed route. If the penalty value for a suppressed route fall below this value, then it will be advertised again. This command sets the reuse value, expressed as a number of route withdrawals. When the stability value for a route reaches or falls below this value, a previously suppressed route will be advertised again. The instability metric for a route is decreased by becoming more stable and by passing half-life time intervals
- The suppress value configures the cutoff value, or number of route withdrawals, at which a flapping route is suppressed and no longer advertised to BGP peers. This value is expressed as a number of route withdrawals. When the stability value for a route exceeds this cutoff value, the route advertisement is suppressed.
- The max-suppress-time value configures the maximum time (in seconds) a route can be suppressed. This time is also known as the maximum holdtime or the maximum instability value. Once this time is reached the route flap history for a route will be deleted and the route will be advertised again (assuming it is still reachable). This maximum holdtime as applied on an individual route basis. Each suppressed route will be held for the amount of time specified in this command unless the route is re-advertised by falling below the reuse value.
- Entering the command with no variables returns the variables back to their defaults.

## Examples

```
-> ip bgp dampening
-> ip bgp dampening half-life 20 reuse 800 suppress 60 max-suppress-time 40
-> no ip bgp dampening
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

---

## ip bgp dampening clear

Clears the dampening history data for all routes on the router, resetting route flap counters and unsuppressing any routes that had been suppressed due to route flapping violations.

**ip bgp dampening clear**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command to clear all of the currently stored information on routes for dampening purposes. When this command is entered, all route information in regards to dampening is cleared.
- BGP dampening of IPv6 route flaps is currently not supported.

### Examples

```
-> ip bgp dampening clear
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp dampening](#) Enables or disables route dampening.

### MIB Objects

```

  alaBgpDampeningClear
```

---

## ip bgp aggregate-address

Creates and deletes a BGP aggregate route. Aggregate routes are used to reduce the size of routing tables by combining the attributes of several different routes and allowing a single aggregate route to be advertised to peers.

The base command (**ip bgp aggregate-address**) may be used with other keywords to set up aggregate address configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

Note that only one of the following optional keywords is specified with each use of the base command. Keywords are not combined together in a single command.

**ip bgp aggregate-address** *ip\_address ip\_mask*

[**admin-state** {**enable** | **disable**}]

[**as-set**]

[**community** *string*]

[**local-preference** *value*]

[**metric** *metric*]

[**summary-only**]

**no ip bgp aggregate-address** *ip\_address ip\_mask*

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address to be used as the aggregate address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete an aggregate route.
- This command allows administrative operations on a BGP aggregate. You must still enable the aggregate route through the **ip bgp aggregate-address admin-state** command.
- You cannot aggregate an address (for example, 100.10.0.0) if you do not have at least one more-specific route of the address (for example, 100.10.20.0) in the BGP routing table.
- Only the aggregate is advertised unless aggregate summarization is disabled using the **ip bgp aggregate-address summary-only** command.

## Examples

```
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0  
-> no ip bgp aggregate-address 172.22.2.0 255.255.255.0
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[ip bgp aggregate-address  
summary-only](#)

Enables or disables aggregate summarization, which suppresses more-specific routes.

## MIB Objects

```
alaBgpAggrAddr  
alaBgpAggrSet  
alaBgpAggrCommunity  
alaBgpAggrLocalPref  
alaBgpAggrMetric  
alaBgpAggrSummarize  
alaBgpAggrMask
```

---

## ip bgp aggregate-address admin-state

Enables or disables a BGP aggregate route.

```
ip bgp aggregate-address ip_address ip_mask admin-state {enable | disable}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address for this aggregate route.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the network address denote the network number.
<b>enable</b>	Enables this aggregate route.
<b>disable</b>	Disables this aggregate route.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Configure all aggregate route parameters before enabling the aggregate with this command. Use the [ip bgp aggregate-address](#) command to configure individual aggregate parameters.
- The [show ip bgp path](#) command displays every aggregate currently defined.

### Examples

```
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0 admin-state enable  
-> ip bgp aggregate-address 172.22.2.0 255.255.255.0 admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**ip bgp aggregate-address**      Creates an aggregate route.  
**show ip bgp path**              Displays aggregate routes.

**MIB Objects**

alaBgpAggrTable  
    alaBgpAggrAddr  
    alaBgpAggrMask

---

## ip bgp aggregate-address as-set

Specifies whether AS path aggregation is to be performed or not. AS path aggregation takes the AS path for all routes in this aggregate and creates a new AS path for the entire aggregate. This aggregated AS path includes all the ASs from the routes in the aggregate, but it does not repeat AS numbers if some routes in the aggregate include the same AS in their path.

**ip bgp aggregate-address** *ip\_address ip\_mask as-set*

**no ip bgp aggregate-address** *ip\_address ip\_mask as-set*

---

### Syntax Definitions

*ip\_address* 32-bit IP address.

*ip\_mask* 32-bit subnet mask that determines how many bits of the IP address denote the network number.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable the **as-set** option.
- When AS path aggregation is disabled (the default), the AS path for the aggregate defaults to the AS number of the local BGP speaker (configured in the **ip bgp autonomous-system** command).
- If AS path aggregation is enabled, a flap in a more specific path's AS path will cause a flap in the aggregate as well.
- Do not use this command when aggregating many paths because of the numerous withdrawals and updates that must occur as path reachability information for the summarized routes changes.

### Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 as-set
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 as-set
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

---

## ip bgp aggregate-address community

Defines a community for an aggregate route created by the **ip bgp aggregate-address** command. Communities are a way of grouping BGP peers that do not share an IP subnet or an AS number.

**ip bgp aggregate-address** *ip\_address ip\_mask community string*

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the aggregate route.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.
<i>string</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.

### Defaults

parameter	default
<i>string</i>	none

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

You can revert the aggregate community string to its default value by setting the community string to “**none**”. For example:

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 community none
```

### Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 community no-export  
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 community no-export
```

### Release History

Release 7.1.1; command was introduced.

## ip bgp aggregate-address local-preference

Configures the local preference attribute value for this BGP aggregate. This value will override the default local preference value; it is used when announcing this aggregate to internal peers.

**ip bgp aggregate-address** *ip\_address ip\_mask local-preference value*

**no ip bgp aggregate-address** *ip\_address ip\_mask local-preference value*

---

### Syntax Definitions

<i>ip_address</i>	An IP address for the aggregate route.
<i>ip_mask</i>	A 32-bit subnet mask that determines how many bits of the IP address denote the network number.
<i>value</i>	The local preference attribute. The valid range is 0–4294967295

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to set the local preference back to the default value.
- You can specify that this route use the default local preference value for the AS by specifying zero (0). In this case the local preference for this route will take the default local preference value set for this AS (defined in the **ip bgp default local-preference** command).

### Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 local-preference 200
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 local-preference 200
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp default local-preference** Sets the default local preference value for this AS.

**MIB Objects**

alaBgpAggrTable

alaBgpAggrAddr

alaBgpAggrMask

    alaBgpAggrLocalPref

---

## ip bgp aggregate-address metric

Configures the MED attribute value for a BGP aggregate. This value is used when announcing this aggregate to internal peers; it indicates the best exit point from the AS.

**ip bgp aggregate-address** *ip\_address ip\_mask metric value*

**no ip bgp aggregate-address** *ip\_address ip\_mask metric value*

---

### Syntax Definitions

<i>ip_address</i>	A 32-bit IP address.
<i>ip_mask</i>	A 32-bit subnet mask that determines how many bits of the IP address denote the network number.
<i>value</i>	The MED attribute. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to reset the aggregate metric back to its default value.
- The default value of zero indicates that a MED will not be sent for this aggregate. When a MED value is missing for a route, BGP will determine a MED value based upon the settings specified in the **ip bgp bestpath med missing-as-worst** command.

### Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 metric 0
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 metric 0
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**ip bgp bestpath med missing-as-worst** Configures the MED for paths that do not contain a MED value.

**ip bgp always-compare-med** Forces BGP to use the MED for comparison of external routes.

## MIB Objects

```
alaBgpAggrTable  
  alaBgpAggrAddr  
  alaBgpAggrMask  
  alaBgpAggrMetric
```

---

## ip bgp aggregate-address summary-only

Enables or disables aggregate summarization, which suppresses more-specific routes. Disabling aggregate summarization means that more-specific routes will be announced to BGP peers (internal and external peers).

**ip bgp aggregate-address** *ip\_address ip\_mask summary-only*

**no ip bgp aggregate-address** *ip\_address ip\_mask summary-only*

---

### Syntax Definitions

<i>ip_address</i>	IP address for the aggregate route.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the IP address denote the network number.

### Defaults

This command is enabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This command specifies whether more-specific routes should be announced or suppressed.
- By default, aggregate summarization is enabled, which means that only the aggregate entry (for example, 100.10.0.0) is advertised. Advertisements of more-specific routes (for example, 100.10.20.0) are suppressed.

### Examples

```
-> ip bgp aggregate-address 172.22.2.115 255.255.255.0 summary-only  
-> no ip bgp aggregate-address 172.22.2.115 255.255.255.0 summary-only
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**MIB Objects**

alaBgpAggrTable

alaBgpAggrAddr

alaBgpAggrMask

    alaBgpAggrSummarize

---

## ip bgp network

Creates or deletes a BGP network. A network must be known to the local BGP speaker; it also must originate from the local BGP speaker. The network may be directly connected, dynamically learned, or static.

In lieu of these options, the base command (**ip bgp network**) may be used with other keywords to set up network configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

**ip bgp network** *network\_address ip\_mask*

[**community** *string*]

[**local-preference** *value*]

[**metric** *metric*]

[**admin-state** {**enable** | **disable**}]

**no ip bgp network** *network\_address ip\_mask*

---

### Syntax Definitions

*network\_address* 32-bit IP address.

*ip\_mask* 32-bit subnet mask that determines how many bits of the network address denote the network number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete a local network.
- Creating and enabling a network entry indicates to BGP that this network should originate from this router. The network specified must be known to the router, whether it is connected, static, or dynamically learned.
- You can create up to 200 network entries. The basic **show ip bgp path** command will display every network currently defined.
- This command allows administrative operations on a BGP network. You must still enable the network through the **ip bgp network admin-state** command.

### Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0
-> no ip bgp network 172.22.2.115 255.255.255.0
```

### Release History

Release 7.1.1; command was introduced.

```

---

## ip bgp network admin-state

Enables or disables a BGP network.

**ip bgp network** *network\_address ip\_mask* **admin-state** {**enable** | **disable**}

---

### Syntax Definitions

<i>network_address</i>	32-bit IP address.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the network address denote the network number.
<b>enable</b>	Enables this network.
<b>disable</b>	Disables this network.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Configure all network parameters before enabling this BGP network with this command. Use the **ip bgp network** command to configure individual aggregate parameters.
- You can create up to 200 network entries. The **show ip bgp path** command displays every network currently defined.

### Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 admin-state enable
```

### Release History

Release 7.1.1; command was introduced.

## ip bgp network community

Defines a community for a route created by the **ip bgp network** command. Communities are a way of grouping BGP peers that do not share an IP subnet or an AS.

**ip bgp network** *network\_address ip\_mask community string*

---

### Syntax Definitions

<i>network_address</i>	32-bit IP address of the network.
<i>ip_mask</i>	32-bit subnet mask that determines how many bits of the network address denote the network number.
<i>string</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.

### Defaults

parameter	default
<i>string</i>	none

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

You can revert the network community string to its default value by setting the community string to “**none**”. For example:

```
-> ip bgp network 172.22.2.115 255.255.255.0 community none
```

### Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 community export
```

---

## ip bgp network local-preference

Defines the local preference value for a route generated by the **ip bgp network** command. This value will override the default local preference value; it is used when announcing this network to internal peers.

**ip bgp network** *network\_address ip\_mask local-preference value*

**no ip bgp network** *network\_address ip\_mask local-preference value*

---

### Syntax Definitions

*network\_address* A 32-bit IP address.

*ip\_mask* A 32-bit subnet mask that determines how many bits of the network address denote the network number.

*value* The local preference attribute value. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to return the local preference of the specified network to its default setting.
- You can specify that this route use the default local preference value for the AS by specifying zero (0). In this case the local preference for this route will take the default local preference value set for this AS (defined in the **ip bgp default local-preference** command).

### Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 local-preference 600
-> no ip bgp network 172.22.2.115 255.255.255.0 local-preference 600
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp network** Creates or deletes a BGP network.

**ip bgp default local-preference** Sets the default local preference for this AS.

**MIB Objects**

```
alaBgpNetworkTable  
  alaBgpNetworkAddr

```

---

## ip bgp network metric

Configures the Multi-Exit Discriminator (MED) attribute value for an network generated by the **ip bgp network** command. This value is used when announcing this network to internal peers; it indicates the best exit point from the AS.

**ip bgp network** *network\_address ip\_mask metric value*

**no ip bgp network** *network\_address ip\_mask metric value*

---

### Syntax Definitions

<i>network_address</i>	A 32-bit IP address.
<i>ip_mask</i>	A 32-bit subnet mask that determines how many bits of the network address denote the network number.
<i>value</i>	A MED attribute value. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to return the metric for this network to its default value.
- The default value of zero indicates that a MED will not be sent for this network. When a MED value is missing for a route, BGP will determine a MED value based upon the settings specified in the **ip bgp bestpath med missing-as-worst** command.

### Examples

```
-> ip bgp network 172.22.2.115 255.255.255.0 metric 100
-> no ip bgp network 172.22.2.115 255.255.255.0 metric 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>ip bgp network</b>	Creates or deletes a BGP network.
<b>ip bgp bestpath med missing-as-worst</b>	Specifies the MED value when it is missing.

**MIB Objects**

```

```

---

## ip bgp neighbor

Creates or deletes a BGP peer.

**ip bgp neighbor** *ip\_address*

**no ip bgp neighbor** *ip\_address*

---

### Syntax Definitions

*ip\_address* 32-bit IP address of the new BGP peer.

### Defaults

No peers configured.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete a BGP peer.
- You must still enable a BGP peer after creating it. A BGP peer is enabled using the **ip bgp neighbor admin-state** command.
- Once created, a BGP peer cannot be enabled until it is assigned an autonomous system number using the **ip bgp neighbor remote-as** command.

### Examples

```
-> ip bgp neighbor 172.22.2.115
-> no ip bgp neighbor 172.22.2.115
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp neighbor admin-state** Enable or disable a BGP peer.  
**ip bgp neighbor remote-as** Configure the AS number for the peer.

### MIB Objects

alaBgpPeerTable  
  alaBgpPeerAddr

---

## ip bgp neighbor admin-state

Enables or disables a BGP peer.

```
ip bgp neighbor ip_address admin-state {enable | disable}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the new BGP peer.
<b>enable</b>	Enables this peer.
<b>disable</b>	Disables this peer.

### Defaults

---

parameter	default
<b>enable   disable</b>	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- You must first create a peer and assign it an IP address using the **ip bgp neighbor** command before enabling the peer.
- Configure all BGP peer related commands before enabling a peer using this command. Once you enable the peer it will begin sending BGP connection and route advertisement messages.

### Examples

```
-> ip bgp neighbor 172.22.2.115 admin-state enable  
-> ip bgp neighbor 172.22.2.115 admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>ip bgp neighbor</b>	Creates a BGP peer.
<b>show ip bgp neighbors</b>	Displays peer parameters.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr
```

---

## ip bgp neighbor advertisement-interval

Configures the time interval for updates between external BGP peers.

```
ip bgp neighbor ip_address advertisement-interval value
```

---

### Syntax Definitions

*ip\_address* 32-bit IP address of the neighbor.

*value* An advertisement time interval in seconds. The valid range is 0–65535.

### Defaults

parameter	default
<i>value</i>	30

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Internal peers sharing the same AS as the local BGP speaker (configured in the [ip bgp autonomous-system](#) command) use the global route advertisement update interval. This command sets the interval this peer uses to send BGP UPDATE messages to external peers.

### Examples

```
-> ip bgp neighbor 172.22.2.115 255.255.255.0 advertisement-interval 60
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip bgp neighbors](#) Displays BGP peer main status.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  bgpPeerMinRouteAdvertisementTinterval
```

---

## ip bgp neighbor clear

Restarts a BGP peer. The peer will be unavailable during this restart.

**ip bgp neighbor** *ip\_address* **clear**

---

### Syntax Definitions

*ip\_address*                                    32-bit IP address of the neighbor.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command whenever changes occur to BGP-related access lists, weights, distribution lists, timer specifications, or administrative distance.
- Many peer commands restart the peer as soon as they are configured. The following commands restart the BGP peer for which they are configured:

**ip bgp neighbor remote-as**  
**ip bgp neighbor md5 key**  
**ip bgp neighbor passive**  
**ip bgp neighbor ebgp-multihop**  
**ip bgp neighbor maximum-prefix**  
**ip bgp neighbor update-source**  
**ip bgp neighbor next-hop-self**  
**ip bgp neighbor soft-reconfiguration**  
**ip bgp neighbor route-reflector-client**  
**ip bgp confederation neighbor**  
**ip bgp neighbor remove-private-as**  
**ip bgp neighbor update-source.**

- You do not need to issue the **ip bgp neighbor clear** command after issuing any of the above commands.

### Examples

```
-> ip bgp neighbor 172.22.2.115 clear
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**ip bgp neighbor auto-restart** Automatically attempts to restart a BGP peer session after a session terminates.

**MIB Objects**

alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerRestart

---

## ip bgp neighbor route-reflector-client

Configures this peer as a client to the local route reflector.

```
ip bgp neighbor ip_address route-reflector-client
```

```
no ip bgp neighbor ip_address route-reflector-client
```

---

### Syntax Definitions

*ip\_address*                                   32-bit IP address of the neighbor.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove this peer as a client to the local route reflector.
- This command configures this peer as one of the clients to the local route reflector.
- All of the peers configured using this command become part of the client group. The remaining peers are members of the non-client group for the local route reflector.
- When route reflection is configured all of the internal BGP speakers in an autonomous system need not be fully meshed. The route reflector take responsibility for passing internal BGP-learned routes to its peers.

### Examples

```
-> ip bgp neighbor 172.22.2.115 route-reflector-client  
-> no ip bgp neighbor 172.22.2.115 route-reflector-client
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp client-to-client reflection](#) Configures the local BGP speaker as a route reflector

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerClientStatus
```

---

## ip bgp neighbor default-originate

Enables or disables BGP peer default origination.

**ip bgp neighbor *ip\_address* default-originate**

**no ip bgp neighbor *ip\_address* default-originate**

---

### Syntax Definitions

*ip\_address* 32-bit IP address of the neighbor.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- When this command is enabled, the local BGP speaker advertises itself as a default to the peer. Such a default route overrides any learned default (propagation) and outbound policy. The default route 0.0.0.0 does not need to exist on the local router.

### Examples

```
-> ip bgp neighbor 172.22.2.115 default-originate
-> no ip bgp neighbor 172.22.2.115 default-originate
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp neighbor** Creates or deletes a BGP peer.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerDefaultOriginate
```

---

## ip bgp neighbor timers

Configures the KEEPALIVE message interval and hold time interval (in seconds) with regards to the specified peer.

**ip bgp neighbor** *ip\_address* **timers** *keepalive holdtime*

---

### Syntax Definitions

<i>ip_address</i>	A 32-bit IP address for the BGP peer.
<i>keepalive</i>	The interval (in seconds) between KEEPALIVE messages. The valid values are zero (0) or the range 1–21845.
<i>holdtime</i>	The hold time interval between updates to peers, in seconds. The valid range is 0, 3–65535.

### Defaults

parameter	default
<i>keepalive</i>	30
<i>holdtime</i>	90

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Configures the time interval between KEEPALIVE messages sent by this peer. KEEPALIVE messages do not contain route updates or indicate a change in the status of the BGP peer; they serve only to tell the receiving BGP peer that the connection is still live and the peer is reachable.
- By default, the keep alive interval of 30 seconds is one-third the default hold-time interval of 90 seconds. The keep alive interval can never be more than one-third the value of the hold-time interval. When the hold interval is reached without receiving keep alive or other updates messages, the peer is considered dead.
- Setting the keep alive value to zero means no keep alive messages will be sent.
- Once a connection is established with a peer and a time period of the length specified in this command transpires with no messages from the remote peer, then the connection with that remote peer will be considered dead.
- Configures the tolerated hold time interval, in seconds, for messages to this peer from other peers. The hold timer is used during the connection setup process and in on-going connection maintenance with BGP peers. If this peer does not receive a KEEPALIVE, UPDATE, or NOTIFICATION message within this time period, then the BGP connection will be closed.
- By default, the hold-interval of 180 seconds is three times the default keep-alive interval of 60 seconds. The hold-interval can never be less than three times the keep-alive value.

- You must restart the peer (using the **ip bgp neighbor clear** command) after issuing this command before the new hold time interval takes effect.
- Both values must be set at the same time.
- Entering this command without the variables resets the variables to their default value.

### Examples

```
-> ip bgp neighbor 172.22.2.115 timers 80 240
-> ip bgp neighbor 172.22.2.115 timers
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

#### **ip bgp neighbor conn-retry-interval**

The interval, in seconds, between BGP retries to set up a connection through the transport protocol with another peer.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  bgpPeerHoldTimeConfigured
  bgpPeerKeepAliveConfigured
```

---

## ip bgp neighbor conn-retry-interval

The interval, in seconds, between BGP retries to set up a connection through the transport protocol with another peer. In the connect state, BGP tries to set up a connection with a remote peer. If the connection fails, then the connect retry interval is started. Once this interval elapses, BGP retries setting up the connection.

**ip bgp neighbor** *ip\_address* **conn-retry-interval** *seconds*

---

### Syntax Definitions

<i>ip_address</i>	A 32-bit IP address for the neighbor.
<i>seconds</i>	The time interval (in seconds) between retries. The valid range is 0–65535.

### Defaults

---

parameter	default
<i>seconds</i>	120

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The time interval is started when a connection to a peer is lost.
- Other BGP peers may automatically attempt to restart a connection with this peer if they have configured automatic peer session restart (using the **ip bgp neighbor auto-restart** command).
- You must restart the peer (using the **ip bgp neighbor clear** command) after issuing this command before the new connection retry interval takes effect.
- Entering this command without the *seconds* variable resets the variable to its default value.

### Examples

```
-> ip bgp neighbor 172.22.2.115 connect-interval 60
-> ip bgp neighbor 172.22.2.115 connect-interval
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

- ip bgp neighbor auto-restart** Enable automatic session restart after a session termination.
- ip bgp neighbor clear** Restarts the peer.

**MIB Objects**

alaBgpPeerTable  
  alaBgpPeerAddr  
  bgpPeerConnectRetryInterval

---

## ip bgp neighbor auto-restart

Enables or disables BGP peer automatic restart. When enabled, this peer will automatically attempt to restart a session with another peer after a session with that peer terminates. When disabled, this peer will not try to re-establish a session with another peer after the session terminates; in such a case, the other peer will have to restart the session for the two peers to resume communication.

**ip bgp neighbor** *ip\_address* **auto-restart**

---

### Syntax Definitions

*ip\_address*                                32-bit IP address for the neighbor.

### Defaults

This command is enabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable automatic peer restart.
- After a session with another peer terminates, the local BGP speaker will wait 60 seconds before attempting to restart the session. If the session does not start on the first attempt a second attempt will be made after another 120 seconds (60x2). On each unsuccessful session attempt, the previous delay between restarts is multiplied by 2, up to a maximum delay of 240 seconds. An exception to this rule occurs when the peer session terminates on receipt of a NOTIFY message with 'unsupported option' code or 'unsupported capability' code; in these cases the delay between restart attempts will begin at 1 second and multiply by 2 after each unsuccessful restart attempt (up to a maximum of 240 second delay).
- Disabling this option can be helpful in cases where other peers are prone to frequent flapping or sending many NOTIFY messages. By not restarting sessions with unstable neighbors, the local BGP speaker forces those unstable neighbors to re-initialize the connection.

### Examples

```
-> ip bgp neighbor 172.22.2.115 auto-restart  
-> no ip bgp neighbor 172.22.2.115 auto-restart
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

- ip bgp neighbor** Creates a BGP peer.  
**ip bgp neighbor admin-state** Enables a BGP peer.

## MIB Objects

alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerAutoRestart

---

## ip bgp neighbor maximum-prefix

Configures the maximum number of prefixes, or paths, the local router can receive from this peer in UPDATE messages.

```
ip bgp neighbor ip_address maximum-prefix maximum [warning-only]
```

---

### Syntax Definitions

*ip\_address* A 32-bit IP address of the BGP peer.

*maximum* The maximum number of prefixes. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>threshold</i>	5000

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When the number of prefixes sent by this peer reaches this limit, the peer is restarted.
- You can use BGP logging to receive a warning when the number of prefixes received from this peer reaches 80 percent of the value you configure in this command.
- If the **warning-only** prefix is used, the operator will be warned when the peer exceeds 80 percent of the configured number of maximum prefixes.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 maximum-prefix 1000
-> ip bgp neighbor 172.22.2.115 maximum-prefix 1000 warning only
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp neighbor clear](#) Restarts the BGP peer.

**MIB Objects**

alaBgpPeerTable

alaBgpPeerAddr

alaBgpPeerMaxPrefixWarnOnly

    alaBgpPeerMaxPrefix

---

## ip bgp neighbor md5 key

Sets an encrypted MD5 signature for TCP sessions with this peer in compliance with RFC 2385.

**ip bgp neighbor** *ip\_address* **md5 key** {*string* | **none**}

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	The MD5 public key. Maximum character length is 200.
<b>none</b>	Removes the MD5 public key.

### Defaults

---

parameter	default
<i>string</i>	no password

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Entering the keyword **none** in place of a key removes the password and disables authentication.
- Due to security concerns the actual password that you specify in this command is encrypted using a 3DES algorithm before it appears in a saved snapshot file. Also, if you were to view this command in a snapshot file, or **boot.cfg** file, it would appear in a different syntax. The syntax for this command used for snapshot files is as follows:

**ip bgp neighbor** *ip\_address* **md5 key-encrypt** *encrypted\_string*

However, you should not use this syntax to actually set an MD5 password; it will not work.

- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 md5 key openpeer5
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****ip bgp neighbor clear**

Restarts the BGP peer.

**MIB Objects**

alaBgpPeerTable

alaBgpPeerAddr

    alaBgpPeerMD5Key

---

## ip bgp neighbor ebgp-multihop

Allows external peers to communicate with each other even when they are not directly connected. The absence of communication between disconnected peers can occur when a router that is not running BGP sits between two BGP speakers; in such a scenario the BGP speakers are multiple hops from each other. By enabling this command, you allow the BGP peers to speak to each other despite the non-BGP router that sits between them.

**ip bgp neighbor** *ip\_address* **ebgp-multihop** [*tth*]

**no ip bgp neighbor** *ip\_address* **ebgp-multihop**

---

### Syntax Definitions

*ip\_address*                      32-bit IP address of the BGP peer.

*tth*                                The Time to Live for the multi-hop connection, in seconds. The range is 1 to 255.

### Defaults

parameter	default
<i>tth</i>	255

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable multi-hop connections.
- By default an external BGP peer is on a directly connected subnet. This command allows you to configure an external BGP peer that is not directly connected and may be multiple hops away. It should be used with caution and only with the guidance of qualified technical support.
- As a safeguard against loops, the multi-hop connection will not be made if the only route to a multi-hop peer is the default route (0.0.0.0).
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 ebgp-multihop 250  
-> no ip bgp neighbor 172.22.2.115 ebgp-multihop 50
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**ip bgp neighbor**

Creates or deletes a BGP peer.

**ip bgp neighbor next-hop-self**

Sets the BGP peer to use next hop processing behavior.

## MIB Objects

alaBgpPeerTable

alaBgpPeerAddr

alaBgpPeerMultiHop

---

## ip bgp neighbor description

Configures the BGP peer name.

```
ip bgp neighbor ip_address description string
```

---

### Syntax Definitions

*ip\_address*                      32-bit IP address of the BGP peer.  
*string*                              Peer name (1 - 20 characters).

### Defaults

parameter	default
<i>string</i>	peer(ip_address)

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The peer name is a text identifier that, by default, follows the format “peer(x.x.x.x)” where x.x.x.x is the IP address of the BGP peer. For example, the default name of a peer at address 198.216.14.23 would be “peer(198.216.14.23)”.
- A peer name with embedded spaces must be enclosed in quotation marks.

### Examples

```
-> ip bgp neighbor 172.22.2.115 description "peer for building 3"
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp neighbor](#)                      Sets the IP address for the peer.

### MIB Objects

alaBgpPeerTable  
    alaBgpPeerAddr  
    alaBgpPeerName

---

## ip bgp neighbor next-hop-self

Sets the BGP peer to use next hop processing behavior. By default, the next-hop processing of BGP updates is disabled. Using this command to enable next-hop behavior may be useful in non-meshed networks where BGP peers do not have direct access to other peers.

**ip bgp neighbor *ip\_address* next-hop-self**

**no ip bgp neighbor *ip\_address* next-hop-self**

---

### Syntax Definitions

N/A

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable next hop processing behavior.
- In partially meshed networks a BGP peer may not have direct connections to other peers. When such a peer receives route updates from these distant peers (through other peers), it may treat the remote peer as if it were the next hop in the routing path. Packet forwarding will not work in such a case because no direct connection exists. This command allows this peer to deem itself the next hop on the routing path so that the two non-connected peers can route packets. This peer would have a direct connection to both peers that want to exchange packets.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 next-hop-self  
-> no ip bgp neighbor 172.22.2.115 next-hop-self
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****ip bgp neighbor**

Creates or deletes a BGP peer.

**MIB Objects**

alaBgpPeerTable

alaBgpPeerAddr

    alaBgpPeerNextHopSelf

---

## ip bgp neighbor passive

Configures the local BGP speaker to wait for this peer to establish a connection. When enabled, the local BGP speaker will not initiate a peer session with this peer; in this sense, the BGP speaker is “passive.” When disabled, the local BGP speaker will attempt to set up a session with this peer.

**ip bgp neighbor *ip\_address* passive**

**no ip bgp neighbor *ip\_address* passive**

---

### Syntax Definitions

*ip\_address*                                      32-bit IP address of the BGP peer.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable passive peer behavior.
- By default BGP will initiate a session to a peer once the peer is configured, has an AS number, and is enabled. You can use this command to configure the local BGP speaker as passive and an outbound session will not be initiated to this peer. For such peers, BGP will always wait passively for the inbound session attempt.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 passive
-> no ip bgp neighbor 172.22.2.115 passive
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp neighbor](#)                                      Creates or deletes a BGP peer.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerPassive
```

---

## ip bgp neighbor remote-as

Assigns an AS number to this BGP peer.

```
ip bgp neighbor ip_address remote-as value
```

---

### Syntax Definitions

*ip\_address* 32-bit IP address of the BGP peer.

*value* Autonomous system number in the range 1 - 65535.

### Defaults

parameter	default
<i>value</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- A BGP peer created with the **ip bgp neighbor** command cannot be enabled (**ip bgp neighbor admin-state enable**) until it is assigned an autonomous system number. If the AS number matches the AS number assigned to the local BGP speaker (assigned using the **ip bgp autonomous-system** command), the peer is considered internal to the local autonomous system. Otherwise, the peer is considered external to the local BGP speaker's AS.
- This BGP peer may not be operational within this router and it may be in an external AS, but it must still be configured on this router before the local BGP speaker can establish a connection to the peer. The local BGP speaker does not auto-discover peers in other routers; it initially learns about peers through the peer commands.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 remote-as 100
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip bgp autonomous-system</b>	Set the AS for the local BGP speaker.
<b>ip bgp neighbor</b>	Create a BGP peer.
<b>ip bgp neighbor admin-state enable</b>	Enables a BGP peer.

## MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerAS
```

---

## ip bgp neighbor remove-private-as

Enables or disables the stripping of private autonomous system numbers from the AS path of routes destined to this peer.

**ip bgp neighbor** *ip\_address* **remove-private-as**

**no ip bgp neighbor** *ip\_address* **remove-private-as**

---

### Syntax Definitions

*ip\_address*                                      32-bit IP address of the BGP peer.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable stripping of private AS numbers.
- By default all AS numbers in the AS path are passed to peers. Enabling this command strips any private AS numbers in the AS path before sending updates to this peer. AS numbers in the range 64512 to 65535 are considered private ASs; they intended for internal use within an organization (such as an enterprise network), but they are not intended for use on public networks (such as the Internet).
- This command has no effect if you are not using ASs in the range 64512 to 65535.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 remove-private-as
-> no ip bgp neighbor 172.22.2.115 remove-private-as
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp neighbor remote-as](#)                      Configures the AS number for this peer.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerRemovePrivateAs
```

---

## ip bgp neighbor soft-reconfiguration

Enables or disables BGP peer soft reconfiguration. Soft reconfiguration increases the stability of the peer by allowing you to reconfigure attributes that require peer resets without halting the TCP connection with other peers.

**ip bgp neighbor *ip\_address* soft-reconfiguration**

**no ip bgp neighbor *ip\_address* soft-reconfiguration**

---

### Syntax Definitions

*ip\_address*                                 32-bit IP address of the BGP peer.

### Default

This command is enabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- This feature stores routes and other configuration information in local memory. When you make configuration changes that require a peer reset, the routing cache is not cleared and connections with other peers are not interrupted.
- By default BGP stores all paths from peers, even those that are policy rejected, in anticipation of policy changes in the future. Storing these paths consumes memory. You can use this command to disable the storing of these paths, or soft reconfiguration. However, if soft reconfiguration is disabled and the inbound policy changes, the peer will have to be restarted using the [ip bgp neighbor out-aspalst](#) command.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp neighbor 172.22.2.115 soft-reconfiguration  
-> no ip bgp neighbor 172.22.2.115 soft-reconfiguration
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

- ip bgp neighbor clear** Restarts this BGP peer.
- ip bgp neighbor out-aspathlist** Resets inbound policies to this peer.

## MIB Objects

alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerSoftReconfig

---

## ip bgp neighbor stats-clear

Clears the statistics for a peer.

**ip bgp neighbor** *ip\_address* stats-clear

---

### Syntax Definitions

*ip\_address*                                    32-bit IP address of the BGP peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command clears the statistical variables for a peer so they can accumulate from a known point.
- The cleared statistics include the total messages sent and received from this peer, the total UPDATE messages sent and received from this peer, the total NOTIFY messages sent and received from this peer, and the total peer state transition messages sent and received from this peer. These statistics can be displayed through [show ip bgp neighbors statistics](#).

### Examples

```
-> ip bgp neighbor 172.22.2.115 stats-clear
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip bgp neighbors statistics](#) Displays peer statistics.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerClearCounter
```

---

## ip bgp confederation neighbor

Configures this peer as a member of the same confederation as the local BGP speaker.

**ip bgp confederation neighbor** *ip\_address*

**no ip bgp confederation neighbor** *ip\_address*

---

### Syntax Definitions

*ip\_address*                        32-bit IP address of the peer.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- You must first assign a confederation number to the local BGP speaker before assigning peers to the confederation. Use the **ip bgp confederation identifier** command to assign a confederation number to the local BGP speaker.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ip bgp confederation neighbor 172.22.2.115
-> no ip bgp confederation neighbor 172.22.2.115
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp confederation identifier** Sets a confederation identification value for the local BGP speaker (this router).

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerConfedStatus
```

---

## ip bgp neighbor update-source

Configures the local address from which this peer will be contacted. This local address can be configured for internal and external BGP peers.

```
ip bgp neighbor ip_address update-source [interface_name]
```

---

### Syntax Definitions

*ip\_address*                      The 32-bit IP address for this peer.

*interface\_name*                The name of the interface.

### Defaults

parameter	default
<i>interface_address</i>	0.0.0.0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This address does not override the router identification for this BGP peer (configured in the **ip bgp neighbor** command). It is the address through which this peer can be contacted within this router. The router identification for a peer, especially an external peer, may not exist in the local router, but that distant peer can still be contacted through this router. This command sets the local address through which this distant peer can be contacted.
- The default is restored by entering the command without a IP address.
- The BGP peer is restarted after issuing this command.
- The update-source is not related to the router-id, it specifies the interface to be used for the TCP connection endpoint. By default, the nearest interface is selected.

### Examples

```
-> ip bgp neighbor 172.22.5.115 update-source 172.22.2.117
-> ip bgp neighbor 172.22.5.115 update-source vlan-22
-> ip bgp neighbor 172.22.5.115 update-source
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **ip bgp neighbor**

Sets the router identification for a BGP peer.

## MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerLocalAddr  
  alaBgpPeerLocalIntfName
```

---

## ip bgp neighbor in-aspathlist

Assigns an inbound AS path list filter to a BGP peer.

**ip bgp neighbor** *ip\_address* **in-aspathlist** {*string* / **none**}

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Inbound AS path list (0 to 70 characters). This name is case sensitive.
<b>none</b>	Removes this AS path list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The AS path list name (**InboundASpath** in the example below) is created using the [ip bgp policy aspath-list](#) command. Any inbound routes from the BGP peer must match this AS path filter before being accepted or passed to inbound policy.
- To deassign an input AS path filter list, use this command to assign a value of **none**.

### Examples

```
-> ip bgp neighbor 172.22.2.115 in-aspathlist InboundASpath
-> ip bgp neighbor 172.22.2.115 in-aspathlist none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy aspath-list](#) Creates or removes an AS path list.

### MIB Objects

alaBgpPeerTable  
alaBgpPeerAspathListIn

---

## ip bgp neighbor in-communitylist

Assigns an inbound community list filter to a BGP peer.

```
ip bgp neighbor ip_address in-communitylist {string / none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Input community list (0 to 70 characters. This name is case sensitive).
<b>none</b>	Removes this community list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The community filter list name (**InboundCommlist** in the example below) is created using the [ip bgp policy community-list](#) command. Any inbound routes from the BGP peer must match this community filter before being accepted or passed to inbound policy.
- To deassign an input community filter list, use this command to assign a value of “**none**.”

### Examples

```
-> ip bgp neighbor 172.22.2.115 in-communitylist InboundCommlist  
-> ip bgp neighbor 172.22.2.115 in-communitylist none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy community-list](#) Creates or deletes a community list.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerCommunityListIn
```

---

## ip bgp neighbor in-prefixlist

Assigns an inbound prefix filter list to a BGP peer.

```
ip bgp neighbor ip_address in-prefixlist {string / none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address.
<i>string</i>	Input prefix filter list (0 to 70 characters). This name is case sensitive.
<b>none</b>	Removes the prefix list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The prefix list name (**InboundPrefix** in the example below) is created using the [ip bgp policy prefix-list](#) command. Any inbound routes from the BGP peer must match this prefix filter before being accepted or passed to inbound policy.
- To deassign an input prefix filter list, use this command to assign a value of “**none.**”

### Examples

```
-> ip bgp neighbor 172.22.2.115 in-prefixlist InboundPrefix  
-> ip bgp neighbor 172.22.2.115 in-prefixlist none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy prefix-list](#) Creates or deletes a prefix match list.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerPrefixListIn
```

---

## ip bgp neighbor out-aspathlist

Assigns an outbound AS path filter list to a BGP peer.

```
ip bgp neighbor ip_address out-aspathlist {string / none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Outbound AS path list (0 - 70 characters).
none	Removes the AS path list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The AS path list name (**OutboundASpath** in the example below) is created using the [ip bgp policy aspath-list](#) command. Any outbound routes from the BGP peer must match this AS path filter, or policy, before being advertised or passed to outbound policy.
- To deassign an output AS path filter list, use this command to assign a value of “**none**”.

### Examples

```
-> ip bgp neighbor 172.22.2.115 out-aspathlist OutboundASpath  
-> ip bgp neighbor 172.22.2.115 out-aspathlist none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy aspath-list](#) Creates or removes an AS path list.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAspathListOut
```

---

## ip bgp neighbor out-communitylist

Assigns an outbound community filter list to a BGP peer.

```
ip bgp neighbor ip_address out-communitylist {string | none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Outbound community list (0 - 70 characters).
none	Removes the community list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The community filter list name (**OutboundCommlist** in the example below) is created using the **ip bgp policy community-list** command. Any outbound routes from the BGP peer must match this community filter before being advertised or passed to outbound policy.
- To deassign an output community filter list, use this command to assign a value of “**none**”.

### Examples

```
-> ip bgp neighbor 172.22.2.115 out-communitylist OutboundCommlist  
-> ip bgp neighbor 172.22.2.115 out-communitylist none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp policy community-list** Creates or deletes a community list.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerCommunityListOut
```

---

## ip bgp neighbor out-prefixlist

Assigns an outbound prefix filter list to a BGP peer.

```
ip bgp neighbor ip_address out-prefixlist {string / none}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the BGP peer.
<i>string</i>	Output prefix filter list (0 - 70 characters).
<b>none</b>	Removes the prefix list from the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The prefix list name (**OutboundPrefix** in the example below) is created using the [ip bgp policy prefix-list](#) command. Any outbound routes from the BGP peer must match this prefix filter before being advertised or passed to outbound policy.
- To deassign an output prefix filter list, use this command to assign a value of “**none**”.

### Examples

```
-> ip bgp neighbor 172.22.2.115 out-prefixlist OutboundPrefix
-> ip bgp neighbor 172.22.2.115 out-prefixlist none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy prefix-list](#) Creates or deletes a prefix match list.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerPrefixListOut
```

---

## ip bgp neighbor route-map

Assigns an inbound policy map to a BGP peer.

```
ip bgp neighbor ip_address route-map {string | none} {in | out}
```

```
no ip bgp neighbor ip_address route-map {in | out}
```

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address of the peer.
<i>string</i>	Inbound policy map name (0 to 70 characters). This name is case sensitive.
<b>none</b>	Deletes the route map if entered rather than a text string.
<b>in</b>	Designates this route map policy as an inbound policy.
<b>out</b>	Designates this route map policy as an outbound policy.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to deassign an inbound map.
- The policy route map name (**peeringPointAMap** in the example below) is created using the **ip bgp policy prefix6-list** command. Any inbound routes from the BGP peer must match this route map filter before being accepted or passed to inbound policy.
- It is also possible to deassign a route map by entering **none** in place of a route map name.

### Examples

```
-> ip bgp neighbor 172.22.2.115 route-map InboundRoute in
-> ip bgp neighbor 172.22.2.115 route-map OutboundRoute out
-> ip bgp neighbor 172.22.2.115 route-map none in
-> no ip bgp neighbor 172.22.2.115 route-map in
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

[ip bgp policy prefix6-list](#)      Creates or deletes a policy route map.

**MIB Objects**

```
alaBgpPeerTable
  alaBgpPeerRouteMapOut
  alaBgpPeerRouteMapIn
```

---

## ip bgp neighbor clear soft

Invokes an inbound or outbound policy reconfiguration for a BGP peer.

**ip bgp neighbor** *ip\_address* **clear soft** {**in** | **out**}

---

### Syntax Definitions

<i>ip_address</i>	32-bit IP address for the BGP peer.
<b>in</b>	Applies reconfiguration to the inbound policies.
<b>out</b>	Applies reconfiguration to the outbound policies.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command reconfigures (or reapplies) all inbound or outbound policies to existing routes without restarting the peer session.
- This command is useful if policies have been changed.

### Examples

```
-> ip bgp neighbor 172.22.2.115 clear soft in
-> ip bgp neighbor 172.22.2.115 clear soft out
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp neighbor soft-reconfiguration](#) Enables or disables BGP peer soft reconfiguration.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerReconfigureInBound
  alaBgpPeerReconfigureOutBound
```

---

## ip bgp policy aspath-list

Creates or removes an AS path list.

**ip bgp policy aspath-list** *name* “*regular\_expression*”

**no ip bgp policy aspath-list** *name* “*regular\_expression*”

---

### Syntax Definitions

<i>name</i>	AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
<i>regular_expression</i>	Regular expression, e.g., “^100 200\$” where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.

### Defaults

No IP BGP peer policy AS path-list exists.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove an AS path list.
- To create an AS path list, use the **ip bgp policy aspath-list** command.
- A regular expression consists of a character string presented in the form of a pattern, e.g., ^100 200\$. Valid regular expression characters (metacharacters) are shown in the table below. See also “Configuring BGP” in your Advanced Routing Guide for more information on using regular expressions in BGP commands.

---

Symbol	Description
^	Matches the beginning of the AS path list.
123	Matches the AS number 123.
.	Matches any single AS number.
?	Matches zero or one occurrence of the previous token, which must be an AS number, a dot, an alternation or a range.
+	Matches one or more occurrences of the previous token, which must be an AS number, a dot, an alternation or a range.
*	Matches zero or more occurrences of the previous token, which must be an AS number, a dot, an alternation or a range.
(	Begins an alternation sequence of AS numbers. It matches any AS number listed in the alternation sequence.

---

Symbol	Description
	Separates AS numbers in an alternation sequence.
)	Ends an alternation sequence of AS numbers
[	Begins a range pair consisting of two AS numbers separated by a dash. It matches any AS number within that inclusive range.
-	Separates the endpoints of a range.
]	Ends a range pair.
\$	Matches the end of the AS path list.
,_	Commas, underscores and spaces are ignored.

- When using a regular expression in the CLI, the regular expression must be enclosed in quotation marks.
- This command creates AS path lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-aspathlist** and **ip bgp neighbor out-aspathlist** commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies.
- If a BGP AS path list is configured to deny routes from a particular string of regular expression, then by default all of the routes coming from any AS would be denied. You must configure the policy instance in the same policy to allow other routes to come in, to be permitted from other ASs.
- General or more specific AS path list information can be displayed by varying the use of the **show ip bgp** command.

## Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$"
-> ip bgp policy aspath-list OutboundAspath "^300 400$"
-> no ip bgp policy aspath-list InboundAspath "^100 200$"
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip bgp neighbor in-aspalthlist</b>	Assigns an inbound AS path list filter to a BGP peer.
<b>ip bgp neighbor out-aspalthlist</b>	Assigns an outbound AS path list filter to a BGP peer.
<b>ip bgp policy aspath-list action</b>	Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found.
<b>ip bgp policy aspath-list priority</b>	Configures priority for processing regular expressions in an AS path list.

## MIB Objects

alaBgpAspathMatchListTable  
  alaBgpAspathMatchListRowStatus

---

## ip bgp policy aspath-list action

Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found. Matching criteria are specified in the regular expression.

**ip bgp policy aspath-list** *name* "*regular\_expression*" **action** {**permit** | **deny**}

---

### Syntax Definitions

<i>name</i>	AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
<i>regular_expression</i>	Regular expression, e.g., " <b>^100 200\$</b> " where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.
<b>permit</b>	Allows matching routes to pass.
<b>deny</b>	Stops matching routes from passing.

### Defaults

parameter	default
<b>permit   deny</b>	permit

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- A regular expression consists of a character string presented in the form of a pattern, e.g., **^100 200\$**. Refer to [ip bgp policy aspath-list](#) on page 21-96 for a table of valid regular expression characters (metacharacters). See also "Configuring BGP" in your Advanced Routing Guide for more information on using regular expressions in BGP commands.
- This command allows or stops AS path lists from being applied to a peer's inbound and outbound routes configured through the [ip bgp neighbor in-aspathlist](#) and [ip bgp neighbor out-aspathlist](#) commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies.
- General or more specific AS path list information can be displayed by varying the use of the [show ip bgp](#) command.

### Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$" action permit
-> ip bgp policy aspath-list OutboundAspath "^300 400$" action deny
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip bgp neighbor in-aspathlist</b>	Assigns an inbound AS path list filter to a BGP peer.
<b>ip bgp neighbor out-aspathlist</b>	Assigns an outbound AS path list filter to a BGP peer.
<b>ip bgp policy aspath-list</b>	Creates or removes an AS path list.
<b>ip bgp policy aspath-list priority</b>	Configures priority for processing regular expressions in an AS path list.

## MIB Objects

```
alaBgpAspathMatchListTable  
    alaBgpAspathMatchListAction
```

---

## ip bgp policy aspath-list priority

Configures the priority for processing regular expressions in an AS path list.

**ip bgp policy aspath-list** *name* "*regular\_expression*" **priority** *value*

---

### Syntax Definitions

<i>name</i>	The AS path name, e.g., InboundAspath, ranging from 0 to 70 characters, or a value of none. The AS path name is case sensitive.
<i>regular_expression</i>	A regular expression, e.g., " <sup>^</sup> 100 200\$" where 100 (followed by a space) represents the beginning of the list and 200 represents the end. The regular expression must be enclosed by quotation marks.
<i>value</i>	A priority value, e.g., 1, assigned to the policy action. Valid priority range is from 1 - 255.

### Defaults

parameter	default
<i>value</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- A regular expression consists of a character string presented in the form of a pattern, e.g., <sup>^</sup>100 200\$. Refer to [ip bgp policy aspath-list](#) on page 21-96 for a table of valid regular expression characters (metacharacters). See also "Configuring BGP" in your Advanced Routing Guide for more information on using regular expressions in BGP commands.
- This command specifies the priority of an AS path list filter being applied to a peer's inbound and outbound routes configured through the [ip bgp neighbor in-aspathlist](#) and [ip bgp neighbor out-aspathlist](#) commands. The AS path list filters routes based on one or more regular expressions, as shown in the example below. If the route matches the AS path list filter, then the *permit* or *deny* action (i.e., policy) associated with the regular expression applies, but only in the order designated by the priority value.
- The higher the priority value specified in the command, the later the matching is processed. For example, regular expressions with a priority of 1 (the default) are processed before an expression assigned a priority of 3. When regular expressions have an equal priority, the processing order is indeterminate.
- General or more specific AS path list information can be displayed by varying the use of the [show ip bgp](#) command.

### Examples

```
-> ip bgp policy aspath-list InboundAspath "^100 200$" priority 1
-> ip bgp policy aspath-list OutboundAspath "^300 400$" priority 5
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

- |   |  |
|---|--|
| <b>ip bgp neighbor in-aspathlist</b>    | Assigns an inbound AS path list filter to a BGP peer.  |
| <b>ip bgp neighbor out-aspathlist</b>   | Assigns an outbound AS path list filter to a BGP peer.   |
| <b>ip bgp policy aspath-list</b>        | Creates or removes an AS path list.  |
| <b>ip bgp policy aspath-list action</b> | Configures a policy action (either permit or deny a route from passing) to be taken for an AS path list when a match is found. |

## MIB Objects

alaBgpAspathMatchListTable  
  alaBgpAspathMatchListPriority

---

## ip bgp policy community-list

Creates or deletes a community list.

**ip bgp policy community-list** *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}

**no ip bgp policy community-list** *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}

---

### Syntax Definitions

<i>name</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
<b>none</b>	Removes the community restrictions on the community section of the route map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.

### Defaults

No IP BGP peer policy community-list exists.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a community-list.
- This command creates community lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-communitylist** and **ip bgp neighbor out-communitylist** commands. The community list filters routes based on one or more community match list strings, as shown in the example below. If the route matches the community list filter, according to the matching type *exact* or *occur*, then the *permit* or *deny* policy action associated with the match list string applies.
- General or more specific community list information can be displayed by varying the use of the **show ip bgp** command.

### Examples

```
-> ip bgp policy community-list CommListAIn 40:40
-> ip bgp policy community-list CommListAOut 400:20
-> ip bgp policy community-list none
-> no ip bgp policy community-list CommListAIn 400:20
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip bgp neighbor in-communitylist</b>	Assigns an inbound AS community list filter to a BGP peer.
<b>ip bgp neighbor out-communitylist</b>	Assigns an outbound AS community list filter to a BGP peer.
<b>ip bgp policy community-list action</b>	Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
<b>ip bgp policy community-list match-type</b>	Configures type of matching to be performed with a community string list.
<b>ip bgp policy community-list priority</b>	Configures priority for processing multiple items in a community list filter.

## MIB Objects

alaBgpCommunityMatchListTable  
alaBgpCommunityMatchListRowStatus

---

## ip bgp policy community-list action

Configures the action to be taken for a community list when a match is found.

**ip bgp policy community-list** *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}  
**action** {**permit** | **deny**}

---

### Syntax Definitions

<i>name</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
<b>none</b>	Removes the community restrictions on the community section of the route map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
<b>permit</b>	Allows matching routes to pass.
<b>deny</b>	Stops matching routes from passing.

### Defaults

parameter	default
<b>permit   deny</b>	<b>permit</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

By default, this command allows routes that match the criteria specified in the community list to pass.

### Examples

```
-> ip bgp policy community-list commListAIn 600:1 action permit
-> ip bgp policy community-list commListAIn 600:1 action deny
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip bgp neighbor in-communitylist</b>	Assigns an inbound AS community list filter to a BGP peer.
<b>ip bgp neighbor out-communitylist</b>	Assigns an outbound AS community list filter to a BGP peer.
<b>ip bgp policy community-list match-type</b>	Configures type of matching to be performed with a community string list.
<b>ip bgp policy community-list priority</b>	Configures priority for processing multiple items in a community list filter.

## MIB Objects

alaBgpCommunityMatchListTable  
alaBgpCommunityMatchListAction

---

## ip bgp policy community-list match-type

Configures the type of matching to be performed with a community string list.

**ip bgp policy community-list** *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}  
**match-type** {**exact** | **occur**}

---

### Syntax Definitions

<i>name</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
<b>none</b>	Removes the community restrictions on the community section of the route map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
<b>exact</b>	Checks for an exact match of the community string and the community attribute.
<b>occur</b>	Checks for an occurrence of the community string anywhere in the community attribute.

### Defaults

parameter	default
<b>exact</b>   <b>occur</b>	exact

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

By default, this command only allows routes to pass if the community string exactly matches the community attribute of the route.

### Examples

```
-> ip bgp policy community-list commListC 600:1 match-type exact
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip bgp neighbor in-communitylist</b>	Assigns an inbound AS community list filter to a BGP peer.
<b>ip bgp neighbor out-communitylist</b>	Assigns an outbound AS community list filter to a BGP peer.
<b>ip bgp policy community-list action</b>	Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
<b>ip bgp policy community-list priority</b>	Configures priority for processing multiple items in a community list filter.

## MIB Objects

alaBgpCommunityMatchListTable  
alaBgpCommunityMatchListType

---

## ip bgp policy community-list priority

Configures the priority for processing multiple items in a community list filter.

**ip bgp policy community-list** *name* {**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*}  
**priority** *value*

---

### Syntax Definitions

<i>name</i>	Community name, e.g., CommListAIn, ranging from 0 to 70 characters, or a value of none. The Community name is case sensitive.
<b>none</b>	Removes the community restrictions on the community section of the route map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.
<i>value</i>	Priority value in the range 0 - 255.

### Defaults

parameter	default
<i>value</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The higher the priority value specified in the command, the later the matching is processed. For example, items with a priority of 1 (the default) are processed before items assigned a priority of 3. When items have an equal priority, the processing order is indeterminate.

### Examples

```
-> ip bgp policy community-list commListB 500:1 priority 3
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip bgp policy community-list</b>	Creates or deletes a community list.
<b>ip bgp policy community-list action</b>	Configures a policy action (either permit or deny a route from passing) to be taken for an AS community list filter when a match is found.
<b>ip bgp policy community-list match-type</b>	Configures type of matching to be performed with community string list.

## MIB Objects

```
alaBgpCommunityMatchListTable  
  alaBgpCommunityMatchListPriority
```

---

## ip bgp policy prefix-list

Creates or deletes a prefix match list.

**ip bgp policy prefix-list** *name ip\_address ip\_mask*

**no ip bgp policy prefix-list** *name ip\_address ip\_mask*

---

### Syntax Definitions

<i>name</i>	Prefix list name.
<i>ip_address</i>	IP address for the prefix list.
<i>ip_mask</i>	Mask for the prefix list.

### Defaults

No IP BGP policy prefix-list exists.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command creates prefix lists that can be applied to a peer's inbound and outbound routes using the **ip bgp neighbor in-prefixlist** and **ip bgp neighbor out-prefixlist** commands. The prefix list filters routes based on one or more prefixes, as shown in the example below. If the route matches the prefix list filter, according to the **ge** (lower) and **le** (upper) limits defined, then the **permit** or **deny** action associated with the prefix applies.
- General or more specific prefix list information can be displayed by varying the use of the **show ip bgp** command.

### Examples

```
-> ip bgp policy prefix-list prefixListA 12.0.0.0 255.0.0.0
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

- ip bgp policy prefix-list action** Configures action to be taken for a prefix list when a match is found.
- ip bgp policy prefix-list ge** Configures lower limit on length of prefix to be matched.
- ip bgp policy prefix-list le** Configures upper limit on length of prefix to be matched.

## MIB Objects

alaBgpPrefixMatchListTable  
  alaBgpPrefixMatchListRowStatus

---

## ip bgp policy prefix-list action

Configures the action to be taken for a prefix list when a match is found.

```
ip bgp policy prefix-list name ip_address ip_mask action {permit | deny}
```

---

### Syntax Definitions

<i>name</i>	Prefix list name.
<i>ip_address</i>	IP address of the prefix list.
<i>ip_mask</i>	Mask for the prefix list.
<b>permit</b>	Allows matching routes to pass.
<b>deny</b>	Stops matching routes from passing.

### Defaults

parameter	default
permit   deny	permit

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Configures the action to be taken for a prefix list when a match is found.

### Examples

```
-> ip bgp policy prefix-list prefixListA 12.0.0.0 255.0.0.0 action deny
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip bgp policy prefix-list</a>	Creates or deletes a prefix match list.
<a href="#">ip bgp policy prefix-list ge</a>	Configures lower limit on length of prefix to be matched.
<a href="#">ip bgp policy prefix-list le</a>	Configures upper limit on length of prefix to be matched.

### MIB Objects

```
alaBgpPrefixMatchListTable
  alaBgpPrefixMatchListAction
```

---

## ip bgp policy prefix-list ge

Configures the lower limit on the length of the prefix to be matched.

**ip bgp policy prefix-list** *name ip\_address ip\_mask ge value*

---

### Syntax Definitions

<i>name</i>	Prefix list name.
<i>ip_address</i>	IP address of the prefix list.
<i>ip_mask</i>	Mask of the prefix list.
<i>value</i>	The lower limit value in the range 0 to 32.

### Defaults

---

parameter	default
<i>value</i>	0

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The default value of zero indicates there is no lower limit on the length of the prefix to be matched.
- This command is used in conjunction with the **ip bgp policy prefix-list le** command to set the prefix matching range. The two commands can be combined, as show in the Example section below.
- The **ge** (lower limit) value must be greater than or equal to the prefix length (8 in the example below) and less than or equal to the **le** (upper limit) value.

### Examples

```
-> ip bgp policy prefix-list prefixListA 14.0.0.0 255.0.0.0 ge 8 le 16
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

## ip bgp policy prefix-list le

Configures the upper limit on the length of the prefix to be matched.

**ip bgp policy prefix-list** *name ip\_address ip\_mask le value*

---

### Syntax Definitions

<i>name</i>	Prefix list name.
<i>ip_address</i>	Prefix list IP address for the prefix list.
<i>ip_mask</i>	Prefix list mask for the prefix list.
<i>value</i>	The upper limit value in the range of 0 to 32.

### Defaults

---

parameter	default
<i>value</i>	0

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The default value of zero indicates there is no upper limit on the length of the prefix to be matched. This command is used in conjunction with **ip bgp policy prefix-list ge** to set the prefix matching range. The two commands can be combined, as show in the Example section below.
- The **ge** (lower limit) value must be greater than or equal to the prefix length (8 in the example below) and less than or equal to the **le** (upper limit) value.

### Examples

```
-> ip bgp policy prefix-list prefixListA 14.0.0.0 255.0.0.0 ge 8 le 16
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

- ip bgp policy prefix-list ge** Configures lower limit on length of prefix to be matched.

**MIB Objects**

alaBgpPrefixMatchListTable  
alaBgpPrefixMatchListLE

---

## ip bgp policy prefix6-list

Configures a BGP prefix6-list policy for filtering IPv6 prefixes. This policy can be applied to filter unique local IPv6 addresses.

**ip bgp policy prefix6-list** *px\_list\_name prefix6/pfx\_length* [action{permit|deny}] [admin-state{enable|disable}] [ge[{masklength}]] [le[{masklength}]]

**no ip bgp policy prefix6-list** *px\_list\_name prefix6/pfx\_length* [action{permit|deny}] [admin-state{enable|disable}] [ge[{masklength}]] [le[{masklength}]]

---

### Syntax Definitions

<i>px_list_name</i>	Prefix list name.
<i>prefix6</i>	Prefix list IPv6 address for the prefix list.
<i>pfx_length</i>	Prefix length. Prefix length should be in the range of 0 to 128.
<b>permit   deny</b>	Action to be taken which can be either permit or deny.
<b>enable   disable</b>	Row Status can be either enabled or disabled.
<i>masklength</i>	Minimum length of the prefix to be matched. It should be in the range of 0 - 32.
<i>masklength</i>	Maximum length of the prefix to be matched. It should be in the range of 0 - 32.

### Defaults

NA

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable this feature.
- BGP must be configured on the system.
- The **ge** (lower limit) value must be greater than or equal to the prefix length and less than or equal to the **le** (upper limit) value.

### Examples

```
-> ip bgp policy prefix6-list uniqLocal FC00::/48
-> ip bgp policy prefix6-list uniqLocal FC00::/48 action permit
-> ip bgp policy prefix6-list uniqLocal FC00::/48 admin-state enable
-> no ip bgp policy prefix6-list uniqLocal FC00::/48
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**show ip bgp policy route-map** Displays configured prefix6-list policies on the system.

**show ipv6 bgp neighbors** Displays the configured IPv6 BGP peers.

## MIB Objects

  alaBgpPrefix6MatchListGE
  alaBgpPrefix6MatchListLE
```

---

## ip bgp policy route-map

Creates or deletes a policy route map.

**ip bgp policy route-map** *name sequence\_number*

---

### Syntax Definitions

<i>name</i>	Route map name. Case-sensitive.
<i>sequence_number</i>	Route map sequence number in the range of 1 to 255. The sequence number allows for multiple instances of the same route map name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command creates policy route maps. Each route map can be configured using the following match commands to specify the match criteria by which routes are allowed to pass. Match criteria is examined in the order the commands are listed below.
  1. **ip bgp policy route-map aspath-list**
  2. **ip bgp policy route-map prefix-list**
  3. **ip bgp policy route-map community-list**
  4. **ip bgp policy route-map match-regexp**
  5. **ip bgp policy route-map match-prefix**
  6. **ip bgp policy route-map match-mask**
  7. **ip bgp policy route-map match-community**
- Each route map can also be configured using the following set commands to sequentially specify the actions to be taken when a match is found.
  - **ip bgp policy route-map community**
  - **ip bgp policy route-map community-mode**
  - **ip bgp policy route-map lpref**
  - **ip bgp policy route-map lpref-mode**
  - **ip bgp policy route-map med**
  - **ip bgp policy route-map med-mode**
  - **ip bgp policy route-map origin**

- [ip bgp policy route-map weight](#)
- Route maps can be referenced as a filtering mechanism for displaying paths using the [show ip bgp path](#) command. They are also referenced in filtering inbound and outbound routes for BGP peers using the [ip bgp neighbor route-map](#) commands.

### Examples

```
-> ip bgp policy route-map routemap1 1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy route-map action](#) Configures action to be taken for a route when a match is found.

### MIB Objects

```
alaBgpRouteMapTable  
  alaBgpRouteMapRowStatus
```

---

## ip bgp policy route-map action

Configures the action to be taken for a route when a match is found.

**ip bgp policy route-map** *name sequence\_number* **action** {**permit** | **deny**}

---

### Syntax Definitions

<i>name</i>	A route map name.
<i>sequence_number</i>	A route map sequence number. The valid range is 1–255.
<b>permit</b>	Allows matching routes to pass.
<b>deny</b>	Stops matching routes from passing. In addition, no further instances (sequence numbers) of the route map are examined.

### Defaultst

parameter	default
<b>permit</b>   <b>deny</b>	<b>permit</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

By default, this command allows routes that match the criteria specified in the route map to pass. If no matching routes are found, any additional instances (sequence numbers) of the route map name are examined. When all instances have been examined with no match, the route is dropped.

### Examples

```
-> ip bgp policy route-map routemap1 1 action deny
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy prefix6-list](#) Creates or deletes a policy route map.

### MIB Objects

alaBgpRouteMapTable  
alaBgpRouteMapAction

---

## ip bgp policy route-map aspath-list

Assigns an AS path matching list to the route map.

**ip bgp policy route-map** *name sequence\_number aspath-list as\_name*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>as_name</i>	The AS path list name or “none”.

### Defaults

parameter	default
<i>as_name</i>	none

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- By default, no AS path list is assigned to a route map.
- This default behavior can be reset by changing the value of the AS path list name to “**none**”.
- The **ip bgp policy aspath-list** and **ip bgp policy aspath-list action** commands are used to create and set permit/deny actions for an AS path list.

### Examples

```
-> ip bgp policy route-map routemap1 1 aspath-list aspathlist1  
-> ip bgp policy route-map routemap1 1 aspath-list none
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp policy prefix6-list** Creates or deletes a policy route map.

### MIB Objects

alaBgpRouteMapAsPathMatchListId

---

## ip bgp policy route-map asprepend

Configures the AS path prepend action to be taken when a match is found.

**ip bgp policy route-map** *name* *sequence\_number* **asprepend** *path*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>path</i>	The AS path to prepend or “none”. Note that multiple AS path entries must be enclosed in quotes (e.g., “500 600 700”).

### Defaults

---

parameter	default
<i>path</i>	none

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

By default, no AS path is prepended. This command allows AS path numbers to be prepended (added to the beginning of the AS path list) to the AS path attribute of a matching route. The default behavior can be reset by changing the value to “none”.

### Examples

```
-> ip bgp policy route-map routemap1 1 asprepend "700 800 900"
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy prefix6-list](#) Creates or deletes a policy route map.

### MIB Objects

alaBgpRouteMapTable  
  alaBgpRouteMapAsPrepend

---

## ip bgp policy route-map community

Configures the action to be taken on the community attribute when a match is found.

**ip bgp policy route-map** *name sequence\_number* **community** [**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*]

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<b>none</b>	Removes the community restrictions on the community section of the route map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes in this community are not advertised to any peer.
<b>no-export-subconfed</b>	Routes in this community are not advertised to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.

### Defaults

parameter	default
<i>string</i>	none

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- By default, no action is taken on a community attribute when a match on a route is found.
- The default behavior can be reset by setting the value to “**none**”.
- The **ip bgp policy community-list** and **ip bgp policy community-list action** commands are used to create and set permit/deny actions for a community path list. This command is used in conjunction with **ip bgp policy route-map community-mode**.

### Examples

```
-> ip bgp policy route-map routemap1 1 community 400:1 500:1
-> ip bgp policy route-map routemap1 1 community 400:1 500:1 community-mode replace
```

### Release History

Release 7.1.1; command was introduced.

---

## ip bgp policy route-map community-list

Assigns a community matching list to the route map.

**ip bgp policy route-map** *name* *sequence\_number* **community-list** *name*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>name</i>	The community list name, or “none”.

### Defaults

---

parameter	default
<i>name</i>	none

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

By default, no community list is assigned to the route map. The default behavior can be reset by changing the value to “**none**”.

### Examples

```
-> ip bgp policy route-map routemap1 1 community-list listB
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip bgp policy prefix6-list](#) Creates or deletes a policy route map.

---

## ip bgp policy route-map community-mode

Configures the action to be taken for a community string when a match is found.

**ip bgp policy route-map** *name sequence\_number* **community-mode** {**add** | **replace**}

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<b>add</b>	Adds the community string specified in the command <b>ip bgp policy route-map community</b> .
<b>replace</b>	Replaces the community string specified in the command <b>ip bgp policy route-map community</b> .

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>add   replace</b>	<b>add</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command is used in conjunction with **ip bgp policy route-map community**. The example on the next line shows the combined usage.

### Examples

```
-> ip bgp policy route-map routemap1 1 community-mode replace
-> ip bgp policy route-map routemap1 1 community 400:1 500:1 community-mode replace
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

alaBgpRouteMapSetCommunityMode

---

## ip bgp policy route-map lpref

Configures the local preference value for the route map.

**ip bgp policy route-map** *name sequence\_number lpref value*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>value</i>	The local preference value. The valid range is 0–4294967295

### Defaults

---

parameter	default
<i>value</i>	0

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used in conjunction with [ip bgp policy route-map lpref-mode](#). The example on the next line shows the combined usage.
- In this example, the local preference value will be incremented for a matching route by 555.

### Examples

```
-> ip bgp policy route-map routemap1 1 lpref 555
-> ip bgp policy route-map routemap1 1 lpref 555 lpref-mode inc
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip bgp policy prefix6-list</a>	Creates or deletes a policy route map.

## ip bgp policy route-map lpref-mode

Configures the action to be taken when setting local preference attribute for a local matching route.

**ip bgp policy route-map** *name sequence\_number lpref-mode* {**none** | **inc** | **dec** | **rep**}

---

### Syntax Definitions

<b>name</b>	The route map name.
<b>sequence_number</b>	The route map sequence number. The valid range is 1–255.
<b>none</b>	Do not set the local preference attribute.
<b>inc</b>	Increment the local preference attribute in the matching route by the value specified in the <b>ip bgp policy route-map med</b> command. No action is taken if no local preference attribute is found in the matching route.
<b>dec</b>	Decrement the local preference attribute in the matching route by the value specified in the <b>ip bgp policy route-map med</b> command. No action is taken if no local preference attribute is found in the matching route.
<b>rep</b>	Replace the local preference attribute in the matching route by the value specified in the <b>ip bgp policy route-map med</b> command even if no local preference attribute is found in the matching route.

### Defaults

parameter	default
<b>none</b>   <b>inc</b>   <b>dec</b>   <b>rep</b>	<b>none</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used in conjunction with **ip bgp policy route-map lpref**. The example below shows the combined usage.
- In this example, the local preference value is incremented for a matching route by 555.

### Examples

```
-> ip bgp policy route-map routemap1 1 lpref-mode none
-> ip bgp policy route-map routemap1 1 lpref 555 lpref-mode inc
```

### Release History

Release 7.1.1; command was introduced.

alaBgpRouteMapTable  
  alaBgpRouteMapLocalPrefMode

---

## ip bgp policy route-map match-community

Configures a matching community primitive for the route map.

**ip bgp policy route-map** *name sequence\_number match-community* [**none** | **no-export** | **no-advertise** | **no-export-subconfed** | *num:num*]

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<b>none</b>	Removes the community match from the route-map.
<b>no-export</b>	Routes in this community are advertised within the AS but not beyond the local AS.
<b>no-advertise</b>	Routes matching the community restricting advertisement to any peer.
<b>no-export-subconfed</b>	Routes matching the community restricting advertisement to any external BGP peer.
<i>num:num</i>	The community number, given in the form of the AS number and the community number, separated by a colon, as defined in RFC 1997.

### Defaults

parameter	default
<i>community_string</i>	none

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command allows a matching community string primitive to be placed directly in the route map. By default, no community string is specified. The default behavior can be reset by changing the value to “none”.

### Examples

```
-> ip bgp policy route-map routemap1 1 match-community 400:1 500 700:1
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

[ip bgp policy prefix6-list](#)      Creates or deletes a policy route map.

**MIB Objects**

alaBgpRouteMapTable  
  alaBgpRouteMapMatchCommunity

---

## ip bgp policy route-map match-mask

Configures a matching mask primitive in the route map.

**ip bgp policy route-map** *name* *sequence\_number* **match-mask** *ip\_address*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>ip_address</i>	The 32-bit IP address of the matching mask or “none”.

### Defaults

parameter	default
<i>ip_address</i>	0.0.0.0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command allows a matching mask primitive to be placed directly in the route map. By default, no mask primitive is specified. The default behavior can be reset by changing the value to “**none**”.
- The example on the next line shows usage combined with the [ip bgp policy route-map match-prefix](#) command.

### Examples

```
-> ip bgp policy route-map routemap1 1 match-mask 255.255.0.0
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0 match-mask 255.255.0.0
```

### Release History

Release 7.1.1; command was introduced.

---

## ip bgp policy route-map match-prefix

Configures a matching prefix primitive in the route map.

**ip bgp policy route-map** *name* *sequence\_number* **match-prefix** *ip\_address*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>ip_address</i>	The 32-bit IP address of the matching prefix.

### Defaults

parameter	default
<i>ip_address</i>	0.0.0.0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command allows a matching prefix primitive to be placed directly in the route map. By default, no prefix primitive is specified. The default behavior can be reset by changing the value to “**none**”.
- The example on the next line shows usage combined with the [ip bgp policy route-map match-mask](#) command.

### Examples

```
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0
-> ip bgp policy route-map routemap1 1 match-prefix 17.0.0.0 match-mask 255.255.0.0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

---

## ip bgp policy route-map match-regexp

Configures an AS path matching regular expression primitive in the route map.

```
ip bgp policy route-map name sequence_number match-regexp "regular_expression"
```

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>regular_expression</i>	Regular expression or “none”. The regular expression must be enclosed by quotation marks.

### Defaults

---

parameter	default
<i>regular_expression</i>	none

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command allows a regular expression matching directive to be placed directly in the route map. By default, no matching regular expression is specified. Regular expressions are defined in [ip bgp policy aspath-list](#) on page 21-96.
- When using regular expressions in the CLI, the regular expression must be enclosed by quotation marks.
- The default behavior can be reset by changing the value to “**none**”.
- See the *OmniSwitch 10K Advanced Routing Configuration Guide* for more information on the use of regular expressions in BGP commands.

### Examples

```
-> ip bgp policy route-map routemap1 1 match-regexp "500 .* 400$"
```

### Release History

Release 7.1.1; command was introduced.

## ip bgp policy route-map med

Configures the Multi-Exit Discriminator (MED) value for a route map.

**ip bgp policy route-map** *name sequence\_number med value*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>value</i>	The MED value. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command is used in conjunction with [ip bgp policy route-map med-mode](#) command. The first example below shows the combined usage. In the second example, the MED value is incremented for a matching route by 5.

### Examples

```
-> ip bgp policy route-map routemap1 1 med 555
-> ip bgp policy route-map routemap1 1 med 555 med-mode inc
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

## ip bgp policy route-map med-mode

Configures the action to be taken when setting the Multi-Exit Discriminator (MED) attribute for a matching route.

**ip bgp policy route-map** *name sequence\_number med-mode* {**none** | **inc** | **dec** | **rep**}

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<b>none</b>	Do not set the MED.
<b>inc</b>	Increment the MED in the matching route by the value specified in the <b>ip bgp policy route-map med</b> command. No action is taken if no MED is found in the matching route.
<b>dec</b>	Decrement the MED in the matching route by the value specified in the <b>ip bgp policy route-map med</b> command. No action is taken if no MED is found in the matching route.
<b>rep</b>	Replace the MED in the matching route by the value specified in the <b>ip bgp policy route-map med</b> command even if no MED is found in the matching route.

### Defaults

parameter	default
<b>none</b>   <b>inc</b>   <b>dec</b>   <b>rep</b>	<b>none</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command is used in conjunction with **ip bgp policy route-map med**. The first example below shows the combined usage. In the second example, the MED value is incremented for a matching route by 5.

### Examples

```
-> ip bgp policy route-map routemap1 1 med-mode inc
-> ip bgp policy route-map routemap1 1 med 5 med-mode inc
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

## ip bgp policy route-map origin

Configures the action to be taken on the origin attribute when a match is found.

```
ip bgp policy route-map name sequence_number origin {igp | egp | incomplete | none}
```

---

### Syntax Definitions

<i>name</i>	Route map name.
<i>sequence_number</i>	Route map sequence number. Valid range 1–255.
<b>igp</b>	Sets the origin attribute to remote internal BGP (IGP).
<b>egp</b>	Sets the origin attribute to local external BGP (EGP).
<b>incomplete</b>	Sets the origin attribute to incomplete, meaning the origin is unknown.
<b>none</b>	Sets the origin attribute to “none”.

### Defaults

---

parameter	default
<b>igp</b>   <b>egp</b>   <b>incomplete</b>   <b>none</b>	<b>none</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

By default, no action is taken on the origin attribute when a match is found. The default behavior can be reset by changing the value to “**none**”.

### Examples

```
-> ip bgp policy route-map routemap1 1 origin egp
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

alaBgpRouteMapOrigin

---

## ip bgp policy route-map prefix-list

Assigns a prefix matching list to the route map.

**ip bgp policy route-map** *name sequence\_number prefix-list prefix\_name*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>prefix_name</i>	The prefix list name or “none”.

### Defaults

parameter	default
<i>prefix_name</i>	none

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- By default, no prefix list is assigned to the route map. The default behavior can be reset by changing the value to “**none**”.
- The [ip bgp policy prefix-list](#), [ip bgp policy prefix-list action](#), [ip bgp policy prefix-list ge](#), and [ip bgp policy prefix-list le](#) commands are used to create and set permit/deny actions for a prefix path list.

### Examples

```
-> ip bgp policy route-map routemap1 1 prefix-list listC
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**MIB Objects**

alaBgpRouteMapTable  
    alaBgpRouteMapPrefixMatchListId

---

## ip bgp policy route-map weight

Configures a BGP weight value to be assigned to inbound routes when a match is found.

**ip bgp policy route-map** *name sequence\_number weight value*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>value</i>	The weight value. The valid range is 0–65535.

### Defaults

---

parameter	default
<i>value</i>	0

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command sets the weight value for routes that pass the route map match criteria. It is only applicable for the inbound policy. The default value of zero means that the weight is not changed by the route map.

### Examples

```
-> ip bgp policy route-map routemap1 1 weight 500
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

## ip bgp policy route-map community-strip

Configures the value to strip from the community attribute of the routes matched by this route map instance (sequence number).

**ip bgp policy route-map** *name* *sequence\_number* **community-strip** *community\_list*

---

### Syntax Definitions

<i>name</i>	The route map name.
<i>sequence_number</i>	The route map sequence number. The valid range is 1–255.
<i>community_list</i>	The community list name.

### Defaults

No IP BGP policy route-map community list exists.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Configures the value to strip from the community attribute of the routes matched by this route map instance (sequence number).

### Examples

```
-> ip bgp policy route-map routemap1 1 community_strip communitylist
```

### Release History

Release 7.1.1; command was introduced.

## show ip bgp

Displays the current global settings for the local BGP speaker.

**show ip bgp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Most of the parameters in this display can be altered through BGP global commands. See the output definitions below for references to the CLI commands used to configure individual parameters.

### Examples

```
-> show ip bgp
Admin Status                = disabled,
Operational Status         = down,
Autonomous system Number   = 1,
BGP Router Id              = 128.0.1.4,
Confederation Id          = 0,
IGP Synchronization Status = disabled,
Minimum AS origin interval (seconds) = 15,
Default Local Preference   = 100,
Route Reflection           = disabled,
Cluster Id                 = 0.0.0.0,
Missing MED Status         = Best,
Aspath Comparison          = enabled,
Always Compare MED         = disabled,
Fast External Fail Over    = disabled,
Log Neighbor Changes       = disabled,
Multi path                 = disabled,
Graceful Restart           = enabled,
Graceful Restart Status    = Not Restarting,
Configured Graceful Restart Interval = 90s,
IPv4 Unicast               = enabled,
IPv6 Unicast               = disabled
```

### *output definitions*

---

<b>Admin Status</b>	Indicates whether the BGP protocol has been enabled or disabled through the <b>ip bgp admin-state</b> command.
<b>Operational Status</b>	Indicates if the local BGP speaker is actively participating in BGP messages, update, routing advertisements.

*output definitions (continued)*

---

<b>Autonomous system Number</b>	The AS assigned to the local BGP speaker through the <b>ip bgp autonomous-system</b> command.
<b>BGP Router Id</b>	The IP address for the local BGP speaker.
<b>Confederation Id</b>	Shows the confederation number assigned to the local BGP speaker. If the BGP speaker does not belong to a confederation, then this value will be zero (0). Confederation numbers are assigned through the <b>ip bgp confederation identifier</b> command.
<b>IGP Synchronization Status</b>	Indicates whether BGP is synchronizing its routing tables with those on non-BGP routers handling IGP traffic (such as a RIP or OSPF router). This value is configured through the <b>ip bgp synchronization</b> command.
<b>Minimum AS origin interval</b>	The frequency, in seconds, at which routes local to the autonomous system are advertised. This value is configured through the <b>ip bgp as-origin-interval</b> command.
<b>Default Local Preference</b>	The local preference that will be assigned to routes that do not already contain a local preference value. This default value is configured through the <b>ip bgp default local-preference</b> command.
<b>Route Reflection</b>	Indicates whether the local BGP speaker is acting as a route reflector for its AS. This value is configured through the <b>ip bgp client-to-client reflection</b> command.
<b>Cluster Id</b>	The IP address for cluster in route reflector configurations using multiple, redundant route reflectors. A value of 0.0.0.0 indicates that a cluster is not set up. This value is configured through the <b>ip bgp cluster-id</b> command.
<b>Missing MED Status</b>	Indicates the MED value that will be assigned to paths that do not contain MED values. Missing MED values will either be assigned to the worst possible value ( $2^{32}-1$ ) or the best possible value (0). This value is set using the <b>ip bgp bestpath med missing-as-worst</b> command. By default, missing MED values are treated as <b>best</b> .
<b>Aspath Comparison</b>	Indicates whether the AS path will be in used in determining the best route. This value is configured through the <b>ip bgp bestpath as-path ignore</b> command.
<b>Always Compare MED</b>	Indicates whether multi-exit discriminator (MED) values are being compared only for internal peers or also for external peers. This value is configured through the <b>ip bgp always-compare-med</b> command.
<b>Fast External Fail Over</b>	Indicates whether Fast External Failover has been enabled or disabled. When enabled a BGP sessions will be reset immediately after a connection to a directly connected external peer goes down. This value is configured through the <b>ip bgp fast-external-failover</b> command.
<b>Log Neighbor Changes</b>	Indicates whether logging of peer state changes is enabled or disabled. This value is configured through the <b>ip bgp log-neighbor-changes</b> command.
<b>Multi path</b>	Indicates whether support for multiple equal cost paths is enabled or disabled. This value is configured through the <b>ip bgp maximum-paths</b> command.
<b>Graceful Restart</b>	Indicates whether graceful restart is enabled or disabled.

*output definitions (continued)*

---

<b>Graceful Restart Status</b>	Indicates the graceful restart state. This feature is not supported in Multiprotocol BGP.
<b>Configured Graceful Restart Interval</b>	Indicates the timer for achieving a graceful restart.
<b>IPv4 Unicast</b>	Indicates whether IPv4 unicast is enabled or disabled.
<b>IPv6 Unicast</b>	Indicates whether IPv6 unicast is enabled or disabled.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>ip bgp unicast</b>	Enables or disables unicast IPv4 updates for the BGP routing process.
<b>ipv6 bgp unicast</b>	Enables or disables unicast IPv6 updates for the BGP routing process
<b>show ip bgp statistics</b>	Displays BGP global statistics.

## show ip bgp statistics

Displays BGP global statistics.

**show ip bgp statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command show various BGP statistics for the router, such as number of neighbors, active prefixes, number of paths, etc.

### Examples

```
-> show ip bgp statistics
# of Active Prefixes Known           = 0,
# of EBGP Neighbors in Established State = 0,
# of IBGP Neighbors in Established State = 0,
# of Feasible Paths                  = 0,
# of Dampened Paths                   = 0,
# of Unsynchronized Paths             = 0,
# of Policy unfeasible paths          = 0,
Total Number of Paths                 = 0
```

### *output definitions*

---

<b># of Active Prefixes Known</b>	The number of prefixes, or route paths, currently known to the local BGP speaker, that are currently up and active.
<b># of EBGP Neighbors in Established State</b>	The number of peers outside the AS of the local BGP speaker that the local BGP speaker can route to.
<b># of IBGP Neighbors in Established State</b>	The number of peers in the same AS as the local BGP speaker that the local BGP speaker can route to.
<b># of Feasible Paths</b>	The number of route paths that are not active due to one of the following reasons: the route is dampened, the route is not permitted based on BGP policies, or the route is waiting to be synchronized with the IGP protocol.
<b># of Dampened Paths</b>	The number of route paths that are not active because they have violated dampening parameters.
<b># of Unsynchronized Paths</b>	The number of route paths that are not active because they are waiting to be synchronized with the IGP routing protocol.

*output definitions (continued)*

---

<b># of Unfeasible Paths</b>	The number of route paths that are not active because they are not permitted based on a configured BGP policy.
<b>Total Number of Paths</b>	The total number of paths known to the speaker, active or not.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

[show ip bgp](#) Displays the current global settings for the local BGP speaker.

## show ip bgp dampening

Displays the BGP route dampening settings.

**show ip bgp dampening**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command shows the setting for dampening on the router, assuming it is enabled.

### Examples

```
-> show ip bgp dampening
Admin Status           = disabled,
Half life value (seconds) = 300,
Reuse value           = 200
Suppress value        = 300,
Max suppress time (seconds) = 1800,
```

#### *output definitions*

---

<b>Admin Status</b>	Indicates whether route dampening is enabled or disabled. This value is configured through the <b>ip bgp dampening</b> command.
<b>Half life value</b>	The half-life interval, in seconds, after which the penalty value for a reachable route will be reduced by half. This value is configured through the <b>ip bgp dampening</b> command.
<b>Reuse value</b>	The value that the route flapping metric must reach before this route is re-advertised. This value is configured through the <b>ip bgp dampening</b> command.
<b>Suppress value</b>	The number of route withdrawals necessary to begin readvertising a previously suppressed route. This value is configured through the <b>ip bgp dampening</b> command.
<b>Max Suppress time</b>	The maximum time (in seconds) that a route will be suppressed. This value is configured through the <b>ip bgp dampening</b> command.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [ip bgp dampening](#)

Enables or disables BGP route dampening or the suppression of unstable routes.

## MIB Objects

```

  alaBgpDampEntry  
  alaBgpDampCeil  
  alaBgpDampCutOff  
  alaBgpDampMaxFlapHistory  
  alaBgpDampReuse  
  alaBgpDampening  
  alaBgpDampeningClear
```

---

## show ip bgp dampening-stats

Displays BGP dampening statistics.

```
show ip bgp dampening-stats [ip_address ip_mask] [peer_address]
```

---

### Syntax Definitions

<i>ip_address</i>	A 32-bit IP address.
<i>ip_mask</i>	A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.
<i>peer_address</i>	A 32-bit IP address of peer (neighbor).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays various statistics on routes that have flapped, and are thus subject to the settings of the dampening feature.

### Examples

```
-> show ip bgp dampening-stats
```

Network	Mask	From	Flaps	Duration	FOM
155.132.44.73	255.255.255.255	192.40.4.121	8	00h:00m:35s	175

#### *output definitions*

---

<b>Network</b>	The IP address for the local BGP speaker that is responsible for route dampening in this router.
<b>Mask</b>	The mask for the local BGP speaker that is responsible for route dampening in this router.
<b>From</b>	The IP address for the route that is flapping.
<b>Flaps</b>	The number of times this route has moved from an UP state to a DOWN state or from a DOWN state to an UP state. If the route goes down and then comes back up, then this statistics would count 2 flaps.

*output definitions (continued)*

---

<b>Duration</b>	The time since the first route flap occurred. In the above example, this route has flapped 8 times in a 35 second period.
<b>FOM</b>	The Figure Of Merit, or instability metric, for this route. This value increases with each unreachable event. If it reaches the cutoff value (configured in <a href="#">ip bgp dampening</a> ), then this route will no longer be advertised.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

---

### Syntax Definitions

<i>ip_address</i>	A 32-bit IP address of the path.
<i>ip_mask</i>	A 32-bit subnet mask of the path.
<i>aspathlist_name</i>	AS path on which to filter.
<i>community_list_name</i>	Community name on which to filter.
<i>prefix_name</i>	Prefix on which to filter.
<i>routemap_name</i>	Route map on which to filter.
<b>cidr-only</b>	Filter out everything except CIDR routes.
<i>community_number</i>	Community number on which to filter.
<i>rcv_peer_address</i>	Filter all except paths received from this path.
<i>adv_peer_addr</i>	Filter all except paths sent to this path.
<i>regular_expression</i>	Regular expression on which to filter. Regular expressions must be enclosed by quotes. For example, "\$100".
<b>best</b>	Show only the best path.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

The basic command displays every path currently in the table. Since the number of paths may run into the thousands, this command provides a number of parameters for displaying a specific path or matching entries for a portion of a path or peer address.

## Examples

```
-> show ip bgp path
```

```
Legends: Sta      = Path state
```

```
      >          = best, F = feasible
```

```
      P          = policy changing, U = un-synchronized
```

```
      D          = dampened, N = none
```

```
      Nbr        = Neighbor
```

```
      (O)        = Path Origin (? = incomplete, i = igp, e = egp)
```

```
      degPref    = degree of preference
```

Sta	Network	Mask	Nbr address	Next Hop	(O)	degPref
>	192.40.4.0	255.255.255.0	192.40.4.29	192.40.4.29	i	100
>	192.40.6.0	255.255.255.248	192.40.4.29	192.40.4.29	i	100
>	192.40.6.8	255.255.255.248	192.40.4.29	192.40.4.29	i	100
U	110.100.10.0	255.255.255.0	2001:100:3:4::1	110.100.10.20	?	100
U	110.100.11.0	255.255.255.0	2001:100:3:4::1	110.100.10.20	?	100
U	110.100.12.0	255.255.255.0	2001:100:3:4::1	110.100.10.20	?	100
U	110.100.13.0	255.255.255.0	2001:100:3:4::1	110.100.10.20	?	100
U	110.100.14.0	255.255.255.0	2001:100:3:4::1	110.100.10.20	?	100

### output definitions

<b>Sta</b>	Status flag. A greater-than sign (>) indicates this is the best route to the destination.
<b>Network</b>	The IP address for this route path. This is the destination of the route.
<b>Mask</b>	The mask for this route path.
<b>Nbr address</b>	The IP or IPv6 address of the BGP peer that is advertising this path.
<b>Next Hop</b>	The next hop along the route path.
<b>(O)</b>	The origin attribute of this route path. A question mark (?) indicates incomplete, and <b>i</b> indicates IGP, and an <b>e</b> indicates EGP.
<b>degPref</b>	The local preference value assigned to this route path.

```
-> show ip bgp path ip-addr 192.40.6.72 255.255.255.248
```

```
BGP Path parameters
```

```
Path address = 192.40.6.72
```

```
Path mask = 255.255.255.248
```

```
Path protocol = ebgp
```

```
Path peer = 192.40.4.29
```

```
  Path nextHop = 192.40.4.29,
```

```
  Path origin = igp,
```

```
  Path local preference = -1,
```

```
  Path state = active,
```

```
  Path weight = 0,
```

```
  Path preference degree = 100,
```

```
  Path autonomous systems = [nAs=2] : 3 2 ,
```

```
  Path MED = -1,
```

```

Path atomic           = no,
Path AS aggregator   = <none>,
Path IPaddr aggregator = <none>,
Path community       = <none>,
Path unknown attribute = <none>

```

### *output definitions*

---

<b>Path address</b>	The IP address for route path.
<b>Path mask</b>	The mask for this route path.
<b>Path protocol</b>	The protocol from which this route path was learned. Possible values for this field are as follows: <b>local</b> , <b>static</b> , <b>directhost</b> , <b>rip</b> , <b>ospf</b> , <b>isis</b> , <b>ibgp</b> , <b>ebgp</b> , and <b>other</b> .
<b>Path peer</b>	The IP address of the peer that is advertising this route path.
<b>Path nextHop</b>	The next hop along the route path.
<b>Path origin</b>	The BGP origin attribute. Possible values will be <b>igp</b> , <b>egp</b> , <b>incomplete</b> , and <b>none</b> . The origin attribute is considered during the route decision process.
<b>Path local preference</b>	The local preference value for this route as received in an UPDATE message. A negative value (for example, the <b>-1</b> in the above display) indicates that the local preference value is missing for this route path.
<b>Path state</b>	Path state indicates the state of the path. The possible states are <b>best</b> , <b>feasible</b> , <b>policy-wait</b> , <b>un-synchronized</b> , <b>dampened</b> , or <b>none</b> . When path state is <b>none</b> , it indicates that there are no paths to this prefix and the route is being purged from the system.
<b>Path weight</b>	The path weight as assigned through inbound and outbound policies.
<b>Path preference degree</b>	The local preference assigned to this route through an inbound or outbound policy, or, if the local preference value is missing, the default local preference (which is assigned through the <b>ip bgp default local-preference</b> ).
<b>Path autonomous systems</b>	The AS path for this route. These numbers show the ASs through which the route has traversed with the most recent AS listed first. In the above example, this route began its path in AS 2 and then traveled through AS 3.
<b>Path MED</b>	The multi-exit discriminator (MED) value for this route path. A negative value (for example, the <b>-1</b> in the above display) indicates that the MED value is missing for this route path.
<b>Path atomic</b>	Indicates whether the ATOMIC-AGGREGATE attribute has been set for this route. When set (this field would read <b>yes</b> ), this attribute indicates that an aggregate has caused a loss of information for this route (a less specific route was chosen over a more specific route included in the aggregate).
<b>Path AS aggregator</b>	Part of the AGGREGATOR attribute. This field indicates the AS for the BGP speaker that created the aggregate. A value of <b>&lt;none&gt;</b> indicates this is not an aggregate route.
<b>Path IPaddr aggregator</b>	Part of the AGGREGATOR attribute. This field indicates the IP address for the BGP speaker that created the aggregate. A value of <b>&lt;none&gt;</b> indicates that this is not an aggregate route.

*output definitions (continued)*

---

<b>Path community</b>	Indicates the community to which this route path belongs, if applicable. A value of <b>&lt;none&gt;</b> indicates that this route does not belong to a community.
<b>Path unknown attribute</b>	Indicates BGP attributes found in UPDATE messages which the router does not support. For example, multi-protocol attributes are not supported by the router in this release, but it is possible for these attributes to appear in a BGP route.

## show ip bgp routes

Displays BGP route details.

**show ip bgp routes** [*network\_address ip\_mask*]

---

### Syntax Definitions

*network\_address* A 32-bit IP address.

*ip\_mask* A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays all the routes in the routing table with details.

### Examples

-> show ip bgp routes

Legends: ECL = EBGp change list, ICC = IBGP client change list

ICL = IBGP change list, LCL = local change list

AGG = Aggregation, AGC = Aggregation contribution

AGL = Aggregation list, GDL = Deletion list

AGW = Aggregation waiting, AGH = Aggregation hidden

DMP = Dampening, ACT = Active route

Address	Mask	ECL	ICC	ICL	LCL	AGG	AGC	AGL	AGW	AGH	GDL	DMP	ACT
192.40.4.0	255.255.255.0	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.0	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.8	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.72	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.80	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.104	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.112	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes
192.40.6.144	255.255.255.248	No	No	No	No	No	No	No	No	No	No	No	Yes

### output definitions

---

<b>Address</b>	The route destination network address.
<b>Mask</b>	The route destination network mask.
<b>ECL</b>	External BGP change list. When Yes, this route will be advertised as soon as the route advertisement timer expires.
<b>ICC</b>	Internal BGP client change list. When Yes, this route will be advertised to internal non-clients.

---

*output definitions (continued)*

---

<b>ICL</b>	Internal BGP change list. When Yes, this route has changes that need to be advertised.
<b>LCL</b>	Local change list. When Yes, this route is local.
<b>AGG</b>	Aggregation. When Yes, this route is an aggregate route.
<b>AGC</b>	Aggregation contribution. When Yes, this route is part of an aggregate route.
<b>AGL</b>	Aggregation list. When Yes, this route is placed on an aggregate list.
<b>AGW</b>	Aggregation waiting. When Yes, this route is waiting for an aggregate contributor.
<b>AGH</b>	Aggregation hidden. When Yes, this route is hidden as part of an aggregate route.
<b>GDL</b>	Deletion list. When Yes, this route will be deleted.
<b>DMP</b>	Dampening. Indicate whether this route has been dampened. If 'Yes', then this route has been dampened and a dampening history exists.
<b>ACT</b>	Active route. When Yes, the route is active.

## show ip bgp aggregate-address

Displays aggregate route status.

**show ip bgp aggregate-address** [*ip\_address ip mask*]

---

### Syntax Definitions

*ip\_address* The 32-bit IP address of the aggregate address.

*ip\_mask* The 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays a specific aggregate address, or all aggregate addresses on the router.

### Examples

```
-> show ip bgp aggregate-address
Network          Mask          Summarize As-Set  Admin state Oper state
-----+-----+-----+-----+-----+-----
155.132.44.73   255.255.255.255 disabled  disabled disabled  not_active
192.40.6.0      255.255.255.255 disabled  disabled disabled  not_active
```

```
-> show ip bgp aggregate-address 192.40.6.0 255.255.255.255
Aggregate address      = 192.40.6.0,
Aggregate mask         = 255.255.255.255,
Aggregate admin state  = disabled,
Aggregate oper state   = not_active,
Aggregate as-set       = disabled,
Aggregate summarize    = disabled,
Aggregate metric       = 0,
Aggregate local preference = 0,
Aggregate community string = 0:500 400:1 300:2
```

### output definitions

---

<b>Network or Aggregate address</b>	The IP address for this aggregate route. This value is configured through the <a href="#">ip bgp aggregate-address</a> command.
<b>Mask or Aggregate mask</b>	The mask for this aggregate route. This value is configured through the <a href="#">ip bgp aggregate-address</a> command.
<b>Summarize or Aggregate summarize</b>	Indicates whether aggregate summarization is enabled or disabled for this aggregate route. This value is configured through the <a href="#">ip bgp aggregate-address summary-only</a> command.

*output definitions (continued)*

---

<b>As-Set or Aggregate as-set</b>	Indicates whether AS path aggregate is enabled or disabled. This value is configured through the <b>ip bgp aggregate-address as-set</b> command.
<b>Admin State or Aggregate admin state</b>	Indicates whether this aggregate route is administratively enabled or disabled. This value is configured through the <b>ip bgp aggregate-address admin-state</b> command.
<b>Oper State or Aggregate oper state</b>	Indicates whether this aggregate route is operational and participating in BGP message exchanges.
<b>Aggregate metric</b>	The multi-exit discriminator (MED) value configured for this aggregate route. This value is configured through the <b>ip bgp aggregate-address metric</b> command.
<b>Aggregate local preference</b>	The local preference value for this aggregate route. This value is configured through the <b>ip bgp aggregate-address local-preference</b> command.
<b>Aggregate community string</b>	The community string value for this aggregate route. This value is configured through the <b>ip bgp aggregate-address community</b> command.

## show ip bgp network

Displays currently defined network configurations.

**show ip bgp network** [*network\_address ip\_mask*]

---

### Syntax Definitions

*network\_address* A 32-bit IP address.

*ip\_mask* A 32-bit subnet mask number that determines how many bits of the IP address parameter denote the network number

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays all the configured networks, or a single network.

### Examples

```
-> show ip bgp network
Network      Mask                Admin state Oper state
-----+-----+-----+-----
155.132.1.2  255.255.255.255 disabled  not_active
155.132.1.3  255.255.255.255 disabled  not_active
```

```
-> show ip bgp network 155.132.1.2 255.255.255.255
Network address      = 155.132.1.2,
Network mask         = 255.255.255.255,
Network admin state  = disabled,
Network oper state   = not_active,
Network metric       = 0,
Network local preference = 0,
Network community string = 0:500 400:1 300:2
```

### output definitions

---

<b>Network</b> or <b>Network address</b>	The IP address configured for this local BGP network. This value is configured through the <b>ip bgp network</b> command.
<b>Mask</b> or <b>Network mask</b>	The mask configured for this local BGP network. This value is configured through the <b>ip bgp network</b> command.
<b>Admin state</b> or <b>Network admin state</b>	Indicates whether this local BGP network is administratively enabled or disabled. This value is configured through the <b>ip bgp network admin-state</b> command.

---

*output definitions (continued)*

---

<b>Oper state or Network oper state</b>	Indicates whether this BGP local network is operationally active or inactive.
<b>Network metric</b>	The multi-exit discriminator (MED) value configured for this local BGP network. This value is configured through the <b>ip bgp network metric</b> command.
<b>Network local preference</b>	The local preference value for this local BGP network. This value is configured through the <b>ip bgp network local-preference</b> command.
<b>Network community string</b>	The community string value for this local BGP network. This value is configured through the <b>ip bgp network community</b> command.

**ip bgp network** Configures a local BGP network.

## MIB Objects

alabgpMIBNetworkGroup  
alaBgpNetworkEntry

---

## show ip bgp neighbors

Displays the configured IPv4 BGP peers.

**show ip bgp neighbors** [*ip\_address*]

---

### Syntax Definitions

*ip\_address*                      A 32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

There are two output options for this command. If you specify `show ip bgp peer` without a peer IP address, then you see summary information for all peers known to the local BGP speaker. If you enter a specific peer IP address with the command, then you see detailed parameter information for that peer only.

### Examples

```
-> show ip bgp neighbors
```

```
Legends:Nbr = Neighbor
```

```
      As = Autonomous System
```

Nbr	address	As	Admin state	Oper state	BgpId	Up/Down
192.40.4.29		3	enabled	estab	192.40.4.29	00h:14m:48s
192.40.4.121		5	disabled	idle	0.0.0.0	00h:00m:00s

#### *output definitions*

---

<b>Nbr address</b>	The IP address for this BGP peer. Assign this address through the <b>ip bgp neighbor</b> command.
<b>As</b>	The autonomous system to which this peer belongs. A peer's AS number is assigned through the <b>ip bgp neighbor remote-as</b> command.
<b>Admin state</b>	Indicates whether this peer has been enabled or disabled through the <b>ip bgp neighbor admin-state</b> command.
<b>Oper state</b>	The current BGP state for this peer. Possible states are <b>idle</b> , <b>connect</b> , <b>active</b> , <b>opensent</b> , <b>openconfirm</b> , and <b>established</b> .
<b>BgpId</b>	The unique BGP identifier of the peer. This value is configured through the <b>ip bgp neighbor update-source</b> command.
<b>Up/Down</b>	The time since this peer has transitioned to its current UP or DOWN state. If the peer is currently Established, then this is the time that the peer has been UP. If the peer is currently Idle, then this is the time the peer has been DOWN.

---

```

-> show ip bgp neighbors 0.0.0.1
Neighbor address                = 0.0.0.1,
Neighbor autonomous system      = 1,

Graceful Restart State          = None,
Advertised Restart Interval     = 0s,
Forwarding State during restart = NotPreserved,
Activate IPv6 unicast           = enabled,
Configured IPv6 NextHop Address = ::,
Neighbor Ipv6 unicast           = advertised

```

### *output definitions*

<b>Neighbor address</b>	The IP address for this BGP peer. Assign this address through the <b>ip bgp neighbor</b> command.
<b>Neighbor autonomous system</b>	The autonomous system to which this peer belongs. A peer's AS number is assigned through the <b>ip bgp neighbor remote-as</b> command.
<b>Neighbor Admin state</b>	Indicates whether this peer has been enabled or disabled through the <b>ip bgp neighbor admin-state</b> command.
<b>Neighbor Oper state</b>	The current BGP state for this peer. Possible states are <b>idle</b> , <b>connect</b> , <b>active</b> , <b>opensent</b> , <b>openconfirm</b> , and <b>established</b> .
<b>Neighbor passive status</b>	Indicates whether the local BGP speaker is "passive" (i.e., waiting for this peer to initiate a session). This value is configured through the <b>ip bgp neighbor passive</b> command.
<b>Neighbor name</b>	The name assigned to this peer through the <b>ip bgp neighbor description</b> command.
<b>Neighbor local address</b>	The interface assigned to this peer. This value is configured through the <b>ip bgp neighbor update-source</b> command.
<b>Neighbor EBGP multihop</b>	Indicates whether BGP multi-hop support is enabled or disabled. This supports allows external BGP peers to communicate with each other even when they are not directly connected. This value is configured through the <b>ip bgp neighbor ebgp-multihop</b> command.

*output definitions (continued)*

<b>Neighbor next hop self</b>	Indicates whether this peer is using next hop processing. This value is configured through the <b>ip bgp neighbor next-hop-self</b> command.
<b>Neighbor Route Refresh</b>	Indicates whether this peer supports Route Refresh capability as defined in RFC 2918. This capability is an alternative to soft-reconfiguration that can save CPU and memory resources. It allows peers to dynamically request the re-advertisement of BGP routing tables. Since this router supports route refresh all BGP peers are automatically enabled for this capability.
<b>Neighbor Ipv4 unicast</b>	Indicates whether this peer is multi-protocol IP version 4 unicast capable. This router is IPv4 unicasts capable so all peers will be enabled for this capability.
<b>Neighbor Ipv4 multicast</b>	Indicates whether this peer is multi-protocol IP version 4 multicast capable. This router is not IPv4 multicasts capable so all peers will be disabled for this capability.
<b>Neighbor type</b>	Indicates whether this peer is internal or external to the router.
<b>Neighbor auto-restart</b>	Indicates whether peer auto-restart is enabled or disabled. This value is configured through the <b>ip bgp neighbor auto-restart</b> command.
<b>Neighbor route-reflector-client</b>	Indicates whether this peer is a client to the local route reflector, if configured. This value is configured through the <b>ip bgp neighbor route-reflector-client</b> command.
<b>Neighbor confederation status</b>	Indicates whether this peer is a member of a BGP confederation. This value is configured through the <b>ip bgp confederation neighbor</b> command.
<b>Neighbor remove private AS</b>	Indicates whether the stripping of private AS numbers (64512 to 65535) from AS paths is enabled or disabled. This value is configured through the <b>ip bgp neighbor remove-private-as</b> command.
<b>Neighbor default originate</b>	Indicates whether peer default origination is enabled or disabled. When enabled, the local BGP speaker advertises itself as a default to the peer. This value is configured through the <b>ip bgp neighbor default-originate</b> command.
<b>Neighbor maximum prefixes</b>	The maximum number of prefixes the local router can receive in UPDATE from this peer. This value is configured through the <b>ip bgp neighbor maximum-prefix</b> command.
<b>Neighbor max prefixes warning</b>	Indicates whether a warning will be issued when this peer exceeds 80 percent of the maximum prefix value. This value is configured through the <b>ip bgp neighbor update-source</b> command.
<b># of prefixes received</b>	Displays the total number of prefixes received by this neighbor.
<b>Neighbor MD5 key [32- 47]</b>	When present, shows an encrypted version of the MD5 password. When not present, and MD5 password has not been configured. This value is configured through the <b>ip bgp neighbor md5 key</b> command.
<b>Neighbor local port</b>	The TCP port used for the session with this peer.
<b>Neighbor TCP window size</b>	The size of the TCP window for this BGP session. This value will always be 32768 as that is the maximum size of a BGP message.
<b>Graceful Restart State</b>	Indicates the graceful restart state. This feature is not supported in Multiprotocol BGP.
<b>Advertised Restart Interval</b>	Indicates the restart interval in seconds.

*output definitions (continued)*

---

<b>Forwarding State during restart</b>	Indicates whether the peer has preserved the forwarding state during the graceful restart.
<b>Activate IPv6 unicast</b>	Indicates if the IPv6 unicast updates are enabled or not. Options include <b>enabled</b> or <b>disabled</b> .
<b>Configured IPv6 NextHop Address</b>	Specifies the IPv6 nexthop address. This is specified using the <b>ipv6 bgp neighbor ipv6-nexthop</b> command.
<b>Neighbor Ipv6 unicast</b>	Indicates whether Multiprotocol IPv6 Unicast capability is enabled or disabled between the peers.

Displays BGP peer policy information.

```
show ip bgp neighbors policy [ip_address]
```

---

### Syntax Definitions

*ip\_address*                      A 32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays all of the configured policies for the router, or the policies configured for a specific peer.

### Examples

```
-> show ip bgp neighbors policy
Neighbor address = 0.0.0.0,
  Neighbor autonomous system      = 1,
  Neighbor output policy map name = <none>,
  Neighbor input policy map name  = <none>,
  Neighbor output aspath-list name = <none>,
  Neighbor input aspath-list name = <none>,
  Neighbor output prefix-list name = <none>,
  Neighbor input prefix-list name = <none>,
  Neighbor output community-list name = <none>,
  Neighbor input community-list name = <none>,
  Neighbor soft reconfiguration   = enabled
Neighbor address = 0.0.0.1,
  Neighbor autonomous system      = 1,
  Neighbor output policy map name = <none>,
  Neighbor input policy map name  = <none>,
  Neighbor output aspath-list name = <none>,
  Neighbor input aspath-list name = <none>,
  Neighbor output prefix-list name = <none>,
  Neighbor input prefix-list name = <none>,
  Neighbor output community-list name = <none>,
  Neighbor input community-list name = <none>,
  Neighbor soft reconfiguration   = enabled
```

*output definitions*

---

<b>Neighbor autonomous system</b>	The AS to which the peer is assigned. This can be assigned by using the <b>ip bgp neighbor remote-as</b> command.
<b>Neighbor output policy map name</b>	The outbound route map policy for the peer. This can be assigned by using the <b>ip bgp neighbor route-map</b> command.
<b>Neighbor input policy map name</b>	The inbound route map policy for the peer. This can be assigned by using the <b>ip bgp neighbor route-map</b> command.
<b>Neighbor output aspath-list name</b>	The outbound AS path list policy for the peer. This can be assigned by using the <b>ip bgp neighbor out-aspathlist</b> command.
<b>Neighbor input aspath-list name</b>	The inbound AS path list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-aspathlist</b> command.
<b>Neighbor output prefix-list name</b>	The outbound prefix list policy for the peer. This can be assigned by using the <b>ip bgp neighbor out-prefixlist</b> command.
<b>Neighbor input prefix-list name</b>	The inbound prefix list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-prefixlist</b> command.
<b>Neighbor output community-list name</b>	The outbound community list policy for the peer. This can be assigned by using the <b>ip bgp neighbor out-communitylist</b> command.
<b>Neighbor input community-list name</b>	The inbound community list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-communitylist</b> command.
<b>Neighbor soft reconfiguration</b>	Lists whether soft reconfigurations are enabled or disabled for this peer. This is configured using the <b>ip bgp neighbor soft-reconfiguration</b> command.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**show ip bgp neighbors** Displays BGP peer main status.

---

## show ip bgp neighbors timer

Displays BGP peer timer statistics.

**show ip bgp neighbors timer** [*ip\_address*]

---

### Syntax Definitions

*ip\_address*                      A 32-bit IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays the timer values for all peer associated with this speaker, or for a specific peer.

### Examples

```
-> show ip bgp neighbors timer
Legends: Nbr      = Neighbor
          As       = Autonomous System
          RtAdv    = Route Advertisement
          Kalive   = Keep Alive (actual)
          Ka(C)    = Configured Keep Alive
Nbr address  As      Hold  Hold(C)  RtAdv  Retry  Kalive  Ka(C)
-----+-----+-----+-----+-----+-----+-----+-----
192.40.4.29  3       90   90       30     120   30     30
192.40.4.121 5       0    90       30     120   0      30
```

### output definitions

---

<b>Nbr address</b>	The IP address for this BGP peer. Assign this address through the <b>ip bgp neighbor</b> command.
<b>As</b>	The autonomous system to which this peer belongs. A peer's AS number is assigned through the <b>ip bgp neighbor remote-as</b> command.
<b>Hold</b>	The current count for the holdtime value.
<b>Hold(C)</b>	The holdtime value configured through the <b>ip bgp neighbor timers</b> command.
<b>RtAdv</b>	The route advertisement interval, in seconds, for updates between external BGP peers. This value is configured through the <b>ip bgp neighbor advertisement-interval</b> command.
<b>Retry</b>	The interval, in seconds, between retries by this peer to set up a connection through TCP with another peer. This value is configured through the <b>ip bgp neighbor timers</b> command.

*output definitions (continued)*

---

<b>Kalive</b>	The current count, in seconds, between keepalive messages. Keepalive messages do not contain route or status updates; they serve only to tell other peers that the connection is still live and this peer is reachable.
<b>Ka(C)</b>	The keepalive interval as configured through the <b>ip bgp neighbor timers</b> command.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**show ip bgp neighbors** Displays BGP peer main status.

---

## show ip bgp neighbors statistics

Displays BGP peer message statistics.

**show ip bgp neighbors statistics** [*ip\_address*]

---

### Syntax Definitions

*ip\_address*                      A 32-bit IP address of the peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays message statistics for all peers associated with this speaker, or with a specific peer.

### Examples

```
-> show ip bgp neighbors statistics
```

```
Legends: RMSGS = number of received messages, SMSGS = number of sent messages
          RUPDS = number of Update messages received,
          SUPDS = number of Update messages sent,
          RNOFY = number of Notify messages received,
          SNOFY = number of Notify messages sent
          RPFXS = number of prefixes received
          UPTNS = number of UP transitions
          DNTNS = number of DOWN transitions
```

Nbr	address	As	RMSGS	SMSGS	RUPDS	SUPDS	RNOFY	SNOFY	RPFXS	UPTNS	DNTNS
192.40.4.29		3	110	123	5	0	0	1	8	2	2
192.40.4.121		5	0	0	0	0	0	0	0	0	0

### output definitions

---

<b>Nbr address</b>	The IP address for this peer. This value is configured through the <b>ip bgp neighbor</b> command.
<b>As</b>	The autonomous system to which this peer belongs. This value is configured through the <b>ip bgp neighbor remote-as</b> command.
<b>RMSGS</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
<b>SMSGS</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent by this peer.

*output definitions (continued)*

---

<b>RUPDS</b>	The number of route UPDATE messages received by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b>SUPDS</b>	The number of route UPDATE messages sent by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b>RNOFY</b>	The number of NOTIFY messages received by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
<b>SNOFY</b>	The number of NOTIFY messages sent by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
<b>RPFXS</b>	The number of unique route prefixes received by this peer.
<b>UPTNS</b>	The number of times this peer has come up, operationally.
<b>DNTNS</b>	Number of times this peer has gone down, operationally.

---

```

-> show ip bgp neighbors statistics 0.0.0.1
Neighbor address                = 0.0.0.1,
# of UP transitions              = 0,
Time of last UP transition      = 00h:00m:00s,
# of DOWN transitions           = 0,
Time of last DOWN transition    = 00h:00m:00s,
Last DOWN reason                = none,
# of msgs rcvd                 = 0,
# of Update msgs rcvd          = 0,
# of prefixes rcvd             = 0,
# of Route Refresh msgs rcvd   = 0,
# of Notification msgs rcvd    = 0,
Last rcvd Notification reason   = none [none]
Time last msg was rcvd         = 00h:00m:00s,
# of msgs sent                  = 0,
# of Update msgs sent           = 0,
# of Route Refresh msgs sent    = 0,
# of Notification msgs sent     = 0,
Last sent Notification reason   = none [none]
Time last msg was sent         = 00h:00m:00s,

```

*output definitions*

---

<b>Neighbor address</b>	The IP address for this peer. This value is configured through the <b>ip bgp neighbor</b> command.
<b># of UP transitions</b>	The number of times this peer has come up, operationally.
<b>Time of last UP transition</b>	The duration that this peer has been up.
<b># of DOWN transitions</b>	Number of times this peer has gone down, operationally.
<b>Time of last DOWN transition</b>	The duration since this peer last went down.

*output definitions (continued)*

---

<b>Last DOWN reason</b>	Provides a message as the last reason why a peer went down. The possible reasons for going down are:  user_request - user initiated conn_timeout - connection timer expired hold_timeout - hold timer expired bad_msg - received a bad message from neighbor fsm_blink - BGP FSM error peer_closed - neighbor closed connection peer_notify - neighbor sent fatal notification tcp_error - Fatal TCP error none - None
<b># of msgs rcvd</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received from this peer.
<b># of Update msgs rcvd</b>	The number of route UPDATE messages received from this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b># of prefixes rcvd</b>	The number of unique route prefixes received by this peer.
<b># of Route Refresh msgs rcvd</b>	The number of route refresh requests this peer has received. Route refresh requests all routes learned by a peer.
<b># of Notification msgs rcvd</b>	The number of NOTIFY messages received from this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

*output definitions (continued)*

---

<b>Last rcvd Notification reason</b>	<p>NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message received from this peer. The notification reasons are listed in two parts separated by a dash (-). The following are possible notification reasons:</p> <ul style="list-style-type: none"> <li>message header error - synchronization loss</li> <li>message header error - bad length</li> <li>message header error - bad type</li> <li>open message error - unsupported version</li> <li>open message error - bad peer autonomous system</li> <li>open message error - bad peer bgp id</li> <li>open message error - unsupported option</li> <li>open message error - authentication failure</li> <li>open message error - unacceptable hold time</li> <li>open message error - unsupported capability</li> <li>update message error - malformed attribute</li> <li>update message error - unknown attribute</li> <li>update message error - missing wellknown attribute</li> <li>update message error - attribute flags error</li> <li>update message error - attribute length error</li> <li>update message error - invalid origin</li> <li>update message error - as loop</li> <li>update message error - invalid nexthop</li> <li>update message error - optional attribute error</li> <li>update message error - invalid network</li> <li>update message error - malformed aspath</li> <li>cease - maximum number of prefixes reached</li> <li>cease - administrative shutdown</li> <li>cease - peer de-configured</li> <li>cease- administrative reset</li> <li>cease- connection rejected</li> <li>cease - other configuration change</li> <li>cease - connection collision resolution</li> <li>cease - out of resources</li> <li>hold time out - none</li> <li>fsm error - none</li> <li>none - none</li> </ul>
<b>Time last msg was rcvd</b>	The duration since a message was received from this peer.
<b># of msgs sent</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent to this peer.
<b># of Update msgs sent</b>	The number of route UPDATE messages sent to this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b># of Route Refresh msgs sent</b>	The number of route refresh requests this peer has sent. Route refresh requests request all routes learned be a peer.
<b># of Notification msgs sent</b>	The number of NOTIFY messages sent to this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

---

*output definitions (continued)*

---

<b>Last sent Notification reason</b>	NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message sent by this peer. The notification reasons are listed in two parts separated by a dash (-). See the list of possible notification reasons under the description for the <b>Peer last received notification reason</b> field above.
<b>Time last msg was sent</b>	The duration since a message was sent to this peer.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

[ip bgp neighbor](#) Creates or deletes a BGP peer.

## show ip bgp policy aspath-list

Displays AS path list parameters.

```
show ip bgp policy aspath-list [name] ["regular_expression"]
```

---

### Syntax Definitions

<i>name</i>	An AS path name.
<i>regular_expression</i>	A regular expression. The regular expression must be enclosed by quotation marks.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command displays a list of all of the AS path policies for the router, or a single policy selected by the list name or regular expression.
- Regular expressions are defined in the [ip bgp policy aspath-list](#) command on page 21-96.
- When using regular expressions in the CLI, the regular expression must be enclosed by quotation marks.

### Examples

```
-> show ip bgp policy aspath-list
Aspath List Name      Aspath regular expression
-----+-----
aspl1                  (500 | 400) ? 300$
aspl2                  (500 | 400)
```

```
-> show ip bgp policy aspath-list aspl1
Aspath List name = aspl1
Aspath Regexp    = (500 | 400) ? 300$
Admin state      = disabled,
Priority          = 1,
Action           = deny,
Primary index    = 0,
```

#### output definitions

---

<b>Aspath List name</b>	The name of the AS path list. This is defined using the <a href="#">ip bgp policy aspath-list</a> command.
<b>Aspath regular expression</b>	The regular expression that defines the AS path list. This is defined using the <a href="#">ip bgp policy aspath-list</a> command.

---

*output definitions (continued)*

---

<b>Admin state</b>	The administration state of the AS path policy. It is either enable or disable.
<b>Priority</b>	The AS path list priority. This is defined using the <b>ip bgp policy aspath-list priority</b> command.
<b>Action</b>	The AS path list action, either permit or deny. This is defined using the <b>ip bgp policy aspath-list action</b> command.
<b>Primary index</b>	The instance identifier for the AS path list. This value is not configurable.

---

## Release History

Release 7.1.1; command was introduced.

---

## show ip bgp policy community-list

Displays community list parameters.

**show ip bgp policy community-list** [*name*] [*string*]

---

### Syntax Definitions

*name*                                      Community name.

*string*                                      Community match list string

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays a list of the community policies for the speaker, or a specific policy defined by its name or community match string.

### Examples

```
-> show ip bgp policy community-list
Community list name      Community string
-----+-----
adfasdf                  0:0
```

```
-> show ip bgp policy community-list coml1
Community List name = coml1
Community string    = 600:1
  Admin state       = disabled,
  Match type        = exact,
  Priority           = 1,
  Action            = deny,
  Primary index     = 0
```

### output definitions

---

<b>Community List name</b>	The community list name. This is defined using the <a href="#">ip bgp policy community-list</a> command.
<b>Community string</b>	The community list definition. This is defined using the <a href="#">ip bgp policy community-list</a> command.
<b>Admin state</b>	The administration state of the community list policy, either enabled or disabled.
<b>Match type</b>	The match type of the community list. This is defined using the <a href="#">ip bgp policy community-list match-type</a> command.

---

*output definitions (continued)*

---

<b>Priority</b>	The community list priority. This is defined using the <b>ip bgp policy community-list priority</b> command.
<b>Action</b>	The community list action. This is defined using the <b>ip bgp policy community-list action</b> command.
<b>Primary index</b>	The instance identifier for the community list. This value is not configurable.

---

**Release History**

  alaBgpCommunityMatchListString
  alaBgpCommunityMatchListPriority
  alaBgpCommunityMatchListType
  alaBgpCommunityMatchListAction
  alaBgpCommunityMatchListRowStatus
```

---

## show ip bgp policy prefix-list

Displays prefix list parameters.

```
show ip bgp policy prefix-list [name] [ip_address ip_mask]
```

---

### Syntax Definitions

<i>name</i>	A prefix list name.
<i>ip_address</i>	A prefix list IP address.
<i>ip_mask</i>	An IP address mask.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays the list of prefix-list policies configured for the speaker, or a specific list determined by the list name or IP address and mask.

### Examples

```
-> show ip bgp policy prefix-list
Prefix List name      Prefix address  Prefix mask
-----+-----+-----
pfxl1                 155.132.33.0   255.255.255.0
pfxl2                 155.148.32.0   255.255.255.0
```

```
-> show ip bgp policy prefix-list pfxl1
Prefix List name = pfxl1
Address          = 155.132.33.0
Mask            = 255.255.255.0
  Admin state    = disabled,
  Match Mask >= (GE) = 0,
  Match Mask <= (LE) = 0,
  Action        = deny
```

#### output definitions

---

<b>Prefix List name</b>	The name of the prefix list. This is defined using the <a href="#">ip bgp policy prefix-list</a> command.
<b>Address</b>	The IP address of the prefix list. This is defined using the <a href="#">ip bgp policy prefix-list</a> command.
<b>Mask</b>	The mask of the prefix list. This is defined using the <a href="#">ip bgp policy prefix-list</a> command.
<b>Admin state</b>	The administrative state of the prefix list, either enabled or disabled.

---

*output definitions (continued)*

---

<b>Match Mask &gt;= (GE)</b>	The GE match mask of the prefix list. This is defined using the <b>ip bgp policy prefix-list ge</b> command.
<b>Match Mask &lt;= (LE)</b>	The LE match mask of the prefix list. This is defined using the <b>ip bgp policy prefix-list le</b> command.
<b>Action</b>	The action of the prefix list. This is defined using the <b>ip bgp policy prefix-list action</b> command.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**ip bgp policy prefix-list**           Creates or deletes a prefix match list.

**MIB Objects**

```
alabgpMIBPrefixListGroup
  alaBgpPrefixMatchListId
  alaBgpPrefixMatchListAddr
  alaBgpPrefixMatchListMask
  alaBgpPrefixMatchListGE

```

---

## show ip bgp policy route-map

Displays policy route map parameters.

```
show ip bgp policy route-map [name] [sequence_number]
```

---

### Syntax Definitions

*name* Route map name.

*sequence\_number* A sequence number. The valid range is 1–255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The route map is displayed as a summary table by entering only the route map name, or as a detailed list by specifying the sequence number.

### Examples

```
-> show ip bgp policy route-map
RouteMap name      Instance
-----+-----
rmap1              1
rmap1              2
rmap2              1

-> show ip bgp policy route-map rmap1
RouteMap name      = rmap1
RouteMap instance = 1
  Admin state      = disabled,
  Local pref (mode/value) = <none> / 0,
  Route map action = permit,
  Origin           = <none>,
  MED (mode/value) = <none> / 0,
  Weight          = 0,
  Aspath-List name = aspl1,
  Aspath prepend  = <none>,
  Aspath match primitive = 500 .* 400$,
  Prefix-List name = <none>,
  Prefix match primitive = 0.0.0.0 0.0.0.0,
  Community-List name = coml2,
  Community match primitive = <none>,
  Community string [mode] = [Additive]
```

*output definitions*

---

<b>RouteMap name</b>	The name of the route map policy. This is determined using the <b>ip bgp policy prefix6-list</b> command.
<b>RouteMap instance</b>	The instance of the route map policy. This is determined using the <b>ip bgp policy prefix6-list</b> command.
<b>Admin state</b>	The administrative state of the route map policy, either enabled or disabled.
<b>Local pref (mode/value)</b>	The local preference of the route map policy. This is determined using the <b>ip bgp policy route-map lpref</b> command.
<b>Route map action</b>	The action of the route map policy. This is determined using the <b>ip bgp policy route-map action</b> command.
<b>Origin</b>	The origin of the route map policy. This is determined using the <b>ip bgp policy route-map origin</b> command.
<b>MED (mode/value)</b>	The MED of the route map policy. This is determined using the <b>ip bgp policy route-map med</b> command.
<b>Weight</b>	The weight of the route map policy. This is determined using the <b>ip bgp policy route-map weight</b> command.
<b>Aspath-List name</b>	The name of the AS path list attached to this route map. This is set using the <b>show ip bgp policy aspath-list</b> command.
<b>Aspath prepend</b>	The value to prepend to the AS_PATH attribute of the routes matched by this RouteMap instance (Empty quotes indicates no AS_PATH prepending is to be done).
<b>Aspath match primitive</b>	The regular expression used to match AS Path for this route map.
<b>Prefix-List name</b>	The name of the prefix list attached to this route map. This is set using the <b>show ip bgp policy prefix-list</b> command.
<b>Prefix match primitive</b>	The prefix to match for this route map.
<b>Community-List name</b>	The name of the community list attached to this route map. This is set using the <b>show ip bgp policy community-list</b> command.
<b>Community match primitive</b>	The community string to match for this route map.
<b>Community string [mode]</b>	The name of the community mode attached to this route map. This is set using the <b>ip bgp policy route-map community-mode</b> command.

---

---

## ip bgp graceful-restart

Configures support for the graceful restart feature on a BGP router.

**ip bgp graceful-restart**

**no ip bgp graceful-restart**

---

### Syntax Definitions

N/A

### Defaults

Graceful restart is enabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable support for the graceful restart feature on a BGP router. It has only unplanned graceful restart.
- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on an OmniSwitch 10K with a single CMM.
- Note that graceful restart does not support IPv6 prefixes at this time.

### Examples

```
-> ip bgp graceful restart  
-> no ip bgp graceful restart
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ip bgp** Displays the current global settings for the local BGP speaker.

### MIB Objects

```
alaBgpGlobal  
  alaBgpGracefulRestart  
  alaBgpRestartInterval
```

---

## ip bgp graceful-restart restart-interval

Configures the grace period for achieving a graceful BGP restart.

**ip bgp graceful-restart restart-interval** [*seconds*]

---

### Syntax Definitions

*seconds*                                      The hitless restart timeout interval, in seconds. The valid range is 1–3600.

### Defaults

parameter	default
<i>seconds</i>	90

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The minimum hardware configuration for this command is a redundant CMM configuration. This command is not supported on an OmniSwitch 10K with a single CMM.
- Note that graceful restart does not support IPv6 prefixes at this time.

### Examples

```
-> ip bgp graceful-restart restart-interval 600
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip bgp](#)                                      Displays the current global settings for the local BGP speaker.

### MIB Objects

```
alaBgpGlobal  
  alaBgpGracefulRestart  
  alaBgpRestartInterval
```

---

## ip bgp unicast

Enables or disables unicast IPv4 advertisements for the BGP routing process.

**ip bgp unicast**

**no ip bgp unicast**

---

### Syntax Definitions

N/A

### Defaults

By default, BGP IPv4 advertisements are enabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to turn off IPv4 unicast advertisements.
- BGP should be disabled before enabling or disabling IPv4 unicast advertisements.
- IPv4 unicast advertisements may be turned off on homogenous IPv6 networks that are not aware of IPv4 routing. In such cases, the command, **ip router router-id**, must be used to explicitly configure the 32-bit unique router identifier.

### Examples

```
-> ip bgp unicast  
-> no ip bgp unicast
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ipv6 bgp unicast</a>	Enables or disables unicast IPv6 updates for the BGP routing process.
<a href="#">show ip bgp</a>	Displays the current global settings for the local BGP speaker.
<a href="#">ip router router-id</a>	Configures the router ID for the router.

### MIB Objects

```
alaBgpGlobal  
  alaBgpMultiProtocolIpv4
```

---

## ipv6 bgp unicast

Enables or disables unicast IPv6 advertisements for the BGP routing process.

**ipv6 bgp unicast**

**no ipv6 bgp unicast**

---

### Syntax Definitions

N/A

### Defaults

By default, IPv6 BGP advertisements are disabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to turn off IPv6 unicast advertisements.
- BGP should be disabled before enabling or disabling IPv6 unicast advertisements.

### Examples

```
-> ipv6 bgp unicast  
-> no ipv6 bgp unicast
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip bgp unicast</a>	Enables or disables unicast IPv4 updates for the BGP routing process.

### MIB Objects

```
alaBgpGlobal  
  alaBgpMultiProtocolIpv6
```

---

## ip bgp neighbor activate-ipv6

Enables or disables the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv4 addresses.

**ip bgp neighbor** *ip\_address* **activate-ipv6**

**no ip bgp neighbor** *ip\_address* **activate-ipv6**

---

### Syntax Definitions

*ip\_address*                      The 32-bit IPv4 address of the neighbor.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to disable the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv4 addresses.

### Examples

```
-> ip bgp neighbor 1.0.0.1 activate-ipv6
-> no ip bgp neighbor 1.0.0.1 activate-ipv6
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip bgp neighbors](#)                      Displays BGP peer main status.

### MIB Objects

```
alaBgpPeerTable
  alaBgpPeerAddr
  alaBgpPeerIpv6Unicast
```

---

## ip bgp neighbor ipv6-nexthop

Configures the IPv6 next hop addresses for the IPv6 prefixes advertised between BGP peers. These BGP peers are identified by their IPv4 addresses.

```
ip bgp neighbor ip_address ipv6-nexthop ipv6_address
```

---

### Syntax Definitions

<i>ip_address</i>	The 32-bit IPv4 address of the neighbor.
<i>ipv6_address</i>	A 128-bit global IPv6 address to be used as the next hop for IPv6 routes being advertised to this BGP speaker.

### Defaults

By default, the IPv6 next hop value is set to all zeros.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- To reset the IPv6 next hop value, enter an all-zero address.
- For internal BGP (IBGP) peers, the IPv6 next hop is used only if the peer **next-hop-self** option is configured.
- For external BGP (EBGP) peers, the IPv6 next hop is used for all the advertised IPv6 routes.

### Examples

```
-> ip bgp neighbor 1.0.0.1 ipv6-nexthop 2001:100:3:4::1  
-> ip bgp neighbor 1.0.0.1 ipv6-nexthop ::
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#) Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeerTable  
  alaBgpPeerAddr  
  alaBgpPeerIpv6NextHop
```

---

## show ipv6 bgp path

Displays the known IPv6 BGP paths for all the routes or a specific route.

**show ipv6 bgp path** [**ipv6-addr** *ipv6\_address/prefix\_length*]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).

### Defaults

By default, IPv6 BGP paths for all the routes will be displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the *ipv6\_address/prefix\_length* parameter to display the IPv6 BGP paths for a specified route.

### Examples

```
-> show ipv6 bgp path
Legends: Sta      = Path state
          >       = best, F = feasible, S = stale
          U       = un-synchronized
          Nbr     = Neighbor
          (O)    = Path Origin (? = incomplete, i = igp, e = egp)
          degPref = degree of preference
```

Sta	Prefix	Nbr	Address	(O)	degPref
>	2020:100:200:1::/64		2001:100:3:4::1	i	100
>	2020:100:200:2::/64		2001:100:3:4::1	i	100
>	2020:100:200:3::/64		2001:100:3:4::1	i	100
>	2020:100:200:4::/64		2001:100:3:4::1	i	100
>	2020:100:200:5::/64		2001:100:3:4::1	i	100
>	2525:2525:1::/48		100.3.4.1	i	100
>	2525:2525:2::/48		100.3.4.1	i	100
>	2525:2525:3::/48		100.3.4.1	i	100
>	2525:2525:4::/48		100.3.4.1	i	100
>	2525:2525:5::/48		100.3.4.1	i	100

### output definitions

---

<b>Sta</b>	Status flag. A greater-than sign (>) indicates this is the best route to the destination.
<b>Prefix</b>	The destination address of the IPv6 route in the hexadecimal format.

*output definitions (continued)*

---

<b>Nbr Address</b>	The IP or IPv6 address of the BGP peer that advertises this path.
<b>(0)</b>	The origin attribute of this route path. A question mark (?) indicates incomplete, and <b>i</b> indicates IGP, and an <b>e</b> indicates EGP.
<b>degPref</b>	The local preference value assigned to this route path.

---

```
-> show ipv6 bgp path ipv6-addr 2020:100:200:1::/64
```

```
BGP Path parameters
```

```
Path address      = 2020:100:200:1::
Path Length      = 64
Path protocol    = ibgp
Path neighbor    = peer(2001:100:3:4::1)
  Path nextHop    = 2001:100:3:4::1,
  Path origin     = igp,
  Path local preference = 100,
  Path state     = active,
  Path weight    = 0,
  Path preference degree = 100,
  Path autonomous systems = [nAs=0] : <none>,
  Path MED      = <none>,
  Path atomic   = no,
  Path AS aggregator = <none>,
  Path IPaddr aggregator = <none>,
  Path community = <none>,
  Path Originator Id = <none>,
  Path Cluster List = <none>,
  Path unknown attribute = <none>
```

*output definitions*

---

<b>Path address</b>	The IPv6 address for route path.
<b>Path Length</b>	The prefix length of the IPv6 path.
<b>Path protocol</b>	The protocol from which this route path was learned. Possible values for this field are as follows: <b>local</b> , <b>static</b> , <b>directhost</b> , <b>rip</b> , <b>ospf</b> , <b>isis</b> , <b>ibgp</b> , <b>ebgp</b> , and <b>other</b> .
<b>Path neighbor</b>	The IPv6 address of the BGP peer.
<b>Path nextHop</b>	The next hop along the route path.
<b>Path origin</b>	The BGP origin attribute. Possible values will be <b>igp</b> , <b>egp</b> , <b>incomplete</b> , and <b>none</b> . The origin attribute is considered during the route decision process.
<b>Path local preference</b>	The local preference value for this route as received in an UPDATE message. A negative value (for example, the <b>-1</b> in the above display) indicates that the local preference value is missing for this route path.
<b>Path state</b>	Indicates the state of the path. The possible states are <b>best</b> , <b>feasible</b> , <b>policy-wait</b> , <b>un-synchronized</b> , <b>dampened</b> , or <b>none</b> . When path state is <b>none</b> , it indicates that there are no paths to this prefix and the route is being purged from the system.
<b>Path weight</b>	The path weight as assigned through inbound and outbound policies.

*output definitions (continued)*

---

<b>Path preference degree</b>	The local preference assigned to this route through an inbound or outbound policy, or, if the local preference value is missing, the default local preference (which is assigned through the <b>ip bgp default local-preference</b> ).
<b>Path autonomous systems</b>	The AS path for this route. These numbers show the ASs through which the route has traversed with the most recent AS listed first. In the above example, this route began its path in AS 2 and then traveled through AS 3.
<b>Path MED</b>	The multi-exit discriminator (MED) value for this route path. A negative value (for example, the <b>-1</b> in the above display) indicates that the MED value is missing for this route path.
<b>Path atomic</b>	Indicates whether the ATOMIC-AGGREGATE attribute has been set for this route. When set (this field would read <b>yes</b> ), this attribute indicates that an aggregate has caused a loss of information for this route (a less specific route was chosen over a more specific route included in the aggregate).
<b>Path AS aggregator</b>	Part of the AGGREGATOR attribute. This field indicates the AS for the BGP speaker that created the aggregate. A value of <b>&lt;none&gt;</b> indicates this is not an aggregate route.
<b>Path IPaddr aggregator</b>	Part of the AGGREGATOR attribute. This field indicates the IP address for the BGP speaker that created the aggregate. A value of <b>&lt;none&gt;</b> indicates that this is not an aggregate route.
<b>Path community</b>	Indicates the community to which this route path belongs, if applicable. A value of <b>&lt;none&gt;</b> indicates that this route does not belong to a community.
<b>Path Originator Id</b>	The Router Id of the BGP4 speaker that performed route reflection
<b>Path Cluster List</b>	Sequence of Cluster Id values representing the reflection path that the route has passed, if this is a reflected route in the local AS.
<b>Path unknown attribute</b>	Indicates BGP attributes found in UPDATE messages which the router does not support. For example, multi-protocol attributes are not supported by the router in this release, but it is possible for these attributes to appear in a BGP route.

---

## show ipv6 bgp routes

Displays the known IPv6 BGP routes.

**show ipv6 bgp routes**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 bgp routes
```

```
Legends: ECL = EBGp change list, ICC = IBGP client change list
          ICL = IBGP change list, LCL = local change list
          AGG = Aggregation, AGC = Aggregation contribution
          AGL = Aggregation list, GDL = Deletion list
          AGW = Aggregation waiting, AGH = Aggregation hidden
          DMP = Dampening, ACT = Active route
```

Prefix	ECL	ICC	ICL	LCL	AGG	AGC	AGL	AGW	AGH	GDL	DMP	ACT
2020:100:200:1::/64	No	No	No	No	No	No	No	No	No	No	No	Yes
2020:100:200:2::/64	No	No	No	No	No	No	No	No	No	No	No	Yes
2020:100:200:3::/64	No	No	No	No	No	No	No	No	No	No	No	Yes
2020:100:200:4::/64	No	No	No	No	No	No	No	No	No	No	No	Yes
2020:100:200:5::/64	No	No	No	No	No	No	No	No	No	No	No	Yes
2525:2525:1::/48	No	No	No	No	No	No	No	No	No	No	No	Yes
2525:2525:2::/48	No	No	No	No	No	No	No	No	No	No	No	Yes
2525:2525:3::/48	No	No	No	No	No	No	No	No	No	No	No	Yes
2525:2525:4::/48	No	No	No	No	No	No	No	No	No	No	No	Yes
2525:2525:5::/48	No	No	No	No	No	No	No	No	No	No	No	Yes

### *output definitions*

---

<b>Prefix</b>	The destination address of the IPv6 route in the hexadecimal format.
<b>ECL</b>	External BGP change list. When Yes, this route will be advertised as soon as the route advertisement timer expires.
<b>ICC</b>	Internal BGP client change list. When Yes, this route will be advertised to internal non-clients.

*output definitions (continued)*

---

<b>ICL</b>	Internal BGP change list. When Yes, this route has changes that need to be advertised.
<b>LCL</b>	Local change list. When Yes, this route is local.
<b>AGG</b>	Aggregation. When Yes, this route is an aggregate route.
<b>AGC</b>	Aggregation contribution. When Yes, this route is part of an aggregate route.
<b>AGL</b>	Aggregation list. When Yes, this route is placed on an aggregate list.
<b>AGW</b>	Aggregation waiting. When Yes, this route is waiting for an aggregate contributor.
<b>AGH</b>	Aggregation hidden. When Yes, this route is hidden as part of an aggregate route.
<b>GDL</b>	Deletion list. When Yes, this route will be deleted.
<b>DMP</b>	Dampening. Indicate whether this route has been dampened. If 'Yes', then this route has been dampened and a dampening history exists.
<b>ACT</b>	Active route. When Yes, the route is active.

---

## ipv6 bgp network

Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.

**ipv6 bgp network** *ipv6\_address/prefix\_length*

**no ipv6 bgp network** *ipv6\_address/prefix\_length*

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to turn off the advertisement of locally reachable IPv6 networks.

### Examples

```
-> ipv6 bgp network 2001::1/64
-> no ipv6 bgp network 2001::1/64
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- ipv6 bgp network admin-state** Enables or disables a BGP network.
- show ipv6 bgp network** Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

### MIB Objects

```
alaBgpNetwork6Table
  alaBgpNetwork6Addr
  alaBgpNetwork6MaskLen
```

---

## ipv6 bgp network community

Defines a community for a route created by the **ipv6 bgp network** command. Communities are a way of grouping BGP peers that do not share an IPv6 subnet or an AS.

```
ipv6 bgp network ipv6_address/prefix_length [community {none | num | num:num}]
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).
<b>none</b>	Removes a prefix from a community.
<i>num</i>	The community attribute number.
<i>num:num</i>	Community attribute in the AA : NN format. AA indicates the autonomous system and NN indicates the community number.

### Defaults

By default, a route is not assigned to a community.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **community** attribute is defined.

### Examples

```
-> ipv6 bgp network 2004::2/64 community 23:20
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>ipv6 bgp network</b>	Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers.
<b>show ipv6 bgp network</b>	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

**MIB Objects**

```
alaBgpNetwork6Table  
  alaBgpNetwork6Addr  
  alaBgpNetwork6MaskLen  
  alaBgpNetwork6Community
```

---

## ipv6 bgp network local-preference

Defines the local preference value for a route generated by the **ipv6 bgp network** command. This value will override the default local preference value; it is used when announcing this network to internal peers.

**ipv6 bgp network** *ipv6\_address/prefix\_length* [**local-preference num**]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).
<i>num</i>	The local preference attribute value. The valid range is 0–4294967295.

### Defaults

---

parameter	default
<i>num</i>	0

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **local-preference** attribute is defined.

### Examples

```
-> ipv6 bgp network 2004::1/24 local-preference 6
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>ipv6 bgp network</b>	Advertises a locally reachable IPv6 address as an IPv6 BGP network to other BGP peers
<b>show ipv6 bgp network</b>	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

**MIB Objects**

```
alaBgpNetwork6Table  
  alaBgpNetwork6Addr  
  alaBgpNetwork6MaskLen  
  alaBgpNetwork6LocalPref
```

---

## ipv6 bgp network metric

Configures the Multi-Exit Discriminator (MED) attribute value for an network generated by the **ipv6 bgp network** command. This value is sent from routers of one AS to another to indicate the path that the remote AS can use to send data to the local AS.

```
ipv6 bgp network ipv6_address/prefix_length [metric num]
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).
<i>num</i>	The MED attribute value. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>num</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **metric** attribute is defined for the same route.

### Examples

```
-> ipv6 bgp network 2001::1/64 metric 20
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>ipv6 bgp network</b>	Advertises a locally reachable IPv6 address as a IPv6 BGP network to other BGP peers.
<b>show ipv6 bgp network</b>	Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network

**MIB Objects**

```
alaBgpNetwork6Table  
  alaBgpNetwork6Addr  
  alaBgpNetwork6MaskLen  
  alaBgpNetwork6Metric
```

---

## ipv6 bgp network admin-state

Enables or disables a BGP network. The BGP status must be manually enabled after configuring all the BGP neighbor and network parameters.

**ipv6 bgp network** *ipv6\_address/prefix\_length* [**admin-state** {**enable** | **disable**}]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).
<b>admin-state</b>	< TBD from updated SFS >.
<b>enable</b>	Enables the BGP network.
<b>disable</b>	Disables the BGP network.

### Defaults

By default, the BGP network is disabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The IPv6 BGP route created with the **ipv6 bgp network** command should exist before the **status** attribute is defined.

### Examples

```
-> ipv6 bgp network 2001::1/64 admin-state enable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ipv6 bgp network** Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

### MIB Objects

alaBgpNetwork6Table  
  alaBgpNetwork6Addr  
  alaBgpNetwork6MaskLen  
  alaBgpNetwork6RowStatus

---

## show ipv6 bgp network

Displays the status of all the IPv6 BGP networks or a specific IPv6 BGP network.

**show ipv6 bgp network** [*ipv6\_address/prefix\_length*]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address.
<i>/prefix_length</i>	The number of bits that are significant in the IPv6 address (mask) (3..128).

### Defaults

By default, all IPv6 BGP networks and their status will be displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the *ipv6\_address/prefix\_length* parameter to display the status of a specific IPv6 BGP network.

### Examples

```
show ipv6 bgp network
Network
-----+-----+-----
2525:500:600::/64          enabled    active
```

```
show ipv6 bgp network 2525:500:600::/64
Network address           = 2525:500:600::/64,
Network admin state      = enabled,
Network oper state       = active,
Network metric           = 0,
Network local preference = 0,
Network community string = <none>
```

### output definitions

<b>Network</b> or <b>Network address</b>	The IPv6 address configured for this local BGP network. This value is configured through the <b>ipv6 bgp network</b> command.
<b>Admin state</b> or <b>Network admin state</b>	Indicates whether this local BGP network is administratively enabled or disabled. This value is configured through the <b>ipv6 bgp network admin-state</b> command.
<b>Oper state</b> or <b>Network oper state</b>	Indicates whether this BGP local network is operationally active or inactive.

---

*output definitions (continued)*

---

<b>Network metric</b>	The multi-exit discriminator (MED) value configured for this local BGP network. This value is configured through the <b>ipv6 bgp network metric</b> command.
<b>Network local preference</b>	The local preference value for this local BGP network. This value is configured through the <b>ipv6 bgp network local-preference</b> command.
<b>Network community string</b>	The community string value for this local BGP network. This value is configured through the <b>ipv6 bgp network community</b> command.

---

## Release History

Release 7.1.1; command was introduced.

```

---

## ipv6 bgp neighbor

Creates or deletes a BGP peer relationship using IPv6 addresses.

**ipv6 bgp neighbor** *ipv6\_address*

**no ipv6 bgp neighbor** *ipv6\_address*

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the new BGP peer.

### Defaults

By default, no BGP peers are configured in the BGP network.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete a BGP peer.
- To establish a BGP session, the BGP peer should be reachable.
- You must manually enable a BGP peer after creating it. A BGP peer is enabled using the **ipv6 bgp neighbor admin-state** command.
- Once created, a BGP peer must be assigned an autonomous system number using the **ipv6 bgp neighbor remote-as** command.
- Use **update-source** keyword to configure the IPv6 interface when link-local address is used as neighbor address.

### Examples

```
-> ipv6 bgp neighbor 2001::1
-> no ipv6 bgp neighbor 2001::1
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**ipv6 bgp neighbor admin-state** Enables or disables the BGP peer status.

**ipv6 bgp neighbor remote-as** Assigns an AS number to the BGP peer.

**MIB Objects**

alaBgpPeer6Table

---

## ipv6 bgp neighbor activate-ipv6

Enables the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv6 addresses.

**ipv6 bgp neighbor** *ipv6\_address* [**activate-ipv6**]

**no ipv6 bgp neighbor** *ipv6\_address* [**activate-ipv6**]

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address.

### Defaults

This command is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to disable the exchange of IPv6 unicast routes between BGP peer routers identified by their IPv6 addresses.

### Examples

```
-> ipv6 bgp neighbor 1.0.0.1 activate-ipv6
-> no ipv6 bgp neighbor 1.0.0.1 activate-ipv6
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#)              Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6ActivateIpv6
```

---

## ipv6 bgp neighbor ipv6-nexthop

Configures the IPv6 next hop addresses for IPv6 prefixes advertised between BGP peers. These BGP peers are identified by their IPv6 addresses.

```
ipv6 bgp neighbor ipv6_address [ipv6-nexthop ipv6_address]
```

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the next hop router.

### Defaults

By default, the IPv6 next hop address is set to all zeros.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- To reset the IPv6 next hop value, enter an all-zero address.
- For internal BGP (IBGP) peers, the IPv6 next hop is used only if the peer **next-hop-self** option is configured.
- For external BGP (EBGP) peers, the IPv6 next hop is used for all the advertised IPv6 routes.
- For BGP peers configured with their link-local addresses, the configured IPv6 next hop is used while advertising IPv6 prefixes.

### Examples

```
-> ipv6 bgp neighbor 2001::1 ipv6-nexthop fe80::/24  
-> no ipv6 bgp neighbor 2001::1 ipv6-nexthop fe80::/24
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#)      Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeerIpv6NextHop
```

---

## ipv6 bgp neighbor admin-state

Enables or disables the BGP peer status. These peers are identified by their IPv6 addresses.

```
ipv6 bgp neighbor ipv6_address [admin-state {enable | disable}]
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address of the new BGP peer.
<b>enable</b>	Enables the BGP peer.
<b>disable</b>	Disables the BGP peer.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- You should first create a BGP peer and assign it an IPv6 address using the [ipv6 bgp neighbor](#) command before enabling the peer.
- You should configure all the BGP peer related commands before enabling a BGP peer. Once you have enabled the peer, it will begin sending BGP connection and route advertisement messages.

### Examples

```
-> ipv6 bgp neighbor 2001::1 admin-state enable  
-> ipv6 bgp neighbor 2001::1 admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#) Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6RowStatus
```

---

## ipv6 bgp neighbor remote-as

Assigns an AS number to the BGP peer.

```
ipv6 bgp neighbor ipv6_address [remote-as num]
```

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the BGP peer.

*num*                                      Autonomous system number in the range 1–65535.

### Defaults

parameter	default
<i>num</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- A BGP peer created with the **ipv6 bgp neighbor** command cannot be enabled until it is assigned an autonomous system number. If the AS number assigned to the peer matches the AS number of the local BGP speaker (assigned using the **ip bgp autonomous-system** command), the peer is considered internal to the local autonomous system. Otherwise, the peer is considered external to the local BGP speaker's AS.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ipv6 bgp neighbor 2001::1 remote-as 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ip bgp autonomous-system**        Sets the AS for the local BGP speaker.

### MIB Objects

```
alaBgpPeer6Table
  alaBgpPeer6Addr
  alaBgpPeer6AS
```

---

## ipv6 bgp neighbor timers

Configures the KEEPALIVE message interval and hold time interval (in seconds) with regards to the specified BGP peer.

**ipv6 bgp neighbor** *ipv6\_address* [**timers** *num num*]

---

### Syntax Definitions

<i>ipv6_address</i>	A 128-bit IPv6 address for the BGP peer.
<i>num</i>	The KEEPALIVE message interval in seconds.
<i>num</i>	The hold time interval in seconds.

### Defaults

parameter	default
<i>num</i> (keepalive)	30 seconds
<i>num</i> (holdtime)	90 seconds

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- KEEPALIVE messages do not contain route updates or indicate a change in the status of the BGP peer; they indicate to the receiving BGP peer that the connection is still live and the peer is reachable.
- By default, the KEEPALIVE interval of 30 seconds is one-third the default hold time interval of 90 seconds. The KEEPALIVE interval can never be more than one-third the value of the hold time interval. When the hold time interval is reached without receiving KEEPALIVE or other updates messages, the peer is considered dead.
- Setting the KEEPALIVE value to zero means no KEEPALIVE messages will be sent.
- Once a connection is established with a peer and a time period of the length specified in this command transpires with no messages from the remote peer, then the connection with that remote peer will be considered dead.
- The hold timer is used during the connection setup process and for on-going connection maintenance with BGP peers. If the peer does not receive a KEEPALIVE, UPDATE, or NOTIFICATION message within this time period, then the BGP connection will be closed.
- Both the KEEPALIVE and hold time interval should be set at the same time.
- Using this command without the variables resets the variables to their default value.

### Examples

```
-> ipv6 bgp neighbor 2001::1 timers 80 240
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**ipv6 bgp neighbor conn-retry-interval** The interval, in seconds, between BGP retries to set up a connection with another peer through the transport protocol.

## MIB Objects

alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6HoldTime  
  alaBgpPeer6KeepAlive

---

## ipv6 bgp neighbor maximum-prefix

Configures the maximum number of prefixes, or paths, the local router can receive from a BGP peer in UPDATE messages.

```
ipv6 bgp neighbor ipv6_address [maximum-prefix num [warning-only]]
```

```
no ipv6 bgp neighbor ipv6_address [maximum-prefix num [warning-only]]
```

---

### Syntax Definitions

*ipv6\_address* A 128-bit IPv6 address for the BGP peer.

*num* The number of prefixes. The valid range is 0–4294967295.

### Defaults

parameter	default
<i>num</i>	5000

By default, **warning-only** is enabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When the number of prefixes sent by the BGP peer reaches the maximum limit, the peer is restarted.
- You can use BGP logging to receive a warning when the number of prefixes received from the peer reaches 80 percent of the value you configure in this command.
- If the **warning-only** prefix is used, the operator will be warned when the peer exceeds 80 percent of the configured number of maximum prefixes.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ipv6 bgp neighbor 2001::2 maximum-prefix 1000 warning-only  
-> no ipv6 bgp neighbor 2001::2 maximum-prefix 1000
```

### Release History

Release 7.1.1; command was introduced.

  alaBgpPeer6Addr

  alaBgpPeer6MaxPrefix

  alaBgpPeer6MaxPrefixWarnOnly

---

## ipv6 bgp neighbor next-hop-self

Configures router to advertise its peering address as the next hop address for the specified neighbor.

```
ipv6 bgp neighbor ipv6_address [next-hop-self]
```

```
no ipv6 bgp neighbor ipv6_address [next-hop-self]
```

---

### Syntax Definitions

*ipv6\_address*                      A 128-bit IPv6 address for the BGP peer.

### Defaults

By default, the **next-hop-self** parameter of BGP updates is disabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable the **next-hop-self** parameter.
- In meshed networks, the BGP peer may not have direct connections to other peers. When such a peer receives route updates from these distant peers (through other peers), it may treat the remote peer as if it were the next hop in the routing path. Packet forwarding will not work in such a case because no direct connection exists. This command allows the peer to deem itself the next hop on the routing path so that the two non-connected peers can route packets. This peer would have a direct connection to both peers that want to exchange packets.
- The BGP peer is restarted after issuing this command.

### Examples

```
-> ipv6 bgp neighbor 2001::2 next-hop-self  
-> no ipv6 bgp neighbor 2001::2 next-hop-self
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#)      Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6NextHopSelf
```

---

## ipv6 bgp neighbor conn-retry-interval

The interval, in seconds, between BGP retries to set up a connection with another peer through the transport protocol. In the connect state, BGP tries to set up a connection with a remote peer. If the connection fails, then the connection retry interval starts. Once this interval elapses, BGP retries setting up the connection.

**ipv6 bgp neighbor** *ipv6\_address* [**conn-retry-interval** *num*]

---

### Syntax Definitions

<i>ipv6_address</i>	A 128-bit IPv6 address for the BGP neighbor.
<i>num</i>	The time interval (in seconds) between retries. The valid range is 0–65535.

### Defaults

---

parameter	default
<i>num</i>	120

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The connection retry time interval starts when a connection to a peer is lost.
- Using this command without the *num* variable resets the variable to its default value.

### Examples

```
-> ipv6 bgp neighbor 2001::2 conn-retry-interval 60
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#) Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6ConnRetryInterval
```

---

## ipv6 bgp neighbor default-originate

Enables or disables the BGP local speaker to advertise a default route to the peer.

```
ipv6 bgp neighbor ipv6_address [default-originate]
```

```
no ipv6 bgp neighbor ipv6_address [default-originate]
```

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address for the neighbor.

### Defaults

This **default-originate** parameter is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable the BGP peer default origination.
- When this command is enabled, the local BGP speaker advertises the default route to the peer. Such a default route overrides any learned default (propagation) and outbound policy. The default route `::/0` does not need to exist on the local router.
- If the peer is capable of exchanging IP as well as IPv6 prefixes, the default route for both IP and IPv6 is advertised.

### Examples

```
-> ipv6 bgp neighbor 2001::1 default-originate  
-> no ipv6 bgp neighbor 2001::1 default-originate
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 bgp neighbors](#)    Displays the configured IPv6 BGP peers.

### MIB Objects

```
alaBgpPeer6Table  
  alaBgpPeer6Addr  
  alaBgpPeer6DefaultOriginate
```

---

## ipv6 bgp neighbor update-source

Configures the local IPv6 interface from which a BGP peer will be connected. This local IPv6 interface can be configured for internal and external BGP peers.

**ipv6 bgp neighbor** *ipv6\_address* [**update-source** *interface\_name*]

**no ipv6 bgp neighbor** *ipv6\_address* [**update-source** *interface\_name*]

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address for the BGP peer.
<i>interface_name</i>	The name of the local IPv6 interface that provides the TCP connection for this BGP peer.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The BGP peer is restarted after issuing this command.
- If a BGP peer is configured with its link-local address, use the **update-source** parameter to specify the name of the IPv6 interface from which this peer is reachable. This is required to establish a BGP peering session.

### Examples

```
-> ipv6 bgp neighbor 2004::1 update-source bgp_ipv6
-> no ipv6 bgp neighbor 2004::1 update-source bgp_ipv6
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

```

---

## ipv6 bgp neighbor ipv4-nexthop

Configures the IPv4 next hop addresses for IPv4 prefixes advertised between BGP peers. These BGP peers are identified by their IPv6 addresses.

```
ipv6 bgp neighbor ipv6_address [ipv4-nexthop ip_address]
```

---

### Syntax Definitions

<i>ipv6_address</i>	The 128-bit IPv6 address for the BGP peer.
<i>ip_address</i>	The 32-bit IP address of the next hop.

### Defaults

By default, the IPv4 next hop value is set to all zeros.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

To reset the IPv4 next hop value, enter an all-zero address.

### Examples

```
-> ipv6 bgp neighbor 2004::1 ipv4-nexthop 172.22.2.115  
-> ipv6 bgp neighbor 2004::1 ipv4-nexthop 0.0.0.0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

```

---

## show ipv6 bgp neighbors

Displays the configured IPv6 BGP peers.

**show ipv6 bgp neighbors** [*ipv6\_address*]

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address of the BGP neighbor.

### Defaults

By default, all the configured IPv6 BGP peers will be displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the *ipv6\_address* parameter to display the details of a specified IPv6 BGP peer.

### Examples

```
-> show ipv6 bgp neighbors
```

```
Legends: Nbr = Neighbor
```

```
      As = Autonomous System
```

Nbr	address	As	Admin state	Oper state	BGP Id	Up/Down

Configured IPv4 NextHop Address = 0.0.0.0,
Configured IPv6 NextHop Address = ::,
Neighbor Ipv6 unicast     = advertised

```

### output definitions

<b>Nbr address</b> or <b>Neighbor address</b>	The IPv6 address for this BGP peer. Assign this address through the <b>ipv6 bgp neighbor</b> command.
<b>As</b> or <b>Neighbor autonomous system</b>	The autonomous system to which this peer belongs. A peer's AS number is assigned through the <b>ipv6 bgp neighbor remote-as</b> command.
<b>Admin state</b> or <b>Neighbor Admin state</b>	Indicates whether this peer has been enabled or disabled through the <b>ipv6 bgp neighbor admin-state</b> command.
<b>Oper state</b> or <b>Neighbor Oper state</b>	The current BGP state for this peer. Possible states are <b>idle</b> , <b>connect</b> , <b>active</b> , <b>opensent</b> , <b>openconfirm</b> , and <b>established</b> .
<b>BGP Id</b>	The unique BGP identifier of the peer.
<b>Up/Down</b>	The time since this peer has transitioned to its current UP or DOWN state. If the peer is currently Established, then this is the time that the peer has been UP. If the peer is currently Idle, then this is the time the peer has been DOWN.
<b>Neighbor passive status</b>	Indicates whether the local BGP speaker is "passive" (i.e., waiting for this peer to initiate a session).
<b>Neighbor name</b>	The name assigned to this peer.
<b>Neighbor local address</b>	The interface assigned to this peer. This value is configured through the <b>ipv6 bgp neighbor update-source</b> command.
<b>Neighbor EBGp multiHop</b>	Indicates whether BGP multi-hop support is enabled or disabled. This supports allows external BGP peers to communicate with each other even when they are not directly connected.
<b>Neighbor next hop self</b>	Indicates whether this peer is using next hop processing. This value is configured through the <b>ipv6 bgp neighbor next-hop-self</b> command.
<b>Neighbor Route Refresh</b>	Indicates whether this peer supports Route Refresh capability as defined in RFC 2918. This capability is an alternative to soft-reconfiguration that can save CPU and memory resources. It allows peers to dynamically request the re-advertisement of BGP routing tables. Since this router supports route refresh all BGP peers are automatically enabled for this capability.
<b>Neighbor Ipv4 unicast</b>	Indicates whether this peer is multiprotocol IPv4 unicast capable.
<b>Neighbor Ipv4 multicast</b>	Indicates whether this peer is multiprotocol IPv4 multicast capable.
<b>Neighbor type</b>	Indicates whether this peer is internal or external to the AS.
<b>Neighbor auto-restart</b>	Indicates whether peer auto-restart is enabled or disabled.

*output definitions (continued)*

---

<b>Neighbor route-reflector-client</b>	Indicates whether this peer is a client to the local route reflector, if configured.
<b>Neighbor confederation status</b>	Indicates whether this peer is a member of a BGP confederation.
<b>Neighbor remove private AS</b>	Indicates whether the stripping of private AS numbers (64512 to 65535) from AS paths is enabled or disabled.
<b>Neighbor default originate</b>	Indicates whether peer default origination is enabled or disabled. When enabled, the local BGP speaker advertises the default route to the peer. This value is configured through the <b>ipv6 bgp neighbor default-originate</b> command.
<b>Neighbor maximum prefixes</b>	The maximum number of prefixes the local router can receive in UPDATE from this peer. This value is configured through the <b>ipv6 bgp neighbor maximum-prefix</b> command.
<b>Neighbor max prefixes warning</b>	Indicates whether a warning will be issued when this peer exceeds 80 percent of the maximum prefix value. This value is configured through the <b>ipv6 bgp neighbor update-source</b> command.
<b># of prefixes received</b>	Displays the total number of prefixes received by this neighbor.
<b>Neighbor MD5 key</b>	When present, shows an encrypted version of the MD5 password. When not present, and MD5 password has not been configured.
<b>Neighbor local port</b>	The TCP port used for the session with this peer.
<b>Neighbor TCP window size</b>	The size of the TCP window for this BGP session. This value will always be 32768 as that is the maximum size of a BGP message.
<b>Graceful Restart State</b>	Indicates the graceful restart state. This feature does not support IPv6 prefixes.
<b>Advertised Restart Interval</b>	Indicates the restart interval in seconds.
<b>Forwarding State during restart</b>	Indicates whether the peer has preserved the forwarding state during the graceful restart.
<b>Activate IPv6 unicast</b>	Indicates whether or not IPv6 unicast advertisements are enabled. Options include <b>enabled</b> or <b>disabled</b> .
<b>Configured IPv4 NextHop Address</b>	Specifies the IPv4 nexthop address. This is specified using the <b>ipv6 bgp neighbor ipv4-nexthop</b> command.
<b>Configured IPv6 NextHop Address</b>	Specifies the IPv6 nexthop address. This is specified using the <b>ipv6 bgp neighbor ipv6-nexthop</b> command.
<b>Neighbor Ipv6 unicast</b>	Indicates whether or not IPv6 unicast capability is advertised between the peers. Options include <b>enabled</b> or <b>disabled</b> .

---

## show ipv6 bgp neighbors statistics

Displays the neighbor statistics of the configured IPv6 BGP peers.

**show ipv6 bgp neighbors statistics** [*ipv6\_address*]

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address.

### Defaults

By default, the neighbor statistics for all the IPv6 BGP peers will be displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the *ipv6\_address* parameter to display the neighbor statistics of a specified IPv6 BGP peer.

### Examples

```
-> show ipv6 bgp neighbors statistics
```

```
Legends: Nbr    = Neighbor
          As     = Autonomous System
          RMSGS  = # of received messages
          SMSGS  = # of sent messages
          RUPDS  = # of Update messages received
          SUPDS  = # of Update messages sent
          RNOFY  = # of Notify messages received
          SNOFY  = # of Notify messages sent
          RPFXS  = # of prefixes received
          UPTNS  = # of UP transitions
          DNTNS  = # of DOWN transitions
```

```

### output definitions

---

<b>Nbr address</b>	The IPv6 address for this peer. This value is configured using the <b>ipv6 bgp neighbor</b> command.
<b>As</b>	The autonomous system to which this peer belongs. This value is configured using the <b>ipv6 bgp neighbor remote-as</b> command.
<b>RMSGS</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
<b>SMSGS</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent by this peer.

*output definitions (continued)*

---

<b>RUPDS</b>	The number of route UPDATE messages received by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b>SUPDS</b>	The number of route UPDATE messages sent by this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b>RNOFY</b>	The number of NOTIFY messages received by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
<b>SNOFY</b>	The number of NOTIFY messages sent by this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.
<b>RPFXS</b>	Number of unique route prefixes received by this peer.
<b>UPTNS</b>	Number of times this peer has come up, operationally.
<b>DNTNS</b>	Number of times this peer has gone down, operationally.

---

```

-> show ipv6 bgp neighbors statistics 2001:100:3:4::1
Neighbor address           = 2001:100:3:4::1,
# of UP transitions        = 1,
Time of last UP transition = 01h:50m:36s,
# of DOWN transitions      = 1,
Time of last DOWN transition = 00h:00m:00s,
Last DOWN reason          = none,
# of msgs rcvd            = 226,

Time last msg was sent     = 00h:00m:18s,

```

*output definitions*

---

<b>Neighbor address</b>	The IPv6 address for this peer. This value is configured using the <b>ipv6 bgp neighbor</b> command.
<b># of UP transitions</b>	Number of times this peer has come up, operationally.
<b>Time of last UP transition</b>	The duration that this peer has been up.
<b># of DOWN transitions</b>	Number of times this peer has gone down, operationally.
<b>Time of last DOWN transition</b>	The duration since this peer last went down.

*output definitions (continued)*

---

<b>Last DOWN reason</b>	Provides a message as the last reason why a peer went down. The possible reasons for going down are:  user_request - user initiated conn_timeout - connection timer expired hold_timeout - hold timer expired bad_msg - received a bad message from neighbor fsm_blink - BGP FSM error peer_closed - neighbor closed connection peer_notify - neighbor sent fatal notification tcp_error - Fatal TCP error none - None
<b># of msgs rcvd</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) received by this peer.
<b># of Update msgs rcvd</b>	The number of route UPDATE messages received from this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b># of prefixes rcvd</b>	Number of unique route prefixes received by this peer.
<b># of Route Refresh msgs rcvd</b>	Number of route refresh requests this peer has received. Route refresh requests all routes learned by a peer.
<b># of Notification msgs rcvd</b>	Number of NOTIFY messages received from this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

*output definitions (continued)*

---

<b>Last rcvd Notification reason</b>	<p>NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message received from this peer. The notification reasons are listed in two parts separated by a dash (-). The following are possible notification reasons:</p> <ul style="list-style-type: none"> <li>message header error - synchronization loss</li> <li>message header error - bad length</li> <li>message header error - bad type</li> <li>open message error - unsupported version</li> <li>open message error - bad peer autonomous system</li> <li>open message error - bad peer bgp id</li> <li>open message error - unsupported option</li> <li>open message error - authentication failure</li> <li>open message error - unacceptable hold time</li> <li>open message error - unsupported capability</li> <li>update message error - malformed attribute</li> <li>update message error - unknown attribute</li> <li>update message error - missing wellknown attribute</li> <li>update message error - attribute flags error</li> <li>update message error - attribute length error</li> <li>update message error - invalid origin</li> <li>update message error - as loop</li> <li>update message error - invalid nexthop</li> <li>update message error - optional attribute error</li> <li>update message error - invalid network</li> <li>update message error - malformed aspath</li> <li>cease - maximum number of prefixes reached</li> <li>cease - administrative shutdown</li> <li>cease - peer de-configured</li> <li>cease- administrative reset</li> <li>cease- connection rejected</li> <li>cease - other configuration change</li> <li>cease - connection collision resolution</li> <li>cease - out of resources</li> <li>hold time out - none</li> <li>fsm error - none</li> <li>none - none</li> </ul>
<b>Time last msg was rcvd</b>	The duration since a message was received from this peer.
<b># of msgsd sent</b>	Total number of messages (UPDATE, NOTIFY, OPEN, KEEPALIVE) sent to this peer.
<b># of Update msgsd sent</b>	Number of route UPDATE messages sent to this peer. UPDATE messages contain route reachability information, BGP attributes, and route feasibility information.
<b># of Route Refresh msgsd sent</b>	Number of route refresh requests this peer has sent. Route refresh requests request all routes learned be a peer.
<b># of Notification msgsd sent</b>	Number of NOTIFY messages sent to this peer. NOTIFY messages contain error information, such as unsupported parameters, invalid attributes, and holdtime expirations.

*output definitions (continued)*

---

<b>Last sent Notification reason</b>	NOTIFY messages include errors codes. These error codes are listed in this field. They apply to the last NOTIFY message sent by this peer. The notification reasons are listed in two parts separated by a dash (-). See the list of possible notification reasons under the description for the <b>Peer last received notification reason</b> field above.
<b>Time last msg was sent</b>	The duration since a message was sent to this peer.

## show ipv6 bgp neighbors policy

Displays the incoming and outgoing prefix6 list policy identifiers configured for BGP IPv6 peer.

```
show ipv6 bgp neighbors policy ipv6_address
```

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays all of the configured policies for the router, or the policies configured for a specific BGP IPv6 peer.

### Examples

```
OS6850::> show ipv6 bgp neighbors policy
Neighbor address = 2001::1,
  Neighbor autonomous system      = 1,
  Neighbor output policy map name = <none>,
  Neighbor input policy map name  = <none>,
  Neighbor output aspath-list name = <none>,
  Neighbor input aspath-list name = <none>,
  Neighbor output prefix-list name = <none>,
  Neighbor input prefix-list name = <none>,
  Neighbor output community-list name = <none>,
  Neighbor input community-list name = <none>,
  Neighbor soft reconfiguration   = enabled
  Neighbor output prefix6-list name = <none>,
  Neighbor input prefix6-list name = <none>
```

#### *output definitions*

---

<b>Neighbor autonomous system</b>	The AS to which the peer is assigned. This can be assigned by using the <a href="#">ip bgp neighbor remote-as</a> command.
<b>Neighbor output policy map name</b>	The outbound route map policy for the peer. This can be assigned by using the <a href="#">ip bgp neighbor route-map</a> command.
<b>Neighbor input policy map name</b>	The inbound route map policy for the peer. This can be assigned by using the <a href="#">ip bgp neighbor route-map</a> command.
<b>Neighbor output aspath-list name</b>	The outbound AS path list policy for the peer. This can be assigned by using the <a href="#">ip bgp neighbor out-aspathlist</a> command.
<b>Neighbor input aspath-list name</b>	The inbound AS path list policy for the peer. This can be assigned by using the <a href="#">ip bgp neighbor in-aspathlist</a> command.

*output definitions (continued)*

---

<b>Neighbor output prefix-list name</b>	The outbound prefix list policy for the peer. This can be assigned by using the <b>ip bgp neighbor out-prefixlist</b> command.
<b>Neighbor input prefix-list name</b>	The inbound prefix list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-prefixlist</b> command.
<b>Neighbor output community-list name</b>	The outbound community list policy for the peer. This can be assigned by using the <b>ip bgp neighbor out-communitylist</b> command.
<b>Neighbor input community-list name</b>	The inbound community list policy for the peer. This can be assigned by using the <b>ip bgp neighbor in-communitylist</b> command.
<b>Neighbor soft reconfiguration</b>	Lists whether soft reconfigurations are enabled or disabled for this peer. This is configured using the <b>ip bgp neighbor soft-reconfiguration</b> command.
<b>Neighbor output prefix6-list name</b>	The outbound prefix6-list policy for the peer.
<b>Neighbor input prefix6-list name</b>	The inbound prefix6-list policy for the peer.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

---

## show ipv6 bgp neighbors timers

Displays the timers for configured IPv6 BGP peers.

**show ipv6 bgp neighbors timers** [*ipv6\_address*]

---

### Syntax Definitions

*ipv6\_address*                      The 128-bit IPv6 address.

### Defaults

By default, the timer values for all the IPv6 BGP peers will be displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the *ipv6\_address* parameter to display the timer value for a specified IPv6 BGP peer.

### Examples

```
-> show ipv6 bgp neighbors timers
Legends: Nbr      = Neighbor
          As       = Autonomous System
          RtAdv    = Route Advertisement
          Kalive   = Keep Alive (actual)
          Ka(C)    = Configured Keep Alive

Nbr address                As      Hold   Hold(C) RtAdv  Retry  Kalive Ka(C)
-----+-----+-----+-----+-----+-----+-----+-----
2001:100:3:4::1           30     90     90      30    120   30     30
```

### output definitions

---

<b>Nbr address</b>	The IPv6 address for this BGP peer. Assign this address using the <a href="#">ipv6 bgp neighbor</a> command.
<b>As</b>	The autonomous system to which this peer belongs. A peer's AS number is assigned using the <a href="#">ipv6 bgp neighbor remote-as</a> command.
<b>Hold</b>	The actual negotiated hold time value.
<b>Hold (C)</b>	The hold time value. This value is configured using the <a href="#">ipv6 bgp neighbor timers</a> command.
<b>RtAdv</b>	The route advertisement interval, in seconds, for updates between external BGP peers.
<b>Retry</b>	The interval, in seconds, between retries by this peer to set up a connection through TCP with another peer. This value is configured using the <a href="#">ipv6 bgp neighbor timers</a> command.

---

*output definitions (continued)*

---

<b>Kalive</b>	The actual negotiated value, in seconds, between KEEPALIVE messages. KEEPALIVE messages do not contain route or status updates; they serve only to tell other peers that the connection is still live and this peer is reachable.
<b>Ka (C)</b>	The KEEPALIVE interval as configured using the <a href="#">ipv6 bgp neighbor timers</a> command.

---

# 22 Server Load Balancing Commands

Server Load Balancing (SLB) allows clients to send requests to servers logically grouped together in clusters. Each cluster logically aggregates a set of servers running identical applications with access to the same content (for example, web servers). Clients access clusters through the use of a Virtual IP (VIP) address.

MIB information for the SLB commands is as follows:

*Filename* AlcatellIND1Slb.mib  
*Module:* ALCATEL-IND1-SLB-MIB

A summary of available commands is listed here:

<b>Global SLB Commands</b>	<code>ip slb admin-state</code> <code>ip slb reset statistics</code> <code>show ip slb</code>
<b>SLB Cluster Commands</b>	<code>ip slb cluster</code> <code>ip slb cluster admin-state</code> <code>ip slb cluster ping period</code> <code>ip slb cluster ping timeout</code> <code>ip slb cluster ping retries</code> <code>ip slb cluster probe</code> <code>show ip slb clusters</code> <code>show ip slb cluster</code>
<b>SLB Server Commands</b>	<code>ip slb server ip cluster</code> <code>ip slb server ip cluster probe</code> <code>show ip slb cluster server</code> <code>show ip slb servers</code>
<b>SLB Probe Commands</b>	<code>ip slb probe</code> <code>ip slb probe timeout</code> <code>ip slb probe period</code> <code>ip slb probe port</code> <code>ip slb probe retries</code> <code>ip slb probe username</code> <code>ip slb probe password</code> <code>ip slb probe url</code> <code>ip slb probe status</code> <code>ip slb probe send</code> <code>ip slb probe expect</code> <code>show ip slb probes</code>

## ip slb admin-state

Enables or disables the administrative status for Server Load Balancing (SLB) on a switch.

**ip slb admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the administrative status for Server Load Balancing on a switch.
<b>disable</b>	Disables the administrative status for Server Load Balancing on the switch.

### Defaults

parameter	default
enable   disable	disable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Disabling the administrative status for the SLB feature does not delete the SLB configuration from the switch. The next time the feature is enabled, the existing configuration becomes active.

### Examples

```
-> ip slb admin-state enable
-> ip slb admin-state disable
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">show ip slb</a>	Displays the status of Server Load Balancing on a switch.
<a href="#">ip slb cluster</a>	Configures a Server Load Balancing cluster on a switch.
<a href="#">ip slb server ip cluster</a>	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

### MIB Objects

```
slbFeatureGroup
  slbAdminStatus
```

---

## ip slb reset statistics

Resets SLB statistics for all clusters configured on the switch.

**ip slb reset statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Note that the **qos apply** command resets both QoS statistics *and* SLB cluster statistics. The **ip slb reset statistics** command only resets SLB statistics.

### Examples

```
-> ip slb reset statistics
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

- |                                      |  |
|--------------------------------------|--|
| <a href="#">show ip slb clusters</a> | Displays the status and configuration of all Server Load Balancing clusters on a switch.                       |
| <a href="#">show ip slb cluster</a>  | Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch. |

### MIB Objects

```
slbFeatureGroup  
  slbResetStatistics
```

---

## ip slb cluster

Configures a Server Load Balancing (SLB) cluster on a switch.

**ip slb cluster** *name* {**vip** *ip\_address* | **condition** *string*} [**I3** | **I2**]

**no ip slb cluster** *name*

---

### Syntax Definitions

<i>name</i>	The name of the Server Load Balancing (SLB) cluster. The name can consist a maximum of 23 characters. Names with spaces must be enclosed within quotation marks (for example, “mail server”).
<i>ip_address</i>	The Virtual IP (VIP) address for the Server Load Balancing cluster. This IP address must be in dotted decimal format.
<i>string</i>	The name of an existing QoS policy condition that identifies the Server Load Balancing cluster.
<b>I3</b>	Specifies Layer 3 Server Load Balancing mode. The source and destination MAC and TTL of each packet is modified before the packet is bridged or routed to the server.
<b>I2</b>	Specifies Layer 2 Server Load Balancing mode. Packets are not modified before they are bridged to the server. This parameter is only available when using the <b>condition</b> parameter.

### Defaults

parameter	default
<b>I3</b>   <b>I2</b>	<b>I3</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete a Server Load Balancing cluster.
- Once a cluster is created, the Virtual IP or condition cannot be modified. To modify these values, delete the cluster and re-create the cluster with the different VIP and conditions.
- The VIP address of the SLB cluster *must* be an address that is in the same subnet as the servers.
- Specifying the **I3** parameter when configuring a VIP cluster is not required. VIP clusters only use the Layer-3 mode to route traffic to the servers. Layer-2 mode is not supported with this type of cluster.
- The QoS policy condition must exist before it is assigned to an SLB cluster. Use the **policy condition** command to create the QoS policy condition. See the “QoS Policy Commands” chapter for more information.

- SLB clusters are not active if the Server Load Balancing feature is disabled for the switch. Use the **ip slb admin-state** command to enable this feature.

---

**Note**

It is possible to configure clusters and add or remove servers from a cluster even when SLB is disabled for the switch.

---

**Examples**

```
-> ip slb cluster corporate_servers vip 1.2.3.4
-> ip slb cluster "mail servers" vip 1.2.3.6
-> ip slb cluster cluster_1 condition intranet_cond 12
-> ip slb cluster cluster_2 condition slb_cond 13
-> no ip slb cluster hr_servers
```

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<b>show ip slb clusters</b>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<b>show ip slb cluster</b>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<b>ip slb admin-state</b>	Enables or disables Server Load Balancing on a switch.
<b>ip slb server ip cluster</b>	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

**MIB Objects**

```
slbClusterTable
  slbClusterName
  slbClusterVIP
  slbClusterRowStatus
  slbClusterPackets
  slbClusterCondition
  slbClusterType
```

---

## ip slb cluster admin-state

Administratively enables or disables a Server Load Balancing (SLB) cluster on a switch.

```
ip slb cluster cluster_name admin-state {enable | disable}
```

---

### Syntax Definitions

<i>cluster_name</i>	The name of an existing Server Load Balancing cluster.
<b>enable</b>	Administratively enables a Server Load Balancing cluster on a switch.
<b>disable</b>	Administratively disables a Server Load Balancing cluster on a switch.

### Defaults

By default, a cluster is administratively enabled when the cluster is created.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The SLB cluster name specified with this command must already exist in the switch configuration.

### Examples

```
-> ip slb cluster hr_servers admin-state enable
-> ip slb cluster "mail servers" admin-state disable
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">show ip slb clusters</a>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<a href="#">show ip slb cluster</a>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<a href="#">ip slb cluster</a>	Configures Server Load Balancing clusters.
<a href="#">ip slb server ip cluster</a>	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

### MIB Objects

```
slbClusterTable
    slbClusterAdminStatus
```

---

## ip slb cluster ping period

Modifies the number of seconds to check the health of the servers in a Server Load Balancing cluster.

**ip slb cluster** *cluster\_name* **ping period** *seconds*

---

### Syntax Definitions

<i>cluster_name</i>	The name of the Server Load Balancing (SLB) cluster.
<i>seconds</i>	The number of seconds for the ping period. Specifying 0 (zero) disables the ping.

### Defaults

---

parameter	default
<i>seconds</i>	60

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If you do not set the ping period to zero, then the ping period *must* be greater than or equal to the ping timeout value divided by 1000. Use the [ip slb cluster ping timeout](#) command to modify the ping timeout value.

### Examples

```
-> ip slb cluster hr_servers ping period 120
-> ip slb cluster "mail servers" ping period 0
```

### Release History

Release 7.1.1; command introduced.

**Related Commands**

<b>show ip slb clusters</b>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<b>show ip slb cluster</b>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<b>ip slb cluster ping timeout</b>	Modifies the ping timeout value.
<b>ip slb cluster ping retries</b>	Modifies the number of ping retries.

**MIB Objects**

```
slbClusterTable  
  slbClusterPingPeriod
```

---

## ip slb cluster ping timeout

Configures the ping timeout value for a Server Load Balancing (SLB) cluster before it retries.

**ip slb cluster** *cluster\_name* **ping timeout** *milliseconds*

---

### Syntax Definitions

*cluster\_name*

The name of the Server Load Balancing (SLB) cluster.

*milliseconds*

The number of milliseconds for the ping timeout. The valid range for the ping timeout value is 0 to 1000 times the ping period. For example, if the ping period is 10 seconds, then maximum value for the ping timeout is 10000.

### Defaults

parameter	default
<i>milliseconds</i>	3000

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the [ip slb cluster ping period](#) command to modify the ping period value.

### Examples

```
-> ip slb cluster "mail servers" ping timeout 1000
-> ip slb cluster hr_servers ping timeout 6000
```

### Release History

Release 7.1.1; command introduced.

**Related Commands**

<b>show ip slb clusters</b>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<b>show ip slb cluster</b>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<b>ip slb cluster ping period</b>	Modifies the ping period value.
<b>ip slb cluster ping retries</b>	Modifies the number of ping retries.

**MIB Objects**

```
slbClusterTable  
    slbClusterPingTimeout
```

---

## ip slb cluster ping retries

Configures the number of ping attempts for a Server Load Balancing (SLB) cluster.

**ip slb cluster** *cluster\_name* **ping retries** *count*

---

### Syntax Definitions

*cluster\_name*                      The name of the Server Load Balancing (SLB) cluster.

*count*                                The number of ping retries.

### Defaults

parameter	default
<i>count</i>	3

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip slb cluster "mail servers" ping retries 5
-> ip slb cluster hr_servers ping retries 10
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

**show ip slb clusters**                Displays the status and configuration of all Server Load Balancing clusters on a switch.

**show ip slb cluster**                 Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.

**ip slb cluster ping period**         Modifies the ping period value.

**ip slb cluster ping timeout**        Modifies the ping timeout value.

### MIB Objects

slbClusterTable  
    slbClusterPingRetries

---

## ip slb cluster probe

Configures a probe for a Server Load Balancing (SLB) cluster.

```
ip slb cluster cluster_name probe probe_name
```

---

### Syntax Definitions

<i>cluster_name</i>	The name of the Server Load Balancing (SLB) cluster.
<i>probe_name</i>	The name of the Server Load Balancing (SLB) probe.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

You must create the probe with the [ip slb probe](#) before you can use this command.

### Examples

```
-> ip slb cluster mail_servers probe mail_server_probe
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">show ip slb clusters</a>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<a href="#">ip slb probe</a>	Configures and deletes SLB probes.
<a href="#">show ip slb cluster</a>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<a href="#">ip slb server ip cluster</a>	Adds, deletes, or modifies parameters of physical servers in logical Server Load Balancing clusters.

### MIB Objects

slbClusterTable  
    slbClusterProbeName

---

## ip slb server ip cluster

Adds a physical server to a Server Load Balancing (SLB) cluster, deletes a physical server from an SLB cluster, or modifies the administrative status of a physical server in an SLB cluster.

**ip slb server ip** *ip\_address* **cluster** *cluster\_name* [**admin-state** {**enable** | **disable**}] [**weight** *weight*]

**no ip slb server ip** *ip\_address* **cluster** *cluster\_name*

---

### Syntax Definitions

<i>ip_address</i>	The IP address for the physical server.
<i>cluster_name</i>	The name of an existing Server Load Balancing cluster.
<b>enable</b>	Enables a server.
<b>disable</b>	Disables a server.
<i>weight</i>	Specifies the weight of the server.

### Defaults

parameter	default
<b>enable   disable</b>	<b>enable</b>
<b>weight</b>	<b>1</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a physical server from a Server Load Balancing cluster.
- Use the **weight** parameter to assign the server preference value. Each server or server cluster can be assigned a weight to set their preference value for distribution of incoming network traffic. The weights assigned are relative. For example, if Servers A and B have respective weights of 10 and 20 within a cluster, Server A would get half the traffic of Server B.
- Assigning a weight of 0 (zero) to a server prevents the server from being assigned any new connections. This server is a backup server.
- A higher weight value indicates that the server can accept more network traffic.

### Examples

```
-> ip slb server ip 10.255.11.127 cluster corporate_servers
-> ip slb server ip 10.255.11.109 cluster "mail servers" admin-state enable
weight 5
-> no ip slb server ip 10.255.11.105 cluster hr_servers
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">show ip slb clusters</a>	Displays the status and configuration of all Server Load Balancing clusters on a switch.

## MIB Objects

```
slbServerTable
  slbServerRowStatus
  slbServerAdminStatus
  slbServerAdminWeight
```

---

## ip slb server ip cluster probe

Configures a probe for a Server Load Balancing (SLB) server.

```
ip slb server ip ip_address cluster cluster_name probe probe_name
```

---

### Syntax Definitions

<i>ip_address</i>	The IP address for the physical server.
<i>cluster_name</i>	The name of the Server Load Balancing (SLB) cluster.
<i>probe_name</i>	The name of the Server Load Balancing (SLB) probe.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

You must create the probe with the [ip slb probe](#) before you can use this command.

### Examples

```
-> ip slb server ip 10.255.11.127 cluster corporate_servers probe p_http
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">show ip slb clusters</a>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<a href="#">show ip slb cluster</a>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<a href="#">ip slb probe</a>	Configures and deletes SLB probes.
<a href="#">ip slb admin-state</a>	Enables or disables Server Load Balancing on a switch.
<a href="#">ip slb cluster</a>	Configures Server Load Balancing clusters.

### MIB Objects

slbServerTable  
    slbServerProbeName

---

## ip slb probe

Configures a Server Load Balancing (SLB) probe used to check the health of servers or clusters.

```
ip slb probe probe_name {ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp}
```

```
no ip slb probe probe_name
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>ftp</b>	Specifies an FTP probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<b>imap</b>	Specifies an IMAP probe.
<b>imaps</b>	Specifies an IMAPS probe.
<b>nntp</b>	Specifies an NNTP probe.
<b>ping</b>	Specifies a ping probe.
<b>pop</b>	Specifies a POP probe.
<b>pops</b>	Specifies a POPS probe.
<b>smtp</b>	Specifies an SMTP probe.
<b>tcp</b>	Specifies a TCP probe.
<b>udp</b>	Specifies a UDP probe.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to delete an SLB probe.

### Examples

```
-> ip slb probe mail_server_probe smtp  
-> no ip slb probe mail_server_probe
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

[show ip slb probes](#)

Displays the configuration of SLB probes.

## MIB Objects

```
slbProbeTable  
  slbProbeName  
  slbProbeMethod
```

---

## ip slb probe timeout

Configures the amount of time to wait for Server Load Balancing (SLB) probe answers.

```
ip slb probe probe_name {ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp}
timeout seconds
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>ftp</b>	Specifies an FTP probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<b>imap</b>	Specifies an IMAP probe.
<b>imaps</b>	Specifies an IMAPS probe.
<b>nntp</b>	Specifies an NNTP probe.
<b>ping</b>	Specifies a ping probe.
<b>pop</b>	Specifies a POP probe.
<b>pops</b>	Specifies a POPS probe.
<b>smtp</b>	Specifies an SMTP probe.
<b>tcp</b>	Specifies a TCP probe.
<b>udp</b>	Specifies a UDP probe.
<i>seconds</i>	Specifies the timeout in seconds.

### Defaults

parameter	default
<i>seconds</i>	3000

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip slb probe mail_server smtp timeout 12000
```

## Release History

Release 7.1.1; command introduced.

slbProbeTimeout

---

## ip slb probe period

Configures the length of time between each SLB probe to check the health of the servers.

```
ip slb probe probe_name {ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp}
period seconds
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>ftp</b>	Specifies an FTP probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<b>imap</b>	Specifies an IMAP probe.
<b>imaps</b>	Specifies an IMAPS probe.
<b>nntp</b>	Specifies an NNTP probe.
<b>ping</b>	Specifies a ping probe.
<b>pop</b>	Specifies a POP probe.
<b>pops</b>	Specifies a POPS probe.
<b>smtp</b>	Specifies an SMTP probe.
<b>tcp</b>	Specifies a TCP probe.
<b>udp</b>	Specifies a UDP probe.
<i>seconds</i>	Specifies the length of time for the SLB probe period.

### Defaults

parameter	default
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip slb probe web_server http period 120
```

## Release History

Release 7.1.1; command introduced.

    slbProbePeriod

---

## ip slb probe port

Configures the TCP/UDP port on which the Server Load Balancing (SLB) probe is sent.

```
ip slb probe probe_name {ftp | http | https | imap | imaps | nntp | ping | pop | pops | smtp | tcp | udp}
port port_number
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>ftp</b>	Specifies an FTP probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<b>imap</b>	Specifies an IMAP probe.
<b>imaps</b>	Specifies an IMAPS probe.
<b>nntp</b>	Specifies an NNTP probe.
<b>ping</b>	Specifies a ping probe.
<b>pop</b>	Specifies a POP probe.
<b>pops</b>	Specifies a POPS probe.
<b>smtp</b>	Specifies an SMTP probe.
<b>tcp</b>	Specifies a TCP probe.
<b>udp</b>	Specifies a UDP probe.
<i>port_number</i>	Specifies the TDP/UDP port number.

### Defaults

parameter	default
<i>port_number</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip slb probe mis_server udp port 200
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

## ip slb probe retries

Configures the number of Server Load Balancing (SLB) probe retries that are performed before deciding that a server is out of service.

**ip slb probe** *probe\_name* {**ftp** | **http** | **https** | **imap** | **imaps** | **nntp** | **ping** | **pop** | **pops** | **smtp** | **tcp** | **udp**}  
**retries** *retries*

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>ftp</b>	Specifies an FTP probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<b>imap</b>	Specifies an IMAP probe.
<b>imaps</b>	Specifies an IMAPS probe.
<b>nntp</b>	Specifies an NNTP probe.
<b>ping</b>	Specifies a ping probe.
<b>pop</b>	Specifies a POP probe.
<b>pops</b>	Specifies a POPS probe.
<b>smtp</b>	Specifies an SMTP probe.
<b>tcp</b>	Specifies a TCP probe.
<b>udp</b>	Specifies a UDP probe.
<i>retries</i>	Specifies the number of retries.

### Defaults

parameter	default
<i>retries</i>	3

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip slb probe mail_server smtp retries 5
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

Displays the configuration of SLB probes.

## MIB Objects

slbProbeTable

    slbProbeName

    slbProbeMethod

    slbProbeRetries

---

## ip slb probe username

Configures a user name that is sent to a server as credentials for an HTTP GET operation to verify the health of the server.

```
ip slb probe probe_name {http | https} username user_name
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<i>user_name</i>	Specifies user name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip slb probe web_server http username subnet1
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

  slbProbeMethod  
  slbProbeHttpUsername
```

---

## ip slb probe password

Configures a password that is sent to a server as credentials for an HTTP GET to verify the health of the server.

```
ip slb probe probe_name {http | https} password password
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<i>password</i>	Specifies the password.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The password is encrypted in the configuration file so that it is not readable.

### Examples

```
-> ip slb probe web_server http password h1f45xc
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

## ip slb probe url

Configures a URL that is sent to a server for an HTTP GET to verify the health of the server.

```
ip slb probe probe_name {http | https} url url
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<i>url</i>	Specifies the URL of the server.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip slb probe web_server http url pub/index.html
```

### Release History

Release 7.1.1; command introduced.

## ip slb probe status

Configures the expected status returned from an HTTP GET to verify the health of a server.

```
ip slb probe probe_name {http | https} status status_value
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<i>status_value</i>	Specifies the expected status returned.

### Defaults

---

parameter	default
<i>status_value</i>	200

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip slb probe web_server http status 404
```

### Release History

Release 7.1.1; command introduced.

---

## ip slb probe send

Configures an ASCII string that is sent to a server to invoke a server response and verify the health of the server.

```
ip slb probe probe_name {tcp | udp} send send_string
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>tcp</b>	Specifies a TCP probe.
<b>udp</b>	Specifies a UDP probe.
<i>send_string</i>	Specifies the ASCII string sent to a server to invoke a response.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

NA

### Examples

```
-> ip slb probe web_server tcp send test
```

## ip slb probe expect

Configures an ASCII string used to compare a response from a server to verify the health of the server.

```
ip slb probe probe_name {http | https | tcp | udp} expect expect_string
```

---

### Syntax Definitions

<i>probe_name</i>	Specifies the name of the Server Load Balancing (SLB) probe.
<b>http</b>	Specifies an HTTP probe.
<b>https</b>	Specifies an HTTPS probe.
<b>tcp</b>	Specifies a TCP probe.
<b>udp</b>	Specifies a UDP probe.
<i>expect_string</i>	Specifies the ASCII string used to compare a response from a server.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

## show ip slb

Displays the status of Server Load Balancing on a switch.

**show ip slb**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip slb
```

```
Admin status           : Enabled,  
Operational status    : In Service,  
Number of clusters    = 3
```

Output fields are described here:

#### *output definitions*

---

<b>Admin status</b>	The current administrative status of Server Load Balancing (SLB) on this switch ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Operational status</b>	The current operational status of Server Load Balancing (SLB) on this switch, which is either <b>In service</b> (at least one SLB cluster is in service) or <b>Out of service</b> (all SLB clusters are out of service).
<b>Number of clusters</b>	The total number of Server Load Balancing (SLB) clusters on this switch.

---

### Release History

Release 7.1.1; command introduced.

## Related Commands

<b>show ip slb servers</b>	Displays the status of all physical servers belonging to Server Load Balancing clusters on a switch.
<b>show ip slb clusters</b>	Displays the status and configuration of all Server Load Balancing clusters on a switch.
<b>show ip slb cluster</b>	Displays detailed status and configuration information for a single Server Load Balancing cluster on a switch.
<b>show ip slb cluster server</b>	Displays detailed status and configuration information for a single physical server in a Server Load Balancing cluster.

## MIB Objects

```
slbFeature  
  slbAdminStatus  
  slbOperStatus  
  slbClustersCount
```

---

## show ip slb clusters

Displays the status and basic configuration for all Server Load Balancing (SLB) clusters on a switch. This command also displays traffic statistics for QoS policy condition clusters.

**show ip slb clusters [statistics]**

---

### Syntax Definitions

**statistics** Displays SLB statistics for QoS policy condition clusters.

### Defaults

By default, the status and basic configuration for all clusters is displayed; statistics are not shown.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **statistics** parameter to display the total number of packets that were passed to clusters because they met the QoS condition criteria configured for that cluster. The polling interval used to obtain such statistics is every 15 minutes. See the second example below.

### Examples

```
-> show ip slb clusters
```

Cluster Name	VIP/COND	Admin Status	Operational Status	# Srv	% Avail
WorldWideWeb	128.241.130.204	Enabled	In Service	3	95
Intranet	128.241.130.205	Enabled	In Service	2	100
FileTransfer	128.241.130.206	Enabled	Out of Service	2	50

Output fields are described here:

#### output definitions

---

<b>Cluster Name</b>	The name of the SLB cluster.
<b>VIP/COND</b>	The virtual IP (VIP) address or the policy condition name for the SLB cluster.
<b>Admin Status</b>	The administrative status of the SLB cluster ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Operational Status</b>	The operational status of the SLB cluster; <b>In Service</b> (at least one physical server is operational in the cluster) or <b>Out of Service</b> .
<b># Srv</b>	The total number of physical servers that belong to the SLB cluster.
<b>% Avail</b>	The percentage of time that the physical server has been available for processing client requests. In other words, the actual ratio of up time ( <b>In Service</b> plus <b>Retrying</b> ) versus down time ( <b>No Answer</b> plus <b>Link Down</b> ). Please note that the <b>Disabled</b> and the initial <b>Discovery</b> states are not counted as down time.

---

```
-> show ip slb clusters statistics
```

```

Cluster Name           Admin   Operational
                      Status  Status           Count
-----+-----+-----+-----
Cluster1               Enabled In Service       4 Servers
Cluster2               Enabled In Service       4 Servers

## show ip slb cluster

Displays detailed statistics and configuration information and operational status for a single Server Load Balancing (SLB) cluster. This command also displays traffic statistics for single QoS policy condition cluster.

**show ip slb cluster** *name* [**statistics**]

---

### Syntax Definitions

**name** Specifies the name of the SLB cluster.

**statistics** Displays SLB statistics for the specified cluster.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **statistics** parameter to display the total number of packets that were passed to the cluster because they met the QoS condition criteria configured for that cluster. The polling interval used to obtain such statistics is every 15 minutes. See the second example below:

### Examples

```
-> show ip slb cluster Intranet
```

```
Cluster Intranet
VIP                : 128.241.130.204,
Type               : L3
Admin status      : Enabled,
Operational status : In Service,
Ping period (seconds) = 60,
Ping timeout (milliseconds) = 3000,
Ping retries      : 3,
Probe             : None,
Number of packets = 25346,
Number of servers = 3
  Server 128.241.130.107
    Admin status = Enabled, Operational status = In Service,
    Weight = 4, Availability (%) = 0
  Server 128.241.130.117
    Admin status = Enabled, Operational status = Discovery,
    Weight = 6, Availability (%) = 0
  Server 128.241.130.127
    Admin status = Enabled, Operational status = Discovery,
    Weight = 1, Availability (%) = 0
```

*output definitions*

---

<b>Cluster</b>	The name of this Server Load Balancing (SLB) cluster.
<b>VIP</b>	The virtual IP (VIP) address for this Server Load Balancing (SLB) cluster.
<b>Type</b>	The classifier for the hypothetical packet, which can be <b>L2</b> or <b>L3</b> .
<b>Admin status</b>	The current administrative status of this Server Load Balancing (SLB) cluster ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Operational status</b>	The current operational status of this Server Load Balancing (SLB) cluster, which is <b>In Service</b> (at least one physical server is operational in the cluster) or <b>Out of Service</b> .
<b>Ping period (seconds)</b>	The ping period (in seconds) used by this Server Load Balancing (SLB) cluster to check the health of physical servers.
<b>Ping timeout (milliseconds)</b>	The timeout (in milliseconds) used by this Server Load Balancing (SLB) cluster to wait for ping answers from physical servers.
<b>Ping retries</b>	The number of ping retries that this Server Load Balancing (SLB) cluster executes before switching the status to <b>No answer</b> .
<b>Probe</b>	The probe configured for this cluster.
<b>Number of packets</b>	The number of packets balanced for this Server Load Balancing (SLB) cluster.
<b>Number of servers</b>	The total number of physical servers that belong to this Server Load Balancing (SLB) cluster.
<b>Server</b>	The IP address for this physical server.
<b>Admin Status</b>	The administrative state of this physical server ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Operational Status</b>	The operational state of this server. The possible states are described as follows: <ul style="list-style-type: none"> <li>• <b>Disabled</b> (this server is administratively disabled).</li> <li>• <b>No Answer</b> (this server has not responded to ping requests).</li> <li>• <b>Link Down</b> (there is a bad connection to this server).</li> <li>• <b>In Service</b> (this server is used for SLB cluster client connections).</li> <li>• <b>Discovery</b> (the SLB cluster is pinging this physical server).</li> <li>• <b>Retrying</b> (the SLB cluster is making another attempt to bring up this server).</li> </ul>
<b>Availability (%)</b>	The percentage of time that this physical server has been available for processing client requests. In other words, the actual ratio of up time ( <b>In Service</b> plus <b>Retrying</b> ) versus down time ( <b>No Answer</b> plus <b>Link Down</b> ). Please note that the <b>Disabled</b> and the initial <b>Discovery</b> states are not counted as down time.

---

```
-> show ip slb cluster Intranet statistics
```

Cluster Name	Admin Status	Operational Status	Count
Intranet	Enabled	In Service	3 Servers
Src IP 15.2.3.2/255.255.255.255			195

### output definitions

<b>Cluster Name</b>	The name of the SLB cluster. This field also contains the administrative and operational status for the cluster and either the VIP address or QoS policy condition value that identifies the cluster.
<b>Admin status</b>	The current administrative status of this physical server ( <b>Enabled</b> or <b>Disabled</b> ).
<b>Oper status</b>	The operational state of this server. The possible states are described as follows: <ul style="list-style-type: none"> <li>• <b>Disabled</b> (this server is administratively disabled).</li> <li>• <b>No Answer</b> (this server has not responded to ping requests).</li> <li>• <b>Link Down</b> (there is a bad connection to this server).</li> <li>• <b>In Service</b> (this server is used for SLB cluster client connections).</li> <li>• <b>Discovery</b> (the SLB cluster is pinging this physical server).</li> <li>• <b>Retrying</b> (the SLB cluster is making another attempt to bring up this server).</li> </ul>
<b>Count</b>	The total number of physical servers that belong to the cluster, and the total number of packets serviced by the cluster.

## show ip slb cluster server

Displays detailed statistics and configuration information for a single physical server in a Server Load Balancing (SLB) cluster.

**show ip slb cluster** *name* **server** *ip\_address*

---

### Syntax Definitions

*name* Specifies the name of the Server Load Balancing (SLB) cluster.

*ip\_address* Specifies the IP address for the physical server.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Specifying a value for the *name* and *ip\_address* parameters is required.

### Examples

```
-> show ip slb cluster Intranet server 128.220.40.4
Cluster c11
  VIP 128.220.40.205
  Server 128.220.40.4
    Admin status           : Enabled,
    Oper status            : In Service,
    Probe                  = phttp,
    Availability time (%)  = 95,
    Ping failures          = 0,
    Last ping round trip time (milliseconds) = 20,
    Probe status           = ,
```

Output fields are described here:

#### *output definitions*

---

<b>Cluster</b>	The name of the Server Load Balancing (SLB) cluster.
<b>VIP</b>	The virtual IP (VIP) address for this Server Load Balancing (SLB) cluster.
<b>Server</b>	The IP address for this physical server.
<b>Admin status</b>	The current administrative status of this physical server ( <b>Enabled</b> or <b>Disabled</b> ).

*output definitions (continued)*

---

<b>Oper status</b>	The operational state of this server. The possible states are described as follows: <ul style="list-style-type: none"> <li>• <b>Disabled</b> (this server is administratively disabled).</li> <li>• <b>No Answer</b> (this server has not responded to ping requests).</li> <li>• <b>Link Down</b> (there is a bad connection to this server).</li> <li>• <b>In Service</b> (this server is used for SLB cluster client connections).</li> <li>• <b>Discovery</b> (the SLB cluster is pinging this physical server).</li> <li>• <b>Retrying</b> (the SLB cluster is making another attempt to bring up this server).</li> </ul>
<b>Probe</b>	The name of the probe configured for this server.
<b>Availability time (%)</b>	The percentage of time that this physical server has been available for processing client requests. In other words, the actual ratio of up time ( <b>In Service</b> plus <b>Retrying</b> ) versus down time ( <b>No Answer</b> plus <b>Link Down</b> ). Please note that the <b>Disabled</b> and the initial <b>Discovery</b> states are not counted as down time.
<b>Ping failures</b>	The total number of pings that have failed on this physical server.
<b>Last ping round trip time (milliseconds)</b>	The total amount of time (in milliseconds) measured for the last valid ping to this physical server to make a round trip.
<b>Probe status</b>	The status of the probe configured for this server.

```

---

## show ip slb probes

Displays the configuration of Server Load Balancing (SLB) probes.

**show ip slb probes** [*probe\_name*]

---

### Syntax Definitions

*probe\_name* Specifies the name of the Server Load Balancing (SLB) probe.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If you do not specify the name of an SLB probe then all SLB probes are displayed.

### Examples

No probe name is specified:

```
-> show ip slb probes
```

Probe Name	Period	Retries	Timeout	Method
web_server	60000	3	12000	HTTP
mail_server	60000	3	3000	SMTP
mis_servers	3600000	5	24000	Ping

Output fields are described here:

#### *output definitions*

---

<b>Probe Name</b>	The user-specified name of the probe.
<b>Period</b>	The period (in seconds) to check the health of servers.
<b>Retries</b>	The number of probe retries before deciding that a server is out of service.
<b>Timeout</b>	The timeout (in seconds) used to wait for probe answers.
<b>Method</b>	The type of probe.

---

The name of a probe that is not an HTTP/HTTPS probe is specified:

```
-> show ip slb probes mail_server
```

```
Probe mail_server
  Type                = SMTP,
  Period (seconds)    = 60,
  Timeout (milliseconds) = 3000,
  Retries              = 3,
  Port                = 0,
```

The name of an HTTP/HTTPS probe is specified:

```
-> show ip slb probes phttp
```

```
Probe phttp
  Type                = HTTP,
  Period (seconds)    = 60,
  Timeout (milliseconds) = 3000,
  Retries              = 3,
  Port                = 0,
  Username            = ,
  Password            = ,
  Expect              = ,
  Status              = 200,
  URL                 = /,
```

Output fields are described here:

### *output definitions*

---

<b>Probe</b>	The user-specified name of the probe.
<b>Type</b>	The type of probe.
<b>Period</b>	The period (in seconds) to check the health of servers.
<b>Timeout</b>	The timeout (in seconds) used to wait for probe answers.
<b>Retries</b>	The number of probe retries before deciding that a server is out of service.
<b>Port</b>	The TCP/UDP port on which the probe is sent.
<b>Username</b>	The configured user name sent to a server as credentials for an HTTP GET operation for the probe.
<b>Password</b>	The configured password for the probe.
<b>Expect</b>	The configured ASCII string used to compare a response from a server to verify the health of the server.
<b>Status</b>	The expected status returned from an HTTP GET to verify the health of a server.
<b>URL</b>	The configured URL sent to a server for an HTTP GET to verify the health of the server.

---

### **Release History**

# 23 IP Multicast Switching Commands

IP Multicast Switching (IPMS) is a one-to-many communication technique employed by emerging applications such as video distribution, news feeds, conferencing, netcasting, and resource discovery (OSPF, RIP2, and BOOTP). Unlike unicast, which sends one packet per destination, multicast sends one packet to all devices in any subnetwork that has at least one device requesting the multicast traffic.

Alcatel-Lucent's IPMS software is compatible with the following RFCs:

- RFC 1112 — Host Extensions for IP Multicasting
- RFC 2236 — Internet Group Management Protocol, Version 2
- RFC 2933 — Internet Group Management Protocol MIB
- RFC 3376 — Internet Group Management Protocol, Version 3

Alcatel-Lucent's IPv6MS software is compatible with the following RFCs:

- RFC 2710 — Multicast Listener Discovery for IPv6
- RFC 3019 — IPv6 MIB for Multicast Listener Discovery Protocol
- RFC 3810 — Multicast Listener Discovery Version 2 for IPv6

MIB information for the IPMS commands is as follows:

*Filename:* AlcatelIND1Igmplib  
*Module:* ALCATEL-IGMP-IND1-MIB

MIB information for the IPv6MS commands is as follows:

*Filename:* AlcatelIND1Mld.mib  
*Module:* ALCATEL-MLD-IND1-MIB

The following table summarizes the available IP and IPv6 multicast commands:

---

**ip multicast admin-state**  
**ip multicast querier-forwarding**  
**ip multicast version**  
**ip multicast max-group**  
**ip multicast vlan max-group**  
**ip multicast port max-group**  
**ip multicast static-querier**  
**ip multicast static-group**  
**ip multicast query-interval**  
**ip multicast last-member-query-interval**  
**ip multicast query-response-interval**  
**ip multicast unsolicited-report-interval**  
**ip multicast router-timeout**  
**ip multicast source-timeout**  
**ip multicast querying**  
**ip multicast robustness**  
**ip multicast spoofing**  
**ip multicast zapping**  
**ip multicast proxying**  
**ip multicast helper-address**

**show ipv6 multicast querier**  
**show ipv6 multicast group**  
**show ipv6 multicast source**  
**show ipv6 multicast tunnel**

---

## ip multicast admin-state

Enables or disables IP Multicast Switching and Routing on the specified VLAN, or on the system if no VLAN is specified.

**ip multicast** [*vlan vid*] **admin-state** [{**enable** | **disable**}]

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable IP Multicast Switching and Routing.
<b>disable</b>	Disable IP Multicast Switching and Routing.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If an IP Multicast Routing protocol is already running on the system, the **ip multicast admin-state** command will override the existing configuration and always enable IP Multicast Switching and Routing.
- If the IP Multicast Switching and Routing is already enabled on the system, then the VLAN configuration will override the system's configuration.
- You can also restore the IP Multicast Switching and Routing to its default (i.e., disabled) status on the system if no VLAN is specified, by using only **ip multicast admin-state**.
- You can also restore the IP Multicast Switching and Routing to its default (i.e., disabled) status on the specified VLAN, by using only **ip multicast vlan vid admin-state**.

### Examples

```
-> ip multicast admin-state enable
-> ip multicast admin-state disable
-> ip multicast vlan 2 admin-state enable
-> ip multicast vlan 2 admin-state disable
-> ip multicast vlan 2 admin-state
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

alaIcmp

    alaIcmpStatus

alaIcmpVlan

    alaIcmpVlanStatus

---

## ip multicast querier-forwarding

Enables or disables IGMP querier forwarding on the specified VLAN or on the system if no VLAN is specified.

**ip multicast [vlan *vid*] querier-forwarding [{enable | disable}]**

**no ip multicast [vlan *vid*] querier-forwarding**

---

### Syntax Definitions

<i>vid</i>	The VLAN on which configuration is applied.
<b>enable</b>	Enable IGMP querier forwarding.
<b>disable</b>	Disable IGMP querier forwarding.

### Defaults

---

parameter	default
<b>enable / disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove an IGMP querier forwarding entry on the specified VLAN or on the system and return to its default behavior.
- If the IGMP querier forwarding is already enabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP querier forwarding refers to promoting detected IGMP queriers to receive all IP multicast data traffic.

### Examples

```
-> ip multicast querier-forwarding enable
-> ip multicast querier-forwarding disable
-> ip multicast querier-forwarding
-> ip multicast vlan 2 querier-forwarding enable
-> ip multicast vlan 2 querier-forwarding disable
-> ip multicast vlan 2 querier-forwarding
-> no ip multicast vlan 2 querier-forwarding
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaIcmp
  alaIcmpQuerierForwarding
alaIcmpVlan
  alaIcmpVlanQuerierForwarding
```

---

## ip multicast version

Sets the default version of the IGMP protocol on the specified VLAN or on the system if no VLAN is specified.

**ip multicast** [**vlan** *vid*] **version** [*version*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*version* Default IGMP protocol version to run. Valid range is 1 to 3.

### Defaults

parameter	default
<i>version</i>	2

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the default IGMP protocol version on the system and/or the specified VLANs.
- If the default IGMP protocol version is already configured on the system, then the VLAN configuration will override the system's configuration.
- Due to protocol inter-operation requirements, this command specifies only a default version of the IGMP protocol to run.
- To restore the IGMP multicast version to the default (i.e., 2) version on the system if no VLAN is specified, use **ip multicast version** followed by the value 0 (e.g., ip multicast version 0) or use only **ip multicast version** (e.g., ip multicast version).
- To restore the IGMP multicast version to the default (i.e., 2) version on the specified VLAN, use **ip multicast vlan *vid* version**, followed by the value 0 (e.g., ip multicast vlan 2 version 0) or use only **ip multicast vlan *vid* version** (e.g., ip multicast vlan 2 version).

### Examples

```
-> ip multicast version 3
-> ip multicast version 0
-> ip multicast version
-> ip multicast vlan 2 version 3
-> ip multicast vlan 2 version 0
-> ip multicast vlan 2 version
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaIcmp
  alaIcmpVersion
alaIcmpVlan
  alaIcmpVlanVersion
```

---

## ip multicast max-group

Configures the global maximum group limit that can be learned per port/VLAN instance. The limit is applied to each port/VLAN instance and an action is taken when it exceeds the limit.

**ip multicast max-group** [*num*] [action {none | drop | replace}]

---

### Syntax Definitions

<i>num</i>	Specifies the maximum IGMP group count. Valid range is 0 to 4294967295.
<b>none</b>	Disables the maximum group limit configuration
<b>drop</b>	Drops the incoming membership request.
<b>replace</b>	Replaces an existing membership with the incoming membership request.

### Defaults

By default, the max-group limit is set to zero.

parameter	defaults
action	none

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance.
- The configuration is allowed even when the ip multicast status is disabled.
- If the num and action parameters are not specified, then the limit is removed.
- The max-group configuration on a specific VLAN or port will override the global configuration.
- IGMP zapping must be enabled when the max-group limit is enabled and the action is dropped.

### Examples

```
-> ip multicast max-group 10 action drop
-> ip multicast max-group 20 action replace
-> ip multicast max-group
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaIcmpMaxGroupLimit  
alaIcmpMaxGroupExceedAction
```

---

## ip multicast vlan max-group

Configures the maximum group limit learned per port on a VLAN. The limit is applied to each port that is a member of the given VLAN.

**ip multicast vlan *vid* max-group [*num*] [action {none | drop | replace}]**

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<i>num</i>	The maximum IGMP group count. Valid range is 0 to 4294967295.
<b>none</b>	Disables the maximum group limit configuration.
<b>drop</b>	Drops the incoming membership request.
<b>replace</b>	Replaces an existing membership with the incoming membership request.

### Defaults

By default, the max-group limit is set to zero.

parameter	defaults
Action	none

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance
- The configuration is allowed even when the ip multicast status is disabled.
- If the num and action parameters are not specified, then the limit is removed.
- The max-group configuration on a VLAN will override the global configuration.
- IGMP zapping must be enabled when the max-group limit is enabled and the action is dropped.

### Examples

```
-> ip multicast vlan 10 max-group 10 action drop
-> ip multicast vlan 10 max-group
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

alaIcmpVlanTable

    alaIcmpVlanMaxGroupLimit

    alaIcmpVlanMaxGroupExceedAction

---

## ip multicast port max-group

Configures the maximum group limit learned per port. The limit is applicable on the given port for all VLAN instances of the port.

**ip multicast port *slot / port* max-group [*num*] [action {none | drop | replace}]**

---

### Syntax Definitions

<i>slot / port</i>	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<i>num</i>	The maximum IGMP group count. Valid range is 0 to 4294967295.
<b>none</b>	Disables the maximum group limit configuration.
<b>drop</b>	Drops the incoming membership request.
<b>replace</b>	Replaces an existing membership with the incoming membership request.

### Defaults

By default, the max-group limit is set to zero.

parameter	defaults
Action	none

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance
- The configuration is allowed even when the ip multicast status is disabled.
- If the num and action parameters are not specified, then the limit is removed.
- The max-group configuration on a port will override the VLAN or global configuration.
- IGMP zapping must be enabled when the max-group limit is enabled and the action is dropped.

### Examples

```
-> ip multicast port 1/1 max-group 10 action drop
-> ip multicast port 6/14 max-group 20 action replace
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

alaIcmpPortTable

  alaIcmpPortMaxGroupLimit

  alaIcmpPortMaxGroupExceedAction

---

## ip multicast static-neighbor

Creates a static IGMP neighbor entry on a specified port on a specified VLAN.

**ip multicast static-neighbor** vlan *vid* port *slot/port*

**no ip multicast static-neighbor** vlan *vid* port *slot/port*

---

### Syntax Definitions

*vid* VLAN to include as a static IGMP neighbor.

*slot/port* The slot/port number you want to configure as a static IGMP neighbor.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove an IGMP static neighbor entry on a specified port on a specified VLAN.
- The **ip multicast static-neighbor** command allows you to create an IGMP static neighbor entry on a specified port on a specified VLAN. This, in turn, enables that network segment to receive all the IGMP traffic.
- You can also create an IGMP static neighbor entry on a link aggregate port by entering **ip multicast static-neighbor** vlan *vid* port, followed by the link aggregation group number (e.g., ip multicast static-neighbor vlan 2 port 7).

### Examples

```
-> ip multicast static-neighbor vlan 4 port 1/1
-> no ip multicast static-neighbor vlan 4 port 1/1
-> ip multicast static-neighbor vlan 4 port 7
-> no ip multicast static-neighbor vlan 4 port 7
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**show ip multicast neighbor** Displays the IGMP neighbor table entries of IP Multicast Switching and Routing.

## MIB Objects

```
alaIcmpStaticNeighborTable  
  alaIcmpStaticNeighborVlan  
  alaIcmpStaticNeighborIfIndex  
  alaIcmpStaticNeighborRowStatus
```

---

## ip multicast static-querier

Creates a static IGMP querier entry on a specified port on a specified VLAN.

**ip multicast static-querier** *vlan vid port slot/port*

**no ip multicast static-querier** *vlan vid port slot/port*

---

### Syntax Definitions

*vid* VLAN to include as a static IGMP querier.

*slot/port* The slot/port number you want to configure as a static IGMP querier.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove an IGMP static querier entry on a specified port on a specified VLAN.
- The **ip multicast static-querier** command allows you to create an IGMP static querier entry on a specified port on a specified VLAN. This, in-turn, enables that network segment to receive all the IGMP traffic.
- You can also create an IGMP static querier entry on a link aggregate port by entering **ip multicast static-querier** *vlan vid port*, followed by the link aggregation group number (e.g., `ip multicast static-querier vlan 2 port 7`).

### Examples

```
-> ip multicast static-querier vlan 4 port 1/1
-> no ip multicast static-querier vlan 4 port 1/1
-> ip multicast static-querier vlan 4 port 7
-> no ip multicast static-querier vlan 4 port 7
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast querier**

Displays the IGMP querier table entries of IP Multicast Switching and Routing.

## MIB Objects

```
alaIgmStaticQuerierTable  
  alaIgmStaticQuerierVlan  
  alaIgmStaticQuerierIfIndex  
  alaIgmStaticQuerierRowStatus
```

---

## ip multicast static-group

Creates a static IGMP group entry on a specified port on a specified VLAN.

**ip multicast static-group** *ip\_address* **vlan** *vid* **port** *slot/port*

**no ip multicast static-group** *ip\_address* **vlan** *vid* **port** *slot/port*

---

### Syntax Definitions

<i>ip_address</i>	The IP address of the multicast group.
<i>vid</i>	VLAN to include as a static IGMP group.
<i>slot/port</i>	The slot/port number you want to configure as a static IGMP group.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove an IGMP static group entry on a specified port on a specified VLAN.
- The **ip multicast static-group** command allows you to create an IGMP static group entry on a specified port on a specified VLAN. This, in-turn, enables that network segment to receive IGMP traffic addressed to the specified IP multicast group address.
- You can also create an IGMP static group entry on a link aggregate port by entering **ip multicast static-group** *ip\_address* **vlan** *vid* **port**, followed by the link aggregation group number (e.g., ip multicast static-group 11.0.0.1 vlan 2 port 7).

### Examples

```
-> ip multicast static-group 229.10.10.10 vlan 4 port 1/1
-> no ip multicast static-group 229.10.10.10 vlan 4 port 1/1
-> ip multicast static-group 225.11.11.11 vlan 4 port 7
-> no ip multicast static-group 225.11.11.11 vlan 4 port 7
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast group**

Displays the IGMP group membership table entries of IP Multicast Switching and Routing for the specified IP multicast group address or all entries if no IP multicast group address is specified.

## MIB Objects

```
alaIcmpStaticMemberTable  
  alaIcmpStaticMemberVlan  
  alaIcmpStaticMemberIfIndex  
  alaIcmpStaticMemberGroupAddress  
  alaIcmpStaticMemberRowStatus
```

---

## ip multicast query-interval

Sets the IGMP query interval on the specified VLAN or on the system if no VLAN is specified.

**ip multicast** [**vlan vid**] **query-interval** [*seconds*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*seconds* IGMP query interval in seconds. Valid range is 1 to 65535.

### Defaults

parameter	default
<i>seconds</i>	125

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP query interval on the system and/or the specified VLANs.
- If the IGMP query interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The IGMP query interval refers to the time period between IGMP query messages.
- To restore the IGMP query interval to its default (i.e., 125 seconds) value on the system if no VLAN is specified, use **ip multicast query-interval** followed by the value 0 (e.g., ip multicast query-interval 0) or use only **ip multicast query-interval** (e.g., ip multicast query-interval).
- To restore the IGMP query interval to its default (i.e., 125 seconds) value on the specified VLAN, use **ip multicast vlan vid query-interval**, followed by the value 0 (e.g., ip multicast vlan 2 query-interval 0) or use only **ip multicast vlan vid query-interval** (e.g., ip multicast vlan 2 query-interval).

### Examples

```
-> ip multicast query-interval 100
-> ip multicast query-interval 0
-> ip multicast query-interval
-> ip multicast vlan 2 query-interval 100
-> ip multicast vlan 2 query-interval 0
-> ip multicast vlan 2 query-interval
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaIcmp
  alaIcmpQueryInterval
alaIcmpVlan
  alaIcmpVlanQueryInterval
```

---

## ip multicast last-member-query-interval

Sets the IGMP last member query interval value on the specified VLAN or on the system if no VLAN is specified.

**ip multicast [vlan vid] last-member-query-interval [tenths-of-seconds]**

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<i>tenths-of-seconds</i>	IGMP last member query interval in tenths of seconds. Valid range is 1 to 65535.

### Defaults

---

parameter	default
<i>tenths-of-seconds</i>	10

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP last member query interval on the system and/or the specified VLANs.
- If the IGMP last member query interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The IGMP last member query interval refers to the time period to reply to an IGMP query message sent in response to a leave group message.
- To restore the IGMP last member query interval to its default (i.e., 10 tenths-of-seconds) value on the system if no VLAN is specified, use **ip multicast last-member-query-interval** followed by the value 0 (e.g., ip multicast last-member-query-interval 0) or use only **ip multicast last-member-query-interval** (e.g., ip multicast last-member-query-interval).
- To restore the IGMP last member query interval to its default (i.e., 10 tenths-of-seconds) value on the specified VLAN, use **ip multicast vlan vid last-member-query interval** followed by the value 0 (e.g., ip multicast vlan 2 last-member-query-interval 0) or use only **ip multicast vlan vid last-member-query-interval** (e.g., ip multicast vlan 2 last-member-query-interval).

### Examples

```
-> ip multicast last-member-query-interval 22
-> ip multicast last-member-query-interval 0
-> ip multicast last-member-query-interval
-> ip multicast vlan 2 last-member-query-interval 22
-> ip multicast vlan 2 last-member-query-interval 0
-> ip multicast vlan 2 last-member-query-interval
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

## ip multicast query-response-interval

Sets the IGMP query response interval on the specified VLAN or on the system if no VLAN is specified.

**ip multicast** [**vlan** *vid*] **query-response-interval** [*tenths-of-seconds*]

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<i>tenths-of-seconds</i>	IGMP query response interval in tenths of seconds. Valid range is 1 to 65535.

### Defaults

---

parameter	default
<i>tenths-of-seconds</i>	100

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP query response interval on the system and/or the specified VLANs.
- If the IGMP query response interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The query response interval refers to the time period to reply to an IGMP query message.
- To restore the IGMP query response interval to its default (i.e., 100 tenths-of-seconds) value on the system if no VLAN is specified, use **ip multicast query-response-interval** followed by the value 0 (e.g., **ip multicast query-response-interval 0**) or use only **ip multicast query-response-interval** (e.g., **ip multicast query-response-interval**).
- To restore the IGMP last member query interval to its default (i.e., 100 tenths-of-seconds) value on the specified VLAN, use **ip multicast vlan** *vid* **query-response-interval** followed by the value 0 (e.g., **ip multicast vlan 2 query-response-interval 0**) or use only **ip multicast vlan** *vid* **query-response-interval** (e.g., **ip multicast vlan 2 query-response-interval**).

### Examples

```
-> ip multicast query-response-interval 200
-> ip multicast query-response-interval 0
-> ip multicast query-response-interval
-> ip multicast vlan 2 query-response-interval 300
-> ip multicast vlan 2 query-response-interval 0
-> ip multicast vlan 2 query-response-interval
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

## MIB Objects

alaIcmp

    alaIcmpQueryResponseInterval

alaIcmpVlan

    alaIcmpVlanQueryResponseInterval

---

## ip multicast unsolicited-report-interval

Sets the value of the IGMP unsolicited report interval on the specified VLAN or on the system if no VLAN is specified.

**ip multicast** [**vlan** *vid*] **unsolicited-report-interval** [*seconds*]

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<i>seconds</i>	IGMP query response interval in seconds. Valid range is 1 to 65535, where 0 represents the default setting.

### Defaults

---

parameter	default
<i>seconds</i>	1

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP unsolicited report interval on the system and/or the specified VLANs.
- If the IGMP query response interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The unsolicited report interval refers to the time period to proxy any changed IGMP membership state.
- To restore the IGMP unsolicited report interval to its default (i.e., 1 second) value on the system if no VLAN is specified, use **ip multicast unsolicited-report-interval** followed by the value 0 (e.g., ip multicast unsolicited-report-interval 0) or use only **ip multicast unsolicited-report-interval** (e.g., ip multicast unsolicited-report-interval).
- To restore the IGMP unsolicited report interval to its default (i.e., 1 second) value on the specified VLAN, use **ip multicast vlan** *vid* **unsolicited-report-interval** followed by the value 0 (e.g., ip multicast vlan 2 unsolicited-report-interval 0) or use only **ip multicast vlan** *vid* **unsolicited-report-interval** (e.g., ip multicast vlan 2 unsolicited-report-interval).

### Examples

```
-> ip multicast unsolicited-report-interval 200
-> ip multicast unsolicited-report-interval 0
-> ip multicast unsolicited-report-interval
-> ip multicast vlan 2 unsolicited-report-interval 300
-> ip multicast vlan 2 unsolicited-report-interval 0
-> ip multicast vlan 2 unsolicited-report-interval
```

## Release History

Release 7.1.1; command was introduced.

  alaIcmpVlanUnsolicitedReportInterval
```

---

## ip multicast router-timeout

Configures the expiry time of IP multicast routers on the specified VLAN or on the system if no VLAN is specified.

**ip multicast** [**vlan vid**] **router-timeout** [*seconds*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*seconds* IGMP router timeout in seconds. Valid range is 1 to 65535.

### Defaults

---

parameter	default
<i>seconds</i>	90

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP router timeout on the system and/or the specified VLANs.
- If the IGMP router timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- To restore the IGMP router timeout to its default (i.e., 90 seconds) value on the system if no VLAN is specified, use **ip multicast router-timeout** followed by the value 0 (e.g., ip multicast router-timeout 0) or use only **ip multicast router-timeout** (e.g., ip multicast router-timeout).
- To restore the IGMP router timeout to its default (i.e., 90 seconds) value on the specified VLAN, use **ip multicast vlan vid router-timeout** followed by the value 0 (e.g., ip multicast vlan 2 router-timeout 0) or use only **ip multicast vlan vid router-timeout** (e.g., ip multicast vlan 2 router-timeout).

### Examples

```
-> ip multicast router-timeout 100
-> ip multicast router-timeout 0
-> ip multicast router-timeout
-> ip multicast vlan 2 router-timeout 100
-> ip multicast vlan 2 router-timeout 0
-> ip multicast vlan 2 router-timeout
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

  alaIcmpRouterTimeout
alaIcmpVlan
  alaIcmpVlanRouterTimeout
```

---

## ip multicast source-timeout

Configures the expiry time of IP multicast sources on the specified VLAN or on the system if no VLAN is specified.

**ip multicast** [**vlan vid**] **source-timeout** [*seconds*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*seconds* IGMP source timeout in seconds. Valid range is 1 to 65535.

### Defaults

parameter	default
<i>seconds</i>	30

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP source timeout on the system and/or the specified VLANs.
- If the IGMP source timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- To restore the IGMP source timeout to its default (i.e., 30 seconds) value on the system if no VLAN is specified, use **ip multicast source-timeout** followed by the value 0 (e.g., ip multicast source-timeout 0) or use only **ip multicast source-timeout** (e.g., ip multicast source-timeout).
- To restore the IGMP source timeout to its default (i.e., 30 seconds) value on the specified VLAN, use **ip multicast vlan vid source-timeout** followed by the value 0 (e.g., ip multicast vlan 2 source-timeout 0) or use only **ip multicast vlan vid source-timeout** (e.g., ip multicast vlan 2 source-timeout).

### Examples

```
-> ip multicast source-timeout 100
-> ip multicast source-timeout 0
-> ip multicast source-timeout
-> ip multicast vlan 2 source-timeout 100
-> ip multicast vlan 2 source-timeout 0
-> ip multicast vlan 2 source-timeout
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaIcmp
  alaIcmpSourceTimeout
alaIcmpVlan
  alaIcmpVlanSourceTimeout
```

---

## ip multicast querying

Enables or disables IGMP querying on the specified VLAN or on the system if no VLAN is specified.

**ip multicast [vlan *vid*] querying [{enable | disable}]**

**no ip multicast [vlan *vid*] querying**

---

### Syntax Definitions

<i>vid</i>	VLAN on which configuration is applied.
<b>enable</b>	Enable IGMP querying.
<b>disable</b>	Disable IGMP querying.

### Defaults

---

parameter	default
<b>enable / disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove an IGMP querying entry on the specified VLAN or on the system and return to its default behavior.
- IP Multicast Switching and Routing must be enabled to enable IGMP querying on the system and/or specified VLANs.
- If the IGMP querying is already enabled/disabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP querying refers to requesting the network's IGMP group membership information by sending out IGMP queries. IGMP querying also involves participating in IGMP querier election.
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ip multicast querying** (e.g., ip multicast querying).
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the specified VLAN, by using only **ip multicast vlan *vid* querying** (e.g., ip multicast vlan 2 querying).

### Examples

```
-> ip multicast querying enable
-> ip multicast querying disable
-> ip multicast querying
-> ip multicast vlan 2 querying enable
-> ip multicast vlan 2 querying disable
-> ip multicast vlan 2 querying
-> no ip multicast vlan 2 querying
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

alaIcmp

    alaIcmpQuerying

alaIcmpVlan

    alaIcmpVlanQuerying

---

## ip multicast robustness

Sets the IGMP robustness variable on the specified VLAN or on the system if no VLAN is specified.

**ip multicast** [**vlan** *vid*] **robustness** [*robustness*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.  
*robustness* IGMP robustness variable. Valid range is 1 to 7.

### Defaults

---

parameter	default
<i>robustness</i>	2

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- IP Multicast Switching and Routing must be enabled to set the IGMP robustness variable on the system and/or the specified VLANs.
- If the IGMP robustness variable is already configured on the system, then the VLAN configuration will override the system's configuration.
- Robustness variable allows fine-tuning on the network, where the expected packet loss would be greater.
- To restore the IGMP robustness variable to its default (i.e., 2) value on the system if no VLAN is specified, use **ip multicast robustness** followed by the value 0 (e.g., ip multicast robustness 0) or use only **ip multicast robustness** (e.g., ip multicast robustness).
- To restore the IGMP robustness variable to its default (i.e., 2) value on the specified VLAN, use **ip multicast vlan vid robustness** followed by the value 0 (e.g., ip multicast vlan 2 robustness 0) or use only **ip multicast vlan vid robustness** (e.g., ip multicast vlan 2 robustness).

### Examples

```
-> ip multicast robustness 3
-> ip multicast robustness 0
-> ip multicast robustness
-> ip multicast vlan 2 robustness 3
-> ip multicast vlan 2 robustness 0
-> ip multicast vlan 2 robustness
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaIcmp
  alaIcmpRobustness
alaIcmpVlan
  alaIcmpVlanRobustness
```

---

## ip multicast spoofing

Enables or disables IGMP spoofing on the specified VLAN or on the system if no VLAN is specified.

**ip multicast [vlan *vid*] spoofing [{enable | disable}]**

**no ip multicast [vlan *vid*] spoofing**

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable IGMP spoofing.
<b>disable</b>	Disable IGMP spoofing.

### Defaults

---

parameter	default
<b>enable / disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove an IGMP spoofing entry on the specified VLAN or on the system and return to its default behavior.
- If the IGMP spoofing is already enabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP spoofing refers to replacing a client's MAC and IP address with the system's MAC and IP address when proxying aggregated IGMP group membership information.
- You can also restore the IGMP spoofing to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ip multicast spoofing** (e.g., ip multicast spoofing).
- You can also restore the IGMP spoofing to its default (i.e., disabled) setting on the specified VLAN, by using only **ip multicast vlan *vid* spoofing** (e.g., ip multicast vlan 2 spoofing).

### Examples

```
-> ip multicast spoofing enable
-> ip multicast spoofing disable
-> ip multicast spoofing
-> ip multicast vlan 2 spoofing enable
-> ip multicast vlan 2 spoofing disable
-> ip multicast vlan 2 spoofing
-> no ip multicast vlan 2 spoofing
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

alaIcmp

    alaIcmpSpoofing

alaIcmpVlan

    alaIcmpVlanSpoofing

---

## ip multicast zapping

Enables or disables IGMP zapping on the specified VLAN or on the system if no VLAN is specified.

```
ip multicast [vlan vid] zapping [{enable | disable}]
```

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable IGMP zapping.
<b>disable</b>	Disable IGMP zapping.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the IGMP zapping is already enabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP zapping refers to processing membership, immediate source filter removals and will not wait for the protocol's specified time period. This mode facilitates IP TV applications looking for quick changes between IP multicast groups.
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ip multicast zapping** (e.g., ip multicast zapping).
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the specified VLAN, by using only **ip multicast vlan *vid* zapping** (e.g., ip multicast vlan 2 zapping).

### Examples

```
-> ip multicast zapping enable
-> ip multicast zapping disable
-> ip multicast zapping
-> ip multicast vlan 2 zapping enable
-> ip multicast vlan 2 zapping disable
-> ip multicast vlan 2 zapping
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaIcmp
  alaIcmpZapping
alaIcmpVlan
  alaIcmpVlanZapping
```

---

## ip multicast proxying

Enables or disables IGMP proxying on the specified VLAN or on the system if no VLAN is specified.

**ip multicast [vlan *vid*] proxying [enable | disable]**

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable IGMP proxying.
<b>disable</b>	Disable IGMP proxying.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the IGMP proxying is already enabled on the system, then the VLAN configuration will override the system's configuration.
- IGMP proxying refers to processing membership information on behalf of client systems and reporting membership on their behalf.
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ip multicast proxying** (e.g., ip multicast proxying).
- You can also restore the IGMP querying to its default (i.e., disabled) setting on the specified VLAN, by using only **ip multicast vlan *vid* proxying** (e.g., ip multicast vlan 2 proxying).

### Examples

```
-> ip multicast proxying enable
-> ip multicast proxying disable
-> ip multicast proxying
-> ip multicast vlan 2 proxying enable
-> ip multicast vlan 2 proxying disable
-> ip multicast vlan 2 proxying
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast**

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaIcmp
  alaIcmpProxying
alaIcmpVlan
  alaIcmpVlanProxying
```

---

## ip multicast helper-address

Specifies the destination IP address of a relay host where IGMP host reports and Leave messages are to be sent.

**ip multicast helper-address** [*ip-address*]

---

### Syntax Definitions

*ip-address*                                      The IP address of the relay host

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- After the destination IP address is specified, the IPMS reporting feature is enabled.
- To disable the IPMS reporting feature, 0.0.0.0 is used as the IP address. It can also be disabled by omitting the IP address from the command.

### Examples

```
-> ip multicast helper-address 10.1.1.198  
-> ip multicast helper-address 0.0.0.0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ip multicast**                              Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

### MIB Objects

```
alaIgmp  
  alaIgmpHelperAddress  
  alaIgmpHelperAddressType
```

---

## ipv6 multicast admin-state

Enables or disables IPv6 Multicast Switching and Routing on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast [vlan *vid*] admin-state [{enable | disable}]**

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable IPv6 Multicast Switching and Routing.
<b>disable</b>	Disable IPv6 Multicast Switching and Routing.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If an IPv6 multicast routing protocol is already running on the system, this command will override this configuration and always enable IPv6 Multicast Switching and Routing.
- If the IPv6 Multicast Switching and Routing is already enabled on the system, then the VLAN configuration will override the system's configuration.
- You can also restore the MLD querying to its default (i.e., disabled) status on the system if no VLAN is specified by using this command.
- You can also restore the MLD querying to its default (i.e., disabled) status on the specified VLAN, by using this command.

### Examples

```
-> ipv6 multicast admin-state enable
-> ipv6 multicast admin-state disable
-> ipv6 multicast admin-state
-> ipv6 multicast vlan 2 admin-state enable
-> ipv6 multicast vlan 2 admin-state disable
-> ipv6 multicast vlan 2 admin-state
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaMld
  alaMldStatus
alaMldVlan
  alaMldVlanStatus
```

---

## ipv6 multicast querier-forwarding

Enables or disables MLD querier forwarding on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast [vlan *vid*] querier-forwarding [{enable | disable}]**

**no ipv6 multicast [vlan *vid*] querier-forwarding**

---

### Syntax Definitions

<i>vid</i>	The VLAN on which configuration is applied.
<b>enable</b>	Enable MLD querier forwarding.
<b>disable</b>	Disable MLD querier forwarding.

### Defaults

parameter	default
enable / disable	disable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove an MLD querier forwarding entry on the specified VLAN or on the system and return to its default behavior.
- If the MLD querier forwarding is already enabled on the system, then the VLAN configuration will override the system's configuration.
- MLD querier forwarding refers to promoting detected MLD queriers to receive all IP multicast data traffic.

### Examples

```
-> ipv6 multicast querier-forwarding enable
-> ipv6 multicast querier-forwarding disable
-> ipv6 multicast querier-forwarding
-> ipv6 multicast vlan 2 querier-forwarding enable
-> ipv6 multicast vlan 2 querier-forwarding disable
-> ipv6 multicast vlan 2 querier-forwarding
-> no ipv6 multicast vlan 2 querier-forwarding
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaMld
  alaMldQuerierForwarding
alaMldVlan
  alaMldVlanQuerierForwarding
```

---

## ipv6 multicast version

Sets the default version of the MLD protocol on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [**vlan** *vid*] **version** [*version*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*version* Default MLD protocol version to run. Valid range is 1 to 2.

### Defaults

parameter	default
<i>version</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the default MLD protocol version on the system and/or the specified VLANs.
- If the default MLD protocol version is already configured on the system, then the VLAN configuration will override the system's configuration.
- Due to protocol inter-operation requirements, this command specifies only a default version of the MLD protocol to run.
- To restore the MLD multicast version to the default (i.e., 1) version on the system if no VLAN is specified, use **ipv6 multicast version** followed by the value 0 (e.g., `ipv6 multicast version 0`) or use only **ipv6 multicast version** (e.g., `ipv6 multicast version`).
- To restore the MLD multicast version to the default (i.e., 1) version on the specified VLAN, use **ipv6 multicast vlan** *vid* **version** followed by the value 0 (e.g., `ipv6 multicast vlan 2 version 0`) or use only **ipv6 multicast vlan** *vid* **version** (e.g., `ipv6 multicast vlan 2 version`).

### Examples

```
-> ipv6 multicast version 2
-> ipv6 multicast version 0
-> ipv6 multicast version
-> ipv6 multicast vlan 2 version 2
-> ipv6 multicast vlan 2 version 0
-> ipv6 multicast vlan 2 version
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```

  alaMldVlanVersion
```

---

## ipv6 multicast max-group

Configures the global maximum group limit that can be learned per port/VLAN instance. The limit is applied to each port/VLAN instance and an action is taken when it exceeds the limit.

**ipv6 multicast max-group** [*num*] [**action** {**none** | **drop** | **replace**}]

---

### Syntax Definitions

<i>num</i>	Specifies the maximum MLD group count. Valid range is 0 to 4294967295.
<b>none</b>	Disables the maximum group limit configuration
<b>drop</b>	Drops the incoming membership request.
<b>replace</b>	Replaces an existing membership with the incoming membership request.

### Defaults

By default, the max-group limit is set to zero.

parameter	defaults
Action	none

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance.
- The configuration is allowed even when the ip multicast status is disabled.
- If the num and action parameters are not specified, then the limit is removed.
- The max-group configuration on a specific VLAN or port will override the global configuration.
- MLD zapping must be enabled when the max-group limit is enabled and the action is dropped.

### Examples

```
-> ipv6 multicast max-group 10 action drop
-> ipv6 multicast max-group 20 action replace
-> ipv6 multicast max-group
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ipv6 multicast**

## MIB Objects

```
alaIcmpMaxGroupLimit  
alaIcmpMaxGroupExceedAction
```

---

## ipv6 multicast vlan max-group

Configures the maximum group limit learned per port on a VLAN. The limit is applied to each port that is a member of the given VLAN.

**ipv6 multicast vlan *vid* max-group [*num*] [action {none | drop | replace}]**

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<i>num</i>	The maximum MLD group count. Valid range is 0 to 4294967295.
<b>none</b>	Disables the maximum group limit configuration.
<b>drop</b>	Drops the incoming membership request.
<b>replace</b>	Replaces an existing membership with the incoming membership request.

### Defaults

By default, the max-group limit is set to zero.

---

parameter	defaults
<b>Action</b>	<b>none</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance.
- The configuration is allowed even when the ip multicast status is disabled.
- If the num and action parameters are not specified, then the limit is removed.
- The max-group configuration on a VLAN will override the global configuration.
- MLD zapping must be enabled when the max-group limit is enabled and the action is dropped.

### Examples

```
-> ipv6 multicast vlan 10 max-group 10 action drop
-> ipv6 multicast vlan 10 max-group 20 action replace
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

## MIB Objects

alaIcmpVlanTable

  alaIcmpVlanMaxGroupLimit

  alaIcmpVlanMaxGroupExceedAction

---

## ipv6 multicast port max-group

Configures the maximum group limit learned per port. The limit is applicable on the given port for all VLAN instances of the port.

**ipv6 multicast port** *slot / port* **max-group** [*num*] [**action** {**none** | **drop** | **replace**}]

---

### Syntax Definitions

<i>slot / port</i>	The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3).
<i>num</i>	The maximum MLD group count. Valid range is 0 to 4294967295.
<b>none</b>	Disables the maximum group limit configuration.
<b>drop</b>	Drops the incoming membership request.
<b>replace</b>	Replaces an existing membership with the incoming membership request.

### Defaults

By default, the max-group limit is set to zero.

parameter	defaults
<b>Action</b>	<b>none</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Configuring a max-group value will have no affect on existing group memberships until the memberships are refreshed on the port/VLAN instance.
- The configuration is allowed even when the ip multicast status is disabled.
- If the num and action parameters are not specified, then the limit is removed.
- The max-group configuration on a port will override the VLAN or global configuration.
- MLD zapping must be enabled when the max-group limit is enabled and the action is dropped.

### Examples

```
-> ipv6 multicast port 1/1 max-group 10 action drop
-> ipv6 multicast port 1/1 max-group action replace
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

## ipv6 multicast static-neighbor

Creates a static MLD neighbor entry on a specified port on a specified VLAN.

**ipv6 multicast static-neighbor** *vlan vid port slot/port*

**no ipv6 multicast static-neighbor** *vlan vid port slot/port*

---

### Syntax Definitions

*vid* VLAN to include as a static MLD neighbor.

*slot/port* The slot/port number you want to configure as a static MLD neighbor.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove an MLD static neighbor entry on a specified port on a specified VLAN.
- The **ipv6 multicast static-neighbor** command allows you to create an MLD static neighbor entry on a specified port on a specified VLAN. This, in turn, enables that network segment to receive all MLD traffic.
- You can also create an MLD static neighbor entry on a link aggregate port by entering **ipv6 multicast static-neighbor** *vlan vid port*, followed by the link aggregation group number (e.g., `ipv6 multicast static-neighbor vlan 2 port 7`).

### Examples

```
-> ipv6 multicast static-neighbor vlan 4 port 1/1
-> no ipv6 multicast static-neighbor vlan 4 port 1/1
-> ipv6 multicast static-neighbor vlan 4 port 7
-> no ipv6 multicast static-neighbor vlan 4 port 7
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**show ipv6 multicast neighbor** Displays the MLD neighbor table entries of IPv6 Multicast Switching and Routing.

## MIB Objects

```
alaMldStaticNeighborTable

  alaMldStaticNeighborIfIndex  
  alaMldStaticNeighborRowStatus
```

---

## ipv6 multicast static-querier

Creates a static MLD querier entry on a specified port on a specified VLAN.

**ipv6 multicast static-querier** *vlan vid port slot/port*

**no ipv6 multicast static-querier** *vlan vid port slot/port*

---

### Syntax Definitions

*vid* VLAN to include as a static MLD querier.

*slot/port* The slot/port number you want to configure as a static MLD querier.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove an MLD static querier entry on a specified port on a specified VLAN.
- The **ipv6 multicast static-querier** command allows you to create an MLD static querier entry on a specified port on a specified VLAN. This, in turn, enables that network segment to receive all MLD traffic.
- You can also create an MLD static querier entry on a link aggregate port by entering **ipv6 multicast static-querier** *vlan vid port*, followed by the link aggregation group number (e.g., `ipv6 multicast static-querier vlan 2 port 7`).

### Examples

```
-> ipv6 multicast static-querier vlan 4 port 1/1
-> no ipv6 multicast static-querier vlan 4 port 1/1
-> ipv6 multicast static-querier vlan 4 port 7
-> no ipv6 multicast static-querier vlan 4 port 7
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**show ipv6 multicast querier** Displays the MLD querier table entries of IPv6 Multicast Switching and Routing.

## MIB Objects

```
alaMldStaticQuerierTable  
  alaMldStaticQuerierVlan

  alaMldStaticQuerierRowStatus
```

---

## ipv6 multicast static-group

Creates a static MLD group entry on a specified port on a specified VLAN.

**ipv6 multicast static-group** *ip\_address* **vlan** *vid* **port** *slot/port*

**no ipv6 multicast static-group** *ip\_address* **vlan** *vid* **port** *slot/port*

Syntax Definitions

---

<i>ip_address</i>	IPv6 multicast group address.
<i>vid</i>	VLAN to include as a static MLD group.
<i>slot/port</i>	The slot/port number you want to configure as a static MLD group.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove an MLD static group entry on a specified port on the specified VLAN.
- The **ipv6 multicast static-group** command allows you to create an MLD static group entry on a specified port on a specified VLAN. This, in turn, enables that network segment to receive MLD traffic addressed to the specified IPv6 multicast group address.
- You can also create an MLD static group entry on a link aggregate port by entering **ipv6 multicast static-group** *ip\_address* **vlan** *vid* **port**, followed by the link aggregation group number (e.g., `ipv6 multicast static-group ff05::5 vlan 2 port 7`).

### Examples

```
-> ipv6 multicast static-group ff05::4681 vlan 4 port 1/1
-> no ipv6 multicast static-group ff05::4681 vlan 4 port 1/1
-> ipv6 multicast static-group ff05::4681 vlan 4 port 7
-> no ipv6 multicast static-group ff05::4681 vlan 4 port 7
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

```

---

## ipv6 multicast query-interval

Sets the MLD query interval on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [*vlan vid*] **query-interval** [*seconds*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*seconds* MLD query interval in seconds. Valid range is 1 to 65535.

### Defaults

parameter	default
<i>seconds</i>	125

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD query interval on the system and/or the specified VLANs.
- If the MLD query interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The MLD query interval refers to the time period between MLD query messages.
- To restore the MLD query interval to its default (i.e., 125 seconds) value on the system if no VLAN is specified, use **ipv6 multicast query-interval** followed by the value 0 (e.g., `ipv6 multicast query-interval 0`) or use only **ipv6 multicast query-interval** (e.g., `ipv6 multicast query-interval`).
- To restore the MLD query interval to its default (i.e., 125 seconds) value on the specified VLAN, use **ipv6 multicast vlan vid query-interval** followed by the value 0 (e.g., `ipv6 multicast vlan 2 query-interval 0`) or use only **ipv6 multicast vlan vid query-interval** (e.g., `ipv6 multicast vlan 2 query-interval`).

### Examples

```
-> ipv6 multicast query-interval 100
-> ipv6 multicast query-interval 0
-> ipv6 multicast query-interval
-> ipv6 multicast vlan 2 query-interval 100
-> ipv6 multicast vlan 2 query-interval 0
-> ipv6 multicast vlan 2 query-interval
```

## ipv6 multicast last-member-query-interval

Sets the MLD last member query interval on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast [vlan *vid*] last-member-query-interval [*milliseconds*]**

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<i>milliseconds</i>	MLD last member query interval in milliseconds. Valid range is 1 to 65535.

### Defaults

parameter	default
<i>milliseconds</i>	1000

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD last member query interval to use on the system and/or the specified VLANs. apply this configuration.
- If the MLD last member query interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The MLD last member query interval refers to the time period to reply to an MLD query message sent in response to a leave group message.
- To restore the MLD last member query interval to its default (i.e., 1000 milliseconds) value on the system if no VLAN is specified, use **ipv6 multicast last-member-query-interval** followed by the value 0 (e.g., `ipv6 multicast last-member-query-interval 0`) or use only **ipv6 multicast last-member-query-interval** (e.g., `ipv6 multicast last-member-query-interval`).
- To restore the MLD last member query interval to its default (i.e., 1000 milliseconds) value on the specified VLAN, use **ipv6 multicast vlan *vid* last-member-query interval** followed by the value 0 (e.g., `ipv6 multicast vlan 2 last-member-query-interval 0`) or use only **ipv6 multicast vlan *vid* last-member-query-interval** (e.g., `ipv6 multicast vlan 2 last-member-query-interval`).

### Examples

```
-> ipv6 multicast last-member-query-interval 2200
-> ipv6 multicast last-member-query-interval 0
-> ipv6 multicast last-member-query-interval
-> ipv6 multicast vlan 4 last-member-query-interval 2200

## ipv6 multicast query-response-interval

Sets the MLD query response interval on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [*vlan vid*] **query-response-interval** [*milliseconds*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*milliseconds* MLD query response interval in milliseconds. Valid range is 1 to 65535.

### Defaults

parameter	default
<i>milliseconds</i>	10000

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD query response interval to use on the system and/or the specified VLANs.
- If the MLD query response interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The MLD query response interval refers to the time period to reply to an MLD query message.
- To restore the MLD query response interval to its default (i.e., 10000 milliseconds) value on the system if no VLAN is specified, use **ipv6 multicast query-response-interval** followed by the value 0 (e.g., `ipv6 multicast query-response-interval 0`) or use only **ipv6 multicast query-response-interval** (e.g., `ipv6 multicast query-response-interval`).
- To restore the MLD last member query interval to its default (i.e., 10000 milliseconds) value on the specified VLAN, use **ipv6 multicast vlan vid query-response-interval** followed by the value 0 (e.g., `ipv6 multicast vlan 2 query-response-interval 0`) or use only **ipv6 multicast vlan vid query-response-interval** (e.g., `ipv6 multicast vlan 2 query-response-interval`).

### Examples

```
-> ipv6 multicast query-response-interval 20000
-> ipv6 multicast query-response-interval 0
-> ipv6 multicast query-response-interval
-> ipv6 multicast vlan 2 query-response-interval 20000
-> ipv6 multicast vlan 2 query-response-interval 0
-> ipv6 multicast vlan 2 query-response-interval
```

## ipv6 multicast unsolicited-report-interval

Sets the MLD unsolicited report interval on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [*vlan vid*] **unsolicited-report-interval** [*seconds*]

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<i>seconds</i>	MLD unsolicited report interval in seconds. Valid range is 1 to 65535, where 0 represents the default setting.

### Defaults

parameter	default
<i>seconds</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD unsolicited report interval to use on the system and/or the specified VLANs.
- If the MLD unsolicited report interval is already configured on the system, then the VLAN configuration will override the system's configuration.
- The unsolicited report interval refers to the time period to proxy any changed MLD membership state.
- To restore the MLD unsolicited interval to its default (i.e., 1 second) value on the system if no VLAN is specified, use **ipv6 multicast unsolicited-report-interval** followed by the value 0 (e.g., `ipv6 multicast unsolicited-report-interval 0`) or use only **ipv6 multicast unsolicited-report-interval** (e.g., `ipv6 multicast unsolicited-report-interval`).
- To restore the MLD unsolicited report interval to its default (i.e., 1 second) value on the specified VLAN, use **ipv6 multicast vlan vid unsolicited-report-interval** followed by the value 0 (e.g., `ipv6 multicast vlan 2 unsolicited-report-interval 0`) or use only **ipv6 multicast vlan vid unsolicited-report-interval** (e.g., `ipv6 multicast vlan 2 unsolicited-report-interval`).

### Examples

```
-> ipv6 multicast unsolicited-report-interval 20000
-> ipv6 multicast unsolicited-report-interval 0
-> ipv6 multicast unsolicited-report-interval
-> ipv6 multicast vlan 2 unsolicited-report-interval 20000
-> ipv6 multicast vlan 2 unsolicited-report-interval 0
-> ipv6 multicast vlan 2 unsolicited-report-interval
```

## ipv6 multicast router-timeout

Configures the expiry time of IPv6 multicast routers on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [*vlan vid*] **router-timeout** [*seconds*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*seconds* MLD router timeout in seconds. Valid range is 1 to 65535.

### Defaults

parameter	default
<i>seconds</i>	90

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD router timeout on the system and/or the specified VLANs. apply this configuration.
- If the MLD router timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- To restore the MLD router timeout to its default (i.e., 90 seconds) value on the system if no VLAN is specified, use **ipv6 multicast router-timeout** followed by the value 0 (e.g., `ipv6 multicast router-timeout 0`) or use only **ipv6 multicast router-timeout** (e.g., `ipv6 multicast router-timeout`).
- To restore the MLD router timeout to its default (i.e., 90 seconds) value on the specified VLAN, use **ipv6 multicast vlan vid router-timeout** followed by the value 0 (e.g., `ipv6 multicast vlan 2 router-timeout 0`) or use only **ipv6 multicast vlan vid router-timeout** (e.g., `ipv6 multicast vlan 2 router-timeout`).

### Examples

```
-> ipv6 multicast router-timeout 100
-> ipv6 multicast router-timeout 0
-> ipv6 multicast router-timeout
-> ipv6 multicast vlan 2 router-timeout 100
-> ipv6 multicast vlan 2 router-timeout 0
-> ipv6 multicast vlan 2 router-timeout
```

### Release History

## ipv6 multicast source-timeout

Configures the expiry time of IPv6 multicast sources on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [**vlan vid**] **source-timeout** [*seconds*]

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*seconds* MLD source timeout in seconds. Valid range is 1 to 65535.

### Defaults

parameter	default
<i>seconds</i>	30

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD source timeout on the system and/or the specified VLANs.
- If the MLD source timeout is already configured on the system, then the VLAN configuration will override the system's configuration.
- To restore the MLD router timeout to its default (i.e., 30 seconds) value on the system if no VLAN is specified, use **ipv6 multicast source-timeout** followed by the value 0 (e.g., `ipv6 multicast source-timeout 0`) or use only **ipv6 multicast source-timeout** (e.g., `ipv6 multicast source-timeout`).
- To restore the MLD router timeout to its default (i.e., 30 seconds) value on the specified VLAN, use **ipv6 multicast vlan vid source-timeout** followed by the value 0 (e.g., `ipv6 multicast vlan 2 source-timeout 0`) or use only **ipv6 multicast vlan vid source-timeout** (e.g., `ipv6 multicast vlan 2 source-timeout`).

### Examples

```
-> ipv6 multicast source-timeout 100
-> ipv6 multicast source-timeout 0
-> ipv6 multicast source-timeout
-> ipv6 multicast vlan 2 source-timeout 100
-> ipv6 multicast vlan 2 source-timeout 0
-> ipv6 multicast vlan 2 source-timeout
```

### Release History

  alaMldVlanSourceTimeout
```

---

## ipv6 multicast querying

Enables or disables MLD querying on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast [vlan *vid*] querying [{enable | disable}]**

**no ipv6 multicast [vlan *vid*] querying**

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

**enable** Enable MLD querying.

**disable** Disable MLD querying.

### Defaults

parameter	default
enable / disable	disable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove an MLD querying entry on the specified VLAN or on the system and return to its default behavior.
- IPv6 Multicast Switching and Routing must be enabled to enable MLD querying on the system and/or specified VLANs.
- If the MLD querying is already enabled/disabled on the system, then the VLAN configuration will override the system's configuration.
- MLD querying refers to requesting the network's MLD group membership information by sending out MLD queries. MLD querying also involves participating in MLD querier election.
- You can also restore the MLD querying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ipv6 multicast querying** (e.g., ipv6 multicast querying).
- You can also restore the MLD querying to its default (i.e., disabled) setting on the specified VLAN, by using only **ipv6 multicast vlan *vid* querying** (e.g., ipv6 multicast vlan 2 querying).

### Examples

```
-> ipv6 multicast querying enable
-> ipv6 multicast querying disable
-> ipv6 multicast querying
-> ipv6 multicast vlan 2 querying enable
-> ipv6 multicast vlan 2 querying disable
-> ipv6 multicast vlan 2 querying
-> no ipv6 multicast vlan 2 querying
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

alaMld

    alaMldQuerying

alaMldVlan

    alaMldVlanQuerying

---

## ipv6 multicast robustness

Sets the MLD robustness variable on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast** [**vlan** *vid*] **robustness** [*robustness*]

---

### Syntax Definitions

*vid* VLAN on which to apply the configuration.

*robustness* MLD robustness variable. Valid range is 1 to 7.

### Defaults

---

parameter	default
<i>robustness</i>	2

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- IPv6 Multicast Switching and Routing must be enabled to set the MLD robustness variable on the system and/or the specified VLANs.
- If the MLD robustness variable is already configured on the system, then the VLAN configuration will override the system's configuration.
- Robustness variable allows fine-tuning on the network, where the expected packet loss would be greater.
- To restore the MLD robustness variable to its default (i.e., 2) value on the system if no VLAN is specified, use **ipv6 multicast robustness** followed by the value 0 (e.g., `ipv6 multicast robustness 0`) or use only **ipv6 multicast robustness** (e.g., `ipv6 multicast robustness`).
- To restore the MLD robustness variable to its default (i.e., 2) value on the specified VLAN, use **ipv6 multicast vlan** *vid* **robustness** followed by the value 0 (e.g., `ipv6 multicast vlan 2 robustness 0`) or use only **ipv6 multicast vlan** *vid* **robustness** (e.g., `ipv6 multicast vlan 2 robustness`).

### Examples

```
-> ipv6 multicast robustness 3
-> ipv6 multicast robustness 0
-> ipv6 multicast robustness
-> ipv6 multicast vlan 2 robustness 3
-> ipv6 multicast vlan 2 robustness 0
-> ipv6 multicast vlan 2 robustness
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaMld
  alaMldRobustness
alaMldVlan
  alaMldVlanRobustness
```

---

## ipv6 multicast spoofing

Enables or disables MLD spoofing on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast [vlan *vid*] spoofing [{enable | disable}]**

**no ipv6 multicast [vlan *vid*] spoofing**

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable MLD spoofing.
<b>disable</b>	Disable MLD spoofing.

### Defaults

parameter	defaults
<b>enable / disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove an MLD spoofing entry on the specified VLAN or on the system and return to its default behavior.
- If the MLD spoofing is already enabled on the system, then the VLAN configuration will override the system's configuration.
- MLD spoofing refers to replacing a client's MAC and IP address with the system's MAC and IP address when proxying aggregated MLD group membership information.
- You can also restore the MLD spoofing to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ipv6 multicast spoofing** (i.e., ipv6 multicast spoofing).
- You can also restore the MLD spoofing to its default (i.e., disabled) setting on the specified VLAN, by using only **ipv6 multicast vlan *vid* spoofing** (i.e., ipv6 multicast vlan 2 spoofing).

### Examples

```
-> ipv6 multicast spoofing enable
-> ipv6 multicast spoofing disable
-> ipv6 multicast spoofing
-> ipv6 multicast vlan 2 spoofing enable
-> ipv6 multicast vlan 2 spoofing disable
-> ipv6 multicast vlan 2 spoofing
-> no ipv6 multicast vlan 2 spoofing
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaMld
  alaMldSpoofing
alaMldVlan
  alaMldVlanSpoofing
```

---

## ipv6 multicast zapping

Enables or disables MLD zapping on the specified VLAN or on the system if no VLAN is specified.

```
ipv6 multicast [vlan vid] zapping [{enable | disable}]
```

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable MLD zapping.
<b>disable</b>	Disable MLD zapping.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the MLD zapping is already enabled on the system, then the VLAN configuration will override the system's configuration.
- MLD zapping refers to processing membership and source filter removals immediately and not waiting for the protocol's specified time period. This mode facilitates IP TV applications looking for quick changes between IP multicast groups.
- You can also restore the MLD zapping to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ipv6 multicast zapping** (e.g., ipv6 multicast zapping).
- You can also restore the MLD zapping to its default (i.e., disabled) setting on the specified VLAN, by using only **ipv6 multicast vlan *vid* zapping** (e.g., ipv6 multicast vlan 2 zapping).

### Examples

```
-> ipv6 multicast zapping enable
-> ipv6 multicast zapping disable
-> ipv6 multicast zapping
-> ipv6 multicast vlan 2 zapping enable
-> ipv6 multicast vlan 2 zapping disable
-> ipv6 multicast vlan 2 zapping
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaMld
  alaMldZapping
alaMldVlan
  alaMldVlanZapping
```

---

## ipv6 multicast proxying

Enables or disables MLD proxying on the specified VLAN or on the system if no VLAN is specified.

**ipv6 multicast [vlan *vid*] proxying [enable | disable]**

---

### Syntax Definitions

<i>vid</i>	VLAN on which to apply the configuration.
<b>enable</b>	Enable MLD proxying.
<b>disable</b>	Disable MLD proxying.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the MLD proxying is already enabled on the system, then the VLAN configuration will override the system's configuration.
- MLD proxying refers to processing membership information on behalf of client systems and reporting membership on their behalf.
- You can also restore the MLD proxying to its default (i.e., disabled) setting on the system if no VLAN is specified, by using only **ipv6 multicast proxying** (e.g., `ipv6 multicast proxying`).
- You can also restore the MLD proxying to its default (i.e., disabled) setting on the specified VLAN, by using only **ipv6 multicast vlan *vid* proxying** (e.g., `ipv6 multicast vlan 2 proxying`).

### Examples

```
-> ipv6 multicast proxying enable
-> ipv6 multicast proxying disable
-> ipv6 multicast proxying
-> ipv6 multicast vlan 2 proxying enable
-> ipv6 multicast vlan 2 proxying disable
-> ipv6 multicast vlan 2 proxying
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ipv6 multicast**

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

## MIB Objects

```
alaMld

alaMldVlan
  alaMldVlanProxying
```

---

## show ip multicast

Displays the IP Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

**show ip multicast** [*vlan vid*]

---

### Syntax Definitions

*vid* VLAN ID number (1–4094).

### Defaults

By default the status and general configuration parameters for the system.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Specify a VLAN ID to display the configuration information for an individual VLAN.

### Examples

```
-> show ip multicast
```

```
Status: Enabled
Querying: Disabled
Proxying Disabled
Spoofing: Disabled
Zapping: Disabled
Querier Forwarding: Disabled
Version: 2
Robustness: 2
Query Interval (seconds): 125
Query Response Interval (tenths of seconds): 100
Last Member Query Interval(tenths of seconds):10
Unsolicited Report Interval(seconds): 1
Router Timeout (seconds): 90
Source Timeout (seconds): 30
```

```
-> show ip multicast vlan 1
```

```
Status: Enabled
Querying: Disabled
Proxying Disabled
Spoofing: Disabled
Zapping: Disabled
Querier Forwarding: Disabled
Version: 2
Robustness: 2
Query Interval (seconds): 125
Query Response Interval (tenths of seconds): 100
Last Member Query Interval(tenths of seconds):10
Unsolicited Report Interval(seconds): 1
Router Timeout (seconds): 90
Source Timeout (seconds): 30
```

Output fields are described here:

### *output definitions*

---

<b>Status</b>	Whether the IP Multicast Switching and Routing is <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable IP Multicast Switching and Routing with the <b>ip multicast admin-state</b> command, which is described on <a href="#">page 23-3</a> .
<b>Querying</b>	The current state of IGMP querying, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable IGMP querying with the <b>ip multicast querying</b> command, which is described on <a href="#">page 23-33</a> .
<b>Proxying</b>	The current state of IGMP proxying on the system, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable IGMP spoofing with the <b>ip multicast proxying</b> command, which is described on <a href="#">page 23-41</a> .
<b>Spoofing</b>	The current state of IGMP spoofing on the system, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable IGMP spoofing with the <b>ip multicast spoofing</b> command, which is described on <a href="#">page 23-37</a> .
<b>Zapping</b>	The current state of IGMP zapping on the system, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable IGMP zapping with the <b>ip multicast zapping</b> command, which is described on <a href="#">page 23-39</a> .
<b>Querier Forwarding</b>	The current state of IGMP querier forwarding on the system, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable IGMP Querier forwarding with the <b>ip multicast querier-forwarding</b> command, which is described on <a href="#">page 23-5</a> .
<b>Version</b>	Displays the default IGMP version, which can be <b>1</b> , <b>2</b> or <b>3</b> . Use the <b>ip multicast version</b> command to modify this parameter.
<b>Robustness</b>	Displays the IGMP robustness value, ranging from <b>1</b> to <b>7</b> . (The default value is 2). Use the <b>ip multicast robustness</b> command to modify this parameter.

---

*output definitions*

---

<b>Query Interval (seconds)</b>	Displays the time (in seconds) between IGMP queries. (The default value is 125 seconds). You can modify this parameter with the <a href="#">ip multicast query-interval</a> command, which is described on <a href="#">page 23-21</a> .
<b>Query Response Interval (tenths of seconds)</b>	Displays the time (in tenths of seconds) taken to reply to an IGMP query message. (The default value is 100 tenths-of-seconds). You can modify this parameter with the <a href="#">ip multicast query-response-interval</a> command, which is described on <a href="#">page 23-25</a> .
<b>Last Member Query Interval (tenths of seconds)</b>	Displays the time (in tenths of seconds) taken to reply to an IGMP query message sent in response to a leave group message. (The default value is 10 tenths-of-seconds.) You can modify this parameter with the <a href="#">ip multicast last-member-query-interval</a> command, which is described on <a href="#">page 23-23</a> .
<b>Unsolicited Report Interval (seconds)</b>	Displays the time period (in seconds) to proxy any changed IGMP membership state. (The default value is 1 second). You can modify this parameter with the <a href="#">ip multicast unsolicited-report-interval</a> command, which is described on <a href="#">page 23-27</a> .
<b>Router Timeout (seconds)</b>	Displays the IGMP router timeout in seconds. (The default value is 90 seconds.) You can modify this parameter with the <a href="#">ip multicast router-timeout</a> command, which is described on <a href="#">page 23-29</a> .
<b>Source Timeout (seconds)</b>	Displays the IGMP source timeout in seconds. (The default value is 30 seconds.) You can modify this parameter with the <a href="#">ip multicast source-timeout</a> command, which is described on <a href="#">page 23-31</a> .

---

**Release History**

Release 7.1.1; command was introduced.

## Related Commands

<b>ip multicast admin-state</b>	Enables or disables IP Multicast Switching and Routing on the specified VLAN, or on the system if no VLAN is specified.
<b>ip multicast version</b>	Sets the default version of the IGMP protocol on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast querying</b>	Enables or disables IGMP querying on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast robustness</b>	Sets the IGMP robustness variable on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast spoofing</b>	Enables or disables IGMP spoofing on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast zapping</b>	Enables or disables IGMP zapping on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast proxying</b>	Enables or disables IGMP proxying on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast query-interval</b>	Sets the IGMP query interval on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast last-member-query-interval</b>	Sets the IGMP last member query interval value on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast query-response-interval</b>	Sets the IGMP query response interval on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast unsolicited-report-interval</b>	Sets the value of the IGMP unsolicited report interval on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast router-timeout</b>	Configures the expiry time of IP multicast routers on the specified VLAN or on the system if no VLAN is specified.
<b>ip multicast source-timeout</b>	Configures the expiry time of IP multicast sources on the specified VLAN or on the system if no VLAN is specified.

## show ip multicast port

Displays the max-group configuration applicable for all port or vlan instances of a given port or all ports. The current number of groups learnt on a given port or vlan instance will also be displayed.

**show ip multicast port** [*slot/port*]

---

### Syntax Definitions

*slot / port*

The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3)).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Specify a slot and port number to display the configuration information for a specific switch port.

### Examples

```
-> show ip multicast port
```

```
Total 5 Port-Vlan Pairs
```

Port	VLAN	Current Igmp Groups	Max-group	Action
1/1	10	1	1	drop
1/1	20	1	1	drop
1/3	15	2	5	replace
1/4	20	3	10	drop
1/6	15	5	0	none

```
-> show ip multicast port 1/1
```

```
Max-group 0 Action none
```

```
Total 2 Port-Vlan Pairs
```

Port	vlan	current IGMP group	max-group	action
1/1	10	1	1	drop
1/1	20	2	5	replace

#### *output definitions*

---

<b>Port</b>	The slot and port number of the IP multicast port.
<b>VLAN</b>	The VLAN associated with the IP multicast port.
<b>Current Groups</b>	The current group associated with the IP Current groups.

*output definitions*

<b>IGMP</b>	The IGMP associated with the IP multicast port.
<b>Max-group</b>	The maximum group count allowed on the port.
<b>Action</b>	The action to be taken when the group membership limit is exceeded.

**Release History**

Release 7.1.1; command was introduced.

## show ip multicast forward

Displays the IP Multicast Switching and Routing forwarding table entries for the specified IP multicast group address or all the entries if no IP multicast group address is specified.

**show ip multicast forward** [*ip\_address*]

---

### Syntax Definitions

*ip\_address* IP multicast group address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip multicast forward
```

```
Total 1 Forwards
```

Group Address	Host Address	Tunnel Address	Ingress		Egress	
			VLAN	Port	VLAN	Port
228.0.0.1	1.0.0.2	0.0.0.0	1	2/1	1	2/23

```
-> show ip multicast forward 228.0.0.1
```

Group Address	Host Address	Tunnel Address	Ingress		Egress	
			VLAN	Port	VLAN	Port
228.0.0.1	1.0.0.2	0.0.0.0	1	2/1	1	2/23

Output fields are described here:

#### *output definitions*

---

<b>Group Address</b>	IP group address of the IP multicast forward.
<b>Host Address</b>	IP host address of the IP multicast forward.
<b>Tunnel Address</b>	IP source tunnel address of the IP multicast forward.
<b>VLAN</b>	VLAN associated with the IP multicast forward.
<b>Port</b>	The slot and port number of the IP multicast forward.

## show ip multicast source

Displays the IP Multicast Switching and Routing source table entries matching the specified IP multicast group address or all entries if no IP multicast group address is specified.

**show ip multicast source** [*ip\_address*]

---

### Syntax Definitions

*ip\_address* IP multicast group address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip multicast source
```

```
Total 1 Sources
Group Address  Host Address  Tunnel Address  VLAN  Port
-----+-----+-----+-----+-----
228.0.0.1      1.0.0.2      0.0.0.0        1     2/1
```

```
-> show ip multicast source 228.0.0.1
```

```
Total 1 Sources
Group Address  Host Address  Tunnel Address  VLAN  Port
-----+-----+-----+-----+-----
228.0.0.1      1.0.0.2      0.0.0.0        1     2/1
```

### output definitions

---

<b>Group Address</b>	IP group address of the IP multicast source.
<b>Host Address</b>	IP host address of the IP multicast source.
<b>Tunnel Address</b>	IP destination tunnel address of the IP multicast source.
<b>VLAN</b>	VLAN associated with the IP multicast source.
<b>Port</b>	The slot and port number of the IP multicast source.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **show ip multicast tunnel**

Display the IP Multicast Switching and Routing tunneling table entries matching the specified IP multicast group address or all entries if no IP multicast address is specified.

## MIB Objects

  alaIcmpSourceHostAddress  
  alaIcmpSourceDestAddress  
  alaIcmpSourceOrigAddress  
  alaIcmpSourceType  
  alaIcmpSourceUpTime
```

---

## show ip multicast tunnel

Display the IP Multicast Switching and Routing tunneling table entries matching the specified IP multi-cast group address or all entries if no IP multicast address is specified.

**show ip multicast tunnel [address]**

---

### Syntax Definitions

**address** IP multicast group address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip multicast tunnel
Total 1 Tunnels
```

Group Address	Host Address	Tunnel Address	Ingress	
			VLAN	Port
228.0.0.1	1.0.0.2	2.1.2.3	1	2/1

#### *output definitions*

---

<b>Group Address</b>	IP group address of the IP multicast tunnel.
<b>Host Address</b>	IP host address of the IP multicast tunnel.
<b>Tunnel Address</b>	IP source tunnel address of the IP multicast tunnel.
<b>VLAN</b>	VLAN associated with the IP multicast tunnel.
<b>Port</b>	The slot and port number of the IP multicast tunnel.

---

### Release History

Release 7.1.1; command was introduced.

### Related Commands

  alaIcmpTunnelNextType
```

---

## show ipv6 multicast

Displays the IPv6 Multicast Switching and Routing status and the general configuration parameters on the specified VLAN or on the system if no VLAN is specified.

**show ipv6 multicast [vlan vid]**

---

### Syntax Definitions

*vid* VLAN for which to display the configuration.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 multicast
```

```
Status: = Enabled
Querying: = Disabled
Proxying: = Disabled
Spoofing: = Disabled
Zapping: = Disabled
Querier Forwarding: = Disabled
Version: = 1
Robustness: = 2
Query Interval (seconds): = 125
Query Response Interval (milliseconds): = 10000
Last Member Query Interval (milliseconds): = 1000
Unsolicited Report Interval (seconds) = 1,
Router Timeout (seconds): = 90
Source Timeout (seconds): = 30
```

```
-> show ipv6 multicast vlan 1
```

```
Status: = Enabled
Querying: = Disabled
Proxying: = Disabled
Spoofing: = Disabled
Zapping: = Disabled
Querier Forwarding: = Disabled
Version: = 1
Robustness: = 2
Query Interval (seconds): = 125
Query Response Interval (milliseconds): = 10000
Last Member Query Interval (milliseconds): = 1000
Unsolicited Report Interval (seconds) = 1,
Router Timeout (seconds): = 90
Source Timeout (seconds): = 30:
```

### *output definitions*

<b>Status</b>	Whether the IPv6 Multicast Switching and Routing is <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable IPv6 Multicast Switching and Routing with the <b>ip multicast helper-address</b> command, which is described on <a href="#">page 23-43</a>
<b>Querying</b>	The current state of MLD querying, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable MLD querying with the <b>ipv6 multicast querying</b> command, which is described on <a href="#">page 23-74</a>
<b>Proxying</b>	The current state of MLD proxying on the system, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable MLD spoofing with the <b>ipv6 multicast proxying</b> command, which is described on <a href="#">page 23-82</a>
<b>Spoofing</b>	The current state of MLD spoofing on the system, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable MLD spoofing with the <b>ipv6 multicast spoofing</b> command, which is described on <a href="#">page 23-37</a>
<b>Zapping</b>	The current state of MLD zapping on the system, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable MLD zapping with the <b>ipv6 multicast zapping</b> command, which is described on <a href="#">page 23-80</a>
<b>Querier Forwarding</b>	The current state of MLD querier forwarding on the system, which can be <b>Enabled</b> or <b>Disabled</b> (the default status). You can enable or disable MLD Querier forwarding with the <b>ipv6 multicast querier-forwarding</b> command, which is described on <a href="#">page 23-46</a> .
<b>Version</b>	Displays the default MLD version, which can be <b>1</b> , <b>2</b> or <b>3</b> . Use the <b>ipv6 multicast version</b> command to modify this parameter.
<b>Robustness</b>	Displays the MLD robustness value, ranging from <b>1</b> to <b>7</b> . Use the <b>ipv6 multicast robustness</b> command to modify this parameter.
<b>Query Interval (seconds)</b>	Displays the time (in seconds) between MLD queries. (The default value is 125 seconds). You can modify this parameter with the <b>ipv6 multicast query-interval</b> command, which is described on <a href="#">page 23-62</a> .

---

*output definitions*

---

<b>Query Response Interval (milliseconds)</b>	Displays the time (in milliseconds) to reply to an MLD query message. (The default value is 10000 milliseconds.) You can modify this parameter with the <b>ipv6 multicast query-response-interval</b> command, which is described on <a href="#">page 23-66</a> .
<b>Last Member Query Interval (milliseconds)</b>	Displays the time (in milliseconds) to reply to an MLD query message sent in response to a leave group message. (The default value is 1000 milliseconds.) You can modify this parameter with the <b>ipv6 multicast last-member-query-interval</b> command, which is described on <a href="#">page 23-64</a> .
<b>Unsolicited Report Interval (seconds)</b>	Displays the time period (in seconds) to proxy any changed MLD membership state. (The default value is 1 second). You can modify this parameter with the <b>ipv6 multicast unsolicited-report-interval</b> command, which is described on <a href="#">page 23-68</a> .
<b>Router Timeout (seconds)</b>	Displays the MLD router timeout in seconds (The default value is 90 seconds.) You can modify this parameter with the <b>ipv6 multicast router-timeout</b> command, which is described on <a href="#">page 23-70</a>
<b>Source Timeout (seconds)</b>	Displays the IGMP source timeout in seconds (The default is 30 seconds.) You can modify this parameter with the <b>ipv6 multicast source-timeout</b> command, which is described on <a href="#">page 23-72</a>

---

**Release History**

Release 7.1.1; command was introduced.

## Related Commands

<b>ip multicast helper-address</b>	Enables or disables IPv6 Multicast Switching and Routing on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast version</b>	Sets the default version of the MLD protocol on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast query-interval</b>	Sets the MLD query interval on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast last-member-query-interval</b>	Sets the MLD last member query interval on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast query-response-interval</b>	Sets the MLD query response interval on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast unsolicited-report-interval</b>	Sets the MLD unsolicited report interval on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast router-timeout</b>	Configures the expiry time of IPv6 multicast routers on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast source-timeout</b>	Configures the expiry time of IPv6 multicast sources on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast querying</b>	Enables or disables MLD querying on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast robustness</b>	Sets the MLD robustness variable on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast spoofing</b>	Enables or disables MLD spoofing on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast zapping</b>	Enables or disables MLD zapping on the specified VLAN or on the system if no VLAN is specified.
<b>ipv6 multicast proxying</b>	Enables or disables MLD proxying on the specified VLAN or on the system if no VLAN is specified.

---

## show ipv6 multicast port

Display the max-group configuration applicable for all port or vlan instances of a given port or all ports. The current number of groups learnt on a given port or vlan instance will also be displayed in this show output..

**show ipv6 multicast port** [*slot/port*]

---

### Syntax Definitions

*slot / port*

The slot number for the module and the physical port number on that module (e.g. 3/1 specifies port 1 on slot 3)).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Specify a VLAN ID to display the configuration information for an individual VLAN.

### Examples

```
-> show ipv6 multicast port 1/6
Max-group 9 Action replace
```

```
Total 1 Port-Vlan Pairs
  Port   VLAN   Current Mld   Max-group   Action
          Groups
-----+-----+-----+-----+-----
    1/6   15           5           0         none
```

Output fields are described here:

#### *output definitions*

---

<b>Port</b>	The slot and port number of the IP multicast port.
<b>VLAN</b>	The VLAN associated with the IP multicast port.
<b>Current Groups</b>	The current group associated with the IP Current groups.
<b>IGMP</b>	The IGMP associated with the IP multicast port.
<b>Max-group</b>	The maximum group count allowed on the port.
<b>Action</b>	The action to be taken when the group membership limit is exceeded.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ipv6 multicast admin-state</b>	Enables or disables IPv6 Multicast Switching and Routing on the specified VLAN or on the system if no VLAN is specified.

## show ipv6 multicast forward

Display the IPv6 Multicast Switching and Routing forwarding table entries for the specified IPv6 multicast group address or all entries if no IPv6 multicast address is specified.

**show ipv6 multicast forward** [*ipv6\_address*]

---

### Syntax Definitions

*ipv6\_address* IPv6 multicast group address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 multicast forward
```

```
Total 1 Forwards
```

Group Address	Host Address	Tunnel Address	Ingress		Egress	
			VLAN	Port	VLAN	Port
ff05::6	4444::2	::	1	2/1	1	2/23

```
-> show ipv6 multicast forward ff05::6
```

Group Address	Host Address	Tunnel Address	Ingress		Egress	
			VLAN	Port	VLAN	Port
ff05::6	4444::2	::	1	2/1	1	2/23

### output definitions

---

<b>Group Address</b>	IPv6 group address of the IPv6 multicast forward.
<b>Host Address</b>	IPv6 host address of the IPv6 multicast forward.
<b>Tunnel Address</b>	IPv6 source tunnel address of the IPv6 multicast forward.
<b>VLAN</b>	VLAN associated with the IPv6 multicast forward.
<b>Port</b>	The slot and port number of the IPv6 multicast forward.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**ipv6 multicast static-group**      Creates a static MLD group entry on a specified port on a specified VLAN.

# 24 DVMRP Commands

This chapter includes CLI command descriptions for Distance Vector Multicast Routing Protocol (DVMRP), version 3.

DVMRPv3 is a dense-mode multicast routing protocol that enables routers to efficiently propagate IP multicast traffic through a network. Multicast traffic consists of a data stream that originates from a single source and is sent to hosts that have subscribed to that stream. Live video broadcasts, video conferencing, corporate communications, distance learning, and distribution of software, stock quotes, and news services are examples of multicast traffic.

For more information about configuring DVMRP, see the applicable *OmniSwitch Advanced Routing Configuration Guide*.

MIB information for the DVMRP commands is as follows:

*Filename:* AlcatelIND1Dvmrp.MIB  
*Module:* ALCATEL-IND1-DVMRP-MIB

*Filename:* IETF\_DVMRP\_STD\_DRAFT.MIB  
*Module:* DVMRP-STD-MIB

A summary of the available commands is listed here:

---

**ip load dvmrp**  
**ip dvmrp admin-state**  
**ip dvmrp flash-interval**  
**ip dvmrp graft-timeout**  
**ip dvmrp interface**

## ip load dvmrp

Dynamically loads DVMRP to memory.

**ip load dvmrp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command must be executed before DVMRP can be configured on the switch. In addition, DVMRP must be administratively enabled before you can run the protocol on the switch. For more information, refer to the [ip dvmrp admin-state command on page 24-3](#).

### Examples

```
-> ip load dvmrp
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip dvmrp admin-state](#) Globally enables or disables DVMRP protocol on the switch.

### MIB Objects

```
alaDrcTmConfig  
  alaDrcTmIPDvmrpStatus
```

---

## ip dvmrp admin-state

Globally enables or disables DVMRP protocol on the switch.

**ip dvmrp admin-state** {enable | disable}

---

### Syntax Definitions

<b>enable</b>	Administratively enables DVMRP on the switch.
<b>disable</b>	Administratively disables DVMRP on the switch.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command must be set to **enable** before DVMRP can run on the switch. In addition, the **ip load dvmrp** command must be issued. For more information, refer to the [ip load dvmrp command on page 24-2](#).
- To enable or disable DVMRP for a particular interface, refer to the [ip dvmrp interface command on page 24-6](#).

### Examples

```
-> ip dvmrp admin-state enable  
-> ip dvmrp admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip dvmrp interface</a>	Enables or disables the DVMRP protocol on a specified interface.
<a href="#">ip load dvmrp</a>	Dynamically loads DVMRP to memory.

### MIB Objects

```
alaDvmrpGlobalConfig  
  alaDvmrpAdminStatus
```

---

## ip dvmrp flash-interval

Configures the minimum flash update interval value. The flash update interval defines how often routing table change messages are sent to neighboring DVMRP routers.

**ip dvmrp flash-interval** *seconds*

---

### Syntax Definitions

*seconds* Specifies the interval value, in seconds (5–86400).

### Defaults

parameter	default
<i>seconds</i>	5

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Because routing table change messages are sent between the transmission of complete routing tables, the flash update interval value must be lower than the route report interval.

### Examples

```
-> ip dvmrp flash-interval 5
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip dvmrp](#) Displays global DVMRP parameters.

### MIB Objects

```
alaDvmrpGlobalConfig  
  alaDvmrpFlashUpdateInterval
```

---

## ip dvmrp graft-timeout

Configures the graft message retransmission value. The graft message retransmission value is the duration of time that the routing switch will wait before retransmitting a graft message if it has not received an acknowledgement from its neighbor.

**ip dvmrp graft-timeout** *seconds*

---

### Syntax Definitions

*seconds* Specifies the graft message retransmission value, in seconds (5–86400).

### Defaults

parameter	default
<i>seconds</i>	5

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp graft-timeout 5
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip dvmrp](#) Displays global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpGraftRetransmission

---

## ip dvmrp interface

Enables or disables the DVMRP protocol on a specified interface.

**ip dvmrp interface** {*interface\_name*}

**no ip dvmrp interface** {*interface\_name*}

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to delete an interface.

### Examples

```
-> ip dvmrp interface vlan-10
-> no ip dvmrp interface vlan-10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- |   |   |
|---|---|
| <a href="#">ip dvmrp admin-state</a>      | Globally enables or disables the DVMRP protocol on the switch.                                |
| <a href="#">ip dvmrp interface metric</a> | Configures the distance metric for an interface, which is used to calculate distance vectors. |
| <a href="#">show ip dvmrp interface</a>   | Displays information for all multicast-capable interfaces.                                    |

### MIB Objects

dvmrpInterfaceTable  
    dvmrpInterfaceLocalAddress  
    dvmrpInterfaceStatus

---

## ip dvmrp interface metric

Configures the distance metric for an interface, which is used to calculate distance vectors. DVMRP uses the distance metric value to determine the most cost-effective way to pass data through the network.

**ip dvmrp interface** *{interface\_name}* **metric** *value*

---

### Syntax Definitions

<i>interface_name</i>	The name of the interface.
<i>value</i>	Specifies the metric value (1–31).

### Defaults

parameter	default
<i>value</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

DVMRP uses the distance metric value to determine the most cost-effective way to pass data through the network. The higher the distance metric value, the higher the cost.

### Examples

```
-> ip dvmrp interface vlan-2 metric 1
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip dvmrp interface</a>	Enables or disables the DVMRP protocol on a specified interface.

dvmrpInterfaceTable
  dvmrpInterfaceLocalAddress
  dvmrpInterfaceMetric
```

---

## ip dvmrp neighbor-interval

Configures the neighbor probe interval time. The neighbor probe interval time specifies how often probes are transmitted on DVMRP-enabled interfaces.

**ip dvmrp neighbor-interval** *seconds*

---

### Syntax Definitions

*seconds* Specifies the probe interval time, in seconds (5–30).

### Defaults

parameter	default
<i>seconds</i>	10

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp neighbor-interval 10
```

### Release History

Release 7.1.1; command was introduced.

---

## ip dvmrp neighbor-timeout

Configures the neighbor timeout. This value specifies how long the switch will wait for activity from a neighboring DVMRP router before assuming that the inactive router is down.

**ip dvmrp neighbor-timeout** *seconds*

---

### Syntax Definitions

*seconds* Specifies the neighbor timeout, in seconds (5–86400).

### Defaults

parameter	default
<i>seconds</i>	35

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp neighbor-timeout 35
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpNeighborTimeout

---

## ip dvmrp prune-lifetime

Indicates the length of time a prune will be in effect—i.e., its *lifetime*. When the prune lifetime expires, the interface is joined back onto the multicast delivery tree. If unwanted multicast datagrams continue to arrive, the prune mechanism will be re-initiated and the cycle will continue.

**ip dvmrp prune-lifetime** *seconds*

---

### Syntax Definitions

*seconds* Specifies the prune lifetime, in seconds (180–86400).

### Defaults

parameter	default
<i>seconds</i>	7200

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp prune-lifetime 7200
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip dvmrp prune-timeout</a>	Configures the prune packet retransmission value.
<a href="#">show ip dvmrp prune</a>	Displays DVMRP prune entries, including the router's upstream prune state.
<a href="#">show ip dvmrp</a>	Displays the global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpPruneLifetime

---

## ip dvmrp prune-timeout

Configures the prune packet retransmission value. This value is the duration of time that the routing switch will wait if it continues to receive unwanted multicast traffic before retransmitting a prune message.

**ip dvmrp prune-timeout** *seconds*

---

### Syntax Definitions

*seconds* Specifies retransmission time, in seconds (30–86400).

### Defaults

parameter	default
<i>seconds</i>	30

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp prune-timeout 30
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpPruneRetransmission

---

## ip dvmrp report-interval

Configures the route report interval. This value defines how often the switch will send its complete routing table to neighboring routers running DVMRP.

**ip dvmrp report-interval** *seconds*

---

### Syntax Definitions

*seconds* Specifies the report interval, in seconds (10–2000).

### Defaults

parameter	default
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp report-interval 60
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip dvmrp route](#) Displays the DVMRP routes that are being advertised to other routers.

[show ip dvmrp](#) Displays the global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
  alaDvmrpRouteReportInterval

---

## ip dvmrp route-holddown

Configures the time during which DVMRP routes are kept in a hold down state. A holddown state refers to the time that a route to an inactive network continues to be advertised.

**ip dvmrp route-holddown** *seconds*

---

### Syntax Definitions

*seconds* Specifies the holddown time, in seconds (1–86400).

### Defaults

parameter	default
<i>seconds</i>	120

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp route-holddown 120
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip dvmrp route-timeout</a>	Configures the route expiration timeout value.
<a href="#">show ip dvmrp</a>	Displays the global DVMRP parameters.
<a href="#">show ip dvmrp route</a>	Displays the DVMRP routes that are being advertised to other routers.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpRouteHoldDown

---

## ip dvmrp route-timeout

Configures the route expiration timeout value. The route expiration timeout value specifies how long the switch will wait before aging out a route. When the route expiration timeout expires, the route is advertised as being in holddown until either its activity resumes or it is deleted from the route table.

**ip dvmrp route-timeout** *seconds*

---

### Syntax Definitions

*seconds* Specifies the timeout value, in seconds (20–4000).

### Defaults

parameter	default
<i>seconds</i>	140

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip dvmrp route-timeout 140
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ip dvmrp route-holddown](#) Configures the time during which DVMRP routes are kept in a hold down state.

[show ip dvmrp](#) Displays the global DVMRP parameters.

### MIB Objects

alaDvmrpGlobalConfig  
alaDvmrpRouteExpirationTimeout

---

## ip dvmrp subord-default

Changes the initial default assumption on a neighbor's subordinate or non-subordinate status. When the status value is true, DVMRP neighbors are assumed to be subordinate and traffic is automatically forwarded to the neighbor upon initial discovery. When the value is false, traffic is not forwarded to the neighbor until route reports have been exchanged and the neighbor has explicitly expressed dependency.

**ip dvmrp subord-default {true | false}**

---

### Syntax Definitions

<b>true</b>	DVMRP neighbors are assumed subordinate; traffic is automatically forwarded to the neighbor on initial discovery.
<b>false</b>	DVMRP neighbors are <i>not</i> assumed to be subordinate; traffic is not forwarded until route reports have been exchanged and the neighbor has explicitly expressed dependency.

### Defaults

---

parameter	default
true   false	true

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- However, if neighbors in the DVMRP domain have difficulty handling large initial bursts of traffic, it is recommended that the neighbor's default status as a subordinate be changed to false.
- To view the current subordinate neighbor status, use the [show ip dvmrp](#) command. For more information, refer to [page 24-19](#).

### Examples

```
-> ip dvmrp subord-default false
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****show ip dvmrp**

Displays the global DVMRP parameters.

**MIB Objects**

alaDvmrpGlobalConfig

    alaDvmrpInitNbrASSubord

---

## ip interface tunnel

Configures the end points for the GRE and IPIP tunnels.

**ip interface** *name* **tunnel** [**source** *ip\_address*] [**destination** *ip\_address*] [**protocol** {**ipip** | **gre**}]

**no ip dvmrp interface** *name*

---

### Syntax Definitions

<i>name</i>	Text string up to 20 characters. Use quotes around string if description contains multiple words with spaces between them (e.g. "Alcatel-Lucent Marketing"). Note that this value is case sensitive.
<b>source</b> <i>ip_address</i>	Source IP address of the tunnel.
<b>destination</b> <i>ip_address</i>	Destination IP address of the tunnel.
<b>ipip</b>	Specifies the tunneling protocol as IPIP.
<b>gre</b>	Specifies the tunneling protocol as GRE.

### Defaults

parameter	default
<b>ipip</b>   <b>gre</b>	<b>ipip</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- You can configure an interface as either a vlan or tunnel interface.
- The maximum number of GRE tunnel interfaces that can be configured on a switch is 8.
- The maximum number of IPIP tunnel interfaces that can be configured on a switch is 127.
- Use the **no** form of this command to remove an IP interface.

### Examples

```
-> ip interface "tnl-1" tunnel source 23.23.23.1 destination 155.2.2.2 protocol gre
-> ip interface "tnl-1" tunnel source 23.23.23.1 destination 155.2.2.2 protocol
ipip
```

### Release History

Release 7.1.1; command introduced

## Related Commands

### **show ip dvmrp interface**

Displays information for all multicast-capable interfaces or for a specified interface. This command also provides options to display only DVMRP-enabled or DVMRP-disabled interfaces.

## MIB Objects

```

Route Timeout      = 140,  
Subord Default     = true,
```

```
Number of Routes          = 2,  
Number of Reachable Routes = 2
```

### *output definitions*

---

**DVMRP Admin Status**

The current global (i.e., switch-wide) status of DVMRP, which can be **enabled** or **disabled**. To change the current DVMRP global status, refer to the [ip dvmrp admin-state command on page 24-3](#).

**Flash Interval**

The current minimum flash update interval value, in seconds. The flash interval defines how often routing table change messages are sent to neighboring DVMRP routers. Because routing table change messages are sent between the transmission of complete routing tables, the flash update interval must be shorter than the route report interval. The default value is 5.

*output definitions (continued)*

---

<b>Graft Timeout</b>	The graft message retransmission value, in seconds. The graft message retransmission value defines the duration of time that the routing switch will wait before retransmitting a graft message if it has not received an acknowledgement from its neighbor. Values may range from 5–86400. The default value is 5.
<b>Neighbor Interval</b>	The current neighbor probe interval time, in seconds. The neighbor probe interval time specifies how often probes are transmitted to interfaces with attached DVMRP neighbors. Values may range from 5–30. The default value is 10.
<b>Neighbor Timeout</b>	The current neighbor timeout value, in seconds. This value specifies how long the routing switch will wait for activity from a neighboring DVMRP router before assuming the inactive router is down. Values may range from 5–86400. The default value is 35.
<b>Prune Lifetime</b>	The length of time, in seconds, a prune will be in effect. When the prune lifetime expires, the interface is joined back onto the multicast delivery tree. If unwanted multicast datagrams continue to arrive, the prune mechanism will be re-initiated and the cycle will continue. Values may range from 180–86400. The default value is 7200.
<b>Prune Timeout</b>	The current prune packet retransmission value, in seconds. This value indicates the duration of time that the routing switch will wait if it continues to receive unwanted multicast traffic before retransmitting a prune message. Values range from 30–86400. The default value is 30.
<b>Report Interval</b>	The current route report interval, in seconds. The route report interval defines how often routers will send their complete routing tables to neighboring routers running DVMRP. Values may range from 10–2000. The default value is 60.
<b>Route Holddown</b>	The current holddown time, in seconds. This value indicates the time during which DVMRP routes are kept in a holddown state. A holddown state refers to the time that a route to an inactive network continues to be advertised. Values may range from 1–120. The default value is 120.
<b>Route Timeout</b>	The current route expiration timeout value, in seconds. The route expiration timeout value specifies how long the routing switch will wait before aging out a route. Values may range from 20–4000. The default value is 140.
<b>Subord Default</b>	Displays the initial default assumption on a neighbor's subordinate or non-subordinate status. When the status value is true, DVMRP neighbors are assumed to be subordinate and traffic is automatically forwarded to the neighbor upon initial discovery. When the value is false, traffic is not forwarded to the neighbor until route reports have been exchanged and the neighbor has explicitly expressed dependency. To change the current subordinate neighbor status, refer to the <a href="#">ip dvmrp subord-default command on page 24-15</a> . Options include true and false. The default value is true.

*output definitions (continued)*

---

<b>Number of Routes</b>	The number of entries in the routing table. This number can be used to monitor the routing table size and detect illegal advertisements of unicast routes.
<b>Number of Reachable Routes</b>	The total number of reachable routes. The number of entries in the routing table with non-infinite metrics. This number can be used to detect network partitions by observing the ratio of reachable routes to total routes. Routes with unreachable metrics, routes in a holddown state, and routes that have aged out are not considered reachable.

---

**Release History**

## show ip dvmrp interface

Displays information for all multicast-capable interfaces *or* for a specified interface. This command also provides options to display only DVMRP-enabled or DVMRP-disabled interfaces.

**show ip dvmrp interface** [*ip\_address* | *interface\_name* | **enabled** | **disabled**]

---

### Syntax Definitions

<i>ip_address</i>	Specifies a particular interface IP address.
<i>interface_name</i>	The name of the interface.
<b>enabled</b>	Displays a list of all interfaces (i.e., VLAN router ports) on which DVMRP is currently <i>enabled</i> .
<b>disabled</b>	Displays a list of all interfaces (i.e., VLAN router ports) on which DVMRP is currently <i>disabled</i> .

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If no optional syntax is specified in the command line, the entire interface table is displayed.
- For an interface to show as *enabled* in the **show ip dvmrp interface** or **show ip dvmrp interface enabled** output, the interface must be both administratively *and* operationally enabled. Although the interface does not have to be passing traffic, at least one VLAN router port must be operational on the corresponding DVMRP-enabled VLAN.
- To view the Generation ID being used on a particular interface, you must include the interface IP address in the command line.

### Examples

```
-> show ip dvmrp interface
Interface Name      Vlan  Metric  Admin-Status  Oper-Status
-----+-----+-----+-----+-----
vlan-1              1     1       Disabled      Disabled
vlan-2              2     1       Enabled       Enabled

-> show ip dvmrp interface enabled
Interface Name      Vlan  Metric  Admin-Status  Oper-Status
-----+-----+-----+-----+-----
vlan-2              2     1       Enabled       Enabled
```

*output definitions*

---

<b>Interface Name</b>	The name of the interface.
<b>Vlan</b>	The associated VLAN ID.
<b>Tunnel</b>	Indicates whether there is a DVMRP tunnel currently configured on the interface.
<b>Metric</b>	The current metric value. A metric is essentially used to determine the most cost-effective way to pass data through the network. The higher the metric value, the higher the cost.
<b>Admin-Status</b>	The current administrative status of the corresponding interface. Options include <b>Enabled</b> or <b>Disabled</b> . An interface can be configured for DVMRP without being operational. To change the DVMRP Admin-status for an individual interface, refer to the <a href="#">ip dvmrp interface command on page 24-6</a> .
<b>Oper-Status</b>	The current operational status of the corresponding multicast-capable interface. Options include <b>Enabled</b> or <b>Disabled</b> . For an interface to be DVMRP-operational, the global DVMRP status must be enabled and the individual interface must be DVMRP-enabled. To change the global DVMRP status, refer to the <a href="#">ip dvmrp admin-state command on page 24-3</a> .

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

[ip dvmrp interface](#) Enables or disables the DVMRP protocol on a specified interface.

```

---

## show ip dvmrp neighbor

Displays the DVMRP neighbor table. The DVMRP neighbor table displays either all neighboring DVMRP routers, or a specified neighboring DVMRP router.

**show ip dvmrp neighbor** [*ip\_address*]

---

### Syntax Definitions

*ip\_address* Specifies a particular IP address for a neighboring DVMRP router.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If a neighbor IP address is not specified, the entire DVMRP Neighbor Table is displayed.

### Examples

```
-> show ip dvmrp neighbor
```

```
Neighbor Address  Intf Name      Uptime        Expires        GenID        Vers  State
-----+-----+-----+-----+-----+-----+-----
143.209.92.214   vlan-2         00h:09m:12s  00h:00m:06s   546947509   3.255  active
```

#### *output definitions*

---

<b>Neighbor Address</b>	The 32-bit IP address of the DVMRP neighbor's router interface.
<b>Intf Name</b>	The interface name of the neighbor's router.
<b>Uptime</b>	The amount of time the neighbor has been running, displayed in hours, minutes, and seconds.
<b>Expires</b>	The amount of time remaining before the neighbor expires, displayed in hours, minutes, and seconds.
<b>GenID</b>	The generation ID for the DVMRP neighbor. This value is used by neighboring routers to detect whether the DVMRP routing table should be resent.
<b>Version</b>	The DVMRP version number for the neighbor.
<b>State</b>	The current state of the DVMRP neighbor. Options include <b>active</b> and <b>down</b> .

---

### Release History

```

---

## show ip dvmrp nexthop

Displays DVMRP next hop entries. This command is used to show the list of next hops on outgoing interfaces to which IP multicast datagrams from particular sources are routed.

**show ip dvmrp nexthop** [*ip\_address ip\_mask*]

---

### Syntax Definitions

<i>ip_address</i>	Specifies a source IP address for which DVMRP next hop entries will be displayed.
<i>ip_mask</i>	Specifies a source IP mask for which DVMRP next hop entries will be displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If an IP address and IP mask are not specified, the entire DVMRP Next Hop table is displayed.

### Examples

```
-> show ip dvmrp nexthop 172.22.2.115 255.255.255.0
```

Src Address/Mask	Interface Name	Vlan	Hop Type
172.22.2.115/24	vlan-2	2	branch

#### *output definitions*

---

<b>Src Address/Mask</b>	The 32-bit source IP address, along with the mask length, shown in bits. The source IP address and mask are separated by a slash (/).
<b>Interface Name</b>	The name of the interface.
<b>Vlan</b>	The associated VLAN ID.
<b>Hop Type</b>	The hop type of the associated entry. Options include <b>leaf</b> or <b>branch</b> . If the next hop VLAN has a DVMRP neighbor attached to it, the hop type will be displayed as <b>branch</b> .

---

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

---

## show ip dvmrp prune

Displays DVMRP prune entries that have been sent upstream.

**show ip dvmrp prune** [*group\_address source\_address source\_mask*]

---

### Syntax Definitions

<i>group_address</i>	Specifies a pruned group address.
<i>source_address</i>	Specifies a source IP address.
<i>source_mask</i>	Specifies a source IP mask.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If a group address, source address, and source mask are not specified, the entire Prune table is displayed.

### Examples

-> show ip dvmrp prune

Group Address	Source Address/Mask	Expires
-----+-----+-----		
224.0.0.4	143.209.92.14/24	00h:00m:30s

#### output definitions

---

<b>Group Address</b>	The 32-bit multicast group address.
<b>Source Address/Mask</b>	The 32-bit source IP address, along with the mask length, shown in bits. The source IP address and mask are separated by a slash (/).
<b>Expires</b>	The amount of time remaining before the current prune state expires, displayed in hours, minutes, and seconds.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[ip dvmrp prune-lifetime](#)

Indicates the length of time a prune will be in effect.

[ip dvmrp prune-timeout](#)

Configures the prune packet retransmission value.

---

## show ip dvmrp route

Displays the DVMRP routes that are being advertised to other routers.

**show ip dvmrp route** [*ip\_address ip\_mask*]

---

### Syntax Definitions

*ip\_address*                      The 32-bit source IP address representing route(s).

*ip\_mask*                         A 32-bit number that determines the subnet mask for the IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If a source IP address and IP mask are not specified, the entire DVMRP route table is displayed.

### Examples

```
-> show ip dvmrp route
Legends:  Flags:  L = Local, R = Remote, F = Flash, H = Holddown, I = Invalid
          Address/Mask      Gateway      Metric      Age           Expires      Flags
-----+-----+-----+-----+-----+-----+-----
      11.0.0.0/8           55.0.0.5           2      00h:13m:14s    02m:07s      R
      22.0.0.0/8           44.0.0.4           2      00h:33m:14s    02m:15s      R
      44.0.0.0/8            -                   1      05h:24m:59s     -             L
      55.0.0.0/8            -                   1      05h:24m:59s     -             L
      66.0.0.0/8           44.0.0.4           2      00h:03m:11s    02m:15s      R
```

#### output definitions

---

<b>Address/Mask</b>	The 32-bit IP address for the router interface, along with the corresponding subnet mask. The interface's subnet mask is shown using the CIDR prefix length: 255.0.0.0 equals /8; 255.255.0.0 equals /16; 255.255.255.0 equals /24, etc.
<b>Gateway</b>	The corresponding 32-bit gateway address. Because it is not applicable, no gateway address is displayed for local routes.
<b>Metric</b>	The current metric value. A metric is essentially used to determine the most cost-effective way to pass data through the network. The higher the metric value, the higher the cost.
<b>Age</b>	The current age of the DVMRP route, displayed in hours, minutes, and seconds.

---

*output definitions (continued)*

---

<b>Expires</b>	The expiration time for the corresponding route. Because it is not applicable, no expiration time is displayed for local routes.
<b>Flags</b>	The flag type of a particular DVMRP route. Options include <b>L</b> (Local), <b>R</b> (Remote), <b>F</b> (Flash), <b>H</b> (Holddown), and <b>I</b> (Invalid).

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<a href="#">ip dvmrp report-interval</a>	Configures the route report interval.
<a href="#">ip dvmrp route-holddown</a>	Configures the time during which DVMRP routes are kept in a hold down state.
<a href="#">ip dvmrp route-timeout</a>	Configures the route expiration timeout value.

**MIB Objects**

```
dvmrpRouteTable
  dvmrpRouteSource
  dvmrpRouteSourceMask
  dvmrpRouteMetric
  dvmrpRouteExpiryTime
  dvmrpRouteUpTime
```

---

## show ip dvmrp tunnel

Displays DVMRP tunnel entries.

**show ip dvmrp tunnel** [*local\_address remote\_address*]

---

### Syntax Definitions

*local\_address*

The IP address of a particular local router interface. The local router interface IP address is an identifier for the local end of the DVMRP tunnel.

*remote\_mask*

The IP address of a particular remote router interface. The remote router interface IP address is an identifier for the remote end of the DVMRP tunnel.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If optional local and remote IP address information is not specified, entire DVMRP Tunnels table is displayed.
- The local IP address of the tunnel must match the IP address of an existing DVMRP-enabled IP interface.

### Examples

-> show ip dvmrp tunnel

Interface Name	Local Address	Remote Address	TTL	Status
vlan-2	143.209.92.203	12.0.0.1	255	Enabled

#### *output definitions*

---

<b>Interface Name</b>	The interface name.
<b>Local Address</b>	The 32-bit local IP address for the DVMRP tunnel.
<b>Remote Address</b>	The 32-bit remote IP address for the DVMRP tunnel.
<b>TTL</b>	The current Time to Live (TTL) value. A value of 0 indicates that the value is copied from the payload's header. Values may range from 0–255.
<b>Status</b>	The corresponding interface status. Options include <b>Enabled</b> or <b>Disabled</b> . If the interface specified by the local address has been configured and is operationally enabled, the status is <b>Enabled</b> . If the interface is down, the value displayed is <b>Disabled</b> .

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

# 25 PIM Commands

Protocol-Independent Multicast (PIM) is an IP multicast routing protocol that uses routing information provided by unicast routing protocols, such as RIP and OSPF. Note that PIM is not dependent on any particular unicast routing protocol. Sparse mode PIM (PIM-SM) contrasts with flood-and-prune dense mode multicast protocols, such as DVMRP and PIM Dense Mode (PIM-DM), in that multicast forwarding in PIM-SM is initiated only through specific requests.

Downstream routers must explicitly join PIM-SM distribution trees to receive multicast streams on behalf of directly connected receivers or other downstream PIM-SM routers. This paradigm of receiver-initiated forwarding makes PIM ideal for network environments where receiver groups are thinly populated and bandwidth conservation is a concern, such as in wide area networks (WANs). PIM-DM uses RPF (Reverse Path Forwarding) to prevent looping of multicast datagrams while flooding. If some areas of the network do not have group members, PIM-DM will prune the forwarding branch by instantiating the prune state.

PIM-DM differs from PIM-SM in two essential ways:

- There are no periodic joins transmitted, only explicitly triggered prunes and grafts.
- There is no Rendezvous Point (RP). This is particularly important in networks that cannot tolerate a single point of failure.

Alcatel-Lucent implementation of PIM can also be configured in an IPv6 environment.

MIB information for the PIM commands is as follows:

*Filename:* AlcatelIND1Pim\_mib.htm  
*Module:* ALCATEL-IND1-PIM-MIB

*Filename:* AlcatelIND1PimBsrDraft\_mib.htm  
*Module:* ALCATEL-IND1-PIM-BSR-MIB

*Filename:* AlcatelIND1PimStdDraft\_mib.htm  
*Module:* ALCATEL-IND1-PIM-STD-MIB

A summary of the available commands is listed here:

---

<b>ip load pim</b>	<b>show ip pim static-rp</b>
<b>ip pim sparse admin-state</b>	<b>show ip pim cbsr</b>
<b>ip pim dense admin-state</b>	<b>show ip pim bsr</b>
<b>ip pim ssm group</b>	<b>show ip pim notifications</b>
<b>ip pim dense group</b>	<b>show ip pim groute</b>
<b>ip pim cbsr</b>	<b>show ip pim sgroute</b>
<b>ip pim static-rp</b>	<b>ipv6 pim sparse admin-state</b>
<b>ip pim candidate-rp</b>	<b>ipv6 pim dense admin-state</b>
<b>ip pim rp-threshold</b>	<b>ipv6 pim ssm group</b>
<b>ip pim keepalive-period</b>	<b>ipv6 pim dense group</b>
<b>ip pim max-rps</b>	<b>ipv6 pim cbsr</b>
<b>ip pim probe-time</b>	<b>ipv6 pim static-rp</b>
<b>ip pim register checksum</b>	<b>ipv6 pim candidate-rp</b>
<b>ip pim register-suppress-timeout</b>	<b>ipv6 pim rp-switchover</b>
<b>ip pim spt admin-state</b>	<b>ipv6 pim spt admin-state</b>
<b>ip pim state-refresh-interval</b>	<b>ipv6 pim interface</b>
<b>ip pim state-refresh-limit</b>	<b>show ipv6 pim sparse</b>
<b>ip pim state-refresh-ttl</b>	<b>show ipv6 pim dense</b>
<b>ip pim interface</b>	<b>show ipv6 pim ssm group</b>
<b>ip pim neighbor-loss-notification-period</b>	<b>show ipv6 pim dense group</b>
<b>ip pim invalid-register-notification-period</b>	<b>show ipv6 pim interface</b>
<b>ip pim invalid-joinprune-notification-period</b>	<b>show ipv6 pim neighbor</b>
<b>ip pim rp-mapping-notification-period</b>	<b>show ipv6 pim static-rp</b>
<b>ip pim interface-election-notification-period</b>	<b>show ipv6 pim group-map</b>
<b>show ip pim sparse</b>	<b>show ipv6 pim candidate-rp</b>
<b>show ip pim dense</b>	<b>show ipv6 pim cbsr</b>
<b>show ip pim ssm group</b>	<b>show ipv6 pim bsr</b>
<b>show ip pim dense group</b>	<b>show ipv6 pim groute</b>
<b>show ip pim neighbor</b>	<b>show ipv6 pim sgroute</b>
<b>show ip pim candidate-rp</b>	
<b>show ip pim group-map</b>	
<b>show ip pim interface</b>	

---

## ip load pim

Dynamically loads PIM to memory.

**ip load pim**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command must be executed before PIM can run on the switch.
- This command is supported in both IPv4 and IPv6 PIM.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

### Examples

```
-> ip load pim
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip pim sparse admin-state</b>	Globally enables or disables the PIM-SM protocol on the switch.
<b>show ip pim sparse</b>	Displays the status of the various global parameters for the PIM sparse mode.
<b>ip pim dense admin-state</b>	Globally enables or disables PIM-DM protocol on the switch.
<b>show ip pim dense</b>	Displays the status of the various global parameters for the PIM Dense mode.
<b>ipv6 pim sparse admin-state</b>	Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.
<b>show ipv6 pim sparse</b>	Displays the status of the various global parameters for the IPv6 PIM sparse mode.
<b>ipv6 pim dense admin-state</b>	Enables or disables the IPv6 PIM-DM (dense mode) globally for IPv6.
<b>show ipv6 pim dense</b>	Displays the status of the various global parameters for the IPv6 PIM dense mode.

## MIB Objects

alaDrcTmIPpimStatus

---

## ip pim sparse admin-state

Globally enables or disables PIM-SM protocol on the switch.

**ip pim sparse admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Globally enables PIM-SM on the switch.
<b>disable</b>	Globally disables PIM-SM on the switch.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command must be set to **enable** before PIM-SM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 25-3](#) for more information.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

### Examples

```
-> ip pim sparse admin-state enable  
-> ip pim sparse admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip pim interface</a>	Enables or disables the PIM protocol on a specific interface.
<a href="#">ip load pim</a>	Dynamically loads PIM to memory.
<a href="#">show ip pim sparse</a>	Displays the status of the various global parameters for the PIM sparse mode.

### MIB Objects

```
alaPimsmGlobalConfig  
  alaPimsmAdminStatus
```

---

## ip pim dense admin-state

Globally enables or disables PIM-DM protocol on the switch.

**ip pim dense admin-state** {enable | disable}

---

### Syntax Definitions

<b>enable</b>	Globally enables PIM-DM on the switch.
<b>disable</b>	Globally disables PIM-DM on the switch.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command must be set to **enable** before PIM-DM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 25-3](#) for more information.
- The advanced routing image file must be loaded to flash before the feature will start to work on the switch.

### Examples

```
-> ip pim dense admin-state enable
-> ip pim dense admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip pim interface</a>	Enables or disables the PIM protocol on a specific interface.
<a href="#">ip load pim</a>	Dynamically loads PIM to memory.
<a href="#">show ip pim dense</a>	Displays the status of the various global parameters for the PIM dense mode.

### MIB Objects

```
alaPimdmGlobalConfig
  alaPimdmAdminStatus
```

---

## ip pim ssm group

Statically maps the specified IP multicast group(s) to the PIM Source Specific Multicast mode (SSM).

```
ip pim ssm group group_address/prefix_length [[no] override] [priority priority]
```

```
no ip pim ssm group group_address/prefix_length
```

---

### Syntax Definitions

<i>group_address</i>	Specifies a 32-bit group address.
<i>/prefix_length</i>	Specifies the prefix length of the multicast group.
<b>override</b>	Specifies the static SSM mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static SSM mode configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the priority option is not set and the override option is set to false.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a SSM mode group mapping.
- The PIM Source-Specific Multicast (SSM) mode for the default SSM address range (232.0.0.0 through 232.255.255.255) reserved by the Internet Assigned Numbers Authority is not enabled automatically and needs to be configured manually to support SSM.
- You can also map additional multicast address ranges for the SSM group using this command. However, the multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- Specifying the priority value obsoletes the **override** option.
- Note that once the priority option has been defined, a value of 65535 can be used to un-set the priority

### Examples

```
-> ip pim ssm group 224.0.0.0/4 priority 50
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>show ip pim sparse</b>	Displays the status of the various global parameters for the PIM sparse mode.
<b>show ip pim ssm group</b>	Displays the static configuration of multicast group mappings for the PIM-Source Specific Multicast (SSM) mode.
<b>show ip pim group-map</b>	Displays the PIM group mapping table.

## MIB Objects

```
alaPimStaticRPTable  
  alaPimStaticRPGrpAddress  
  alaPimStaticRPGrpPrefixLength  
  alaPimStaticRPOverrideDynamic  
  alaPimStaticRPPrecedence  
  alaPimStaticRPProwStatus
```

---

## ip pim dense group

Statically maps the specified IP multicast group(s) to the PIM Dense mode (DM).

```
ip pim dense group group_address/prefix_length [[no] override] [priority priority]
```

```
no ip pim dense group group_address/prefix_length
```

---

### Syntax Definitions

<i>group_address</i>	Specifies a 32-bit group address.
<i>/prefix_length</i>	Specifies the prefix length of the multicast group.
<b>override</b>	Specifies this static Dense mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the priority option is not set and the override option is set to false.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a dense mode group mapping.
- This command specifies the mode as Dense (PIM-DM) for the specified multicast group address.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to un-set the priority.

### Examples

```
-> ip pim dense group 224.0.0.0/4 priority 50
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

- |                                |  |
|--------------------------------|--|
| <b>show ip pim dense</b>       | Displays the status of the various global parameters for the PIM dense mode.           |
| <b>show ip pim dense group</b> | Displays the static configuration of multicast group mappings for PIM-Dense Mode (DM). |
| <b>show ip pim group-map</b>   | Displays the PIM group mapping table.  |

## MIB Objects

```
alaPimStaticRPTable

  alaPimStaticRPGrpPrefixLength  
  alaPimStaticRPOverrideDynamic  
  alaPimStaticRPPrecedence  
  alaPimStaticRPRowStatus
```

---

## ip pim cbsr

Configures the local router as the Candidate-BSR for the PIM domain.

**ip pim cbsr** *ip\_address* [**priority** *priority*] [**mask-length** *bits*]

**no ip pim cbsr** *ip\_address*

---

### Syntax Definitions

<i>ip_address</i>	Specifies the 32-bit address that the local router uses to advertise itself as a Candidate-BSR.
<i>priority</i>	Specifies the priority value of the local router as a Candidate-BSR. The higher the value, the higher the priority. Values may range from 0 to 255.
<i>bits</i>	Specifies a 32-bit mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group). Values may range from 1 to 32.

### Defaults

parameter	default
<i>priority</i>	64
<i>bits</i>	30

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove the local routers candidature as the BSR.
- This command is supported only in the sparse mode.
- The information configured using this command is used in the Bootstrap messages.
- Candidate-BSRs also avoid a single point of failure in a PIM domain.

### Examples

```
-> ip pim cbsr 50.1.1.1 priority 100 mask-length 4
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### `show ip pim cbsr`

Displays the Candidate-BSR information that is used in the Bootstrap messages.

## MIB Objects

```
alaPimBSrCandidateBSRTable  
  alaPimBsrCandidateBSRAddress  
  alaPimBsrCandidateBSRPriority  
  alaPimBsrCandidateBSRHashMaskLength  
  alaPimBsrCandidateBSRRowStatus
```

---

## ip pim static-rp

Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

```
ip pim static-rp group_address/prefix_length rp_address [[no] override] [priority priority]
```

```
no ip pim static-rp group_address/prefix_length rp_address
```

---

### Syntax Definitions

<i>group_address</i>	Specifies a 32-bit group address.
<i>/prefix_length</i>	Specifies the prefix length of the multicast group.
<i>rp_address</i>	Specifies a 32-bit Rendezvous Point (RP) address.
<b>override</b>	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for the static RP configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the priority option is not set and the override option is set to false.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete a static RP configuration.
- Specifying the priority value obsoletes the **override** option.
- The PIM Source-Specific Multicast (SSM) mode for the default SSM address range (232.0.0.0 through 232.255.255.255) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM. You can also map additional multicast address ranges for the SSM group. However, the multicast groups in the reserved address range can be mapped only to the SSM mode.
- This command is supported only in the sparse mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Note that once the priority option has been defined, a value of 65535 can be used to un-set the priority
- To view current static RP configuration settings, use the [show ip pim static-rp](#) command.

### Examples

```
-> ip pim static-rp 224.0.0.0/4 10.1.1.1 priority 10
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

- |                              |   |
|------------------------------|---|
| <b>show ip pim sparse</b>    | Displays the status of the various global parameters for the PIM sparse mode.   |
| <b>show ip pim static-rp</b> | Displays the PIM static RP table for ASM mode, which includes group address/prefix length, the static Rendezvous Point (RP) address, and the current status of static RP configuration (i.e., enabled or disabled). |
| <b>show ip pim group-map</b> | Displays the PIM group mapping table.   |

## MIB Objects

```
alaPimStaticRPTable  
  alaPimStaticRPGrpAddress  
  alaPimStaticRPGrpPrefixLength  
  alaPimStaticRPPAddress  
  alaPimStaticRPOverrideDynamic  
  alaPimStaticRPPrecedence  
  alaPimStaticRPRowStatus
```

---

## ip pim candidate-rp

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IP multicast group(s).

**ip pim candidate-rp** *rp\_address* *group-address/prefix\_length* [**priority** *priority*] [**interval** *seconds*]

**no ip pim candidate-rp** *rp\_address* *group-address/prefix\_length*

---

### Syntax Definitions

<i>rp_address</i>	Specifies a 32-bit address that will be advertised as a Candidate-RP.
<i>group_address</i>	Specifies a 32-bit group address for which the local router will advertise itself as a Candidate-RP.
<i>/prefix_length</i>	Specifies the prefix length of the multicast group.
<i>priority</i>	Specifies the priority value of the Candidate-RP. Values may range from 0 to 192. The lower the value, the higher the priority.
<i>seconds</i>	Specifies the interval at which the C-RP advertisements are sent to the bootstrap router, in seconds. Values may range from 1 to 300.

### Defaults

parameter	default
<i>priority</i>	192
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a C-RP for a particular multicast group.
- The specified *rp\_address* must belong to a PIM enabled interface.
- Only one RP address is supported per switch. If multiple candidate-RP entries are defined, they must specify the same *rp-address*.
- The priority and the interval values are used by the switch. If they are modified for one entry, the switch will modify these for all the candidate-rp entries.
- This command is supported only in the sparse mode.

### Examples

```
-> ip pim candidate-rp 50.1.1.1 224.0.0.0/4 priority 100 interval 100
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

## ip pim rp-threshold

Specifies the data rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing a source-specific (S, G) Join message toward the source.

**ip pim rp-threshold** *bps*

---

### Syntax Definitions

*bps* The data rate value, in bits per second, at which the RP will attempt to switch to native forwarding (0–2147483647).

### Defaults

parameter	default
<i>bps</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is supported only in the sparse mode.
- To disable the RP threshold feature, specify a bits per second value of 0. When the RP threshold is disabled, the RP will never initiate an (S, G) Join message toward the source; the packets will be register-encapsulated to the RP. It will issue a (S, G) Join message upon receiving the first data packet, if its bits per second value is 1.
- To view the current RP threshold, use the [show ip pim sparse](#) command.

### Examples

```
-> ip pim rp-threshold 131072
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip pim sparse](#) Displays the global parameters for PIM sparse mode.

---

## ip pim keepalive-period

Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.

**ip pim keepalive-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the timeout value, in seconds (0-65535).

### Defaults

parameter	default
<i>seconds</i>	210

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This timer is called the Keepalive Period in the PIM-SM specification and the Source Lifetime in the PIM-DM specification.
- This command includes support for both IPv4 PIM and IPv6 PIM.

### Examples

```
-> ip pim keepalive-period 500
```

### Release History

Release 7.1.1; command was introduced.

## MIB Objects

alaPim  
alaPimKeepalivePeriod

---

## ip pim max-rps

Configures the maximum number of C-RP routers allowed in the PIM-SM domain.

**ip pim max-rps** *number*

---

### Syntax Definitions

*number* The maximum number of C-RP routers allowed in the PIM-SM domain (1–100).

### Defaults

parameter	default
<i>number</i>	32

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is supported only in the sparse mode.
- This command is used with both IPv4 and IPv6 PIM-SM. The PIM-SM must be disabled before changing **max-rps** value.
- PIM-SM must be globally disabled before changing the maximum number of C-RP routers. To globally disable PIM-SM, refer to the [ip pim sparse admin-state](#) command on page 25-5.

### Examples

```
-> ip pim max-rps 32
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>ip pim sparse admin-state</b>	Globally enables or disables the PIM-SM protocol on the switch.

---

## ip pim probe-time

Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.

**ip pim probe-time** *seconds*

---

### Syntax Definitions

*seconds* The probe time, in seconds (1–300).

### Defaults

parameter	default
<i>seconds</i>	5

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used with both IPv4 and IPv6 PIM-SM.
- This command is supported only in the sparse mode.

### Examples

```
-> ip pim probe-time 5
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

alaPimsmProbeTime

---

## ip pim register checksum

Configures the application of the checksum function on sent and received register messages in the domain.

**ip pim register checksum {header | full}**

---

### Syntax Definitions

<b>header</b>	Specifies that the checksum for registers is done only on the PIM header.
<b>full</b>	Specifies that the checksum is done over the entire PIM register message.

### Defaults

---

parameter	default
header   full	header

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The **full** option may be required for compatibility with older implementations of PIM-SM v2.
- This parameter setting must be consistent across the PIM domain.
- This command is supported only in the sparse mode.

### Examples

```
-> ip pim register checksum header
-> ip pim register checksum full
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

### MIB Objects

```

  alaPimsmOldRegisterMessageSupport
```

---

## ip pim register-suppress-timeout

Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.

**ip pim register-suppress-timeout** *seconds*

---

### Syntax Definitions

*seconds*                              The timeout value, in seconds (0–65535).

### Defaults

parameter	default
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is supported in both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

### Examples

```
-> ip pim register-suppress-timeout 10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">show ip pim sparse</a>	Displays the status of the various global parameters for the PIM sparse mode.

### MIB Objects

alaPim  
alaPimRegisterSuppressionTime

---

## ip pim spt admin-state

Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first data packet is received.

**ip pim spt admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables last hop DR switching to the SPT.
<b>disable</b>	Disables last hop DR switching to the SPT.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is supported only in the sparse mode.
- As mentioned above, if SPT status is enabled, last hop DR switching to the SPT begins once the first data packet is received.
- To view whether SPT status is currently enabled (default) or disabled, use the [show ip pim sparse](#) command.

### Examples

```
-> ip pim spt admin-state enable
-> ip pim spt admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip pim sparse](#) Displays the status of the various global parameters for the PIM sparse mode.

## ip pim state-refresh-interval

Sets the interval between successive State Refresh messages originated by a router.

**ip pim state-refresh-interval** *seconds*

---

### Syntax Definitions

*seconds*                                      The interval between successive State Refresh messages, in seconds. Values may range from 0 to 65535.

### Defaults

parameter	default
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 PIM-DM and IPv6 PIM-DM.

### Examples

```
-> ip pim state-refresh-interval 80
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

### MIB Objects

alaPim  
alaPimRefreshInterval

---

## ip pim state-refresh-limit

Sets the limit at which a router will not forward successive State Refresh messages if they are received at less than the interval.

**ip pim state-refresh- limit** *ticks*

---

### Syntax Definitions

*ticks*

The limit at which the received State Refresh messages will not be forwarded, if the messages are received at less than the interval. Values may range from 0 to 65535.

### Defaults

parameter	default
<i>ticks</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 and IPv6.

### Examples

```
-> ip pim state-refresh-limit 2
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

---

## ip pim state-refresh-ttl

Sets the Time to Live to be used in a router's originated State Refresh messages if the data packet's Time to Live is not recorded.

**ip pim state-refresh-ttl** *num*

---

### Syntax Definitions

*num* The Time to Live to be used. Values may range from 0 to 255.

### Defaults

parameter	default
<i>num</i>	16

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is supported only in the dense mode.
- This value is used with both IPv4 and IPv6 PIM-DM.

### Examples

```
-> ip pim state-refresh-ttl 122
```

### Release History

Release 7.1.1; command was introduced.

---

## ip pim interface

Enables PIM and configures PIM-related statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the interface.

**ip pim interface** *if\_name* [**hello-interval** *seconds*] [**triggered-hello** *seconds*] [**joinprune-interval** *seconds*] [**hello-holdtime** *seconds*] [**joinprune-holdtime** *seconds*] [**prune-delay** *milliseconds*] [**override-interval** *milliseconds*] [**dr-priority** *priority*] [[**no**] **stub**] [**prune-limit-interval** *seconds*] [**graft-retry-interval** *seconds*]

**no ip pim interface** *if\_name*

---

### Syntax Definitions

<i>if_name</i>	The interface name on which PIM is being enabled or disabled.
<b>hello-interval</b> <i>seconds</i>	The frequency at which PIM Hello messages are transmitted on a specified interface, in seconds. Values may range from 0 to 18000.
<b>triggered-hello</b> <i>seconds</i>	Specifies the maximum time, in seconds, before a triggered PIM Hello message is sent on this interface. Values may range from 0 to 60.
<b>joinprune-interval</b> <i>seconds</i>	The frequency at which periodic Join/Prune messages are sent on this interface, in seconds. Values may range from 0 to 18000.
<b>hello-holdtime</b> <i>seconds</i>	Specifies the value set in the Holdtime field of PIM Hello messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>joinprune-holdtime</b> <i>seconds</i>	Specifies the value inserted into the Holdtime field of the Join/Prune messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>prune-delay</b> <i>milliseconds</i>	Specifies the value of the expected propagation delay between PIM routers on this network, inserted into the LAN prune-delay option of the Hello messages sent on this interface, in milliseconds. Values may range from 0 to 32767.
<b>override-interval</b> <i>milliseconds</i>	Specifies the value inserted into the Override Interval field of the LAN prune-delay option of the Hello messages sent on this interface, in <i>milliseconds</i> . Values may range from 0 to 65535.
<b>dr-priority</b> <i>priority</i>	Specifies the Designated Router priority inserted into the DR priority option on a specified interface. The DR priority option value can range between 1 to 192. A higher numeric value denotes a higher priority.
<b>prune-limit-interval</b> <i>seconds</i>	Specifies the minimum interval that must elapse between two successive prune messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>graft-retry-interval</b> <i>seconds</i>	Specifies the minimum interval that must elapse between two successive graft messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>stub</b>	Specifies the interface not to send any PIM packets through this interface, and to ignore received PIM packets.

## Defaults

parameter	default
<b>hello-interval</b> <i>seconds</i>	30
<b>triggered-hello</b> <i>seconds</i>	5
<b>joinprune-interval</b> <i>seconds</i>	60
<b>hello-holdtime</b> <i>seconds</i>	105
<b>joinprune-holdtime</b> <i>seconds</i>	210
<b>prune-delay</b> <i>milliseconds</i>	500
<b>override-interval</b> <i>milliseconds</i>	2500
<b>dr-priority</b> <i>priority</i>	1
<b>prune-limit-interval</b> <i>seconds</i>	60
<b>graft-retry-interval</b> <i>seconds</i>	3
<b>stub</b>	Disabled.

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Use the **no** form of this command to delete a PIM interface.
- PIM must be enabled globally on the switch before it runs on the interface. To globally enable or disable PIM-SM on the switch, refer to the [ip pim sparse admin-state command on page 25-5](#). To enable or disable PIM-DM on the switch, refer to the [ip pim dense admin-state command on page 25-6](#).
- Specifying zero for the hello-interval represents an infinite time, in which case periodic PIM Hello messages are not sent.
- Specifying zero for the joinprune-interval represents an infinite time, in which case periodic PIM Join/Prune messages are not sent.
- Specifying the value of 65535 for hello-holdtime represents an infinite time. If a PIM router gets Hello packet from a neighbor with its hello-holdtime value as infinite time, then the PIM router will not time out the sender(neighbor). It is recommended that you should use a hello-holdtime interval that is 3.5 times the value of the hello-interval, or 65535 seconds if the hello-interval is set to zero.
- Specifying the value of 65535 for joinprune-holdtime represents an infinite time. The receipt of Join/Prune messages with its joinprune-holdtime value as infinite time, then this specifies an infinite hold-time for the particular join/prune message. It is recommended that you use a joinprune-holdtime interval that is 3.5 times the value of the Join/Prune interval defined for the interface, or 65535 seconds if the joinprune-interval is set to zero.
- The interface configured as a **stub** will not send any PIM packets through that interface, and any received PIM packets are also ignored. By default, a PIM interface is not set to be a stub one.
- The **graft-retry-interval** and **prune-limit-interval** options can be used only with the PIM-DM mode.

## Examples

```
-> ip pim interface vlan-2 hello-interval 100 triggered-hello 10 joinprune-inter-  
val 100 hello-holdtime 350 joinprune-holdtime 400  
-> no ip pim interface vlan-2
```

## Release History

Release 7.1.1; command was introduced.

## Related Command

### [show ip pim interface](#)

Displays detailed PIM settings for a specific interface. In general, it displays PIM settings for all the interfaces if no argument is specified.

```

---

## ip pim neighbor-loss-notification-period

Specifies the minimum time that must elapse between PIM neighbor loss notifications originated by the router.

**ip pim neighbor-loss-notification-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the time value that must elapse between neighbor loss notifications, in seconds (0–65535).

### Defaults

parameter	default
<i>seconds</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The maximum value of 65535 represents an infinite time. The PIM neighbor loss notifications are never sent in case of infinite time.
- This command is used with both IPv4 and IPv6 PIM.

### Examples

```
-> ip pim neighbor-loss-notification-period 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

### MIB Objects

alaPim  
alaPimNeighborLossNotificationPeriod

---

## ip pim invalid-register-notification-period

Specifies the minimum time that must elapse between the PIM invalid register notifications originated by the router.

**ip pim invalid-register-notification-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the minimum time value that must elapse between invalid register notifications, in seconds (10–65535).

### Defaults

parameter	default
<i>seconds</i>	65535

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The default value of 65535 represents an infinite time. The PIM invalid register notifications are never sent in case of infinite time.
- The non-zero minimum allowed value provides resilience against the propagation of denial-of-service attacks from the data and control planes to the network management plane.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

### Examples

```
-> ip pim invalid-register-notification-period 100
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

---

## ip pim invalid-joinprune-notification-period

Specifies the minimum time that must elapse between the PIM invalid joinprune notifications originated by the router.

**ip pim invalid-joinprune-notification-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the minimum time value that must elapse between invalid joinprune notifications, in seconds (10–65535).

### Defaults

parameter	default
<i>seconds</i>	65535

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The default value of 65535 represents an infinite time. The PIM invalid joinprune notifications are never sent in case of infinite time.
- The non-zero minimum allowed value provides resilience against the propagation of denial-of-service attacks from the control plane to the network management plane.
- This value is used with both IPv4 and IPv6 PIM.

### Examples

## ip pim rp-mapping-notification-period

Specifies the minimum time that must elapse between the PIM RP mapping notifications originated by the router.

**ip pim rp-mapping-notification-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the minimum time value that must elapse between RP mapping notifications, in seconds (0–65535).

### Defaults

parameter	default
<i>seconds</i>	65535

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The default value of 65535 represents an infinite time. The RP mapping notifications are never sent in case of infinite time.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

### Examples

```

## ip pim interface-election-notification-period

Specifies the minimum time that must elapse between the PIM interface election notifications originated by the router.

**ip pim interface-election-notification-period** *seconds*

---

### Syntax Definitions

*seconds* Specifies the minimum time value that must elapse between interface election notifications, in seconds (0–65535).

### Defaults

parameter	default
<i>seconds</i>	65535

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The default value of 65535 represents an infinite time. The interface election notifications are never sent in case of infinite time.
- This value is used with both IPv4 and IPv6 PIM.
- This command is supported only in the sparse mode.

### Examples

```

## show ip pim sparse

Displays the status of the various global parameters for the PIM sparse mode.

**show ip pim sparse**

---

### Syntax Definitions

N/A.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip pim sparse
Status                = enabled,
Keepalive Period      = 210,
Max RPs                = 32,
Probe Time            = 5,
Register Checksum     = header,
Register Suppress Timeout = 60,
RP Threshold          = 1,
SPT Status            = enabled,
```

---

*output definitions*

---

<b>Status</b>	The current global (i.e., switch-wide) status of PIM-SM. Options include <b>enabled</b> and <b>disabled</b> .
<b>Keepalive Period</b>	The duration of the Keepalive timer. The default value is 210.
<b>Max RPs</b>	The maximum number of Rendezvous Points (RPs) allowed in the PIM-SM domain (1–100). The default value is 32.
<b>Probe Time</b>	The amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP. Values may range from 1 to 300. The default value is 5.
<b>Register Checksum</b>	The current application of the checksum function on register messages in the domain. Options include <b>header</b> and <b>full</b> . The default setting is <b>header</b> .
<b>Register Suppress Timeout</b>	The amount of time, in seconds, the Designated Router (DR) will stop sending registers to the Rendezvous Point (RP) once a Register-Stop is received (1–300). The default value is 60.
<b>RP Threshold</b>	Displays the current RP data rate threshold. This value indicates the rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing an (S, G) Join message toward the source. Values may range from 0 to 2147483647. The default value is 1. A value of 0 indicates that the feature is currently disabled.
<b>SPT Status</b>	The current status of last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). Options include <b>enabled</b> and <b>disabled</b> . The default setting is <b>enabled</b> .

---

**Release History**

Release 7.1.1; command was introduced.

## Related Commands

<b>ip pim sparse admin-state</b>	Globally enables or disables PIM-SM protocol on the switch.
<b>ip pim interface</b>	Enables or disables the PIM protocol on a specific interface.
<b>ip pim keepalive-period</b>	Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.
<b>ip pim max-rps</b>	Configures the maximum number of C-RP routers allowed in the PIM-SM domain.
<b>ip pim probe-time</b>	Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.
<b>ip pim register checksum</b>	Configures the application of the checksum function on sent and received register messages in the domain.
<b>ip pim register-suppress-timeout</b>	Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.
<b>ip pim rp-threshold</b>	Specifies the data rate, in bits per second (bps), at which the Rendezvous Point (RP) will attempt to switch to native forwarding by issuing a source-specific (S, G) Join message toward the source.
<b>ip pim spt admin-state</b>	Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first data packet is received.

*output definitions*

---

<b>Status</b>	The current global (i.e., switch-wide) status of PIM-DM. Options include <b>enabled</b> and <b>disabled</b> .
<b>Source Lifetime</b>	The duration of the Keepalive or Source Lifetime timer. The default value is 210.
<b>State Refresh Interval</b>	The time-interval, in seconds, between successive State Refresh messages originated by the router. The default value is 60.
<b>State Refresh Limit Interval</b>	Displays the limit at which a router will not forward the State Refresh messages, if they are received at less than the interval.
<b>State Refresh TTL</b>	Displays the TTL to be used in the router's originated State Refresh messages. The default value is 16.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>ip pim dense admin-state</b>	Globally enables or disables PIM-DM protocol on the switch.
<b>ip pim interface</b>	Enables or disables the PIM protocol on a specific interface.
<b>ip pim state-refresh-interval</b>	Sets the interval between successive State Refresh messages originated by a router.
<b>ip pim state-refresh-limit</b>	Sets the limit at which a router will not forward successive State Refresh messages if they are received at less than the interval.
<b>ip pim state-refresh-ttl</b>	Sets the Time to Live to be used in a router's originated State Refresh messages if the data packet's Time to Live is not recorded.
<b>ip pim keepalive-period</b>	Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.

```

---

## show ip pim ssm group

Displays the static configuration of multicast group mappings for the PIM-Source Specific Multicast (SSM) mode.

```
show ip pim ssm group
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- This command is supported only in the sparse mode.

### Examples

```
-> show ip pim ssm group
Group Address/Pref Length  Mode  Override  Precedence  Status
-----+-----+-----+-----+-----
224.0.0.0/4                ssm   false    none        enabled
```

#### *output definitions*

<b>Group Address/Pref Length</b>	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
<b>Mode</b>	The PIM mode to be used for groups in this prefix. The possible values include asm, ssm, or dm.
<b>Override</b>	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
<b>Precedence</b>	Specifies the precedence value to be used for this static RP configuration.
<b>Status</b>	Displays whether this entry is currently enabled or disabled. Options include <b>enabled</b> and <b>disabled</b> .

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

- ip pim ssm group**                      Statically maps the specified IP multicast group(s) to the PIM Source Specific Multicast mode (SSM).
- show ip pim group-map**                Displays the PIM group mapping table.

## MIB Objects

  alaPimStaticRPRowStatus
```

---

## show ip pim dense group

Displays the static configuration of multicast group mappings for PIM-Dense Mode (DM).

**show ip pim dense group**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- This command is supported only on PIM dense mode.

### Examples

```
-> show ip pim dense group
```

```
Group Address/Pref Length  Mode  Override  Precedence  Status
-----+-----+-----+-----+-----
224.0.0.0/4                dm    false    none        enabled
```

#### *output definitions*

<b>Group Address/Pref Length</b>	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
<b>Mode</b>	The PIM mode to be used for groups in this prefix. The possible values include asm, ssm, or dm.
<b>Override</b>	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
<b>Precedence</b>	Specifies the precedence value to be used for this static RP configuration.

## show ip pim neighbor

Displays a list of active PIM neighbors.

**show ip pim neighbor** [*ip\_address*]

---

### Syntax Definitions

*ip\_address*                                      The 32-bit IP address for the PIM neighbor.

### Defaults

If a neighbor's IP address is not specified, the entire PIM neighbor table is displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

To view more detailed information about a particular neighbor, specify the neighbor's IP address in the command line. Additional information will be displayed, which includes LAN Prune Delay, Override Interval, TBit field, State Refresh capable, and Designated Router option status.

### Examples

```
-> show ip pim neighbor
Neighbor Address      Interface Name      Uptime      Expires      DR Priority
-----+-----+-----+-----+-----
212.61.20.250        vlan-2             01h:07m:07s 00h:01m:38s 100
212.61.60.200        vlan-6             01h:07m:07s 00h:01m:38s 100
214.28.4.254         vlan-26            01h:07m:07s 00h:01m:38s 100
```

If a specific neighbor IP address is specified in the command line, *detailed information for the corresponding neighbor only* displays:

```
-> show ip pim neighbor 212.61.30.7
Neighbor IP Address   = 212.61.30.7,
Interface Name        = vlan-30,
Uptime                = 00h:04m:14s,
Expires               = 00h:01m:31s,
Lan Prune Delay Present = true,
Propagation Delay     = 500,
Override Interval     = 2500,
TBit field            = false,
Gen ID Present        = true,
Gen ID Value          = 0x79ca868e,
BiDir Capable         = false,
DR Priority Present    = true,
DR Priority            = 1,
State Refresh Capable = true
```

*output definitions*

---

<b>Neighbor (IP) Address</b>	The 32-bit IP address of the active PIM neighbor.
<b>Interface Name</b>	The name of the interface used to reach this PIM neighbor.
<b>Uptime</b>	The amount of time since this PIM neighbor last became a neighbor of the local router, displayed in hours, minutes, and seconds.
<b>Expiry time</b>	The minimum amount of time remaining before the PIM neighbor will be aged out, displayed in hours, minutes, and seconds.
<b>Lan Prune Delay Present</b>	Evaluates to TRUE if this neighbor is using the Lan Prune Delay option.
<b>Propagation Delay</b>	The expected propagation delay between PIM routers on this network.
<b>DR Priority Present</b>	Evaluates to TRUE if the neighbor is using the DR Priority option.
<b>DR Priority</b>	The value of the Designated Router Priority from the last PIM Hello message received from this neighbor. This object is always zero if the DR Priority Present value is FALSE.
<b>TBit field</b>	The value of the Tbit field of the LAN prune delay option received from this neighbor. The Tbit specifies the ability of the neighbor to disable Join suppression.
<b>Generation ID Present</b>	Evaluates to TRUE if this neighbor is using the Generation ID option.
<b>Generation ID Value</b>	The value of the Generation ID from the last PIM Hello message received from the neighbor.
<b>BiDir Capable</b>	Evaluates to TRUE if this neighbor is using the Bidirectional-PIM Capable option.
<b>State Refresh Capable</b>	Displays whether the neighbor is capable of receiving State Refresh messages. Options include <b>true</b> or <b>false</b> .
<b>Override Interval</b>	The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.

---

## show ip pim candidate-rp

Displays the IP multicast groups for which the local router advertises itself as a Candidate-RP.

**show ip pim candidate-rp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip pim candidate-rp
RP Address          Group Address      Priority  Interval  Status
-----+-----+-----+-----+-----
172.21.63.11       224.0.0.0/4       192      60        enabled
```

#### *output definitions*

---

<b>RP Address</b>	A 32-bit IP address that is advertised as the Candidate-Rendezvous Point (RP).
<b>Group Address</b>	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/). This is the group for which the local router advertises itself as a C-RP.
<b>Priority</b>	The C-RP router's priority. The lower the value, the higher the priority.
<b>Interval</b>	The time interval at which the C-RP advertisements are sent to the BSR.
<b>Status</b>	The current status of this entry. The status is shown as enabled only if the PIM-SM is globally enabled and the PIM interface is enabled.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [ip pim candidate-rp](#)

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IP multicast group(s).

## MIB Objects

```
alaPimBsrCandidateRPTable  
  alaPimBsrCandidateRPAddress  
  alaPimBsrCandidateRPGroupAddress  
  alaBsrCandidateRPGroupPrefixLength  
  alaPimBsrCandidateRPPriority  
  alaPimBsrCandidateRPInterval  
  alaPimBsrCandidateRPStatus
```

---

## show ip pim group-map

Displays the PIM group mapping table.

**show ip pim group-map** [**bsr** | **static-rp** | **ssm** | **dense**]

---

### Syntax Definitions

N/A

### Defaults

If the keywords **bsr**, **static-rp**, **ssm**, or **dense** are included in the command line, then only the entries that were created by the specified origin are displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If static RP configuration is being used, this information is obtained from those static RP addresses that are defined through the **ip pim static-rp** command. As long as the RP addresses defined in the static RP set are reachable, they will be added to the group mapping table.
- If the IP multicast groups are mapped to the mode SSM or DM, then the entries created by local SSM address range configuration using the **ip pim ssm group** command and local Dense Mode address range configuration using the **ip pim dense group** command are displayed.
- If the bootstrap mechanism is being used, this information is obtained from received Candidate-RP advertisements (when the local router is the BSR; when the local router is not the BSR, this information is obtained from received bootstrap messages).

### Examples

```
-> show ip pim group-map
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
BSR	224.0.0.0/4	172.21.63.11	asm	192
BSR	224.0.0.0/4	214.0.0.7	asm	192
Static	232.0.0.0/8		ssm	

```
-> show ip pim group-map bsr
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
BSR	224.0.0.0/4	172.21.63.11	asm	192
BSR	224.0.0.0/4	214.0.0.7	asm	192

```
-> show ip pim group-map static
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
Static	232.0.0.0/8		ssm	

*output definitions*

---

<b>Origin</b>	The mechanism by which the PIM mode and RP for the group were learned. The possible values include 'static RP' for local static RP configuration, 'static SSM' for both SSM group configuration and Dense Mode Group configuration, and 'BSR' for the PIM Bootstrap Router mechanism.
<b>Group Address/Prefix Length</b>	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/).
<b>RP Address</b>	The IP address of the Rendezvous Point to be used for groups within the group prefix. There is no RP address if the PIM mode is either SSM or DM.
<b>Mode</b>	The PIM mode to be used for groups in this prefix.
<b>Mapping Precedence</b>	The precedence value of a particular row, which determines which row applies to a given group address. Numerically higher values for this object indicate lower precedences, with the value zero denoting the highest precedence.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>ip pim ssm group</b>	Creates and manages the static configuration of a Source Specific Multicast mode group mappings.
<b>ip pim dense group</b>	Creates and manages the static configuration of dense mode (DM) group mappings.
<b>ip pim static-rp</b>	Adds, modifies, or deletes a static RP for a group (“modifies” applies only to the RP address, since the table is indexed from group address and mask parameters).

**MIB Objects**

```

alaPimGroupMappingTable
  alaPimGroupMappingOrigin
  alaPimGroupMappingGrpAddress
  alaPimGroupMappingPrecedence
  alaPimGroupMappingRPAddress
  alaPimGroupMappingPimMode
  alaPimGroupMappingGrpPrefixLength

```

---

## show ip pim interface

Displays detailed PIM settings for a specific interface. In general, it displays PIM settings for all the interfaces if no argument is specified.

**show ip pim interface** [*if\_name*]

---

### Syntax Definitions

*if\_name*                                The interface name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

To view more detailed information about a particular interface, specify the interface name in the command line. Additional information includes Triggered Hello Interval, Hello Holdtime, Prune Delay status and value, Override Interval, LAN Delay status, Generation ID status, and Join/Prune Holdtime.

### Examples

```
-> show ip pim interface
Total 1 Interfaces
```

Interface Name	IP Address	Designated Router	Hello Interval	J/P Interval	Oper Status
tesvl	50.1.1.1	50.1.1.1	100	10	disabled

```
-> show ip pim interface tesvl
Interface Name           = tesvl,
IP Address               = 50.1.1.1,
Designated Router       = 50.1.1.1,
Hello Interval          = 30,
Triggered Hello Interval = 5,
Hello HoldTime         = 105,
Join/Prune Interval    = 60,
Join/Prune HoldTime    = 210,
Propagation (Prune) Delay = 500,
Override Interval      = 2500,
Generation ID           = 0x46e68b13,
DR Priority              = 1,
DR Priority Enabled     = true,
Lan Delay Enabled      = true,
Effective Propagation Delay = 500,
Effective Override Interval = 2500,
Suppression Enabled    = true,
```

```

Stub Interface           = false,
Prune Limit Interval    = 60,
Graft Retry Interval    = 3,
State Refresh Enabled   = true,
Operational Status     = disabled

```

*output definitions*

---

<b>Interface Name</b>	The name of the interface on which PIM is enabled.
<b>IP address</b>	Specifies the IP address of the specified interface.
<b>Designated Router</b>	The 32-bit IP address for the Designated Router (DR). The DR acts on behalf of any directly-connected hosts with respect to the PIM-SM protocol. Only one router in the LAN will act as the DR.
<b>Hello Interval</b>	The frequency at which PIM Hello messages are transmitted on a specified interface. Values may range from 1 to 18000. The default value is 30.
<b>Join/Prune Interval</b>	The Join/Prune interval for the associated interface. The Join/Prune interval is the interval at which periodic PIM-SM Join/Prune messages are sent. Values may range from 1 to 18000.
<b>Triggered Hello Interval</b>	The current Triggered Hello Interval. This value indicates the maximum time, in seconds, before a triggered PIM Hello message is transmitted on the corresponding interface. Values may range from 1 to 60. The default value is 5.
<b>Hello Holdtime</b>	The current Hello Holdtime value. This value indicates the maximum amount of time, in seconds, Hello messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 105.
<b>Join/Prune Holdtime</b>	The current Join/Prune Holdtime value. This value indicates the maximum amount of time, in seconds, Join/Prune messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 210.
<b>Propagation Delay</b>	The expected propagation delay between PIM routers on this network.
<b>Override Interval</b>	The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.
<b>Generation ID Option</b>	The value of the Generation ID this router inserted in the last PIM Hello message it sent on this interface.
<b>DR Priority</b>	Displays the Designated Router priority for each interface. This value is used in determining the Designated Router on an interface. Values may range from 1 to 192. A higher numeric value denotes a higher priority. Note that priority-based election is used only if all routers on the interface are using the DR priority option. The default value is 1.
<b>Lan Delay Enabled</b>	Options include <b>true</b> and <b>false</b> . The value will be true if all neighbors on the interface are using the LAN Prune Delay option. Otherwise, the setting will be false.
<b>Effective Propagation Delay</b>	The Effective Propagation Delay on this interface.

*output definitions (continued)*

---

<b>Effective Override Interval</b>	The Effective Override Interval on this interface.
<b>Suppression Enabled</b>	Specifies whether the Join suppression is enabled on this interface.
<b>DR Priority Enabled</b>	Evaluates to TRUE if all routers on this interface are using the DR Priority option.
<b>Stub Interface</b>	Specifies whether this interface is a 'stub interface'. If this is TRUE, then no PIM packets are sent out on this interface, and any received PIM packets are ignored.
<b>Prune Limit Interval</b>	The minimum interval that must transpire between two successive Prunes sent by a router. This is used only with PIM-DM.
<b>Graft Retry Interval</b>	Displays the time-interval a router waits for a Graft acknowledgment before resending a Graft on the interface. This is used only with PIM-DM. Values may range from 1 to 65535. The default value is 3.
<b>SR Priority Enabled</b>	Evaluates to TRUE if all routers on this interface are using the State Refresh option. This is used only by PIM-DM.
<b>Operational Status</b>	The current operational status of the corresponding interface. Options include <b>enabled</b> and <b>disabled</b> . This value indicates whether the IP interface is operationally up. For example, if PIM is enabled on the interface, but the IP interface is currently down, this field will display as disabled. The default setting is <b>disabled</b> . To globally enable or disable PIM on the switch, refer to the <a href="#">ip pim sparse admin-state command on page 25-5</a> and <a href="#">ip pim dense admin-state command on page 25-6</a> .

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

## show ip pim static-rp

Displays the PIM Static RP table for the ASM mode, which includes group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the Static RP configuration (i.e., enabled or disabled).

```
show ip pim static-rp
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range

### Examples

```
-> show ip pim static-rp
Group Address/Pref Length  RP Address      Mode  Override Precedence Status
-----+-----+-----+-----+-----+-----
224.0.0.0/4                172.21.63.11  asm   false    none     enabled
```

#### *output definitions*

<b>Group Address/Pref Length</b>	The 32-bit IP address for a multicast group, along with the mask length, shown in bits. The group IP address and mask are separated by a slash (/). To change the current multicast group address and mask, refer to the <a href="#">ip pim static-rp command on page 25-13</a> .
<b>RP Address</b>	A 32-bit IP address of the Rendezvous Point (RP). To change the current RP address, refer to the <a href="#">ip pim static-rp command on page 25-13</a> .
<b>Mode</b>	The PIM mode to be used for groups in this prefix. The possible values include asm, ssm, or dm.
<b>Override</b>	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
<b>Precedence</b>	Specifies the precedence value to be used for this static RP configuration.
<b>Status</b>	Displays whether static RP configuration is currently enabled or disabled. Options include <b>enabled</b> and <b>disabled</b> . To change the current status, refer to the <a href="#">ip pim static-rp command on page 25-13</a> .

---

## Release History

Release 7.1.1; command was introduced.

```

---

## show ip pim cbsr

Displays the Candidate-BSR information that is used in the Bootstrap messages.

**show ip pim cbsr**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip pim cbsr
CBSR Address           = 214.0.0.7,
Status                 = enabled,
CBSR Priority          = 0,
Hash Mask Length      = 30,
Elected BSR          = False,
Timer                 = 00h:00m:00s
```

### *output definitions*

<b>CBSR Address</b>	The 32-bit address that the local router uses to advertise itself as a Candidate-BSR.
<b>Status</b>	The current status of this entry. The status is shown as enabled only if the PIM-SM is globally enabled and the PIM interface is enabled.
<b>CBSR Priority</b>	The value for the local router as a Candidate-BSR. The higher the value, the higher the priority.
<b>Hash Mask Length</b>	The 32-bit mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group.
<b>Elected BSR</b>	Specifies whether the local router is the elected BSR.
<b>Timer</b>	The time value that is remaining before the local router originates the next bootstrap message. This value is zero if this router is not the elected BSR.

### Release History

Release 7.1.1; command was introduced.

## show ip pim notifications

Displays the configuration of the configured notification periods as well as information on the events triggering the notifications.

**show ip pim notifications**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The outputs from this command includes both IPv4 and IPv6 information.

### Examples

```
-> show ip pim notifications
Neighbor Loss Notifications
  Period      = 0
  Count       = 0
Invalid Register Notifications
  Period      = 65535
  Msgs Rcvd   = 0
  Origin      = None
  Group       = None
  RP          = None
Invalid Join Prune Notifications
  Period      = 65535
  Msgs Rcvd   = 0
  Origin      = None
  Group       = None
  RP          = None
RP Mapping Notifications
  Period      = 65535
  Count       = 0
Interface Election Notifications
  Period      = 65535
  Count       = 0
```

*output definitions*

---

<b>Neighbor Loss Notification</b>	<p><b>Period:</b> Minimum time interval that must elapse between the PIM neighbor loss notification originated by the device.</p> <p><b>Count:</b> The number of neighbor loss events that have occurred. This counter is incremented whenever a neighbor loss notification is generated.</p>
<b>Invalid Register Notification</b>	<p><b>Period:</b> Minimum time interval that must elapse between the PIM invalid register notifications originated by the device.</p> <p><b>Msgs Rcvd:</b> The number of invalid PIM register notification messages that have been received by the device.</p> <p><b>Group:</b> The multicast group address to which the last unexpected Register message received by the device was addressed.</p> <p><b>RP:</b> The RP address to which the last unexpected Register message received by the device was delivered.</p> <p><b>Origin:</b> The source address of the last unexpected Register message received by the device.</p>
<b>Invalid Join/Prune Notification</b>	<p><b>Period:</b> Minimum time that must elapse between PIM invalid join-prune notifications originated by the device.</p> <p><b>Msgs Rcvd:</b> The number of invalid PIM join/prune messages that have been received by the device.</p> <p><b>Origin:</b> The source address of the last unexpected join/prune message received by the device.</p> <p><b>Group:</b> The multicast group address carried in the last unexpected join-prune message received by the device.</p> <p><b>RP:</b> The RP address carried in the last unexpected join/prune message received by the device.</p>
<b>RP Mapping Notifications</b>	<p><b>Period:</b> Minimum time that must elapse between PIM RP mapping change notifications originated by the device.</p> <p><b>Count:</b> The number of changes to active RP mappings on this device.</p>
<b>Interface Election Notifications</b>	<p><b>Period:</b> Minimum time that must elapse between PIM Interface Election traps originated by the router.</p> <p><b>Count:</b> The number of times this device has been elected DR on any interface.</p>

---

**Release History**

Release 7.1.1; command was introduced.

## Related Commands

### **ip pim neighbor-loss-notification-period**

Specifies the minimum time that must elapse between PIM neighbor loss notifications originated by the router.

### **ip pim invalid-register-notification-period**

Specifies the minimum time that must elapse between PIM invalid register notifications originated by the router.

### **ip pim invalid-joinprune-notification-period**

Specifies the minimum time that must elapse between PIM invalid joinprune notifications originated by the router.

### **ip pim rp-mapping-notification-period**

Specifies the minimum time that must elapse between PIM RP mapping notifications originated by this router.

### **ip pim interface-election-notification-period**

Specifies the minimum time that must elapse between the PIM interface election notifications originated by the router.

## show ip pim groute

Displays all (\*,G) state that the IPv4 PIM has.

**show ip pim groute** [*group\_address*]

---

### Syntax Definitions

*group\_address* A 32-bit multicast address. If an IP address is not specified, the current PIM status for all multicast route entries are displayed.

### Defaults

By default, entire (\*,G) routing table is displayed. To view more detailed (\*,G) state information about a particular group, specify the group address in the command line.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

When the *group\_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.

### Examples

```
-> show ip pim groute
```

```
Total 1 (*,G)
```

Group Address	RP Address	RPF Interface	Upstream Neighbor	UpTime

### *output definitions*

---

<b>Group-address</b>	The IPv4 Multicast Group Address.
<b>RP Address</b>	The address of the Rendezvous Point (RP) for the group.
<b>RPF Interface</b>	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
<b>Upstream Neighbor</b>	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (*,G) join messages to.
<b>UpTime</b>	The time since this entry was created.
<b>Pim Mode Origin</b>	The mechanism by which the PIM mode and RP for the group were learned.
<b>Upstream Join State</b>	Whether the local router should join the RP tree for the group.
<b>Upstream Join Timer</b>	The time remaining before the local router next sends a periodic (*,G) Join message on the RPF IfIndex.
<b>RPF Next Hop</b>	The address of the RPF next hop towards the RP.

*output definitions (continued)*

---

<b>RPF Route Protocol</b>	The routing mechanism through which the route used to find the RPF interface towards the RP was learned.
<b>RPF Route Address/Prefix Length</b>	The IPv6 address combined with the prefix length identifies the route used to find the RPF interface towards the RP.
<b>Route Metric Pref</b>	The metric preference of the route used to find the RPF interface towards the RP.
<b>Route Metric</b>	The routing metric of the route used to find the RPF interface towards the RP.
<b>Interface Name</b>	The interface name that corresponds to the ifIndex.
<b>Local Membership</b>	Whether the local router has (*,G) local membership on this interface.
<b>Join Prune State</b>	The state resulting from (*,G) Join/Prune messages received on this interface.
<b>Prune Pending Timer</b>	The time remaining before the local router acts on a (*,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
<b>Join Expiry Timer</b>	The time remaining before (*,G) Join state for this interface expires.
<b>Assert State</b>	The (*,G) Assert state for this interface. The possible values are No Info, Winner or Loser.
<b>Assert Timer</b>	If Assert State is 'Winner', this is the time remaining before the local router next sends a (*,G) Assert message on this interface. If the Assert State is 'Loser', this is the time remaining before the (*,G) assert state expires.
<b>Assert Winner Address</b>	If the Assert State is 'Loser', this is the address of the assert winner.
<b>Assert Winner Metric Pref</b>	If the Assert State is 'Loser', this is the metric preference of the route to the RP advertised by the assert winner; otherwise, this is zero.
<b>Assert Winner Metric</b>	If the Assert State is 'Loser', this is the routing metric of the route to the RP advertised by the assert winner; otherwise, this is zero.

## show ip pim sgroute

Displays all (S,G) state that the IPv4 PIM has.

**show ip pim sgroute** [*source\_address group\_address*]

---

### Syntax Definitions

*source\_address*                      The 32-bit IP address for a specific multicast source.

*group\_address*                        A 32-bit multicast address.

### Defaults

By default, entire (S,G) routing table is displayed. To view the detailed information for a particular (S,G) entry, use the *source\_address* and *group\_address* associated with that entry.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When the *source\_address* and *group\_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.
- If an IP address is not specified, the current PIM status for all multicast route entries are displayed.

### Examples

```
-> show ip pim sgroute
```

```
Legend: Flags: D = Dense, S = Sparse, s = SSM Group,
          L = Local, R = RPT, T = SPT, F = Register,
          P = Pruned, O = Originator
```

```
Total 1 (S,G)

### *output definitions*

---

<b>Source-address</b>	The IPv4 Source address.
<b>Group-address</b>	The IPv4 Multicast Group Address.
<b>RPF Interface</b>	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.

*output definitions (continued)*

<b>Upstream Neighbor</b>	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (S,G) join messages to.
<b>UpTime</b>	The time since this entry was created.
<b>Flags</b>	Flags indicating SPTBit, Prune State, Join State, etc.
<b>Pim Mode</b>	Whether the Group Address is SSM, ASM or DM.
<b>Upstream Join State</b>	Whether the local router should join the SPT for the source and group represented by this entry.
<b>Upstream Join Timer</b>	The time remaining before the local router next sends a periodic (S,G) Join message.
<b>RPF Next Hop</b>	The address of the RPF next hop towards the source.
<b>RPF Route Protocol</b>	The routing mechanism through which the route used to find the RPF Interface towards the source was learned.
<b>RPF Route Address/Prefix Length</b>	The IP address which when combined with the Route Prefix length identifies the route used to find the RPF interface towards the source.
<b>RPF Route Metric Pref</b>	The metric preference of the route used to find the RPF interface towards the source.
<b>RPF Route Metric</b>	The metric preference of the route used to find the RPF interface towards the source.
<b>DR Register State</b>	Whether the local router should encapsulate (S,G) data packets in Register messages and send them to the RP. The possible values include No Info, Join, Join Pending, or Prune.
<b>DR Register Stop Timer</b>	The value of the Register Stop Timer. If the Register State is 'prune', this is the time remaining before the local router sends a Null-Register message to the RP. If the State is 'joinPending', this is the time remaining before the local router resumes encapsulating data packets and sending them to the RP.
<b>Upstream Prune State</b>	Whether the local router has pruned itself from the tree. This is only used by PIM-DM. The possible values include forwarding, Ack Pending, or Pruned.
<b>Upstream Prune Limit Timer</b>	The time remaining before the local router may send a (S,G) prune message on alaPimSGRPFifIndex. This is only used by PIM-DM.
<b>Originator State</b>	Whether this router is an originator for the (S,G) message flow. This is only used by PIM-DM. The possible values include Not Originator or Originator.
<b>Source Active Timer</b>	If this router is the Originator, this is the time remaining before the local router reverts to notOriginator state. Otherwise, this is zero. This is only used by PIM-DM.
<b>State Refresh Timer</b>	If Originator state is 'originator', this is the time remaining before the local router sends a State Refresh Message. Otherwise, this is zero. This is only used by PIM-DM.
<b>Interface Name</b>	The interface name corresponding to the ifIndex that corresponds to this entry.
<b>Uptime</b>	The time since this entry was created.
<b>Local Membership</b>	Whether the local router has (S,G) local membership on this interface.

*output definitions (continued)*

---

<b>Join Prune State</b>	The state resulting from (S,G) Join/Prune messages received on this interface. The possible values include No Info, Join, or Prune Pending.
<b>Prune Pending Timer</b>	The time remaining before the local router acts on an (S,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
<b>Join Expiry Timer</b>	The time remaining before (S,G) Join state for this interface expires.
<b>Assert State</b>	The (S,G) Assert state for this interface. The possible values include No Info, Winner, or Loser.
<b>Assert Timer</b>	If Assert State is Winner, this is the time remaining before the local router sends a (S,G) Assert message on this interface. If the Assert State is Loser, this is the time remaining before the (S,G) Assert state expires.
<b>Assert Winner</b>	If the Assert State is Loser, this is the address of the assert winner.
<b>Assert Winner Metric Pref</b>	If the Assert State is Loser, this is the metric preference of the route to the source advertised by the assert winner.
<b>Assert Winner Metric Metric</b>	If the Assert State is Loser, this is the routing metric of the route to the source advertised by the assert winner.

## ipv6 pim sparse admin-state

Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.

**ipv6 pim sparse admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables PIM-SM globally for IPv6.
<b>disable</b>	Disables PIM-SM globally for IPv6.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command must be set to **enable** before PIM-SM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 25-3](#) for more information.

### Examples

```
-> ipv6 pim sparse admin-state enable
-> ipv6 pim sparse admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ipv6 pim interface</a>	Enables or disables the PIM protocol on a specific interface.
<a href="#">ip load pim</a>	Dynamically loads PIM to memory.
<a href="#">show ipv6 pim sparse</a>	Displays the status of the various global parameters for the IPv6 PIM sparse mode.

### MIB Objects

```
alaPimsmGlobalConfig
  alaPimsmV6AdminStatus
```

---

## ipv6 pim dense admin-state

Enables or disables the IPv6 PIM-DM (dense mode) globally for IPv6.

**ipv6 pim dense admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables PIM-DM globally for IPv6.
<b>disable</b>	Disables PIM-DM globally for IPv6.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command must be set to **enable** before PIM-DM can run on the switch. In addition, the **ip load pim** command must be executed. Refer to [page 25-3](#) for more information.

### Examples

```
-> ipv6 pim dense admin-state enable
-> ipv6 pim dense admin-state disable
```

### Release History

  alaPimdmV6AdminStatus
```

---

## ipv6 pim ssm group

Statically maps the specified IPv6 multicast group(s) to the PIM Source Specific Multicast mode (SSM).

```
ipv6 pim ssm group group_address/prefix_length [[no] override] [priority priority]
```

```
no ipv6 pim ssm group group_address/prefix_length
```

---

### Syntax Definitions

<i>group_address</i>	Specifies the IPv6 multicast group address.
<i>/prefix_length</i>	Specifies the prefix length of the IPv6 multicast group. Values may range from 4 to 128.
<b>override</b>	Specifies the static SSM mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static SSM mode configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the priority option is not set and the override option is set to false.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a Source Specific Multicast mode group mapping.
- The IPv6 PIM Source-Specific Multicast (SSM) mode for the default SSM address range (FF3x::/32) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM.
- You can also map additional IPv6 multicast address ranges for the SSM group using this command. However, the IPv6 multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to un-set the priority.

### Examples

```
-> ipv6 pim ssm group ff30::1234:abcd/128 priority 50
-> no ipv6 pim ssm group ff30::1234:abcd/128
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**show ipv6 pim group-map**

Displays the IPv6 PIM group mapping table.

**show ipv6 pim ssm group**

Displays the static configuration of IPv6 multicast group mappings for PIM-Source Specific Multicast (SSM).

## MIB Objects

alaPimStaticRPGrpAddress  
alaPimStaticRPGrpPrefixLength  
alaPimStaticRPOverrideDynamic  
alaPimStaticRPPrecedence  
alaPimStaticRPProwStatus

---

## ipv6 pim dense group

Statically maps the specified IPv6 multicast group(s) to the PIM Dense mode (DM).

**ipv6 pim dense group** *group\_address/prefix\_length* [[**no**] **override**] [**priority** *priority*]

**no ipv6 pim dense group** *group\_address/prefix\_length*

---

### Syntax Definitions

<i>group_address</i>	Specifies the IPv6 multicast group address.
<i>/prefix_length</i>	Specifies the prefix length of the IPv6 multicast group.
<b>override</b>	Specifies the static dense mode mapping configuration to override the dynamically learned group mapping information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the priority option is not set and the override option is set to false.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a static configuration of a dense mode group mapping.
- This command specifies the mode as Dense (PIM-DM) for the specified IPv6 multicast group addresses.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- Specifying the priority value obsoletes the **override** option and once the priority option has been defined, a value of 65535 can be used to un-set the priority.

### Examples

```
-> ipv6 pim dense group ff0e::1234/128 priority 50
-> no ipv6 pim dense group ff0e::1234/128
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**show ipv6 pim group-map**

Displays the IPv6 PIM group mapping table.

**show ipv6 pim dense group**

Displays the static configuration of IPv6 multicast group mappings for PIM Dense Mode (DM).

## ipv6 pim cbsr

Configures the local router as the Candidate-BSR for the PIM domain.

**ipv6 pim cbsr** *ipv6\_address* [**priority** *priority*] [**mask-length** *bits*]

**no ipv6 pim cbsr** *ipv6\_address*

---

### Syntax Definitions

<i>ipv6_address</i>	The IPv6 unicast address that the local router will use to advertise itself as a Candidate-BSR. The specified address must be a domain-wide reachable address.
<i>priority</i>	The priority value of the local router as a Candidate-BSR. Values may range from 0 to 255.
<i>bits</i>	The hash mask length that is advertised in the bootstrap messages for IPv6 PIM (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group). Values may range from 1 to 128.

### Defaults

parameter	default
<i>priority</i>	64
<i>bits</i>	126

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a Candidate-BSR for a PIM domain.
- This command is supported only in the sparse mode.
- The information configured using this command is used in the Bootstrap messages.
- Candidate-BSRs also avoid a single point of failure in a PIM domain.

### Examples

```
-> ipv6 pim cbsr 2000::1 priority 100 mask-length 4
-> no ipv6 pim cbsr 2000::1
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### `show ipv6 pim cbsr`

Displays the IPv6 Candidate-BSR information that is used in the Bootstrap messages.

## MIB Objects

```
alaPimBsrCandidateBSRTable  
  alaPimBsrCandidateBSRAddress  
  alaPimBsrCandidateBSRPriority  
  alaPimBsrCandidateBSRHashMaskLength  
  alaPimBsrCandidateBSRRowStatus
```

---

## ipv6 pim static-rp

Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).

**ipv6 pim static-rp** *group\_address/prefix\_length rp\_address* [[**no**] **override**] [**priority** *priority*]

**no ipv6 pim static-rp** *group\_address/prefix\_length rp\_address*

---

### Syntax Definitions

<i>group_address</i>	Specifies the IPv6 multicast group address.
<i>/prefix_length</i>	Specifies the prefix length of the IPv6 multicast group.
<i>rp_address</i>	Specifies the IPv6 unicast address of the Rendezvous Point (RP). This must be a domain-wide reachable address.
<b>override</b>	Specifies the static RP configuration to override the dynamically learned RP information for the specified group(s).
<i>priority</i>	Specifies the preference value to be used for this static RP configuration and provides fine control over which configuration is overridden by this static configuration. Values may range from 0 to 128.

### Defaults

By default, the priority option is not set and the override option is set to false.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete a static RP configuration.
- Specifying the priority value obsoletes the **override** option.
- The IPv6 PIM Source-Specific Multicast (SSM) mode for the default SSM address range (FF3x::/32) reserved by the Internet Assigned Numbers Authority is not enabled automatically and must be configured manually to support SSM. You can also map additional IPv6 multicast address ranges for the SSM group. However, the IPv6 multicast groups in the reserved address range can be mapped only to the SSM mode.
- If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.
- Note that once the priority option has been defined, a value of 65535 can be used to un-set the priority.
- This command is supported only in the sparse mode.

### Examples

```
-> ipv6 pim static-rp ff0e::1234/128 2000::1 priority 10
-> no ipv6 pim static-rp ff0e::1234/128 2000::1
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**show ipv6 pim group-map**

Displays the IPv6 PIM group mapping table.

**show ipv6 pim static-rp**

Displays the IPv6 PIM Static RP table, which includes IPv6 multi-cast group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the Static RP configuration (i.e., enabled or disabled).

## MIB Objects

alaPimStaticRPTable

alaPimStaticRPGrpAddress  
alaPimStaticRPGrpPrefixLength  
alaPimStaticRPRPAddress  
alaPimStaticRPOverrideDynamic  
alaPimStaticRPPrecedence  
alaPimStaticRPRowStatus

---

## ipv6 pim candidate-rp

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IPv6 multicast group(s).

**ipv6 pim candidate-rp** *rp\_address group\_address/prefix\_length* [**priority** *priority*] [**interval** *seconds*]

**no ipv6 pim candidate-rp** *rp\_address group\_address/prefix\_length*

---

### Syntax Definitions

<i>rp_address</i>	Specifies the IPv6 unicast address that will be advertised as a Candidate-RP. This must be a domain-wide reachable address.
<i>group_address</i>	Specifies the IPv6 multicast group address for which the local router will advertise itself as a Candidate-RP.
<i>/prefix_length</i>	Specifies the prefix length of the specified IPv6 multicast group address.
<i>priority</i>	Specifies the priority value of the Candidate-RP. Values may range from 0 to 192. The lower the value, the higher the priority.
<i>seconds</i>	Specifies the interval at which the C-RP advertisements are sent to the bootstrap router, in seconds. Values may range from 1 to 300.

### Defaults

parameter	default
<i>priority</i>	192
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove the association of the device as a C-RP for a particular multicast group.
- Only one RP address is supported per switch. If multiple candidate-RP entries are defined, they must specify the same *rp-address*.
- This command is supported only in the sparse mode.

### Examples

```
-> ipv6 pim candidate-rp 2000::1 ff0e::1234/128 priority 100 interval 100
-> no ipv6 pim candidate-rp 2000::1 ff0e::1234/128
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**show ipv6 pim candidate-rp** Displays the IPv6 multicast groups for which the local router will advertise itself as a Candidate-RP.

## MIB Objects

```
alaPimBsrCandidateRPTable  
  alaPimBsrCandidateRPAddress  
  alaPimBsrCandidateRPGroupAddress  
  alaPimBsrCandidateRPGroupPrefixLength  
  alaPimBsrCandidateRPPriority  
  alaPimBsrCandidateRPAdvInterval  
  alaPimBsrCandidateRPRowStatus
```

---

## ipv6 pim rp-switchover

Enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated packet in the IPv6 PIM domain.

**ipv6 pim rp-switchover {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables the RP to switch to native forwarding.
<b>disable</b>	Disables the RP from switching to native forwarding.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- You cannot specify a pre-configured threshold, such as the RP threshold, as you would do for IPv4 PIM.
- This command is supported only in the sparse mode.

### Examples

```
-> ipv6 pim rp-switchover enable
-> ipv6 pim rp-switchover disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ipv6 pim sparse** Displays the status of the various global parameters for the IPv6 PIM sparse mode.

### MIB Objects

```
alaPimsmGlobalConfig
  alaPimsmV6RPSwitchover
```

---

## ipv6 pim spt admin-state

Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT).

```
ipv6 pim spt admin-state {enable | disable}
```

---

### Syntax Definitions

**enable** Enables last hop DR switching to the SPT.

**disable** Disables last hop DR switching to the SPT.

### Defaults

parameter	default
enable   disable	enable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is supported only in the sparse mode.
- If the SPT status is enabled, last hop DR switching to the SPT begins once the first data packet is received.

### Examples

```
-> ipv6 pim spt admin-state enable  
-> ipv6 pim spt admin-state disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ipv6 pim sparse](#) Displays the status of the various global parameters for the IPv6 PIM sparse mode.

### MIB Objects

```
alaPimsmGlobalConfig  
  alaPimsmV6SPTConfig
```

---

## ipv6 pim interface

Enables IPv6 PIM and configures the statistics such as hello-interval, triggered-hello, hello-holdtime, join-prune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the IPv6 interface.

**ipv6 pim interface** *if\_name* [**hello-interval** *seconds*] [**triggered-hello** *seconds*] [**joinprune-interval** *seconds*] [**hello-holdtime** *seconds*] [**joinprune-holdtime** *seconds*] [**prune-delay** *milliseconds*] [**override-interval** *milliseconds*] [**dr-priority** *priority*] [[**no**] **stub**] [**prune-limit-interval** *seconds*] [**graft-retry-interval** *seconds*]

**no ipv6 pim interface** *if\_name*

---

### Syntax Definitions

<i>if_name</i>	The interface name on which the IPv6 PIM is being enabled or disabled.
<b>hello-interval</b> <i>seconds</i>	The frequency at which IPv6 PIM Hello messages are transmitted on this interface, in seconds. Values may range from 0 to 18000.
<b>triggered-hello</b> <i>seconds</i>	Specifies the maximum time, in seconds, before a triggered IPv6 PIM Hello message is sent on this interface. Values may range from 0 to 60.
<b>joinprune-interval</b> <i>seconds</i>	The frequency at which periodic IPv6 PIM Join/Prune messages are sent on this interface, in seconds. Values may range from 0 to 18000.
<b>hello-holdtime</b> <i>seconds</i>	Specifies the value of the IPv6 PIM hello-holdtime for this interface. This value is set in the Holdtime field of IPv6 PIM Hello messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>joinprune-holdtime</b> <i>seconds</i>	Specifies the value that is set in the Holdtime field of the IPv6 PIM Joinprune messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>prune-delay</b> <i>milliseconds</i>	Specifies the value of the expected propagation delay between IPv6 PIM routers on this network, inserted into the LAN prune-delay option of the IPv6 PIM Hello messages sent on this interface, in milliseconds. Values may range from 0 to 32767.
<b>override-interval</b> <i>milliseconds</i>	Specifies the value set in the Override Interval field of the LAN prune-delay option of the IPv6 PIM Hello messages sent on this interface, if the prune-delay status is enabled, in <i>milliseconds</i> . Values may range from 0 to 65535.
<b>dr-priority</b> <i>priority</i>	Specifies the Designated Router priority set in the DR priority option on this interface. The DR priority option value (1–192). A higher numeric value denotes a higher priority.
<b>prune-limit-interval</b> <i>seconds</i>	Specifies the minimum interval that must elapse between two successive IPv6 PIM prune messages sent on this interface, in seconds. Values may range from 0 to 65535.
<b>graft-retry-interval</b> <i>seconds</i>	Specifies the minimum interval that must elapse between two successive IPv6 PIM graft messages sent on this interface, in seconds. Values may range from 0 to 65535.

**stub** Specifies the interface not to send any IPv6 PIM packets through this interface, and to ignore received IPv6 PIM packets.

## Defaults

parameter	default
<b>hello-interval</b> <i>seconds</i>	30
<b>triggered-hello</b> <i>seconds</i>	5
<b>joinprune-interval</b> <i>seconds</i>	60
<b>hello-holdtime</b> <i>seconds</i>	105
<b>joinprune-holdtime</b> <i>seconds</i>	210
<b>prune-delay</b> <i>milliseconds</i>	500
<b>override-interval</b> <i>milliseconds</i>	2500
<b>dr-priority</b> <i>priority</i>	1
<b>prune-limit-interval</b> <i>seconds</i>	60
<b>graft-retry-interval</b> <i>seconds</i>	3
<b>stub</b>	Disabled

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Use the **no** form of this command to delete an IPv6 PIM interface.
- IPv6 PIM must be enabled globally on the switch before IPv6 PIM will begin running on the interface. To globally enable or disable IPv6 PIM-SM on the switch, refer to the [ipv6 pim sparse admin-state command on page 25-75](#). To enable or disable IPv6 PIM-DM on the switch, refer to the [ipv6 pim dense admin-state command on page 25-76](#).
- Specifying zero for IPv6 PIM hello-interval represents an infinite time, in which case the periodic IPv6 PIM hello messages are not sent.
- Specifying zero for IPv6 PIM joinprune-interval represents an infinite time, in which case the periodic IPv6 PIM joinprune messages are not sent.
- Specifying the value of 65535 for IPv6 PIM hello-holdtime represents an infinite time. If an IPv6 PIM router gets IPv6 PIM Hello packet from a neighbor with its hello-holdtime value as infinite time, then the router will not time out the sender(neighbor). It is recommended that you use an IPv6 PIM hello-holdtime interval that is 3.5 times the value of the IPv6 PIM hello-interval, or 65535 seconds if the IPv6 PIM hello-interval is set to zero
- Specifying the value of 65535 for IPv6 PIM joinprune-holdtime represents an infinite time. The receipt of IPv6 Join/Prune messages with its joinprune-holdtime value as infinite time, then this specifies an infinite holdtime for the particular IPv6 join/prune message. It is recommended that you use a join-prune- holdtime interval that is 3.5 times the value of the IPv6 PIM Join/Prune interval defined for the interface, or 65535 seconds if the IPv6 PIM joinprune-interval is set to zero.

- The interface configured as a **stub** will not send any IPv6 PIM packets through that interface, and any received IPv6 PIM packets are also ignored. By default, an IPv6 PIM interface is not set to be a stub one.
- The IPv6 PIM **graft-retry-interval** and **prune-limit-interval** options can be used only with the IPv6 PIM-DM mode.

## Examples

```
-> ipv6 pim interface vlan-2 hello-interval 100 triggered-hello 10 joinprune-interval 100 hello-holdtime 350 joinprune-holdtime 400
-> no ipv6 pim interface vlan-2
```

## Release History

## show ipv6 pim sparse

Displays the status of the various global parameters for the IPv6 PIM sparse mode.

**show ipv6 pim sparse**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 pim sparse
Status                = enabled,
Keepalive Period      = 210,
Max RPs                = 32,
Probe Time            = 5,
Register Suppress Timeout = 60,
RP Switchover         = enabled,
SPT Status            = enabled,
```

### *output definitions*

---

<b>Status</b>	The current global (i.e., switch-wide) status of the IPv6 PIM sparse mode. Options include <b>enabled</b> and <b>disabled</b> .
<b>Keepalive Period</b>	The duration of the Keepalive timer. The default value is 210.
<b>Max RPs</b>	The maximum number of Rendezvous Points (RPs) allowed in the IPv6 PIM-SM domain (1–100). The default value is 32.
<b>Probe Time</b>	The amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP. Values may range from 1 to 300. The default value is 5.
<b>Register Suppress Timeout</b>	The amount of time, in seconds, the Designated Router (DR) will stop sending registers to the Rendezvous Point (RP) once a Register-Stop is received (1–300). The default value is 60.

*output definitions*

---

<b>RP switchover</b>	The current status of the RP Switchover capability. RP switchover enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated data packet. Options include <b>enabled</b> and <b>disabled</b> . The default setting is <b>enabled</b> .
<b>SPT Status</b>	The current status of last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). Options include <b>enabled</b> and <b>disabled</b> . The default setting is <b>enabled</b> .

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>ipv6 pim rp-switchover</b>	Enables or disables an RP to attempt switching to native forwarding upon receiving the first register-encapsulated packet in the IPv6 PIM domain.
<b>ipv6 pim spt admin-state</b>	Enables or disables last hop Designated Router (DR) switching to the Shortest Path Tree (SPT). If enabled, last hop DR switching to the SPT begins once the first multicast data packet is received.
<b>ipv6 pim sparse admin-state</b>	Enables or disables the IPv6 PIM-SM (sparse mode) globally for IPv6.
<b>ipv6 pim interface</b>	Enables IPv6 PIM and configures statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the interface.
<b>ip pim max-rps</b>	Configures the maximum number of C-RP routers allowed in the PIM-SM domain.
<b>ip pim probe-time</b>	Configures the amount of time before the Register Suppression timer expires, at which point the Designated Router (DR) sends a Null Register message to the Rendezvous Point (RP). This allows the RP to refresh the Register-Stop. If the Register Suppression timer expires, the DR will resume encapsulating packets from the source to the RP.
<b>ip pim register-suppress-timeout</b>	Specifies the period during which a Designated Router (DR) stops sending Register-encapsulated packets to the Rendezvous Point (RP) after receiving a Register-Stop message.

## show ipv6 pim dense

Displays the status of the various global parameters for the IPv6 PIM dense mode.

```
show ipv6 pim dense
```

---

### Syntax Definitions

N/A.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show IPv6 pim dense
Status                = enabled,
Source Lifetime       = 210,
State Refresh Interval = 60,
State Refresh Limit Interval = 0,
State Refresh TTL     = 16
```

*output definitions*

---

<b>Status</b>	The current global (i.e., switch-wide) status of the IPv6 PIM dense mode. Options include <b>enabled</b> and <b>disabled</b> .
<b>Source Lifetime</b>	The duration of the Keepalive or Source Lifetime timer. The default value is 210.
<b>State Refresh Interval</b>	The time-interval, in seconds, between successive State Refresh messages originated by the router. The default value is 60.
<b>State Refresh Limit Interval</b>	Displays the limit at which a router will not forward the State Refresh messages, if they are received at less than the interval. The default value is 0.
<b>State Refresh TTL</b>	Displays the TTL to be used in the router's originated State Refresh messages. The default value is 16.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>ipv6 pim dense admin-state</b>	Enables or disables IPv6 PIM-DM (dense mode) globally on the switch.
<b>ip pim keepalive-period</b>	Configures the period during which the (S,G) Join state will be maintained in the absence of (S,G) Join messages or explicit (S,G) local membership.
<b>ip pim state-refresh-interval</b>	Sets the interval between successive State Refresh messages originated by a router.
<b>ip pim state-refresh-limit</b>	Sets the limit at which a router will not forward successive State Refresh messages if they are received at less than the interval.
<b>ip pim state-refresh-ttl</b>	Sets the Time to Live to be used in a router's originated State Refresh messages if the data packet's Time to Live is not recorded.

  alaPimdmStateRefreshTimeToLive

```

---

## show ipv6 pim ssm group

Displays the static configuration of IPv6 multicast group mappings for PIM-Source Specific Multicast (SSM).

**show ipv6 pim ssm group**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

### Examples

```
-> show ipv6 pim ssm group
```

```
Group Address/Pref Length  Mode  Override Precedence Status
-----+-----+-----+-----+-----
ff00::/8                   ssm   false   none     enabled
ff34::/32                   ssm   false   none     enabled
```

#### *output definitions*

---

<b>Group Address/Pref Length</b>	The IPv6 multicast group address along with the prefix length.
<b>Mode</b>	The IPv6 PIM mode that is used for the groups in this prefix.
<b>Override</b>	Specifies this static RP configuration to override the dynamically learned RP information for the specified group(s).
<b>Precedence</b>	The precedence value that can be used for this static RP configuration.
<b>Status</b>	Displays whether this entry is currently enabled or disabled. Options include <b>enabled</b> and <b>disabled</b> .

---

### Release History

---

## show ipv6 pim interface

Displays detailed IPv6 PIM settings for a specific interface. In general, it displays IPv6 PIM settings for all the interfaces if no argument is specified.

**show ipv6 pim interface** [*if\_name*]

---

### Syntax Definitions

*if\_name*                                 The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

To view more detailed information about a particular interface, specify the interface name in the command line. Additional information includes Triggered Hello Interval, Hello Holdtime, Prune Delay status and value, Override Interval, LAN Delay status, Generation ID status, and Join/Prune Holdtime.

### Examples

```
-> show ipv6 pim interface
```

Interface Name	Designated Router	Hello Interval	Join/Prune Interval	Oper Status
vlan-5	fe80::2d0:95ff:feac:a537	30	60	enabled
vlan-30	fe80::2d0:95ff:feac:a537	30	60	disabled
vlan-40	fe80::2d0:95ff:fee2:6eec	30	60	enabled

```
-> show ipv6 pim interface vlan-5
```

```
Interface Name           = vlan-5,  
IP Address                = fe80::2d0:95ff:fee2:6eec,  
Designated Router         = fe80::2d0:95ff:fee2:a537,  
Hello Interval            = 30,  
Triggered Hello Interval = 5,  
Hello HoldTime           = 105,  
Join/Prune Interval      = 60,  
Join/Prune HoldTime      = 210,  
Propagation (Prune) Delay = 500,  
Override Interval        = 2500,  
Generation ID             = 0x4717be4d,  
DR Priority               = 1,  
DR Priority Enabled       = true,  
Lan Delay Enabled        = true,  
Effective Propagation Delay = 500,  
Effective Override Interval = 2500,  
Suppression Enabled      = true,  
Stub Interface           = false,
```

```

Prune Limit Interval      = 60,
Graft Retry Interval     = 3,
State Refresh Enabled    = true,
Operational Status      = enabled

```

### *output definitions*

---

<b>Interface Name</b>	The name of the IPv6 PIM interface.
<b>IPv6 address</b>	Specifies the IPv6 address of the specified interface.
<b>Designated Router</b>	The primary IP address for the Designated Router (DR). The DR acts on behalf of any directly-connected hosts with respect to the PIM-SM protocol. Only one router in the LAN will act as the DR.
<b>Hello Interval</b>	The frequency at which PIM Hello messages are transmitted on a specified interface. Values may range from 1 to 18000. The default value is 30.
<b>Join/Prune Interval</b>	The Join/Prune interval for the associated interface. The Join/Prune interval is the interval at which periodic PIM-SM Join/Prune messages are sent. Values may range from 0 to 18000. The default value is 60.
<b>Triggered Hello Interval</b>	The current Triggered Hello Interval. This value indicates the maximum time, in seconds, before a triggered PIM Hello message is transmitted on the corresponding interface. Values may range from 0 to 60. The default value is 5.
<b>Hello Holdtime</b>	The current Hello Holdtime value. This value indicates the maximum amount of time, in seconds, Hello messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 105.
<b>Join/Prune Holdtime</b>	The current Join/Prune Holdtime value. This value indicates the maximum amount of time, in seconds, Join/Prune messages will be held before they are considered invalid. Values may range from 0 to 65535. The default value is 210.
<b>Propagation Delay</b>	The expected propagation delay between PIM routers on the network. Values may range from 0 to 32767. The default value is 500.
<b>Override Interval</b>	The current Override Interval. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by a router is dictated by this number. Values may range from 0 to 65535. The default value is 2500.
<b>Generation ID Option</b>	The value of the Generation ID this router inserted in the last PIM Hello message it sent on this interface.
<b>DR Priority</b>	Displays the Designated Router priority for each interface. This value is used in determining the Designated Router on an interface. Values may range from 1 to 192. A higher numeric value denotes a higher priority. Note that priority-based election is used only if all routers on the interface are using the DR priority option. The default value is 1.
<b>Lan Delay Enabled</b>	Options include <b>true</b> and <b>false</b> . The value will be true if all neighbors on the interface are using the LAN Prune Delay option. Otherwise, the setting will be false.
<b>Effective Propagation Delay</b>	The Effective Propagation Delay on this interface.

*output definitions (continued)*

---

<b>Effective Override Interval</b>	The Effective Override Interval on this interface.
<b>Suppression Enabled</b>	Specifies whether the Join suppression is enabled on this interface.
<b>DR Priority Enabled</b>	Evaluates to TRUE if all routers on this interface are using the DR Priority option.
<b>Stub Interface</b>	Specifies whether this interface is a 'stub interface'. If this is TRUE, then no PIM packets are sent out on this interface, and any received PIM packets are ignored.
<b>Prune Limit Interval</b>	The minimum interval that must transpire between two successive Prunes sent by a router. This is used only with PIM-DM. Values may range from 0 to 65535. The default value is 60.
<b>Graft Retry Interval</b>	Displays the time-interval a router waits for a Graft acknowledgment before resending a Graft on the interface. This is only used with PIM-DM. Values may range from 0 to 65535. The default value is 3.
<b>SR Priority Enabled</b>	Evaluates to TRUE if all routers on this interface are using the State Refresh option. This is used only by PIM-DM.
<b>Operational Status</b>	The current operational status of the corresponding interface. Options include <b>enabled</b> and <b>disabled</b> . This value indicates whether the IPv6 interface is operationally up. For example, if PIM is enabled on the interface, but the interface is currently down, this field will display as disabled. The default setting is <b>disabled</b> . To enable or disable PIM on an interface, refer to the <a href="#">ipv6 pim interface command on page 25-89</a> . To globally enable or disable PIM on the switch, refer to the <a href="#">ipv6 pim sparse admin-state command on page 25-75</a> and <a href="#">ipv6 pim dense admin-state command on page 25-76</a> .

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**[ipv6 pim interface](#)

Enables IPv6 PIM and configures statistics such as hello-interval, triggered-hello, hello-holdtime, joinprune, prune-delay, override-interval, dr-priority, stub interface, prune limit interval, and graft retry interval on the interface.

---

## show ipv6 pim neighbor

Displays a list of active IPv6 PIM neighbors.

**show ipv6 pim neighbor** [*ipv6\_address*] [*if\_name*]

---

### Syntax Definitions

*ipv6\_address*                      The IPv6 address for the PIM neighbor.

*if\_name*                              The name of the interface.

### Defaults

If the neighbor's IPv6 address or interface name is not specified, the entire IPv6 PIM neighbor table is displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

To view more detailed information about a particular neighbor, specify the neighbor's IPv6 address or the associated interface name in the command line. Additional information will be displayed, which includes LAN Prune Delay, Override Interval, TBit field, State Refresh capable, and Designated Router option status.

### Examples

```
-> show ipv6 pim neighbor
Neighbor Address                      Interface Name                      Uptime                      Expires                      DR Pri
-----+-----+-----+-----+-----
fe80::2d0:95ff:feac:a537              vlan-30                              02h:56m:51s 00h:01m:28s 1
```

If a specific neighbor address is specified in the command line, *detailed information for the corresponding neighbor only* displays:

```
-> show ipv6 pim neighbor fe80::2d0:95ff:feac:a537
vlan-30
Neighbor IPv6 Address                  = fe80::2d0:95ff:feac:a537,
Uptime                                   = 02h:57m:09s,
Expires                                  = 00h:01m:40s,
Lan Prune Delay Present                = True,
Propagation Delay                       = 500,
Override Interval                       = 2500,
TBit Field                               = True,
Gen ID Present                          = True,
Gen ID Value                            = 0x7720c123,
BiDir Capable                          = False,
DR Priority Present                      = True,
DR Priority                              = 1,
```

```

State Refresh Capable      = True,
Secondary Addresses:
  3000::11

vlan-40
Neighbor IPv6 Address      = fe80::2d0:95ff:feac:a537,
Uptime                    = 03h:57m:03s,
Expires                   = 00h:01m:20s,
Lan Prune Delay Present   = True,
Propagation Delay         = 500,
Override Interval         = 2500,
TBit Field                = True,
Gen ID Present            = True,
Gen ID Value              = 0x7720c123,

DR Priority Present        = True,
DR Priority                = 1,
State Refresh Capable     = True,
Secondary Addresses:
  4000::11

```

If a specific interface name is specified in the command line, *detailed information corresponding to all neighbors on the specified interface only* displays:

```

-> show IPv6 pim neighbor vlan-30
vlan-30
Neighbor IPv6 Address      = fe80::2d0:95ff:feac:a537,
Uptime                    = 02h:57m:09s,
Expires                   = 00h:01m:40s,
Lan Prune Delay Present   = True,
Propagation Delay         = 500,
Override Interval         = 2500,
TBit Field                = True,
Gen ID Present            = True,
Gen ID Value              = 0x7720c123,
BiDir Capable             = False,
DR Priority Present        = True,
DR Priority                = 1,
State Refresh Capable     = True,
Secondary Addresses:
  3000::11

```

### output definitions

<b>Neighbor IPv6 Address</b>	The IPv6 address of the active PIM neighbor.
<b>Interface Name</b>	The name of the IPv6 PIM interface that is used to reach the neighbor.
<b>Uptime</b>	The amount of time since this PIM neighbor last became a neighbor of the local router, displayed in hours, minutes, and seconds.
<b>Expires</b>	The minimum amount of time remaining before the PIM neighbor will be aged out, displayed in hours, minutes, and seconds.
<b>LAN Prune Delay present</b>	Specifies whether this neighbor is using the LAN Prune Delay option. Options include <b>true</b> or <b>false</b> .
<b>Propagation Delay</b>	The value of the propagation-delay field of the LAN prune-delay option received from this neighbor. A value of 0 indicates that no LAN prune-delay option was received from this neighbor.

*output definitions (continued)*

---

<b>Override Interval</b>	The current Override Interval of the LAN prune-delay option received from this neighbor. This value is used to avoid synchronization of override messages when multiple downstream routers share a multi-access link. The sending of override messages is delayed at random time intervals. The amount of randomization used by the neighboring router is dictated by this number. Values may range from 0 to 65535. A value of 0 indicates that no LAN prune-delay option was received from this neighbor.
<b>TBit field</b>	The value of the Tbit field of the LAN prune-delay option received from this neighbor. The Tbit specifies the ability of the neighbor to disable Join suppression.
<b>Gen ID present</b>	Specifies whether this neighbor is using Generation ID option. Options include <b>true</b> or <b>false</b> .
<b>Gen ID Value</b>	The value of the Generation ID in the last PIM Hello message received from this neighbor.
<b>BiDir Capable</b>	Specifies whether this neighbor is using the Bidirectional-PIM Capable option.
<b>DR Priority Present</b>	Displays whether the neighbor is using the Designated Router option. Options include <b>true</b> or <b>false</b> .
<b>DR priority</b>	The value of the Designated Router Priority in the last PIM Hello message received from this neighbor.
<b>State Refresh Capable</b>	Displays whether the neighbor is capable of receiving State Refresh messages. Options include <b>true</b> or <b>false</b> .
<b>Secondary Addresses</b>	The secondary IPv6 address of this PIM neighbor.

## show ipv6 pim static-rp

Displays the IPv6 PIM Static RP table, which includes IPv6 multicast group address/prefix length, the static Rendezvous Point (RP) address, and the current status of the static RP configuration (i.e., enabled or disabled).

```
show ipv6 pim static-rp
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If the group prefixes configured for two or more rows in this table overlap, the row with the greatest prefix length value is used for the overlapping range.

### Examples

```
-> show ipv6 pim static-rp
```

Group Address/Pref Length	RP Address	Mode	Override	Precedence	Status
ff00::/8	3000::11	asm	false	none	enabled
ff34::/32	3000::11	asm	false	none	enabled

#### *output definitions*

<b>Group Address/Pref Length</b>	The IPv6 multicast group address along with the prefix length.
<b>RP Address</b>	The IPv6 address of the RP that is mapped for the groups within the group prefix. This field is set to zero, if the specified IPv6 PIM mode is SSM or DM.
<b>Mode</b>	The IPv6 PIM mode that is used for the groups in this prefix. The possible values include ASM, SSM, or DM.
<b>Override</b>	Specifies that this static RP configuration can override the dynamically learned RP information for the specified group(s).
<b>Precedence</b>	The precedence value that is used for this static RP configuration.
<b>Status</b>	Displays whether the static RP configuration is currently enabled or disabled. Options include <b>enabled</b> and <b>disabled</b> .

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **ipv6 pim static-rp**

Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).

## MIB Objects

```
alaPimStaticRPTable  
  alaPimStaticRPGrpAddress  
  alaPimStaticRPGrpPrefixLength  
  alaPimStaticRPAddress  
  alaPimStaticRPPimMode  
  alaPimStaticRPOverrideDynamic  
  alaPimStaticRPRowStatus  
  alaPimStaticRPPrecedence
```

---

## show ipv6 pim group-map

Displays the IPv6 PIM group mapping table.

**show ipv6 pim group-map** [**bsr** | **static-rp** | **ssm** | **dense**]

---

### Syntax Definitions

N/A

### Defaults

If the keywords **bsr**, **static-rp**, **ssm**, or **dense** are included in the command line, then only the entries that were created by the specified origin are displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If static RP configuration is being used, this information is obtained from those static RP addresses that are defined through the **ipv6 pim static-rp** command. As long as the RP addresses defined in the static RP set are reachable, they will be added to the group mapping table.
- If the IPv6 multicast groups are mapped to the mode DM or SSM, then the entries created by local SSM address range configuration using the **ipv6 pim ssm group** command and local Dense Mode address range configuration using the **ipv6 pim dense group** command are displayed.
- If the bootstrap mechanism is being used, this information is obtained from received Candidate-RP advertisements (when the local router is the BSR; when the local router is not the BSR, this information is obtained from received bootstrap messages).

### Examples

```
-> show ipv6 pim group-map
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
BSR	ff00::/8	3000::11	asm	192
BSR	ff00::/8	4000::7	asm	192
SSM	ff33::/32		ssm	

```
-> show ipv6 pim group-map bsr
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
BSR	ff00::/8	3000::11	asm	192
BSR	ff00::/8	4000::7	asm	192

```
-> show ipv6 pim group-map ssm
```

Origin	Group Address/Pref Length	RP Address	Mode	Precedence
--------	---------------------------	------------	------	------------

SSM ff33::/32 ssm

### output definitions

---

<b>Origin</b>	The mechanism by which the PIM mode and RP for the group were learned. The possible values include 'static RP' for local static RP configuration, 'static SSM' for both static SSM group configuration and Dense Mode Group configuration, and 'BSR' for the PIM Bootstrap Router mechanism.
<b>Group Address/Prefix Length</b>	The IPv6 multicast group address along with the prefix length.
<b>RP Address</b>	The IPv6 address of the Rendezvous Point to be used for groups within the group prefix.
<b>Mode</b>	The IPv6 PIM mode to be used for groups in this prefix.
<b>Mapping Precedence</b>	The precedence value of a particular row, that determines which row applies to a given group address. Numerically higher values for this object indicate lower precedences, with the value zero denoting the highest precedence.

---

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ipv6 pim static-rp</a>	Adds, modifies, or deletes a static RP for an IPv6 multicast group (“modifies” applies only to the RP address, since the table is indexed from group address and prefix length parameters).

## show ipv6 pim candidate-rp

Displays the IPv6 multicast groups for which the local router advertises itself as a Candidate-RP.

**show ipv6 pim candidate-rp**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 pim candidate-rp
RP Address          Group Address      Priority  Interval  Status
-----+-----+-----+-----+-----
3000::11           FF00::/8           192      60        enabled
```

#### *output definitions*

---

<b>RP Address</b>	An IPv6 unicast address that is advertised as the Candidate-Rendezvous Point (RP).
<b>Group Address</b>	The IPv6 multicast group address along with the prefix length. This is the group for which the local router advertises itself as a C-RP.
<b>Priority</b>	The C-RP router's priority. The lower the value, the higher the priority.
<b>Interval</b>	The time interval at which the C-RP advertisements are sent to the BSR.
<b>Status</b>	The current status of this entry. The status is shown as enabled only if the IPv6 PIM-SM is globally enabled and the IPv6 PIM interface is enabled.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [ipv6 pim candidate-rp](#)

Configures the local router as the Candidate-Rendezvous Point (C-RP) for a specified IPv6 multicast group(s).

## show ipv6 pim cbsr

Displays the IPv6 Candidate-BSR information that is used in the Bootstrap messages.

**show ipv6 pim cbsr**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 pim cbsr
CBSR Address           = 3000::7,
Status                 = enabled,
CBSR Priority           = 0,
Hash Mask Length       = 126,
Elected BSR           = False,
Timer                  = 00h:00m:00s
```

### *output definitions*

---

<b>CBSR Address</b>	An IPv6 unicast address that the local router uses to advertise itself as a Candidate-BSR.
<b>Status</b>	The current status of this entry. The status is shown as enabled only if the IPv6 PIM-SM is globally enabled and the IPv6 PIM interface is enabled.
<b>CBSR Priority</b>	The value for the local router as a Candidate-BSR. The higher the value, the higher the priority.
<b>Hash Mask Length</b>	The hash mask length that is advertised in the bootstrap messages (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for an IPv6 multicast group)
<b>Elected BSR</b>	Specifies whether the local router is the elected BSR.
<b>Timer</b>	The time value that is remaining before the local router originates the next Bootstrap message. This value is zero if this router is not the elected BSR.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [ipv6 pim cbsr](#)

Configures the Candidate-BSR information that is used in the Bootstrap messages.

  alaPimBsrCandidateBSRPriority
```

---

## show ipv6 pim bsr

Displays information about the elected IPv6 BSR.

```
show ipv6 pim bsr
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 pim bsr
BSR Address           = 3000::7,
BSR Priority           = 192,
Hash Mask Length     = 126,
Expiry Time          = 00h:01m:35s
```

#### *output definitions*

---

<b>BSR Address</b>	The IPv6 unicast address of the elected BSR.
<b>BSR Priority</b>	The priority value of the elected BSR. The higher the value, the higher the priority.
<b>Hash Mask Length</b>	The hash mask length that is advertised in the Bootstrap messages by the elected BSR (the length of the mask is used in the hash function when computing the Rendezvous Point (RP) for a multicast group).
<b>Expiry Time</b>	The minimum time remaining before the elected BSR will be declared down.

---

### Release History

Release 7.1.1; command was introduced.

```

---

## show ipv6 pim groute

Displays all (\*,G) state that the IPv6 PIM has.

**show ipv6 pim groute** [*group\_address*]

---

### Syntax Definitions

*group\_address*                      The IPv6 address of the Multicast Group.

### Defaults

By default, entire (\*,G) routing table is displayed. To view more detailed (\*,G) state information about a particular group, specify the group address in the command line.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

When the *group\_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.

### Examples

```
-> show ipv6 pim groute
Total 1 (*,G)
```

Group Address	RP Address	RPF Interface	UpTime
ff0e::7	5ffe::3	vlan-4	00h:01m:23s

```

### *output definitions*

---

<b>Group-address</b>	The IPv6 Multicast Group Address.
<b>RP Address</b>	The address of the Rendezvous Point (RP) for the group.
<b>RPF Interface</b>	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
<b>Upstream Neighbor</b>	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (*,G) join messages to.
<b>UpTime</b>	The time since this entry was created.
<b>Pim Mode Origin</b>	The mechanism by which the PIM mode and RP for the group were learned.
<b>Upstream Join State</b>	Whether the local router should join the RP tree for the group.
<b>Upstream Join Timer</b>	The time remaining before the local router next sends a periodic (*,G) Join message on the RPF IfIndex.
<b>RPF Next Hop</b>	The address of the RPF next hop towards the RP.
<b>RPF Route Protocol</b>	The routing mechanism through which the route used to find the RPF interface towards the RP was learned.
<b>RPF Route Address/Prefix Length</b>	The IPv6 address combined with the prefix length identifies the route used to find the RPF interface towards the RP.
<b>Route Metric Pref</b>	The metric preference of the route used to find the RPF interface towards the RP.
<b>Route Metric</b>	The routing metric of the route used to find the RPF interface towards the RP.
<b>Interface Name</b>	The interface name that corresponds to the ifIndex.
<b>Local Membership</b>	Whether the local router has (*,G) local membership on this interface.
<b>Join Prune State</b>	The state resulting from (*,G) Join/Prune messages received on this interface.

*output definitions (continued)*

---

<b>Prune Pending Timer</b>	The time remaining before the local router acts on a (*,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
<b>Join Expiry Timer</b>	The time remaining before (*,G) Join state for this interface expires.
<b>Assert State</b>	The (*,G) Assert state for this interface. The possible values are No Info, Winner or Loser.
<b>Assert Timer</b>	If Assert State is 'Winner', this is the time remaining before the local router next sends a (*,G) Assert message on this interface. If the Assert State is 'Loser', this is the time remaining before the (*,G) assert state expires.
<b>Assert Winner Address</b>	If the Assert State is 'Loser', this is the address of the assert winner.
<b>Assert Winner Metric Pref</b>	If the Assert State is 'Loser', this is the metric preference of the route to the RP advertised by the assert winner; otherwise, this is zero.
<b>Assert Winner Metric</b>	If the Assert State is 'Loser', this is the routing metric of the route to the RP advertised by the assert winner; otherwise, this is zero.

## show ipv6 pim sgroute

Displays all (S,G) state that the IPv6 PIM has.

**show ipv6 pim sgroute** [*source\_address* *group\_address*]

---

### Syntax Definitions

*source\_address*                      The IPv6 address for a specific multicast source.

*group\_address*                        A IPv6 multicast address.

### Defaults

By default, entire (S,G) routing table is displayed. To view the detailed information for a particular (S,G) entry, use the *source\_address* and *group\_address* associated with that entry.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When the *source\_address* and *group\_address* is specified in the command line, the detailed information displayed also includes the detailed state of every outgoing interface.
- If an IPv6 address is not specified, the current PIM status for all multicast route entries are displayed.

### Examples

```
-> show ipv6 pim sgroute
```

```
Legend: Flags: D = Dense, S = Sparse, s = SSM Group,
           L = Local, R = RPT, T = SPT, F = Register,
           P = Pruned, O = Originator
```

```
Total 1 (S,G)
```

Source Address	Group Address	RPF Interface	UpTime	Flags
8ffe::3	ff0e::7		00h:01m:34s	SR

```
-> show ipv6 pim sgroute 8ffe::3 ff0e::7
(8ffe::3,ff0e::7)
```

```
UpTime                                = 00h:01m:40s
PIM Mode                              = ASM,
Upstream Join State                  = Not Joined,
Upstream RPT State                   = Not Pruned,
Upstream Join Timer                  = 00h:00m:00s,
Upstream Neighbor                   = none,
SPT Bit                               = False,
DR Register State                    = No Info,
DR Register Stop Timer               = 00h:00m:00s,
Interface Specific State:
```

```

vlan-3
  UpTime                = 00h:01m:40s,
  Local Membership      = False,
  Join/Prune State      = No Info,
  RPT State             = No Info,

```

### *output definitions*

---

<b>Source-address</b>	The IPv6 Source address.
<b>Group-address</b>	The IPv6 Multicast Group Address.
<b>RPF Interface</b>	The RPF interface towards the RP. The ifIndex is converted to the if-name for the display.
<b>Upstream Neighbor</b>	The primary address of the neighbor on the RPF Interface that the local router is sending periodic (S,G) join messages to.
<b>UpTime</b>	The time since this entry was created.
<b>Flags</b>	Flags indicating SPTBit, Prune State, Join State, etc.
<b>Pim Mode</b>	Whether the Group Address is SSM, ASM or DM.
<b>Upstream Join State</b>	Whether the local router should join the SPT for the source and group represented by this entry.
<b>Upstream Join Timer</b>	The time remaining before the local router next sends a periodic (S,G) Join message.
<b>RPF Next Hop</b>	The address of the RPF next hop towards the source.
<b>RPF Route Protocol</b>	The routing mechanism through which the route used to find the RPF Interface towards the source was learned.
<b>RPF Route Address/Prefix Length</b>	The IP address which when combined with the Route Prefix length identifies the route used to find the RPF interface towards the source.
<b>RPF Route Metric Pref</b>	The metric preference of the route used to find the RPF interface towards the source.

*output definitions (continued)*

---

<b>RPF Route Metric</b>	The metric preference of the route used to find the RPF interface towards the source.
<b>DR Register State</b>	Whether the local router should encapsulate (S,G) data packets in Register messages and send them to the RP. The possible values include No Info, Join, Join Pending, or Prune.
<b>DR Register Stop Timer</b>	The value of the Register Stop Timer. If the Register State is 'prune', this is the time remaining before the local router sends a Null-Register message to the RP. If the State is 'joinPending', this is the time remaining before the local router resumes encapsulating data packets and sending them to the RP.
<b>Upstream Prune State</b>	Whether the local router has pruned itself from the tree. This is only used by PIM-DM. The possible values include forwarding, Ack Pending, or Pruned.
<b>Upstream Prune Limit Timer</b>	The time remaining before the local router may send a (S,G) prune message on alaPimSGRPFifIndex. This is only used by PIM-DM.
<b>Originator State</b>	Whether this router is an originator for the (S,G) message flow. This is only used by PIM-DM. The possible values include Not Originator or Originator.
<b>Source Active Timer</b>	If this router is the Originator, this is the time remaining before the local router reverts to notOriginator state. Otherwise, this is zero. This is only used by PIM-DM.
<b>State Refresh Timer</b>	If Originator state is 'originator', this is the time remaining before the local router sends a State Refresh Message. Otherwise, this is zero. This is only used by PIM-DM.
<b>Interface Name</b>	The interface name corresponding to the ifIndex that corresponds to this entry.
<b>Uptime</b>	The time since this entry was created.
<b>Local Membership</b>	Whether the local router has (S,G) local membership on this interface.
<b>Join Prune State</b>	The state resulting from (S,G) Join/Prune messages received on this interface. The possible values include No Info, Join, or Prune Pending.
<b>Prune Pending Timer</b>	The time remaining before the local router acts on an (S,G) Prune message received on this interface, during which the router is waiting to see whether another downstream router will override the Prune message.
<b>Join Expiry Timer</b>	The time remaining before (S,G) Join state for this interface expires.
<b>Assert State</b>	The (S,G) Assert state for this interface. The possible values include No Info, Winner, or Loser.
<b>Assert Timer</b>	If Assert State is Winner, this is the time remaining before the local router sends a (S,G) Assert message on this interface. If the Assert State is Loser, this is the time remaining before the (S,G) Assert state expires.
<b>Assert Winner</b>	If the Assert State is Loser, this is the address of the assert winner.
<b>Assert Winner Metric Pref</b>	If the Assert State is Loser, this is the metric preference of the route to the source advertised by the assert winner.
<b>Assert Winner Metric Metric</b>	If the Assert State is Loser, this is the routing metric of the route to the source advertised by the assert winner.

# 26 Multicast Routing Commands

This chapter describes multicast routing commands. Multicast routing is used in conjunction with IP Multicast Switching (IPMS). IPMS can operate either with or without multicast routing. However, for Multicast Routing to function, IPMS must be configured.

Multicast uses Class D IP addresses in the range 224.0.0.0 to 239.255.255.255. Addresses in the range 239.0.0.0 to 239.255.255.255 are reserved for boundaries, which are used to prevent multicast traffic from being forwarded on a VLAN group or network.

IP multicast routing is a way of controlling multicast traffic across networks. The multicast router discovers which networks want to receive multicast traffic by sending out Internet Group Management Protocol (IGMP) queries and receiving IGMP reports from attached networks. The IGMP reports signal that users want to join or leave a multicast group. If there is more than one multicast router in the network, the router with the lowest IP address is elected the querier router, which is responsible for querying the subnetwork for group members.

The current release also provides support for IPv6 multicast addresses. In the IPv6 addressing scheme, multicast addresses begin with the prefix ff00::/8. Similar to IPv6 unicast addresses, IPv6 multicast addresses also have different scopes depending on their prefix, though the range of possible scopes is different.

Multicast Listener Discovery (MLD) is the protocol used by an IPv6 router to discover the nodes which request multicast packets on its directly attached links and the multicast addresses that are of interest to those neighboring nodes. MLD is derived from version 2 of IPv4's Internet Group Management Protocol, IGMPv2. MLD uses ICMPv6 message types, rather than IGMP message types.

MIB information for the multicast routing commands is as follows:

*Filename:* AlcatelIND1Ipmmr.mib  
*Module:* ALCATEL-IND1-IPMRM-MIB

*Filename:* AlcatelIND1IpMcastDraft.mib  
*Module:* ALCATEL-IND1-IPMCAST-MIB

A summary of the available commands is listed here:

---

**ip mroute-boundary**  
**ip mroute interface ttl**  
**ipv6 mroute interface ttl**  
**show ip mroute-boundary**  
**show ip mroute**  
**show ipv6 mroute**  
**show ip mroute interface**  
**show ipv6 mroute interface**  
**show ip mroute-nexthop**  
**show ipv6 mroute-nexthop**

---

## ip mroute-boundary

Adds or deletes scoped multicast address boundaries for a router interface. When a user on the specified interface joins the multicast group as defined by the scoped address—plus the mask length—all multicast traffic will stop being forwarded on that interface. This provides a mechanism for the end user to control multicast traffic from the network.

Refer to the “Configuring Multicast Address Boundaries” chapter in the applicable *OmniSwitch Advanced Routing Guide* for detailed information.

**ip mroute-boundary** *if\_name scoped\_address mask*

**no ip mroute-boundary** *if\_name scoped\_address mask*

---

### Syntax Definitions

<i>if_name</i>	The interface name on which the boundary is being assigned.
<i>scoped_address</i>	A scoped multicast address identifying the group range for the boundary. Scoped addresses may range from 239.0.0.0–239.255.255.255.
<i>mask</i>	A corresponding Class A, B, or C mask address (e.g., 255.0.0.0).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to delete the scoped multicast address boundaries for a router interface.

### Examples

```
-> ip mroute-boundary vlan-2 239.0.0.0 255.0.0.0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show ip mroute-boundary** Displays scoped multicast address boundaries for the switch’s router interfaces.

**MIB Objects**

IpMRouteBoundaryTable

ipMRouteBoundaryIfIndex

ipMRouteBoundaryAddress

ipMRouteBoundaryAddressMask

ipMRouteBoundaryStatus

---

## ip mroute interface ttl

Specifies a multicast datagram Time to Live (TTL) threshold for an existing router interface. IP multicast datagrams with a TTL value lower than the specified TTL threshold value will not be forwarded out of the interface.

**ip mroute interface** *if\_name* **ttl** *threshold*

---

### Syntax Definitions

<i>if_name</i>	The interface name that has one of the Multicast routing protocols running (either DVMRP or PIM).
<i>threshold</i>	The TTL threshold value. Values may range from 0–255. The default value of 0 allows all multicast packets to be forwarded out of the interface.

### Defaults

---

parameter	default
<i>threshold</i>	0

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ip mroute interface vlan-1 ttl 255
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ip mroute interface](#) Displays IP multicast interface information.

### MIB Objects

```
alaIpMcastInterfaceTable  
  alaIpMcastInterfaceIfIndex  
  alaIpMcastInterfaceTtl
```

---

## ipv6 mroute interface ttl

Specifies a multicast datagram Time to Live (TTL) threshold for an existing IPv6 interface. Any IP multicast datagrams with a TTL value lower than the specified TTL threshold value will not be forwarded out of the interface.

**ipv6 mroute interface** *if\_name* **ttl** *threshold*

---

### Syntax Definitions

<i>if_name</i>	The name of the IPv6 interface.
<i>threshold</i>	The TTL threshold value. Values may range from 0–255. The default value of 0 allows all multicast packets to be forwarded out of the interface.

### Defaults

---

parameter	default
<i>threshold</i>	0

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ipv6 mroute interface vlan-1 ttl 255
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

  alaIpMcastInterfaceTtl
```

---

## show ip mroute-boundary

Displays scoped multicast address boundaries for the switch's router interfaces.

**show ip mroute-boundary**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip mroute-boundary
```

```
Interface Name  Interface Address  Boundary Address
-----+-----+-----
vlan-4         214.0.0.7         239.1.1.1/32
```

#### *output definitions*

---

<b>Interface Name</b>	The name of the interface on which the boundary is assigned. Packets with a destination address in the associated address/mask range will not be forwarded from this interface.
<b>Interface Address</b>	The IP address of this interface where the boundary is assigned.
<b>Boundary Address</b>	The scoped multicast address that, when combined with the boundary mask, identifies the scoped boundary range. The boundary's subnet mask is shown using the CIDR prefix length: 255.0.0.0 equals /8; 255.255.0.0 equals /16; 255.255.255.0 equals /24.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

---

## show ip mroute interface

Displays IP multicast interface information.

**show ip mroute interface** {*interface\_name*}

---

### Syntax Definitions

*interface\_name*                      The name of the interface.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Not specifying an interface name displays all known IP multicast interfaces information.

### Examples

-> show ip mroute interface

Interface Name	IP Address	TTL	Multicast Protocol
vlan-4	214.0.0.7	0	PIM
vlan-26	172.21.63.7	0	PIM
vlan-11	212.61.11.7	0	PIM

### output definitions

---

<b>Interface Name</b>	The name configured for the interface.
<b>IP Address</b>	The IP address of this interface entry.
<b>TTL</b>	The datagram TTL threshold for the interface. Any IP multicast datagrams with a TTL less than the threshold displayed in the table will not be forwarded out of the interface. The default value, 0, specifies that <i>all</i> multicast packets are forwarded out of the interface.
<b>Multicast Protocol</b>	The multicast routing protocol currently running on this interface. Options include DVMRP and PIM.

---

### Release History

Release 7.1.1; command was introduced.

## show ip mroute-nexthop

Displays next-hop information on outgoing interfaces for routing IP multicast datagrams.

**show ip mroute-nexthop**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ip mroute-nexthop
```

```
Total 10 Nexthops
```

Group Address	Src Address	Interface Name	Next Hop Address	Protocol
225.0.0.0	214.0.0.2/32	vlan-26	225.0.0.0	PIM-SM
225.0.0.1	214.0.0.2/32	vlan-26	225.0.0.1	PIM-SM
225.0.0.2	214.0.0.2/32	vlan-26	225.0.0.2	PIM-SM
225.0.0.3	214.0.0.2/32	vlan-26	225.0.0.3	PIM-SM
225.0.0.4	214.0.0.2/32	vlan-26	225.0.0.4	PIM-SM
225.0.0.5	214.0.0.2/32	vlan-26	225.0.0.5	PIM-SM
225.0.0.6	214.0.0.2/32	vlan-26	225.0.0.6	PIM-SM
225.0.0.7	214.0.0.2/32	vlan-26	225.0.0.7	PIM-SM
225.0.0.8	214.0.0.2/32	vlan-26	225.0.0.8	PIM-SM
225.0.0.9	214.0.0.2/32	vlan-26	225.0.0.9	PIM-SM

#### *output definitions*

---

<b>Group Address</b>	The IP multicast group address for this entry.
<b>Src Address</b>	The network address, which identifies the source for this entry.
<b>Interface Name</b>	Generally, this is the name configured for the interface.
<b>Next Hop Address</b>	The address of the next-hop that is specific to this entry.
<b>Protocol</b>	The routing protocol by which this next-hop was learned (i.e., DVMRP or PIM-SM).

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

### [show ip mroute](#)

Displays multicast routing information for IP datagrams sent by particular sources to the IP multicast groups known to this router.

## MIB Objects

alaIpMcastRouteNextHopTable  
  alaIpMcastRouteNextHopGroup  
  alaIpMcastRouteNextHopSource  
  alaIpMcastRouteNextHopIfIndex  
  alaIpMcastRouteNextHopAddress  
  alaIpMcastRouteNextHopProtocol
```

---

## show ipv6 mroute-nexthop

Displays IPv6 next-hop information on outgoing interfaces for routing IP multicast datagrams.

**show ipv6 mroute-nexthop**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show ipv6 mroute-nexthop
```

```
Total 2 Nexthops
```

Group Address	Source Address	Interface	Next Hop Address	Protocol
ff06:7777::1	2600::7	vlan-40	ff06:7777::1	PIM-SM
ff06:7777::2	2600::7	vlan-40	ff06:7777::2	PIM-SM

#### *output definitions*

---

<b>Group Address</b>	The IPv6 multicast group address for this entry.
<b>Src Address</b>	The IPv6 multicast address, which identifies the source for this entry.
<b>Interface Name</b>	The name of the IPv6 interface on which the datagrams sent by these sources to this IPv6 multicast address are received.
<b>Next Hop Address</b>	The IPv6 address of the next-hop that is specific to this entry.
<b>Protocol</b>	The IPv6 multicast routing protocol by which this IPv6 multicast forwarding entry was learned.

# 27 QoS Commands

Alcatel-Lucent's QoS software provides a way to manipulate flows coming through the switch based on user-configured policies. The flow manipulation (generally referred to as *Quality of Service* or *QoS*) may be as simple as allowing/denying traffic, or as complicated as remapping 802.1p bits from a Layer 2 network to ToS values in a Layer 3 network.

This chapter provides information about configuring QoS global and port parameters through the Command Line Interface (CLI). Refer to [Chapter 44, "QoS Policy Commands,"](#) for information about commands used to configure QoS policy rules.

MIB information for the QoS commands is as follows:

*Filename:* ALCATEL-IND1-QOS-MIB\_mib  
*Module* alaQoS MIB

*Filename:* ALCATEL-IND1-VIRTUAL-FLOW-CONTROL-MIB\_mib  
*Module* alcatelIND1VfcMIB

---

**Important Note.** Some of the commands listed here are not currently supported on one or more platforms. See command descriptions in this chapter and check release notes for information about commands that are not supported.

---

The QoS commands are listed here:

---

<b>Global commands</b>	<b>qos</b> <b>qos trust-ports</b> <b>qos forward log</b> <b>qos log console</b> <b>qos log lines</b> <b>qos log level</b> <b>qos stats interval</b> <b>qos phones</b> <b>qos user-port</b> <b>qos dei</b> <b>debug qos</b> <b>debug qos internal</b> <b>clear qos log</b> <b>qos apply</b> <b>qos revert</b> <b>qos flush</b> <b>qos reset</b> <b>qos stats reset</b> <b>show qos slice</b> <b>show qos log</b> <b>show qos config</b> <b>show qos statistics</b>
------------------------	--

---

---

<b>Port and Slice commands</b>	<code>qos port</code> <code>qos port reset</code> <code>qos port trusted</code> <code>qos port maximum egress-bandwidth</code> <code>qos port maximum ingress-bandwidth</code> <code>qos port default 802.1p</code> <code>qos port default dscp</code> <code>qos port default classification</code> <code>qos port dei</code> <code>show qos port</code>
<b>Queue Management commands</b>	<code>qos wred</code> <code>qos wrp</code> <code>qos qset</code> <code>qos qsp</code> <code>qos qsi</code> <code>qos qsi qsp</code> <code>show qos wred</code> <code>show qos wrp</code> <code>show qos qset</code> <code>show qos qsp</code> <code>show qos qsi</code> <code>show qos qsi stats</code> <code>show qos qsi stats rate</code> <code>show qos qsi stats bytes</code> <code>show qos qsi wred-stats</code> <code>clear qos qsi stats</code>

---

## qos

Enables or disables QoS. This section describes the base command with a single required option (**enable** or **disable**).

In lieu of these options, the base command (**qos**) may be used with other keywords to set up global QoS configuration. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

```
qos {enable | disable}
    [trust-ports]
    [forward log]
    [log console]
    [log lines lines]
    [log level level]
    [stats interval seconds]
    [phones [priority priority_value | trusted]]
    [user-port {filter | shutdown} {spoof | bgp | bpdu | rip | ospf | vrrp | dvmrp | pim | isis | dhcpserver
    | dns-reply}]
```

---

### Syntax Definitions

<b>enable</b>	Enables QoS. The QoS software in the switch classifies flows coming into the switch to attempt to match them to QoS policies. If a match is found, the policy parameters are applied to the flow. The <b>enable</b> setting may be used alone or in conjunction with optional command keywords.
<b>disable</b>	Disables QoS. Flows coming into the switch are not matched to policies. The <b>disable</b> setting cannot be used with any other command keyword.

### Defaults

parameter	default
enable   disable	enable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When QoS is disabled, flows coming into the switch are classified but not matched to a policy. Traffic is treated as best effort and assigned to default queues.
- The command keywords may be used with or without **enable**; these keywords cannot be used with **disable**.

### Examples

```
-> qos enable default disposition deny
```

```
-> qos disable  
-> qos enable
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">policy rule</a>	Configures a policy rule on the switch.
<a href="#">show policy rule</a>	Displays information for policy rules configured on the switch.

## MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigEnable  
  alaQoSConfigTrustedPorts  
  alaQoSConfigForwardLog  
  alaQoSConfigLogLines  
  alaQoSConfigLogLevel  
  alaQoSConfigLogConsole  
  alaQoSConfigStatsInterval  
  alaQoSConfigAutoPhones  
  alaQoSConfigUserportFilter  
  alaQoSConfigAppliedUserportFilter  
  alaQoSConfigUserportShutdown  
  alaQoSConfigAppliedUserportShutdown
```

---

## qos trust-ports

Configures the global trust mode for QoS ports. Trusted ports can accept 802.1p and ToS/DSCP values in incoming packets; untrusted ports will set any 802.1p or ToS/DSCP values to zero in incoming packets, unless a default 802.1p or ToS/DSCP value is configured.

Any port configured through the **qos port** command will automatically be added in the trust mode specified by this command. See [page 27-32](#) for more information about this command.

**qos trust-ports**

**qos no trust-ports**

---

### Syntax Definitions

N/A

### Defaults

By default, all ports are untrusted.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **qos ports trusted** command to override the default for a particular port.
- The setting only applies to ports with incoming traffic.
- Any port configured for 802.1Q tagging is always trusted regardless of the global setting.
- Mobile ports are always trusted regardless of the global setting.
- Use the **qos port default 802.1p** or **qos port default dscp** commands to specify that a value other than zero should be applied to the incoming packets. Note that this value is overridden if a policy exists that specifies a different value for such packets.

### Examples

```
-> qos trust-ports
-> qos no trust-ports
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****qos port**

Configures a physical port for QoS.

**qos port trusted**

Configures whether or not a particular port is trusted or untrusted.

**show qos port**

Displays information about QoS ports.

**MIB Objects**

alaQoSConfigTable

    alaQoSConfigTrustedPorts

---

## qos forward log

Enables the QoS software in the switch to send events to the policy server software in the switch in real time. The policy server software may then be polled by an NMS application for logged events.

**qos forward log**

**qos no forward log**

---

### Syntax Definitions

N/A

### Defaults

By default, logged events are not sent to the policy server software in the switch.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

An NMS application may query the Policy Manager in the switch for logged events. Use the **qos forward log** command to forward each event as it happens.

### Examples

```
-> qos forward log
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">qos log lines</a>	Configures the number of lines in the QoS log.
<a href="#">show qos log</a>	Displays the log of QoS events.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigForwardLog
```

---

## qos log console

Sends QoS log messages to the switch logging utility, which is an event logging application available on the OmniSwitch. The configuration of the switch logging utility determines if QoS messages are sent to a log file in the switch's flash file system, displayed on the switch console, or sent to a remote syslog server.

**qos log console**

**qos no log console**

---

### Syntax Definitions

N/A

### Defaults

QoS log messages are not sent to the switch logging utility by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- To display QoS log events as they happen on an output console attached to the switch, configure the switch logging utility to output events to the console. This is done using the **swlog output** command.
- The entire log may be viewed at any time using the **show qos log** command.

### Examples

```
-> qos log console  
-> qos no log console
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">qos log lines</a>	Configures the number of lines in the QoS log.
<a href="#">swlog output</a>	Enables or disables switch logging output to the console, file, or data socket (remote session).
<a href="#">swlog output</a>	Displays the log of QoS events.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigLogConsole
```

---

## qos log lines

Configures the number of lines in the QoS log.

**qos log lines** *lines*

---

### Syntax Definitions

*lines*

The number of lines included in the QoS log. A value of zero turns off logging to the console. The range is 0–512.

### Defaults

parameter	default
<i>lines</i>	10000

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- To turn off logging, enter 0 for the number of log lines. (Note that error messages will still be logged.)
- If you change the number of log lines, you may clear all messages in the QoS log. To avoid clearing all messages in the log, enter the **qos log lines** command in the **boot.cfg** file. The log length will be changed at the next reboot.

### Examples

```
-> qos log lines 5  
-> qos log lines 0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show qos log](#) Displays the log of QoS events.

### MIB Objects

alaQoSConfigTable  
  alaQoSConfigLogLines

---

## qos log level

Configures the level of log detail.

**qos log level** *level*

**qos no log level**

---

### Syntax Definitions

*level* The level of log detail, in the range from 1 (least detail) to 8 (most detail).

### Defaults

parameter	default
<i>level</i>	5

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **qos debug** command to change the type of debugging messages that are logged. The **qos log level** command configures the level of detail for these messages.
- If the **qos debug** command is not configured to log any kind of information (this is the default), the **qos log level** command has no effect.
- To log fatal errors only, set the log level to 0.
- Note that a high log level value will impact the performance of the switch.

### Examples

```
-> qos log level 4  
-> qos log level 0
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****qos log lines**

Configures the number of lines in the QoS log.

**show qos log**

Displays the log of QoS events.

**MIB Objects**

alaQoSConfigTable

    alaQoSConfigLogLevel

---

## qos stats interval

Configures how often the switch polls network interfaces for statistics about QoS events.

**qos stats interval** *seconds*

---

### Syntax Definitions

*seconds*

The number of seconds before the switch polls network interfaces for statistics. The range is 1–3600.

### Defaults

parameter	default
<i>seconds</i>	60

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Change the statistics interval to a smaller interval if you want to monitor QoS events.
- Change the statistics interval to a larger interval if you want to free some switch memory.

### Examples

```
-> qos stats interval 30
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show qos statistics](#)

Displays statistics about the QoS configuration.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigStatsInterval
```

---

## qos phones

Enables or disables the automatic prioritization of IP phone traffic.

**qos phones** [*priority priority\_value* | **trusted**]

**qos no phones**

---

### Syntax Definitions

*priority\_value*                      The priority given to scheduling traffic on the output port. Values range from 0 (lowest) to 7 (highest).

**trusted**                                Trusts IP phone traffic; priority value of the IP phone packet is used.

### Defaults

parameter	default
<i>priority_value</i>   <b>trusted</b>	trusted

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable automatic prioritization of IP phone traffic.
- IP phone traffic is identified by examining the source MAC address of the packet received on the port. If the source MAC falls within one of the following ranges, the QoS IP phone priority is automatically assigned to the MAC:  
 00-80-9F-54-xx-xx to 00-80-9F-64-xx-xx  
 00-80-9F-66-xx-xx to 00-80-9F-6F-xx-xx.
- To automatically apply the QoS IP phone priority to other, non-IP phone traffic, add the source MAC addresses of such traffic to the QoS “alaPhone” group.
- When automatic prioritization of IP phone traffic is enabled, QoS policies that specify priority are not applied to the IP phone traffic. Other QoS policies, however, are applied to this type of traffic as usual.

### Examples

```
-> qos phones priority 7
-> qos phones trusted
-> qos no phones
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands****show qos config**

Displays the QoS configuration for the switch.

**MIB Objects**

alaQoSConfigTable

    alaQoSConfigAutoPhones

---

## qos user-port

Configures the option to filter packets or administratively disable a port when the specified type of traffic is received on a port that is a member of the pre-defined UserPorts group.

```
qos user-port {filter | shutdown} {spoof | bgp | bpdu | rip | ospf | vrrp | dvmrp | pim | isis | dhcp-server | dns-reply}
```

```
qos no user-port {filter | shutdown}
```

---

### Syntax Definitions

<b>filter</b>	Filters the specified type of traffic when it is received on UserPort ports.
<b>shutdown</b>	Administratively disables UserPort ports that receive the specified type of traffic.
<b>spoof</b>	Detects IP spoofing. The source IP address of a packet ingressing on a user port is compared to the subnet of the VLAN for the user port; the packet is dropped if these two items do not match. Also applies to ARP packets.
<b>bgp</b>	Filters only BGP protocol packets from a TCP session that was not originated by the same switch that has this filter configured.
<b>bpdu</b>	Filters conventional Spanning Tree BPDU (destination MAC address 0x0180c2:000000) packets and GVRP (destination MAC address 0x0180c2:000021) packets.
<b>rip</b>	Filters RIP protocol packets.
<b>ospf</b>	Filters OSPF protocol packets.
<b>vrrp</b>	Filters VRRP protocol packets.
<b>dvmrp</b>	Filters IGMP packets with a type of 0x13. This applies only to IP packets with no options.
<b>pim</b>	Filters PIMv1, PIM-DM, and PIM-SM packets. The PIMv1 filter applies only to IP packets with no options.
<b>isis</b>	Filters IS-IS protocol packets.
<b>dhcp-server</b>	Filters response packets originating from a DHCP or BOOTP server that is configured on the known UDP port 67.
<b>dns-reply</b>	Filters all packets (both TCP and UDP) that originate from the known DNS port 53.

## Defaults

parameter	default
<b>filter</b>	spooof
<b>shutdown</b>	none

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Use the **no** form of this command to disable the filter or shutdown function. This form of the command effects the overall operation of the feature.
- To specify more than one traffic type in the same command line, enter each type separated by a space (e.g., **spooof bgp ospf**).
- Note that existing traffic types to filter or shutdown are removed each time the **filter** or **shutdown** option is configured. Specify all desired traffic types each time the **qos user-port** command is performed to retain previously configured traffic types.
- No changes to the **filtering** and **shutdown** options are applied to the switch until the **qos apply** command is performed.
- This command only applies to ports that are members of the UserPorts group. Use the **policy port group** command to create and assign members to the UserPorts group.
- An SNMP trap is sent when a port is administratively disabled through a UserPorts shutdown function or a port disable action.
- To enable a port disabled by a user port shutdown operation, use the **interfaces admin** command to administratively enable the port or disconnect and reconnect the port cable.
- Up to 126 IP interfaces are supported with spooof detection on user ports. If the number of interfaces exceeds this amount, user port packets ingressing on those interfaces that exceed the 126 limit are dropped.

## Examples

```
-> qos user-port filter spooof bpdu
-> qos user-port shutdown spooof bgp ospf
-> qos no user-port shutdown
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**policy port group**

Configures a port group and its associated slot and port numbers.

**show qos config**

Displays QoS configuration information.

## MIB Objects

alaQoSConfigTable

alaQoSConfigUserportFilter

alaQoSConfigAppliedUserportFilter

alaQoSConfigUserportShutdown

alaQoSConfigAppliedUserportShutdown

---

## qos dei

Configures the global Drop Eligible Indicator (DEI) bit mapping and marking setting for all QoS ports. The DEI setting applies to packets marked yellow (non-conforming) as the result of Tri-Color Marking (TCM) rate limiting.

**qos dei {ingress | egress}**

**qos no dei {ingress | egress}**

---

### Syntax Definitions

<b>ingress</b>	Maps the DEI/CFI bit to yellow (non-conforming) if this bit is set for ingress traffic.
<b>egress</b>	Marks the DEI/CFI bit for egress packets if TCM marked the packets yellow.

### Defaults

By default, no DEI/CFI bit marking or mapping is done.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to disable the global DEI bit mapping (ingress) or marking (egress) configuration for the switch.
- Use the **qos port dei** command to set the DEI bit mapping and marking configuration for a specific port. Note that the port setting takes precedence over the global DEI setting.
- Packets marked yellow by TCM rate limiting are still transmitted when there is no congestion on the egress port queues. Setting the DEI/CFI bit for yellow egress packets (**qos dei egress**) ensures that an upstream switch is made aware that the packet was marked yellow.
- When a switch receives a yellow packet with the DEI/CFI bit set and ingress DEI/CFI bit mapping is enabled (**qos dei ingress**), the packet is mapped to an internal drop precedence or yellow color marking for the switch.

### Examples

```
-> qos dei ingress
-> qos dei egress
-> qos no dei ingress
-> qos no dei egress
```

### Release History

Release 7.2.1; command was introduced.

## Related Commands

<b>qos port</b>	Configures a physical port for QoS.
<b>qos port dei</b>	Configures the Drop Eligible Indicator (DEI) bit mapping and marking setting for the specified QoS port.
<b>policy action cir</b>	Configures a Tri-Color Marking policy action.
<b>show qos config</b>	Displays global information about the QoS configuration.
<b>show qos port</b>	Displays information about QoS ports.

## MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigDEIMapping  
  alaQoSConfigDEIMarking
```

---

## debug qos

Configures the type of QoS events that will be displayed in the QoS log.

```
debug qos [info] [config] [rule] [main] [port] [msg] [sl] [ioctl] [mem] [mapper] [slot] [l2] [l3] [classifier] [nat] [sem] [pm] [ingress] [egress]
```

```
debug no qos
```

```
debug no qos [info] [config] [rule] [main] [port] [msg] [sl] [ioctl] [mem] [mapper] [slot] [l2] [l3] [classifier] [nat] [sem] [pm] [ingress] [egress]
```

---

### Syntax Definitions

<b>rule</b>	Logs events for rules configured on the switch.
<b>l2</b>	Logs Layer 2 QoS events on the switch.
<b>l3</b>	Logs Layer 3 QoS events on the switch.
<b>nat</b>	Logs events for Network Address Translation policies. <i>Not supported for the OmniSwitch 6624/6648.</i>
<b>port</b>	Logs events related to QoS ports.
<b>msg</b>	Logs QoS messages.
<b>classifier</b>	Logs information whenever the switch classifies a flow; more details are provided if the log level is higher.
<b>info</b>	Logs basic information about the switch
<b>config</b>	Logs information about the global configuration.
<b>main</b>	Logs information about basic program interfaces.
<b>sl</b>	Logs information about source learning.
<b>mem</b>	Logs information about memory.
<b>mapper</b>	Logs information about mapping queues.
<b>slot</b>	Logs events related to slots.
<b>sem</b>	Logs information about semaphore, process locking.
<b>pm</b>	Logs events related to the Policy Manager.
<b>ingress</b>	Logs information about packets arriving on the switch.
<b>egress</b>	Logs information about packets leaving the switch.

### Defaults

By default basic information messages are logged (**info**). Error messages are always logged.

### Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Use the **no** form of this command to change the type of messages that will be logged or to return debugging to its default state.
- Use this command to troubleshoot QoS events on the switch.

## Examples

```
-> debug qos flows queue
-> qos debug no flows no queue
-> debug no qos
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">qos forward log</a>	Enables the switch to send events to the PolicyView application in real time.
<a href="#">qos log lines</a>	Configures the number of lines in the QoS log.
<a href="#">show qos log</a>	Displays the log of QoS events.

## MIB Objects

```
alaQoSConfigTable
  alaQoSConfigDebug
```

---

## debug qos internal

Displays debugging information for QoS internal to the switch.

**debug qos internal** [*slice slot/slice*] [**flow**] [**queue**] [**port**] [**l2tree**] [**l3tree**] [**vector**] [**pending**] [**verbose**] [**mapper**] [**pool**] [**log**] [**pingonly** | **nopingonly**]

---

### Syntax Definitions

<i>slot/slice</i>	The slot number and slice for which you want to view debugging information. A <i>slice</i> is a logical section of hardware that corresponds to particular ports on a network interface module.
<b>flow</b>	Displays information about QoS flows.
<b>queue</b>	Displays information about QoS queues.
<b>port</b>	Displays information about QoS ports.
<b>l2tree</b>	Displays information about Layer 2 flows.
<b>l3tree</b>	Displays information about Layer 3 flows.
<b>vector</b>	Displays information about vectors.
<b>pending</b>	Displays information about pending QoS objects.
<b>verbose</b>	Sets the output to verbose mode for more detailed information.
<b>mapper</b>	Displays information about QoS mapping flows to queues.
<b>pool</b>	Displays information about the buffer pool.
<b>log</b>	Displays information about QoS information that is logged.
<b>pingonly</b>	Specifies that any policies configured with an ICMP protocol condition apply only to ICMP echo-requests and echo-replies.
<b>nopingonly</b>	Configures the switch so that any policies configured with an ICMP protocol condition apply to any ICMP packets.

### Defaults

Debugging is disabled by default.

parameter	default
<b>pingonly</b>   <b>nopingonly</b>	<b>nopingonly</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **debug qos** command to set the level of log detail in the QoS log.

**Examples**

```
-> debug qos internal "verbose log"
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

[debug qos](#)

Configures the type of QoS events that will be displayed in the QoS log.

---

## clear qos log

Clears messages in the current QoS log.

```
clear qos log
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command is useful for clearing messages from a large log file so that the file is easier to view. Logs can get large if invalid rules are configured on the switch, or if a lot of QoS events have taken place. Clearing the log makes the file easier to manage.

### Examples

```
-> clear qos log
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">qos log lines</a>	Configures the number of lines in the QoS log.
<a href="#">debug qos</a>	Configures the type of QoS events that will be displayed in the QoS log.
<a href="#">show qos log</a>	Displays the log of QoS events.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigClearLog
```

---

## qos apply

Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).

**qos apply**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is required to activate all QoS and policy commands. This is the only command that causes current changes to be written to flash.
- Rules are configured through the **policy rule** command, but are not active on the switch until you enter **qos apply**.

### Examples

```
-> qos apply
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">qos revert</a>	Removes any policies configured through policy rule but not applied to the current configuration through the <b>qos apply</b> command.
<a href="#">qos reset</a>	Resets the QoS configuration to its default values.
<a href="#">qos flush</a>	Deletes all pending policy information.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigApply
```

---

## qos revert

Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

**qos revert**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use this command to remove currently configured policies that have not yet been activated through the **qos apply** command.

### Examples

```
-> qos revert
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">policy rule</a>	Configures a policy rule and saves it to the current configuration but does not make it active on the switch.
<a href="#">qos apply</a>	Applies all QoS settings configured on the switch to the current configuration.
<a href="#">qos reset</a>	Resets the QoS configuration to its defaults.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigRevert
```

---

## qos flush

Deletes all pending policy information. This command is different from **qos revert**, which returns the pending policy configuration to its last applied settings.

**qos flush**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If you enter this command, the pending policy configuration is completely erased. If you then enter **qos apply**, the erased configuration *overwrites the applied policies and you will erase all of your policy configuration*.

---

**Note.** Do not use this command unless you want to erase all of your policy configuration and start configuring new policies.

---

- Use the **qos revert** command to return the pending policy configuration to its last applied value.
- Policy configuration includes the following commands:

---

#### base commands

---

<b>policy rule</b>	<b>policy mac group</b>
<b>policy network group</b>	<b>policy port group</b>
<b>policy service</b>	<b>policy condition</b>
<b>policy service group</b>	<b>policy action</b>

---

### Examples

```
-> qos flush
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **qos revert**

Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

### **qos apply**

Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).

### **policy server flush**

Removes all cached LDAP policy data from the switch.

## MIB Objects

alaQoSConfigTable

    alaQoSConfigFlush

---

## qos reset

Resets the QoS configuration to its defaults.

```
qos reset
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use this command to reset QoS configuration that has not yet been applied through the **qos apply** command. The parameters are reset to their defaults.

### Examples

```
-> qos reset
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

#### [qos apply](#)

Applies all QoS settings configured on the switch to the current configuration.

#### [qos revert](#)

Deletes any QoS configuration that has not been applied to the configuration through the **qos apply** command.

### MIB Objects

```
alaQoSConfigTable  
  alaQoSConfigReset
```

---

## qos stats reset

Resets QoS statistic counters to zero.

```
qos stats reset
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use this command to reset global QoS statistics to zero. Statistics may be displayed with the **show qos statistics** command.

### Examples

```
-> qos stats reset
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show qos statistics](#) Displays statistics about the QoS configuration.

### MIB Objects

```
alaQoSConfigTable  
    alaQoSConfigStatsReset
```

---

## qos port reset

Resets all QoS port configuration to the default values.

**qos port** *slot/port* reset

---

### Syntax Definitions

*slot/port* The physical slot and port number. For example: 3/1.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The QoS port configuration parameters that are reset include:

parameter	default
default queues	8
trusted	not trusted

### Examples

```
-> qos port 3/1 reset
```

### Release History

Release 7.1.1; command was introduced.

### MIB Objects

```
alaQoSPortTable  
  alaQoSPortSlot  
  alaQoSPortPort  
  alaQoSPortReset
```

---

## qos port

Configures QoS parameters for a physical port. This section describes the base command with a single required option (*slot/port*).

In lieu of these options, the base command (**qos port**) may be used with other keywords to set up a QoS configuration on a per port basis. These keywords are listed here and described as separate commands later in this chapter. In addition, some keywords have a **no** form to remove the parameter or return it to its default.

```
qos port slot/port[-port]  
    [trusted]  
    [maximum egress-bandwidth bps]  
    [maximum ingress-bandwidth bps]  
    [maximum depth bps]  
    [default 802.1p value]  
    [default dscp value]  
    [default classification {802.1p | tos | dscp}]
```

---

### Syntax Definitions

*slot/port*[-*port*]                      The physical slot and port number. Use a hyphen to specify a range of ports (4/1-8).

### Defaults

- All ports are untrusted.
- By default, QoS ports do not preempt queues of lower priority.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **trusted** option to change the trust mode for the port.

### Examples

```
-> qos port 3/1 trusted  
-> qos port 4/2 no trusted
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>qos apply</b>	Applies configured QoS and policy settings to the current configuration.
<b>qos port</b>	Configures whether the default mode for QoS ports is trusted or untrusted.
<b>show qos port</b>	Displays information about QoS ports.

## MIB Objects

```
alaQoSPortTable
  alaQoSPortSlot
  alaQoSPortPort
  alaQoSPortTrusted
  alaQoSPortMaximumBandwidth
  alaQoSPortMaximumBandwidthStatus
  alaQoSPortMaximumIngBandwidth
  alaQoSPortMaximumIngBandwidthStatus
  alaQoSPortMaximumDefaultDepth
  alaQoSPortMaximumDefaultDepthStatus
  alaQoSPortDefault8021p
  alaQoSPortDefaultDSCP
  alaQoSPortDefaultClassification
```

---

## qos port trusted

Configures whether an individual port is trusted or untrusted. Trusted ports can accept the 802.1p and ToS/DSCP values in incoming packets; untrusted ports will set any 802.1p or ToS/DSCP values to zero in incoming packets, unless a default 802.1p or ToS/DSCP value is configured.

**qos port *slot/port*[-*port*] trusted**

**qos port *slot/port* no trusted**

---

### Syntax Definitions

*slot/port*[-*port*]

The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).

### Defaults

By default, all ports are untrusted.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **qos trust ports** command to set the default trust mode for all QoS ports. The **qos port trusted** command may be used to override the default.
- The setting applies only to ports with incoming traffic.
- Use the **qos port default 802.1p** or **qos port default dscp** commands to specify that a value other than zero should be applied to the incoming packets. Note that this value is overridden if a policy exists that specifies a different 802.1p or ToS/DSCP value for such packets.

### Examples

```
-> qos port 3/1 trusted
-> qos port 4/2 no trusted
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">qos port</a>	Configures a physical port for QoS.
<a href="#">qos trust ports</a>	Configures the global trust mode for QoS ports.
<a href="#">show qos port</a>	Displays information about QoS ports.

**MIB Objects**

alaQoSPortTable  
    alaQoSPortTrusted

---

## qos port maximum egress-bandwidth

Configures the maximum rate at which to send traffic on the specified QoS port.

**qos port** *slot/port[-port]* **maximum egress-bandwidth** *bps[k | m | g | t]*

**qos port** *slot/port[-port]* **no maximum egress-bandwidth**

---

### Syntax Definitions

*slot/port[-port]* The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).

*bps[k | m | g | t]* The maximum amount of bandwidth, in bits-per-second, for all traffic that egresses on the port. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k**, **5m**, **1g**, **1t**).

### Defaults

By default, the maximum bandwidth is the maximum allowed for the interface type on which the port resides.

parameter	default
<i>k   m   g   t</i>	<b>k</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a configured maximum egress bandwidth value from a port.
- If the maximum egress bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- The maximum egress bandwidth value cannot exceed the maximum bandwidth of the interface type associated with the port.
- Modifying the maximum egress bandwidth is most useful for low-bandwidth links.

### Examples

```
-> qos port 3/1 maximum egress-bandwidth 1000
-> qos port 4/1-8 maximum egress-bandwidth 10m
-> qos port 3/1 no maximum egress-bandwidth
-> qos port 4/1-8 no maximum egress-bandwidth
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">qos port maximum ingress-bandwidth</a>	Configures the rate at which traffic is received on a QoS port.

  alaQoSPortSlot  
  alaQoSPortPort  
  alaQoSPortMaximumBandwidth  
  alaQoSPortMaximumBandwidthStatus
```

---

## qos port maximum ingress-bandwidth

Configures the maximum rate at which traffic is received on a QoS port.

**qos port** *slot/port[-port]* **maximum ingress-bandwidth** *bps[k | m | g | t]*

**qos port** *slot/port[-port]* **no maximum ingress-bandwidth**

---

### Syntax Definitions

*slot/port[-port]* The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).

*bps[k | m | g | t]* The maximum amount of bandwidth, in bits-per-second, for all traffic that ingresses on the port. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k**, **5m**, **1g**, **1t**).

### Defaults

By default, the maximum bandwidth is the maximum allowed for the interface type on which the port resides.

parameter	default
<i>k   m   g   t</i>	<b>k</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a configured maximum ingress bandwidth value from a port.
- If the maximum ingress bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- The maximum ingress bandwidth value cannot exceed the maximum bandwidth of the interface type associated with the port.
- Modifying the maximum ingress bandwidth is most useful for low-bandwidth links.

### Examples

```
-> qos port 3/1 maximum ingress-bandwidth 1000
-> qos port 4/1-8 maximum ingress-bandwidth 10m
-> qos port 3/1 no maximum ingress-bandwidth
-> qos port 4/1-8 no maximum ingress-bandwidth
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">qos port maximum egress-bandwidth</a>	Configures the rate at which traffic is sent on a QoS port.
<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.

<a href="#">show qos port</a>	Displays information about QoS ports.

## MIB Objects

```
alaQoSPortTable  
  alaQoSPortSlot  
  alaQoSPortPort  
  alaQoSPortMaximumIngBandwidth  
  alaQoSPortMaximumIngBandwidthStatus
```

---

## qos port maximum depth

Configures the maximum bucket size used for traffic metering. The bucket size determines how much the traffic can burst over the maximum bandwidth rate.

**qos port** *slot/port[-port]* **maximum depth** *bps[k | m | g | t]*

**qos port** *slot/port[-port]* **no maximum depth**

---

### Syntax Definitions

*slot/port[-port]*

The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).

*bps[k | m | g | t]*

The maximum bucket size, in bits-per-second. The value may be entered as an integer (for example, **10**) or with abbreviated units (for example, **10k**, **5m**, **1g**).

### Defaults

parameter	default
<i>k   m   g   t</i>	<b>k</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This QoS port parameter is configured in conjunction with the maximum bandwidth parameters. When the bucket size is reached, the switch starts to drop packets.
- Use the **no** form of the command to remove the maximum depth setting from a port.
- If the maximum depth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum depth value used. However, if **10G** is specified, the maximum depth value applied is **10** gbps.
- Modifying the maximum depth is most useful for low-bandwidth links.

### Examples

```
-> qos port 3/1 maximum depth 100
-> qos port 4/1-8 maximum depth 10m
-> qos port 3/1 no maximum depth
-> qos port 4/1-8 no maximum depth
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">qos port</a>	Configures a physical port for QoS.
<a href="#">show qos port</a>	Displays information about QoS ports.

## MIB Objects

```
alaQoSPortTable  
  alaQoSPortSlot  
  alaQoSPortPort  
  alaQoSPortMaximumDefaultDepth
```

---

## qos port default 802.1p

Configures the 802.1p value to be inserted in flows ingressing on an untrusted port.

**qos port** *slot/port**[-port]* **default 802.1p** *value*

---

### Syntax Definitions

<i>slot/port</i> <i>[-port]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<i>value</i>	The priority value to be set. Values range from 0 (lowest priority) to 7 (highest priority).

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- By default untrusted ports will set the 802.1p bit to zero on incoming flows. Use this command to specify that a different 802.1p value should be applied to the flow.
- The default 802.1p value is not used if there is a matching QoS policy rule that sets the priority.
- Note that the 802.1p bit for tagged packets received on untrusted ports is set with the default 802.1p value, which is configured using the **qos port default 802.1p** command. If the packet is untagged, however, then the DSCP bit is set with the default DSCP value, which is configured using the **qos port default dscp** command.

### Examples

```
-> qos port 3/1 default 802.1p 5
-> qos port 4/1-8 default 802.1p 7
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>qos apply</b>	Applies configured QoS and policy settings to the current configuration.
<b>qos port</b>	Configures a physical port for QoS.
<b>show qos port</b>	Displays information about QoS ports.

## **MIB Objects**

alaQoSPortTable  
  alaQoSPortDefault8021p

---

## qos port default dscp

Configures the ToS/DSCP value to be inserted in flows ingressing on an untrusted port.

```
qos port slot/port[-port] default dscp value
```

---

### Syntax Definitions

*slot/port[-port]* The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).

*value* The ToS/DSCP value. The range is 0–63.

### Defaults

parameter	default
<i>value</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The value configured by this command sets the upper byte (precedence) and therefore configures the ToS/DSCP value for the port.
- The default DSCP value is not used if there is a matching QoS policy rule that sets the priority.
- Note that on the 802.1p bit for tagged packets received on untrusted ports is set with the default 802.1p value, which is configured using the [qos port default 802.1p](#) command. If the packet is untagged, however, then the DSCP bit is set with the default DSCP value, which is configured using the [qos port default dscp](#) command.

### Examples

```
-> qos port 3/1 default dscp 63  
-> qos port 4/1-8 default dscp 33
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

<b>qos apply</b>	Applies configured QoS and policy settings to the current configuration.
<b>qos port</b>	Configures a physical port for QoS.
<b>show qos port</b>	Displays information about QoS ports.

**MIB Objects**

alaQoSPortTable  
alaQoSPortDefaultDSCP

---

## qos port default classification

Specifies the default egress priority value to use for IP traffic ingressing on trusted ports.

**qos port** *slot/port[-port]* **default classification** {**tos** | **802.1p** | **dscp**}

---

### Syntax Definitions

<i>slot/port[-port]</i>	The slot number and port number of the physical port. Use a hyphen to specify a range of ports (4/1-8).
<b>tos</b>	Specifies that the ToS value of the flow will be used to prioritize flows coming in on the port.
<b>802.1p</b>	Specifies that the 802.1p value of the flow will be used to prioritize flows coming in on the port.
<b>dscp</b>	Specifies that the DSCP value of the flow will be used to prioritize flows coming in on the port.

### Defaults

parameter	default
<b>tos</b>   <b>802.1p</b>   <b>dscp</b>	dscp

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The egress priority assigned to an IP packet received on a trusted port is based on the DSCP value of the packet unless 802.1p is specified using this command.
- The default classification priority is not used if there is a matching QoS policy rule that sets the egress priority value.
- This command does not affect Layer 2 traffic, which is always classified with 802.1p.
- In some network situations, some IP traffic may be dropped before any QoS rules can take effect for the traffic.

### Examples

```
-> qos port 8/24 default classification dscp
-> qos port 4/1-8 default classification dscp
-> qos port 7/1 default classification 802.1p
-> qos port 5/1-8 default classification 802.1p
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">qos port</a>	Configures a physical port for QoS.
<a href="#">show qos port</a>	Displays information about QoS ports.

## MIB Objects

alaQoSPortTable  
alaQoSPortDefaultClassification

---

## qos port dei

Configures the Drop Eligible Indicator (DEI) bit mapping and marking setting for the specified QoS port. The DEI setting applies to packets marked yellow (non-conforming) as the result of Tri-Color Marking (TCM) rate limiting.

```
qos port slot/port dei {ingress | egress}
```

```
qos port slot/port no dei {ingress | egress}
```

---

### Syntax Definitions

<i>slot/port</i>	The slot number and port number of the physical port.
<b>ingress</b>	Maps the DEI/CFI bit to yellow (non-conforming) if this bit is set for ingress packets.
<b>egress</b>	Sets the DEI/CFI bit for egress packets if TCM marked the packets yellow.

### Defaults

By default, no DEI/CFI bit mapping or marking is done.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to disable the DEI bit mapping (ingress) or marking (egress) configuration for the specified port
- Use the **qos dei** command to set the global DEI bit mapping and marking configuration for all QoS switch ports. Note that the port-level setting takes precedence over the global DEI setting.
- Packets marked yellow by TCM rate limiting are still transmitted when there is no congestion on the egress port queues. Setting the DEI/CFI bit for yellow egress packets (**qos port dei egress**) ensures that an upstream switch is made aware that the packet was marked yellow.
- When a switch receives a yellow packet with the DEI/CFI bit set and ingress DEI/CFI bit mapping is enabled (**qos port dei ingress**), the packet is mapped to an internal drop precedence or yellow color marking for the switch.

### Examples

```
-> qos port 1/10 dei ingress
-> qos port 1/20 dei egress
-> qos port 1/10 no dei ingress
-> qos port 1/20 no dei egress
```

### Release History

Release 7.2.1; command was introduced.

## Related Commands

<b>qos port</b>	Configures a physical port for QoS.
<b>qos dei</b>	Configures the global Drop Eligible Indicator (DEI) bit mapping and marking setting for all QoS ports.
<b>policy action cir</b>	Configures a Tri-Color Marking policy action.
<b>show qos config</b>	Displays global information about the QoS configuration.
<b>show qos port</b>	Displays information about QoS ports.

## MIB Objects

```
alaQoSPortTable  
  alaQoSPortDEIMapping  
  alaQoSPortDEIMarking
```

---

## qos wred

Configures a Weighted Random Early Detection (WRED) drop profile. The WRED profiler function monitors the virtual output queues (VOQs) of the switch to provide early detection and notification of queue congestion.

```
qos wred {wrp-id wrp_id | wrp-name name} [color {all | g | y | r} {min min_% | max max_% | pb pb_% | gain gain}] [admin-state {enable | disable}]
```

```
no qos wred {wrp-id wrp_id | wrp-name name}
```

---

### Syntax Definitions

<i>wrp_id</i>	A WRED profile ID number. The valid range is 1–4.
<i>name</i>	An optional WRED profile name.
<b>all</b>	Configures green, yellow, and red color parameters.
<b>g</b>	Configures only green color bandwidth parameters.
<b>y</b>	Configures only yellow color bandwidth parameters.
<b>r</b>	Configures only red color bandwidth parameters.
<i>min_%</i>	The minimum queue threshold, in percent of queue size.
<i>max_%</i>	The maximum queue threshold, in percent of queue size.
<i>pb_%</i>	The maximum drop probability, in percent of queue size. The valid range is 0–99.
<i>gain</i>	The queue gain to smooth average queue size. The valid range is 1–15.
<b>admin-state enable</b>	Administratively enables the WRED profile.
<b>admin-state disable</b>	Administratively disables the WRED profile.

### Defaults

A default profile (wrp-1) is pre-configured with the following parameter values:

parameter	default
<i>name</i>	<b>wrp-1</b>
<b>g</b> <i>min_%</i>   <i>max_%</i>   <i>pb_%</i>   <i>gain</i>	40   90   24   9
<b>y</b> <i>min_%</i>   <i>max_%</i>   <i>pb_%</i>   <i>gain</i>	30   90   30   9
<b>r</b> <i>min_%</i>   <i>max_%</i>   <i>pb_%</i>   <i>gain</i>	20   90   36   9
<b>admin-state</b> { <b>enable</b>   <b>disable</b> }	enable

### Platforms Supported

OmniSwitch 10k

## Usage Guidelines

- The default WRED profile (WRP 1) is automatically assigned to all VOQ queue set (QSet) profiles and to individual queue profiles within the QSet. As a result, it is only necessary to configure new WRED profiles if the existing default profile settings are not sufficient.
- Use the **no** form of this command to remove WRED profile 2, 3, or 4 from the switch configuration. Note that the default WRP 1 cannot be deleted, however, WRP 1 parameters can be changed.
- Each time a WRED profile is created, the new profile inherits the default WRP 1 parameter settings if specific parameter values are not specified at the time the profile is created.
- Once a profile is created, the next step is to assign that profile to a QSet.
- To modify parameters for an existing profile, specify the ID number or name of the profile then the specific parameter values to change.
- Specify either the ID number or alphanumeric name when creating a WRED profile, not both at the same time. If a WRP name is specified instead of a WRP ID, the ID assigned to the WRED profile is the next available profile number. For example, if WRP 1 and 2 exist, the next profile created without specifying an ID number is assigned WRP ID 3.
- Setting the minimum, maximum, and probability thresholds to the same percentage value creates a color blind WRED profile.

## Examples

```
-> qos wred wrp-id 1 admin-state disable
-> qos wred wrp-id 2
-> qos wred wrp-name colorsense1 color g min 30 max 90 pb 4 y min 25 max 85 pb 5
-> qos wred wrp-name colorblind color g min 30 max 90 pb 4 y min 30 max 90 pb 4 r
min 30 max 90 pb 4

## qos wrp

Configures a Weighted Random Early Detection profile (WRP). The WRED profiler function monitors the egress queues of the switch to provide early detection and notification of queue congestion.

```
qos wrp {wrp_id | wrp_name} [gain gain] [color {red | yellow | green | all}] {min min_% | max max_% | pb pb_%}
```

```
no qos wrp {wrp_id | name}
```

---

### Syntax Definitions

<i>wrp_id</i>	A WRED profile ID number. The valid range is 1–4.
<i>wrp_name</i>	An optional WRED profile name.
<b>red</b>	Configures only red color bandwidth parameters.
<b>yellow</b>	Configures only yellow color bandwidth parameters.
<b>green</b>	Configures only green color bandwidth parameters.
<b>all</b>	Configures green, yellow, and red color parameters.
<i>min_%</i>	The minimum queue threshold, in percent of queue size.
<i>max_%</i>	The maximum queue threshold, in percent of queue size.
<i>pb_%</i>	The maximum drop probability, in percent of queue size. The valid range is 0–99.
<i>gain</i>	The queue gain to smooth average queue size. The valid range is 1–15.

### Defaults

A default profile (wrp-1) is pre-configured with the following parameter values:

parameter	default
<i>wrp_name</i>	<b>wrp-1</b>
<b>r</b> <i>min_%</i>   <i>max_%</i>   <i>pb_%</i>   <i>gain</i>	20   90   36   9
<b>y</b> <i>min_%</i>   <i>max_%</i>   <i>pb_%</i>   <i>gain</i>	30   90   30   9
<b>g</b> <i>min_%</i>   <i>max_%</i>   <i>pb_%</i>   <i>gain</i>	40   90   24   9
<b>admin-state</b> { <b>enable</b>   <b>disable</b> }	enable

### Platforms Supported

OmniSwitch 6900; **qos wrp** command not supported in the 7.2.1.R01 release.

OmniSwitch 10k; **qos wrp** command not supported (use the **qos wred** command instead).

## Usage Guidelines

- The default WRED profile (WRP 1) is automatically assigned to all queue set (QSet) profiles and to individual queue profiles within the QSet. As a result, it is only necessary to configure new WRED profiles if the existing default profile settings are not sufficient.
- Use the **no** form of this command to remove WRED profile 2, 3, or 4 from the switch configuration. Note that the default WRP 1 cannot be deleted, however, WRP 1 parameters can be changed.
- Each time a WRED profile is created, the new profile inherits the default WRP 1 parameter settings if specific parameter values are not specified at the time the profile is created.
- Once a profile is created, the next step is to assign that profile to a QSet.
- To modify parameters for an existing profile, specify the ID number or name of the profile then the specific parameter values to change.
- Specify either the ID number or alphanumeric name when creating a WRED profile, not both at the same time. If a WRP name is specified instead of a WRP ID, the ID assigned to the WRED profile is the next available profile number. For example, if WRP 1 and 2 exist, the next profile created without specifying an ID number is assigned WRP ID 3.
- Setting the minimum, maximum, and probability thresholds to the same percentage value creates a color blind WRED profile.

## Examples

```
-> qos wrp 2
-> qos wrp colorsense1 color green min 30 max 90 pb 4 yellow min 25 max 85 pb 5
-> qos wrp colorblind color green min 30 max 90 pb 4 yellow min 30 max 90 pb 4 red
min 30 max 90 pb 4
-> qos wrp colorblind color all min 30 max 90 pb 4
-> no qos wrp 2
```

## Release History

---

## qos qset

Configures the QSet profile (QSP) parameters for the specified profile (QSP 1–4). A QSet refers to a set of eight virtual output queues (VOQs) that is associated with each switch port and link aggregate (LAG). VOQ management is implemented using a QSet framework. The QSet profile (QSP) defines the QoS behavior for the QSet instance (QSI) associated with the profile.

```
qos qset {qsp-id qsp_id | qsp-name qsp_name} [wrp-id wrp_id | wrp-name wrp_name] [wred-admin {enable | disable}] [stats-admin {enable | disable}]
```

---

### Syntax Definitions

<i>qsp_id</i>	A QSet profile (QSP) ID number. The valid range is 1–4.
<i>qsp_name</i>	The QSet profile name (qsp-1, qsp-2, qsp-3, or qsp-4).
<i>wrp_id</i>	The WRED profile (WRP) ID to associate with the QSet profile.
<i>wrp_name</i>	The name of the WRED profile to associate with the QSet profile.
<b>wred-admin enable</b>	Enables the associated WRED profile for the QSet profile.
<b>wred-admin disable</b>	Disables the associated WRED profile for the QSet profile.
<b>stats-admin enable</b>	Enables scheduling statistics collection for the QSet queues.
<b>stats-admin disable</b>	Disables scheduling statistics collection for the QSet queues.

### Defaults

- There are four pre-defined QSet profiles (QSP 1–4) that are configured with the following QSet parameter values:

parameter	default
<i>qsp_id</i>	1-4
<i>qsp_name</i>	<b>qsp-id</b>
<i>wrp_id</i>	<b>1</b>
<i>wrp_name</i>	<b>wrp-1</b>
<b>wred-admin {enable   disable}</b>	<b>enabled</b>
<b>stats-admin {enable   disable}</b>	<b>disabled</b>

- Each of the four profiles is pre-configured with a different queuing scheme for the associated queues. See the “Configuring QoS” chapter in the *OmniSwitch AOS Release 7 Network Configuration Guide* for more information.

### Platforms Supported

OmniSwitch 10k

## Usage Guidelines

- QSP 1, 2, 3, and 4 are pre-defined in the switch configuration and cannot be deleted. In addition, only the parameters specified with this command are configurable for each profile at this time.
- QSP 1 is the default profile that is assigned to every QSI. To select a different QSP for a specific instance, use the `qos qsi` command.
- The default WRED profile (WRP 1) is assigned to each QSet profile (QSP) and to each queue profile within the QSet. If the default settings are not sufficient, use this command to select a different WRP for the QSet.
- The WRP ID or name specified with this command must already exist in the switch configuration. Use the `qos wred` command to create a new profile, if necessary.
- There is only one QSI per port or LAG ID and only one QSP associated with a QSI. However, the same QSP may be associated with more than one QSI. As a result, when parameter values are changed for a specific QSP, the changes are applied to all the QSIs associated with that QSP.
- When a port becomes a member of a link aggregate, the QSI/QSP for that port takes on the QSP attributes of the LAG QSI/QSP. In other words, a parent/child relationship is established between the port QSI (child) and LAG QSI (parent).
- When a port leaves a LAG, the port QSI reverts back to using QSP 1 (the default), not the QSP to which the port QSI was originally assigned.

## Examples

```
-> qos qset qsp-id 4 wrp-id 2
-> qos qset qsp-id 2 wrp-id 1 wred-admin enable
-> qos qset qsp-id 1 stats-admin enable
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<code>qos wred</code>	Configures a Weighted Random Early Detection (WRED) profile.
<code>show qos wred</code>	Displays the WRED profile configuration.
<code>show qos qset</code>	Displays the QSet profile configuration.

## MIB Objects

```
alcatelIND1VfcMIB
alaVfcQsetProfileTable
  alaVfcQSPId
  alaVfcQSPName
  alaVfcQSPWRPId
  alaVfcQSPWRPName
  alaVfcQSPWRPAdminState
  alaVfcQSPStatsAdmin
```

## qos qsp

Configures the QSet profile (QSP) parameters for the specified profile (QSP 1–4). A QSet refers to a set of eight egress queues that is associated with each switch port and link aggregate (LAG). The QSet profile (QSP) defines the QoS behavior for the QSet instance (QSI) associated with the profile.

```
qos qsp {qsp_id | qsp_name} [wrp {wrp_id | wrp_name}] [bw %]
```

---

### Syntax Definitions

<i>qsp_id</i>	A QSet profile (QSP) ID number. The valid range is 1–4.
<i>qsp_name</i>	The QSet profile name (qsp-1, qsp-2, qsp-3, or qsp-4).
<i>wrp_id</i>	The WRED profile (WRP) ID to associate with the QSet profile.
<i>wrp_name</i>	The name of the WRED profile to associate with the QSet profile.
<i>bw_%</i>	The percentage of bandwidth allocation for the QSet profile.

### Defaults

- There are four pre-defined QSet profiles (QSP 1–4) that are configured with the following QSet parameter values:

parameter	default
<i>qsp_id</i>	1-4
<i>qsp_name</i>	<b>qsp-id</b>
<i>wrp_id</i>	<b>1</b>
<i>wrp_name</i>	<b>wrp-1</b>

- Each of the four profiles is pre-configured with a different queuing scheme for the associated queues. See the “Configuring QoS” chapter in the *OmniSwitch AOS Release 7 Network Configuration Guide* for more information.

### Platforms Supported

OmniSwitch 6900; **qos qsp** command not supported in the 7.2.1.R01 release.

OmniSwitch 10k; **qos qsp** command not supported (use the **qos qset** command instead)

### Usage Guidelines

- QSP 1, 2, 3, and 4 are pre-defined in the switch configuration and cannot be deleted. In addition, only the parameters specified with this command are configurable for each profile at this time.
- QSP 1 is the default profile that is assigned to every QSI. To select a different QSP for a specific instance, use the **qos qsi** command.
- The default WRED profile (WRP 1) is assigned to each QSet profile (QSP) and to each queue profile within the QSet. If the default settings are not sufficient, use this command to select a different WRP for the QSet.

- The WRP ID or name specified with this command must already exist in the switch configuration. Use the **qos wrp** command to create a new profile, if necessary.
- There is only one QSI per port or LAG ID and only one QSP associated with a QSI. However, the same QSP may be associated with more than one QSI. As a result, when parameter values are changed for a specific QSP, the changes are applied to all the QSIs associated with that QSP.
- When a port becomes a member of a link aggregate, the QSI/QSP for that port takes on the QSP attributes of the LAG QSI/QSP. In other words, a parent/child relationship is established between the port QSI (child) and LAG QSI (parent).
- When a port leaves a LAG, the port QSI reverts back to using QSP 1 (the default), not the QSP to which the port QSI was originally assigned.

## Examples

```
-> qos qsp 4 wrp 2
-> qos qsp 2 wrp 2
-> qos qsp 1 bw 20
```

## Release History

Release 7.2.1; command not supported.

## Related Commands

<b>qos wrp</b>	Configures a Weighted Random Early Detection (WRED) profile.
<b>show qos wrp</b>	Displays the WRED profile configuration.
<b>show qos qsp</b>	Displays the QSet profile configuration.

## MIB Objects

```
alcatelIND1VfcMIB
alaVfcQsetProfileTable
  alaVfcQSPId
  alaVfcQSPName
  alaVfcQSPWRPId
  alaVfcQSPWRPName
  alaVfcQSPBandwidthLimitValue
```

---

## qos qsi

Configures the QSet profile (QSP) association and the administrative status for the WRED profile (WRP) and statistics collection for the specified QSet instance (QSI). A QSI is a logical set of eight virtual output queues (VOQs) associated with each port and link aggregate (LAG) ID.

```
qos qsi {port slot/port[-port] | slot slot | linkagg agg_id[-agg_id]} {qsp-id qsp_id | qsp-name qsp_name}
[wred-admin {enable | disable}] [stats-admin {enable | disable}]
```

```
no qsi {port slot/port[-port] | slot slot | linkagg agg_id[-agg_id]}
```

---

### Syntax Definitions

<i>slot/port</i> [- <i>port</i> ]	The physical slot and port number to associate with the QSet. Use a hyphen to specify a range of ports (3/1-10).
<i>slot</i>	The slot number to associate with the QSet.
<i>agg_id</i> [- <i>agg_id</i> ]	The link aggregate ID to associate with the QSet. Use a hyphen to specify a range of IDs (10-20).
<i>qsp_id</i>	An existing QSet profile (QSP) ID number to assign to this instance. The valid range is 1–8.
<i>qsp_name</i>	An existing QSet profile name.
<b>wred-admin enable</b>	Enables the WRED profile for the instance.
<b>wred-admin disable</b>	Disables the WRED profile for the instance.
<b>stats-admin enable</b>	Enables statistics collection for the instance.
<b>stats-admin disable</b>	Disables statistics collection for the instance.

### Defaults

parameter	default
<i>qsp_id</i>	<b>1</b>
<i>qsp_name</i>	<b>qsp-1</b>
<b>wred-admin {enable   disable}</b>	<b>enabled</b>
<b>stats-admin {enable   disable}</b>	<b>disabled</b>

### Platforms Supported

OmniSwitch 10k

### Usage Guidelines

- Use the **no** form of this command to revert the QSP assignment to the default profile (QSP 1).
- There is only one QSI per port or LAG ID and only one QSP associated with the QSI. The QSP imports the WRED profile (WRP) that is applied to the QSet.

- Changing the WRED profile or statistics collection status for a QSI, changes the status only for the port or link aggregate to which the QSI is associated.
- A QSI hierarchy exists consisting of parent/child relationships. For example, all member ports of a link aggregate will import the QSI/QSP settings of the parent link aggregate. When a member port moves out of the link aggregate, the QSI/QSP settings for that port are reset to the default settings.
- The number of children supported for a LAG ID is 8.

## Examples

```
-> qos qsi port 1/2 qsp-id 4 stats-admin enable
-> qos qsi port 2/1-10 qsp-id 2 wred-admin disable stats-admin enable
-> qos qsi slot 3 wred-admin disable
-> qos qsi linkagg 10 qsp-id 4 wred-admin disable
-> no qos qsi port 1/2
-> no qos qsi slot 3
-> no qos qsi linkagg 10
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">qos qset</a>	Configures a queue set profile.
<a href="#">show qos qsi</a>	Displays the QSet instance configuration.
<a href="#">show qos qsi stats</a>	Displays statistics for one or more QSet instances.

## MIB Objects

```

  alaVfcQsetQSPID
  alaVfcQsetQSPName
  alaVfcQsetWRPAdminState
  alaVfcQsetStatsAdmin
```

---

## qos qsi qsp

Configures the QSet profile (QSP) administrative status, the administrative status for the WRED profile (WRP), and the statistics collection administrative status and interval for the specified QSet instance (QSI). A QSI is a set of eight egress queues that is automatically associated with each port and link aggregate (LAG) ID.

```
qos qsi {port slot/port[-port] | slot slot | linkagg agg_id[-agg_id]} [qsp qsp_id | qsp_name] [admin-state {enable | disable}] [wred admin-state {enable | disable}] [stats {admin-state {enable | disable} | interval interval_time}]
```

---

### Syntax Definitions

<i>slot/port</i> [- <i>port</i> ]	The physical slot and port number to associate with the QSet. Use a hyphen to specify a range of ports (3/1-10).
<i>slot</i>	The slot number to associate with the QSet.
<i>agg_id</i> [- <i>agg_id</i> ]	The link aggregate ID to associate with the QSet. Use a hyphen to specify a range of IDs (10-20).
<i>qsp_id</i>	An existing QSet profile (QSP) ID number to assign to this instance. The valid range is 1.
<i>qsp_name</i>	An existing QSet profile name.
<b>admin-state enable</b>	Enables the QSet profile for the instance.
<b>admin-state disable</b>	Disables the Qset profile for the instance.
<b>wred admin-state enable</b>	Enables the WRED profile for the instance.
<b>wred admin-state disable</b>	Disables the WRED profile for the instance.
<b>stats admin-state enable</b>	Enables statistics collection for the instance.
<b>stats admin-state disable</b>	Disables statistics collection for the instance.
<i>interval_time</i>	The time interval for statistics gathering. The valid range is 10 to 300 seconds.

## Defaults

parameter	default
<i>qsp_id</i>	1
<i>qsp_name</i>	qsp-1
admin-state {enable   disable}	enabled
wred admin-state {enable   disable}	disabled
stats admin-state {enable   disable}	disabled
interval <i>interval_time</i>	10

## Platforms Supported

OmniSwitch 6900; **qsp** parameter only supported for default QSP 1, cannot assign additional QSPs.  
OmniSwitch 10k; **qos qsi qsp** command not supported (use the **qos qsi** command instead).

## Usage Guidelines

- There is only one QSI per port or LAG ID and only one QSP associated with the QSI. The QSP imports the WRED profile (WRP) that is applied to the QSet.
- Changing the WRED profile or statistics collection status for a QSI, changes the status only for the port or link aggregate to which the QSI is associated.
- A QSI hierarchy exists consisting of parent/child relationships. For example, all member ports of a link aggregate will import the QSI/QSP settings of the parent link aggregate. When a member port moves out of the link aggregate, the QSI/QSP settings for that port are reset to the default settings.
- The number of children supported for a LAG ID is 8.

## Examples

```
-> qos qsi port 1/2 qsp 1 stats admin-state enable
-> qos qsi port 2/1-10 qsp 1 wred admin-state disable stats admin-state enable
-> qos qsi slot 3 qsp 1 wred admin-state disable
-> qos qsi linkagg 10 qsp 1 wred admin-state enable stats interval 120
```

## Release History

Release 7.1.1; command not supported.

## Related Commands

<b>qos qsp</b>	Configures a queue set profile.
<b>show qos qsi</b>	Displays the QSet instance configuration.
<b>show qos qsi stats</b>	Displays statistics for one or more QSet instances.

## MIB Objects

```
alcatelIND1VfcMIB  
alaVfcQsetInstanceTable  
    alaVfcQsetQSPID  
    alaVfcQsetQSPName  
    alaVfcQsetWRPAdminState  
    alaVfcQsetStatsAdmin  
    alaVfcQsetStatsInterval
```

---

## show qos port

Displays information about all QoS ports or a particular port.

**show qos port** [*slot/port*] [*statistics*]

---

### Syntax Definitions

*slot/port*                      The physical slot and port number. For example: 3/1.

**statistics**                      Displays statistics for high-density gigabit modules.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Information for all ports is displayed unless a particular port is specified.
- Use the **qos port** command to configure port parameters.
- For ports that are trusted (**Yes** displays in the Trust field), the Trust field includes one of the following characters:

character	definition
+	Indicates that the port is manually configured as trusted through the <b>qos port trusted</b> command; the port setting takes precedence over the global trust setting configured through the <b>qos trust ports</b> command.
*	Indicates that the port is automatically trusted regardless of the global setting set through the <b>qos trust ports</b> command. (Applies to mobile ports and ports configured for 802.1Q.)

### Examples

```
-> show qos port
Slot/      Default   Default   Bandwidth
Port  Active Trust P/DSCP  Classification  Physical  Ingress  Egress  Type
1/1    No    No    0/ 0    DSCP          0K        -    -    ethernet
1/2    Yes   No    0/ 0    DSCP          1.00G     -    -    ethernet-1G
1/3    No    No    0/ 0    DSCP          0K        -    -    ethernet
1/4    No    No    0/ 0    DSCP          0K        -    -    ethernet
1/5    No    No    0/ 0    DSCP          0K        -    -    ethernet
1/6    No    No    0/ 0    DSCP          0K        -    -    ethernet
1/7    No    No    0/ 0    DSCP          0K        -    -    ethernet
1/8    No    No    0/ 0    DSCP          0K        -    -    ethernet
1/9    No    No    0/ 0    DSCP          0K        -    -    ethernet
1/10   No    No    0/ 0    DSCP          0K        50K  -    ethernet
1/11   No    *Yes  0/ 0    *802.1P       0K        -    -    ethernet
1/12   No    *Yes  0/ 0    *802.1P       0K        -    -    ethernet
```

```
-> show qos port 4/2
Slot/           Default   Default           Bandwidth
Port  Active Trust  P/DSCP Classification  Physical Ingress Egress  Type
4/2   Yes   No   0/ 0           DSCP           1.00G         -     -   ethernet-1G
```

### output definitions

---

<b>Slot/Port</b>	The slot and physical port number.
<b>Active</b>	Whether or not the port is sending/receiving QoS traffic.
<b>Trust</b>	Whether the port is trusted or not trusted. Configured through the <b>qos port trusted</b> command.
<b>Default P</b>	The default 802.1p setting for the port. Configured through the <b>qos port default 802.1p</b> command.
<b>Default DSCP</b>	The default ToS/DSCP setting for the port. Configured through the <b>qos port default dscp</b> command.
<b>Default Classification</b>	The default classification setting for the port ( <b>802.1p</b> , <b>ToS</b> , or <b>DSCP</b> ). Configured through the <b>qos port default classification</b> command.
<b>Physical Bandwidth</b>	The amount of physical bandwidth available on the port.
<b>Ingress Bandwidth</b>	The amount of ingress bandwidth configured for the port. Configured through the <b>qos port maximum ingress-bandwidth</b> command.
<b>Egress Bandwidth</b>	The amount of egress bandwidth configured for the port. Configured through the <b>qos port maximum egress-bandwidth</b> command.
<b>Type</b>	The interface type, <b>ethernet</b> or <b>wan</b> .

---

### Release History

```

---

## show qos slice

Displays rule availability and usage information for QoS slices of QoS slots. A *slice* is a logical section of hardware and corresponds to particular ports on the interface.

**show qos slice** [*slot/slice*]

---

### Syntax Definitions

*slot/slice* The slot number and slice for which you want to view information. The number of slices per module varies depending on the type of module.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Information for all slots/slices is displayed unless a particular slot/slice is requested.
- This command is useful for monitoring switch resources required for policy rules.

### Examples

```
-> show qos slice
Slot/      Ranges      Rules      Counters      Meters
Slice      Type  Total/Free  CAM  Total/Free    Total/Free    Total/Free
  3/0  Triumph2   16/16      0   128/101      128/101      64/64
        1     128/125      1   128/125      128/125      64/64
        2     128/0        2   128/0        128/0        64/64
        3     128/0        3   128/0        128/0        64/64
        4     128/0        4   128/0        128/0        64/64

### output definitions

---

<b>Slot/Slice</b>	The slot and slice number.
<b>Type</b>	The type of slice.
<b>Ranges Total</b>	The total number of TCP/UDP port ranges supported per slot/slice.

---

*output definitions (continued)*

---

<b>Ranges Free</b>	The number of TCP/UDP port ranges that are still available for use.
<b>CAM</b>	The CAM number.
<b>Rules Total</b>	The total number of rules supported per CAM.
<b>Rules Free</b>	The number of rules that are still available for use. On startup, the switch uses 27 rules.
<b>Counters Total</b>	The total number of counters supported per CAM.
<b>Counter Free</b>	The number of counters that are still available for use.
<b>Meters Total</b>	The total number of meters supported per CAM.
<b>Meters Free</b>	The number of meters that are still available for use.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands****[policy rule](#)**

Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

**MIB Objects**

N/A

---

## show qos log

Displays the log of QoS events.

**show qos log**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use this command to display the current QoS log. To clear the log, use the **qos clear log** command.

### Examples

```
-> show qos log
**QOS Log**
Insert rule 0
Rule index at 0
Insert rule 1
Rule index at 1
Insert rule 2
Rule index at 2
Enable rule r1 (1) 1,1
Enable rule r2 (0) 1,1
Enable rule yuba1 (2) 1,1
Verify rule r1(1)
Enable rule r1 (1) 1,1
Really enable r1
Update condition c1 for rule 1 (1)
Verify rule r2(1)
Enable rule r2 (0) 1,1
Really enable r2
Update condition c2 for rule 0 (1)
Verify rule yuba1(1)
Enable rule yuba1 (2) 1,1
Really enable yuba1
Update condition yubamac for rule 2 (1)
QoS Manager started TUE MAR 10 13:46:50 2002

Match rule 2 to 1
Match rule 2 to 2
Match rule 2 to 3
```

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

[qos clear log](#)

Clears messages in the current QoS log.

[qos log lines](#)

Configures the number of lines in the QoS log.

**MIB Objects**

N/A

---

## show qos config

Displays global information about the QoS configuration.

**show qos config**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use this command to view the current global configuration for QoS. Use the **show qos statistics** command to view statistics about the QoS software in the switch.

### Examples

```
-> show qos config
QoS Configuration,
  Admin                               = enable,
  Trust ports                          = no,
  Phones                               = trusted,
  Log lines                             = 10240,
  Log level                             = 5,
  Log console                           = no,
  Forward log                           = no,
  Stats interval                        = 5,
  User-port filter                       = spoof,
  User-port shutdown                    = none,
  Debug                                 = info,
  Pending changes                       = port
```

### *output definitions*

---

<b>Admin</b>	Whether or not QoS is enabled or disabled. Configured through the <b>qos</b> command.
<b>Trust Ports</b>	The default trusted mode for switch ports. Configured through the <b>qos trust ports</b> command.
<b>Phones</b>	Whether or not IP Phone traffic is automatically trusted or assigned a priority value. Configured through the <b>qos phones</b> command.
<b>Log lines</b>	The number of lines included in the QoS log. Configured through the <b>qos log lines</b> command.
<b>Log level</b>	The level of log detail. Configured through the <b>qos log level</b> command.

*output definitions (continued)*

---

<b>Log console</b>	Whether or not log messages are sent to the console. Configured through the <b>qos log console</b> command.
<b>Forward log</b>	Whether or not logged events are sent to the policy server software in the switch in real time. Configured through the <b>qos forward log</b> command.
<b>Stats interval</b>	How often the switch polls network interfaces for statistics about QoS events. Configured through the <b>qos stats interval</b> command.
<b>User-port filter</b>	The type of traffic that is filtered on ports that are members of the UserPorts group. Configured through the <b>qos user-port</b> command.
<b>User-port shutdown</b>	The type of traffic that will trigger an administrative shutdown of the port if the port is a member of the UserPorts group. Configured through the <b>qos user-port</b> command.
<b>Debug</b>	The type of information that will be displayed in the QoS log. A value of <b>info</b> indicates the default debugging type.
<b>Pending changes</b>	QoS changes not yet applied to the configuration.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>qos</b>	Enables or disables QoS. This base command may be used with keyword options to configure QoS globally on the switch.
<b>show qos statistics</b>	Displays statistics about the QoS configuration.

**MIB Objects**

## show qos statistics

Displays statistics about the QoS configuration.

**show qos statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays statistics about the global QoS configuration. Use the **show qos config** command to display information about configurable global parameters.

### Examples

```
-> show qos statistics
QoS stats
```

	Events	Matches	Drops
L2	15	0	0
L3 Inbound	0	0	0
L3 Outbound	0	0	0
IGMP Join	0	0	0
Fragments	: 0		
Bad Fragments	: 0		
Unknown Fragments	: 0		
Sent NI messages	: 9		
Received NI messages	: 4322		
Failed NI messages	: 0		
Load balanced flows	: 0		
Reflexive flows	: 0		
Reflexive correction	: 0		
Flow lookups	: 0		
Flow hits	: 0		
Max PTree nodes	: 0		
Max PTree depth	: 0		
Spoofed Events	: 0		
NonSpoofed Events	: 0		
DropServices	: 0		

#### *output definitions*

---

<b>Events</b>	The number of Layer 2 or Layer 3 flows transmitted on the switch.
<b>Matches</b>	The number of Layer 2 or Layer 3 flows that match policies.

*output definitions (continued)*

---

<b>Drops</b>	The number of Layer 2 or Layer 3 flows that were dropped.
<b>L2</b>	The number of Layer 2 events, matches, and drops.
<b>L3 Ingress</b>	The number of Layer 3 ingress events, matches, and drops.
<b>L3 Egress</b>	The number of Layer 3 egress events, matches, and drops.
<b>IGMP join</b>	The number of multicast events, matches, and drops.
<b>Fragments</b>	The number of fragments dropped.
<b>Bad Fragments</b>	The number of fragments received with an offset of 1.
<b>Unknown Fragments</b>	The number of out-of-order fragments received.
<b>Sent NI messages</b>	The number of messages sent to network interfaces.
<b>Received NI messages</b>	The number of messages received by network interfaces.
<b>Failed NI messages</b>	The number of failed message attempts to network interfaces.
<b>Load balanced flows</b>	The number of Server Load Balance flow entries.
<b>Reflexive flows</b>	The number of reflexive flows.
<b>Reflexive correction</b>	The number of reflexive flow corrections.
<b>Flow lookups</b>	The number of flow table lookups.
<b>Flow hits</b>	The number of flow table lookup hits.
<b>Max PTree nodes</b>	The highest number of nodes in the classifier tree.
<b>Max Ptree depth</b>	The length of the longest path in the classifier tree.
<b>Spoofed Events</b>	The number of spoofed events.
<b>Nonspoofed Events</b>	The number of nonspoofed events.
<b>DropServices</b>	The number of TCP/UDP flows dropped.

---

## show qos wred

Displays the Weighted Random Early Detection (WRED) profile (WRP) configuration for the switch.

```
show qos wred [wrp-id wrp_id | wrp-name name] [detail [port slot/port[-port]] | slot slot | linkagg
agg_id[-agg_id]]
```

---

### Syntax Definitions

<i>wrp_id</i>	A WRED profile (WRP) ID number. The valid range is 2–16.
<i>wrp_name</i>	A WRED profile name.
<b>detail</b>	Displays WRED profile configuration details for a port, slot, or link aggregate.
<i>slot/port[-port]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>slot</i>	A slot number. Displays information for all ports on the slot.
<i>agg_id[-agg_id]</i>	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

### Defaults

By default, displays all the WRED drop profiles in the switch configuration.

### Platforms Supported

OmniSwitch 10k

OmniSwitch 6900; **show qos wred** command not supported (use the **show qos wrp** command instead).

### Usage Guidelines

- Use the **wrp-id** *wrp\_id* and **wrp-name** *name* parameters to display information for a specific profile.
- Use the **detail** parameter to display additional profile information, such as the profile configuration associated with queues and ports.
- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg\_id* parameters to display profile information associated with specific ports or link aggregates. These parameters are used in combination with the **detail** parameter.

### Examples

```
-> show qos wred
WRP 1 (wrp-1)
  Admin: Ena, #Ports: 480, MTU: 1540
  Red
    Min-Th: 20, Max-Th: 90, Max-Pb: 36, Gain: 9
  Yellow
    Min-Th: 30, Max-Th: 90, Max-Pb: 30, Gain: 9
  Green
    Min-Th: 40, Max-Th: 90, Max-Pb: 24, Gain: 9
```

*output definitions*

---

<b>WRP</b>	The WRED profile (WRP) ID number and name.
<b>Admin</b>	The administrative state of the profile.
<b>#Ports</b>	The number of ports to which this profile is attached.
<b>MTU</b>	The MTU size.
<b>Min-Th</b>	The minimum queue threshold percentage for red, green, and yellow packets.
<b>Max-Th</b>	The maximum queue threshold percentage for red, green, and yellow packets.
<b>Max-Pb</b>	The maximum drop probability percentage for red, green, and yellow packets.
<b>Gain</b>	The gain value to smooth out the queue (1–15).

---

```
-> show qos wred detail port 1/1
Port 1/1
  QSAP: 1, Parent: 1, Admin: Ena,
  WRP: 1, Name: wrp-1, Admin: Dis

      QI 8
        WRP: 1, Name: wrp-1, Admin: Dis
```

*output definitions*

---

<b>Port</b>	The physical slot and port number (or link aggregate ID for a logical port).
<b>QSAP</b>	The QSet attachment point (QSAP). This is a logical entity used internally by the switch to identify the association between a QSet instance and a port or link aggregate. The QSAP is not configurable at this time.
<b>Parent</b>	The QSAP ID for the parent QSAP, if any.
<b>Admin</b>	The administrative status of the QSAP.
<b>WRP Name Admin</b>	The WRED profile (WRP) ID number, name, and administrative status.
<b>QSI</b>	The QSet instance (QSI) ID number.
<b>QSP</b>	The QSet profile (QSP) ID number.

*output definitions (continued)*

---

<b>Name</b>	The QSP name.
<b>QI 1...8</b>	The WRP information for each of the QSet queues.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>qos wred</b>	Configures a WRED profile.

## show qos qset

Displays the QSet profile (QSP) configuration for the switch.

```
show qos qset [qsp-id qsp_id | qsp-name qsp_name] [detail [port slot/port[-port]] | slot slot | linkagg
agg_id[-agg_id]]
```

---

### Syntax Definitions

<i>qsp_id</i>	A QSet profile (QSP) ID number. The valid range is 1–4.
<i>qsp_name</i>	A QSP profile name.
<b>detail</b>	Displays QSP configuration details for a port, slot, or link aggregate.
<i>slot/port</i> [- <i>port</i> ]	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>slot</i>	A slot number. Displays information for all ports on the slot.
<i>agg_id</i> [- <i>agg_id</i> ]	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

### Defaults

By default, displays the configuration for all four of the QSet profiles (QSP 1–4).

### Platforms Supported

OmniSwitch 10k

OmniSwitch 6900; **show qos qset** command not supported (use the **show qos qsp** command instead).

### Usage Guidelines

- Use the **qsp-id** *qsp\_id* and **qsp-name** *qsp\_name* parameters to display information for a specific profile.
- Use the **detail** parameter to display additional profile information for all ports and link aggregates in the switch.
- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg\_id* parameters to display profile information associated with specific ports or link aggregates. These parameters are used in combination with the **detail** parameter.

---

<b>QSP</b>	The QSet profile (QSP) ID number and name.
<b>#Ports</b>	The number of ports to which this profile is attached.
<b>#Queues</b>	The number of queues associated with this QSet. Currently there are eight queues for each QSet.
<b>BW%</b>	The bandwidth percentage for the QSet. The bandwidth is shared between all the queues.
<b>Type</b>	Whether the QSP is static or dynamic. Currently there are 4 pre-defined, static profiles (QSP 1–4). User-configured, dynamic profiles are not supported at this time.
<b>WRP</b>	The WRED profile (WRP) ID number associated with the QSet.
<b>Name</b>	The WRP name.
<b>Admin</b>	The administrative status of the WRP for this QSP.
<b>Scheduler</b>	The type of scheduler, such as queue specific priority (Qspec) or strict priority.
<b>Stats-Admin</b>	The administrative status of statistics collection for the WRP.
<b>QP 1...8</b>	The queue profile configuration for each QSet queue. The configuration for each of the individual queue profiles is defined by the QSP in use. For example, QSP 1 applies a different queue configuration than QSP 2, 3, or 4.

### output definitions

<b>QSAP Port</b>	The port number or link aggregate ID for the QSet attachment point (QSAP). A QSAP is a logical entity generated internally by the switch to identify the association between a QSet instance and a port or link aggregate. The QSAP is not configurable at this time.
<b>QSAP Type</b>	The type of QSAP port; Phy = physical (slot/port), Log = logical (link-agg ID).
<b>dQSI</b>	The default QSet instance (dQSI) ID number. This number is generated internally by the switch to identify the QSI that is automatically assigned to each port and link aggregate.
<b>ID</b>	The QSet profile (QSP) ID number.
<b>Name</b>	The QSP name.
<b>QSAP Parent</b>	The QSAP parent ID number.
<b>Admin</b>	The administrative state of the QSet.
<b>Oper</b>	The operational state of the QSet.
<b>BW (%) Admin</b>	The administrative bandwidth percentage for the QSet. The admin percentage is not configurable at this time.
<b>BW (Mbps)Oper</b>	The operational bandwidth value, which is based on port speed.
<b>Type</b>	Whether the QSet profile is a default profile (D = default templates 1–4) or a custom profile (C = user-configured 5–8). Configuring a custom profile is not supported at this time.

### Release History

Release 7.1.1; command was introduced.

## show qos qsp

Displays the QSet profile (QSP) configuration for the switch.

**show qos qsp** [*qsp\_id* | *qsp\_name*] [**detail** [**port** *slot/port*[-*port*]] | **slot** *slot* | **linkagg** *agg\_id*[-*agg\_id*]]

---

### Syntax Definitions

<i>qsp_id</i>	A QSet profile (QSP) ID number. The valid range is 1–4.
<i>qsp_name</i>	A QSP profile name.
<b>detail</b>	Displays QSP configuration details for a port, slot, or link aggregate.
<i>slot/port</i> [- <i>port</i> ]	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>slot</i>	A slot number. Displays information for all ports on the slot.
<i>agg_id</i> [- <i>agg_id</i> ]	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).

### Defaults

By default, displays the configuration for all four of the QSet profiles (QSP 1–4).

### Platforms Supported

OmniSwitch 6900

OmniSwitch 10k; **show qos qsp** command not supported (use the **show qos qset** command instead).

### Usage Guidelines

- Use the *qse\_id* or the *qsp\_name* parameter to display information for a specific profile.
- Use the **detail** parameter to display additional profile information for all ports and link aggregates.
- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg\_id* parameters to display profile information associated with specific ports or link aggregates. These parameters are used in combination with the **detail** parameter.

## show qos qsi

Displays the QSet instance (QSI) configuration for the switch. A QSI is a logical set of eight virtual output queues (OmniSwitch 10k) or eight egress queues (OmniSwitch 6900) associated with each port and link aggregate (LAG) ID.

**show qos qsi** [**port** *slot/port*[-*port*] | **slot** *slot* | **linkagg** *agg\_id*[-*agg\_id*]] [**detail**]

---

### Syntax Definitions

<i>slot/port</i> [- <i>port</i> ]	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>slot</i>	A slot number. Displays information for all ports on the slot.
<i>agg_id</i> [- <i>agg_id</i> ]	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
<b>detail</b>	Displays additional queue information for the instance.

### Defaults

By default, displays the entire QSI configuration for the switch.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg\_id* parameters to display the QSI information associated with specific ports or link aggregates.
- Use the **detail** parameter to display additional profile information, such as the profile configuration associated with queues and ports.

### Examples

The following example shows an output display of the **show qos qsi** command on an OmniSwitch 10k:

```
-> show qos qsi port 1/1

*output definitions*

---

<b>QSAP</b>	The QSet attachment point (QSAP) ID number. This is a logical entity generated internally by the switch to identify the association between a QSet instance and a port or link aggregate. The QSAP is not configurable at this time.
<b>Parent</b>	The parent QSAP ID. If the parent ID is different than the QSAP ID, then the port is a member of a link aggregate.
<b>Admin</b>	The administrative status of the QSAP.
<b>QSI</b>	The QSet instance (QSI) ID number, internally generated by the switch.
<b>QSP, Name, Type</b>	The QSet profile (QSP) ID number and name associated with the QSI. Configured through the <b>qos qsi</b> command. Also indicates the type of QSP, which is one of the pre-defined, default profiles (QSP 1–4) currently supported. User-configured, dynamic profiles are not supported at this time.
<b>WRP, Name, Admin, Oper</b>	The WRED profile (WRP) ID number associated with the QSet profile that is assigned to the QSI. Configured through the <b>qos qset</b> command. Also indicates the administrative and operational status of the WRP for the QSI. The WRP administrative status for the QSI is configured through the <b>qos qsi</b> command.
<b>Scheduler</b>	The scheduling method used, such as queue specific priority (Qspec) or strict priority.
<b>Stats-Admin, Stats-Oper</b>	The administrative and operational status of statistics collection for this QSI. The administrative status of statistics collection for the QSI is configured through the <b>qos qsi</b> command.
<b>BW Admin (%)</b>	The administrative percentage of bandwidth (currently not user-configurable).
<b>BW Oper (Mbps)</b>	The operational amount of bandwidth as determined by the port speed. For a link aggregate, this value is the sum of the operational bandwidths for the member ports.
<b>QI 1–8</b>	The queue scheduling and bandwidth configuration for each QSI queue. These values are determined by which one of the four QSet profiles (QSP 1–4) is associated with the QSI.

---

The following example shows an output display of the **show qos qsi** command on an OmniSwitch 6900:

```
-> show qos qsi port 1/10
Port 1/10
  QSAP:  Port 1/10, Parent:  Port 1/10

## show qos qsi stats

Displays the total number of packets that flow through the QSet instance (QSI) queues associated with the specified port or link aggregate.

**show qos qsi** [**port** *slot/port[-port]* | **slot** *slot* | **linkagg** *agg\_id[-agg\_id]*] [**qi-id** *qi\_id* | **qi** *qi\_id*] **stats**

---

### Syntax Definitions

<i>slot/port[-port]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>slot</i>	A slot number. Displays information for all ports on the slot.
<i>agg_id[-agg_id]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-15).
<b>qi-id</b> <i>qi_id</i>	The queue instance (QI) ID number. The valid range is 1–8. This parameter is supported only on the OmniSwitch 10k.
<b>qi</b> <i>qi_id</i>	The queue instance (QI) ID number. The valid range is 1–8. This parameter is supported only on the OmniSwitch 6900.

### Defaults

By default, displays statistics for all QSet instances.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg\_id* parameters to display QSI statistics associated with specific ports or link aggregates.
- Use the **qi-id** *qi\_id* or **qi** *qi\_id* parameter to display statistics for a specific queue instance. There are eight queues associated with a single QSet instance. Each port and link aggregate is associated with one QSet instance.

### Examples

The following example shows an output display of the **show qos qsi stats** command on an OmniSwitch 10k:

```
-> show qos qsi port 1/1 stats

### *output definitions*

<b>QSAP</b>	The QSet attachment point (QSAP) ID number. This is a logical entity generated internally by the switch to identify the association between a QSet instance and a port or link aggregate. The QSAP is not configurable at this time.
<b>Parent</b>	The parent QSAP ID. If the parent ID is different than the QSAP ID, then the port is a member of a link aggregate.
<b>Admin</b>	The administrative status of the QSAP.
<b>QSI</b>	The QSet instance (QSI) ID number, internally generated by the switch.

*output definitions (continued)*

<b>QSP, Name, Type</b>	The QSet profile (QSP) ID number and name associated with the QSI. Configured through the <b>qos qsi</b> command. Also indicates the type of QSP, which is one of the pre-defined, default profiles (QSP 1–4) currently supported. User-configured, dynamic profiles are not supported at this time.
<b>WRP, Name, Admin, Oper</b>	The WRED profile (WRP) ID number associated with the QSet profile that is assigned to the QSI. Configured through the <b>qos qset</b> command. Also indicates the administrative and operational status of the WRP for the QSI. The WRP administrative status for the QSI is configured through the <b>qos qsi</b> command.
<b>BW Admin (%)</b>	The administrative percentage of bandwidth (currently not user-configurable).
<b>BW Oper (Mbps)</b>	The operational amount of bandwidth as determined by the port speed. For a link aggregate, this value is the sum of the operational bandwidths for the member ports.
<b>QI 1–8</b>	The queue profile configuration for each QSet queue.
<b>Scheduler</b>	Displays egress scheduler statistics. For a physical port, these totals are the sum of all queue statistics for the port. For a link aggregate, these totals are the sum of all member port statistics.
<b>Green Yellow Red</b>	Displays WRED packet statistics. For a physical port, these totals are the sum of all queue statistics for the port. For a link aggregate, these total are the sum of all member port statistics.

The following example shows an output display of the **show qos qsi stats** command on the OmniSwitch 6900:

```
-> show qos qsi port 1/7 stats
```

Port	Q	Total Tx	Total Drop
1/7	1	1566	0
1/7	2	24327553388	22977758468
1/7	3	0	0
1/7	4	0	0
1/7	5	0	0
1/7	6	40954875698	0
1/7	7	16	0
1/7	8	307882	0

```
-> show qos qsi port 1/7 qi 2 stats
```

Port	Q	Total Tx	Total Drop
1/7	2	24327553388	22977758468

*output definitions*

<b>Port</b>	The switch port.
<b>QI</b>	The egress queue ID (1–8) associated with the port.
<b>Total TX</b>	The total number of packets transmitted.
<b>Total Drop</b>	The total number of packets dropped.

## Release History

Release 7.1.1; command was introduced.

Release 7.2.1; output display modified for the OmniSwitch 6900

## Related Commands

<b>show qos qsi</b>	Displays the QSet instance configuration.
<b>show qos qsi stats rate</b>	Displays the number of packets per second that flow through the QSI queues. Supported only on the OmniSwitch 6900.
<b>show qos qsi stats bytes</b>	Displays the total number of bytes that flow through the QSI queues. Supported only on the OmniSwitch 6900.
<b>clear qos qsi stats</b>	Clears statistics collected for one or more QSet instances.

## show qos qsi stats rate

Displays the number of packets per second that flow through the QSet instance (QSI) queues.

```
show qos qsi {port slot/port[-port] | slot slot | linkagg agg_id[-agg_id]} [qi qi_id] stats rate [bytes]
```

---

### Syntax Definitions

<i>slot/port[-port]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>slot</i>	A slot number. Displays information for all ports on the slot.
<i>agg_id[-agg_id]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-15).
<b>qi</b> <i>qi_id</i>	The queue instance (QI) ID number. The valid range is 1–8.
<b>bytes</b>	Displays the number of bytes per second, instead of the number of packets per second.

### Defaults

By default, displays the number of packets per second for all the QSI queues.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg\_id* parameters to display QSI statistics associated with specific ports or link aggregates.
- Use the **qi** *qi-id* parameter to display statistics for a specific queue instance. There are eight queues associated with a single QSet instance. Each port and link aggregate is associated with one QSet instance.

### Examples

```
-> show qos qsi port 1/7 stats rate
```

Port	Q	Average Tx/s	Average Drop/s
1/7	1	0	0
1/7	2	8956	3177031
1/7	3	0	0
1/7	4	0	0
1/7	5	0	0
1/7	6	3186422	0
1/7	7	0	0
1/7	8	1	0

```

-> show qos qsi port 1/1 qi 2 stats rate
      Port          Q          Average          Average
      Port          Q          Tx/s          Drop/s
-----+-----+-----+-----+
1/7          2          8956          3177031

-> show qos qsi port 1/7 stats rate bytes
      Port          Q          Average          Average
      Port          Q          Tx/s          Drop/s
-----+-----+-----+-----+
1/7          1          0          0
1/7          2          3254839          1151070600
1/7          3          0          0
1/7          4          0          0
1/7          5          0          0
1/7          6          1154619451          0
1/7          7          0          0
1/7          8          349          0

-> show qos qsi port 1/7 qi 2 stats rate bytes
      Port          Q          Average          Average
      Port          Q          Tx/s          Drop/s
-----+-----+-----+-----+
1/7          2          3254839          1151070600

```

**output definitions**

---

<b>Port</b>	The switch port.
<b>QI</b>	The egress queue ID (1–8) associated with the port.
<b>Total TX</b>	The number of packets or bytes transmitted per second.
<b>Total Drop</b>	The number of packets or bytes dropped per second.

---

**Release History**

Release 7.2.1; command was introduced

## show qos qsi stats bytes

Displays the total number of bytes that flow through the QSet instance (QSI) queues.

**show qos qsi** {*port slot/port[-port]* | *slot slot* | *linkagg agg\_id[-agg\_id]*} [*qi qi\_id*] **stats bytes**

---

### Syntax Definitions

<i>slot/port[-port]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>slot</i>	A slot number. Displays information for all ports on the slot.
<i>agg_id[-agg_id]</i>	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-15).
<i>qi qi_id</i>	The queue instance (QI) ID number. The valid range is 1–8.

### Defaults

By default, displays the total number of bytes for each of the QSI queues.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg\_id* parameters to display QSI statistics associated with specific ports or link aggregates.
- Use the **qi** *qi-id* parameter to display statistics for a specific queue. There are eight queues associated with each QSet instance. Each port and link aggregate is associated with one QSet instance.

### Examples

```
-> show qos qsi port 1/7 stats bytes
```

Port	Q	Total Tx	Total Drop
1/7	1	389250	0
1/7	2	8803326761200	8467375458000
1/7	3	0	0
1/7	4	0	0
1/7	5	0	0
1/7	6	14972813873924	0
1/7	7	1072	0

## show qos qsi wred-stats

Displays the Weighted Random Early Detection (WRED) statistics for the QSet instance.

**show qos qsi** {port *slot/port*[-*port*] | slot *slot* | linkagg *agg\_id*[-*agg\_id*]} **wred-stats** [*rate* | *bytes*]

---

### Syntax Definitions

<i>slot/port</i> [- <i>port</i> ]	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>slot</i>	A slot number. Displays information for all ports on the slot.
<i>agg_id</i> [- <i>agg_id</i> ]	The link aggregate ID number. Use a hyphen to specify a range of IDs (10-15).
<b>rate</b>	Displays the number of packets per second.
<b>bytes</b>	Displays the total number of bytes.

### Defaults

By default, displays the total number of packets for all the QSI queues.

### Platforms Supported

OmniSwitch 6900; **show qos qsi wred-stats** command not supported in the 7.2.1.R01 release.

### Usage Guidelines

- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg\_id* parameters to display QSI statistics associated with specific ports or link aggregates.
- This command displays the total number of packets or bytes.

### Examples

```
-> show qos qsi port 1/2 wred-stats
* OS6900 WRED Per Q stats not supported, Tx stats not supported
      Green          Yellow          Red
Port   Q Drop          Drop          Drop
-----+-----+-----+-----+-----+-----+-----+-----
Port 1/2  - 0              0              0

-> show qos qsi port 1/1 qi 3 wred-stats
PPort   Q Green          Green          Yellow          Yellow          Red          Red
        TX          Drop          TX          Drop          TX          Drop
-----+-----+-----+-----+-----+-----+-----+-----
Port 1/1 3 0              0              0              0              0              0

-> show qos qsi port 1/1 wred-stats rate

## clear qos qsi stats

Clears QSet instance (QSI) statistics.

**clear qos qsi [port slot/port[-port] | slot slot | linkagg agg\_id[-agg\_id]] [qi-id qi\_id] stats**

---

### Syntax Definitions

<i>slot/port[-port]</i>	A physical slot and port number. Use a hyphen to specify a range of ports (1/5-10).
<i>slot</i>	A slot number. Displays information for all ports on the slot.
<i>agg_id[-agg_id]</i>	The link aggregate ID. Use a hyphen to specify a range of IDs (10-15).
<i>qi-id</i>	The queue instance (QI) ID number. The valid range is 1–8.

### Defaults

By default, clears statistics for all QSIs.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **port** *slot/port*, **slot** *slot*, and **linkagg** *agg\_id* parameters to clear QSI statistics associated with specific ports or link aggregates.
- Use the **qi-id** *qi\_id* parameter to clear statistics for a specific queue instance. There are eight queues associated with a single QSet instance.

### Examples

```
-> clear qos qsi port 1/2 qi-id 3 stats
-> clear qos qsi linkagg 10 stats
-> clear qos qsi linkagg 5 qi-id 8 stats
-> clear qos qsi slot 2 stats
```

### Release History

# 28 QoS Policy Commands

This chapter describes CLI commands used for policy management in the switch. The Quality of Service (QoS) software in the switch uses policy rules for classifying incoming flows and deciding how to treat outgoing flows. A policy rule is made up of a policy condition and a policy action. Policy rules may be created on the switch through CLI or SNMP commands, or they may be created through the PolicyView GUI application on an attached LDAP server.

---

**Note.** Rules created through PolicyView cannot be modified through the CLI; however, you can create policies in the CLI that take precedence over policies created through PolicyView.

---

Refer to [Chapter 43, “QoS Commands,”](#) for information about commands used to configure QoS software.

MIB information for the QoS policy commands is as follows:

*Filename:* alcatelIND1Qos.mib  
*Module* ALCATEL-IND1-QoS-MIB

---

**Important Note.** Some of the commands listed here are not currently supported on one or more platforms. See command descriptions in this chapter and check release notes for information about commands that are not supported.

---

The QoS Policy commands are listed here:

---

**Action commands**

**policy action**  
**policy action disposition**  
**policy action shared**  
**policy action priority**  
**policy action maximum bandwidth**  
**policy action maximum depth**  
**policy action cir**  
**policy action cpu priority**  
**policy action tos**  
**policy action 802.1p**  
**policy action dscp**  
**policy action map**  
**policy action permanent gateway-ip**  
**policy action port-disable**  
**policy action redirect port**  
**policy action redirect linkagg**  
**policy action no-cache**  
**policy action mirror**

---

Types of policies are generally determined by the kind of traffic they classify (policy conditions) and how the policy is enforced (policy actions). Commands used for particular types of policies are listed here. See the *OmniSwitch AOS Release 7 Network Configuration Guide* for more information about creating these types of policies and information about valid condition/action combinations.

<b>Access Control Lists</b>	<b>policy condition</b> <b>policy action disposition</b> <b>policy rule</b>
<b>Traffic prioritization/shaping</b>	<b>policy action shared</b> <b>policy action priority</b> <b>policy action maximum bandwidth</b> <b>policy rule</b>
<b>802.1p/ToS/DSCP tagging or mapping</b>	<b>policy condition tos</b> <b>policy condition dscp</b> <b>policy condition 802.1p</b> <b>policy action tos</b> <b>policy action 802.1p</b> <b>policy action dscp</b> <b>policy action map</b> <b>policy rule</b>
<b>Network Address Translation (NAT)</b>	<b>policy condition source ip</b> <b>policy condition source ipv6</b> <b>policy rule</b>
<b>Policy based port mirroring</b>	<b>policy action mirror</b>
<b>VLAN Stacking</b>	<b>policy condition inner source-vlan</b> <b>policy condition inner 802.1p</b>

## policy rule

Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

**policy rule** *rule\_name* [**enable** | **disable**] [**precedence** *precedence*] [**condition** *condition*] [**action** *action*] [**validity-period** *name*] [**save**] [**log** [**log-interval** *seconds*]] [**count** {**packets** | **bytes**}] [**trap**] [**default-list**]

**policy rule** *rule\_name* **no** {**validity-period** | **save** | **log** | **trap** | **default-list**}

**no policy rule** *rule\_name*

---

### Syntax Definitions

<i>rule_name</i>	The name of the policy rule, any alphanumeric string.
<b>enable</b>	Enables the policy rule.
<b>disable</b>	Disables the policy rule.
<i>precedence</i>	The precedence value in the range 0–65535. This value determines the order in which rules are searched for a matching condition. A higher number indicates higher precedence. Typically the range 30000–65535 is reserved for PolicyView.
<i>condition</i>	The condition name that is associated with this rule. Conditions are configured through the <b>policy condition</b> command.
<i>action</i>	The name of the action that is associated with this rule. Actions are configured through the <b>policy action</b> command.
<i>name</i>	The name of a user-defined validity period that is associated with this rule. Validity periods are configured through the <b>policy validity period</b> command.
<b>save</b>	Marks the policy rule so that it may be captured as part of the switch configuration.
<b>log</b>	Configures the switch to log messages about specific flows coming into the switch that match this policy rule.
<i>seconds</i>	Configures how often to look for packets that match this policy rule when rule logging is applied (in the range from 0–3600 seconds). A value of 0 specifies to log as often as possible.
<b>packets</b>	Counts the number of packets that match the rule.
<b>bytes</b>	Counts the number of bytes that match the rule.
<b>trap</b>	Enables or disables traps for the rule.
<b>default-list</b>	Adds the rule to the QoS default policy list.

## Defaults

parameter	default
<b>enable   disable</b>	enable
<i>precedence</i>	0
<b>log</b>	no
<i>seconds</i>	60
<b>packets   bytes</b>	packets
<b>trap</b>	enable
<b>default-list</b>	adds rule to the default list

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Any rule configured through this command is not active on the switch until the **qos apply** command is issued.
- A policy rule configured through the PolicyView application may not be edited in the CLI. You may, however, create a rule using the CLI with a higher precedence that will override a rule created through PolicyView.
- Use the **no** form of the command to remove the rule from the configuration or to remove parameters from a particular rule. The change will not take effect, however, until the **qos apply** command is issued.
- Only one validity period is associated with a policy rule. Each time this command is entered with a validity period name specified, the existing period name is overwritten with the new one.
- Software and hardware resources are allocated for rules associated with a validity period even if the validity period is not active. Pre-allocating the resources makes sure the rule can be enforced when the validity period becomes active.
- The **save** option marks the policy rule so that the rule will be captured in an ASCII text file (using the **configuration snapshot** command), saved to the working directory after the **write memory** command or **copy running-config working** command is entered, or saved after a reboot. Rules are saved by default. If **no save** is entered for the rule, the policy rule will not be written to the configuration. The **save** option should be disabled only if you want to use a policy rule temporarily.
- The **default-list** option adds the rule to the default policy list. Rules are added to this list by default when the rule is created. A rule can belong to multiple policy lists. As a result, the rule remains a member of the default list even when it is subsequently assigned to additional lists.
- If the rule is going to belong to a QoS policy list for a Universal Network Profile (UNP), use the **no default-list** option when creating the rule. Doing so will give the rule precedence over default list rules when the policy list is applied to UNP device traffic.

- Note that each time a rule is assigned to a policy list, an instance of that rule is created and each instance is allocated system resources. Use the **no default-list** option with this command to exclude the rule from the default policy list.
- If the **configuration snapshot** command is entered after the **policy rule** command is configured, the resulting ASCII file will include the following additional syntax for the **policy rule** command:

**from {cli | ldap | blt}**

This syntax indicates how the rule was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in rule, this setting is not configurable.

- The **log** option is useful for determining the source of attacks on the switch firewall.
- If traps are enabled for the rule, a trap is only sent when a port disable action or UserPort shutdown operation is triggered.

## Examples

```
-> policy rule rule2 condition c2 action a2
-> policy rule rule3 condition c3 action a3 no default-list
-> policy rule rule2 precedence 65535
-> policy rule rule2 validity-period vp01
-> policy rule rule2 no precedence
-> policy rule rule2 no validity-period
-> policy rule rule3 no default-list
-> no policy rule rule2
```

## Release History

Release 7.1.1; command was introduced.

---

## policy validity-period

Configures a validity period that specifies the days and times in which a policy rule is in effect.

**policy validity-period** *name* [**days** *days*] [**months** *months*] [**hours** *hh:mm to hh:mm*] [**interval** *mm:dd:yyyy hh:mm to mm:dd:yyyy hh:mm*]

**policy validity-period** *name* **no** {**hours** / **interval**}

**no policy validity-period** *name*

---

### Syntax Definitions

<i>name</i>	The name of the validity period (up to 31 alphanumeric characters).
<i>days</i>	The day(s) of the week this validity period is active. Enter the actual day of the week (e.g., <b>monday</b> , <b>tuesday</b> , <b>wednesday</b> , etc.).
<i>months</i>	The month(s) in which the validity period is active. Enter the actual month (e.g., <b>january</b> , <b>february</b> , <b>march</b> , etc.).
<i>hh:mm</i>	The time of day, specified in hours and minutes, the validity period starts and the time of day the validity period ends (e.g., 10:30 to 11:30).
<i>mm:dd:yyyy hh:mm</i>	An interval of time in which a rule is in effect. Specify a start and end to the interval period by entering a beginning date and time followed by an end date and time (e.g., 11:01:2005 12:01 to 11:02:2005 12:01).

### Defaults

By default, no validity period is in effect for a policy rule.

parameter	default
<i>days</i>	no restriction
<i>months</i>	no restriction
<i>hh:mm</i>	no specific time
<i>mm:dd:yyyy hh:mm</i>	no interval

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a validity period from the configuration, or to remove parameters from a particular validity period. Note that at least one parameter must be associated with a validity period.
- Any combination of days, months, hours, and interval parameters is allowed. The validity period is only in effect when all specified parameters are true.

- Use the **policy rule** command to associate a validity period with a rule.
- Software and hardware resources are allocated for rules associated with a validity period even if the validity period is not active. Pre-allocating the resources makes sure the rule can be enforced when the validity period becomes active.
- If the **snapshot** command is entered after the **policy validity-period** command is configured, the resulting ASCII file will include the following additional syntax for the **policy validity-period** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

## Examples

```
-> policy validity-period vp01 days tuesday thursday months january february
-> policy validity-period vp01 hours 13:00 to 19:00
-> policy validity-period vp02 interval 01/01/05 12:01 to 02/01/05 11:59
-> policy validity-period vp01 no days thursday
-> no policy-validity period vp02
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">policy rule</a>	Configures a policy rule on the switch and optionally associates that rule with a validity period.

---

## policy list

Configures a QoS policy list. There are two types of lists available: a Universal Network Profile (UNP) policy list and the default policy list. Rules assigned to a UNP list are applied to traffic classified into a specific profile. A default policy list is available when the switch boots up; all policy rules belong to this list unless otherwise specified.

**policy list** *list\_name* **type unip** [**enable** | **disable**]

**no policy list** *list\_name*

---

### Syntax Definitions

<i>list_name</i>	The name to assign to the policy list. Note that the list name is case sensitive.
<b>unip</b>	Specifies the list type as a Universal Network Profile list.
<b>enable</b>	Enables the policy list.
<b>disable</b>	Disables the policy list.

### Defaults

By default, the list is created as a UNP policy list. The **unip** parameter is optional.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of the command to remove a policy list from the configuration.
- The default policy list available in every switch has no name and is not configurable. All QoS policy rules are assigned to the default list unless the **no default-list** option of the **policy rule** command is used at the time the rule is created.
- Once a policy list is created, use the **policy list rules** command to add rules to the list.
- Any policy list configured through this command is not active on the switch until the **qos apply** command is issued.
- If the **snapshot** command is entered after the **policy list** command is configured, the resulting ASCII file will include the following additional syntax for the **policy list** command:

**from** {**cli** | **ldap** | **blt**}

This syntax indicates how the list was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy list unip1 type unip
-> policy list unip1 disable
```

```
-> policy list unpl enable
-> no policy list unpl
```

## Release History

Release 7.2.1; command was introduced.

## Related Commands

<a href="#">policy list rules</a>	Assigns QoS policy rules to a QoS policy list.

  alaQoSRuleDefaultList
  alaQoSRuleGroupsName
  alaQoSRuleGroupsSource
  alaQoSRuleGroupsType
  alaQoSRuleGroupsEnabled
  alaQoSRuleGroupsStatus
alaQoSAppliedRuleGroupsTable
  alaQoSAppliedRuleGroupsName
  alaQoSAppliedRuleGroupsSource
  alaQoSAppliedGroupsType
  alaQoSAppliedGroupsEnabled
  alaQoSAppliedRuleGroupsStatus
```

---

## policy list rules

Assigns existing QoS policy rules to the specified QoS policy list.

**policy list** *list\_name* **rules** *rule\_name* [*rule\_name2*...]

**policy list** *list\_name* **no rules** *rule\_name* [*rule\_name2*...]

---

### Syntax Definitions

<i>list_name</i>	The name of an existing QoS policy list. Note that the list name is case sensitive.
<i>rule_name</i>	The name of an existing QoS policy rule to include in the policy list.
<i>rule_name2</i>	Optional. The name of another QoS policy rule to include in the policy list. Separate each rule name specified with a space.

### Defaults

A default policy list is available when the switch boots up. This list has no name and is not configurable. All QoS policy rules are assigned to the default list unless the **no default-list** option of the **policy rule** command is used.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of the command to remove a policy rule from an existing list.
- The QoS policy list and rule names specified with this command must already exist in the switch configuration.
- This command is only used to assign rules to a UNP policy list. Create the rules for this type of list using the **no default-list** option of the **policy rule** command to ensure these rules take precedence over other default list rules when the UNP policy list is applied to device traffic.
- A rule may belong to a UNP list and the default list at the same time. By default, a rule is assigned to a default policy list when the rule is created. If the rule is subsequently assigned to another policy list, it still remains associated with the default list.
- If a rule is a member of multiple policy lists but one or more of these lists are disabled, the rule is still active in those lists that are enabled.
- If the QoS status of a policy rule is disabled, then the rule is disabled for all lists even if a list to which the policy rule belongs is enabled.
- Any policy list configured through this command is not active on the switch until the **qos apply** command is issued.

## Examples

```
-> policy list unpl rules r1 r2 r3
-> policy list unpl no rules r2
```

## Release History

Release 7.2.1; command was introduced.

  alaQoSAppliedGroupsEnabled
  alaQoSAppliedRuleGroupsStatus
```

---

## policy network group

Configures a network group name and its associated IP addresses. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the network group.

**policy network group** *net\_group ip\_address [mask net\_mask] [ip\_address2 [mask net\_mask2]...]*

**no policy network group** *net\_group*

**policy network group** *net\_group no ip\_address [mask netmask] [ip\_address2 [mask net\_mask2]...]*

---

### Syntax Definitions

<i>net_group</i>	The name of the network group (up to 31 alphanumeric characters).
<i>ip_address</i>	An IPv4 address included in the network group. IPv6 addresses are not supported with network groups.
<i>net_mask</i>	The mask for the IPv4 address. If no mask is entered, the IPv4 address is assumed to be a host address.
<i>ip_address2</i>	Optional. Another IPv4 address to be included in the network group. Multiple IP addresses may be configured for a network group. Separate each address/mask combination with a space.
<i>net_mask2</i>	Optional mask for the IPv4 address. If no mask is entered, the natural mask for the address will be used.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command to configure a group of IPv4 addresses to which you want to apply QoS rules. Rather than create a condition for each IPv4 address, group the addresses together. Use the **policy condition** command to associate a condition with the network group.
- Use the **no** form of the command to remove a network group from the configuration, or to remove an IP address from a network group.
- If the **snapshot** command is entered after the **policy network group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy network group** command:

**from {cli | ldap | blt}**

This syntax indicates how the network group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in network group, this setting is not configurable.

## Examples

```
-> policy network group webgroup1 10.10.12.5 10.50.3.1
-> policy network group webgroup1 no 10.10.12.5
-> no policy network group webgroup1
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">policy condition</a>	Configures a policy condition. A network group may be configured as part of a policy condition.
<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">show policy network group</a>	Displays information for policy network groups.

alaQoSAppliedNetworkGroupTable
  alaQoSAppliedNetworkGroupIpAddr
  alaQoSAppliedNetworkGroupsIpMask
```

---

## policy service group

Configures a service group and its associated services. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the service group.

**policy service group** *service\_group service\_name1 [service\_name2...]*

**no policy service group** *service\_group*

**policy service group** *service\_group no service\_name1 [service\_name2...]*

---

### Syntax Definitions

<i>service_group</i>	The name of the service group (up to 31 alphanumeric characters).
<i>service_name1</i>	The service name is configured through the <b>policy service</b> command and includes information about protocol, source port, and destination port.
<i>service_name2...</i>	Optional. Additional service names may be configured for a service group. Separate each service name with a space.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command to configure a group of services to which you want to apply QoS rules. Rather than create a condition for each service, group services together. Use the **policy condition** command to associate a condition with the service group.
- Use the **no** form of the command to remove a service group from the configuration, or to remove a service from a service group.
- To drop packets destined to specific TCP and UDP ports, create port services for the traffic that you want dropped and add these services to a service group. Then create a condition for this service group and a source port group, which can then be used in a deny rule. Refer to the switch *Network Configuration Guide* for more information about ACL security enhancements.
- If the **snapshot** command is entered after the **policy service group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service group** command:

**from {cli | ldap | blt}**

This syntax indicates how the service group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in service group, this setting is not configurable.

## Examples

```
-> policy service group servgroup2 telnet ftp
-> policy service group servgroup2 no telnet
-> no policy service group servgroup2
```

## Release History

Release 7.1.1; command was introduced.

```

---

## policy mac group

Configures a MAC group and its associated MAC addresses. The group may be used as part of a policy condition. The action associated with any policy using the condition will be applied to all members of the MAC group.

**policy mac group** *mac\_group mac\_address [mask mac\_mask] [mac\_address2 [mask mac\_mask2]...]*

**no policy mac group** *mac\_group*

**policy mac group** *mac\_group no mac\_address [mask mac\_mask] [mac\_address2 [mask mac\_mask2]...]*

---

### Syntax Definitions

<i>mac_group</i>	The name of the MAC group (up to 31 alphanumeric characters).
<i>mac_address</i>	The MAC address associated with the group (for example, 00:20:da:05:f6:23).
<i>mac_mask</i>	The mask of the MAC address, used to identify which bytes in the MAC address are significant when comparing the MAC address in the received frame with the MAC address in the policy condition. If no mask is specified, the switch automatically uses ff:ff:ff:ff:ff:ff.
<i>mac_address2</i>	Optional. Additional MAC addresses may be configured for a MAC group. Separate each address with a space.
<i>mac_mask2</i>	The mask of an additional MAC address, used to identify which bytes in the MAC address are significant when comparing the MAC address in the received frame with the MAC address in the policy condition. If no mask is specified, the switch automatically uses ff:ff:ff:ff:ff:ff.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command to configure a group of source or destination MAC addresses to which you want to apply QoS rules. Rather than create a condition for each MAC address, group MAC addresses together. Use the **policy condition** command to associate a condition with the MAC group.
- Use the **no** form of the command to remove a MAC group from the configuration, or to remove a MAC address from a MAC group.
- The MAC group name “alaPhones” is a reserved group name used to identify the MAC addresses of IP phones. See the [qos phones](#) command for more information.
- If the **snapshot** command is entered after the **policy map group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy map group** command:

**from {cli | ldap | blt}**

This syntax indicates how the map group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

**Examples**

```
-> policy mac group mac_group1 00:20:da:05:f6:23 00:20:da:05:f6:24
-> no policy mac group mac_group1
```

**Release History**

Release 7.1.1; command was introduced.

---

## policy port group

Configures a port group and its associated slot and port numbers. A port group may be attached to a policy condition. The action associated with that policy will be applied to all members of the port group.

**policy port group** *group\_name slot/port[-port] [slot/port[-port]...]*

**no policy port group** *group\_name*

**policy port group** *group\_name no slot/port[-port] [slot/port[-port]...]*

---

### Syntax Definitions

<i>group_name</i>	The name of the port group (up to 31 alphanumeric characters).
<i>slot/port[-port]</i>	The slot and port (or port range) to be included in the group. At least one slot/port combination must be specified. Additional combinations may be included in the group; each combination should be separated by a space.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command to configure a group of ports to which you want to apply QoS rules. Rather than create a condition for each port, group ports together. Use the **policy condition** command to associate a condition with the port group.
- Use the **no** form of the command to remove a port group from the configuration, or to remove a slot/port from a port group.
- If a range of ports is specified using the syntax *slot/port-port* (i.e., 2/1-8), a single port within that range cannot be removed on its own. The entire range must be deleted as it was entered.
- When a port group is used as part of a policy rule and a policy action specifies a maximum bandwidth, each interface in the port group will be allowed the maximum bandwidth.
- To prevent IP source address spoofing, add ports to the port group called **UserPorts**. This port group does not need to be used in a condition or rule to be effected on flows and only applies to routed traffic. Ports added to the UserPorts group will block spoofed traffic while still allowing normal traffic on the port. Refer to the *OmniSwitch 10000 Network Configuration Guide* for more information about ACL security enhancements.
- Use the **qos user-port** command to configure the option to filter or administratively disable a port when a specific type of traffic (Spoof, RIP, BPDU, OSPF, and/or BGP) is received on a port that is a member of the pre-defined UserPorts group.

- If the **snapshot** command is entered after the **policy port group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy port group** command:

**from {cli | ldap | blt}**

This syntax indicates how the port group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

## Examples

```
-> policy port group port_group4 3/1-2 4/3 5/4
-> policy port group port_group4 no 3/1-2
-> policy port group UserPorts 4/1-8 5/1-8
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">policy condition</a>	Configures a policy condition. A port group may be configured as part of a policy condition.

  alaQoSAppliedPortGroupPort
  alaQoSAppliedPortGroupPortEnd
```

---

## policy map group

Configures a map group and its associated mappings for 802.1p, Type of Service (ToS), or Differentiated Services Code Point (DSCP) values. A map group may be referenced in a policy action with the **map** keyword.

```
policy map group map_group {value1:value2...}
```

```
no policy map group map_group
```

```
policy map group no {value1:value2...}
```

---

### Syntax Definitions

<i>map_group</i>	The name of the map group (up to 31 alphanumeric characters).
<i>value1</i>	The 802.1p, ToS, or DSCP value to be mapped to another value. May be a value or a range of values (for example, <b>1-2</b> ).
<i>value2...</i>	The 802.1p, ToS, or DSCP value to be used in place of <i>value1</i> . Additional mapping pairs may be included.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a mapping pair or to remove the map group entirely.
- The map group may contain more than one mapping pair.
- If the **snapshot** command is entered after the **policy map group** command is configured, the resulting ASCII file will include the following additional syntax for the **policy map group** command:

```
from {cli | ldap | blt}
```

This syntax indicates how the map group was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy map group tosGroup 1-4:3 5-6:5 7:6
-> policy map group tosGroup no 7:6
-> no policy map group tosGroup
```

### Release History

Release 7.1.1; command was introduced.

## policy service

Configures a service that may be used as part of a policy service group or included as part of a policy condition. A service is a source and/or destination TCP or UDP port or port range.

This overview section describes the base command. *At least one option must be configured with the base command.* Some options may be used in combination; some options are shortcuts for keyword combinations (see the Usage Guidelines). Options are described as separate commands. See the command descriptions and usage guidelines for valid combinations.

Use the **no** form for keywords to remove a parameter from a service.

```
policy service service_name
  [protocol protocol]
  [source ip port port[-port]]
  [destination ip port port[-port]]
  [source tcp port port[-port]]
  [destination tcp port port[-port]]
  [source udp port port[-port]]
  [destination udp port port[-port]]
```

```
no policy service service_name
```

---

### Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>protocol</i>	The protocol associated with the service. The range of values is 0–255. Currently a value of 6 (for TCP) or 17 (for UDP) is supported. This value must be specified for <b>source ip port</b> or <b>destination ip port</b> ; it cannot be specified for <b>source tcp port</b> , <b>destination tcp port</b> , <b>source udp port</b> , or <b>destination udp port</b> .
<i>port</i>	The well-known port number (or port range) for the desired service. For example, the port number for Telnet is 23. Specify a range of ports using a hyphen (for example, <b>22-23</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.

- The command options offer alternate ways of configuring TCP or UDP ports for a service. Note that port types (TCP or UDP) cannot be mixed in the same service. The following table shows how the keywords are used:

To configure:	Use keywords:	Notes
TCP or UDP ports for a service	<b>protocol</b> <b>source ip port</b> <b>destination ip port</b>	<i>The protocol must be specified with at least one source or destination port.</i>
TCP ports for a service	<b>source tcp port</b> <b>destination tcp port</b>	<i>Keywords may be used in combination.</i>
UDP ports for a service	<b>source udp port</b> <b>destination udp port</b>	<i>Keywords may be used in combination.</i>

- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

## Examples

The following two commands show two different ways of configuring the same service:

```
-> policy service telnet2 protocol 6 destination ip port 23
-> policy service telnet3 destination tcp port 23
```

## Release History

Release 7.1.1; command was introduced.

## policy service protocol

Configures a service with a protocol and IP port or port range that may be used as part of a policy service group or included as part of a policy condition.

```
policy service service_name protocol protocol {[source ip-port port[-port]]  
[destination ip-port port[-port]]}
```

```
no policy service service_name
```

```
policy service service_name no {source ip-port | destination ip-port}
```

---

### Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>protocol</i>	The protocol associated with the service. The range of values is 0–255. Currently a value of 6 (for TCP) or 17 (for UDP) is supported.
<i>port</i>	The well-known port number (or port range) for the desired service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, <b>22-23</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a service from the configuration or to remove parameters from a particular service. (A protocol value cannot be removed from a service.)
- Shortcut commands for the **policy service protocol** command include the following: **policy service source tcp-port**, **policy service destination tcp-port**, **policy service source udp-port**, and **policy service destination udp-port**.
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

```
from {cli | ldap | blt}
```

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy service telnet2 protocol 6 destination ip-port 23 source ip-port 22  
-> policy service telnet2 no source ip-port
```

## policy service source tcp-port

Configures a service with a source TCP port or port range that may be used as part of a policy service group or included as part of a policy condition.

**policy service** *service\_name* **source tcp-port** *port[-port]*

**no policy service** *service\_name*

**policy service** *service\_name* **no source tcp port**

---

### Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>port</i>	The well-known port number (or port range) for the desired TCP service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, <b>22-23</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.
- Ports associated with a particular service must all be of the same type. (The **destination tcp port** keyword may be used with this command; other keywords for the command are not allowed.)
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy service serv_5 source tcp port 21-22
-> policy service serv_5 no source tcp port
```

### Release History

Release 7.1.1; command was introduced.

```

---

## policy service destination tcp-port

Configures a service with a destination TCP port or port range that may be used as part of a policy service group or included as part of a policy condition.

**policy service** *service\_name* **destination tcp-port** *port[-port]*

**no policy service** *service\_name*

**policy service** *service\_name* **no destination tcp-port**

---

### Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>port</i>	The well-known port number (or port range) for the desired TCP service. For example, the port number for Telnet is 23. A port range should be separated by a hyphen (for example, <b>22-23</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a service from the configuration, or to remove parameters from a particular service.
- This command is a shortcut for the **policy service protocol** command.
- A policy service may be grouped in a policy group using the **policy service group** command. A policy condition may then be associated with the service group.
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy service service4 destination tcp-port 23
-> policy service service4 no destination tcp-port
```

### Release History

Release 7.1.1; command was introduced.

  alaQoSAppliedServiceName
  alaQoSAppliedServiceSource
  alaQoSAppliedServiceDestinationTcpPort
  alaQoSAppliedServiceDestinationTcpPortEnd
```

---

## policy service source udp-port

Configures a service with a source UDP port or port range that may be used as part of a policy service group or included as part of a policy condition.

**policy service** *service\_name* **source udp-port** *port[-port]*

**no policy service** *service\_name*

**policy service** *service\_name* **no source udp-port**

---

### Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>port</i>	The well-known port number (or port range) for the desired UDP service. Specify a port range with a hyphen (for example, <b>22-23</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service. Note that at least one parameter must be associated with a service.
- Ports associated with a particular service must all be of the same type. (The **destination tcp port** keyword may be used with this command; other keywords for the command are not allowed.)
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy service serv_a source udp-port 1000
-> no policy service serv_a source udp-port
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

```

---

## policy service destination udp-port

Configures a service with a destination UDP port or port range that may be used as part of a policy service group or included as part of a policy condition.

**policy service** *service\_name* **destination udp-port** *port[-port]*

**no policy service** *service\_name*

**policy service** *service\_name* **no destination udp-port**

---

### Syntax Definitions

<i>service_name</i>	The name of the service (up to 31 alphanumeric characters).
<i>port</i>	The well-known port number (or port range) for the desired UDP service. For example, a port number for NETBIOS is 137. A port range should be separated by a hyphen (for example, <b>137-138</b> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is a shortcut for the **policy service protocol** command.
- A policy service may be grouped in a policy group using the **policy service group** command. A policy condition may then be associated with the service group.
- Use the **no** form of the command to remove a service from the configuration, or to remove parameters from a particular service.
- If the **snapshot** command is entered after the **policy service** command is configured, the resulting ASCII file will include the following additional syntax for the **policy service** command:

**from {cli | ldap | blt}**

This syntax indicates how the service was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in object, this setting is not configurable.

### Examples

```
-> policy service service4 destination udp-port 137
-> policy service service4 no destination udp-port
```

### Release History

Release 7.1.1; command was introduced.

---

## policy condition

Creates a QoS policy condition. The condition determines what parameters the switch uses to classify incoming flows. Condition parameters may be configured when the condition is created; or parameters may be configured for an existing condition. At least one parameter must be configured for a condition.

This section describes the base command. Optional keywords are listed below and described as separate commands later in this chapter. (Options may be used in combination but are described separately for ease in explanation.) Use the **no** form for keywords to remove a parameter from the condition.

Some condition parameters may not be supported depending on the platform you are using. Also some condition parameters may not be supported with some action parameters. See the condition/action tables in your switch *Network Configuration Guide*.

**policy condition** *condition\_name*

```
[source ip ip_address [mask netmask]]
[source ipv6 {any | ipv6_address [mask netmask]}]
[destination ip ip_address [mask netmask]]
[destination ipv6 {any | ipv6_address [mask netmask]}]
[multicast ip ip_address [mask netmask]]
[source network group network_group]
[destination network group network_group]
[multicast network group multicast_group]
[source ip port port[-port]]
[destination ip port port[-port]]
[source tcp port port[-port]]
[destination tcp port port[-port]]
[source udp port port[-port]]
[destination udp port port[-port]]
[ethertype etype]
[established]
[tcpflags {any | all} flag [mask flag]]
[service service]
[service group service_group]
[icmptype type]
[icmpcode code]
[ip protocol protocol]
[ipv6]
[nh next_header_value]
[flow-label flow_label_value]
[tos tos_value tos_mask]
[dscp {dscp_value[-value] [dscp_mask]}]
[source mac mac_address [mask mac_mask]]
[destination mac mac_address [mask mac_mask]]
[source mac group group_name]
[destination mac group mac_group]
[source vlan vlan_id]
[destination vlan vlan_id]
[802.1p 802.1p_value]
```

```
[source port slot/port[-port]]
[source port group group_name]
[destination port slot/port[-port]]
[destination port group group_name]
[vrf {vrf_name | default}]
[fragments]
```

```
no policy condition condition_name
```

---

## Syntax Definitions

*condition\_name*                      The name of the condition. Any alphanumeric string.

## Defaults

N/A

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- A policy condition and a policy action are combined to make a policy rule. See the [policy rule command on page 44-6](#).
- Use the [qos apply](#) command to activate configuration changes.
- If multiple keywords are defined for a single condition, the traffic flow must match all of the parameters in the condition before the rule is enforced.
- Use the **no** form of the command to remove a condition from a policy rule.
- At least one parameter must be associated with a condition.
- If the **snapshot** command is entered after the **policy condition** command is configured, the resulting ASCII file will include the following additional syntax for the **policy condition** command:

```
from {cli | ldap | blt}
```

This syntax indicates how the condition was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in condition, this option is not configurable.

## Examples

```
-> policy condition cond4 source port 3/1
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">policy action</a>	Configures a policy action.
<a href="#">policy rule</a>	Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).
<a href="#">show policy condition</a>	Shows information about policy conditions configured on the switch.

## MIB Objects

```
alaQoSConditionTable
  alaQoSConditionName
  alaQoSConditionSource
alaQoSAppliedConditionTable
  alaQoSAppliedConditionName
  alaQoSAppliedConditionSource
```

---

## policy condition source ip

Configures a source IP address for a policy condition.

**policy condition** *condition\_name* **source ip** *ip\_address* [**mask** *netmask*]

**policy condition** *condition\_name* **no source ip**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>ip_address</i>	The source IP address of the Layer 3 flow.
<i>netmask</i>	The mask for the source IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A source IP address and a source IP network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a source IP address from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond3 source ip 173.201.18.3
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.

---

## policy condition source ipv6

Configures a source IPv6 address for a policy condition.

**policy condition** *condition\_name* **source ipv6** {**any** | *ipv6\_address* [**mask netmask**]}

**policy condition** *condition\_name* **no source ipv6**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<b>any</b>	Any source IPv6 address.
<i>ipv6_address</i>	A specific source IPv6 address.
<i>netmask</i>	The mask for the source IPv6 address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a source IPv6 address from a condition; however, at least one classification parameter must be associated with a condition.
- If a mask is not specified, the IPv6 address is assumed to be a host address.

### Examples

```
-> policy condition cond3 source ipv6 ::1234:531F:BCD2:F34A
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

## policy condition destination ip

Configures a destination IP address for a policy condition.

**policy condition** *condition\_name* **destination ip** *ip\_address* [**mask** *netmask*]

**policy condition** *condition\_name* **no destination ip**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>ip_address</i>	The destination IP address of the Layer 3 flow.
<i>netmask</i>	The mask for the destination IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A destination IP address and a destination IP network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a destination IP address from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond4 destination ip 208.192.21.0 mask 255.255.255.0
```

### Release History

## policy condition multicast ip

Configures a multicast IP address for a policy condition.

**policy condition** *condition\_name* **multicast ip** *ip\_address* [**mask** *netmask*]

**policy condition** *condition\_name* **no multicast ip**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>ip_address</i>	The multicast IP address.
<i>netmask</i>	Optional. The mask for the multicast IP address.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If a mask is not specified, the IP address is assumed to be a host address.
- A multicast IP address and a multicast network group cannot be specified in the same condition.
- Use the **no** form of the command to remove a multicast IP address from a condition; however, at least one classification parameter must be associated with a condition.

## policy condition source network group

Associates a source network group with a policy condition.

**policy condition** *condition\_name* **source network group** *network\_group*

**policy condition** *condition\_name* **no source network group**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>network_group</i>	The name of the source network group. Network groups are configured through the <b>policy network group</b> command. See <a href="#">page 44-16</a> for more information about this command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a source network group from a condition; however, at least one classification parameter must be associated with a condition.
- A source IP address and a source IP network group cannot be specified in the same condition.

### Examples

```

## policy condition destination network group

Associates a destination network group with a policy condition.

**policy condition** *condition\_name* **destination network group** *network\_group*

**policy condition** *condition\_name* **no destination network group**

---

### Syntax Definitions

*condition\_name*

The name of the condition.

*network\_group*

The name of the destination network group. Network groups are configured through the **policy network group** command. See [page 44-16](#) for more information about this command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a destination network group from a condition; however, at least one classification parameter must be associated with a condition.
- A destination IP address and a destination IP network group cannot be specified in the same condition.

### Examples

```
-> policy condition cond6 destination network group webgroup1

## policy condition multicast network group

Associates a multicast group with a policy condition.

**policy condition** *condition\_name* **multicast network group** *multicast\_group*

**policy condition** *condition\_name* **no multicast network group**

---

### Syntax Definitions

*condition\_name* The name of the condition.

*multicast\_group* The multicast group name. Multicast groups are configured through the **policy network group** command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a multicast group from a condition; however, at least one classification parameter must be associated with a condition.
- A multicast address and a multicast network group cannot be specified in the same condition.

### Examples

```
-> policy condition cond3 multicast group video2
```

## policy condition source ip-port

Configures a source IP port number for a policy condition.

**policy condition** *condition\_name* **source ip-port** *port*[-*port*]

**policy condition** *condition\_name* **no source ip-port**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The TCP or UDP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a source IP port from a condition; however, at least one classification parameter must be associated with a condition.
- The protocol (TCP or UDP) must be specified in the condition, either on the same command line or in a previous command. Use the **ip protocol** keywords. See the [policy condition ip-protocol](#) command.
- The same condition cannot specify a source IP port with a source TCP port, source UDP port, service, or service group.

### Examples

```
-> policy condition cond1 ip protocol 6 source ip-port 137
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

## policy condition destination ip-port

Configures a destination IP port number for a policy condition.

**policy condition** *condition\_name* **destination ip-port** *port[-port]*

**policy condition** *condition\_name* **no destination ip-port**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The TCP or UDP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a destination IP port from a condition; however, at least one classification parameter must be associated with a condition.
- The protocol (TCP or UDP) must be specified in the same condition, either on the same command line or in a previous command. Use the **ip protocol** keywords. See the [policy condition ip-protocol](#) command.
- The same condition cannot specify a destination IP port with a service or service group.

### Examples

```
-> policy condition cond2 ip protocol 6 destination ip-port 137-138
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

## policy condition source tcp-port

Configures a source TCP port number for a policy condition.

```
policy condition condition_name source tcp-port port[-port]
```

```
policy condition condition_name no source tcp-port
```

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The TCP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a source TCP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition source ip-port** command, which requires that the protocol also be specified. Rather than specifying **source ip-port** and **ip protocol**, use **source tcp-port**.
- The same condition cannot specify a source TCP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

### Examples

```
-> policy condition cond3 source tcp-port 137
-> policy condition cond4 ipv6 source tcp-port 21
-> policy condition cond3 no source tcp-port
```

### Release History

Release 7.1.1; command was introduced.

## policy condition source udp-port

Configures a source UDP port number for a policy condition.

```
policy condition condition_name source udp-port port[-port]
```

```
policy condition condition_name no source udp-port
```

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The UDP port number of the source address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a source UDP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition source ip-port** command, which requires that the protocol also be specified. Rather than specifying **source ip port** and **ip protocol**, use **source udp-port**.
- The same condition cannot specify a source UDP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

### Examples

```
-> policy condition cond5 source udp-port 1200-1400
-> policy condition cond6 ipv6 source-udp port 1000
-> policy condition cond5 no source udp-port
```

### Release History

## policy condition destination udp-port

Configures a destination UDP port number for a policy condition.

```
policy condition condition_name destination udp-port port[-port]
```

```
policy condition condition_name no destination udp-port
```

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>port</i>	The UDP port number (or port range) of the destination address of the Layer 3 flow, in the range from 0–65535. A range of ports (separated by a hyphen) may be specified instead of a single port.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a destination UDP port from a condition; however, at least one classification parameter must be associated with a condition.
- This command is a shortcut for the **policy condition destination ip-port** command, which requires that the protocol also be specified. Rather than specifying **destination ip-port** and **ip protocol**, use **destination udp-port**.
- The same condition cannot specify a destination UDP port with a service or service group.
- IP port protocol types cannot be mixed in the same condition; ports must be either TCP or UDP.
- Use this condition in combination with the IPv6 condition (**policy condition ipv6**) to configure IPv6 policies for Layer 4 information, services, and service groups.

### Examples

```
-> policy condition cond4 destination udp-port 137-138
-> policy condition cond5 ipv6 destination udp-port 140
-> policy condition cond4 no destination udp-port
```

### Release History

Release 7.1.1; command was introduced.

```

---

## policy condition ethertype

Configures an ethertype value to use for traffic classification.

**policy condition** *condition\_name* **ethertype** *etype*

**policy condition** *condition\_name* **no ethertype**

---

### Syntax Definitions

*condition\_name* The name of the condition.

*etype* The ethertype value, in the range 1536–65535 or 0x600–0xffff hex.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove an ethertype value from a condition; however, at least one classification parameter must be associated with a condition.
- Enter a numeric or equivalent hex value for the *etype*.

### Examples

```
-> policy condition cond12 ethertype 8137
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.

---

## policy condition established

Configures an established TCP connection as a policy condition. A connection is considered established if the **ack** or **rst** flags in the TCP header of the packet are set.

**policy condition** *condition\_name* **established**

**policy condition** *condition\_name* **no established**

---

### Syntax Definitions

*condition\_name*                      The name of the condition.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove **established** from a condition; however, at least one classification parameter must be associated with a condition.
- When an initial TCP connection packet is received only the **syn** flag is set. As a result, TCP packets are only examined if they are not the starting packet.
- Typically this condition is used in combination with **source ip**, **destination ip**, **source port**, **destination port**, **source TCP port**, or **destination TCP port** conditions.
- Note that even though **established** can be used with most action parameters, it is mainly intended for ACL use.

### Examples

```
-> policy condition cond2 source ip 192.168.5.10 established
-> policy condition cond3 destination ip 10.255.11.40
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">policy condition</a>	Creates a policy condition.
<a href="#">show policy condition</a>	Shows information about policy conditions configured on the switch.

**MIB Objects**

```
alaQoSConditionTable
  alaQoSConditionTcpEstablished
alaQoSAppliedConditionTable
  alaQoSAppliedConditionTcpEstablished
```

---

## policy condition tcpflags

Configures a specific TCP flag value or combination of flag values as a policy condition.

**policy condition** *condition\_name* **tcpflags** [**any** | **all**] {**F** | **S** | **R** | **P** | **A** | **U** | **E** | **W**} **mask** {**F** | **S** | **R** | **P** | **A** | **U** | **E** | **W**}

**policy condition** *condition\_name* **no tcpflags**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<b>any</b>	Match on any of the specified TCP flags.
<b>all</b>	Match all specified TCP flags.
<b>F</b>   <b>S</b>   <b>R</b>   <b>P</b>   <b>A</b>   <b>U</b>   <b>E</b>   <b>W</b>	TCP flag value to match ( <b>F</b> =fin, <b>S</b> =syn, <b>R</b> =rst, <b>P</b> =psh, <b>A</b> =ack, <b>U</b> =urg, <b>E</b> =ecn, and <b>W</b> =cwr). <i>The E and W flags are currently not supported.</i>

### Defaults

parameter	default
<b>any</b>   <b>all</b>	all

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove **tcpflags** from a condition; however, at least one classification parameter must be associated with a condition.
- Use the **any** option to indicate that a match on any one of the specified TCP flags qualifies as a match for the condition. Use the **all** option to indicate that a match on all specified TCP flags is required to qualify as a match for the condition.
- Enter one or more TCP flags after the **any** or **all** keyword to indicate that the value of the flag bit must be set to one to qualify as a match.
- Enter one or more TCP flags after the **mask** keyword to indicate which TCP flags to match.
- If a TCP flag is specified as part of the **mask** but does not have a corresponding match value specified with the **any** or **all** options, then zero is assumed as the match value. For example, **tcpflags all f s mask f s a** looks for the following bit values to determine a match: **f**=1, **s**=1, **a**=0.
- Typically this condition is used in combination with **source ip**, **destination ip**, **source port**, **destination port**, **source TCP port**, or **destination TCP port** conditions.
- Note that even though **tcpflags** can be used with most action parameters, it is mainly intended for ACL use.

## Examples

```
-> policy condition c1 tcpflags all f s mask f s a
-> policy condition c2 tcpflags any a r mask a r
```

## Release History

---

## policy condition service

Configures a service for a policy condition.

**policy condition** *condition\_name* **service** *service\_name*

**policy condition** *condition\_name* **no service**

---

### Syntax Definitions

*condition\_name* The name of the condition.

*service\_name* The service name, configured through the **policy service** command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a service group from a condition; however, at least one classification parameter must be associated with a condition.
- A policy condition that specifies a service cannot also specify a service group, IP protocol, source IP port, or destination IP port.

### Examples

```
-> policy condition cond12 service serv2
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">policy service</a>	Configures a service that may be used as part of a policy service group.
<a href="#">qos apply</a>	Applies configured global QoS and policy settings to the current configuration (changes will be active and stored in flash).
<a href="#">show policy service</a>	Displays information about all particular policy services or a particular policy service configured on the switch.

### MIB Objects

    alaQoSAppliedConditionService
```

---

## policy condition service group

Associates a policy service group with a policy condition.

**policy condition** *condition\_name* **service group** *service\_group*

**policy condition** *condition\_name* **no service group**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>service_group</i>	The service group name. Service groups are configured through the <a href="#">policy service group</a> command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a service group from a condition; however, at least one classification parameter must be associated with a condition.
- A policy condition that specifies a service group cannot also specify a service, IP protocol, source IP port, or destination IP port.

### Examples

```
-> policy condition cond12 service group servgroup2
```

### Release History

Release 7.1.1; command was introduced.

---

## policy condition icmp-type

Configures an ICMP type value to use for traffic classification.

**policy condition** *condition\_name* **icmp-type** *type*

**policy condition** *condition\_name* **no icmp-type**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>type</i>	The ICMP type value, in the range 0–255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of the command to remove an ICMP type value from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond12 icmp-type 100
```

### Release History

Release 7.1.1; command was introduced.

## policy condition icmpcode

Configures an ICMP code value to use for traffic classification.

**policy condition** *condition\_name* **icmpcode** *code*

**policy condition** *condition\_name* **no icmpcode**

---

### Syntax Definitions

*condition\_name*                      The name of the condition.

*code*                                      The ICMP code value, in the range 0–255.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of the command to remove an ICMP code value from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond12 icmpcode 150
```

### Release History

Release 7.1.1; command was introduced.

## policy condition ip-protocol

Configures an IP protocol for a policy condition.

**policy condition** *condition\_name* **ip-protocol** *protocol*

**policy condition** *condition\_name* **no ip-protocol**

---

### Syntax Definitions

*condition\_name* The name of the condition.

*protocol* The protocol associated with the flow. The range is 0–255.

### Defaults

parameter	default
<i>protocol</i>	6

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a protocol from a condition; however, at least one classification parameter must be associated with a condition.
- If a source or destination port is specified (through the **policy condition source ip port** or **policy condition destination ip port** commands), the protocol must be specified.
- The same condition cannot specify an IP protocol with a service or service group.

### Examples

```
-> policy condition cond4 ip protocol 6
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**policy condition source ip-port** Configures a source IP port number for a policy condition.

**policy condition destination ip-port** Configures a destination IP port number for a policy condition.

---

## policy condition ipv6

Configures a policy condition to classify IPv6 traffic.

**policy condition** *condition\_name* **ipv6**

**policy condition** *condition\_name* **no ipv6**

---

### Syntax Definitions

*condition\_name*                      The name of the condition.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove IPv6 traffic as a condition; however, at least one classification parameter must be associated with a condition.
- When the **ipv6** keyword is used in a condition, a policy that uses the condition is considered an IPv6 policy. IPv6 policies are effected only on IPv6 traffic. All other IP policies are considered IPv4 policies and are effected only on IPv4 traffic.
- IPv6 Layer 4 policies are supported and are configured using the **ipv6** keyword in a condition that specifies Layer 4 information, services, or service groups. Note that IPv6 Layer 4 policies only work with packets that contain a single header.
- The **icmptype** and **icmpcode** keywords in an IPv6 policy imply the ICMPv6 protocol, not the ICMPv4 protocol.

### Examples

```
-> policy condition cond4 ipv6
-> policy condition cond5 ipv6 tos 7
-> policy condition cond6 ipv6 source port 1/1
-> policy condition cond7 ipv6 source tcp port 21
-> policy condition cond8 ipv6 source tcp port 0-1024
-> policy condition cond6 no ipv6
```

### Release History

Release 7.1.1; command was introduced.

## policy condition nh

Configures an IPv6 next header value as a policy condition. This value is compared to the next header value in the IPv6 header.

**policy condition** *condition\_name* **nh** *next\_header\_value*

**policy condition** *condition\_name* **no nh**

---

### Syntax Definitions

*condition\_name*                      The name of the condition.

*next\_header\_value*                  The next header value (0–255).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of the command to remove the next header value as a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond4 nh 100
-> policy condition cond4 no nh
```

### Release History

Release 7.1.1; command was introduced.

---

## policy condition flow-label

Configures an IPv6 flow label value as a policy condition. This value is compared to the flow label value in the IPv6 header.

**policy condition** *condition\_name* **flow-label** *flow\_label\_value*

**policy condition** *condition\_name* **no flow-label**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition.
<i>flow_label_value</i>	The flow-label value (0–1048575).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of the command to remove the flow label value as a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond4 flow-label 1500
-> policy condition cond4 no flow-label
```

### Release History

Release 7.1.1; command was introduced.

## policy condition tos

Configures the precedence bits in the Type of Service (ToS) byte value for a policy condition.

**policy condition** *condition\_name* **tos** *tos\_value* [**mask** *tos\_mask*]

**policy condition** *conditioning* **no tos**

---

### Syntax Definitions

<i>conditioning</i>	The name of the condition. May be an existing condition name or a new condition.
<i>tos_value</i>	The Type of Service bits value included in the IP header. The three most significant bits of the byte determine the precedence (i.e, priority) of the frame (0 is the lowest, 7 is the highest).
<i>tos_mask</i>	The mask for the ToS bits, in the range 0–7.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a ToS value from a condition; however, at least one classification parameter must be associated with a condition.
- If a ToS value is specified, a DSCP value may not be specified.

### Examples

```
-> policy condition cond2 tos 7
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">policy condition</a>	Creates a policy condition.

---

## policy condition dscp

Configures the Differentiated Services Code Point (DSCP) for a policy condition. The DSCP value defines the six most significant bits of the DS byte in the IP header.

**policy condition** *condition\_name* **dscp** {*dscp\_value*[-*value*]} [**mask** *dscp\_mask*]

**policy condition** *condition\_name* **no dscp**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
{ <i>dscp_value</i> [- <i>value</i> ]}	The DiffServ Code Point value, in the range 0–63. Use a hyphen to specify a range of DSCP values for the condition (for example, 10-20).
<i>dscp_mask</i>	The mask for the DiffServ Code Point, in the range 0–63.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a DSCP value from a condition; however, at least one classification parameter must be associated with a condition.
- If a DSCP value is specified, a ToS value may not be specified.
- When a DSCP policy condition is configured on one of these switches, QoS automatically calculates the appropriate mask value.

### Examples

```
-> policy condition cond4 dscp 10
-> policy condition cond5 dscp 20-30
```

### Release History

Release 7.1.1; command was introduced.

## policy condition source mac

Configures a source MAC address for a policy condition.

**policy condition** *condition\_name* **source mac** *mac\_address* [**mask** *mac\_mask*]

**policy condition** *condition\_name* **no source mac**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>mac_address</i>	The source MAC address in the Layer 2 header of the frame (for example, 00:20:da:05:f6:23)
<i>mac_mask</i>	Optional. The mask for the source MAC address (for example, ff:ff:ff:ff:ff:ff).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a source MAC address from a condition; however, at least one classification parameter must be associated with a condition.
- A source MAC address and a source MAC group cannot be specified in the same condition.

### Examples

```
-> policy condition cond2 source mac 00:20:da:05:f6:23
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

## policy condition destination mac

Configures a destination MAC address for a policy condition.

---

**Note.** Specifying a destination MAC address and mask of all zeros (00:00:00:00:00:00) as a policy condition can result in the switch dropping all traffic. Only use this type of condition in combination with other policies that will allow desired traffic and/or if a source or destination slot/port is also part of the destination MAC condition.

---

**policy condition** *condition\_name* **destination mac** *mac\_address* [**mask** *mac\_mask*]

**policy condition** *condition\_name* **no destination mac**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>mac_address</i>	The destination MAC address in the Layer 2 header of the frame (for example, 00:20:da:05:f6:23).
<i>mac_mask</i>	Optional. The mask for the destination MAC address (for example, ff:ff:ff:ff:ff:ff).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a destination MAC address from a condition; however, at least one classification parameter must be associated with a condition.
- A destination MAC address and a destination MAC group cannot be specified in the same condition.

### Examples

```
-> policy condition cond3 destination mac 00:20:da:05:f6:23
```

### Release History

Release 7.1.1; command was introduced.

---

## policy condition source mac group

Associates a source MAC group with a policy condition.

**policy condition** *condition\_name* **source mac group** *group\_name*

**policy condition** *condition\_name* **no source mac group**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>group_name</i>	The name of the source MAC group, configured through the <b>policy mac group</b> command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a source MAC group from a condition; however, at least one classification parameter must be associated with a condition.
- A source MAC address and a source MAC group cannot be specified in the same condition.

### Examples

```
-> policy condition cond4 source mac group mac_group1
```

## policy condition source VLAN

Configures a source VLAN for a policy condition.

**policy condition** *condition\_name* **source vlan** *vlan\_id*

**policy condition** *condition\_name* **no source vlan**

---

### Syntax Definitions

*condition\_name*                      The name of the condition. May be an existing condition name or a new condition.

*vlan\_id*                                The source VLAN ID for the flow.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of the command to remove a source VLAN from a policy condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond5 source vlan 3
```

### Release History

Release 7.1.1; command was introduced.

```

---

## policy condition inner source-vlan

Configures an inner source VLAN ID as a policy condition. This condition applies to double-tagged VLAN Stacking traffic and is used to classify such traffic based on the inner VLAN ID tag, also known as the customer VLAN ID.

**policy condition** *condition\_name* **inner source-vlan** *vlan\_id*

**policy condition** *condition\_name* **no inner source-vlan**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>vlan_id</i>	The inner source VLAN ID (customer VLAN ID) to match on double-tagged packets.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove an inner source VLAN from a policy condition; however, at least one classification parameter must be associated with a condition.
- Policies that use the inner source VLAN condition are referred to as QoS VLAN Stacking policies. These are separate policies from those configured through the VLAN Stacking Service application.

### Examples

```
-> policy condition cond5 inner source-vlan 3
-> policy condition cond5 no inner source-vlan
```

### Release History

Release 7.1.1; command was introduced.

## policy condition destination vlan

Configures a destination VLAN (multicast only) for a policy condition. Use the **no** form of the command to remove a destination VLAN from a condition.

**policy condition** *condition\_name* **destination vlan** *vlan\_id*

**policy condition** *condition\_name* **no destination vlan**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>vlan_id</i>	The destination VLAN ID for the flow.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a destination VLAN from a condition; however, at least one classification parameter must be associated with a condition.
- Note that this condition is supported for multicast only policies.

### Examples

```
-> policy condition cond4 destination vlan 3 multicast ip any
```

### Release History

Release 7.1.1; command was introduced.

## policy condition 802.1p

Configures the 802.1p value for a policy condition.

**policy condition** *condition\_name* **802.1p** *802.1p\_value*

**policy condition** *condition\_name* **no 802.1p**

---

### Syntax Definitions

*condition\_name* The name of the condition. May be an existing condition name or a new condition.

*802.1p\_value* The 802.1p value in the 802.1Q VLAN tag for the flow. Values range from 0 (lowest priority) to 7 (highest priority).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of the command to remove an 802.1p value for a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond3 802.1p 7
```

### Release History

Release 7.1.1; command was introduced.

---

## policy condition inner 802.1p

Configures an inner (customer) source 802.1p value for a policy condition. This condition applies to double-tagged VLAN Stacking traffic and is used to classify such traffic based on the inner 802.1p bit value.

**policy condition** *condition\_name* **inner 802.1p** *802.1p\_value*

**policy condition** *condition\_name* **no inner 802.1p**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>802.1p_value</i>	The inner 802.1p value of the inner 802.1Q VLAN tag (customer VLAN) to match on double-tagged packets. Values range from 0 (lowest priority) to 7 (highest priority).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove an 802.1p value for a condition; however, at least one classification parameter must be associated with a condition.
- Policies that use the inner 802.1p condition are referred to as QoS VLAN Stacking policies. These are separate policies from those configured through the VLAN Stacking Service application.

### Examples

```
-> policy condition cond3 inner 802.1p 7
-> policy condition cond3 no inner 802.1p
```

### Release History

Release 7.1.1; command was introduced.

---

## policy condition source port

Configures a source port number for a policy condition. Use the **no** form of the command to remove a source port number from a condition.

**policy condition** *condition\_name* **source port** *slot/port[-port]*

**policy condition** *condition\_name* **no source port**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>slot/port</i>	The slot and port number (or range of ports) on which the frame is received.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of the command to remove a source port from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond2 source port 3/1
-> policy condition cond3 source port 3/2-4
```

### Release History

Release 7.1.1; command was introduced.

## policy condition destination port

Configures a destination port number for a policy condition.

**policy condition** *condition\_name* **destination port** *slot/port*[-*port*]

**policy condition** *condition\_name* **no destination port**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>slot/port</i>	The slot and port number (or range of ports) on which the frame is received.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a destination port from a condition; however, at least one classification parameter must be associated with a condition.
- The destination port condition is only applied to bridged traffic, it is not applied to routed traffic.

### Examples

```
-> policy condition cond3 destination port 4/2
-> policy condition cond4 destination port 4/3-4
```

### Release History

Release 7.1.1; command was introduced.

## policy condition source port group

Associates a source port group with a policy condition. Use the **no** form of the command to remove a source port group from a condition.

**policy condition** *condition\_name* **source port group** *group\_name*

**policy condition** *condition\_name* **no source port group**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>group_name</i>	The name of the source port group. Port groups are configured through the <b>policy port group</b> command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of the command to remove a source port group from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond6 source port group portgr4
```

### Release History

Release 7.1.1; command was introduced.

---

## policy condition vrf

Associates a Virtual Routing and Forwarding (VRF) instance with a policy condition.

**policy condition** *condition\_name* **vrf** {*vrf\_name* / **default**}

**policy condition** *condition\_name* **no vrf**

---

### Syntax Definitions

<i>condition_name</i>	The name of the condition. May be an existing condition name or a new condition.
<i>vrf_name</i>	The name of the VRF instance to which the QoS policy condition applies.
<b>default</b>	Specifies the default VRF instance.

### Defaults

By default, QoS policy conditions are not associated with any VRF instance. The policy applies across all instances.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a VRF instance from a condition; however, at least one classification parameter must be associated with a condition.
- VRF policies are configured in the default VRF, similar to how all other QoS policies are configured. If the VRF name specified does not exist, the policy is not allocated any system resources.
- Policies that do not specify a VRF name are considered global policies and are applied across all VRF instances and VLANs.
- Policies that specify the default VRF apply only to traffic in the default VRF instance.
- Policies that specify a VRF name apply only to traffic in the VRF instance associated with that name.
- The **switch** network group is supported only in VRF policies that specify the default VRF instance. If this group is specified in a global policy (no VRF specified) then the policy is applied across all VRF instances.

### Examples

```
-> policy condition cond6 vrf engr-vrf
-> policy condition cond7 vrf default
-> policy condition cond6 no vrf
```

### Release History

Release 7.1.1; command was introduced.

---

## policy condition fragments

Associates TCP packet fragments with a policy condition.

**policy condition** *condition\_name* **fragments**

**policy condition** *condition\_name* **no fragments**

---

### Syntax Definitions

*condition\_name*                      The name of the condition. May be an existing condition name or a new condition.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove TCP packet fragments from a condition; however, at least one classification parameter must be associated with a condition.

### Examples

```
-> policy condition cond6 fragments
-> policy condition cond7 no fragments
```

### Release History

Release 7.1.1; command was introduced.

```

---

## policy action

Configures or deletes a QoS action. A QoS action describes how traffic that matches a particular QoS condition should be treated. It may specify a particular set of bandwidth and queue parameters, or it may simply specify whether the flow is allowed or denied on the switch.

This section describes the base command. Optional keywords are listed below and described as separate commands later in this chapter. (Options may be used in combination but are described separately for ease in explanation.) Use the **no** form for keywords to remove the parameter from the action.

Note that some action parameters may not be supported depending on the platform you are using. Also some action parameters may not be supported with some conditions. See the condition table in your switch's *Network Configuration Guide*.

**policy action** *action\_name*

[**disposition** {**accept** | **drop** | **deny**}]  
 [**shared**]  
 [**priority** *priority\_value*]  
 [**maximum bandwidth** *bps*]  
 [**maximum depth** *bytes*]  
 [**cir** *bps* [**cbs** *bps*] [**pir** *bps*] [**pbs** *bps*] [**cpu priority** *priority*] [**color-only**]  
 [**tos** *tos\_value*]  
 [**802.1p** *802.1p\_value*]  
 [**dscp** *dscp\_value*]  
 [**map** {**802.1p** | **tos** | **dscp**} **to** {**802.1p** | **tos** | **dscp**} **using** *map\_group*]  
 [**permanent gateway ip** *ip\_address*]  
 [**port-disable**]  
 [**redirect port** *slot/port*]  
 [**redirect linkagg** *link\_agg*]  
 [**no-cache**]  
 [{**ingress** | **egress** | **ingress egress** | **no**} **mirror** *slot/port*]

**policy no action** *action\_name*

---

### Syntax Definitions

*action\_name* A name for the action, any alphanumeric string.

### Defaults

By default, no drop algorithm is configured for the action, and any queues created by the action are not shared.

parameter	default
<b>accept</b>   <b>drop</b>   <b>deny</b>	accept

### Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Any condition parameters that the hardware supports will be used to classify the traffic; any condition parameters that are not supported by the hardware will not be used to classify traffic, and the event will be logged in the QoS log.
- Bandwidth parameters may be specified when the action is created or may be specified as separate commands.
- Use the **qos apply** command to activate configuration changes.
- Use the **no** form of the command to remove a QoS action from the configuration.
- If the **snapshot** command is entered after the **policy action** command is configured, the resulting ASCII file will include the following additional syntax for the **policy action** command:

**from {cli | ldap | blt}**

This syntax indicates how the action was created. The **cli** and **ldap** options may be changed by a user modifying the ASCII file; however, changing this setting is not recommended. The **blt** option indicates a built-in action, this setting is not configurable.

## Examples

```
-> policy action action1 accept
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">policy condition</a>	Configures a condition associated with the action.

```

---

## policy action disposition

Configures a disposition for a policy action.

**policy action** *action\_name* **disposition** {**accept** | **drop** | **deny**}

**policy action** *action\_name* **no disposition**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<b>accept</b>	Specifies that the switch should accept the flow.
<b>drop</b>	Specifies that the switch should silently drop the flow.
<b>deny</b>	Specifies that the switch should drop the flow and issue an ICMP message indicating the flow was dropped for administrative reasons. Currently this option will provide the same result as <b>drop</b> ; that is, the flow is silently dropped.

### Defaults

parameter	default
<b>accept</b>   <b>drop</b>   <b>deny</b>	accept

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to remove a disposition from an action.

### Examples

```
-> policy action a3 disposition deny
-> policy action a3 no disposition
```

### Release History

Release 7.1.1; command was introduced.

---

## policy action shared

Enables bandwidth sharing among multiple QoS rules that use the same maximum bandwidth action.

**policy action** *action\_name* **shared**

**policy action** *action\_name* **no shared**

---

### Syntax Definitions

*action\_name*                      The name of the action.

### Defaults

By default, queues created by an action are *not* shared.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the **shared** policy action is not specified, then each bandwidth rule will implement a separate instance of the specified bandwidth allocation.
- Use the **no** form of the command to disable sharing.

### Example

```
-> policy action action5 maximum bandwidth 10m shared
-> policy action action6 maximum bandwidth 10m shared
-> policy action action5 no shared
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

  alaQoSAppliedActionName
  alaQoSAppliedActionShared
```

---

## policy action priority

Configures the priority for queuing a flow to which the QoS action applies.

**policy action** *action\_name* **priority** *priority\_value*

**policy action** *action\_name* **no priority**

---

### Syntax Definitions

*action\_name*

The name of the action.

*priority\_value*

The priority given to scheduling traffic on the output port. Values range from 0 (lowest) to 7 (highest).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a priority value from an action.
- This priority value is independent of 802.1Q, Type of Service (ToS), or Differentiated Services Code Point (DSCP) values.

### Examples

```
-> policy action action1 priority 1  
-> policy action action1 no priority
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[qos apply](#)

Applies configured QoS and policy settings to the current configuration.

[policy action](#)

Creates a policy action.

[show policy action](#)

Displays information about policy actions.

**MIB Objects**

```

  alaQoSAppliedActionPriority
  alaQoSAppliedActionPriorityStatus
```

---

## policy action maximum bandwidth

Configures a maximum bandwidth value for a policy action.

**policy action** *action\_name* **maximum bandwidth** *bps[k | m | g | t]*

**policy action** *action\_name* **no maximum bandwidth**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>bps[k   m   g   t]</i>	The maximum amount of bandwidth, in bits-per-second, for all traffic that ingresses on the port. The value may be entered as an integer (for example, <b>10</b> ) or with abbreviated units (for example, <b>10k</b> , <b>5m</b> , <b>1g</b> , <b>1t</b> ).

### Defaults

parameter	default
<i>k   m   g   t</i>	<b>k</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a maximum bandwidth value from an action.
- If the maximum bandwidth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum bandwidth value used. However, if **10G** is specified, the maximum bandwidth value applied is **10** gbps.
- Use the **shared** policy action to enabling sharing of bandwidth across policy rules that specify the same maximum bandwidth action.

### Examples

```
-> policy action action3 maximum bandwidth 10000
-> policy action action4 maximum bandwidth 10k shared
-> policy action action5 maximum bandwidth 10k shared
-> policy action action4 no maximum bandwidth
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">qos apply</a>	Applies configured QoS and policy settings to the current configuration.
<a href="#">policy action</a>	Creates a policy action.
<a href="#">show policy action</a>	Displays information about policy actions.

## MIB Objects

```
alaQoSActionTable
  alaQoSActionName
  alaQoSActionMaximumBandwidth
alaQoSAppliedActionTable
  alaQoSAppliedActionName
  alaQoSAppliedActionMaximumBandwidth
```

---

## policy action maximum depth

Configures the maximum bucket size assigned to this action. The bucket size determines how much the traffic can burst over the maximum bandwidth rate. When the bucket size is reached, the switch starts to drop packets.

**policy action** *action\_name* **maximum depth** *bps*[**k** | **m** | **g** | **t**]

**policy action** *action\_name* **no maximum depth**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>bps</i> [ <b>k</b>   <b>m</b>   <b>g</b>   <b>t</b> ]	The maximum bucket size, in bits-per-second. The value may be entered as an integer (for example, <b>10</b> ) or with abbreviated units (for example, <b>10k</b> , <b>5m</b> , <b>1g</b> ).

### Defaults

parameter	default
<b>k</b>   <b>m</b>   <b>g</b>   <b>t</b>	<b>k</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a maximum depth value from a policy action.
- If the maximum depth value is specified as an integer, without an abbreviated unit designation, the value is applied in kbps by default. For example, if the number **10** is specified, **10K** is the maximum depth value used. However, if **10G** is specified, the maximum depth value applied is **10** gbps.
- A maximum depth action is used in combination with a maximum bandwidth action.

### Examples

```
-> policy action action2 maximum depth 100
-> policy action action2 no maximum depth
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>qos apply</b>	Applies configured QoS and policy settings to the current configuration.
<b>policy action</b>	Creates a policy action.
<b>show policy action</b>	Displays information about policy actions.

  alaQoSActionMaximumDepth
alaQoSAppliedActionTable
  alaQoSAppliedActionName
  alaQoSAppliedActionMaximumDepth
```

---

## policy action cir

Configures a Tri-Color Marking (TCM) policy action. This type of action includes parameters for Committed Information Rate (CIR), Committed Burst Size (CBS), Peak Information Rate (PIR), and Peak Burst Size (PBS). The TCM policier meters and marks packets red, green, or yellow based on the parameter values of this policy action.

**policy action** *action\_name* **cir** *bps* [**cbs** *bps*] [**pir** *bps*] [**pbs** *bps*] [**color-only**]

**policy action** *action\_name* **no cir**

**policy action** *action\_name* **no pir**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>bps</i> [ <b>k</b>   <b>m</b>   <b>g</b>   <b>t</b> ]	The maximum amount of bandwidth, in bits-per-second, for all traffic that ingresses on the port. The value may be entered as an integer (for example, <b>10</b> ) or with abbreviated units (for example, <b>10k</b> , <b>5m</b> , <b>1g</b> , <b>1t</b> ).
<b>color-only</b>	Disables TCM rate limiting based on the metering results. Packets are only marked the specific color that applies to the level of packet conformance.

### Defaults

parameter	default
<b>cbs pir pbs</b> <i>bps</i>	0
<b>k</b>   <b>m</b>   <b>g</b>   <b>t</b>	<b>k</b>
<i>priority</i>	0

By default, this action enables rate limiting based on TCM marking and metering.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove the TCM parameter values.
- If the **color-only** parameter is specified with this command, the TCM action will only mark packet color; packets are not rate limited based on the metering results. In this case, packets are then subject to any rate limiting specifications as defined in the virtual flow control (VCF) queue configuration for the switch. See the [qos wred](#) command for more information.
- This implementation of TCM supports two rate limiting modes: Single-Rate (srTCM) and Two-Rate (trTCM). The srTCM mode marks packets based only on the CIR and the two burst sizes: CBS and PBS. The trTCM mode marks packets based on both the CIR and PIR and their associated CBS and PBS values.

- There is no explicit CLI command to configure the mode (srTCM or trTCM) in which the TCM meter operates. Instead, the mode is determined by the CIR and PIR values configured for the policy action. If the PIR value is greater than the CIR value, trTCM is used. If the PIR value is less than the CIR value, srTCM is used.
- Configuring CIR and CBS is similar to configuring a maximum bandwidth. Configuring CIR and PIR is similar to configuring maximum depth.
- The number of packets counted as a result of the counter color mode setting is displayed using the **show active policy rule** command. These statistics are only shown for those rules that are configured with a TCM policy action.

## Examples

The following command examples configure srTCM (the default):

```
-> policy action A3 cir 10M
-> policy action A4 cir 10M cbs 4k
-> policy action A5 cir 10M cbs 4k pir 10M
-> policy action A6 cir 10M cbs 4k pir 10M pbs 4k
-> policy action a7 cir 5M cbs 2k color-only
-> policy action A3 no cir
-> policy action A5 no pir
```

The following command examples configure trTCM (note that PIR is greater than CIR):

```
-> policy action A7 cir 10M cbs 4k pir 20M
-> policy action A8 cir 10M cbs 4k pir 20M pbs 40M
-> policy action a9 cir 5M cbs 1M pbs 10M pbs 2M color-only
-> policy action A7 no cir
```

---

## policy action cpu priority

Configures a CPU priority policy action.

**policy action** *action\_name* **cpu priority** *priority*

**policy action** *action\_name* **no cpu priority**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>priority</i>	The CPU queue on which packets destined for the CPU are received. The valid range is 0–31.

### Defaults

By default, the CPU priority is set to zero.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to remove the CPU priority parameter value.

### Examples

```
-> policy action A7 cpu priority 15
-> policy action A8 cpu priority 31
-> policy action A7 no cpu priority
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

---

## policy action tos

Configures a Type of Service (ToS) bits value to be applied to packets in outgoing flows to which the specified policy applies.

**policy action** *action\_name* **tos** *tos\_value*

**policy action** *action\_name* **no tos**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>tos_value</i>	The three-bit priority value in the IP header that should be set on outgoing frames in flows that match the specified policy. Values range from 0 (lowest priority) to 7 (highest priority).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a ToS value from a policy action.
- Note that specifying both ToS and DSCP in the same action is *not* allowed.

### Examples

```
-> policy action action3 tos 4
-> policy action action3 no tos
```

### Release History

Release 7.1.1; command was introduced.

  alaQoSAppliedActionTos
```

---

## policy action 802.1p

Configures a value to be set in the 802.1p bits of the 802.1Q byte of an outgoing frame for traffic that matches a policy with this action.

**policy action** *action\_name* **802.1p** *802.1p\_value*

**policy action** *action\_name* **no 802.1p**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>802.1p_value</i>	The priority value to be set in 802.1Q frames. Values range from 0 (lowest priority) to 7 (highest priority).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove an 802.1p value from a policy action.
- Note that specifying both ToS and DSCP in the same action is not allowed.

### Examples

```
-> policy action action4 802.1p 7
-> policy action action4 no 802.1p
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

    alaQoSAppliedActionName  
    alaQoSAppliedAction8021p

---

## policy action dscp

Configures a Differentiated Services Code Point (DSCP) value to be set in an outgoing flow for traffic that matches rules with this action.

**policy action** *action\_name* **dscp** *dscp\_value*

**policy action** *action\_name* **no dscp**

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<i>dscp_value</i>	The DSCP value to be set, in the range 0–63.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a DSCP value from a policy action.
- Note that specifying both ToS and DSCP in the same action is *not* allowed.

### Examples

```
-> policy action action2 dscp 61
-> policy action action2 no dscp
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

    alaQoSAppliedActionName

    alaQoSAppliedActionDscp

---

## policy action map

Configures a mapping group for a policy action.

**policy action map {802.1p | tos | dscp} to {802.1p | tos| dscp} using *map\_group***

**policy action no map**

---

### Syntax Definitions

<b>802.1p</b>	Indicates that an 802.1p value should be mapped.
<b>tos</b>	Indicates that a ToS value should be mapped.
<b>dscp</b>	Indicates that a DSCP value should be mapped.
<i>map_group</i>	The name of the map group, configured through the <a href="#">policy map group</a> command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When remapping is configured with this command and a flow matches a policy with this remapping action, and the 802.1p, ToS, or DSCP setting in the incoming flow is specified by the map group, the value will be remapped in the outgoing flow according to the map group.
- If the 802.1p, ToS, or DSCP setting in the incoming flow is not a value specified in the map group, the switch will do one of two things:

If the *remap from* and *remap to* types are the same (802.1p to 802.1p, ToS to ToS, or DSCP to DSCP), the values in the outgoing flow will be unchanged. If the *remap from* and *remap to* types are not the same (for example: 802.1p to ToS), the switch will determine the outgoing 802.1p and ToS based on whether or not the port is trusted or untrusted).

- Use the **no** form of the command to delete the map group from the configuration.

### Examples

```
-> policy action a1 map 802.1p to 802.1p using mapGroup2
-> policy action a2 map 802.1p to tos using mapGroup3
```

### Release History

Release 7.1.1; command was introduced.

```

---

## policy action permanent gateway-ip

Used for Policy Based Routing (PBR). Routed flows to which this action is applied will be directed to the IP address specified in the action regardless of whether or not a route already exists in the switch routing table.

**policy action** *action\_name* **permanent gateway-ip** *ip\_address*

**policy action** *action\_name* **no permanent gateway-ip**

---

### Syntax Definitions

*action\_name* The name of the action.

*ip\_address* The destination IP address to which packets will be routed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a gateway IP address from a policy action.
- If the gateway goes down, the traffic to be routed over the gateway will be dropped.

### Examples

```
-> policy action pbr2 permanent gateway-ip 10.10.2.1  
-> policy action pbr2 no permanent gateway-ip
```

### Release History

Release 7.1.1; command was introduced.

## policy action port-disable

Administratively disables the source port of the traffic to which this action is applied.

**policy action** *action\_name* **port-disable**

**policy action** *action\_name* **no port-disable**

---

### Syntax Definitions

*action\_name*                      The name of the action.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove **port-disable** from the policy action.
- An SNMP trap is sent when a port is administratively disabled through a port disable action or a User-Ports shutdown function.
- To enable a port disabled by this action, use the **interfaces** or **clear violation** command to administratively enable the port, or physically disconnect and reconnect the port cable.

### Examples

```
-> policy action pd01 port-disable
-> policy action pb02 no port-disable
```

### Release History

Release 7.1.1; command was introduced.

---

## policy action redirect port

Redirects all traffic (flooded, bridged, routed, and multicast) matching a redirect policy to the specified port instead of the port to which the traffic was destined.

**policy action** *action\_name* **redirect port** *slot/port*

**policy action** *action\_name* **no redirect port**

---

### Syntax Definitions

*action\_name*                      The name of the action.

*slot/port*                         The slot and port number that will receive the redirected traffic.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove **redirect port** from the policy action.
- When redirecting routed traffic from VLAN A to VLAN B, the redirect port must belong to VLAN B (tagged or default VLAN).
- Routed packets (from VLAN A to VLAN B) are not modified after they are redirected; the source and MAC address remain the same. In addition, if the redirect port is tagged, the redirected packets will have a tag from the ingress VLAN A.
- If a route exists for the redirected flow, then redirected packets are the final post-routing packets.
- If a route does not exist for the redirected flow, the flow is not redirected to the specified port or link aggregate and is “blackholed”. As soon as a route is available, the flow is then redirected as specified in the policy.
- In most cases, a redirected flow will *not* trigger an update to the routing and ARP tables. If necessary, create a static route for the flow or assign the redirect port to the ingress VLAN (VLAN A) to send packets to the redirect port until a route is available.
- When redirecting bridged traffic on VLAN A, the redirect port must belong to VLAN A (tagged or default VLAN).

### Examples

```
-> policy action rp01 redirect port 1/12
-> policy action rp01 no redirect port
```

### Release History

Release 7.1.1; command was introduced.

```

---

## policy action redirect linkagg

Redirects all traffic (flooded, bridged, routed, and multicast) matching a redirect policy to the specified link aggregate ID instead of the link aggregate to which the traffic was destined.

**policy action** *action\_name* **redirect linkagg** *link\_agg*

**policy action** *action\_name* **no redirect linkagg**

---

### Syntax Definitions

*action\_name* The name of the action.

*link\_agg* The link aggregate ID number (0–32) to assign to the specified VLAN. See [Chapter 12, “Link Aggregation Commands.”](#)

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove **redirect linkagg** from the policy action.
- When redirecting routed traffic from VLAN A to VLAN B, the redirect link aggregate ID must belong to VLAN B (tagged or default VLAN).
- Routed packets (from VLAN A to VLAN B) are not modified after they are redirected; the source and MAC address remain the same. In addition, if the redirect link aggregate ID is tagged, the redirected packets will have a tag from the ingress VLAN A.
- If a route exists for the redirected flow, then redirected packets are the final post-routing packets.
- If a route does not exist for the redirected flow, the flow is not redirected to the specified link aggregate ID and is “blackholed”. As soon as a route is available, the flow is then redirected as specified in the policy.
- In most cases, a redirected flow will *not* trigger an update to the routing and ARP tables. If necessary, create a static route for the flow or assign the redirect port or link aggregate ID to the ingress VLAN (VLAN A) to send packets to the redirect port until a route is available.
- When redirecting bridged traffic on VLAN A, the redirect port or link aggregate ID must belong to VLAN A (tagged or default VLAN).

### Examples

```
-> policy action rp01 redirect port 1/12
-> policy action rp01 no redirect port
```

```

---

## policy action no-cache

Disables logging of rule entries to the hardware cache.

**policy action** *action\_name* **no-cache**

**policy action** *action\_name* **no no-cache**

---

### Syntax Definitions

*action\_name*                      The name of the action.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove **no cache** from the policy action.
- Recommended for use when applied to traffic going to the switch.

### Examples

```
-> policy action nc01 no-cache  
-> policy action nc01 no no-cache
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

```

---

## policy action mirror

Mirrors ingress, egress, or both ingress and egress packets that match a mirroring policy to the specified port.

**policy action** *action\_name* [**ingress** | **egress** | **ingress egress**] **mirror** *slot/port*

**policy action** *action\_name* **no mirror** *slot/port*

---

### Syntax Definitions

<i>action_name</i>	The name of the action.
<b>ingress</b>	Mirrors ingress packets.
<b>egress</b>	Mirrors egress packets.
<b>ingress egress</b>	Mirrors ingress and egress packets.
<i>slot/port</i>	The slot and port number that will receive the mirrored traffic.

### Defaults

parameter	default
<b>ingress</b>   <b>egress</b>   <b>ingress egress</b>	<b>ingress</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove **mirror** from the policy action.
- Use this command to configure a mirror-to-port (MTP) action that is used for policy based mirroring.
- Only one MTP session is supported at any given time. As a result, all mirroring policies should specify the same MTP port.
- Policy based mirroring and the port based mirroring feature can run simultaneously on the same switch.

### Examples

```
-> policy action a1 mirror 1/7 (default ingress)
-> policy action a1 ingress mirror 1/7
-> policy action a1 egress mirror 1/7
-> policy action a1 ingress egress mirror 1/7
-> policy action a1 no mirror
```

### Release History

Release 7.1.1; command was introduced.

```

---

## show policy network group

Displays information about pending and applied policy network groups.

**show [applied] policy network group** [*network\_group*]

---

### Syntax Definitions

<b>applied</b>	Indicates that only network groups that have been applied should be displayed.
<i>network_group</i>	The name of the policy network group for which you want to display information; or a wildcard sequence of characters for displaying information about network groups with similar names. Use an asterisk (*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Information for all policy network groups displays unless *network\_group* is specified.

### Examples

```
-> show policy network group
Group Name      : netg1
State           = new,
Entries         = 198.206.10.1
```

```
-> show policy network group
Group Name      : group1
Entries         = 203.185.129.0 mask 255.255.255.0,
                  203.185.131.192 mask 255.255.255.192,
                  203.185.132.0 mask 255.255.252.0,
                  204.226.0.0 mask 255.255.0.0
```

### *output definitions*

---

<b>Group Name</b>	The name of the port group, configured through the <b>policy network group</b> command.
<b>State</b>	This field appears if the group was created or modified but not yet applied to the QoS configuration. When the <b>qos apply</b> command is issued, this field no longer displays.
<b>Entries</b>	The IP addresses associated with the network group.

## show policy service

Displays information about pending and applied policy services.

**show [applied] policy service** [*service\_name*]

---

### Syntax Definitions

#### applied

Indicates that only services that have been applied should be displayed.

#### *service\_name*

The name of the service for which you want to display information; or a wildcard sequence of characters for displaying information about services with similar names. Use an asterisk (\*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Information about all policy services is displayed unless *service\_name* is specified.

### Examples

```
-> show policy service
Service name           : s1
State                  = new,
Destination UDP port   = 1001-2004
```

#### *output definitions*

                2:18,
                3:27,
                4:36,
                5:45,
                6:54,
                7:63
```

### *output definitions*

---

<b>Group Name</b>	The name of the map group, configured through the <b>policy map group</b> command.
<b>State</b>	This field appears if the group was created or modified but not yet applied to the QoS configuration. When the <b>qos apply</b> command is issued, this field no longer displays.
<b>Entries</b>	The slot/port combinations associated with the port group.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

### [policy map group](#)

Configures a map group and its associated mappings for 802.1p, Type of Service (ToS), or Differentiated Services Code Point (DSCP) values.

## MIB Objects

```

  alaQoSMapGroupsName
  alaQoSMapGroupsSource
alaQoSAppliedMapGroupsTable
  alaQoSAppliedMapGroupsName
  alaQoSAppliedMapGroupsSource
alaQoSMapGroupTable
  alaQoSMapGroupKey
  alaQoSMapGroupKeyEnd
  alaQoSMapGroupValue
alaQoSAppliedMapGroupTable
  alaQoSAppliedMapGroupKey
  alaQoSAppliedMapGroupKeyEnd
  alaQoSAppliedMapGroupValue
```

---

## show policy action

Displays information about pending and applied policy actions configured on the switch.

**show [applied] policy action** [*action\_name*]

---

### Syntax Definitions

#### applied

Indicates that only actions that have been applied should be displayed.

#### *action\_name*

The name of the action for which you want to display information; or a wildcard sequence of characters for displaying information about actions with similar names. Use an asterisk (\*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Information for all policy actions displays unless *action\_name* is specified.

### Examples

```
-> show policy action
Action name           : a1
  Committed Information Rate = 10.0M,
  Committed Burst size    = 5.00M,
  Peak Information Rate    = 20.0M,
  Peak Burst size         = 5.00M

Action name           : a2
  State                 = new,
  Disposition           = deny

Action name           : a3
  State                 = new,
  Priority               = 7,

-> show applied policy action
Action name           : a1
  Committed Information Rate = 10.0M,
  Committed Burst size    = 5.00M,
  Peak Information Rate    = 20.0M,
  Peak Burst size         = 5.00M
```

*output definitions*

---

<b>Action Name</b>	The name of the action, configured through the <b>policy action</b> command.
<b>State</b>	This field appears if the action was created or modified but not yet applied to the QoS configuration. When the <b>qos apply</b> command is issued, this field no longer displays.
<b>Policy Action Parameters</b>	Displays the configured policy action parameters.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**policy action** Creates a policy action. A QoS action is a particular set of bandwidth and queue parameters that may be applied to a flow matching particular QoS conditions.

**MIB Objects**

alaQoSActionTable

```

alaQoSActionName
alaQoSActionSource
alaQoSActionDisposition
alaQoSActionShared
alaQoSActionMinimumBandwidth
alaQoSActionMaximumBandwidth
alaQoSActionMaximumDepth

alaQoSAppliedActionSource
alaQoSAppliedActionDisposition
alaQoSAppliedActionShared
alaQoSAppliedActionMinimumBandwidth
alaQoSAppliedActionMaximumBandwidth
alaQoSAppliedActionMaximumDepth

```

---

## show policy condition

Displays information about pending and applied policy conditions.

**show [applied] policy condition** [*condition\_name*]

---

### Syntax Definitions

<b>applied</b>	Indicates that only conditions that have been applied should be displayed.
<i>condition_name</i>	The name of the condition for which you want to display information; or a wildcard sequence of characters for displaying information about conditions with similar names. Use an asterisk (*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Information for all policy conditions displays unless *condition\_name* is specified.

### Examples

```
-> show policy condition
Condition name           : c1
  Source VLAN           = 1001

Condition name           : c2
  State                 = new,
  Source IP              = 10.2.2.1,
  Destination UDP port  = 17

-> show applied policy condition
Condition name           : c1
  Source VLAN           = 1001
```

### *output definitions*

---

<b>Condition Name</b>	The name of the condition, configured through the <b>policy condition</b> command.
<b>State</b>	This field appears if the condition was created or modified but not yet applied to the QoS configuration. When the <b>qos apply</b> command is issued, this field no longer displays.
<b>Policy Condition Parameters</b>	Displays the configured policy condition parameters.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

### [policy condition](#)

Creates a policy condition. The condition determines what parameters the switch uses to classify incoming flows.

## MIB Objects

---

## show active policy rule

Displays information about pending and applied policy rules that are active (enabled) on the switch.

**show active** [**bridged** | **routed** | **multicast**] **policy rule** [*rule\_name*]

---

### Syntax Definitions

<b>bridged</b>	Displays active rules that apply to bridged traffic.
<b>routed</b>	Displays active rules that apply to routed traffic.
<b>multicast</b>	Displays active rules that apply to multicast traffic.
<i>rule_name</i>	The name of the rule for which you want to display information; or a wildcard sequence of characters for displaying information about rules with similar names. Use an asterisk (*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **show policy rule** command to display inactive as well as active policy rules.
- Information for all rules is displayed unless *rule\_name* is specified.
- Information for all rule types is displayed unless a keyword (**bridged**, **routed**, **multicast**) is specified.
- Applied rules may or may not be active on the switch. Applied rules are inactive if they have been administratively disabled with the **disable** option in the **policy rule** command.

### Examples

```
-> show active policy rule
Rule name           : r1
Condition name      = c1,
Action name         = a1,
Packets             = 4166772,
Bytes               = 266665728
```

### output definitions

---

<b>Rule name</b>	The name of the policy rule, configured through the <b>policy rule</b> command.
<b>State</b>	This field appears if the rule was created or modified but not yet applied to the QoS configuration. When the <b>qos apply</b> command is issued, this field no longer displays.
<b>Condition name</b>	The name of the condition configured for this rule.

---

*output definitions (continued)*

---

<b>Action name</b>	The name of the action configured for this rule.
<b>Packets</b>	The number of packets that match this rule.
<b>Bytes</b>	The number of bytes that match this rule.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**policy rule** Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

**MIB Objects**

```
alaQoSRuleTable
  alaQoSRuleName
  alaQoSRuleEnabled
  alaQoSRuleSource
  alaQoSRulePrecedence
  alaQoSRuleActive
  alaQoSRuleReflexive
  alaQoSRuleLog
  alaQoSRuleTrapEvents
  alaQoSRuleSave
  alaQoSRuleCondition
  alaQoSRuleAction
```

---

## show policy rule

Displays information about pending and applied policy rules.

```
show [applied] [bridged | routed | multicast] policy rule [rule_name]
```

---

### Syntax Definitions

<b>applied</b>	Indicates that only policy rules that have been applied should be displayed.
<b>bridged</b>	Displays rules that apply to bridged traffic.
<b>routed</b>	Displays rules that apply to routed traffic.
<b>multicast</b>	Displays rules that apply to multicast traffic.
<i>rule_name</i>	The name of the rule for which you want to display information; or a wildcard sequence of characters for displaying information about rules with similar names. Use an asterisk (*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Information for all rules is displayed unless *rule\_name* is specified.
- Information for all rule types is displayed unless a keyword (**bridged**, **routed**, **multicast**) is specified.
- Use the [show active policy rule](#) command to display only active rules that are currently being enforced on the switch.

### Examples

```
-> show policy rule
Rule name           : r1
  Condition name    = c1,
  Action name       = a1

Rule name           : r2
  State             = new,
  Condition name    = c2,
  Action name       = a1

Rule name           : r3
  State             = new,
  Condition name    = c2,
  Action name       = a2
```

```
-> show applied policy rule
Rule name           : r1
Condition name      = c1,
Action name         = a1
```

### *output definitions*

---

<b>Rule name</b>	The name of the policy rule, configured through the <b>policy rule</b> command.
<b>State</b>	This field appears if the rule was created or modified but not yet applied to the QoS configuration. When the <b>qos apply</b> command is issued, this field no longer displays.
<b>Condition name</b>	The name of the condition configured for this rule.
<b>Action name</b>	The name of the action configured for this rule.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**policy rule** Configures a policy rule on the switch. A rule is made up of a condition (for classifying incoming traffic) and an action (to be applied to outgoing traffic).

```

---

## show policy validity period

Displays information about policy validity periods.

**show policy validity period** [*name*]

---

### Syntax Definitions

*name* The name of the validity period.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Information for all validity periods is displayed unless *name* is specified.
- Use the [show policy rule](#) command to display the validity period that is associated with a policy rule.

### Examples

```
-> show policy validity-period
Validity period name = tuesday
State                = new,
Days                 = tuesday

Validity period name = february
Months               = february

-> show applied policy validity-period
Validity period name = february
Months               = february
```

### output definitions

---

<b>Validity period name</b>	The name of the policy validity period, configured through the <a href="#">policy validity period</a> command.
<b>State</b>	This field appears if the validity period was created or modified but not yet applied to the QoS configuration. When the <b>qos apply</b> command is issued, this field no longer displays.
<b>Days</b>	The days of the week the validity period is active, configured through the <a href="#">policy validity period</a> command. If this field does not appear, then the validity period is not restricted to specific days.
<b>Months</b>	The months during which the validity period is active, configured through the <a href="#">policy validity period</a> command. If this field does not appear, then the validity period is not restricted to specific months.

*output definitions*

---

<b>Hours</b>	The time of day the validity period begins and ends, configured through the <b>policy validity period</b> command. If this field does not appear, then the validity period is not restricted to a specific time.
<b>Interval</b>	The date and time a validity period interval begins and ends, configured through the <b>policy validity period</b> command. If this field does not appear, then the validity period is not restricted to a specific date and time interval.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**policy validity period** Configures a validity period that specifies days, times, and/or months during which an associated policy rule is in effect.

**MIB Objects**

```

alaQoSValidityPeriodTable
  alaQoSValidityPeriodName
  alaQoSValidityPeriodSource
  alaQoSValidityPeriodDays
  alaQoSValidityPeriodDaysStatus
  alaQoSValidityPeriodMonths
  alaQoSValidityPeriodMonthsStatus
  alaQoSValidityPeriodHour
  alaQoSValidityPeriodHourStatus
  alaQoSValidityPeriodEndHour
  alaQoSValidityPeriodInterval
  alaQoSValidityPeriodIntervalStatus
  alaQoSValidityPeriodEndInterval
alaQoSAppliedValidityPeriodTable
  alaQoSAppliedValidityPeriodName
  alaQoSAppliedValidityPeriodSource

  alaQoSAppliedValidityPeriodEndHour
  alaQoSAppliedValidityPeriodInterval
  alaQoSAppliedValidityPeriodIntervalStatus
  alaQoSAppliedValidityPeriodEndInterval

```

---

## show active policy list

Displays information about applied policy lists that are active (enabled) on the switch.

**show active policy list** [*list\_name*]

---

### Syntax Definitions

*list\_name*

The name of the list for which you want to display information; or a wildcard sequence of characters for displaying information about lists with similar names. Use an asterisk (\*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Information for all active rules is displayed unless a *list\_name* is specified.
- Use the [show policy list](#) command to display inactive as well as active policy lists.
- Applied lists may or may not be active on the switch. Applied lists are inactive if they have been administratively disabled with the **disable** option in the **policy list** command.
- The display may include any of the following characters:

character	definition
+	Indicates that the policy list has been modified or has been created since the last <b>qos apply</b> .
-	Indicates the policy list is pending deletion.
#	Indicates that the policy list differs between the pending/applied lists.

### Examples

```
-> show active policy list
Group Name                               From  Type  Enabled  Entries
-----
list1                                     cli   unp   Yes      r1
                                           r2
+list2                                     cli   unp   Yes      r3
egress_list1                             cli   egress Yes      r1
                                           r2
                                           r3
```

*output definitions*

---

<b>Group Name</b>	The name of the policy list. Configured through the <b>policy list</b> command. A plus sign (+) preceding a policy list name indicates that the list was modified or created since the last <b>qos apply</b> .
<b>From</b>	Where the list originated.
<b>Type</b>	The type of rule ( <b>unp</b> or <b>egress</b> ). Configured through the <b>policy list</b> command. Note that the default policy list is not shown. Use the <b>show policy rule</b> command to display rules that are members of the default policy list.
<b>Enabled</b>	Whether or not the rule is enabled. Configured through the <b>policy list</b> command.
<b>Entries</b>	The QoS policy rules that are grouped together in this policy list. Configured through the <b>policy list</b> command.

---

**Release History**

Release 7.2.1; command was introduced.

**Related Commands**

**show policy list**

Displays information about pending and applied policy lists.

**show policy rule**

Displays information about pending and applied policy rules

## show policy list

Displays information about pending and applied policy lists.

**show [applied] policy list** [*list\_name*]

---

### Syntax Definitions

#### applied

Displays only those policy lists that have been applied to the switch configuration.

#### *list\_name*

The name of the list for which you want to display information; or a wildcard sequence of characters for displaying information about lists with similar names. Use an asterisk (\*) to indicate a wildcard character.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Information for all rules is displayed unless a *list\_name* is specified.
- Use the [show active policy list](#) command to display only active policy lists that are currently enforced on the switch.
- The display may include any of the following characters:

character	definition
+	Indicates that the policy list has been modified or has been created since the last <b>qos apply</b> .
-	Indicates the policy list is pending deletion.
#	Indicates that the policy list differs between the pending/applied lists.

### Examples

```
-> show policy list
Group Name          From  Type  Enabled  Entries
list1               cli   unp   Yes      r1
                   r2

+list2              cli   unp   Yes      r3

egress_list1        cli   egress No       r1
                   r2
                   r3
```

```

-> show applied policy list
Group Name          From  Type  Enabled  Entries
list1               cli   unp   Yes      r1
                   r2

egress_list1       cli   egress No       r1
                   r2
                   r3

```

### output definitions

# 29 Policy Server Commands

This chapter describes CLI commands used for managing policies downloaded to the switch from an attached LDAP server. Policy rules can be created on an attached server through the PolicyView GUI application. Policy rules can also be created on the switch directly through CLI or SNMP commands. This chapter describes commands related to managing LDAP policies only. See [Chapter 27, “QoS Commands,”](#) for information about commands for creating and managing policies directly on the switch.

The policy commands are based on RFC 2251 and RFC 3060.

MIB information for policy server commands is as follows:

*Filename:* alcatelIND1policy.mib  
*Module:* ALCATEL-IND1-POLICY-MIB

The policy server commands are summarized here:

---

**policy server load**  
**policy server flush**  
**policy server**  
**show policy server**  
**show policy server long**  
**show policy server statistics**  
**show policy server rules**  
**show policy server events**

---

## policy server load

Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

**policy server load**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Policies are downloaded to the switch from the directory server with the highest preference setting; this server must be enabled and operational (able to bind).

### Examples

```
-> policy server load
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[policy server flush](#) Removes all cached LDAP policy data from the switch.

### MIB Objects

```
serverPolicyDecision
```

---

## policy server flush

Removes all cached LDAP policy data from the switch.

**policy server flush**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use this command to remove LDAP policies. Policies configured through the CLI or SNMP are not removed.

### Examples

```
-> policy server flush
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

#### [policy server load](#)

Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

### MIB Objects

```
serverPolicyDecision
```

---

## policy server

Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

```
policy server ip_address [port port_number] [admin-state {enable | disable}] [preference preference]  
[user user_name password password] [searchbase search_string] [ssl | no ssl]
```

```
no policy server ip_address [port port_number]
```

---

### Syntax Definitions

<i>ip_address</i>	The IP address of the LDAP-enabled directory server.
<i>port_number</i>	The TCP/IP port number used by the switch to connect to the directory server.
<b>enable</b>	Enables the specified policy server to download rules to the switch. The policy servers are <b>up</b> by default.
<b>disable</b>	Prevents the specified policy server from downloading rules to the switch.
<i>preference</i>	Determines which directory server is used for policy downloads when multiple servers are configured. The range is 0–255. The server with the highest value is used as the policy server. If that server becomes unavailable, the server with the next highest preference value is used for policy downloads.
<i>user_name</i>	The user name for accessing the database entries on the directory server. When spaces are used in the user name, quotation marks must be included: (e.g. “Directory Manager”).
<i>password</i>	The password associated with the user name. The password must match the password defined on the directory server.
<i>search_string</i>	The root of the directory required for searching the policy information. Typically, the <i>search_string</i> includes <b>o=organization</b> and <b>c=country</b> . For example, <b>o=company</b> and <b>c=country</b> .
<b>ssl</b>	Enables a Secure Socket Layer between the switch and the policy server.
<b>no ssl</b>	Disables a Secure Socket Layer between the switch and the policy server.

## Defaults

parameter	default
<b>admin</b>	<b>up</b>
<i>port_number</i>	389 (SSL disabled) 636 (SSL enabled)
<i>preference</i>	0
<b>ssl   no ssl</b>	<b>no ssl</b>

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

If you change the port number, another entry is added to the policy server table; the existing port number is not changed. To remove a port number, use the **no** form of this command with the relevant policy server IP address and the port number you want to remove.

## Examples

```
-> policy server 222.22.22.2 port 345 user dirmgr password secret88 searchbase
ou=qos,o=company,c=country
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

[show policy server](#) Displays information about policies downloaded from an LDAP server.

## MIB Objects

```
DIRECTORYSERVERTABLE
  directoryServerAddress
  directoryServerPort
  directoryServerAdminStatus
  directoryServerPreference
  directoryServerUserId
  directoryServerAuthenticationType
  directoryServerPassword
  directoryServerSearchbase
  directoryServerEnableSSL
```

## show policy server

Displays information about servers from which policies can be downloaded to the switch.

**show policy server**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays basic information about policy servers. Use the **show policy server long** command to display more details about the servers.

### Examples

```
-> show policy server
```

```
Server  IP Address  port  enabled  status  primary
-----+-----+-----+-----+-----+-----
   1    208.19.33.112  389    Yes     Up      X
   2    208.19.33.66   400    No      Down    -
```

#### *output definitions*

---

<b>Server</b>	The index number corresponding to the LDAP server.
<b>IP Address</b>	The IP address of the LDAP server.
<b>port</b>	The TCP/IP port number used by the switch to connect to the policy server.
<b>enabled</b>	Whether or not the policy server is enabled.
<b>status</b>	The state of the policy server, <b>Unkn</b> , <b>Up</b> or <b>Down</b> .
<b>primary</b>	Indicates whether the server is the primary server; this server can be used for the next download of policies; only one server is a primary server.

---

### Release History

Release 7.1.1; command introduced.

**Related Commands****policy server**

Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

**MIB Objects**

```
directoryServerTable
  directoryServerAddress
  directoryServerPort
  directoryServerAdminState
```

---

## show policy server long

Displays more detailed information about an LDAP policy server.

**show policy server long**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays detailed information about policy servers. Use the **show policy server** command to display basic information about policy servers.

### Examples

```
-> show policy server long
LDAP server 0
  IP address       : 155.132.44.98,
  TCP port        : 16652,
  Enabled         : Yes,
  Operational status : Unkn,
  Preference      : 99,
  Authentication  : password,
  SSL            : Disabled,
  login DN       : cn=Directory Manager,
  searchbase     : ou:4.1, cn=policyRoot, o=company.fr
  Last load time  : 09/13/01 16:38:18
LDAP server 1
  IP address       : 155.132.48.27,,
  TCP port        : 21890,
  Enabled         : Yes,
  Operational status : Unkn,
  Preference      : 50,
  Authentication  : password,
  SSL            : Disabled,
  login DN       : cn=Directory Manager,
  searchbase     : o=company.fr
  Last load time  : 00/00/00 00:00:00
```

### *output definitions*

---

<b>IP address</b>	The IP address of the policy server.
<b>TCP port</b>	The TCP/IP port number used by the switch to connect to the policy server.

*output definitions (continued)*

---

<b>Enabled</b>	Displays whether the policy server is enabled through the PolicyView application.
<b>Operational status</b>	The state of the policy server, <b>Up</b> or <b>Down</b> .
<b>Preference</b>	Determines which directory server is used for policy downloads when multiple servers are configured. The range is 0–255. The server with the highest value is used as the policy server. If that server becomes unavailable, the server with the next highest preference value is used for policy downloads.
<b>Authentication</b>	Displays <b>password</b> if a user name and password was specified for the server through the <b>policy server</b> command. Displays <b>anonymous</b> if a user name and password are not configured.
<b>login DN</b>	The directory user name.
<b>searchbase</b>	The searchbase name, which is the root of the directory that can be searched for policy download information.
<b>Last load time</b>	The date and time that policies were last downloaded. Values of zero indicate that no policies have been downloaded.

---

**Release History**

```

---

## show policy server statistics

Displays statistics about policy directory servers.

**show policy server statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays statistics about server downloads. For information about server parameters, use the **show policy server** command.

### Examples

```
-> show policy server statistics
Server  IP Address      port  accesses  delta  successes delta  errors  delta
-----+-----+-----+-----+-----+-----+-----+-----+-----
   1    155.132.44.98 16652    793     793     295     295     0       0
   2    155.132.48.27 21890     0       0       0       0     0       0
```

### output definitions

---

<b>Server</b>	The index number corresponding to the server.
<b>IP Address</b>	The IP address of the LDAP server.
<b>port</b>	The TCP/IP port number used by the switch to connect to the policy server.
<b>accesses</b>	The number of times the server was polled by the switch to download policies.
<b>delta</b>	The change in the number of accesses since the last time the policy server was accessed.
<b>successes</b>	The number of times the server was polled by the switch to download policies and the policies were successfully downloaded.
<b>delta</b>	The change in the number of successful policy downloads since the last time the policy server was accessed.
<b>errors</b>	The number of errors returned by the server.
<b>delta</b>	The change in the number of errors returned by the server since the last time the policy server was accessed.

---

## Release History

Release 7.1.1; command introduced.

## Related Commands

Configures operational parameters for an LDAP-enabled directory server on which policies are stored.

## MIB Objects

policyStatsTable

    policyStatsAddress

    policyStatsServerPort

    policyStatsAccessCount

    policyStatsSuccessAccessCount

    policyStatsNotFoundCount

---

## show policy server rules

Displays the names of policies originating from a directory server, that have been downloaded to the switch.

**show policy server rules**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays information about policies created on directory servers only. [Chapter 27, “QoS Commands,”](#) for information about configuring and displaying policies directly on the switch.

### Examples

```
-> show policy server rules
Num      name          prio      scope      status
-----+-----+-----+-----+-----
1         QoSRule1       0         Provisioned Active
2         QoSrule2       0         Provisioned Active
```

Fields are defined here:

#### *output definitions*

---

<b>Num</b>	An index number corresponding to the policy rule.
<b>name</b>	The name of the policy rule; only rules configured through PolicyView are displayed in this table.
<b>prio</b>	The priority or preference of the rule. Indicates the order in which rules can be checked to match to the incoming traffic. If two or more rules apply to the traffic, the rule with the highest preference is applied. Preference is determined when the rule is created.
<b>scope</b>	The type of rule. <b>Provisioned</b> is the only type valid for the current release.
<b>status</b>	The status of the rule: <b>Active</b> indicates that the rule <del>has been pushed to</del> is available in the QoS software on the switch and is available to be applied to the traffic; <b>notInService</b> means the rule can be pushed to the QoS software in the future but is not available yet (typically because of a variable validity period); <b>notReady</b> indicates that the rule can never be pushed to the QoS software because its validity period has expired or because it has been disabled through SNMP.

---

## Release History

Release 7.1.1; command introduced.

## Related Commands

### [policy server load](#)

Downloads policies from a LDAP server. These policies are created through the PolicyView management application.

## MIB Objects

```
policyRuleNamesTable
  policyRuleNamesIndex
  policyRuleNamesName
  policyRuleOperStatus
```

---

## show policy server events

Displays any events related to a directory server on which policies are stored.

**show policy server events**

---

### Syntax Definitions

N/A

### Defaults

The display is limited to 50 events.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The Policy Manager initialization event is always the first event logged.

### Examples

```
-> show policy server events
  Event Time                event description
-----+-----
09/13/01 16:38:15 Policy manager log init
09/13/01 16:38:17 LDAP server 155.132.44.98/16652 defined
09/13/01 16:38:17 LDAP server 155.132.44.98/21890 defined
09/13/01 16:38:18 PDP optimization: PVP day-of-week all 1

# 30 UNP Commands

The Universal Network Profile (UNP) feature provides administrators with the ability to define and apply network access control to specific types of devices by grouping such devices according to specific matching profile criteria. This allows network administrators to create virtual machine network profiles (VNPs) *and* profiles for user devices from a unified framework of operation and administration.

UNP is not limited to creating profiles to classify only certain types of devices. However, the following classification methods implemented through UNP functionality and profile criteria provide the ability to tailor profiles for specific devices (physical or virtual):

- MAC-based authentication using a RADIUS-capable server.
- Switch-wide classification rules to classify on source MAC or IP address (no authentication required).
- VLAN tag classification to create VLAN port associations based on the VLAN ID contained in device packets.
- Default UNP classification for untagged traffic or traffic not classified through other methods.

Basically, UNP provides a method for dynamically assigning network devices to VLAN domains. A profile consists of configurable attributes. When a device sends traffic that matches such attributes, the device is then assigned to a VLAN associated with the UNP. The UNP may also specify a QoS/ACL policy list that is subsequently applied to device traffic associated with the UNP VLAN.

Dynamic assignment of devices using UNP is achieved through port-based functionality that provides the ability to authenticate and classify device traffic. Authentication verifies the device identity and provides a UNP name. In the event authentication is not available or is unsuccessful, classification rules associated with the UNPs are applied to the traffic to determine the UNP VLAN assignment.

This chapter provides information about configuring UNP port parameters and profile attributes through the Command Line Interface (CLI).

MIB information for the UNP commands is as follows:

*Filename:* ALCATEL-IND1-DA-MIB  
*Module:* alcatelIND1DaMIB

A summary of the available commands is listed here:

---

<b>UNP commands</b>	<b>unp name</b> <b>unp port</b> <b>unp port default-unp</b> <b>unp port mac-authentication</b> <b>unp port mac-authentication pass-alternate</b> <b>unp port classification</b> <b>unp port trust-tag</b> <b>unp classification mac-address</b> <b>unp classification mac-range</b> <b>unp classification ip-address</b> <b>unp classification vlan-tag</b> <b>unp dynamic-vlan-configuration</b> <b>unp auth-server-down-unp</b> <b>unp auth-server-down-timeout</b>
<b>UNP show commands</b>	<b>show unp</b> <b>show unp global configuration</b> <b>show unp classification</b> <b>show unp port</b> <b>show unp user</b>

---

## unp name

Configures a Universal Network Profile (UNP) that is used to provide role-based access to the switch. The UNP determines the VLAN ID a device can join and if any QoS policy rules are applied to control access to network resources.

**unp name** *unp\_name* **vlan** *vlan\_id* [**qos-policy-list** *list\_name*]

**no unp name** *unp\_name*

---

### Syntax Definitions

<i>unp_name</i>	The name of the UNP.
<i>vlan_id</i>	The VLAN ID number to associate with the specified UNP. Devices classified with the UNP are assigned to the associated VLAN.
<i>list_name</i>	The name of a policy list to associate with the specified UNP. The policy list contains QoS policy rules/ACLs that are applied to devices classified with the UNP.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove a UNP from the switch configuration.
- Specifying a QoS policy list name that is inactive or does not already exist in the switch configuration is allowed. However, the list will remain inactive for the UNP until the list is enabled or configured using the QoS policy list commands.
- If the UNP dynamic VLAN configuration capability is enabled, a VLAN specified with this command that does not exist in the switch configuration is automatically created when the UNP is created.

---

**Note.** Dynamic VLANs are not saved in the VLAN section of the **boot.cfg** file. However, the **unp** commands to enable dynamic VLAN configuration and create a UNP are saved in the UNP section of the **boot.cfg** file. As a result, the VLAN is created again on the next switch bootup.

---

### Examples

```
-> unp name unp1 vlan 100 qos-policy-list "list1"
-> unp name unp2 vlan 200 qos-policy-list "bad-list"
-> no unp name unp1
```

## Release History

Release 7.2.1; command was introduced.

## Related Commands

<a href="#">unp port</a>	Enables UNP on a port.
<a href="#">unp dynamic-vlan-configuration</a>	Configures the status of dynamic VLAN configuration for profiles created with a VLAN ID that does not exist.
<a href="#">policy rule</a>	Configures a QoS policy rule.
<a href="#">policy list</a>	Configures a QoS policy list.

## MIB Objects

```
alaDaUserNetProfileTable  
  alaDaUserNetProfileName  
  alaDaUserNetProfileVlanID  
  alaDaUserNetProfileRowStatus  
  alaDaUserNetProfileQosPolicyListName
```

---

## unp port

Configures the status of UNP for the specified port. Enabling UNP makes the port eligible for dynamic assignment to a VLAN based on UNP authentication and classification.

**unp port** *slot/port1[-port2]* {**enable** | **disable**}

---

### Syntax Definitions

<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<b>enable</b>	Enables UNP functionality on the specified port.
<b>disable</b>	Disables UNP functionality and removes the UNP configuration for the specified port.

### Defaults

By default, UNP functionality is disabled on all switch ports.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Enabling UNP is not supported on the following port types:
  - > 802.1q-tagged ports.
  - > Learned Port Security (LPS) ports.
  - > Link aggregate logical ports and member ports.
  - > MVRP ports.
  - > Multi-Chassis Link Aggregation (MC-LAG) ports
  - > Port Mirroring destination ports (MTP).
  - > Port Mapping network ports.
  - > STP and ERP ports.
  - > Ports on which a static MAC address is configured.
  - > Ports on which dynamic Source Learning is disabled.
  - > VLAN Stacking (Ethernet Services NNI or UNI) ports.
- There is no limit to the number of switch ports that can have UNP enabled.
- Disabling UNP on a port removes the UNP configuration on that port from the switch configuration.
- Any configuration change to a UNP-enabled port will flush all MAC addresses learned on that port. This applies only to CLI commands used to configure UNP port parameters.

## Examples

```
-> unp port 1/1 enable
-> unp port 1/1 disable
-> unp port 1/1-3 enable
```

## Release History

Release 7.2.1; command was introduced.

## Related Commands

<a href="#">unp name</a>	Configures a UNP in the switch configuration.
<a href="#">unp port default-unp</a>	Associates a default UNP to a port.

## MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortSlotNumber
  alaDaUNPPortPortNumber
  alaDaUNPPortDefaultProfileName
  alaDaUNPPortPassAltProfileName
  alaDaUNPPortRowStatus
  alaDaUNPPortMacAuthFlag
  alaDaUNPPortClassificationFlag
  alaDaUNPPortTrustTagStatus
```

---

## unp port default-unp

Configures the name of an existing UNP to serve as the default UNP for the specified port.

**unp port** *slot/port[-port2]* **default-unp** *unp\_name*

**no unp port** *slot/port[-port2]* **default-unp**

---

### Syntax Definitions

*slot/port[-port2]* The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

*unp\_name* The name of the UNP.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of the command to remove the default UNP from the port configuration.
- This command is allowed only on UNP-enabled ports.
- The UNP specified with this command must already exist in the switch configuration.
- The default UNP is used to classify devices on the port when one of the following conditions occur:
  - > UNP authentication and classification are not enabled on the port.
  - > MAC authentication fails.
  - > Device traffic does not match UNP classification rules.
  - > The UNP trust VLAN tag option (see [unp port trust-tag](#)) is enabled for the port, but the VLAN ID specified in the tag field of the device traffic does not exist.
  - > Untagged device traffic is not classified.

### Examples

```
-> unp port 1/1 default-unp "Sales"
-> unp port 1/1 no default-unp
-> unp port 1/1-4 default-unp "Sales"
ERROR: Port 1/2 is not a unp port
ERROR: Port 1/3 is not a unp port
-> unp port 1/1 default-unp "BAD-UNP"
ERROR: UNP doesn't exist
-> no unp port 1/1 default-unp
-> no unp port 1/1-3 default-unp
```

## Release History

Release 7.2.1; command was introduced.

## Related Commands

<b>unp name</b>	Configures a UNP in the switch configuration.
<b>unp port</b>	Configures the status of UNP functionality on the port.
<b>unp port trust-tag</b>	Configures whether or not a device is classified into an existing VLAN that matches the VLAN ID tag of the packets received from the device.

## MIB Objects

```
alaDaUNPPortTable  
  alaDaUNPPortIfIndex  
  alaDaUNPPortDefaultProfileName  
  alaDaUNPPortPassAltProfileName  
  alaDaUNPPortMacAuthFlag  
  alaDaUNPPortClassificationFlag  
  alaDaUNPPortTrustTagStatus  
  alaDaUNPPortRowStatus
```

---

## unp port mac-authentication

Configures the status of MAC authentication for the specified UNP port. Enable this functionality to invoke MAC-based authentication for devices connected to the UNP port..

**unp port *slot/port[-port2]* mac-authentication {enable | disable}**

---

### Syntax Definitions

<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<b>enable</b>	Enables MAC authentication.
<b>disable</b>	Disables MAC authentication.

### Defaults

By default, the MAC authentication is disabled.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- This command is allowed only on UNP-enabled ports.
- MAC-based authentication is supported only through a RADIUS server.
- An option exists to classify a device into an alternate UNP in the event successful MAC authentication does not return a UNP name. This option is configured through the [unp port mac-authentication pass-alternate](#) command.
- If MAC authentication fails, any classification rules configured for the UNP port are applied.
- If both UNP MAC authentication and classification (see [unp port classification](#)) are not enabled on the UNP port, all MAC addresses received on that port are blocked unless a default UNP is configured and/or trust VLAN tag is enabled for the port.

### Examples

```
-> unp port 1/1 mac-authentication enable
-> unp port 1/1 mac-authentication disable
```

### Release History

Release 7.2.1; command was introduced.

## Related Commands

<b>unp name</b>	Configures a UNP in the switch configuration.
<b>unp port</b>	Configures the status of UNP functionality on the port.
<b>unp port mac-authentication pass-alternate</b>	Assigns the device to another UNP when successful MAC authentication does not return a UNP name.
<b>unp port classification</b>	Configures the classification status for the UNP port.

## MIB Objects

```
alaDaUNPPortTable  
  alaDaUNPPortIfIndex  
  alaDaUNPPortDefaultProfileName  
  alaDaUNPPortPassAltProfileName  
  alaDaUNPPortMacAuthFlag  
  alaDaUNPPortClassificationFlag  
  alaDaUNPPortTrustTagStatus  
  alaDaUNPPortRowStatus
```

---

## unp port mac-authentication pass-alternate

Configures the name of an existing UNP to use as an alternate UNP. A device is assigned to the alternate UNP when successful MAC authentication does not return a UNP name.

**unp port** *slot/port[-port2]* **mac-authentication pass-alternate unp-name** *unp\_name*

**no unp port** *slot/port[-port2]* **mac-authentication pass-alternate**

---

### Syntax Definitions

*slot/port[-port2]* The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

*unp\_name* The name of the UNP.

### Defaults

By default, no alternate UNP name is not specified.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove the alternate UNP from the UNP port configuration.
- This command is allowed only on UNP-enabled ports.
- The UNP name specified with this command must exist in the switch configuration.

### Examples

```
-> port 1/1 mac-authentication pass-alternate unp-name Finance
-> port 1/1-3 mac-authentication pass-alternate unp-name Finance
-> no unp port 1/1-3 mac-authentication pass-alternate
```

### Release History

Release 7.2.1; command was introduced.

### Related Commands

<a href="#">unp name</a>	Configures a UNP in the switch configuration.
<a href="#">unp port</a>	Configures the status of UNP functionality on the port.
<a href="#">unp port mac-authentication</a>	Configures the MAC authentication status for the UNP port.
<a href="#">show unp port</a>	Displays the UNP port parameter configuration.

**MIB Objects**

alaDaUNPPortTable  
  alaDaUNPPortIfIndex  
  alaDaUNPPortDefaultProfileName  
  alaDaUNPPortPassAltProfileName  
  alaDaUNPPortMacAuthFlag  
  alaDaUNPPortClassificationFlag  
  alaDaUNPPortTrustTagStatus  
  alaDaUNPPortRowStatus

---

## unp port classification

Configures the classification status for the specified UNP port. When enabled and MAC authentication is disabled or fails, UNP classification rules (MAC address, MAC address range, IP network address, or VLAN tag) are applied to the traffic received on the UNP port.

**unp port *slot/port[-port2]* classification {enable | disable}**

---

### Syntax Definitions

<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<b>enable</b>	Enables classification.
<b>disable</b>	Disables classification.

### Defaults

By default, classification is disabled on the UNP port.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- This command is allowed only on UNP-enabled ports.
- UNP classification rules are applied if MAC authentication is disabled on the port, is enabled on the port but the RADIUS server is not configured, or MAC authentication fails.
- If untagged device traffic does not match any of the classification rules, the device is assigned to the default UNP configured for the port.
- If tagged device traffic does not match any of the classification rules and the trust VLAN tag option (see [unp port trust-tag](#)) is enabled for the port, the device is classified based on the VLAN tag if a VLAN matching the tag exists in the switch configuration.
- If both UNP MAC authentication and classification (see [unp port mac-authentication](#)) are not enabled on the UNP port, all MAC addresses received on that port are blocked unless a default VLAN is specified and/or trust VLAN tag is enabled for the port.
- When classification is enabled for the port, UNP classification rules are applied in the following order of precedence:
  - > MAC address + VLAN tag
  - > MAC address
  - > MAC address range + VLAN tag
  - > MAC address range
  - > IP address + VLAN tag
  - > IP address
  - > VLAN tag

## Examples

```
-> unp port 1/1 classification enable
-> unp port 1/1 classification disable
-> unp port 1/1-4 classification enable
ERROR: Port 1/3 is not a unp-port
```

## Release History

Release 7.2.1; command was introduced.

## Related Commands

- unp classification mac-address** Configures a MAC address classification rule for the UNP port.
- unp classification mac-range** Configures a MAC address range classification rule for the UNP port.
- unp classification ip-address** Configures an IP network address rule for the UNP port.

## MIB Objects

```
alaDaUNPPortTable
  alaDaUNPPortIfIndex
  alaDaUNPPortDefaultProfileName
  alaDaUNPPortPassAltProfileName
  alaDaUNPPortMacAuthFlag
  alaDaUNPPortClassificationFlag
  alaDaUNPPortTrustTagStatus
  alaDaUNPPortRowStatus
```

---

## unp port trust-tag

Configures the option of whether or not to trust the VLAN ID of a tagged packet when the VLAN specified also exists in the switch configuration. If the VLAN tag is trusted, the device is assigned to the VLAN ID on the switch that matches the VLAN tag.

**unp port *slot/port[-port2]* trust-tag {enable | disable}**

---

### Syntax Definitions

<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<b>enable</b>	Trust the VLAN ID tag.
<b>disable</b>	Do not trust the VLAN ID tag..

### Defaults

By default, the VLAN tag is not trusted.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- When this option is enabled and the VLAN ID tag matches an existing VLAN in the system, the device is classified into the VLAN when one of the following conditions occur:
  - MAC authentication passes, but the RADIUS server returns a UNP that does not exist in the switch configuration.
  - MAC authentication passes, but the RADIUS server does not return a UNP and the alternate UNP option is disabled for the port.
  - Device traffic does not match any of the classification rules configured for the UNP port.
  - The UNP VLAN obtained from the matching classification rule does not exist in the switch configuration.
  - Auth-Server-Down UNP option is used, but the VLAN associated with that UNP does not exist in the switch configuration.
- When the trust tag option is triggered by one of the above conditions, a VLAN-port-association (VPA) is created between the UNP port and the matching VLAN even if the matching VLAN is *not* associated with a UNP.
- Enabling the trust VLAN ID tag option provides an implicit method of VLAN tag classification that will accept tagged traffic matching any of the existing UNPs without the need to create specific classification rules for those profiles.

## Examples

```
-> unp port 1/1 trust-tag enable
-> unp port 1/1 trust-tag disable
-> unp port 1/1-4 trust-tag enable
```

## Release History

Release 7.2.1; command was introduced.

## Related Commands

<a href="#">unp port default-unp</a>	Associates a default UNP to a port.

```

---

## unp classification mac-address

Defines a MAC address classification rule for the specified Universal Network Profile (UNP). If the source MAC address of the device traffic matches the MAC address defined for the rule, the specified UNP is applied to the device. An optional VLAN ID tag parameter is available to specify a VLAN tag that device traffic must also match in addition to the source MAC address.

**unp classification mac-address** *mac\_address* [**vlan-tag** *vlan\_id*] **unp-name** *unp\_name*

**no unp classification mac-address** *mac\_address*

---

### Syntax Definitions

<i>mac_address</i>	MAC address (e.g., 00:00:39:59:f1:0c).
<i>vlan_id</i>	A VLAN ID.
<i>unp_name</i>	The name of a UNP.

### Defaults

By default, no classification rules are defined for a UNP.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove the MAC address rule.
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified source MAC address *and* the VLAN ID tag.
- Untagged packets are only classified using the specified MAC address; the VLAN ID tag is ignored if it is specified with this rule.

### Examples

```
-> unp classification mac-address 00:11:22:33:44:55 unp-name Finance
-> unp classification mac-address 00:11:22:33:44:55 vlan-tag 100 unp-name Finance
```

### Release History

Release 7.2.1; command was introduced.

### Related Commands

<a href="#">unp port classification</a>	Configures the classification status for the UNP port. Rules are not applied when classification is disabled for the port.
<a href="#">show unp classification</a>	Displays the UNP classification configuration.

```
alaDaUNPMacRuleTable  
  alaDaUNPMacRuleAddr  
  alaDaUNPMacRuleProfileName  
  alaDaUNPMacRuleVlanTag
```

---

## unp classification mac-range

Defines a MAC address range classification rule for the specified Universal Network Profile (UNP). If the source MAC address of the device traffic matches any address within the range of MAC addresses, the specified UNP is applied to the device. An optional VLAN ID tag parameter is available to specify a VLAN tag that device traffic must also match in addition to the source MAC address.

**unp classification mac-range** *low\_mac\_address high\_mac\_address* [**vlan-tag** *vlan\_id*] **unp-name**  
*unp\_name*

**no unp classification mac-range** *low\_mac\_address high\_mac\_address*

---

### Syntax Definitions

<i>low_mac_address</i>	MAC address that defines the low end of the range (e.g., 00:00:39:59:f1:00).
<i>high_mac_address</i>	MAC address that defines the high end of the range (e.g., 00:00:39:59:f1:90).
<i>vlan_id</i>	A VLAN ID.
<i>unp_name</i>	The name of a UNP.

### Defaults

By default, no classification rules are defined for a UNP.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove a MAC address range rule.
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing a source MAC address within the specified range *and* the VLAN ID tag.
- Untagged packets are only classified using the specified MAC address range; the VLAN ID tag is ignored if it is specified with this rule.

### Examples

```
-> unp classification mac-range 00:11:22:33:44:66 00:11:22:33:44:77 unp-name Sales
-> unp classification mac-range 00:11:22:33:44:88 00:11:22:33:44:99 vlan-tag 200
unp-name
```

### Release History

Release 7.2.1; command was introduced.

## Related Commands

  alaDaUNPMacRangeRuleHiAddr  
  alaDaUNPMacRangeRuleProfileName  
  alaDaUNPMacRangeRuleVlanTag
```

---

## unp classification ip-address

Defines an IP address classification rule for the specified Universal Network Profile (UNP). If the source IP address of the device traffic matches the IP address defined for the rule, the specified UNP is applied to the device. An optional VLAN ID tag parameter is available to specify a VLAN tag that device traffic must also match in addition to the source MAC address.

**unp classification ip-address** *ip\_address* **mask** *subnet\_mask* [**vlan-tag** *vlan\_id*] **unp-name** *unp\_name*

**no unp classification ip-address** *ip\_address* **mask** *subnet\_mask*

---

### Syntax Definitions

<i>ip_address</i>	IPv4 network address (e.g., 10.0.0.0, 171.15.0.0, 196.190.254.0).
<i>subnet_mask</i>	An IP address mask to identify the IP subnet for the interface (supports class-less masking).
<i>vlan_id</i>	A VLAN ID.
<i>unp_name</i>	The name of a UNP.

### Defaults

- By default, the subnet mask is set to the default subnet mask value for the IP address class.
- By default, no classification rules defined for a UNP.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove an IP address rule.
- If a VLAN ID tag is specified with this command, the UNP is only applied to tagged packets containing the specified source IP address *and* the VLAN ID tag.
- Untagged packets are only classified using the specified IP address; the VLAN ID tag is ignored if it is specified with this rule.

### Examples

```
-> unp classification ip-address 10.1.1.1 unp-name Engg
-> unp classification ip-address 20.1.1.1 255.255.0.0 unp-name Admin
-> unp classification ip-address 50.1.1.1 vlan-tag 300 unp-name HR
```

### Release History

Release 7.2.1; command was introduced.

## Related Commands

  alaDaUNPIpNetRuleProfileName
  alaDaUNPIpNetRuleVlanTag
```

---

## unp classification vlan-tag

Defines VLAN tag classification rule for the specified Universal Network Profile (UNP). If the VLAN ID tag of the device traffic matches the VLAN ID defined for the rule, the specified UNP is applied to the device.

**unp classification vlan-tag** *vlan\_id* **unp-name** *unp\_name*

**no unp classification vlan-tag** *vlan\_id*

---

### Syntax Definitions

*vlan\_id*                                    A VLAN ID.  
*unp\_name*                                 The name of a UNP.

### Defaults

By default, no classification rules are defined for a UNP.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use the **no** form of this command to remove a VLAN tag rule.
- Untagged packets are not classified with this rule if a VLAN ID tag is specified with this command.

### Examples

```
-> unp classification vlan-tag 400 unp-name Admin  
-> unp classification vlan-tag 300 unp-name HR
```

### Release History

Release 7.2.1; command was introduced.

### Related Commands

[unp port classification](#)                Configures the classification status for the UNP port. Rules are not applied when classification is disabled for the port.

[show unp classification](#)                Displays the UNP classification configuration.

  alaDaUNPVlanTagRuleVlan  
  alaDaUNPVlanTagRuleProfileName
```

---

---

## unp dynamic-vlan-configuration

Configures the UNP status for dynamic VLAN configuration. When this functionality is enabled and the UNP is created with a VLAN that does not exist, the switch will dynamically create the VLAN at the time the UNP is created.

**unp dynamic-vlan-configuration {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables dynamic VLAN configuration for UNPs.
<b>disable</b>	Disables dynamic VLAN configuration for UNPs.

### Defaults

By default, dynamic VLAN configuration is disabled.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

---

**Note.** Dynamic VLANs are not saved in the VLAN section of the **boot.cfg** file. However, the **unp** commands to enable dynamic VLAN configuration and create a UNP are saved in the UNP section of the **boot.cfg** file. As a result, the VLAN is created again on the next switch bootup.

---

- When dynamic VLAN configuration is disabled, creating a UNP with a VLAN that does not exist in the switch configuration is not allowed.
- The VLAN status and other port (non-UNP port) assignments for a dynamic UNP VLAN are configurable using standard VLAN commands. In addition, the STP status is configurable and enabled by default when the dynamic VLAN is created.
- A dynamic VLAN cannot be deleted using standard VLAN commands (**no vlan *vlan\_id***).
- UNP dynamic VLANs are identified as a separate type of VLAN. The **vlan show** commands will display this type with the default name of “UNP-DYN-VLAN” and the designated type as “UNP Dynamic Vlan”.

### Examples

```
-> unp dynamic-vlan-configuration enable
-> unp dynamic-vlan-configuration disable
```

### Release History

Release 7.2.1; command was introduced.

## Related Commands

- |                       |   |

```
alaDaUNPGlobalConfiguration  
  alaDaUNPDynamicVlanConfigFlag
```

---

## unp auth-server-down-timeout

Configures the authentication server down timer value. This timer value is applied to devices that were learned in the authentication server down UNP.

**unp auth-server-down-timeout** *seconds*

---

### Syntax Definitions

*seconds*                                      The number of seconds the authentication server down timer is active. The valid range is 10 to 1000 seconds.

### Defaults

By default, the timeout value is set to 60 seconds.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- When this timer expires, devices learned in the authentication server down UNP are cleared from that UNP and authenticated and classified again.
- When the authentication server down UNP is removed, the authentication server down timer is also cleared.

### Examples

```
-> unp auth-server-down-timeout 500
-> unp auth-server-down-timeout 60
```

### Release History

Release 7.2.1; command was introduced.

### Related Commands

**unp auth-server-down-unp**              Configures a UNP to which a device is classified if MAC authentication fails because the RADIUS server is unreachable.

**show unp global configuration**      Displays the global UNP configuration for the switch.

### MIB Objects

alaDaUNPGlobalConfiguration  
  alaDaUNPAuthServerDownTimeout

---

## show unp

Displays the Universal Network Profile (UNP) configuration for the switch.

**show unp** [*unp\_name*]

---

### Syntax Definitions

*unp\_name*                                      The name of the UNP.

### Defaults

By default, the configuration for all UNPs is displayed.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Enter a UNP name with this command to display information for a specific UNP.

### Examples

```
-> show unp
Name                               Vlan Policy List Name
-----+-----+-----
Sales                               100  list1
Finance                             1000 list2

-> show unp Finance
Name                               Vlan Policy List Name
-----+-----+-----
Finance                             1000 list2
```

### Release History

Release 7.2.1; command was introduced.

### Related Commands

**unp name**                                      Configures a UNP in the switch configuration.

**show unp user**                                Displays the MAC addresses learned on a UNP port and the UNP that was used for classification.

## show unip global configuration

Displays the configuration for global Universal Network Profile (UNP) parameter settings.

**show unip global configuration**

---

### Syntax Definitions

N/A

### Defaults

N/A.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

N/A

### Examples

```
-> show unip global configuration
Dynamic Vlan Configuration: Enabled,
Auth Server Down UNP: SrvDownUnp,
Auth Server Down Timeout (Sec): 60
```

```
-> show unip global configuration
Dynamic Vlan Configuration: Disabled,
Auth Server Down UNP: -,
Auth Server Down Timeout (Sec): 60
```

### *output definitions*

---

<b>Dynami Vlan Configuration</b>	The status (enabled or disabled) of dynamic VLAN configuration. Configured through the <a href="#">unip dynamic-vlan-configuration</a> .
<b>Auth Server Down UNP</b>	The name of a UNP that a device is assigned to in the event the RADIUS server is unreachable. This feature is not configured if a UNP name does not appear in this field. Configured through the <a href="#">unip auth-server-down-unip</a> command.
<b>Auth Server Down Timeout</b>	The amount of time, in seconds, that devices remain in the VLAN associated with the authentication server down UNP. Configured through the <a href="#">unip auth-server-down-timeout</a> command.

---

### Release History

Release 7.2.1; command was introduced.

**Related Commands****show unp**

Displays the profile configuration for the switch.

**show unp port**Displays the UNP configuration for the port.

---

## show unp classification

Displays the UNP classification rule configuration for the switch.

**show unp classification {mac-rule | mac-range-rule | ip-rule | vlan-tag-rule}**

---

### Syntax Definitions

<b>mac-rule</b>	Display the MAC address rule configuration.
<b>mac-range-rule</b>	Displays the MAC address range rule configuration.
<b>ip-rule</b>	Displays the IP network address rule configuration.
<b>vlan-tag-rule</b>	Displays the VLAN tag rule configuration.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Specifying one of the classification rule type parameters is required with this command.

### Examples

```
-> show unp classification mac-rule
```

MAC Address	UNP Name	VLAN Tag
00:11:22:33:44:55	Sales	100
00:0f:b5:46:d7:56	Finance	-

```
-> show unp classification mac-range-rule
```

Low MAC Address	High MAC Address	UNP Name	VLAN Tag
00:11:22:33:44:66	00:11:22:33:44:77	Sales	-
00:11:22:33:44:88	00:11:22:33:44:99	HR	-

```
-> show unp classification ip-rule
```

IP Address	IP Mask	UNP Name	VLAN Tag
10.1.1.1	255.0.0.0	Engg	-
20.1.1.1	255.255.0.0	Admin	-
50.1.1.1	255.0.0.0	HR	300
60.1.1.1	255.0.0.0	HR	-

```
-> show unp classification vlan-tag-rule
```

```
VLAN Tag UNP Name
-----+-----
400      Admin
300      HR
```

## Release History

Release 7.2.1; command was introduced.

## Related Commands

[show unp port](#)

Displays the UNP configuration for the port.

[show unp user](#)

Displays the MAC addresses learned on a UNP port and the UNP that was used for classification.

---

## show unp port

Displays the UNP configuration for the port..

**show unp port** *slot/port[-port2]*

---

### Syntax Definitions

*slot/port[-port2]*                      The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

Displays information only for thos ports configured as UNP ports.

### Examples

-> show unp port

```
Port Mac-Auth Classification Default Pass-Alternate Trust-Tag
-----+-----+-----+-----+-----+-----
1/1 Enabled Enabled Sales Finance Enabled
1/2 Enabled Disabled Engg Accouting Disabled
1/3 Disabled Disabled Engg - Enabled
1/4 Disabled Disabled - - Disabled
```

-> show unp port 1/2-4

```

-----+-----+-----+-----+-----+-----
1/2 Enabled Disabled Engg Accouting Enabled
1/3 Disabled Disabled Engg - Disabled
1/4 Disabled Disabled - - Enabled
```

-> show unp port 1/1

```
Port Mac-Auth Classification Default Pass-Alternate Trust-Tag
-----+-----+-----+-----+-----+-----
1/1 Enabled Enabled Sales Finance Enabled
```

### Release History

Release 7.2.1; command was introduced.

**Related Commands****show unp**

Displays the UNP configuration for the switch.

**show unp user**Displays the MAC addresses learned on a UNP port and the UNP that was used for classification.

---

## show unp user

Displays the MAC addresses learned on a UNP port and the UNP that was used for classification.

```
show unp user [[user_name] | [slot/port[-port2]] count]
```

---

### Syntax Definitions

<i>user_name</i>	The name of a specific device (for example, the device MAC address).
<i>slot/port[-port2]</i>	The slot and port number (3/1). Use a hyphen to specify a range of ports (3/1-8).
<b>count</b>	Displays the number of UNP users.

### Defaults

By default, information is displayed for all learned devices.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

The authentication status field may contain one of the following:

- > “\_”
- > Authenticated
- > Failed
- > In Progress
- > The Classification Source could be one of the following.
- > Pass alternate UNP
- > Pass alternate UNP - Blocked
- > Default UNP
- > Default UNP - Blocked
- > Server UNP
- > Server UNP - Blocked
- > Auth Fail - Default UNP
- > Auth Fail - Default UNP - Blocked
- > Auth Fail - MAC Rule UNP
- > Auth Fail - MAC Rule UNP - Blocked
- > Auth Fail - MAC Range Rule UNP

## Release History

Release 7.2.1; command was introduced.

## Related Commands

### **show unp**

Displays the UNP configuration for the switch.

### **show unp port**

Displays the UNP configuration for the port.

### **show unp user**

This command displays the users learned on a given port/port-range and/or the count of users.

# 31 AAA Commands

This chapter includes descriptions for authentication, authorization, and accounting (AAA) commands. The commands are used for configuring the type of authentication as well as the AAA servers and the local user database on the switch.

- **Authenticated Switch Access.** Authenticates users into the switch to manage the switch. User information is stored on a RADIUS, TACACS+, LDAP or information may be stored locally in the switch user database.
- **Local user database.** User information may be configured for Authenticated Switch Access. For functional management access, users may be allowed to access specific command families or domains.

MIB information for the AAA commands is as follows:

*Filename:* alcatelIND1AAA.mib  
*Module:* ALCATEL-IND1-AAA-MIB

A summary of the available commands is listed here:

<b>Authentication servers</b>	<b>aaa radius-server</b> <b>aaa tacacs+-server</b> <b>aaa ldap-server</b> <b>show aaa server</b>
<b>Authenticated Switch Access</b>	<b>aaa authentication</b> <b>aaa authentication default</b> <b>aaa accounting session</b> <b>aaa accounting command</b> <b>show aaa authentication</b> <b>show aaa accounting</b>
<b>Port-based Network Access Control</b>	<b>aaa device-authentication mac</b> <b>show aaa device-authentication</b>

---

## aaa radius-server

Configures or modifies a RADIUS server for Authenticated Switch Access.

```
aaa radius-server server [host {hostname | ip_address} [hostname2 | ip_address2]] [key secret]
[retransmit retries] [timeout seconds] [auth-port auth_port] [acct-port acct_port]
```

```
no aaa radius server server
```

---

### Syntax Definitions

<i>server</i>	The name of the RADIUS server.
<i>hostname</i>	The host name (DNS name) of the primary RADIUS server. The host name or IP address is required when creating a server.
<i>ip_address</i>	The IP address of the primary RADIUS server. An IP address or host name is required when creating a server.
<i>hostname2</i>	The host name (DNS name) of an optional backup RADIUS server.
<i>ip_address2</i>	The IP address of an optional backup RADIUS server.
<i>secret</i>	The shared secret known to the switch and the server, but which is not sent over the network. Can be any text or hexadecimal string but <b>MUST</b> match the secret configured on the server. The secret is case-sensitive. Required when creating a server.
<i>retries</i>	The number of retries the switch makes to authenticate a user before trying the backup server ( <i>hostname2</i> or <i>ip_address2</i> ).
<i>seconds</i>	The timeout for server replies to authentication requests.
<i>auth_port</i>	The UDP destination port for authentication requests.
<i>acct_port</i>	The UDP destination port for accounting requests.

### Defaults

parameter	default
<i>retries</i>	3
<i>seconds</i>	2
<i>auth_port</i>	1812
<i>acct_port</i>	1813

### Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- A host name (or IP address) and a secret are required when configuring a server.
- The server and the backup server must both be RADIUS servers.
- Use the **no** form of the command to remove a RADIUS server from the configuration. Only one server may be deleted at a time.

## Examples

```
-> aaa radius-server pubs2 host 10.10.2.1 key wwwtoe timeout 5
-> no aaa radius-server pubs2
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">show aaa server</a>	Displays information about AAA servers.
<a href="#">aaa authentication</a>	Specifies the AAA servers to be used for Authenticated Switch Access.
<a href="#">aaa accounting session</a>	Specifies the accounting servers to be used for Authenticated Switch Access.

## MIB Objects

```
aaaServerTable
  aaasProtocol
  aaasHostName
  aaasIpAddress
  aaasHostName2
  aaasIpAddress2
  aaasRadKey
  aaasRetries
  aaasTimeout
  aaasRadAuthPort
  aaasRadAcctPort
```

---

## aaa tacacs+-server

Configures or modifies a TACACS+ server for Authenticated Switch Access.

```
aaa tacacs+-server server [host {hostname | ip_address} {hostname2 | ip_address2}] [key secret]
[timeout seconds] [port port]
```

```
no aaa tacacs+-server server
```

---

### Syntax Definitions

<i>server</i>	The name of the TACACS+ server.
<i>hostname</i>	The host name (DNS name) of the primary TACACS+ server. The host name or IP address is required when creating a server.
<i>ip_address</i>	The IP address of the primary TACACS+ server. An IP address or host name is required when creating a server.
<i>hostname2</i>	The host name (DNS name) of an optional backup TACACS+ server.
<i>ip_address2</i>	The IP address of an optional backup TACACS+ server.
<i>secret</i>	The shared secret known to the switch and the server, but which is not sent over the network. Can be any text or hexadecimal string but <b>MUST</b> match the secret configured on the server. The secret is case-sensitive. required when creating a server.
<i>seconds</i>	The timeout for server replies to authentication requests.
<i>port</i>	The port number for the primary TACACS+ server.

### Defaults

parameter	default
<i>seconds</i>	2
<i>port</i>	49

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to remove a TACACS+ server from the configuration. Only one server may be deleted at a time.
- A host name (or IP address) and a secret are required when configuring a server.
- The server and the backup server must both be TACACS+ servers.

## Examples

```
-> aaa tacacs+-server tpub host 10.10.2.2 key otna timeout 10
-> no aaa tacacs+-server tpub
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">show aaa server</a>	Displays information about AAA servers.
<a href="#">aaa authentication</a>	Specifies the AAA servers to be used for Authenticated Switch Access.
<a href="#">aaa accounting session</a>	Specifies the accounting servers to be used for Authenticated Switch Access.

## MIB Objects

```
aaaServerTable
  aaasName
  aaasProtocol
  aaasHostName
  aaasIpAddress
  aaasHostName2
  aaasIpAddress2
  aaasTacacsKey
  aaasTimeout
  aaasTacacsPort
```

---

## aaa ldap-server

Configures or modifies an LDAP server for Authenticated Switch Access.

```
aaa ldap-server server_name [host {hostname | ip_address} [{hostname2 | ip_address2}]] [dn dn_name]
[password super_password] [base search_base] [retransmit retries] [timeout seconds] [ssl | no ssl]
[port port]
```

```
no aaa ldap-server server-name
```

---

### Syntax Definitions

<i>server_name</i>	The name of the LDAP server.
<i>hostname</i>	The host name (DNS) of the primary LDAP server. The host name or IP address is required when creating a new server.
<i>ip_address</i>	The IP address of the primary LDAP server.
<i>hostname2</i>	The host name (DNS) of the backup LDAP server.
<i>ip_address2</i>	The IP address of a backup host for the LDAP server.
<i>dn_name</i>	The super-user or administrative distinguished name in the format recognized by the LDAP-enabled directory servers. For example: <b>cn=manager</b> . Must be different from the <i>search-base</i> name and must be in a format supported by the server. Required when creating a new server.
<i>super_password</i>	The super-user password recognized by the LDAP-enabled directory servers. The password may be clear text or hexadecimal format. Required when creating a new server.
<i>search_base</i>	The search base recognized by the LDAP-enabled directory servers. For example, <b>o=company</b> or <b>c=country</b> . Must be different from the <i>dn_name</i> . Required when creating a new server.
<i>retries</i>	The number of retries the switch makes to the LDAP server to authenticate a user before trying the backup server.
<i>seconds</i>	The timeout in seconds for server replies to authentication requests from the switch.
<b>ssl</b>	Enables a secure switch layer (SSL) between the switch and the LDAP server.
<b>no ssl</b>	Disables a secure switch layer (SSL) between the switch and the LDAP server.
<i>port</i>	The port number for the primary LDAP server and any backup server. Must match the port number configured on the server.

## Defaults

Defaults for optional parameters are as follows:

parameter	default
<i>port</i>	389 (SSL disabled) 636 (SSL enabled)
<i>retries</i>	3
<i>seconds</i>	2
<b>ssl   no ssl</b>	<b>no ssl</b>

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- The *dn\_name* must be different from the *search\_base* name.
- Use the **no** form of the command to remove an LDAP server from the configuration. Only one server may be removed at a time.
- The port number configured on the switch must match the port number configured for the server.

## Examples

```
-> aaa ldap-server topanga5 host 10.10.3.4 dn cn=manager password tpub base c=us
retransmit 4
-> no aaa ldap-server topanga5
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

---

## aaa authentication

Configures the interface for Authenticated Switch Access and specifies the server(s) to be used. This type of authentication gives users access to manage the switch.

```
aaa authentication {console | telnet | ftp | http | snmp | ssh | default} server1 [server2...] [local]
```

```
no aaa authentication [console | telnet | ftp | http | snmp | ssh | default]
```

---

### Syntax Definitions

<b>console</b>	Configures Authenticated Switch Access through the console port.
<b>telnet</b>	Configures Authenticated Switch Access for any port used for Telnet.
<b>ftp</b>	Configures Authenticated Switch Access for any port used for FTP.
<b>http</b>	Configures Authenticated Switch Access for any port used for Web-based management.
<b>snmp</b>	Configures Authenticated Switch Access for any port used for SNMP.
<b>ssh</b>	Configures Authenticated Switch Access for any port used for Secure Shell.
<b>default</b>	Configures Authenticated Switch Access for any port using any service ( <b>telnet</b> , <b>ftp</b> , etc.). Note that SNMP access is enabled only if an LDAP or local server is specified with the command.
<i>server1</i>	The name of the authentication server used for Authenticated Switch Access. At least one server is required. The server may be a RADIUS, TACACS+, LDAP, or the local user database. RADIUS, TACACS+, and LDAP server names are set up through the <b>aaa radius-server</b> , <b>aaa tacacs+-server</b> , and <b>aaa ldap-server</b> commands.
<i>server2...</i>	The names of backup servers for Authenticated Switch Access. Up to 3 backups may be specified (including <b>local</b> ). These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the authentication server.
<b>local</b>	Specifies that the local user database will be a backup for the authentication servers. If you want to use the local user database as the only authentication server, specify <b>local</b> for <i>server1</i> .

### Defaults

- At switch startup, Authenticated Switch Access is available through console port via the local database. Authentication for other management interfaces (Telnet, FTP, etc.) is disabled.
- The default user on the switch is **admin**, and **switch** is the password.

### Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- The server type may be RADIUS, TACACS+, LDAP, or the local user database. Up to 4 servers may be configured for an interface type; at least one is required. Each server name should be separated by a space.
- The switch uses *only the first available server* in the list to check for user information. For example, if *server1* is not available, the switch will poll *server2*. If user information is not found on the first available server, the authentication request will fail.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the [aaa radius-server](#), [aaa tacacs+-server](#), and [aaa ldap-server](#) commands.
- If the local switch database will be used as the only authentication server, specify **local** for *server1*. If **local** is specified as a backup server, it should be entered last in the list of servers. The local user database is always available if the switch is up.
- Only LDAP or the local database may be used for authenticated SNMP management.
- If Secure Shell (**ssh**) is enabled, Telnet and FTP should be disabled.

## Examples

```
-> aaa authentication telnet pubs1
-> no aaa authentication telnet
-> aaa authentication default pubs2 pubs3
```

## Release History

Release 7.1.1; command was introduced.

```

---

## aaa authentication default

Sets the authenticated switch access type to the default server setting.

**aaa authentication {console | telnet | ftp | http | snmp | ssh} default**

---

### Syntax Definitions

<b>console</b>	Configures the default Authenticated Switch Access server setting for the console port.
<b>telnet</b>	Configures the default Authenticated Switch Access server setting for Telnet.
<b>ftp</b>	Configures the default Authenticated Switch Access server setting for FTP.
<b>http</b>	Configures the default Authenticated Switch Access server setting for Web-based management.
<b>snmp</b>	Configures the default Authenticated Switch Access server setting for any port used for SNMP.
<b>ssh</b>	Configures the default Authenticated Switch Access server setting for any port used for Secure Shell.

### Defaults

By default, the default Authenticated Switch Access server setting does not include any servers.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **aaa authentication** command to set the default servers.

### Examples

```
-> aaa authentication telnet default
-> aaa authentication default default
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">aaa radius-server</a>	Configures or modifies a RADIUS server for Authenticated Switch Access.

```

---

## aaa accounting session

Configures an accounting server or servers for authenticated switch sessions. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

**aaa accounting session** *server1* [*server2...*] [**local**]

**no accounting session**

---

### Syntax Definitions

<i>server1</i>	The name of the RADIUS, TACACS+, or LDAP server used for accounting of authenticated switch sessions. At least one server is required. RADIUS, TACACS+, and LDAP server names are set up through the <a href="#">aaa radius-server</a> , <a href="#">aaa tacacs+-server</a> , and <a href="#">aaa ldap-server</a> commands.
<i>server2...</i>	The names of backup servers. Up to 3 backups may be specified (including <b>local</b> ); each server name should be separated by a space. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
<b>local</b>	Local accounting is done through the Switching Logging feature on the switch.

### Defaults

Accounting is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to disable accounting for Authenticated Switch Access.
- Up to 4 accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The servers may be RADIUS, TACACS+, LDAP servers, and/or the local Switch Logging facility.
- If **local** is specified as *server1*, the switch will **only** use the local Switching Logging facility for accounting.
- If **local** is specified as a backup, it should be entered last in the list of servers. The Switch Logging facility is always available if the switch is up.
- The switch uses **only the first available server** in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.
- RADIUS, TACACS+, and LDAP servers may each have an additional backup specified through the [aaa radius-server](#), [aaa tacacs+-server](#), and [aaa ldap-server](#) commands.

## Examples

```
-> aaa accounting session ldap1 radius2 local  
-> no aaa accounting session
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

### [show aaa accounting](#)

  aaacsName1  
  aaacsName2  
  aaacsName3  
  aaacsName4
```

---

## aaa accounting command

Enables or disables the server for command accounting. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

**aaa accounting command** *server1* [*server2...*] [**local**]

**no accounting command**

---

### Syntax Definitions

<i>server1</i>	The name of the TACACS+ server used for command accounting. At least one server is required. TACACS+ server names are set up through the <a href="#">aaa tacacs+-server</a> commands.
<i>server2...</i>	The names of TACACS+ backup servers. Up to 3 backups may be specified; each server name should be separated by a space. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the accounting server.
<b>local</b>	Local accounting is done through the Switching Logging feature on the switch.

### Defaults

Accounting is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of the command to disable command accounting.
- Up to 4 accounting servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- The servers can be only TACACS+ servers.
- The switch uses *only the first available server* in the list for accounting. For example, if *server1* is not available, the switch will use *server2*.
- TACACS+ server may each have an additional backup specified through the [aaa tacacs+-server](#) command.

### Examples

```
-> aaa accounting command tacacs1 tacacs2 tacacs3
-> no aaa accounting command
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [show aaa accounting](#)

Displays information about accounting servers configured for Authenticated Switch Access.

## MIB Objects

aaaAcctCmdTable  
  aaacmdSrvName1  
  aaacmdSrvName2  
  aaacmdSrvName3  
  aaacmdSrvName4
```

---

## aaa device-authentication mac

Enables/Disables the switch for MAC authentication. This type of authentication is available in addition to 802.1x authentication and is designed to handle devices that do not support an 802.1x authentication method (non-suplicants).

**aaa device-authentication mac** *server1* [*server2*] [*server3*] [*server4*]

**no device-authentication mac**

---

### Syntax Definitions

<i>server1</i>	The name of the RADIUS authentication server used for MAC authentication. ( <i>Note that only RADIUS servers are supported for MAC authentication.</i> ) At least one server is required. RADIUS server names are set up through the <a href="#">aaa radius-server</a> command.
<i>server2...server4</i>	The names of backup servers used for MAC authentication. Up to 3 backups may be specified; include a space between each server name. These backups are only used if <i>server1</i> becomes unavailable. They are polled in the order they are listed in this command. The first available server becomes the authentication server.

### Defaults

N/A

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Up to 4 RADIUS servers (total) may be specified. At least one server is required. Each server name should be separated by a space.
- Use the **no** form of this command to disable MAC authentication for the switch.
- The switch uses **only the first available server** in the list to check for user information. For example, if *server1* is not available, the switch will poll *server2*. If user information is not found on the first available server, the authentication request will fail.
- RADIUS servers may each have an additional backup specified through the [aaa radius-server](#) command.
- MAC authentication verifies the source MAC address of a device via a remote RADIUS server. Used to classify devices for the Universal Network Profile (UNP) feature, this method sends RADIUS frames to the server with the MAC address embedded in the username and password attributes.
- Use the [unp port](#) command to enable or disable ports for UNP classification based on MAC authentication.
- Multiple devices can be authenticated on a given UNP port. Each device MAC address received on the port is authenticated and learned separately.

## Examples

```
-> aaa device-authentication mac rad1 rad2  
-> no aaa device-authentication mac
```

## Release History

Release 7.2.1; command was introduced.

| <a href="#">show aaa device-authentication</a> | Displays information about the global 802.1X configuration on the switch.   |

## MIB Objects

```
AaaAuthDatable  
  aaaDaName1  
  aaaDaName2  
  aaaDaName3  
  aaaDaName4
```

---

## user

Configures or modifies user entries in the local user database. Use the **no** form of the command to remove the user from the local database.

**user** *username* [**password** *password*] [**expiration** {*day* | *date*}] [**read-only** | **read-write** [*families...* / *domains...*] **all** | **none**] [**no snmp** | **no auth** | **sha** | **md5** | **sha+des** | **md5+des**] [**console-only** {**enable** | **disable**}]

**no user** *username*

---

### Syntax Definitions

<i>username</i>	The name of the user. Used for logging into the switch. Required to create a new user entry or for modifying a user. Maximum 63 characters.
<i>password</i>	The user's password in clear text or hexadecimal (corresponding to encrypted form). Required to create a new user entry. Maximum 47 characters.
<i>day</i>	The number of days before this user's current password expires. The range is 1 to 150 days.
<i>date</i>	The date (in the format <i>mm/dd/yyyy hh:mm</i> ) that the user's current password will expire.
<b>read-only</b>	Specifies that the user will have read-only access to the switch.
<b>read-write</b>	Specifies that the user will have read-write access to the switch.
<i>families</i>	Determines the command families available to the user on the switch. Each command family should be separated by a space. Command families are subsets of domains.
<i>domains</i>	Determines the command domains available to the user on the switch. Each domain should be separated by a space.
<b>all</b>	Specifies that all command families and domains are available to the user.
<b>none</b>	Specifies that no command families or domains are available to the user.
<b>no snmp</b>	Denies the specified user SNMP access to the switch.
<b>no auth</b>	Specifies that the user has SNMP access without any required SNMP authentication and encryption protocol.
<b>sha</b>	Specifies that the SHA authentication algorithm should be used for authenticating SNMP PDU for the user.
<b>md5</b>	Specifies that the MD5 authentication algorithm should be used for authenticating SNMP PDU for the user.
<b>sha+des</b>	Specifies that the SHA authentication algorithm and DES encryption standard should be used for authenticating and encrypting SNMP PDU for the user.

<b>md5+des</b>	Specifies that the MD5 authentication algorithm and the DES encryption standard should be used for authenticating and encrypting SNMP PDU for the user.
<b>console-only enable</b>	Enables console only access for the user <i>admin</i> .
<b>console-only disable</b>	Disables console only access for the user <i>admin</i> .

## Defaults

By default, if a user is created without indicating the read and write privileges and SNMP access, the user will be given privileges based on the *default user account*. The *default* user account may be modified.

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- At least one user with SHA/MD5 authentication and/or DES encryption must be configured on the switch for SNMPv3 communication with OmniVista.
- Note that the exclamation point (!) is not a valid password character. In addition, specifying an asterisk (\*) as one or more characters in a password is allowed as long as every character is not an asterisk. For example, **password \*\*123456\*\*** is allowed; **password \*\*\*\*\*** is not allowed.
- A password expiration for the user's current password may be configured with the **expiration** option. However, if the password is changed, or the global password expiration setting is configured with the **user password-expiration** command, the user's password expiration will be configured with the global expiration setting.
- When modifying a user's SNMP access, the user password must be re-entered (or a new one configured). This is required because the hash algorithm used to save the password in the switch depends on the SNMP authentication level.
- At initial startup, the default user on the switch is **admin** with a password of **switch**. The switch will not recreate this user at any successive startup as long as there exists at least one user defined with write access to all commands. (Note that if password expiration is configured for the **admin** user, or configured globally through the **user password-expiration** command, when the **admin** user's password expires, the **admin** user will have access only through the console port.)
- New users or updated user settings are saved *automatically*.

## Examples

```
-> user techpubs password writer_pass read-only config
-> no user techpubs
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[password](#)

Configures the current user's password.

[show user](#)

Displays information about users configured in the local database on the switch.

## MIB Objects

aaaUserTable

aaauPassword

aaauReadRight

aaauWriteRight

aaauSnmpLevel

aaauSnmpAuthKey

aaauPasswordExpirationDate

---

## password

Configures the current user's password.

**password**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the **snapshot** command is used to capture the switch configuration, the text of the password is not displayed in the file. Instead an authentication key is included in the file.
- A new password cannot be identical to the current password; it cannot be identical to any of the three passwords that preceded the current password.
- Note that the exclamation point (!) is not a valid password character. In addition, specifying an asterisk (\*) as one or more characters in a password is allowed as long as every character is not an asterisk. For example, **password \*\*123456\*\*** is allowed; **password \*\*\*\*\*** is not allowed.
- Password settings are saved *automatically*.

### Examples

```
-> password
enter old password: *****
enter new password: *****
reenter new password: *****
->
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

#### [user](#)

Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges.

### MIB Objects

aaaUserTable

```
aaauPassword  
aaauOldPassword
```

---

## user password-size min

Configures the minimum number of characters required when configuring a user password.

**user password-size min** *size*

---

### Syntax Definitions

*size*

The number of characters required when configuring a user password through the **password** command or when setting up a user password through the **user** command. The range is 1 to 14 characters.

### Defaults

parameter	default
<i>size</i>	6

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A.

### Examples

```
-> user password-size min 9
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[user](#)

Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges.

[show user password-policy](#)

Displays the global password policy configuration for the switch.

### MIB Objects

aaaAsaConfig

aaaAsaPasswordSizeMin

---

## user password-expiration

Configures an expiration date for all user passwords stored locally on the switch or disables password expiration.

**user password-expiration** {*day* / **disable**}

---

### Syntax Definitions

<i>day</i>	The number of days before locally configured user passwords will expire. The range is 1 to 150 days.
<b>disable</b>	Disables password expiration for users configured locally on the switch.

### Defaults

---

parameter	default
<i>day</i> / <b>disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The **user password-expiration** command sets a default password expiration for users configured locally on the switch.
- Password expiration may be configured on a per-user basis through the **user** command; the user setting overrides the **user password-expiration** setting until the user password is changed or the **user password-expiration** command is entered again.

### Examples

```
-> user password-expiration 2
-> user password-expiration disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>user</b>	Configures entries in the local user database. May be used by a system administrator to change any user's password in addition to configuring user privileges.
<b>show user password-policy</b>	Displays the global password policy configuration for the switch.

**MIB Objects**

aaaAsaConfig

aaaAsaDefaultPasswordExpirationInDays

---

## user password-policy cannot-contain-username

Specifies whether or not a user can configure a password that contains the username for the account.

**user password-policy cannot-contain-username {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Does not allow the password to contain the username.
<b>disable</b>	Allows the password to contain the username.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The status of this function is specified as part of a global password policy that is applied to all passwords when they are created or modified.
- When this function is enabled, a check is done at the time the password is created or modified to ensure that the username is not specified as part of the password text.

### Examples

```
-> user password-policy cannot-contain-username enable
-> user password-policy cannot-contain-username disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show user password-policy](#) Displays the global password policy configuration for the switch.

### MIB Objects

aaaAsaConfig  
aaaAsaPasswordContainUserName

---

## user password-policy min-uppercase

Configures the minimum number of uppercase English characters required for a valid password.

`user password-policy min-uppercase number`

---

### Syntax Definitions

*number*                      The minimum number of uppercase characters. The range is 0 to 7.

### Defaults

parameter	default
<i>number</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Specify **0** with this command to disable the minimum uppercase character requirement.
- The minimum number of uppercase characters is specified as part of a global password policy that is applied to all passwords when they are created or modified.

### Examples

```
-> user password-policy min-uppercase 2
-> user password-policy min-uppercase 0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show user password-policy](#)      Displays the global password policy configuration for the switch.

### MIB Objects

aaaAsaConfig  
aaaAsaPasswordMinUpperCase

---

## user password-policy min-lowercase

Configures the minimum number of lowercase English characters required for a valid password.

**user password-policy min-uppercase** *number*

---

### Syntax Definitions

*number* The minimum number of lowercase characters. The range is 0 to 7.

### Defaults

---

parameter	default
<i>number</i>	0

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Specify **0** with this command to disable the minimum lowercase character requirement.
- The minimum number of lowercase characters is specified as part of a global password policy that is applied to all passwords when they are created or modified.

### Examples

```
-> user password-policy min-lowercase 2
-> user password-policy min-lowercase 0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show user password-policy](#) Displays the global password policy configuration for the switch.

### MIB Objects

aaaAsaConfig  
aaaAsaPasswordMinLowerCase

---

## user password-policy min-digit

Configures the minimum number of base-10 digits required for a valid password.

**user password-policy min-digit** *number*

---

### Syntax Definitions

*number*                                   The minimum number of digits. The range is 0 to 7.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>number</i>	0

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Specify **0** with this command to disable the minimum number of digits requirement.
- The minimum number of digits requirement is specified as part of a global password policy that is applied to all passwords when they are created or modified.

### Examples

```
-> user password-policy min-digit 2
-> user password-policy min-digit 0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show user password-policy](#)       Displays the global password policy configuration for the switch.

### MIB Objects

aaaAsaPasswordMinDigit

---

## user password-policy min-nonalpha

Configures the minimum number of non-alphanumeric characters (symbols) required for a valid password.

**user password-policy min-nonalpha** *number*

---

### Syntax Definitions

*number*                                      The minimum number of non-alphanumeric characters.  
The range is 0 to 7.

### Defaults

parameter	default
<i>number</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Specify **0** with this command to disable the minimum non-alphanumeric character requirement.
- The minimum number of non-alphanumeric characters is specified as part of a global password policy that is applied to all passwords when they are created or modified.

### Examples

```
-> user password-policy min-nonalpha 2
-> user password-policy min-nonalpha 0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show user password-policy](#)            Displays the global password policy configuration for the switch.

### MIB Objects

aaaAsaConfig  
aaaAsaPasswordMinNonAlpha

---

## user password-history

Configures the maximum number of old passwords to retain in the password history.

**user password-history** *number*

---

### Syntax Definitions

*number* The maximum number of old passwords to retain.  
The range is 0 to 24.

### Defaults

parameter	default
<i>number</i>	4

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Specify **0** with this command to disable the password history function.
- The user is prevented from specifying any passwords that are recorded in the password history and fall within the range configured through this command.
- The password history value is specified as part of a global password policy that is applied to all passwords when they are created or modified.

### Examples

```
-> user password-history 2  
-> user password-history 0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show user password-policy](#) Displays the global password policy configuration for the switch.

### MIB Objects

```
aaaAsaConfig  
aaaAsaPasswordHistory
```

---

## user password-min-age

Configures the minimum number of days during which a user is prevented from changing a password.

**user password-min-age** *days*

---

### Syntax Definitions

*days* The number of days to use as the minimum age of the password. The range is 0 to 150.

### Defaults

parameter	default
<i>days</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Specify **0** with this command to disable the minimum number of days requirement.
- Configure the minimum age of a password with a value that is less than the value configured for the password expiration.
- The password minimum age value is specified as part of a global password policy that is applied to all passwords when they are created or modified.

### Examples

```
-> user password-min-age 7
-> user password-min-age 0
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show user password-policy](#) Displays the global password policy configuration for the switch.

### MIB Objects

```
aaaAsaConfig
  aaaAsaPasswordMinAge
```

---

## user lockout-window

Configures a moving period of time (observation window) during which failed login attempts are counted to determine if the number of failed attempts has exceeded the number of allowed attempts. The number of failed login attempts is decremented by the number of failed attempts that age beyond the observation window time period.

**user lockout-window** *minutes*

---

### Syntax Definitions

*minutes*                      The number of minutes the observation window remains active. The range is 0 to 99999.

### Defaults

parameter	default
<i>minutes</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is only available to the **admin** user because the **admin** user account is the only account protected from any type of lockout attempt.
- Specify **0** with this command to disable the observation window function. This means that failed login attempts will never age out; the number of failed attempts is never decremented.
- Do not configure an observation window time period that is greater than the lockout duration time period.
- If the number of failed login attempts exceeds the number of failed attempts allowed before the observation window time expires, then the user account is locked out of the switch.
- The observation window time period is a global lockout setting that is applied to all passwords configured on the switch.
- Lockout settings are saved *automatically*.

### Examples

```
-> user lockout-window 500
-> user lockout-window 0
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">user lockout-duration</a>	Configures the amount of time a user account remains locked out of the switch.
<a href="#">user lockout-threshold</a>	Configures the number of failed password attempts allowed before the user account is locked out of the switch.
<a href="#">user lockout unlock</a>	Manually locks or unlocks a user account on the switch.
<a href="#">show user lockout-setting</a>	Displays the global user lockout settings for the switch.

## MIB Objects

```
aaaAsaConfig  
  aaaAsaLockoutWindow
```

---

## user lockout-threshold

Configures the number of failed password login attempts allowed during a certain period of time (observation window). If the number of failed attempts exceeds the lockout threshold number before the observation window period expires, the user account is locked out.

**user lockout-threshold** *number*

---

### Syntax Definitions

*number*                                      The number of failed login attempts allowed. The range is 0 to 999.

### Defaults

parameter	default
<i>number</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is only available to the **admin** user because the **admin** user account is the only account protected from any type of lockout attempt.
- If the lockout threshold is set to zero (the default), there is no limit to the number of failed login attempts allowed.
- A user account remains locked out for the length of the lockout duration time period; at the end of this time, the account is automatically unlocked.
- If the lockout duration time period is set to zero, only the **admin** user or a user with read/write AAA privileges can unlock a locked user account. An account is unlocked by changing the user account password or with the **user lockout unlock** command.
- The lockout threshold time period is a global lockout setting that is applied to all passwords configured on the switch.
- Lockout settings are saved *automatically*; that is, these settings do not require the **issu slot**, **reload slot**, or **configuration snapshot** command to save user settings over a reboot.

### Examples

```
-> user lockout-threshold 3
-> user lockout-threshold 0
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">user lockout-window</a>	Configures a window of time during which failed login attempts are counted to determine if the number of failed attempts has exceeded the number of allowed attempts.

## MIB Objects

```
aaaAsaConfig  
  aaaAsaLockoutThreshold
```

---

## user lockout-duration

Configures the length of time a user account remains locked out of the switch. At the end of this time period, the user account is automatically unlocked.

**user lockout-duration** *minutes*

---

### Syntax Definitions

*minutes* The number of minutes the user account remains locked out. The range is 0 to 99999.

### Defaults

parameter	default
<i>minutes</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is only available to the **admin** user because the **admin** user account is the only account protected from any type of lockout attempt.
- Note that if the lockout duration time period is set to zero (the default), then locked user accounts are never automatically unlocked.
- Only the **admin** user or a user with read/write AAA privileges can unlock a locked user account when the lockout duration time is set to zero. An account is unlocked by changing the user password or with the **user lockout unlock** command.
- Do not configure a lockout duration time period that is less than the amount of time configured for the observation window.
- The lockout duration time period is a global lockout setting that is applied to all passwords configured on the switch.
- Lockout settings are saved *automatically*; that is, these settings do not require the **issu slot**, **reload slot**, or **configuration snapshot** command to save user settings over a reboot.

### Examples

```
-> user lockout-duration 60
-> user lockout-duration 0
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<a href="#">user lockout-window</a>	Configures a window of time during which failed login attempts are counted to determine if the number of failed attempts has exceeded the number of allowed attempts,

## MIB Objects

```
aaaAsaConfig  
  aaaAsaLockoutDuration
```

---

## user lockout unlock

Manually locks or unlocks a user account on the switch.

```
user username {lockout | unlock}
```

---

### Syntax Definitions

<i>username</i>	The username of the account to lock or unlock.
<b>lockout</b>	Locks the user account out of the switch.
<b>unlock</b>	Unlocks a locked user account.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is only available to the **admin** user or a user with read/write AAA privileges.
- The **admin** user account is protected from any type of lockout attempt.
- User lockouts and unlocks are saved *automatically*.

### Examples

```
-> user j_smith lockout
-> user j_smith unlock
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">show user</a>	Displays information about all users or a particular user configured in the local user database on the switch.

## show aaa server

Displays information about a particular AAA server or AAA servers.

**show aaa server** [*server\_name*]

---

### Syntax Definitions

*server\_name*                      The server name, which is defined through the **aaa radius-server** or **aaa ldap-server** commands.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If you do not include a server name in the syntax, information for all servers displays.

### Examples

```
-> show aaa server
Server name = ldap2
  Server type           = LDAP,
  Host name 1           = ors40535,
  Retry number          = 3,
  Timeout (in sec)     = 2,
  Port                  = 389,
  Domain name           = manager,
  Search base           = c=us,
Server name = rad1
  Server type           = RADIUS,
  IP Address 1          = 10.10.2.1,
  IP Address 2          = 10.10.3.5,
  Retry number          = 3,
  Timeout (in sec)     = 2,
  Authentication port   = 1645,
  Accounting port       = 1646
Server name = Tpub1
  Server type           = TACACS+,
  IP Address 1          = 10.10.5.1,
  Port                  = 3,
  Timeout (in sec)     = 2,
  Encryption enabled    = no
```

```

-> show aaa server ldap2
Server name = ldap2
  Server type           = LDAP,
  Host name 1          = ors40535,
  Retry number         = 3,
  Timeout (in sec)    = 2,
  Port                 = 389,
  Domain name         = manager,
  Search base         = c=us,

```

### *output definitions*

<b>Server name</b>	The name of the server. A RADIUS, TACACS+ or LDAP server name is defined through the <b>aaa radius-server</b> , <b>aaa tacacs+-server</b> , and <b>aaa ldap-server</b> commands respectively.
<b>Server type</b>	The type of server (ACE, LDAP, TACACS+, or RADIUS).
<b>Host name</b>	The name of the primary LDAP, TACACS+, or RADIUS host.
<b>IP address</b>	The IP address(es) of the server.
<b>Retry number</b>	The number of retries the switch makes to authenticate a user before trying the backup server.
<b>Timeout</b>	The timeout for server replies to authentication requests.
<b>Port</b>	The port number for the primary LDAP or TACACS+ server.
<b>Encryption enabled</b>	The status of the encryption.
<b>Domain name</b>	The super-user or administrative distinguished name in the format recognized by the LDAP-enabled directory servers.
<b>Search base</b>	The search base recognized by the LDAP-enabled directory servers.
<b>Authentication port</b>	The UDP destination port for authentication requests.
<b>Accounting port</b>	The UDP destination port for accounting requests.

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<b>aaa radius-server</b>	Configures or modifies a RADIUS server for Authenticated Switch Access.
<b>aaa ldap-server</b>	Configures or modifies an LDAP server for Authenticated Switch Access.
<b>aaa tacacs+-server</b>	Configures or modifies an TACACS+ server for Authenticated Switch Access.

## show aaa authentication

Displays information about the current authenticated switch session.

**show aaa authentication**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **show aaa authentication** command to display authentication information about switch management services (Telnet, FTP, console port, Secure Shell, etc.).

### Examples

```
-> show aaa authentication
Service type = Default
  1rst authentication server = RadiusServer
  2nd authentication server = local
Service type = Console
  1rst authentication server = local
Service type = Telnet
  Authentication = Use Default,
  1rst authentication server = RadiusServer
  2nd authentication server = local
Service type = FTP
  Authentication = Use Default,
  1rst authentication server = RadiusServer
  2nd authentication server = local
Service type = Http
  Authentication = Use Default,
  1rst authentication server = RadiusServer
  2nd authentication server = local
Service type = Snmp
  Authentication = Use Default,
  1rst authentication server = RadiusServer
  2nd authentication server = local
Service type = Ssh
  Authentication = Use Default,
  1rst authentication server = TacacsServer
  2nd authentication server = local
```

*output definitions*

---

<b>Authentication</b>	Displays <b>denied</b> if the management interface is disabled. Displays <b>Use Default</b> if the management interface is configured to use the default configuration.
<b>1st authentication server</b>	The first server to be polled for authentication information.
<b>2nd authentication server</b>	The next server to be polled for authentication information.

## show aaa accounting

Displays information about accounting servers configured for Authenticated Switch Access. Accounting servers keep track of network resources (time, packets, bytes, etc.) and user activity.

**show aaa accounting**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **show aaa accounting** command to display accounting servers configured for management session types (Telnet, FTP, console port, HTTP, or SNMP).

### Examples

```
-> show aaa accounting
    1st accounting server      = RadiusServer
    2nd accounting server      = local
```

### output definitions

---

<b>Session</b>	Indicates servers for Authenticated Switch Access session.
<b>1st authentication server</b>	The first server to be polled for authentication information.
<b>2nd authentication server</b>	The next server to be polled for authentication information.

## show user

Displays information about all users or a particular user configured in the local user database on the switch.

**show user** [*username*]

---

### Syntax Definitions

*username*    The name of the user. Used for logging into the switch.

### Defaults

By default, all users are displayed if the *username* parameter is not specified with this command.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use this command to display information about read/write access and partitioned management access (domains and families).

### Examples

```
-> show user
User name = Customer1,
  Password expiration      = 10/27/2010 11:01 (30 days from now),
  Password allow to be modified date    = 9/30/2010 10:59 (3 days from now),
  Account lockout         = Yes (Automatically unlocked after 19 minute(s)from now),
  Password bad attempts   = 3,
  Read Only for domains   = None,
  Read/Write for domains  = Admin System Physical Layer2 Services policy Security ,
  Read/Write for families = ip rip ospf bgp vrrp ip-routing ipx ipmr ipms ,
  Snmp allowed            = YES,
  Snmp authentication     = SHA,
  Snmp encryption        = DES
User name = admin,
  Password expiration      = 10/27/2010 11:01 (30 days from now),
  Password allow to be modified date    = 9/30/2010 10:59 (3 days from now),
  Account lockout         = None,
  Password bad attempts   = 0,
  Read Only for domains   = None,
  Read/Write for domains  = All ,
  Snmp allowed            = NO
```

*output definitions*

<b>User name</b>	The user name for this account.
<b>Password expiration</b>	The date and time on which the password will expire. This field only displays if the password expiration is configured specifically for a user, or a default password expiration is configured globally on the switch through the <b>user password-expiration</b> command. (Note that the date/time are based on the switch's default system date/time or the system date/time configured through the <b>system date</b> and <b>system time</b> commands.)
<b>Password allow to be modified date</b>	The earliest date and time on which the user may change the password. Configured through the <b>user password-min-age</b> command.
<b>Account lockout</b>	Indicates if the user account is locked out ( <b>Yes</b> or <b>No</b> ) and how many minutes remain until the user account is automatically unlocked. If no remaining time is displayed, the <b>admin</b> user or a user with admin privileges must manually unlock the account. Configured through the <b>user lockout-duration</b> and <b>user lockout unlock</b> commands.
<b>Password bad attempts</b>	The number of failed password login attempts for this user account.
<b>Read Only for domains</b>	The command domains available with the user's read-only access. See the table on the next page for a listing of valid domains.
<b>Read/Write for domains</b>	The command domains available with the user's read-write access. See the table on the next page for a listing of valid domains.
<b>Read Only for families</b>	The command families available with the user's read-only access. See the table on the next page for a listing of valid families.
<b>Read/Write for families</b>	The command families available with the user's read-write access. See the table on the next page for a listing of valid families.
<b>Snmp allowed</b>	Indicates whether or not the user is authorized to use SNMP ( <b>YES</b> or <b>NO</b> ). SNMP is allowed for the user account when SNMP authentication is specified for the account.
<b>Snmp authentication</b>	The level of SNMP authentication, if any, configured for the user. This field only displays if the user is authorized to use SNMP.
<b>Snmp encryption</b>	The level of SNMP encryption, if any, configured for the user. This field only displays if the user is authorized to use SNMP.

Possible values for command domains and families are listed here:

<b>Domain</b>	<b>Corresponding Families</b>
domain-admin	file telnet dshell debug
domain-system	system aip snmp rmon webmgt config
domain-physical	chassis module interface pmm health
domain-network	ip rip ospf bgp vrrp ip-routing ipx ipmr ipms
domain-layer2	vlan bridge stp 802.1q linkagg ip-helper
domain-service	dns
domain-policy	qos policy slb
domain-security	session avlan aaa

## show user password-policy

Displays the global password settings configured for the switch.

**show user password-policy**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The password policy contains parameter values that define configuration requirements for all passwords that are created on the switch. Use this command to display the current parameter values for the password policy.

### Examples

```
-> show user password-policy
Password Policy:
Contain username flag: Enable
Minimum number of English uppercase characters: 6
Minimum number of English lowercase characters: 4
Minimum number of base-10 digit: 2
Minimum number of non-alphanumeric: 3
Minimum size: 8
Password history: 4
Password minimum age: 20 (days)
Password expiration: 40 (days)
```

#### *output definitions*

<b>Contain username flag</b>	Indicates if the username is included with the password check ( <b>Enable</b> or <b>Disable</b> ). Configured through the <b>user password-policy cannot-contain-username</b> command.
<b>Minimum number of English uppercase characters</b>	The minimum number of uppercase characters required in a password. Configured through the <b>user password-policy min-uppercase</b> command.
<b>Minimum number of English lowercase characters</b>	The minimum number of lowercase characters required in a password. Configured through the <b>user password-policy min-lowercase</b> .
<b>Minimum number of base-10 digit</b>	The minimum number of digits required in a password. Configured through the <b>user password-policy min-digit</b> command.
<b>Minimum number of non-alphanumeric</b>	The minimum number of non-alphanumeric characters required in a password. Configured through the <b>user password-policy min-non-alpha</b> command.

---

*output definitions*

---

<b>Minimum size</b>	The minimum number of characters required for the password size. Configured through the <b>user password-size min</b> command.
<b>Password history</b>	The maximum number of old passwords retained in the password history. Configured through the <b>user password-history</b> command.
<b>Password minimum age</b>	The number of days a password is protected from any modification. Configured through the <b>user password-min-age</b> command.
<b>Password expiration</b>	The default expiration date applied to all passwords. Configured through the <b>user password-expiration</b> command.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

**show user password-policy** Displays the expiration date for passwords configured for user accounts stored on the switch.

**MIB Objects**

```
aaaAsaConfig
  aaaAsaPasswordContainUserName
  aaaAsaPasswordMinUpperCase
  aaaAsaPasswordMinLowerCase
  aaaAsaPasswordMinDigit
  aaaAsaPasswordMinNonAlpha
  aaaAsaPasswordHistory
  aaaAsaPasswordMinAge
  aaaAsaPasswordSizeMin
  aaaAsaDefaultPasswordExpirationInDays
```

---

## show user lockout-setting

Displays the global user lockout settings for the switch.

**show user lockout-setting**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The global lockout settings include parameter values that determine the length of a user observation window, the amount of time a locked user remains locked, and the number of failed password login attempts allowed.

### Examples

```
-> show user lockout-setting
Lockout Setting:
Observation window: 30 (minutes)
Duration: 200 (minutes)
Threshold: 20
```

#### *output definitions*

---

<b>Observation window</b>	The amount of time, in minutes, during which the number of failed password login attempts are counted. Configured through the <a href="#">user lockout-window</a> command.
<b>Duration</b>	The amount of time, in minutes, that a locked user account remains locked out of the switch. Configured through the <a href="#">user lockout-duration</a> command.
<b>Threshold</b>	The maximum number of failed password login attempts allowed before the user is locked out of the switch. Configured through the <a href="#">user lockout-threshold</a> command.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[user lockout unlock](#)

Manually locks or unlocks a user account on the switch.

[show user](#)

Displays information about all users or a particular user configured in the local user database on the switch.

## MIB Objects

aaaAsaConfig

aaaAsaLockoutWindow

aaaAsaLockoutDuration

aaaAsaLockoutThreshold

---

## show aaa priv hexa

Displays hexadecimal values for command domains/families. Useful for determining how to express command families in hexadecimal; hexadecimal values are used in configuring user privileges in attributes on an external LDAP or RADIUS authentication server.

**show aaa priv hexa** [*domain or family*]

---

### Syntax Definitions

*domain or family*

The CLI command domain or particular command family for which you want to display hexadecimal values. See table in Usage Guidelines.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Valid values for the family parameter are listed in the Corresponding Families column of the following table:

Domain	Corresponding Families
domain-admin	file telnet dshell debug
domain-system	system aip snmp rmon webmgt config
domain-physical	chassis module interface pmm health
domain-network	ip rip ospf bgp vrrp ip-routing ipx ipmr ipms
domain-layer2	vlan bridge stp 802.1q linkagg ip-helper
domain-service	dns
domain-policy	qos policy slb
domain-security	session avlan aaa

- Note that some command families may not be supported depending on the hardware platform you are running.
- If you do not specify a command family, hexadecimal values for all commands sets will display.

## Examples

```

-> show aaa priv hexa
file           = 0x00000001 0x00000000,
telnet        = 0x00000008 0x00000000,

# 32 Port Mapping Commands

Port Mapping is a security feature that controls communication between peer users. Each session comprises of a session ID and a set of user ports and/or a set of network ports. The user ports within a session cannot communicate with each other and can only communicate through network ports. In a port mapping session with user port set A and network port set B, ports in set A can communicate with ports in set B only. If set B is empty, the ports in set A can communicate with the rest of the ports in the system.

A port mapping session can be configured in a unidirectional or bidirectional mode. In the unidirectional mode, the network ports can communicate with each other within the same session. In the bidirectional mode, the network ports cannot communicate with each other. Network ports of a unidirectional port mapping session can be shared with other unidirectional sessions, but cannot be shared with any session that is configured in bidirectional mode. Network ports of different sessions can communicate with each other.

MIB information for the Port Mapping commands is as follows:

*Filename:* AlcatelIND1PortMapping.mib  
*Module:* ALCATEL-IND1-PORT-MAPPING

A summary of the available commands is listed here:

---

**port-mapping user-port network-port**  
**port-mapping** (configures port mapping status and direction)  
**port-mapping [unidirectional | bidirectional]**  
**port-mapping unknown-unicast-flooding**  
**show port-mapping status**  
**show port-mapping**

---

## port-mapping user-port network-port

Creates a port mapping session with the user ports, network ports, or both user ports and network ports. Use the **no** form of the command to delete ports or a link aggregate group from a session.

**port-mapping** *port\_mapping\_sessionid* [**user-port** {*slot slot* | *slot/port[-port2]*} | **linkagg** *linkagg\_id*]  
[**network-port** {*slot slot* | *slot/port[-port2]*} | **linkagg** *linkagg\_id*]

**no port-mapping** *port\_mapping\_sessionid* [**user-port** {*slot slot* | *slot/port[-port2]*} | **linkagg** *linkagg\_id*]  
[**network-port** {*slot slot* | *slot/port[-port2]*} | **linkagg** *linkagg\_id*]

---

### Syntax Definitions

<i>port_mapping_sessionid</i>	The port mapping session ID.
<b>user-port</b>	Specifies a user port of the mapping session.
<b>network-port</b>	Specifies a network port of the mapping session.
<b>slot</b>	Specifies that a slot is assigned to the mapping session.
<i>slot</i>	Enter the slot number to be assigned to the mapping session.
<i>port</i>	Enter the port number to be assigned to the mapping session.
<i>port2</i>	Last port number in a range of ports assigned to the mapping session.
<b>linkagg</b>	Specifies that a link aggregation group is assigned to the mapping session.
<i>linkagg_id</i>	Enter a link aggregate ID number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- User ports that are part of one session cannot communicate with each other. The user ports can communicate only through network ports of the session to the other elements of the system.
- User ports can be part of only one port mapping session.
- An aggregable port of a link aggregation group cannot be a mapped port and a mapped port cannot be an aggregable port of a link aggregation group.
- A mirrored port cannot be a mapped port and a mapped port cannot be a mirrored port.

## Examples

```
-> port-mapping 3 user-port 2/3 network-port 6/4
-> port-mapping 4 user-port 2/5-8
-> port-mapping 5 user-port 2/3 network-port slot 3
-> no port-mapping 5 user-port 2/3
-> no port-mapping 6 network-port linkagg 7
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">port-mapping</a>	Enables, disables, or deletes a port mapping session.
<a href="#">port-mapping [unidirectional   bidirectional]</a>	Configures the direction of a port mapping session.
<a href="#">port-mapping unknown-unicast-flooding</a>	Enables or disables flooding of unknown unicast traffic from all ports to user ports for a particular session.
<a href="#">show port-mapping</a>	Displays the configuration of one or more port mapping sessions.

## MIB Objects

```
PortMappingSessionTable
    pmapSessionNumber
portMappingTable
    pmapPortIfindex
    pmapPortType
```

---

## port-mapping

Enables, disables, or deletes a port mapping session.

**port-mapping** *port\_mapping\_sessionid* {**enable** | **disable**}

**no port-mapping** *port\_mapping\_sessionid*

---

### Syntax Definitions

<i>port_mapping_sessionid</i>	The port mapping session ID.
<b>enable</b>	Enables a port mapping session.
<b>disable</b>	Disables a port mapping session.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>enable   disable</b>	<b>disable</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

To be enabled, a session should have a minimum of two ports.

### Examples

```
-> port-mapping 3 enable
-> port-mapping 4 disable
-> no port-mapping 5
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<b>port-mapping user-port network-port</b>	Creates a port mapping session with or without the user ports, network ports, or both.
<b>port-mapping [unidirectional   bidirectional]</b>	Configures the direction of a port mapping session.
<b>show port-mapping status</b>	Displays the status of one or more port mapping sessions.
<b>show port-mapping</b>	Displays the configuration of one or more port mapping sessions.

## MIB Objects

PortMappingSessionTable  
    pmapSessionNumber  
    pmapSessionStatus

---

## port-mapping [unidirectional | bidirectional]

Configures the direction of a port mapping session.

**port-mapping** *port\_mapping\_sessionid* [unidirectional | bidirectional]

---

### Syntax Definitions

<i>port_mapping_sessionid</i>	The port mapping session ID.
<b>unidirectional</b>	Specifies unidirectional port mapping.
<b>bidirectional</b>	Specifies bidirectional port mapping.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>enable</b>
<b>unidirectional   bidirectional</b>	<b>bidirectional</b>

---

### Platform Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- In the bidirectional mode, the network ports of a session cannot communicate with each other. Also, the network ports of that session cannot be a part of a network port set of another session.
- In the unidirectional mode, the network ports of a session can communicate with each other. Also, the network ports of that session can be part of a network port set of another session that is in the unidirectional mode.
- To change the directional mode of an active session with network ports, delete the network ports of the session, change the direction, and recreate the network ports.

### Examples

```
-> port-mapping 5 enable unidirectional
-> port-mapping 5 disable unidirectional
-> port-mapping 6 enable bidirectional
-> port-mapping 5 disable bidirectional
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

**port-mapping user-port  
network-port**

Creates a port mapping session with or without the user ports, network ports or both.

**port-mapping**

Enables, disables, or deletes a port mapping session.

**show port-mapping**

Displays the configuration of one or more port mapping sessions.

## MIB Objects

PortMappingSessionTable

    PmapSessionNumber

    PmapSessionDirection

---

## port-mapping unknown-unicast-flooding

Enables or disables flooding of unicast traffic from all the switch ports to the user ports related to a particular session.

**port-mapping *session\_id* unknown-unicast-flooding {enable | disable}**

---

### Syntax Definitions

<i>session_id</i>	Enter the port mapping session ID.
<b>enable</b>	Enables the flooding of unknown unicast traffic from all ports to the user ports for a particular session.
<b>disable</b>	Disables the flooding of unknown unicast traffic from all ports to the user ports for a particular session.

### Defaults

---

parameter	default
<b>enable   disable</b>	<b>enable</b>

---

### Platform Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Configuring unknown unicast flooding creates a new port mapping session if there is no existing session.
- When a link aggregate is configured as a user port, the unknown unicast flooding configuration is applied to all the member ports of the aggregate.

### Examples

```
-> port-mapping 1 unknown-unicast-flooding enable
-> port-mapping 2 unknown-unicast-flooding disable
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

**port-mapping user-port  
network-port**

Creates a port mapping session with or without the user ports, network ports or both.

**port-mapping**

Enables, disables, or deletes a port mapping session.

**show port-mapping**

Displays the configuration of one or more port mapping sessions.

**show port-mapping status**

Displays the status of one or more port mapping sessions.

## MIB Objects

portMappingSessionTable

  pmapSessionUnknownUnicastFloodStatus

---

## show port-mapping status

Displays the status of one or more port mapping sessions.

**show port-mapping** [*port\_mapping\_sessionid*] **status**

---

### Syntax definitions

*port\_mapping\_sessionid*            The port mapping session ID.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If you do not specify the port mapping session ID, then the status of all the port mapping sessions are displayed.

### Examples

-> show port-mapping status

SessionID	Direction	Status	Unknown Unicast
1	bi	enable	drop
2	bi	disable	flood

### output definitions

---

<b>SessionID</b>	Displays the port mapping session ID.
<b>Direction</b>	Displays the direction of a port mapping session.
<b>Status</b>	Displays status of a port mapping session.

---

### Release History

Release 7.1.1; command introduced.

**show port-mapping** [*port\_mapping\_sessionid*]

---

### Syntax Definitions

*port\_mapping\_sessionid*            The port mapping session ID.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If you do not specify the port mapping session ID, then the user port and network port information are displayed for all the port mapping sessions active on the switch.

### Examples

```
-> show port-mapping 3
```

SessionID	USR-PORT	NETWORK-PORT
1	1/2	1/3
1	1/6	
1	1/7	

### *output definitions*

---

<b>SessionID</b>	Displays the port mapping session ID.
<b>USR-PORT</b>	Displays the set of user ports of a port mapping session.
<b>NETWORK-PORT</b>	Displays the set of network ports of a port mapping session.

# 33 Learned Port Security Commands

Learned Port Security (LPS) provides a mechanism for controlling network device communication on one or more switch ports. Configurable LPS parameters allow the user to restrict source learning on a port to:

- A maximum number of learned source MAC addresses.
- A specific amount of time in which source MAC addresses are learned.
- An individual learned source MAC address.
- A range of learned source MAC addresses.

This chapter includes descriptions of the CLI commands used to define LPS parameters and display information about the current LPS configuration.

MIB information for Learned Port Security commands is as follows:

*Filename:* AlcatelInd1LearnedPortSecurity.mib  
*Module:* ALCATEL-IND1-LPS-MIB

A summary of the available commands is listed here:

---

**port-security**  
**port-security learning-window**  
**port-security port maximum**  
**port-security port max-filtering**  
**port-security port mac-range**  
**port-security port violation**  
**port-security port learn-trap-threshold**  
**show port-security**  
**show violation**  
**show port-security learning-window**  
**clear violation**

---

## port-security

Enables or disables Learned Port Security (LPS) on the switch port(s). When LPS is enabled, only devices that have a source MAC address that comply with LPS restrictions are learned on the port(s).

**port-security** {**port** *slot/port*[-*port2*] | **chassis**} [**learning-enable** | **learning-disable**]

**no port-security port** *slot/port*[-*port2*]

**port-security chassis learning-disable**

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).
<b>learning-enable</b>	Enables Learned Port Security (LPS) on the specified port(s).
<b>learning-disable</b>	Disables LPS on the specified port(s).
<b>chassis learning-disable</b>	Disables all LPS-eligible ports on the chassis.

### Defaults

By default, LPS is disabled on all switch ports.

parameter	default
<b>learning-enable</b>   <b>learning-disable</b>	<b>learning-enable</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove LPS *and* clear all entries from the table. This command enables learning of new MAC addresses.
- Learned Port Security (LPS) cannot be applied on the whole chassis. The **learning-enable** option cannot be used along with the **chassis** option.
- The **port-security chassis learning-disable** command disables all the LPS-eligible ports on the chassis. Disabling port security restricts a port from learning new MAC addresses.
- LPS is supported on Ethernet fixed, 802.1Q tagged ports, and 802.1x ports.
- LPS is not supported on Ethernet, link aggregate, or 802.1Q tagged link aggregate (trunked) ports.
- Note that when LPS is enabled on an active port, all MAC addresses learned on that port before the time LPS is enabled, are cleared from the source learning MAC address table.

- MAC learning restrictions that can be configured are:
  - Setting a source learning time limit window
  - Specifying a maximum number of MACs allowed on a specific port
  - Configuring a list of MAC addresses (individual or range of addresses) allowed on the port
  - Determining how a port handles traffic that is unauthorized.

## Examples

```
-> port-security port 4/8 learning-enable
-> port-security port 2/1-10 learning-enable
-> port-security port 2/11-15 learning-disable
-> no port-security port 1/1-12
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

- |                                      |   |
|--------------------------------------|---|
| <b>port-security port mac-range</b>  | Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port.           |
| <b>port-security port maximum</b>    | Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.                 |
| <b>port-security learning-window</b> | Configures the amount of time in minutes to allow source learning on all LPS ports.                           |
| <b>port-security port violation</b>  | Selects the method for handling traffic that does not comply with LPS restrictions for the specified port(s). |

## MIB Objects

```
learnedPortSecurityTable
  lpsAdminStatus
```

---

## port-security learning-window

Configures the amount of time in minutes, to allow source learning on all LPS ports. This LPS parameter applies to the entire switch, so when the time limit expires, source learning of *new* MAC addresses is stopped on all LPS ports. Only authorized MAC addresses are allowed to be associated on LPS ports after this timer expires. This command also enables or disables the conversion of dynamic MAC addresses to static MAC addresses on LPS ports.

**port-security learning-window** *minutes* [**convert-to-static** {**enable** | **disable**}]

**no port-security learning-window**

---

### Syntax Definitions

<i>minutes</i>	The number of minutes that defines the amount of time in which source learning is allowed across all LPS ports.
<b>enable</b>	Enables the conversion of dynamic MAC addresses to static MAC addresses on the LPS port.
<b>disable</b>	Disables the conversion of dynamic MAC addresses to static MAC addresses on the LPS port.

### Defaults

By default, the LPS source learning time limit is not set for the switch.

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The LPS source learning time window is started and/or reset each time the **port-security learning-window** command is issued.
- To automatically start the timer on switch reboot, save this command to the **boot.cfg** file for the switch. Each time the switch reboots, the timer is restarted. However, you can reset the timer by issuing the command again.
- If the **convert-to-static** parameter is enabled and the LPS source learning time window expires, then all dynamic MAC addresses are converted to static MAC addresses. This stops the MAC addresses from aging out.

- The conversion of dynamic MAC addresses to static ones does not apply to LPS ports.

---

**Note.** The LPS source learning time window has a higher priority over the maximum number of MAC addresses allowed. For example, if the maximum number of MAC addresses allowed is set at 30 and the learning interval expires when the port has only learned 15, then the port does *not* learn anymore MAC addresses.

---

## Examples

```
-> port-security learning-window 25
-> port-security learning-window 60
-> port-security learning-window 2 convert-to-static enable
-> port-security learning-window 2 convert-to-static disable

-> no port-security learning-window 25
```

## Release History

  lpsConvertToStatic
```

---

## port-security port maximum

Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.

**port-security port *slot/port*[-*port2*] maximum *number***

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).
<i>number</i>	The number of source MAC addresses that are allowed on this port.

### Defaults

By default, the number of MAC addresses allowed is set to 1.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the port attempts to learn a MAC address that exceeds the maximum number allowed, the port blocks the unauthorized address or a shutdown occurs. Use the [port-security port violation](#) command to specify how an LPS port handles violating traffic.
- Note that source learning of configured authorized MAC addresses is still allowed after the LPS time limit has expired; however, all learning is stopped if the number of MAC addresses learned meets or exceeds the maximum number of addresses allowed, even if the LPS time limit has not expired.

### Examples

```
-> port-security 2/14 maximum 25
-> port-security 4/10-15 maximum 100
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<b>port-security</b>	Enables or disables Learned Port Security (LPS) on the switch port(s).
<b>port-security port mac-range</b>	Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port.
<b>port-security learning-window</b>	Configures the amount of time in minutes to allow source learning on all LPS ports. Also, enables or disables the conversion of dynamic MAC addresses to static MAC addresses on LPS ports.
<b>port-security port violation</b>	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.

## MIB Objects

learnedPortSecurityTable  
lpsMaxMacNum

---

## port-security port max-filtering

Configures the maximum number of MAC addresses that can be filtered on the LPS port(s).

**port-security port *slot/port*[-*port2*] max-filtering *number***

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).
<i>number</i>	The maximum number of filtered MAC addresses that are allowed on this port.

### Defaults

By default, the maximum number of filtered MAC addresses that can be learned on an LPS port is set to 5.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

When the number of filtered MAC addresses learned on the port reaches the maximum, either the port is disabled (Shutdown Violation mode) or MAC address learning is disabled (Restrict Violation mode). By default, MAC address learning is disabled.

### Examples

```
-> port-security 1/10 max-filtering 6
-> port-security 1/10-13 max-filtering 18
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">port-security port maximum</a>	Specifies the maximum number of source MAC addresses that an LPS port(s) is allowed to learn.
<a href="#">port-security port violation</a>	Selects the method for handling traffic that does not comply with LPS restrictions for the specified port.

### MIB Objects

```
learnedPortSecurityTable
  lpsMaxFilteredMacNum
```

---

## port-security port mac-range

Configures a list of authorized MAC addresses by defining a range of addresses allowed on the port. This command also enables LPS on the specified port, if LPS is not already active on the port.

**port-security port** *slot/port*[-*port2*] **mac-range** [**low** *mac\_address* / **high** *mac\_address* / **low** *mac\_address* **high** *mac\_address*]

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).
<b>low</b> <i>mac_address</i>	MAC address that defines the low end of a range of MACs (for example, 00:20:95:00:10:2A).
<b>high</b> <i>mac_address</i>	MAC address that defines the high end of a range of MACs (for example, 00:20:95:00:10:2F).

### Defaults

parameter	default
<b>high</b> <i>mac_address</i>	ff:ff:ff:ff:ff:ff
<b>low</b> <i>mac_address</i>	00:00:00:00:00:00

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If **low** and **high** end MAC addresses are not specified with this command, then the range is set back to the default range value (00:00:00:00:00:00– ff:ff:ff:ff:ff:ff).
- Source MAC addresses received on an LPS port that fall within the authorized range are allowed on the port. An additional entry is made in the LPS table for each of these learned addresses.
- Any additional source MAC addresses received that do not match configured authorized addresses are allowed on the port based on the LPS time limit (if active) and the maximum number of MAC addresses allowed.
- Each configured authorized MAC address counts towards the number of addresses allowed on the port even if the port has not learned the configured address. For example, if a port has 3 configured authorized MAC addresses and the maximum number of addresses allowed is set to 10, then only 7 additional MAC addresses are allowed on that port.

## Examples

```
-> port-security port 4/20 mac-range low 00:20:95:00:fa:5c
-> port-security port 5/11-15 mac-range low 00:da:95:00:00:10 high
00:da:95:00:00:1f
-> port-security port 5/16-20 mac-range high 00:da:95:00:00:1f
-> port-security port 5/11-15 mac-range
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

---

## port-security port violation

Selects the method for handling traffic that does not comply with LPS restrictions for the specified port(s).

**port-security port *slot/port[-port2]* violation {restrict | shutdown}**

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).
<b>restrict</b>	Filters (blocks) unauthorized traffic but allows traffic that complies with LPS restrictions to forward on the port.
<b>shutdown</b>	The port is disabled when the port receives unauthorized traffic. No further traffic is allowed on the port in such an instance.

### Defaults

By default, the security violation mode is set to **restrict** when LPS is enabled on the port.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When a traffic violation occurs on an LPS port, a notice is sent to the switch log.
- If the violation mode is set to **restrict**, unauthorized source MAC addresses are not learned in the LPS table. However they are recorded in the source learning MAC address table with a filtered operational status. Hence the user can view MAC addresses attempting unauthorized access to the LPS port.

### Examples

```
-> port-security port 2/14 violation restrict
-> port-security port 4/10-15 violation shutdown
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

lpsViolationOption

---

## port-security port learn-trap-threshold

Configures the number of bridged MAC addresses to learn before sending a trap.

**port-security port *slot/port*[-*port2*] learn-trap-threshold *number***

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).
<i>number</i>	The number of bridged MAC addresses to learn before sending a trap.

### Defaults

By default, the number of bridged MAC addresses learned is set to 5.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When the number of bridged MAC addresses learned on the port matches the specified threshold amount, a trap is sent for every bridged MAC address learned thereafter.
- Sending a trap when this threshold is reached provides notification of newly learned bridged MAC addresses. Trap contents includes identifying information about the MAC, such as the address itself, the corresponding IP address, switch identification, and the slot and port number on which the MAC was learned.

### Examples

```
-> port-security port 1/10 learn-trap-threshold 6
-> port-security port 1/10-13 learn-trap-threshold 18
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show port-security](#) Displays Learned Port Security (LPS) configuration and table entries.

### MIB Objects

```
learnedPortSecurityTable
  lpsLearnTrapThreshold
```

---

## show port-security

Displays Learned Port Security (LPS) configuration and table entries.

```
show port-security {port [slot/port[-port2] / slot slot]}
```

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).
<i>slot</i>	Enter the slot number for a module to specify that the command should include all ports on that module (for example, 6 specifies all ports on the module found in slot 6 of the switch chassis).

### Defaults

By default, all ports with an LPS configuration are displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Displays ports that have an LPS configuration, even if LPS is disabled on the port.
- Use the **port** parameter and the port numbers with this command to display the LPS configuration for a specific port or a range of ports.
- Use the **slot** parameter and the slot numbers with this command to display the LPS configuration for all the ports on a specific slot.
- In addition, MAC addresses learned on the LPS enabled port that are within the specified MAC address range, appear as a separate entries in the LPS table as dynamic MAC type addresses.
- Dynamic MAC addresses are stored as configured MAC addresses in the LPS table when the switch configuration is saved and the switch is rebooted. If the configuration is not saved before the next reboot, all dynamic MAC addresses are cleared from the LPS table.
- The MAC TYPE field is blank if an authorized MAC address range is configured for the LPS enabled port.

## Examples

```
-> show port-security
```

```
Port: 7/10
Operation Mode      :          ENABLED,
Max MAC bridged    :          1,
Trap Threshold     :          DISABLED,
Max MAC filtered   :          5,
Low MAC Range      :          00:00:00:00:00:00,
High MAC Range     :          ff:ff:ff:ff:ff:ff,
Violation          :          RESTRICT

MAC Address          VLAN  MAC TYPE      OPERATION
-----+-----+-----+-----
00:20:95:00:fa:5c   1    STATIC      ENABLED
```

### output definitions

<b>Port</b>	The module slot number and the physical port number on that module.
<b>Operation Mode</b>	The Learned Port Security operation status for the port ( <b>enabled</b> or <b>disabled</b> ). Configured through the <b>port-security</b> command.
<b>Max MAC bridged</b>	The maximum number of bridged MAC addresses that are allowed on this port. Configured through the <b>port-security port maximum</b> command.
<b>Trap Threshold</b>	The number of bridged MACs to learn before sending a trap. After this number is reached, a trap is sent out for every MAC learned thereafter. If <b>disabled</b> is displayed in this field, the trap threshold is not in force. Configured through the <b>port-security port learn-trap-threshold</b> command.
<b>Max MAC filtered</b>	The maximum number of filtered MAC addresses that the LPS port can learn. Configured through the <b>port-security port max-filtering</b> command.
<b>Low MAC Range</b>	MAC address that defines the lower end of a MAC address range. Configured through the <b>port-security port mac-range</b> command.
<b>High MAC Range</b>	MAC address that defines the higher end of a MAC address range. Configured through the <b>port-security port mac-range</b> command.
<b>Violation</b>	The security violation mode for the port ( <b>restrict</b> or <b>shutdown</b> ). Configured through the <b>port-security port violation</b> command.
<b>MAC Address</b>	The MAC address learned dynamically or configured statically on the switch.
<b>VLAN</b>	The VLAN to which the LPS port belongs.
<b>MAC TYPE</b>	Indicates if the MAC address was dynamically learned or statically configured as an authorized MAC address for the port. Dynamic MAC addresses become configured MAC address entries when we save the configuration and reboot the switch.

*output definitions*

---

<b>OPERATION</b>	LPS status of the port. The various operation modes are ENABLED, DISABLED, SHUTDOWN and RESTRICTED.
<b>TYPE</b>	Indicates if the MAC address was dynamically learned or statically configured as an authorized MAC address for the port. Dynamic MAC addresses become configured MAC address entries after a configuration save and switch reboot.

---

**Release History**

Release 7.1.1; command introduced.

## show violation

Displays the address violations that occur on ports with LPS restrictions. This command displays a port violation for sticky port security when the maximum number of MAC address of the connected workstation that the switch learns.

**show violation** {port *slot/port*[-*port2*] | linkagg *linkagg\_id*[-*linkagg\_id2*]}

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports (for example, 3/1-4 specifies ports 1-4 on slot 3).
<i>linkagg_id</i>	Enter a link aggregate ID number.
<i>-linkagg_id2</i>	The last aggregate ID number in a range of link aggregate ports.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

NA

### Examples

-> show violation

Port	Source	Action	Reason	Timer
1/1	src lrn	simulated down	lps shutdown	0
1/1	src lrn	simulated down	lps restrict	0
2	qos	admin down	policy	0

The admin down action in the **show violation** output for port 2 represents that there has been a port violation on one of the ports related to the link aggregate group with ID 2.

### *output definitions*

---

<b>Port</b>	The slot and port numbers or link aggregate IDs of the ports that list address violations.
<b>Source</b>	Specifies the source application that detects the violation.

---

*output definitions\*

---

<b>Action</b>	Specifies the action that is taken when the violation is detected on the port. The two type of actions are: <b>admin down</b> - deactivates the physical port. This action is taken for a UDLD violation. <b>simulated down</b> - the port is put in blocking state.
<b>Reason</b>	Specifies the reason for the violation to occur.
<b>Timer</b>	Specifies the duration of the violation.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

  portViolationTimerAction
```

---

## show port-security learning-window

Displays the amount of time during which source learning can occur on all LPS ports.

**show port-security learning-window**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The source learning time limit is a switch-wide parameter that applies to all ports that have LPS enabled.
- If the shutdown time is set to zero, then a source learning time limit is not active on LPS ports.

---

**Note.** Source learning of configured authorized MAC addresses is allowed even after the LPS time limit has expired. However, all learning is stopped if the number of MAC addresses learned meets or exceeds the maximum number of addresses allowed, even if the LPS time limit has not expired.

---

### Examples

```
-> show port-security learning-window
```

```
LPS Shutdown Config      = 2 min  
Convert-to-static        = DISABLE  
Remaining Learning Window = 110 sec
```

#### *output definitions*

---

<b>LPS Shutdown Config</b>	The configured amount of time during which the LPS port can learn new MAC addresses.
<b>Convert-to-static</b>	Indicates whether or not dynamic MACs are converted to static MACs ( <b>enabled</b> or <b>disabled</b> ). Configured through the <b>port-security learning-window</b> command.
<b>Remaining Learning Window</b>	The remaining amount of time during which the LPS port can learn MAC addresses.

---

### Release History

Release 7.1.1; command introduced.

## Related Commands

---

## clear violation

Clears all the MAC address violation logs for a particular port and session.

```
clear violation {port slot/port[-port2] | linkagg agg_num[-agg_num2]}
```

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports you want to configure on the same slot (for example, 3/1-4 specifies ports 1-4 on slot 3).
<i>agg_num</i>	Enter a link aggregate ID number.
<i>-agg_num2</i>	The last aggregate ID number in a range of link aggregate ports.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When a violation is set on a physical port that is part of a link aggregate, the violation is set for the whole link aggregate. All ports on that link aggregate is brought down. This command can be applied to the link aggregate IDs to activate all the ports of the link aggregates.
- If physical or link aggregate ports are simulated down, toggle the link to clear the violation.

### Examples

```
-> clear violation port 1/10  
-> clear violation linkagg 10-20
```

### Release History

Release 7.1.1; command introduced.

# 34 Port Mirroring and Monitoring Commands

The Port Mirroring and Port Monitoring features are primarily used as diagnostic tools.

The Port Mirroring feature allows you to have all the inbound and outbound traffic of an Ethernet port sent to another port on the switch. When you enable port mirroring, the active, or “mirrored,” port transmits and receives network traffic normally and the “mirroring” port receives a copy of all transmit and receive traffic to the active port. You can connect an RMON probe or network analysis device to the mirroring port to see an exact duplication of traffic on the mirrored port without disrupting network traffic to and from the mirrored port.

The Port Monitoring feature allows you to capture and examine the data traffic to and from a monitored Ethernet port.

MIB information for the Port Mirroring commands is as follows:

*Filename:* AlcatelIND1portMirMon.mib  
*Module:* ALCATEL-IND1-PORT-MIRRORING-MONITORING-MIB

The following table summarizes the available commands:

<b>Port Mirroring Commands</b>	<a href="#">port-mirroring source destination</a> <a href="#">port-mirroring</a> <a href="#">show port-mirroring status</a>
<b>Port Monitoring Commands</b>	<a href="#">port-monitoring source</a> <a href="#">port-monitoring</a> <a href="#">show port-monitoring status</a> <a href="#">show port-monitoring file</a>

## port-mirroring source destination

Defines the port to mirror and the port that is to receive data from the mirrored port. Also, enables or disables remote port mirroring.

**port-mirroring** *port\_mirror\_sessionid* **source** {*slot/port*[-*port2*] [*slot/port*[-*port2*]...]  
**destination** *slot/port* [**rpmir-vlan** *vlan\_id*] [**bidirectional** | **inport** | **outport**] [**unblocked** *vlan\_id*]  
[**enable** | **disable**]

**port-mirroring** *port\_mirror\_sessionid* **no source** {*slot/port*[-*port2*] [*slot/port*[-*port2*]...]

---

### Syntax Definitions

<i>port_mirror_sessionid</i>	Mirroring session identifier.
<b>source</b>	Specifies source port, or range of ports desired to be mirrored.
<b>no source</b>	Removes a port or range of ports from a port mirroring session.
<b>destination</b>	Specifies the destination port, that receives all the mirrored packets.
<i>slot/port</i>	Enter a port number.
[ <i>slot/port</i> [- <i>port2</i> ]...]	Enter a range of port numbers.
<b>rpmir-vlan</b> <i>vlan_id</i>	Specifies a reserved VLAN to carry the mirroring traffic.
<b>bidirectional</b>	Specifies bidirectional port mirroring.
<b>inport</b>	Specifies incoming unidirectional port mirroring.
<b>outport</b>	Specifies outgoing unidirectional port mirroring.
<b>unblocked</b> <i>vlan_id</i>	Specifies the VLAN that is to be protected from Spanning Tree changes when port mirroring is active. Ports in this VLAN remain unblocked.
<b>enable</b>	Enables port mirroring status.
<b>disable</b>	Disables port mirroring status.

### Defaults

parameter	default
<b>bidirectional</b>   <b>inport</b>   <b>outport</b>	<b>bidirectional</b>
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- You can configure a port mirroring and a port monitoring session on the same network interface module in an OmniSwitch 10K, 6900.
- A mirroring port can not be assigned to a tagged VLAN port.
- When a port is configured as a mirroring port, it does not belong to any VLAN. Inbound traffic to the mirroring port is dropped since it does not belong to any VLAN.
- Spanning tree is disabled by default on a mirroring port.
- Port mirroring is not supported on logical link aggregate ports. However, it is supported on individual ports that are members of a link aggregate.
- Execute the **port mirroring source destination** command to define the mirrored port and enable port mirroring status. Use the **port mirroring** command to enable the port mirroring session.
- Specify the *vlan\_id* number of the mirroring port that is to remain **unblocked** when the command is executed. The **unblocked** VLAN becomes the default VLAN for the mirroring port. This VLAN handles the inbound traffic for the mirroring port. Spanning tree remains disabled on the unblocked VLAN.

## Usage Guidelines - Remote Port Mirroring

- Remote port mirroring is supported only on OmniSwitch 10K, 6900 switches.
- Use the **rpmir-vlan** parameter and VLAN ID with this command to configure remote port mirroring and to assign the VLAN ID for remote port mirroring.
- The VLAN ID assigned for remote port mirroring cannot be assigned to a general port mirroring port.
- There must not be any physical loop present in the remote port mirroring VLAN.
- Source learning must be disabled or overridden on the ports belonging to the remote port mirroring VLAN on intermediate and destination switches.
- On OmniSwitch 10K, 6900 switches the QoS redirect feature can be used to override source learning.
- The **mac-learning** command can also be used to disable learning on the RPMIR VLAN ID.

## Examples

```
-> port-mirroring 6 source 2/2
-> port-mirroring 6 source 2/3-5
-> port-mirroring 6 destination 1/12 rpmir-vlan 7
-> port-mirroring 6 no source 2/2-5

-> port-mirroring 7 source 2/3 destination 6/4 unblocked 750

-> port-mirroring 8 source 1/7 bidirectional
-> port-mirroring 8 no source 1/7

-> port-mirroring 9 source 1/23 inport
-> port-mirroring 9 destination 1/24
-> port-mirroring 9 disable
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

[port-mirroring](#)

Enables, disables, or deletes a port mirroring session.

## port-mirroring

Enables, disables, or deletes a port mirroring session.

**port-mirroring** *port\_mirror\_sessionid* {**enable** | **disable**}

**no port-mirroring** *port\_mirror\_sessionid*

---

### Syntax Definitions

*port\_mirror\_sessionid*                      Mirroring session identifier.

**enable**                                      Enables port mirroring.

**disable**                                     Disables port mirroring.

### Defaults

parameter	default
<b>enable</b>   <b>disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete a port mirroring session.
- Use the [port-mirroring source destination](#) command to specify the mirrored ports and destination port. before using this command to enable or disable port mirroring activity for the particular port mirroring session.

### Examples

```
-> port-mirroring 6 enable
-> port-mirroring 6 disable
-> no port-mirroring 6
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

[port-mirroring source destination](#)

Defines a port to mirror and the port that is to receive data from the mirrored port, and enables or disables port mirroring status.

[show port-mirroring status](#)

Displays the status of mirrored ports. This value may be enabled or disabled.

## MIB Objects

## port-monitoring source

Configures a port monitoring session.

```
port-monitoring port_monitor_sessionid source slot/port  
[{no file | file filename [size filesize] | [overwrite {on | off}]}]  
[inport | output | bidirectional] [timeout seconds] [enable | disable] [capture-type {full | brief}]
```

---

### Syntax Definitions

<i>port_monitor_sessionid</i>	Monitoring session identifier.
<i>slot/port</i>	Enter the slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<b>file filename</b>	Specifies a file name and pathname for capturing information related to the monitoring session (for example, <b>/flash/port2.enc</b> ).
<i>filesize</i>	Specifies the size of the file in 64K byte increments. For example, a value of 3 would specify a size of (3 x 64K) bytes.
<b>no file</b>	<i>This option is not supported at this time.</i>
<b>overwrite on</b>	Specifies that capturing of data packets into the port monitoring file continues and old information is overwritten if the total data exceeds the specified file size.
<b>overwrite off</b>	Specifies that capturing of data packets into the port monitoring file is stopped when the maximum file size is reached.
<b>inport</b>	Specifies incoming unidirectional port monitoring.
<b>output</b>	Specifies outgoing unidirectional port monitoring.
<i>seconds</i>	Specifies the number of seconds after which the session is disabled.
<b>enable</b>	Enables the port monitoring status.
<b>disable</b>	Disables the port monitoring status.
<b>full</b>	Captures port monitoring information in detail.
<b>brief</b>	Captures only the concise port monitoring data transmitted.

## Defaults

parameter	default
<i>filesize</i>	1
<b>on   off</b>	<b>on</b>
<b>bidirectional   inport   outport</b>	<b>bidirectional</b>
<i>seconds</i>	0
<b>enable   disable</b>	<b>disable</b>
<b>capture-type</b>	<b>brief</b>

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- You can configure a port mirroring and a port monitoring session on the same NI module in an OmniSwitch 10K, 6900.
- If the port monitoring capture-type is set to **brief**, the first 64 bytes of the traffic is captured. If the port-monitoring capture-type is set to **full**, the entire packet is captured.
- By default, a file called **pmonitor.enc** is created in the **/flash** directory when you configure and enable a port monitoring session. Use the **file** option to create a user-specified file.
- The **/flash** directory is the default and the only directory used to capture the port monitoring files.
- The format of the file created is compliant with the ENC file format (Network General Sniffer Network Analyzer Format).
- By default, the recent frames overwrite the older frames in a port monitoring file if the total data exceeds the specified file size. Use the **overwrite off** option to prevent this from occurring.

## Examples

```
-> port-monitoring 6 source 2/3
-> port-monitoring 6 source 2/3 file /flash/user_port size 2 enable
-> port-monitoring 6 source 2/3 file /flash/user_port capture-type full
```

## Release History

Release 7.1.1; command introduced.

## port-monitoring

Disables, pauses, resume, or deletes an existing port monitoring session.

**port-monitoring** *port\_monitor\_sessionid* {**disable** | **pause** | **resume**}

**no port-monitoring** *port\_monitor\_sessionid*

---

### Syntax Definitions

<i>port_monitor_sessionid</i>	Monitoring session identifier.
<b>disable</b>	Disables the port monitoring session.
<b>pause</b>	Pauses the port monitoring session.
<b>resumes</b>	Resumes the port monitoring session.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to delete a port monitoring session.

### Examples

```
-> port-monitoring 6 pause
-> port-monitoring 6 disable
-> port-monitoring 6 resume
-> no port-monitoring 6
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

## show port-mirroring status

Displays the status of mirrored ports.

**show port-mirroring status** [*port\_mirror\_sessionid*]

---

### Syntax Definitions

*port\_mirror\_sessionid*                      Mirroring session identifier.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If a port mirroring session identifier is not specified with this command, then all port mirroring sessions are displayed.

### Examples

-> show port-mirroring status

Session	Mirror Destination	Mirror Direction	Unblocked Vlan	Config Status	Oper Status
6.	1/41	-	NONE	Enable	Off
	Mirror Source				
6.	1/20	bidirectional	-	Enable	Off
6.	1/21	bidirectional	-	Enable	Off
6.	1/22	bidirectional	-	Enable	Off
6.	1/23	bidirectional	-	Enable	Off
6.	1/24	bidirectional	-	Enable	Off
6.	1/25	bidirectional	-	Enable	Off
6.	1/26	bidirectional	-	Enable	Off
6.	1/27	bidirectional	-	Enable	Off
6.	1/28	bidirectional	-	Enable	Off
6.	1/29	bidirectional	-	Enable	Off
6.	1/30	bidirectional	-	Enable	Off

#### output definitions

---

<b>Session</b>	The port mirroring session identifier.
<b>Mirror Destination</b>	The location of the mirrored port.
<b>Mirror Direction</b>	The direction of the mirroring or mirrored port, which can be <b>bidirectional</b> (the default), <b>inport</b> , or <b>outport</b> .
<b>Unblocked VLAN</b>	The mirroring VLAN ID number.

*output definitions (continued)*

---

<b>Config Status</b>	The configuration status of the session.
<b>Oper Status</b>	The current status of the mirroring or mirrored port.
<b>Mirror Source</b>	The location of the mirroring port.

---

On OmniSwitch 10K, 6900 series switches:

-> show port-mirroring status

Session	Mirror Destination	Mirror Direction	Unblocked Vlan	Config Status	Oper Status
6.	1/41	-	NONE	Enable	Off
	Mirror Source				
6.	1/20	bidirectional	-	Enable	Off
6.	1/21	bidirectional	-	Enable	Off
6.	1/22	bidirectional	-	Enable	Off
6.	1/23	bidirectional	-	Enable	Off
6.	1/24	bidirectional	-	Enable	Off
6.	1/25	bidirectional	-	Enable	Off
6.	1/26	bidirectional	-	Enable	Off
6.	1/27	bidirectional	-	Enable	Off
6.	1/28	bidirectional	-	Enable	Off
6.	1/29	bidirectional	-	Enable	Off
6.	1/30	bidirectional	-	Enable	Off

*output definitions*

---

<b>Session</b>	The port mirroring session identifier.
<b>Mirror Destination</b>	The location of the mirrored port.
<b>Mirror Direction</b>	The direction of the mirroring or mirrored port, which can be <b>bidirectional</b> (the default), <b>inport</b> , or <b>outport</b> .
<b>Unblocked VLAN</b>	The mirroring VLAN ID number.
<b>Config Status</b>	The configuration status of the session.
<b>Oper Status</b>	The current status of the mirroring or mirrored port.
<b>Mirror Source</b>	The location of the mirroring port.

---

**Release History**

Release 7.1.1; command introduced.

## Related Commands

[port-mirroring](#)

Enables, disables, or deletes a port mirroring session.

## show port-monitoring status

Displays port monitoring status.

**show port-monitoring status** [*port\_monitor\_sessionid*]

---

### Syntax Definitions

*port\_monitor\_sessionid*            Monitoring session identifier.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If a port monitoring session identifier is not specified with this command, then all port monitoring sessions are displayed.

### Examples

```
-> show port-monitoring status
```

```

Sess Mon. Mon. Over Oper. Admin Capt. Max. File
      Src Dir  write Stat  Stat  Type  Size  Name
-----+-----+-----+-----+-----+-----+-----+-----+-----
  1.  1/2  Out  OFF   OFF   OFF  Brief   64K  /flash/pm.enc

```

### output definitions

---

<b>Sess</b>	<b>Session</b> - The port monitoring session identifier.
<b>Mon. Src</b>	<b>Monitor Source</b> - The source ports that are monitored.
<b>Mon Dir</b>	<b>Monitor Direction</b> - The direction of the monitoring session, which can be <b>bidirectional</b> (the default), <b>inport</b> , or <b>outport</b> .
<b>Overwrite</b>	Whether files created by a port monitoring session can be overwritten. The default is ON.
<b>Oper Stat</b>	<b>Operating Status</b> - The current operating status of the port monitoring session (on/off).
<b>Admin Stat</b>	<b>Admin Status</b> - The current administrative status of the port monitoring session (on/off).
<b>Capt Type</b>	<b>Capture type</b> - <b>Brief</b> - captures only 64 bytes of data per traffic data packet. <b>Full</b> - captures the entire packet.
<b>Max Size</b>	<b>Maximum Size</b> - The maximum size of the port monitoring file.
<b>File Name</b>	The name of the port monitoring file.

---

## Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">port-monitoring source</a>	Configures a port monitoring session.
<a href="#">port-monitoring</a>	Disables, pauses, resumes, or deletes a port monitoring session.
<a href="#">show port-monitoring file</a>	Displays port monitoring data.

  monitorFileStatus
  monitorFileName
  monitorFileSize
  monitorScreenStatus
  monitorScreenLine
  monitorTrafficType
  monitorDirection
  monitorTimeout
  monitorCaptureType
  monitorFileOverWrite
  monitorDirection
```

---

## show port-monitoring file

Displays port monitoring data.

**show port-monitoring file** *port\_monitor\_sessionid*

---

### Syntax Definitions

*port\_monitor\_sessionid*            Monitoring session identifier.

### Defaults

A single line from the captured packet is displayed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Only a single line from the captured packet is displayed, even though the full packet is captured. To view the entire packet, download the file and view it using compatible network analyzer tool.

### Examples

```
-> show port-monitoring file 1
```

Destination	Source	Type	Data
01:80:C2:00:00:00	00:20:DA:8F:92:C6	BPDU	00:26:42:42:03:00:00:00:00:00

# 35 sFlow Commands

sFlow is a network monitoring technology that gives visibility in to the activity of the network, by providing network usage information. It provides the data required to effectively control and manage the network usage. sFlow is a sampling technology that meets the requirements for a network traffic monitoring solution.

sFlow provides a network-wide view of usage and active routes. It is used for measuring network traffic, collecting, storing, and analyzing the traffic data. As it is scalable, that doesn't add significant network load. sFlow is an industry standard with many vendors delivering products with this support. Some of the applications of the sFlow data include:

- Detecting, diagnosing, and fixing network problems
- Real-time congestion management
- Detecting unauthorized network activity
- Usage accounting and billing
- Understanding application mix
- Route profiling and peer optimization
- Capacity planning

sFlow is a sampling technology embedded within switches/routers. It provides the ability to monitor the traffic flows. It requires an sFlow agent software process running as part of the switch software and a sFlow collector which receives and analyses the monitored data. The sFlow collector makes use of SNMP to communicate with an sFlow agent in order to configure sFlow monitoring on the device (switch).

An sFlow agent running on the switch/router combines interface counters and traffic flow (packet) samples, preferably, on all the interfaces into sFlow datagrams that are sent across the network to an sFlow collector.

Packet sampling on the switch/router is typically performed by the switching/routing ASICs, providing wire-speed performance. In this case, an sFlow agent does very little processing, by packaging data into sFlow datagrams that are immediately sent on network. This minimizes the memory and CPU utilization by the sFlow agent.

MIB information for the sFlow commands is as follows:

*Filename:* AlcatelIND1PortMirMon.MIB  
*Module:* Alcatel-IND1-PORT-MIRRORING-MONITORING-MIB

*Filename:* SFLOW\_RFC3176.MIB  
*Module:* SFLOW-MIB

A summary of the available commands is listed here:

---

**sflow agent**  
**sflow agent**  
**sflow sampler**  
**sflow poller**  
**show sflow agent**  
**show sflow receiver**  
**show sflow sampler**  
**show sflow poller**

---

## sflow agent

Configures a specific sflow agent IP address.

**sflow agent ip** <ip\_address>

**no sflow agent ip** <ip\_address>

---

### Syntax Definitions

*ip\_address*                      The sflow agent IP address.

### Defaults

parameter	default
<i>ip-address</i>	0.0.0.0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete the IP address.
- If no IP address is configured 0.0.0.0 is used.
- If no IP address is configured but the Loopback0 address is configured, the Loopback0 address is used.

### Examples

```
-> sflow agent ip 192.168.1.1  
-> no sflow agent ip 192.168.1.1
```

### Release History

Release 7.1.1; command was introduced.

## sflow receiver

Sets the destination hosts where the sFlow datagrams are sent out. If there are multiple destinations, then each destination has an instance of the receiver. All these receivers are attached to the sFlow manager instance and to an associated sampler/poller.

**sflow receiver** *receiver\_index* {**name** *string* | **timeout** { *seconds* | **forever** } | **address** {*ip\_address* | *ipv6address*} | **udp-port** *port* | **packet-size** *size* **Version** *num* | **release**}

---

### Syntax Definitions

<i>receiver_index</i>	Specifies the receiver index.
<i>string</i>	Specifies the name.
<i>seconds</i> / <b>forever</b>	Specifies the timeout value.
<i>ip_address</i> / <i>ipv6address</i>	Specifies the 32/128-bit ip address.
<i>port</i>	Specifies the UDP (destination) port.
<i>size</i>	Specifies the maximum number of data bytes (size) that can be sent.
<i>num</i>	Specifies the version number.

### Defaults

parameter	default
<i>string</i>	empty
<i>seconds</i>	0
<i>ip_address</i>	0.0.0.0(ipv4)
<i>port</i>	6343
<i>size</i>	1400
<i>version num</i>	5

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **release** form at the end of the command to delete a receiver.

### Examples

```
-> sflow receiver 1 name Golden Rcvr1 address 198.206.181.3
-> sflow receiver 1 release
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[show sflow receiver](#) Displays the receiver table.

## MIB Objects

```
sFlowRcvrTable
  sFlowRcvrIndex
  sFlowRcvrOwner
  sFlowRcvrTimeout
  sFlowRcvrMaximumDatagramSize
  sFlowRcvrAddressType
  sFlowRcvrAddress
  sFlowRcvrPort
  sFlowRcvrDatagramVersion
```

---

## sflow sampler

Gets the hardware sampled from Q-dispatcher and fills up the sampler part of the UDP datagram.

**sflow sampler** *num* **port** *slot/port[-port]* {**receiver** *receiver\_index* | **rate** *value* | **sample-hdr-size** *size*}

**no sflow sampler** *num* *portlist*

---

### Syntax Definitions

<i>num</i>	Specifies the instance id.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>receiver_index</i>	Specifies the receiver index.
<i>value</i>	Specifies the rate value for packet sampling.
<i>size</i>	Specifies the maximum number of bytes (size) that can be copied from a sampled packet.
<i>portlist</i>	Specifies the interface index range.

### Defaults

parameter	default
<i>receiver_index</i>	0
<i>value</i>	0
<i>size</i>	128

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete a sampler.
- A sampling rate of 1 counts all packets. A sampling rate of 0 disables sampling.

### Examples

```
-> sflow sampler 1 2/1 receiver 1 rate 5 sample-hdr-size 64
-> no sflow sampler 1 2/1-5
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**show sflow sampler**                      Displays the sampler table.

## MIB Objects

sFlowFsTable  
    sFlowFsDataSource  
    sFlowFsInstance  
    sFlowFsReceiver  
    sFlowFsPacketSamplingRate  
    sFlowFsMaximumHeaderSize

---

## sflow poller

Gets counter samples from ethernet driver and fills up the counter part of the UDP datagram.

**sflow poller** *num port slot/port[-port] {receiver receiver\_index | interval value}*

**no sflow poller** *num portlist*

---

### Syntax Definitions

<i>num</i>	Specifies the instance id.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (e.g., 3/1 specifies port 1 on slot 3).
<i>receiver_index</i>	Specifies the receiver index.
<i>value</i>	Specifies the maximum number of seconds between successive samples (interval value).
<i>portlist</i>	Specifies the interface index range.

### Defaults

parameter	default
<i>receiver_index</i>	0
<i>value</i>	0

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **no** form of this command to delete a poller.

### Examples

```
-> sflow poller 1 1/1 receiver 2 interval 20
-> sflow poller 1 2/6-10 receiver 1 interval 30
-> no sflow poller 1 2/6-10
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show sflow poller](#) Displays the poller table.

**MIB Objects**

sFlowCpTable

sFlowCpDataSource

sFlowCpInstance

sFlowCpReceiver

    sFlowCpInterval

---

## show sflow agent

Displays the sflow agent table.

**show sflow agent**

---

### Syntax Definitions

**agent** Collects sample datagrams and send it to the collector across the network.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- It is necessary to execute the **ip interface** command to make a loopback0 IP address as the fixed primary address of the switch, in order to avoid interface changes, which might need the collector software to be restarted for it to communicate using the new agent IP address. Normally, the primary IP address could change depending on the IP interface going up/down. Therefore, the sFlow agent always needs to send a fixed IP address in the datagram.
- The loopback address should be an IP interface configured on the switch.

### Examples

```
-> ip interface loopback0 address 198.206.181.100
-> show sflow agent
Agent Version = 1.3; Alcatel-Lucent; 6.1.1
Agent IP      = 127.0.0.1
```

#### *output definitions*

<b>Agent Version</b>	Identifies the version which includes the MIB version, organization name, and the specific software build of the agent.
<b>Agent address</b>	IP address associated with the agent.

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show sflow receiver** Displays the receiver table.

**MIB Objects**

sFlowAgent

sFlowVersion

sFlowAgentAddressType

  sFlowAgentAddress

---

## show sflow receiver

Displays the sflow receiver table.

**show sflow receiver** [*num*]

---

### Syntax Definitions

*num* Specifies the receiver index.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show sflow receiver
Receiver 1
Name      = Golden
Address   = IP_V4  198.206.181.3
UDP Port  = 6343
Timeout   = 65535
Packet Size= 1400
DatagramVer= 5
```

### *output definitions*

---

<b>Name</b>	Name of the entry to claim.
<b>Address</b>	IP address of the sFlow collector.
<b>UDP Port</b>	Destination port for sFlow datagrams.
<b>Timeout</b>	Time remaining before the sampler is released and stops sampling.
<b>Packet size</b>	Maximum number of data bytes that can be sent in a single sample datagram.
<b>Datagram ver</b>	Version of sFlow datagrams that should be sent.

---

### Release History

Release 7.1.1; command was introduced.

**Related Commands****sflow agent**

Sets the destination hosts where the sFlow datagrams are sent out.

**MIB Objects**

sFlowRcvrTable

sFlowRcvrIndex

---

## show sflow sampler

Displays the sflow sampler table.

**show sflow sampler***[num]*

---

### Syntax Definitions

*num* Specifies the instance id.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A.

### Examples

```
-> show sflow sampler
```

Instance	Interface	Receiver	Sample-rate	Sample-hdr-size
1	2/ 1	1	2048	128
1	2/ 2	1	2048	128
1	2/ 3	1	2048	128
1	2/ 4	1	2048	128
1	2/ 5	1	2048	128

#### *output definitions*

---

<b>Instance</b>	Instance for the flow sampler.
<b>Interface</b>	Interface used for the flow sampler.
<b>Receiver</b>	Receiver associated with the flow sampler.
<b>Sample-rate</b>	Statistical sampling rate for packet sampling from the source.
<b>Sample-hdr-size</b>	Maximum number of bytes that should be copied from a sampled packet.

---

### Release History

Release 7.1.1; command was introduced.

**Related Commands****sflow sampler**

Gets hardware sampled from Q-dispatcher.

**MIB Objects**

sFlowFsTable

sFlowFsInstance

---

## show sflow poller

Displays the sflow poller table.

**show sflow poller** [*num*]

---

### Syntax Definitions

*num* Specifies the instance id.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show sflow poller
Instance  Interface  Receiver  Interval
-----
         1      2/ 6        1         30
         1      2/ 7        1         30
         1      2/ 8        1         30
         1      2/ 9        1         30
         1      2/10       1         30
```

#### *output definitions*

---

<b>Instance</b>	Instance for the counter poller.
<b>Interface</b>	Interface used for the counter poller.
<b>Receiver</b>	Receiver associated with the counter poller.
<b>Interval</b>	The maximum number of seconds between successive samples of the counters associated with the data source.

---

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**sflow poller** Gets counter samples.

# 36 RMON Commands

Remote Network Monitoring (RMON) probes can be used to monitor, manage, and compile statistical data about network traffic from designated active ports in a LAN segment without negatively impacting network performance. This feature supports basic RMON 4 group implementation compliant with RFC 2819 (Remote Network Monitoring Management Information Base), but does not support RMON 10 group or RMON 2. This chapter includes descriptions of RMON commands used to enable or disable individual (or a group of a certain flavor type) RMON probes, show a list of (or individual) RMON probes and show a list of (or individual) RMON logged events.

MIB information for the RMON commands is as follows:

*Filename:* IETF\_RMON.mib  
*Module:* RMON-MIB

The following table summarizes the available commands:

---

**rmon probes**  
**show rmon probes**  
**show rmon events**

---

## rmon probes

This command enables or disables types of RMON probes.

```
rmon probes {stats | history | alarm} [entry-number] {enable | disable}
```

---

### Syntax Definitions

<b>stats</b>	Ethernet Statistics Table probe entries.
<b>history</b>	History Control Table probe entries.
<b>alarm</b>	Alarm Table probe entries.
<i>entry-number</i>	The entry number in the list of probes ( <i>optional</i> ).
<b>enable</b>	Enables the RMON probe.
<b>disable</b>	Disables the RMON probe.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Network activity on subnetworks attached to the RMON probe can be monitored by NMS applications.
- RMON will not monitor activities on the CMM onboard Ethernet Management port.

### Examples

```
-> rmon probes stats 4012 enable
-> rmon probes history 10240 disable
-> rmon probes alarm 11235 enable
-> rmon probes stats enable
-> rmon probes history disable
-> rmon probes alarm enable
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[show rmon probes](#)

Displays a list of RMON probes or a single RMON probe.

[show rmon events](#)

Displays a list of RMON logged events or a single RMON event.

## MIB Objects

ETHERSTATSTABLE

etherStatsStatus

HISTORYCONTROLTABLE

historyControlStatus

ALARMTABLE

---

## show rmon probes

Displays a list of RMON probes or a single RMON probe.

**show rmon probes** [**stats** | **history** | **alarm**] [*entry-number*]

---

### Syntax Definitions

<b>stats</b>	Ethernet Statistics Table probe entries.
<b>history</b>	History Control Table probe entries.
<b>alarm</b>	Alarm Table probe entries.
<i>entry-number</i>	The entry number in the list of probes ( <i>optional</i> ).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- To display a list of current probes, omit the *entry-number* from the command line.
- To display statistics for a particular probe, include the probe's *entry-number* in the command line.
- The **show rmon probes** command displays the following information: Entry number, Slot/Port, Flavor (whether the probe type is Ethernet, History or Alarm), Status (Active or Inactive), Duration (time since the last change in status, in hours/minutes) and System Resources (the amount of memory allocated to this probe).
- The **show rmon probes entry-number** command displays the following information: Probe's Owner (probe type and location), Slot/Port, Entry number, Flavor (whether the probe type is Ethernet, History or Alarm), Status (Active or Inactive), Time since the last change in status (hours/minutes), and System Resources (the amount of memory allocated to this probe). Displayed statistics may vary, depending on whether the probe type is Ethernet, History or Alarm.

### Examples

```
-> show rmon probes stats
```

Entry	Slot/Port	Flavor	Status	Duration	System Resources
4001	4/1	Ethernet	Active	00:25:00	275 bytes
4008	4/8	Ethernet	Active	00:25:00	275 bytes
4005	4/5	Ethernet	Active	00:25:00	275 bytes

-> show rmon probes history

Entry	Slot/Port	Flavor	Status	Duration	System Resources
1	4/1	History	Active	00:25:00	9063 bytes
10240	4/5	History	Active	00:14:00	601 bytes
10325	4/8	History	Active	00:14:00	601 bytes

-> show rmon probes alarm

Entry	Slot/Port	Flavor	Status	Duration	System Resources
11235	4/8	Alarm	Active	00:07:00	835 bytes

-> show rmon probes stats 4005

Probe's Owner: Falcon Switch Auto Probe on Slot 4, Port 5  
 Entry 4005  
 Flavor = History, Status = Active  
 Time = 48 hrs 54 mins,  
 System Resources (bytes) = 275

-> show rmon probes history 10325

Probe's Owner: Analyzer-p:128.251.18.166 on Slot 4, Port 5  
 History Control Buckets Requested = 2  
 History Control Buckets Granted = 2  
 History Control Interval = 30 seconds  
 History Sample Index = 5859  
 Entry 10325  
 Flavor = History, Status = Active  
 Time = 48 hrs 53 mins,  
 System Resources (bytes) = 601

-> show rmon probes alarm 11235

Probe's Owner: Analyzer-t:128.251.18.166 on Slot 4, Port 8  
 Alarm Rising Threshold = 5  
 Alarm Falling Threshold = 0  
 Alarm Rising Event Index = 26020  
 Alarm Falling Event Index = 0  
 Alarm Interval = 10 seconds  
 Alarm Sample Type = delta value  
 Alarm Startup Alarm = rising alarm  
 Alarm Variable = 1.3.6.1.2.1.16.1.1.1.5.4008  
 Entry 11235  
 Flavor = Alarm, Status = Active  
 Time = 48 hrs 48 mins,  
 System Resources (bytes) = 1677

*output definitions*

---

<b>Probe's Owner</b>	Description and interface (location) of the probe.
<b>Slot/Port</b>	The Slot/Port number (interface) that this probe is monitoring.
<b>Entry</b>	The Entry number in the list of probes.
<b>Flavor</b>	Whether the probe type is Ethernet, History, or Alarm.
<b>Status</b>	The status of the probe— <b>Creating</b> (the probe is under creation), <b>Active</b> (the probe is Active), or <b>Inactive</b> (the probe is inactive).
<b>Duration</b>	Elapsed time (hours/minutes/seconds) since the last change in status.
<b>System Resources</b>	Amount of memory that has been allocated to this probe.

## show rmon events

Displays RMON events (actions that take place based on alarm conditions detected by the RMON probe).

**show rmon events** [*event-number*]

---

### Syntax Definitions

*event-number*                      The event number (*optional*) in the list of probes.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- To display a list of logged events, omit the *event-number* from the command line.
- To display statistics for a particular event, include the *event-number* in the command line.
- The **show rmon events** command displays the following information for all RMON Logged Events: Entry number, Time (hours/minutes/seconds) since the last change in status and Description (nature of the event).
- The **show rmon events *event-number*** command displays the following information for a particular RMON Logged Event: Entry number, Time (hours/minutes/seconds) since the last change in status and Description (nature of the event).

### Examples

```
-> show rmon events
```

Entry	Time	Description
1	00:08:00	etherStatsPkts.4008: [Falling trap] "Falling Event"
2	00:26:00	etherStatsCollisions.2008: "Rising Event"

```
-> show rmon events 2
```

Entry	Time	Description
2	00:26:00	etherStatsCollisions.2008: "Rising Event"

*output definitions*

---

<b>Entry</b>	The entry number in the list of probes.
<b>Time</b>	Time (hours, minutes, and seconds) since the last change in status.
<b>Description</b>	Description of the Alarm condition detected by the probe.

# 37 VLAN Stacking Commands

The VLAN Stacking feature provides a method for tunneling multiple customer VLANs (CVLAN) through a service provider network using one or more service provider VLANs by way of 802.1Q double tagging or VLAN Translation. This feature enables service providers to provide their customers with Transparent LAN Services (TLS). This service is multipoint in nature to support multiple customer sites or networks distributed over the edges of a service provider network.

MIB information for the VLAN Stacking commands is as follows:

*Filename:* AlcatelIND1VlanStacking.MIB  
*Module:* Alcatel-IND1-VLAN-STACKING-MIB

*Filename:* AlcatelIND1VlanManager.MIB  
*Module:* Alcatel-IND1-VLAN-MGR-MIB

A summary of the available commands is listed here:

---

<b>VLAN Stacking Service Mode</b>	<b>ethernet-service svlan</b> <b>ethernet-service uni-profile</b> <b>ethernet-service svlan source-learning</b> <b>ethernet-service service-name</b> <b>ethernet-service svlan nni</b> <b>ethernet-service nni</b> <b>ethernet-service sap</b> <b>ethernet-service sap uni</b> <b>ethernet-service sap cvlan</b> <b>ethernet-service sap-profile</b> <b>ethernet-service sap sap-profile</b> <b>ethernet-service uni-profile</b> <b>ethernet-service uni uni-profile</b> <b>show ethernet-service vlan</b> <b>show ethernet-service</b> <b>show ethernet-service sap</b> <b>show ethernet-service</b> <b>show ethernet-service nni</b> <b>show ethernet-service uni</b> <b>show ethernet-service uni-profile</b> <b>show ethernet-service sap-profile</b>
-----------------------------------	---

---

## ethernet-service svlan

Creates a VLAN Stacking VLAN (SVLAN) for tunneling customer traffic.

```
ethernet-service svlan {svlan_id [-svlan_id2]} [admin-state {enable | disable}] [stp {enable | disable}]
[name description]
```

```
no ethernet-service svlan {svlan_id [-svlan_id2]}
```

---

### Syntax Definitions

<b>svlan</b>	Creates an SVLAN for tunneling customer traffic.
<i>svlan_id</i>	The VLAN ID number identifying the SVLAN.
<i>[-svlan_id2]</i>	The last VLAN ID number in a range of SVLANs that you want to configure (for example 10-12 specifies VLANs 10, 11, and 12).
<b>enable</b>	Enables the SVLAN administrative status.
<b>disable</b>	Disables the SVLAN administrative status, which blocks all ports bound to that SVLAN.
<b>stp enable</b>	Enables the SVLAN Spanning Tree status for the service provider network topology.
<b>stp disable</b>	Disables the SVLAN Spanning Tree status for the service provider network topology.
<i>description</i>	An alphanumeric string. Use quotes around the string if the VLAN name contains multiple words with spaces between them (for example, "Alcatel-Lucent Engineering").

### Defaults

By default, the Spanning Tree status is enabled in both the **per-vlan** and **flat** mode when the SVLAN is created

parameter	default
<b>enable   disable</b>	<b>enable</b>
<b>stp enable   disable</b>	<b>enable</b>
<i>description</i>	VLAN ID number

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete an SVLAN or a range of SVLANs. Note that SVLAN port associations are also removed when the SVLAN is deleted.
- This command does not work if the *svlan\_id* specified already exists as a standard VLAN.

---

**Note.** Spanning Tree status for an SVLAN only applies to the Spanning Tree topology calculations for the service provider network. This status is not applied to customer VLANs (CVLANs) and does not affect the customer network topology.

---

## Examples

```
-> ethernet-service svlan 1001-1005 admin-state enable name "Customer ABC"  
-> ethernet-service svlan 1001-1005 stp enable  
-> no ethernet-service svlan 1001
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

[show ethernet-service vlan](#)      Displays a list of SVLANs configured from the switch

## MIB Objects

```
vlanTable  
  vlanNumber  
  vlanDescription  
  vlanType  
  vlanAdmStatus  
  vlanStatus
```

---

## ethernet-service svlan source-learning

Configures the status of source learning on a VLAN Stacking VLAN (SVLAN) used for tunneling customer traffic

**ethernet-service svlan *svlan1*[-*svlan2*] source-learning {enable| disable}**

---

### Syntax Definitions

<i>svlan1</i>	The VLAN ID number identifying the SVLAN.
[- <i>svlan2</i> ]	The last SVLAN ID number in a range of SVLAN IDs.

### Defaults

---

parameter	default
enable   disable	enable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- By default, source MAC address learning is enabled on all the SVLANs.
- Disabling source learning on an SVLAN clears all the dynamically learned MAC addresses associated with the VLAN from the MAC address table.
- Static MAC addresses associated with an SVLAN are *not* cleared when source learning is disabled for the SVLAN.
- Use the **disable** option with this command to disable the source MAC address learning.

### Examples

```
-> ethernet-service svlan 20 source-learning enable
-> ethernet-service svlan 21-25 source-learning enable
-> ethernet-service svlan 20-25 source-learning disable
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">ethernet-service svlan</a>	Creates a VLAN Stacking VLAN (SVLAN).
<a href="#">show ethernet-service vlan</a>	Displays a list of SVLANs configured for the switch.

**MIB Objects**

```
vlanTable  
  vlanEntry  
  vlanNumber  
  vlanStatus  
  vlanMacLearningControlStatus
```

---

## ethernet-service service-name

Creates a VLAN Stacking service and associates the service with an SVLAN. A service can be carried only on a single SVLAN. All traffic within the associated service is carried on the SVLAN.

**ethernet-service service-name** *service-name* **svlan** *svlan\_id*

**no ethernet-service service-name** *service-name* **svlan** *svlan\_id*

---

### Syntax Definitions

*service-name*

The name of the VLAN Stacking service; an alphanumeric string. Use quotes around string if the service name contains multiple words with spaces between them (for example, "Alcatel-Lucent Engineering").

*svlan\_id*

The VLAN ID number that identifies an existing SVLAN to associate with the VLAN Stacking service.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a VLAN Stacking service. Note that when a service is removed, the SVLAN association with that service is also removed.
- If the VLAN Stacking service is associated with a Service Access Point (SAP), then remove the SAP associations before attempting to remove the VLAN Stacking service.
- Each VLAN Stacking service is associated with one SVLAN. Specifying an additional VLAN ID for an existing service is not allowed.

### Examples

```
-> ethernet-service service-name Marketing svlan 10
-> no ethernet-service service-name Marketing svlan 10
```

### Release History

Release 7.1.1; command introduced.

**Related Commands****ethernet-service svlan**

Creates an SVLAN for customer traffic, a management VLAN for provider traffic for multicast traffic.

**MIB Objects**

```
alaEServiceTable  
  alaEServiceID  
  alaEServiceSVLAN  
  alaEServiceRowStatus
```

---

## ethernet-service svlan nni

Configures the switch port as a VLAN Stacking Network Network Interface (NNI) and associates the port with a customer SVLAN or normal SVLAN. A network port connects to another provider bridge and carries both customer and provider traffic.

```
ethernet-service svlan {svlan_id [-svlan_id2]} nni {port slot/port[-port2] | linkagg linkagg_id [-linkagg_id2]}
```

```
no ethernet-service svlan {svlan_id [-svlan_id2]} nni {port slot/port[-port2] / linkagg linkagg_id [-linkagg_id2]}
```

---

### Syntax Definitions

<i>svlan_id</i>	The VLAN ID number identifying the SVLAN .
[- <i>svlan_id2</i> ]	The last VLAN ID number in a range of SVLANs that you want to specify (for example 10-12 specifies VLANs 10, 11, and 12).
<i>slot/port</i>	The slot number for the module and the physical port number of a NNI port on that module (for example, 3/1 specifies port 1 on slot 3).
- <i>port2</i>	The last port number in a range of ports that you want to configure on the same slot of a NNI port (for example, 3/1-4 specifies ports 1, 2, 3, and 4 on slot 3).
<i>linkagg_id</i>	The link aggregate ID number of a linkagg associated to a NNI.
<i>linkagg_id2</i>	The last link aggregate ID number associated to a NNI in a range of aggregates that you want to configure.

### Defaults

NA

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove an association between an NNI port and an SVLAN. Note that when the last SVLAN association is removed, the NNI port reverts to become a conventional switch port.
- Only fixed ports can be configured as NNI ports.
- Only SVLAN IDs are accepted with this command. This SVLAN ID specified must already exist in the switch configuration.
- When this command is used, the default VLAN for the NNI port is changed to a VLAN reserved by the switch for applications such as VLAN Stacking. The reserved VLAN cannot be configured using standard VLAN management commands.

- The network port or link aggregate associated to the SVLAN using this command must be an NNI port or link aggregate.
- NNI ports can be tagged with normal VLANs. This allows NNI ports to carry regular 802.1q tagged traffic as well as SVLAN tagged traffic.

### Examples

```
-> ethernet-service svlan 10 nni port 1/3
-> ethernet-service svlan 255 nni port 2/10-15
-> ethernet-service svlan 500 nni linkagg 31-35
-> no ethernet-service svlan 10 nni port 1/3
-> no ethernet-service svlan 255 nni port 2/12
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

#### [ethernet-service svlan](#)

Creates an SVLAN for customer traffic, a management VLAN for provider traffic for multicast traffic.

#### [ethernet-service nni](#)

Configures the vendor TPID value and the legacy BPDU processing status for a VLAN Stacking Network Network Interface (NNI).

### MIB Objects

```
alaEServiceNniSvlanTable
  alaEServiceNniSvlanNni
  alaEServiceNniSvlanSvlan
  alaEServiceNniSvlanRowStatus
```

---

## ethernet-service nni

Configures the vendor TPID value and the legacy BPDU processing status for a VLAN Stacking Network Network Interface (NNI).

```
ethernet-service nni {port slot/port [-port2] | linkagg linkagg_id [-linkagg_id2]} [tpid tpid_value]
[[stp | mvrp] legacy-bpdu {enable | disable}]
```

```
no ethernet-service nni {port slot/port [-port2] | linkagg linkagg_id [-linkagg_id2]}
```

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>[-port2]</i>	The last port number in a range of ports that you want to configure on the same slot (for example, 3/1-4 specifies ports 1, 2, 3, and 4 on slot 3).
<i>linkagg_id</i>	The link aggregate ID.
<i>[-linkagg_id2]</i>	The last link aggregate ID number in a range of link aggregates that you want to configure.
<i>tpid_value</i>	Specifies the TPID value of the port.
<b>enable</b>	Enables the specified legacy BPDU support.
<b>disable</b>	Disables the specified legacy BPDU support.

### Defaults

parameter	default
<i>tpid_value</i>	0x8100
<b>stp legacy-bpdu enable   disable</b>	<b>disable</b>
<b>mvrp legacy-bpdu enable   disable</b>	<b>disable</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable the ethernet service for the VLAN Stacking NNI ports.
- This command only applies to ports configured as VLAN Stacking NNI ports.
- NNI ports can be 802.1q tagged with normal VLANs. In this case, the TPID of the packets tagged with a normal VLAN must always be 0x8100 (regardless the TPID of the NNI port). This allows NNI port to carry regular 802.1q tagged traffic as well as SVLAN tagged traffic.
- Enable legacy BPDU support only on VLAN Stacking network ports that are connected to legacy BPDU switches. Enabling legacy BPDU between AOS switches can cause flooding or an unstable network.

- If legacy BPDU is enabled on a network port while at same time BPDU flooding is enabled on user ports, make sure that tagged customer BPDUs are not interpreted by intermediate switches in the provider network.
- Note that if the peer switch connected to the VLAN Stacking network port supports the Provider MAC address (STP, 802.1ad/D6.0 MAC), then enabling legacy BPDU support is not required on the network port. Refer to the following table to determine the type of STP MAC used:

---

STP	
Customer MAC	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x00}
Provider MAC address (802.1ad/D6.0)	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x08}
Provider MAC address (Legacy MAC)	{0x01, 0x80, 0xc2, 0x00, 0x00, 0x00}

---

- STP legacy BPDU are supported only when the **flat** Spanning Tree mode is active on the switch.

## Examples

```
-> ethernet-service 10 nni port 1/3-5
-> ethernet-service 255 nni port 2/10-15 tpid 88a8
-> ethernet-service 500 nni port 1/3-5 stp legacy-bpdu enable
-> no ethernet-service 10 nni port 1/3
-> no ethernet-service 255 nni linkagg 12-15
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

**ethernet-service svlan nni** Configures the switch port as a VLAN Stacking NNI and associates the port with a customer SVLAN, management SVLAN.

## MIB Objects

```
alaEServicePortTable
  alaEServicePortID
  alaEServicePortType
  alaEServicePortVendorTpid
  alaEServicePortLegacyStpBpdu
  alaEServicePortRowStatus
```

---

## ethernet-service sap

Creates a VLAN Stacking Service Access Point (SAP) and associates the SAP with a VLAN Stacking service.

```
ethernet-service sap sap_id service-name service_name
```

```
no ethernet-service sap sap_id
```

---

### Syntax Definitions

*sap\_id* The SAP ID number identifying the service instance.

*service\_name* The name of the service to associate with this SAP.

### Defaults

The “default-sap-profile” profile is automatically associated with the SAP ID when the SAP is created.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to delete a VLAN Stacking SAP. When a SAP is deleted, all port and CVLAN associations with the SAP are also deleted.
- The service name specified with this command must already exist in the switch configuration. Use the **ethernet-service service-name** command to create a service to associate with the SAP.
- Each SAP ID is associated with only one service; however, it is possible to associate one service with multiple SAP IDs.

### Examples

```
-> ethernet-service sap 10 service-name CustomerA  
-> no ethernet-service sap 11
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

**ethernet-service service-name** Creates a VLAN Stacking service and associates the service with an SVLAN.

**ethernet-service sap-profile** Creates a VLAN Stacking SAP profile.

**ethernet-service sap sap-profile** Associates a SAP profile with a SAP ID.

## MIB Objects

```
alaEServiceSapTable  
  alaEServiceSapID  
  alaEServiceSapServiceID  
  alaEServiceSapProfile  
  alaEServiceSapRowStatus
```

---

## ethernet-service sap uni

Configures the switch port as a VLAN Stacking User Network Interface (UNI) and associates the port with a VLAN Stacking Service Access Point (SAP). A UNI port is a customer facing port on which traffic enters the SAP.

```
ethernet-service sap {sap_id} uni {port slot/port[-port2]} / linkagg linkagg_id [-linkagg_id2]}
```

```
no ethernet-service sap {sap_id} uni {port slot/port[-port2]} / linkagg linkagg_id [-linkagg_id2]}
```

---

### Syntax Definitions

<i>sap_id</i>	The SAP ID number identifying the service instance.
<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports that you want to configure on the same slot (for example, 3/1-4 specifies ports 1, 2, 3, and 4 on slot 3).
<i>linkagg_id</i>	The link aggregate ID number.
<i>-linkagg_id2</i>	The last link aggregate ID number in a range of aggregates that you want to configure.

### Defaults

A switch port or a link aggregate becomes a VLAN Stacking UNI port by default when the port or link aggregate is associated with a VLAN Stacking SAP.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove an association between a UNI port and a SAP. Note that when the last SAP association is removed, the UNI port converts back to a conventional switch port.
- Only fixed ports can be configured as UNI ports.
- The SAP ID specified with this command must already exist. Use the **ethernet-service sap** command to create a SAP.
- When this command is used, the default VLAN for the UNI port is changed to a reserved VLAN and all customer traffic received is dropped until the type of traffic for the port is configured using the **ethernet-service sap cvlan** command.

### Examples

```
-> ethernet-service sap 10 uni port 1/3
-> ethernet-service sap 10 uni port 2/10-15
-> ethernet-service sap 10 uni linkagg 31-40
-> no ethernet-service sap 10 uni port 1/10-15
-> no ethernet-service sap 10 uni linkagg 31
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

- ethernet-service sap** Creates a VLAN Stacking SAP and associates the SAP with a VLAN Stacking SAP profile and service.
- ethernet-service sap sap-profile** Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.
- ethernet-service uni uni-profile** Associates a VLAN Stacking UNI profile with a UNI port.

## MIB Objects

```
alaEServiceSapUniTable  
  alaEServiceSapUniSap  
  alaEServiceSapUniUni  
  alaEServiceSapUniRowStatus
```

---

## ethernet-service sap cvlan

Associates customer VLAN (CVLAN) traffic with a VLAN Stacking Service Access Point (SAP). The parameter values configured with this command are applied to frames received on all SAP UNI ports and determines the type of customer traffic that is accepted on the UNI ports and processed by the service.

**ethernet-service sap** {*sap\_id*} **cvlan** {**all** | *cvlan\_id* | *cvlan\_id1-cvlan\_id2* | **untagged**}

**no ethernet-service sap** {*sap\_id*} **cvlan** {**all** | *cvlan\_id* | *cvlan\_id1-cvlan\_id2* | **untagged**}

---

### Syntax Definitions

<i>sap_id</i>	The SAP ID number.
<b>all</b>	Applies the SAP profile to tagged and untagged frames.
<i>cvlan_id</i>	Applies the SAP profile to frames tagged with this CVLAN ID.
<i>cvlan_id1-cvlan_id2</i>	Applies the SAP profile to frames tagged with a CVLAN ID that falls within this range of CVLAN IDs (for example, 10-12 specifies frames tagged with CVLAN 10, 11, or 12).
<b>untagged</b>	Applies the SAP profile only to untagged frames.

### Defaults

By default, no CVLAN traffic is associated with the SAP ID when the SAP is created.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to remove a CVLAN ID or the designation for **all** or **untagged** frames from the SAP. Note that when the last CVLAN parameter is deleted from an SAP configuration, the SAP is not automatically deleted.
- The **all** and **untagged** parameters are configurable in combination with a CVLAN ID. For example, if **untagged** and a CVLAN ID are associated with the same SAP ID, then the SAP profile is applied to only untagged traffic *and* traffic tagged with the specified CVLAN ID. All other traffic is dropped.
- The SAP ID specified with this command must already exist. Use the **ethernet-service sap** command to create a SAP.
- Configuring the **all** and **untagged** parameters for the same SAP is not allowed. Specify only one of these two parameters per SAP.
- Either the **all** or **untagged** parameters can be configured for the SAP. In such an instance, the default VLAN for the UNI ports associated with the SAP is changed to the VLAN assigned to the SAP related service.
- Only one SAP, with the **all** or **untagged** option, is allowed per UNI. For example, if UNI port 1/17 is part of SAP 10 and SAP 20 and SAP 10 is configured for **all** traffic, then only **untagged** parameter or a CVLAN ID is allowed for SAP 20.

- If you do not specify **all** or **untagged** options with a UNI, then the default VLAN 4095 is set for the UNI and all untagged, untagged control traffic and unmatched tag traffic is dropped.

### Examples

```
-> ethernet-service sap 10 cvlan 200
-> ethernet-service sap 10 cvlan all
-> ethernet-service sap 11 cvlan 100-150
-> ethernet-service sap 11 cvlan untagged
-> no ethernet-service sap 10 cvlan 200
-> no ethernet-service sap 10 cvlan all
-> no ethernet-service sap 10 cvlan 100-150
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

#### [ethernet-service sap](#)

Creates a VLAN Stacking Service Access Point (SAP) and associates the SAP with a VLAN Stacking service.

## ethernet-service sap-profile

Creates a profile for a VLAN Stacking Service Access Point (SAP). Profile attributes are used to define traffic engineering policies that are applied to traffic serviced by the SAP.

**ethernet-service sap-profile** *sap\_profile\_name* [**bandwidth not-assigned**] [[**shared** | **not-shared**]  
**ingress-bandwidth** *mbps* ] [**cvlan-tag** {**preserve** | **translate**}] **priority** [**not-assigned** |  
**map-inner-to-outer-p** | **map-dscp-to-outer-p** | **fixed** *value*][**egress-bandwidth** *mbps*]

**no ethernet-service sap-profile** *sap\_profile\_name*

---

### Syntax Definitions

<i>sap_profile_name</i>	An alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, “Alcatel-Lucent Engineering”).
<b>bandwidth not-assigned</b>	Specifies that the SAP profile does not allocate switch resources to enforce bandwidth requirements. Applies only when the profile specifies the default ingress bandwidth value (zero).
<b>shared</b>	Shares the ingress bandwidth limit across all SAP ports and CVLANs.
<b>not shared</b>	Applies the ingress bandwidth limit to individual SAP ports and CVLANs; bandwidth is not shared.
<b>ingress bandwidth</b> <i>mbps</i>	The maximum amount of bandwidth to be allowed for SAP ports, for the incoming traffic, in megabits per second. This parameter can be used only along with the shared option or not-shared option.
<b>preserve</b>	Retains the customer VLAN ID (inner tag) and double tags the frame with the SVLAN ID (outer tag).
<b>translate</b>	Replaces the customer VLAN ID with the SVLAN ID.
<b>priority not-assigned</b>	Specifies that the SAP profile is not assigned with a priority value or priority mapping.
<b>map-inner-to-outer-p</b>	Maps the customer VLAN (inner tag) priority bit value to the SVLAN (outer tag) priority bit value.
<b>map-dscp-to-outer-p</b>	Maps the customer VLAN (inner tag) DSCP value to the SVLAN (outer tag) priority bit value.
<b>fixed</b> <i>value</i>	Sets the SVLAN (outer tag) priority bit to the specified value.
<b>egress-bandwidth</b> <i>mbps</i>	The maximum amount of bandwidth to be allowed for SAP ports, for the outgoing traffic, in megabits per second.

## Defaults

parameter	default
<b>shared   not shared</b>	<b>shared</b>
<i>mbps</i>	0
<b>preserve   translate</b>	<b>preserve</b>
<b>not-assigned   map-inner-to-outer-p   map-dscp-to-outer-p   fixed <i>value</i></b>	<b>fixed 0</b>

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Use the **no** form of this command to delete a SAP profile.
- If a profile is not specified when a SAP is created, a default profile (default-sap-profile) is automatically associated with the SAP.
- Use the **ethernet-service sap sap-profile** command to associate a profile to a VLAN Stacking SAP.
- Only one SAP profile name is associated with each SAP ID; however, it is possible to associate the same SAP profile name to multiple SAP IDs.
- Configure the **ingress-bandwidth** or **egress-bandwidth** parameters to define rate limiting values for the SAP.

## Examples

```
-> ethernet-service sap-profile video1 egress-bandwidth 10 cvlan-tag translate
priority map-inner-to-outer-p
-> ethernet-service sap-profile voice1 not-shared ingress-bandwidth 10 cvlan-tag
preserve
-> ethernet-service sap-profile voice2 shared ingress-bandwidth 10
-> no ethernet-service sap-profile video1
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

- ethernet-service sap** Creates a VLAN Stacking SAP and associates the SAP with a service.
- ethernet-service sap sap-profile** Associates a SAP profile with a SAP ID.
- show ethernet-service sap-profile** Displays the profile attribute configuration for a SAP profile.

  alaEServiceSapProfileFixedPriority  
  alaEServiceSapProfileBandwidthShare  
  alaEServiceSapRowStatus
```

---

## ethernet-service sap sap-profile

Associates a VLAN Stacking Service Access Point (SAP) with a SAP profile. This command is also used to change an existing SAP profile association.

```
ethernet-service sap sap_id sap-profile sap_profile_name
```

```
no ethernet-service sap sap_id
```

---

### Syntax Definitions

*sap\_id* The SAP ID number.

*sap\_profile\_name* The name of the SAP profile to associate with this SAP ID.

### Defaults

The “default-sap-profile” profile is automatically associated with the SAP ID when the SAP is created.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command along with the SAP ID to remove the SAP profile.
- If a profile association already exists for the specified SAP ID, the current profile is replaced with the profile specified with this command.
- To change the profile associated with the SAP back to the default profile, enter “default-sap-profile” with this command.
- Do not specify a service name; doing so returns an error message. This command is only for associating an existing profile to a VLAN Stacking SAP.

### Examples

```
-> ethernet-service sap 10 sap-profile CustomerC
-> ethernet-service sap 11 sap-profile CustomerD
-> ethernet-service sap 11 sap-profile default-sap-profile
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

### [ethernet-service sap](#)

Creates a VLAN Stacking SAP and associates the SAP with a VLAN Stacking SAP profile and service.

### [ethernet-service sap-profile](#)

  alaEServiceSapID
  alaEServiceSapProfile
  alaEServiceSapRowStatus
```

---

## ethernet-service uni-profile

Creates a User Network Interface (UNI) profile that is used to specify how to process control packets ingressing on UNI ports.

**ethernet-service uni-profile** *uni-profile-name* [l2-protocol {**stp** | **802.1x** | **802.1ab** | **802.3ad** | **mvrp** | **amap**} {**peer** | **discard** | **tunnel**}

**no ethernet-service uni-profile** *uni-profile-name*

---

### Syntax Definitions

<i>uni-profile-name</i>	Alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, "Alcatel-Lucent Engineering").
<b>stp</b>	Specifies how Spanning Tree BPDU is processed on the UNI port.
<b>802.1x</b>	Specifies how 802.1x control frames are processed on the UNI port.
<b>802.1ab</b>	Specifies how 802.1ab control frames are processed on the UNI port.
<b>802.3ad</b>	Specifies how 802.3ad and 802.3ah control frames are processed on the UNI port.
<b>mvrp</b>	Specifies how Multicast VLAN Registration Protocol packets are processed on the UNI port.
<b>amap</b>	Specifies how Alcatel Management Adjacency Protocol packets must be processed on the UNI port.
<b>peer</b>	Allows the UNI port to participate in the specified protocol.
<b>discard</b>	Discards the specified PDU.
<b>tunnel</b>	Tunnels the specified PDU across the provider network.

### Defaults

parameter	default
<b>stp</b>	<b>tunnel</b>
<b>mvrp</b>	<b>tunnel</b>
<b>amap</b>	<b>discard</b>
<b>802.1x</b>	<b>discard</b>
<b>802.3ad</b>	<b>peer</b>
<b>802.1ab</b>	<b>discard</b>

### Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Use the **no** form of this command to delete a UNI profile.
- Remove any UNI profile associations with UNI ports before attempting to modify or delete the profile.
- Up to five unique UNI profile combinations, including the default profile, are allowed per switch. If a profile has the same processing settings as any other profile, then it is not considered unique.
- Not all of the protocol parameters are currently supported with the **peer**, **tunnel**, and **discard** parameters. Use the following table to determine the parameter combinations that are supported:

	<b>peer</b>	<b>discard</b>	<b>tunnel</b>
<b>stp</b>	no	yes	yes
<b>802.1x</b>	yes	yes	yes
<b>802.3ad</b>	yes	yes	yes
<b>802.1ab</b>	yes	yes	yes
<b>mvrp</b>	no	yes	yes
<b>amap</b>	no	yes	no

- If a user-configured UNI profile is *not* associated with a UNI port, then the default profile (default-uni-profile) is used to process control packets ingressing on the port.
- A uni-profile cannot be modified if it is associated with a UNI. The uni-profile cannot be deleted unless the associations are deleted.

## Examples

```
-> ethernet-service uni-profile uni_1 l2-protocol stp mvrp discard
-> no ethernet-service uni-profile uni_1
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

<b>ethernet-service uni uni-profile</b>	Associates a VLAN Stacking UNI profile with a UNI port.
<b>ethernet-service sap uni</b>	Configures the switch port as a VLAN Stacking UNI and associates the port with a VLAN Stacking Service Access Point (SAP).
<b>show ethernet-service uni</b>	Displays the profile associations for VLAN Stacking UNI ports.
<b>show ethernet-service uni-profile</b>	Displays the profile attribute configuration for VLAN Stacking UNI profiles.

  alaEServiceUNIProfileRowStatus
```

---

## ethernet-service uni uni-profile

Associates a VLAN Stacking User Network Interface (UNI) profile with a UNI port.

```
ethernet-service uni {port slot/port[-port2] | linkagg linkagg_id [-linkagg_id2]} uni-profile  
uni-profile-name
```

```
no ethernet-service uni-profile uni-profile-name
```

---

### Syntax Definitions

<i>slot/port</i>	The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).
<i>-port2</i>	The last port number in a range of ports that you want to configure on the same slot (for example, 3/1-4 specifies ports 1, 2, 3, and 4 on slot 3).
<i>linkagg_id</i>	The link aggregate ID.
<i>[-linkagg_id2]</i>	The last link aggregate ID number in a range of link aggregates that you want to configure.
<i>uni_profile_name</i>	Alphanumeric string. Use quotes around string if the profile name contains multiple words with spaces between them (for example, "Alcatel-Lucent Engineering").

### Defaults

The default profile (default-uni-profile) is used to process control packets ingressing on a UNI port. This profile is assigned at the time a port is configured as a VLAN Stacking UNI.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command along with the **uni-profile** name to delete the uni-profile.
- This UNI specified with this command must already exist in the switch configuration.
- To change the profile associated with a UNI port, use this command and specify a different profile name than the one currently associated with the port. The last profile associated with the port, is the profile that is applied to UNI port traffic.
- To change the profile associated with a UNI port back to the default profile, enter "default-uni-profile" with this command.

### Examples

```
-> ethernet-service uni port 1/3 uni-profile uni_1  
-> ethernet-service uni linkagg 1-5 uni-profile uni_2  
-> ethernet-service uni port 2/10-15 uni-profile default-uni-profile  
-> no ethernet-service uni-profile uni_1
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

**ethernet-service sap sap-profile** Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.

## show ethernet-service vlan

Displays a list of SVLANs configured on the switch.

**show ethernet-service vlan** [*svlan\_id*-[*svlan\_id2*]]

---

### Syntax Definitions

<i>svlan_id</i>	The VLAN ID number identifying the SVLAN.
- <i>svlan_id2</i>	The last VLAN ID number in a range of SVLANs that you want to specify (for example 10-12 specifies VLANs 10, 11, and 12).

### Defaults

By default, all SVLANs are displayed if an SVLAN or range of SVLANs are not specified with this command.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Specify a single SVLAN ID or a range of SVLAN IDs to display configuration information for the specific SVLANs.

### Examples

```
-> show ethernet-service vlan
```

```

vlan          Type      name
+-----+-----+-----+
4010         svlan      Customer ABC
4020         mgmt      Provider Management
4021         svlan      Customer XYZ

```

```
-> show ethernet-service vlan 1001
```

```

Name          : VLAN 1001,
Type          : Service Vlan,
Administrative State : enabled,
Operational State  : disabled,
IP Router Port  : disabled,
IP MTU        : 1500

```

```
-> show ethernet-service vlan 1000-1004
```

```

vlan  type  admin  oper  ip    mtu  name
-----+-----+-----+-----+-----+-----+-----+
1000  vstk    Ena    Dis  Dis   1500  VLAN 1000
1001  vstk    Ena    Dis  Dis   1500  VLAN 1001
1002  vstk    Ena    Dis  Dis   1500  VLAN 1002
1003  vstk    Ena    Dis  Dis   1500  VLAN 1003
1004  vstk    Ena    Dis  Dis   1500  VLAN 1004

```

---

*output definitions*

---

<b>vlan</b>	The SVLAN ID number identifying the instance.
<b>type</b>	The type of SVLAN.
<b>admin</b>	The administrative state of the VLAN. ( <b>Ena</b> or <b>Dis</b> ).
<b>oper</b>	The operation status of the VLAN ( <b>Ena</b> or <b>Dis</b> ).
<b>ip</b>	The status of the IP router port ( <b>Ena</b> or <b>Dis</b> ).
<b>mtu</b>	The IP MTU value configured for the VLAN.
<b>name</b>	The user-defined text description for the SVLAN. By default, the SVLAN ID is specified for the description.

---

## Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">ethernet-service svlan</a>	Creates a VLAN Stacking VLAN (SVLAN) for tunneling customer traffic, a management SVLAN for provider traffic application uses to distribute multicast traffic.

---

## show ethernet-service

Displays configuration information for VLAN Stacking Ethernet services.

**show ethernet-service** [**service-name** *service-name* / **svlan** *svlan\_id*]

---

### Syntax Definitions

<i>service-name</i>	The name of an existing VLAN Stacking service. Use quotes around string if the service name contains multiple words with spaces between them (for example, "Alcatel-Lucent Engineering").
<i>svlan_id</i>	The VLAN ID number that identifies an existing SVLAN .

### Defaults

By default, all services are displayed if a service name or SVLAN ID is not specified with this command.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Enter the name of a service to display configuration information for a specific service.
- Enter an SVLAN ID to display configuration information for all services that are associated with a specific SVLAN.

### Examples

```
-> show ethernet-service
```

```
Service Name : VideoOne
  SVLAN      : 300
  NNI(s)     : 2/1, 3/2
  SAP Id     : 20
    UNIs      : 1/1, 1/2
    CVLAN(s)  : 10, 20
    sap-profile : sap-video1
  SAP Id     : 30
    UNIs      : 1/3
    CVLAN(s)  : untagged, 40
    sap-profile : sap-video2

Service Name : CustomerABC
  SVLAN      : 255
  NNI(s)     : 1/22
  SAP Id     : 10
    UNIs      : 2/10, 2/11
    CVLAN(s)  : 500, 600
    sap-profile : default-sap-profile
```

```
-> show ethernet-service service-name CustomerABC
```

```
Service Name : CustomerABC
SVLAN       : 255

## show ethernet-service sap

Displays configuration information for VLAN Stacking Service Access Points (SAP).

**show ethernet-services sap** [*sap\_id*]

---

### Syntax Definitions

*sap\_id*                                      The SAP ID number identifying the service instance.

### Defaults

By default, all SAPs are displayed if a SAP ID is not specified with this command.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Specify a single SAP ID to display configuration information for a specific SAP.

### Examples

```
-> show ethernet-services sap

SAP Id   : 10
  UNIs    : 2/10, 2/11
  CVLAN(s) : 500, 600
  sap-profile : default-sap-profile

SAP Id   : 20
  UNIs    : 1/1, 1/2
  CVLAN(s) : 10, 20
  sap-profile : sap-video1

SAP Id   : 30
  UNIs    : 1/3
  CVLAN(s) : 30, 40
  sap-profile : sap-video2

-> show ethernet-service sap 10

SAP Id   : 10
  UNIs    : 2/10, 2/11
  CVLAN(s) : 500, 600
  sap-profile : default-sap-profile
```

*output definitions*

---

<b>SAP Id</b>	The ID number for the VLAN Stacking Service Access Point that is applied to the service.
<b>UNIs</b>	VLAN Stacking User Network Interface ports that receive customer traffic.

---

## show ethernet-service

Displays configuration information for a VLAN Stacking service port.

**show ethernet-service port** {*slot/port* / **linkagg** *linkagg\_id*}

---

### Syntax Definitions

*slot/port*                      The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

*linkagg\_id*                    The link aggregate ID number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Specifying a slot/port or link aggregate ID number is required with this command.

### Examples

```
-> show ethernet-service port 1/10
```

```
Interface : 1/10
Port Type  : UNI
  UNI Profile  : default-uni-profile
  Default SVLAN : 4095
```

```
Service Name : svlan_service
  SVLAN      : 20
  NNI(s)     : No NNIs configured
  SAP Id     : 1
    UNIs      : 1/10
    CVLAN(s)  : 200
  sap-profile : translate_profile
```

```

-> show ethernet-service port 1/22

Interface : 1/22
Port Type : NNI

Service Name : CustomerABC
  SVLAN      : 255
  NNI(s)     : 1/22
  SAP Id     : 10
  UNIs       : 2/10, 2/11
  CVLAN(s)   : 500, 600
  sap-profile : default-sap-profile

Service Name : Video-Service
  SVLAN      : 300
  NNI(s)     : 1/22, 3/2
  SAP Id     : 20
  UNIs       : 1/1, 1/2
  CVLAN(s)   : 10, 20
  sap-profile : sap-video1
  SAP Id     : 30
  UNIs       : 1/3
  CVLAN(s)   : 30, 40
  sap-profile : sap-video2

```

### *output definitions*

---

<b>Interface</b>	The slot and port number or link aggregate ID for the specified interface.
<b>Port Type</b>	The type of VLAN Stacking port ( <b>UNI</b> or <b>NNI</b> ).
<b>Service Name</b>	The name of the VLAN Stacking service.
<b>SVLAN</b>	Displays the SVLAN ID associated with the service. Note that SVLAN appears as the field name if the VLAN ID is an SVLAN-
<b>NNI(s)</b>	VLAN Stacking Network Network Interface ports associated with the service to tunnel SVLAN customer traffic.
<b>SAP Id</b>	The ID number for the VLAN Stacking Service Access Point that is applied to the service.
<b>UNIs</b>	VLAN Stacking User Network Interface ports that receive customer traffic.
<b>CVLAN(s)</b>	Customer VLAN IDs ingressing on UNI ports.
<b>sap-profile</b>	The name of the SAP profile associated with the SAP.

## show ethernet-service nni

Displays configuration information for VLAN Stacking Network Network Interface (NNI) ports.

**show ethernet-service nni** [**port** *slot/port* / **linkagg** *linkagg\_id*]

---

### Syntax Definitions

*slot/port* The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

*linkagg\_id* The link aggregate ID number.

### Defaults

By default, all NNI ports are displayed if a slot/port or link aggregate ID number is not specified.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Specify a slot/port or link aggregate ID number to display information for a single port or link aggregate ID.

### Examples

```
-> show ethernet-service nni
```

```

```

#### *output definitions*

---

<b>Port</b>	The slot/port number or link aggregate ID for the NNI port.
<b>TPID</b>	The vendor TPID value configured for the NNI port.
<b>stp</b>	Whether or not Spanning Tree legacy BPDU processing is enabled for the NNI port.
<b>mvrp</b>	Whether or not MVRP legacy BPDU processing is enabled for the port.

---

## Release History

Release 7.1.1; command introduced.

## Related Commands

<a href="#">ethernet-service svlan nni</a>	Configures the switch port as a VLAN Stacking NNI port and associates the port with a customer SVLAN, management SVLAN.
<a href="#">ethernet-service nni</a>	Configures the vendor TPID value and the legacy BPDU processing status for a VLAN Stacking Network Network Interface (NNI).
<a href="#">show ethernet-service</a>	Displays configuration information for VLAN Stacking Ethernet services.

## MIB Objects

```
alaEServicePortTable  
  alaEServicePortID  
  alaEServicePortVendorTpid  
  alaEServicePortLegacyStpBpdu  
  alaEServicePortLegacyGvrpBpdu
```

---

## show ethernet-service uni

Displays a list of UNI ports configured for the switch and the profile association for each port.

**show ethernet-service uni** [**port** *slot/port* / **linkagg** *linkagg\_id*]

---

### Syntax Definitions

*slot/port*                      The slot number for the module and the physical port number on that module (for example, 3/1 specifies port 1 on slot 3).

*linkagg\_id*                      The link aggregate ID number.

### Defaults

By default, profile information for all UNI ports is displayed if a slot/port or link aggregate ID number is not specified.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Specify a slot/port or link aggregate ID number to display information for a single slot/port or link aggregate ID.

### Examples

```
-> show ethernet-service uni
```

```

Port      UNI Profile
-----+-----
  1/1     uni-profile-default
  1/2     multi-site
  1/3     multi-site

```

```
-> show ethernet-service uni port 1/3
```

```

Port      UNI Profile
-----+-----
  1/3     multi-site

```

#### *output definitions*

---

<b>Port</b>	The slot/port number or link aggregate ID for the UNI port.
<b>UNI Profile</b>	The UNI profile associated with the port.

---

### Release History

Release 7.1.1; command introduced.

## Related Commands

- ethernet-service sap sap-profile** Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.
- ethernet-service uni uni-profile** Associates a VLAN Stacking UNI profile with a UNI port.
- show ethernet-service uni-profile** Displays the profile attribute configuration for VLAN Stacking User Network Interface (UNI) profiles.

## MIB Objects

```
alaEServiceUniProfileTable  
  alaEServicePortID  
  alaEServicePortProfileID
```

---

## show ethernet-service uni-profile

Displays the profile attribute configuration for VLAN Stacking User Network Interface (UNI) profiles.

**show ethernet-service uni-profile** [*uni-profile-name*]

---

### Syntax Definitions

*uni-profile-name* An alphanumeric string. Use quotes around the string if the profile name contains multiple words with spaces between them (for example, "Alcatel-Lucent Engineering").

### Defaults

By default, all UNI profiles are displayed if a UNI profile name is not specified with this command.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Specify a UNI profile name to display attributes for a single UNI profile.

### Examples

```
-> show ethernet-service uni-profile
```

```

  Profile Name      Stp      802.1x      802.3ad      802.1AB      MVRP      AMAP
+-----+-----+-----+-----+-----+-----+
uprofile-videol  tunnel  drop      peer      drop      tunnel      drop

```

#### *output definitions*

---

<b>Profile Name</b>	The name of the UNI profile.
<b>Stp</b>	Indicates how Spanning Tree traffic control packets are processed.
<b>802.1x</b>	Indicates how IEEE 802.1x control packets are processed.
<b>802.3ad</b>	Indicates how IEEE 802.3ad control packets are processed.
<b>802.1AB</b>	Indicates how IEEE 802.1AB control packets are processed.
<b>MVRP</b>	Indicates how the Multiple VLAN Registration Protocol packets are processed.
<b>AMAP</b>	Indicates how Alcatel-Lucent Mapping Adjacency Protocol packets are processed.

---

### Release History

Release 7.1.1; command introduced.

## Related Commands

- ethernet-service sap sap-profile** Creates a UNI profile that is used to specify how to process control packets ingressing on UNI ports.
- ethernet-service uni uni-profile** Associates a VLAN Stacking UNI profile with a UNI port.
- show ethernet-service uni** Displays the profile associations for VLAN Stacking User Network Interface (UNI) ports.

## MIB Objects

```
alaEServiceUNIProfileTable  
  alaEServiceUNIProfileID  
  alaEServiceUNIProfileStpBpduTreatment  
  alaEServiceUNIProfile8021xTreatment  
  alaEServiceUNIProfile8021ABTreatment  
  alaEServiceUNIProfile8023adTreatment  
  alaEServiceUNIProfileMvrpTreatment  
  alaEServiceUNIProfileAmapTreatment
```

---

## show ethernet-service sap-profile

Displays the profile attribute configuration for VLAN Stacking Service Access Point (SAP) profiles.

**show ethernet-service sap-profile** *sap\_profile\_name*

---

### Syntax Definitions

*sap\_profile\_name* An alphanumeric string. Use quotes around the string if the profile name contains multiple words with spaces between them (for example, "Alcatel-Lucent Engineering").

### Defaults

By default, all SAP profiles are displayed if a SAP profile name is not specified with this command.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Specify a SAP profile name to display attributes for a single SAP profile.
- The ingress bandwidth value is displayed in megabytes.

### Examples

```
-> show ethernet-service sap-profile
```

Profile Name	Ingr/Egr Bw	Ingr Bw Sharing	Inner Tag Option	Priority Mapping	Priority Value
default-sap-profile	0/0	Enable	Preserve	fixed	0
map_pbit	0/0	Enable	Preserve	in-out	P
sap1	24324/0	NA	Preserve	NA	NA
sap_1	0/0	NA	Preserve	NA	NA

```
-> show ethernet-service sap-profile sap-video1
```

Profile Name	Ingr/Egr Bw	Ingr Bw Sharing	Inner Tag Option	Priority Mapping	Priority Value
sap-video1	20	Disable	Preserve	NA	NA

### output definitions

---

<b>Profile Name</b>	The name of the SAP profile.
<b>Ingr/Egr Bw</b>	<b>Ingress Egress Bandwidth</b> - The maximum amount of ingress and egress bandwidth to allow for SAP ports.

*output definitions*

---

<b>Ingr Bw Sharing</b>	<b>Ingress Bandwidth Sharing</b> - The status of bandwidth sharing ( <b>enable</b> , <b>disable</b> , or <b>NA</b> ). If enabled, the ingress bandwidth value is shared across all SAP ports and CVLANs. If disabled, the bandwidth value is not shared and applied to individual SAP ports and CVLANs.
<b>Inner Tag Option</b>	Indicates how the CVLAN tag is processed ( <b>translate</b> or <b>preserve</b> ). If set to <b>preserve</b> , the CVLAN tag is retained and the SVLAN is added to the frame. If set to <b>translate</b> , the CVLAN tag is changed to the SVLAN tag.
<b>Priority Mapping</b>	Indicates how the priority value is configured for the SVLAN ( <b>NA</b> , <b>in-out</b> or <b>fixed</b> ). If set to <b>in-out</b> , the CVLAN priority value is mapped to the SVLAN. If set to <b>fixed</b> , a user-specified priority value is used for the SVLAN priority.
<b>Priority Value</b>	Indicates the priority value mapped to the SVLAN ( <b>NA</b> , default 0, a number, <b>P</b> , or <b>DSCP</b> ). A number indicates a fixed, user-specified value is used; <b>P</b> indicates the CVLAN 802.1p bit value is used; <b>DSCP</b> indicates the CVLAN DSCP value is used.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<b>ethernet-service sap-profile</b>	Creates a profile for a VLAN Stacking Service Access Point (SAP).
<b>ethernet-service sap</b>	Creates a VLAN Stacking SAP and associates the SAP with a service and SAP profile.
<b>ethernet-service sap sap-profile</b>	Specifies a different SAP profile for the SAP.
<b>show ethernet-service sap</b>	Displays configuration information for VLAN Stacking SAPs.

# 38 Switch Logging Commands

This chapter includes descriptions for Switch Logging commands. These commands are used to configure parameters for the Switch Logging utility.

MIB information for the system commands is as follows:

*Filename:* AlcatelIND1System.MIB  
*Module:* ALCATEL-IND1-SYSTEM-MIB

A summary of the available commands is listed here.

---

**swlog**  
**swlog appid level**  
**swlog output**  
**swlog output flash file-size**  
**swlog clear**  
**show log swlog**  
**show swlog**

---

## swlog

Enables or disables switch logging. Switch logging allows you to view a history of various switch activities in a text format.

**swlog**

**no swlog**

---

### Syntax Definitions

N/A

### Defaults

By default, switch logging is enabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> swlog
-> no swlog
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">swlog appid level</a>	Defines the level at which switch logging information will be filtered for the specified application.
<a href="#">swlog output</a>	Enables or disables switch logging output to the console, file, or data socket.
<a href="#">show log swlog</a>	Displays stored switch logging information from flash.
<a href="#">show swlog</a>	Displays switch logging information.

### MIB Objects

```
systemSwitchLoggingGroup
  systemSwitchLoggingEnable
```

---

## swlog appid level

Defines the level at which switch logging information will be filtered for the specified application. All application events of the defined level and lower are captured. Applications can be specified by their application ID (i.e., subsystem) or by their numeric equivalent.

**swlog appid** {*app\_id* | *integer*} **level** {*level* | *integer*}

**no swlog appid** *app\_id*

---

### Syntax Definitions

*app\_id* An application identification keyword. Current application IDs are listed in the table below.

*integer* A numerical equivalent value for the application ID. Current numeric equivalent values are listed in the table below.

---

### Supported Application IDs and their Numeric Equivalents

802.1q - 7	ip - 15	psm - 81
aaa - 20	ipc-diag - 1	qdispatcher - 3
amap - 18	ip-helper - 22	qdriver - 2
bridge - 10	ipc-link - 4	qos - 13
chassis - 64	ipc-mon - 21	rmon - 79
cli - 67	ipms - 17	rsvp - 14
config - 66	ipx - 16	session - 71
dbggw - 89	lanpower - 108	slb - 25
diag - 0	ldap - 86	smni - 83
distrib - 84	linkagg - 12	snmp - 68
drc - 74	mipgw - 70	ssl - 88
eipc - 26	module - 24	stp - 11
epilogue - 85	nan-driver - 78	system - 75
ftp - 82	ni-supervision - 5	telnet - 80
gmap - 19	nosnmp - 87	trap - 72
health - 76	pmm - 23	vlan - 8
idle - 255	policy - 73	vrrp - 77
interface - 6	port-mgr - 64	web - 69

*level* The severity level filter keyword value for the application ID (*see table on the following page*). All switch logging messages of the specified level and lower will be captured. The severity level is a value assigned to the relative severity of the switch logging message. A lower value indicates messages that are more severe, a higher value indicates messages that are less severe.

*integer* A numerical equivalent value for the severity level (*see table on the following page*). All switch logging messages of the specified level and lower will be captured. The severity level is a value assigned to the relative severity of the switch logging message. A lower value indicates messages that are more severe, a higher value indicates messages that are less severe. Values range from 2–9.

Supported Levels	Numeric Equivalents	Description
<b>alarm</b>	<b>2</b>	Highest severity. The system is about to crash and reboot.
<b>error</b>	<b>3</b>	System functionality is reduced.
<b>alert</b>	<b>4</b>	A violation has occurred.
<b>warning</b>	<b>5</b>	A unexpected, non-critical event has occurred.
<b>info</b>	<b>6</b>	Any other non-debug message (default).
<b>debug1</b>	<b>7</b>	A normal event debug message.
<b>debug2</b>	<b>8</b>	A debug-specific message.
<b>debug3</b>	<b>9</b>	Lowest severity. A maximum verbosity debug message.

## Defaults

Default severity level is **info**. The numeric equivalent for info is 6.

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- You may enter multiple application IDs in the command line. Separate each application ID with a space and no comma.
- Application IDs may be entered in any order.
- This command can also be used on the secondary CMM.

## Examples

```
-> swlog appid 254 level alarm
-> swlog appid policy level info
-> swlog appid policy snmp web aaa vlan level alert
-> no swlog appid debug2
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>swlog</b>	Enables or disables switch logging.
<b>swlog output</b>	Enables or disables switch logging output to the console, file, or data socket.
<b>show log swlog</b>	Displays stored switch logging information from flash.
<b>show swlog</b>	Displays switch logging information.

## MIB Objects

```
systemSwitchLoggingGroup  
  systemSwitchLoggingLevelAppId  
  systemSwitchLoggingLevel
```

---

## swlog output

Enables or disables switch logging output to the console, file, or data socket (remote session).

```
swlog output {console | flash | socket [ip_address]}
```

```
no swlog output {console | flash | socket [ip_address]}
```

---

### Syntax Definitions

<b>console</b>	Specifies console output. When enabled, switch logging output is printed to the user console.
<b>flash</b>	Specifies /flash file output. When enabled, switch logging output is printed to a file in the switch's /flash file system.
<b>socket</b>	Specifies data socket output. When enabled, switch logging output is printed to a remote session.
<i>ip_address</i>	The IPv4 or IPv6 address for the remote session host.

### Defaults

---

<b>parameter</b>	<b>default</b>
<b>console   flash   socket</b>	<b>flash and console</b>

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable one or more configured output IP addresses.
- This command can also be used on the secondary CMM.
- You can send output to a single host using the **socket** keyword, followed by the IP address of the remote host.

### Examples

```
-> swlog output console
-> no swlog output flash
-> swlog output socket 14.1.1.1
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<b>swlog</b>	Enables or disables switch logging.
<b>swlog appid level</b>	Defines the level at which switch logging information will be filtered for the specified application.
<b>show log swlog</b>	Displays stored switch logging information from flash.
<b>show swlog</b>	Displays switch logging information.

## MIB Objects

```
systemSwitchLoggingGroup
  systemSwitchLoggingFlash
  systemSwitchLoggingSocket
  systemSwitchLoggingSocketIpAddr
  systemSwitchLoggingConsole
systemSwitchLoggingHostTable
  systemSwitchLoggingHostIpAddr
  systemSwitchLoggingHostPort
  systemSwitchLoggingHostStatus
```

---

## swlog output flash file-size

Configures the size of the switch logging file.

**swlog output flash file-size** *bytes*

---

### Syntax Definitions

*bytes*                                      The size of the switch logging file.

### Defaults

parameter	default
<i>bytes</i>	128000

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **ls** command to determine the amount of available flash memory.
- This command can also be used on the secondary CMM.

### Examples

```
-> swlog output flash file size 400000
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- |                       |  |
|-----------------------|--|
| <b>swlog clear</b>    | Clears the files that store switch logging data.       |
| <b>show log swlog</b> | Displays stored switch logging information from flash. |
| <b>show swlog</b>     | Displays switch logging information.                   |

### MIB Objects

systemSwitchLoggingGroup  
  systemSwitchLoggingFileSize

---

## swlog clear

Clears the files that store switch logging data.

**swlog clear**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command when the switch logging display is too long due to some of the data being old or out of date.
- This command can also be used on the secondary CMM.

### Examples

```
-> swlog clear
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">swlog output</a>	Enables or disables switch logging output to the console, file, or data socket.
<a href="#">show log swlog</a>	Displays stored switch logging information from flash.
<a href="#">show swlog</a>	Displays switch logging information.

### MIB Objects

```
systemSwitchLoggingGroup  
  systemSwitchLoggingClear
```

---

## show log swlog

Displays stored switch logging information.

**show log swlog**

**show log swlog** [*session session\_id*] [*timestamp start\_time [end\_time]*] [*appid appid*] [*level level*]

---

### Syntax Definitions

<i>session_id</i>	Identification number of the session for which switch logging information is displayed.
<i>start_time</i>	Specify the starting time for the switch logging information to be displayed. Use the format mm/dd/yyyy hh:mm where mm represents the month, dd is the day, yyyy is the year, hh is the hour, and mm is the minutes. Use four digits to specify the year.
<i>end_time</i>	Specify the ending time for the switch logging information to be displayed. Use the format mm/dd/yyyy hh:mm where mm represents the month, dd is the day, yyyy is the year, hh is the hour, mm is the minutes. Use four digits to specify the year.
<i>appid</i>	A digit that represents the application ID for the switch logging information to be displayed. Values are listed in the following table.

---

### Supported Application IDs and their Numeric Equivalents

802.1q - 7	ip - 15	qdispatcher - 3
aaa - 20	ipc-diag - 1	qdriver - 2
amap - 18	ip-helper - 22	qos - 13
bridge - 10	ipc-link - 4	rmon - 79
chassis - 64	ipc-mon - 21	rsvp - 14
cli - 67	ipms - 17	session - 71
config - 66	ipx - 16	slb - 25
dbggw - 89	ldap - 86	smni - 83
diag - 0	linkagg - 12	snmp - 68
distrib - 84	mipgw - 70	ssl - 88
drc - 74	module - 24	stp - 11
eipc - 26	nan-driver - 78	system - 75
epilogue - 85	ni-supervision - 5	telnet - 80
ftp - 82	nosnmp - 87	trap - 72
gmap - 19	pmm - 23	vlan - 8
health - 76	policy - 73	vrrp - 77
idle - 255	port-mgr - 64	web - 69
interface - 6	psm - 81	

---

*level*

A numerical equivalent value for the severity level (*see table below*). All switch logging messages of the specified level and lower will be shown. The severity level is a value assigned to the relative severity of the switch logging message. A lower value indicates messages that are more severe, a higher value indicates messages that are less severe. Values range from 2–9.

Supported Levels	Numeric Equivalents	Description
<b>alarm</b>	<b>2</b>	Highest severity. The system is about to crash and reboot.
<b>error</b>	<b>3</b>	System functionality is reduced.
<b>alert</b>	<b>4</b>	A violation has occurred.
<b>warning</b>	<b>5</b>	A unexpected, non-critical event has occurred.
<b>info</b>	<b>6</b>	Any other non-debug message (default).
<b>debug1</b>	<b>7</b>	A normal event debug message.
<b>debug2</b>	<b>8</b>	A debug-specific message.
<b>debug3</b>	<b>9</b>	Lowest severity. A maximum verbosity debug message.

## Defaults

N/A

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- When the switch logging display is too long, you may use the **show log swlog** command to clear all of the switch logging information.
- This command can also be used on the secondary CMM.

## Examples

```
-> show log swlog
Displaying file contents for 'swlog2.log'
FILEID: fileName[swlog2.log], endPtr[32]
configSize[64000], currentSize[64000], mode[2]
Displaying file contents for 'swlog1.log'
FILEID: fileName[swlog1.log], endPtr[395]
configSize[64000], currentSize[64000], mode[1]
```

```
Time Stamp           Application      Level   Log Message
-----+-----+-----+-----
MON NOV 11 12:42:11 2002      SYSTEM     info Switch Logging files cleared by
command
MON NOV 11 13:07:26 2002          WEB       info The HTTP session login successfu
l!
MON NOV 11 13:18:24 2002          WEB       info The HTTP session login successfu
l!
MON NOV 11 13:24:03 2002      TELNET     info New telnet connection, Address ,
```

```
128.251.30.88
MON NOV 11 13:24:03 2002      TELNET    info Session 4, Created
MON NOV 11 13:59:04 2002      WEB       info The HTTP session user logout suc
cessful!
```

### *output definitions*

---

<b>Time Stamp</b>	The day, date and time for which Switch Logging log information is displayed.
<b>Application</b>	The Application ID (Subsystem) for which Switch Logging log information is displayed.
<b>Level</b>	The corresponding Severity Level for which Switch Logging information was stored. Levels include alarm, error, alert, warning, info, debug1, debug2, and debug3.
<b>Log Message</b>	The condition that resulted in the logging information being stored.

---

### **Release History**

Release 7.1.1; command was introduced.

### **Related Commands**

<b>swlog</b>	Enables or disables switch logging.
<b>swlog appid level</b>	Adds or removes a filter level for a specified subsystem.
<b>swlog output</b>	Enables or disables switch logging output to the console, file, or data socket.
<b>swlog clear</b>	Clears the files that store switch logging data.
<b>show swlog</b>	Displays switch logging information.

---

## show swlog

Displays switch logging information (e.g., switch logging status, log devices, application IDs with non-default severity level settings).

**show swlog**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command can also be used on the secondary CMM.

### Examples

```
-> show swlog
Switch Logging is :
  - INITIALIZED.
  - RUNNING.
```

```
Log Device(s)
-----
flash
console
socket ipaddr 11.1.1.1
socket ipaddr 12.1.1.1
socket ipaddr 13.1.1.1
socket ipaddr 14.1.1.1
```

All Applications have their trace level set to the level 'info' (6)

### *output definitions*

---

<b>Application ID</b>	The Application ID (subsystem) for which the Severity Level is not set to the info (6) default setting.
<b>Level</b>	The Severity Level of the above-referenced Application ID. Levels include (2), error (3), alert (4), warning (5), info (6), debug1 (7), debug2 (8), and debug3 (9).

---

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

<b>swlog</b>	Enables or disables switch logging.
<b>swlog appid level</b>	Defines the level at which switch logging information will be filtered for the specified application.
<b>swlog output</b>	Enables or disables switch logging output to the console, file, or data socket.
<b>show log swlog</b>	Displays stored switch logging information from flash.

---

# 39 Health Monitoring Commands

The Health Monitoring function monitors the consumable resources of the switch (for example, bandwidth usage, CPU usage) and provides a single integrated resource for a Network Management System (NMS). This function monitors the switch, and at fixed intervals, collects the current values for each resource being monitored. Users specify resource threshold limits and traps are sent to an NMS if a value falls above or below a user-specified threshold.

The Health Monitoring commands comply with RFC1212.

MIB information for the Health Monitoring commands is as follows:

*Filename:* AlcatelIND1Health.mib  
*Module:* healthMIB

A summary of the available commands is listed here:

---

**health threshold**  
**health interval**  
**show health configuration**  
**show health**  
**show health all**

---

## health threshold

Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage, CPU usage, and chassis temperature.

Input traffic, output/input traffic, memory usage, and CPU usage thresholds specify the maximum percentage for each resource that may be consumed before a trap is sent to the user. The temperature threshold specifies the maximum operating temperature, in Celsius, allowed within the chassis before a trap is sent.

**health threshold** { *rx percent* | *txrx percent* | *memory percent* | *cpu percent* }

---

### Syntax Definitions

<b>rx</b>	Specifies the maximum input (RX) traffic threshold.
<b>txrx</b>	Specifies the maximum output/input (TX/RX) traffic threshold.
<b>memory</b>	Specifies the maximum RAM memory usage threshold.
<b>cpu</b>	Specifies the maximum CPU usage threshold.
<i>percent</i>	The new threshold value, in percent, for the corresponding resource— <b>rx</b> , <b>txrx</b> , <b>memory</b> , <b>cpu</b> —(0–100).
<i>degrees</i>	The new threshold value, in Celsius, for the chassis temperature threshold (0–100).

### Defaults

parameter	default
<i>percentage</i>	80
<i>degrees</i>	50

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When a resource falls back below the configured threshold, an additional trap is sent to the user. This indicates that the resource is no longer operating beyond its configured threshold limit.
- Changing a threshold value sets the value for all levels of the switch (the switch, module, and port). You cannot set different threshold values for each level.
- For detailed information on each threshold type, refer to [page 39-5](#), or refer to the chapter titled “Diagnosing Switch Problems” in your Network Configuration Guide.
- To view the current health threshold values, use the [show health configuration](#) command.

## Examples

```
-> health threshold rx 85
-> health threshold txrx 55
-> health threshold memory 95
-> health threshold cpu 85
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

[show health configuration](#)      Displays the current health threshold settings.

## MIB Objects

```
HealthThreshInfo
  healthThreshDeviceRxLimit
  healthThreshDeviceTxRxLimit
  healthThreshDeviceMemoryLimit
  healthThreshDeviceCpuLimit
```

---

## health interval

Configures the sampling interval between health statistics checks. The sampling interval is the time interval between polls of the consumable resources of the switch to see if it is performing within set thresholds.

**health interval** *seconds*

---

### Syntax Definitions

*seconds* Sampling interval (in seconds). Valid entries are 1, 2, 3, 4, 5, 6, 10, 12, 15, 20, 30.

### Defaults

parameter	default
<i>seconds</i>	5

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Decreasing the polling interval may impact switch performance.

### Examples

```
-> health interval 6
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show health](#) Displays the current health sampling interval.

### MIB Objects

HealthThreshInfo  
healthSamplingInterval

---

## show health configuration

Displays current health configuration settings.

**show health configuration**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show health configuration
Rx Threshold           : 80
TxRx Threshold        : 80
Cpu Threshold          : 80
Memory Threshold      : 80
Sampling Interval (Secs) : 10
```

*output definitions*

---

<b>Rx Threshold</b>	The current device input (RX) threshold. This value displays the maximum percentage of total bandwidth allowed for <i>incoming traffic</i> on the switch. The total bandwidth is defined as the Ethernet port capacity for all NI modules currently operating in the switch, in Mbps. For example, a chassis with 48 100Base-T Ethernet ports installed has a total bandwidth of 4800 Mbps. The default value is 80 percent and can be changed using the <b>health threshold</b> command.
<b>TxRx Threshold</b>	The current device output/input (TX/RX) threshold. This value displays the maximum percentage of total bandwidth allowed for <i>all incoming and outgoing traffic</i> . As with the RX threshold described above, the total bandwidth is defined as the Ethernet port capacity for all the NI modules currently operating in the switch, in Mbps. The default value is 80 percent and can be changed using the <b>health threshold</b> command.
<b>Memory Threshold</b>	Displays the current memory usage threshold. Memory usage refers to the total amount of RAM memory currently used by switch applications. The default value is 80 percent and can be changed using the <b>health threshold</b> command.
<b>CPU Threshold</b>	Displays the current CPU usage threshold. CPU usage refers to the total amount of CPU processor capacity currently used by switch applications. The default value is 80 percent and can be changed using the <b>health threshold</b> command.
<b>Sampling Interval</b>	Displays the sampling interval time period in seconds. The default value is 5 seconds. Sampling interval can be changed using the <b>health interval</b> command.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<b>health threshold</b>	Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage, CPU usage, and chassis temperature.
<b>health interval</b>	Configures the sampling interval between health statistics checks.

**MIB Objects**

HealthThreshInfo

```
healthThreshDeviceRxLimit
healthThreshDeviceTxRxLimit
healthThreshDeviceTempLimit
healthThreshDeviceMemoryLimit
healthThreshDeviceCpuLimit
```

---

## show health

Displays the health statistics for the switch. Statistics are displayed as percentages of total resource capacity and represent data taken from the last sampling interval.

**show health** [**port** *slot/port* | **slot** *slot* [-*slot1*]] [**statistics**]

---

### Syntax Definitions

<b>port</b>	To view a specific port, enter the slot and port number (for example, 3/1).
<b>slot</b>	To view a series of slots, enter the range of slot numbers (for example, 1-10) along with the slot keyword.
<b>statistics</b>	Optional command syntax. It displays the same information as the <b>show health</b> command.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If no slot or port information is specified, the aggregate health statistics for all ports is displayed.

### Examples

```
-> show health
```

CMM	Current	1 Min	1 Hr	1 Day
Resources		Avg	Avg	Avg
-----+-----+-----+-----+-----				
CPU	0	0	0	0
Memory	30	30	24	24
Receive	01	01	01	01
Transmit/Receive	01	01	01	01
Memory	66	66	66	66
Temperature Cmm	33	33	33	33
Temperature Cmm Cpu	32	32	32	32

```
-> show health port 4/3
```

Port	Resources	Limit	Curr	1 Min	1 Hr	1 Hr
				Avg	Avg	Max
Port 04/03						
-----+-----+-----+-----+-----						
Receive	80	01	01	01	01	01
Transmit/Receive	80	01	01	01	01	01

---

<b>Receive</b>	Traffic received by the switch.
<b>Transmit/Receive</b>	Traffic transmitted and received by the switch.
<b>Memory</b>	Switch memory.
<b>CPU</b>	Switch CPU.
<b>Temperature Cmm</b>	CMM Chassis Temperature.
<b>Temperature Cmm Cpu</b>	CMM CPU Temperature.
<b>Limit</b>	Currently configured device threshold levels (percentage of total available bandwidth or temperature measured in degrees Celsius).
<b>Curr</b>	Current device bandwidth usage or temperature (measured in degrees Celsius).
<b>1 Min Avg</b>	Average device bandwidth usage or temperature (measured in degrees Celsius) over a 1-minute period.
<b>1 Hr Avg</b>	Average device bandwidth usage or temperature (measured in degrees Celsius) over a 1-hour period.
<b>1 Hr Max</b>	Maximum device bandwidth usage or temperature (measured in degrees Celsius) over a 1-hour period (the maximum of the 1 minute averages).

---

## Release History

Release 7.1.1; command introduced.

## Related Commands

### [show health all](#)

Displays health statistics for a specified resource on *all* NIs currently operating in the chassis.

## MIB Objects

```
healthModuleTable
  healthModuleSlot
  healthModuleRxLatest
  healthModuleRx1MinAvg
  healthModuleRx1HrAvg
  healthModuleRx1HrMax
  healthModuleRxTxLatest
  healthModuleRxTx1MinAvg
  healthModuleRxTx1HrAvg
  healthModuleRxTx1HrMax
  healthModuleMemoryLatest
  healthModuleMemory1MinAvg
  healthModuleMemory1HrAvg
  healthModuleMemory1HrMax
  healthModuleCpuLatest
  healthModuleCpu1MinAvg
  healthModuleCpu1HrAvg
  healthModuleCpu1HrMax
```

---

## show health all

Displays health statistics for a specified resource on all *active NI modules* installed in the chassis.

**show health all {memory | cpu | rx | txrx}**

---

### Syntax Definitions

<b>memory</b>	Displays the RAM memory health statistics for all active NI modules in the switch.
<b>cpu</b>	Displays the CPU health statistics for all active NI modules.
<b>rx</b>	Displays the health statistics for traffic <i>received</i> on all active NI modules.
<b>txrx</b>	Displays the health statistics for traffic both <i>transmitted and received</i> on all active NI modules.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show health all memory
```

```
* - current value exceeds threshold
```

Memory	Limit	Curr	1 Min Avg	1 Hr Avg	1 Hr Max
01	80	40	40	40	40
02	80	40	40	40	40
03	80	40	40	40	40
04	80	40	40	40	40
05	80	40	40	40	40
06	80	40	40	40	40
07	80	40	40	40	40
13	80	40	40	40	40

*output definitions*

---

<b>Memory (Cpu, TXX, RX)</b>	A list of all currently-active NI modules (i.e., active slots) on the switch. The column header corresponds with the resource keyword entered. For example, if <b>show health all cpu</b> is entered, <b>Cpu</b> is used as the column header.
<b>Limit</b>	Current usage threshold for the specified resource type, on the corresponding slot (in percent). The usage threshold refers to the maximum amount of the resource's total bandwidth that can be used by switch applications before a notification is sent to the user. The default value for all resource types is 80 percent. This threshold can be changed using the <b>health threshold</b> command.
<b>Curr</b>	Current usage of the resource on the corresponding slot, in percent ( the amount of the total resource bandwidth actually being used by the switch applications).
<b>1 Min Avg</b>	Average usage of the resource on the corresponding slot over a one minute period.
<b>1 Hr Avg</b>	Average usage of the resource on the corresponding slot over a one hour period.
<b>1 Hr Max</b>	The highest average hourly usage for the resource on the corresponding slot.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

**show health**

Displays the health statistics for the switch.

**health threshold**

Configures thresholds for input traffic (RX), output/input traffic (TX/RX), memory usage, CPU usage, and chassis temperature.

**MIB Objects**

```
healthModuleTable
  healthModuleSlot
  healthModuleRxLatest
  healthModuleRx1MinAvg
  healthModuleRx1HrAvg

# 40 CMM Commands

The Chassis Management Module (CMM) CLI commands permit you to manage switch software files on the CMM.

MIB information for the CMM commands is as follows:

*Filename:* AlcatelIND1Chassis.mib  
*Module:* ALCATEL-IND1-CHASSIS-MIB

*Filename:* AlcatelIND1ConfigMgr.mib  
*Module:* ALCATEL-IND1-CONFIG-MGR-MIB DEFINITIONS

A summary of available commands is listed here:

---

**reload secondary**  
**reload slot**  
**reload all**  
**reload from**  
**issu from**  
**write memory**  
**issu slot**  
**copy certified**  
**copy running certified**  
**modify running-directory**  
**copy flash-synchro**  
**takeover**  
**show running-directory**  
**show reload**  
**show microcode**  
**show issu status**  
**usb**  
**usb auto-copy**  
**mount**  
**umount**  
**show usb statistics**

---

## reload secondary

Reloads the secondary CMM from the *certified* directory.

**reload secondary** [**in** [*hours:*] *minutes* | **at** *hour:minute* [*month day* / *day month*]]

**reload secondary cancel**

---

### Syntax Definitions

**in** [*hours:*] *minutes*

Optional syntax. Schedules a reload of the software to take effect in the time. The time can be specified in minutes or hours and minutes within the next 24 hours.

**at** *hour:minute*

Optional syntax. Schedules a reload of the software to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.

*month day* / *day month*

The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. See examples below for further explanation.

**cancel**

Cancels a pending time delayed reboot.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K

### Usage Guidelines

- Can be issued from both primary or secondary CMM.
- Reloads the secondary CMM only, the Primary CMM remains operational.

### Examples

```
-> reload secondary
-> reload secondary in 15:25
-> reload secondary at 15:25 august 10
-> reload secondary at 15:25 10 august
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

### **reload from**

Reloads both CMMs from the specified directory.

## MIB Objects

```
chasEntPhysicalTable
  csEntPhysicalIndex
  chasEntPhysAdminStatus
chasControlRedundantTable
  chasControlDelayedRebootTimer
```

---

## reload all

Reloads both Chassis Management Modules (CMMs) from the *certified* directory.

**reload all** [**in** [*hours:*] *minutes* | **at** *hour:minute* [*month day* / *day month*]]

**reload all cancel**

---

### Syntax Definitions

**in** [*hours:*] *minutes*

Optional syntax. Schedules a reload of all modules to take effect in the specified minutes or hours and minutes within the next 24 hours.

**at** *hour:minute*

Optional syntax. Schedules a reload of all modules to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.

*month day* / *day month*

The name of the month and the number of the day for the scheduled reload. Specify a month name and the day number. It is unimportant if the month or day is first. See examples below for further explanation.

**cancel**

Cancels a pending time delayed reload.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Can be issued from the Primary CMM only.

### Examples

```
-> reload all
-> reload all in 1:30
-> reload all at 12:00 july 25
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

**reload slot** Reloads a specific NI module.

## MIB Objects

chasEntPhysicalTable

  chasEntPhysAdminStatus

  chasGlobalControl

  chasGlobalControlDelayedResetAll

---

## reload from

Reloads both CMMs from the specified directory. There is no CMM failover during this reboot, causing a loss of switch functionality during the reboot. All the NIs and the secondary CMM will reload.

**reload from** *image-dir* {**rollback-timeout** *minutes* | **no rollback-timeout** [**in** [*hours:*] *minutes* | **at** *hour:minute*] [**redundancy-time** *minutes*]}

---

### Syntax Definitions

<i>image-dir</i>	The directory that contains the image files to be loaded onto the switch.
<b>rollback-timeout</b> <i>minutes</i>	Sets a timeout period, in minutes. The switch immediately reboots from the specified directory. At the end of this time period, the switch automatically reboots again from the <i>certified</i> directory. The valid range of rollback timeout minutes is 1–15.
<b>no rollback-timeout</b>	Specifies no timeout to rollback. If the command is issued with this keyword, then the switch continues to run from the specified directory until manually rebooted.
<b>in</b> [ <i>hours:</i> ] <i>minutes</i>	Optional syntax. Schedules a reload of the to take effect in the specified minutes or hours and minutes within the next 24 hours.
<b>at</b> <i>hour:minute</i>	Optional syntax. Schedules a reload to take place at the specified time using a 24-hour clock. If you do not specify the month and day, the reload takes place at the specified time on the current day provided the specified time is later than the time when the CLI command is issued. If the specified time is earlier than the current time, the reload takes place on the following day.
<b>redundancy-time</b> <i>minutes</i>	Specifies the time period in minutes that the switch must run without failure. If a failure occurs within this time period, the switch will reboot from the <i>certified</i> directory.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Can be issued from Primary CMM only.
- This command is used to reload the switch from the specified directory.
- A file verification will be performed before rebooting to ensure all necessary files are present and valid. An error message will be displayed describing any issues found.
- The image directory reload takes place immediately unless a time frame is set using the **in** or **at** keywords.

- If a rollback-timeout is set, the switch reboots again after the set number of minutes, from the **certified** directory. The reboot can be halted by issuing a cancel order as described in the **reload all** command.

## Examples

```
-> reload working rollback-timeout 5
-> reload working no rollback-timeout
-> reload working no rollback-timeout in 50
-> reload working rollback-timeout 10 at 12:50
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

**reload all** Reboots both CMMs from the *certified* directory.

## MIB Objects

```
chasControlModuleTable
  chasControl
  chasControlVersionMngt
  chasControlActivateTimeout
  chasControlRedundancyTime
  chasControlDelayedActivateTimer
  chasControlWorkingVersion
  chasControlNextRunningVersion
```

---

## copy certified

Copies the contents of the *certified* directory to the specified directory.

**copy certified** *image-dir* [**make-running-directory**]

---

### Syntax Definitions

*image-dir*

The directory that the contents of the *certified* directory will be copied to.

**make-running-directory**

Makes the destination directory the new RUNNING DIRECTORY after the configuration is copied.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Using the **make-running-directory** parameter changes the RUNNING DIRECTORY allowing changes to be saved using the **write memory** command.
- This command does not delete any extra files in the target directory.

### Examples

```
-> copy certified mydir  
-> copy certified mydir make-running-directory
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[copy flash-synchro](#)

Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

### MIB Objects

```
chasControlModuleTable  
  chasControlVersionMngt  
  chasControlWorkingVersion
```

---

## issu from

Upgrades the system with the images stored in the specified directory with minimal disruption to traffic.

**issu from** *image-dir*

---

### Syntax Definitions

*image-dir*

Specifies the pathname for the directory that contains the image files.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K

### Usage Guidelines

- The new code must support ISSU with the current running version of code.
- A text file named '*issu\_version*' is used to determine ISSU compatibility between code versions. It can be downloaded from the Service and Support website and must be included in the directory along with the new image files.

### Examples

```
-> issu from myissu
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[issu slot](#)

Causes a power-cycle of the NI in the specified slot after an ISSU upgrade.

### MIB Objects

chasEntModuleTable

chasControlWorkingVersion  
chasControlRedundancyTime

---

## issu slot

Causes a reset of the NI in the specified slot after an ISSU upgrade.

**issu slot** *num*

---

### Syntax Definitions

*num* Specifies the slot number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K

### Usage Guidelines

- Will return an error if ISSU is not in progress or if the slot has already been reset after the ISSU.

### Examples

```
-> issu slot 2
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[issu from](#) Upgrades the system with the images stored in the specified directory without disruption to traffic.

### MIB Objects

chasEntPhysicalTable  
entPhysicalIndex

---

## write memory

Copies the current configuration (RAM) to the RUNNING DIRECTORY on the primary CMM.

**write memory** [**flash-synchro**]

---

### Syntax Definitions

**flash-synchro** Synchronizes the primary and secondary CMM.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used to copy the changes performed using the CLI commands from the running configuration (RAM) to the RUNNING DIRECTORY.
- The **flash-synchro** keyword synchronizes the files between the primary and secondary CMMs by overwriting the contents of the secondary CMM *certified* directory with the contents of the primary CMM certified directory.
- This command is only valid if the switch isn't running from the *certified* directory. Use the [show running-directory](#) command to check where the switch is running from.

### Examples

```
-> write memory  
-> write memory flash-synchro
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[copy flash-synchro](#) Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

### MIB Objects

```
configManager  
  configWriteMemory
```

---

## copy running certified

Copies the current *running* directory configuration to the *certified* directory on both CMMs.

**copy running certified [flash-synchro]**

---

### Syntax Definitions

**flash-synchro** Synchronizes the primary and secondary CMM.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command is used to overwrite the contents of the *certified* directory with the configuration from the *running* directory. This should only be done if the *running* configuration has been verified.
- The **flash-synchro** keyword synchronizes the files between the primary and secondary CMMs by overwriting the contents of the secondary CMM *certified* directory with the contents of the primary CMM *certified* directory.
- If there is not enough free space, the copy attempt fails and an error message is generated.
- This command does not work if the switch is running from the *certified* directory. To view where the switch is running from, see the **show running-directory** command.
- This command may take up to two minutes to complete.

### Examples

```
-> copy running certified  
-> copy running certified flash-synchro
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

**copy flash-synchro** Copies the startup primary flash version of the CMM software to the startup secondary flash version of the CMM software.

### MIB Objects

```
chasControlModuleTable  
  chasControlVersionMngt  
  chasControlWorkingVersion
```

---

## modify running-directory

Changes the RUNNING DIRECTORY to the specified directory.

**modify running-directory** *image-dir*

---

### Syntax Definitions

*image-dir*

The directory name to become the new RUNNING DIRECTORY.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command to change the RUNNING DIRECTORY and allow configuration changes to be saved to the new RUNNING DIRECTORY.

### Examples

```
-> modify running-directory user-config1  
-> write memory
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[write memory](#)

Copies the running primary RAM version of the CMM software to the RUNNING DIRECTORY.

### MIB Objects

```
chasControlModuleTable  
  CurrentRunningVersion
```

---

## copy flash-synchro

Copies the *certified* directory version of the primary CMM software to the *certified* directory of the secondary CMM.

**copy flash-synchro**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K

### Usage Guidelines

- This command is used to synchronize the *certified* directories of the primary and secondary CMMs. The two CMMs must be synchronized if a fail over occurs, otherwise switch performance is affected.

### Examples

```
-> copy flash-synchro
-> configure copy flash-synchro
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[copy running certified](#)

Copies the RUNNING DIRECTORY configuration to the *certified* directory on the primary CMM.

### MIB Objects

```
chasControlModuleTable
  chasControlVersionMngt
```

---

## takeover

Forces the current secondary CMM to assume the role of the primary CMM.

**takeover**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K

### Usage Guidelines

- This command causes the secondary CMM to take over the functions of the primary CMM. After this command, the old primary CMM is the new secondary CMM.
- Be sure that the secondary CMM has all software (i.e., image and configuration files) required to continue CMM operations, before issuing the **takeover** command.
- For information on synchronizing the primary and secondary CMM software before issuing the **takeover** command, see the [copy flash-synchro](#) command.

### Examples

```
-> takeover
```

### Release History

Release 7.1.1; command introduced.

### Related Command

[reload all](#) Reboots the switch.

### MIB Objects

chasEntPhysicalTable  
chasEntPhysAdminStatus

---

## show running-directory

Shows the current state of version and configuration management for a CMM.

**show running-directory**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Once a switch boots up and is running, it runs either from the *working*, *certified*, or a *user-defined* directory. If the switch is running from the *certified* directory, changes made to the RUNNING CONFIGURATION using CLI commands, cannot be saved.

### Examples

The following is an example of the display on OmniSwitch 10K switches:

```
-> show running-directory
```

```
CONFIGURATION STATUS
  Running CMM           : PRIMARY,
  CMM Mode              : MONO CMM,
  Current CMM Slot     : A,
  Running configuration : CERTIFIED,
  Certify/Restore Status : CERTIFIED,
SYNCHRONIZATION STATUS
  Flash Between CMMs   : SYNCHRONIZED
  Running Configuration : SYNCHRONIZED
```

#### *output definitions*

---

<b>Running CMM</b>	The CMM currently controlling the switch, either PRIMARY or SECONDARY.
<b>CMM Mode</b>	Whether there are one or two CMMs installed.
<b>Current CMM Slot</b>	The slot of the primary CMM, A or B.
<b>Running Configuration</b>	The current RUNNING DIRECTORY.
<b>Certify/Restore Status</b>	Indicates if the CMM has been certified.

*output definitions (continued)*

---

<b>Flash Between CMMs</b>	<b>SYNCHRONIZED:</b> Flash between CMMs is identical. <b>NOT SYNCHRONIZED:</b> Flash between CMMs is not identical.
<b>Running Configuration</b>	<b>SYNCHRONIZED:</b> RUNNING CONFIGURATION has been saved to the RUNNING DIRECTORY. <b>NOT SYNCHRONIZED:</b> RUNNING CONFIGURATION has not been saved to the RUNNING DIRECTORY.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<b>reload all</b>	Reboots the switch.
<b>copy flash-synchro</b>	Copies the <i>certified</i> directory version of the primary CMM software to the <i>certified</i> directory of the secondary CMM.

**MIB Objects**

```
chasControlModuleTable
  chasControlSynchronizationStatus
  chasControlCertifyStatus
  chasControlRunningVersion
```

```
chasEntPhysicalTable
  chasEntPhysOperStatus
  entPhysicalIndex
```

```
chasControlReloadTable
  chasControlReloadStatus
```

---

## show reload

Shows the status of any time delayed reboot(s) that are pending on the switch.

**show reload** [**status** | **all status**]

---

### Syntax Definitions

**status** Displays whether or not either of the CMMs are scheduled for a reload.  
**all status** Displays whether or all the modules are scheduled for a reload

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- It is possible to preset a reboot on a CMM by using the **reload** command. If this is done, use the **show reload** command to see when the next scheduled reboot is going to occur.
- If the **reload from** command is used, and a rollback timeout is set, the rollback occurs and is shown using the **show reload** command.

### Examples

```
-> show reload status
Primary   Control Module Reload Status: No Reboot Scheduled,
Secondary Control Module Reload Status: No Reboot Scheduled
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[reload secondary](#) Reboots the primary or secondary CMM to its startup software configuration.

[reload from](#) Immediate primary CMM reboot to the specified software configuration without secondary CMM takeover.

### MIB Objects

```
chasControlModuleTable
  chasControlDelayedActivateTimer
chasGlobalControl
  chasGlobalControlDelayedResetAll
```

---

## show microcode

Displays microcode versions installed on the switch.

**show microcode** [**certified** | **loaded** | **issu** | *image-dir*]

---

### Syntax Definitions

<b>certified</b>	Specifies the <i>certified</i> directory.
<b>loaded</b>	Specifies the loaded (i.e., currently-active) microcode versions.
<b>working</b>	Specifies the <i>working</i> directory.
<b>issu</b>	Specifies the <i>issu</i> directory.
<i>image-dir</i>	Specifies the <i>user-defined</i> directory.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If no additional parameters are entered microcode information for the RUNNING CONFIGURATION is displayed.

### Examples

```
-> show microcode
Package           Release           Size           Description
-----+-----+-----+-----
Ros.img           7.1.1.403.R01    1828255       Alcatel-Lucent OS
Reni.img          7.1.1.403.R01    1359435       Alcatel-Lucent NI
```

*output definitions*

---

<b>Package</b>	File name.
<b>Release</b>	Version number.
<b>Size</b>	File size.
<b>Description</b>	File description.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

**usb** Displays the archive history for microcode versions installed on the switch.

**MIB Objects**

N/A

---

## usb

Enables access to the device connected to the USB port.

**usb {enable | disable}**

---

### Syntax Definitions

N/A

### Defaults

parameter	default
enable / disable	disable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Must use an Alcatel-Lucent certified USB device.
- If a Alcatel-Lucent certified USB device is connected after enabling the USB interface, the device will be automatically mounted as **/uflash**.
- Once mounted, common file and directory commands can be used for file management.

### Examples

```
-> usb enable
-> cp /flash/working/boot.cfg /uflash/boot.cfg
-> ls /uflash
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

#### MIB Objects

##### **usb auto-copy**

Allows backup image files from the USB device to be automatically copied to the /flash/working directory on the switch immediately after the USB device is connected

#### MIB Objects

```
systemServices
  systemServicesUsbEnable
```

---

## usb auto-copy

Allows the image files from the USB device to be automatically copied to the switch immediately after the USB device is connected.

**usb auto-copy {enable | disable}**

---

### Syntax Definitions

N/A

### Defaults

parameter	default
enable / disable	disable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the auto-copy is successful the switch will automatically reboot.
- The USB device must contain the proper file structure and image files mentioned below and the USB root directory must contain a signature file named *aossignature*. The *aossignature* file can be a blank text file transferred to the switch.
- This operation will enable all of the image files from the */uflash/10000/working* or */uflash/6900/working* directory to be copied to the */flash/working* directory.
- If the auto-copy is successful, the auto-copy feature will be disabled before rebooting the switch and must be re-enabled by the administrator for the next auto-copy process to execute. This will prevent running the same auto-copy multiple times.

### Examples

```
-> usb auto-copy enable  
-> usb auto-copy disable
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**usb**

Enables access to the device connected to the USB interface.

## MIB Objects

systemServices

systemServicesUsbAutoCopyEnable

---

## mount

Mounts a USB device on /uflash.

**mount** [/uflash]

---

### Syntax Definitions

**/uflash**                                      The name of the file-system to mount.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Once the USB device is mounted most file and directory commands associated with the **/flash** file system can be used with **/uflash** such as: mkdir, rmdir, cd, rm, cp, ls.

### Examples

```
-> mount /uflash
-> ls /uflash
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**umount**                                      Unmounts the /uflash file system from AOS.

### MIB Objects

```
systemServicesAction
  systemServicesArg1
```

---

## umount

Unmounts the /uflash file system from AOS.

**umount /uflash**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command unmounts the USB drive and should be used prior to unplugging the USB drive to prevent possible data corruption.

### Examples

```
-> umount /uflash
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[mount](#) Mounts the /uflash file system from AOS.

### MIB Objects

```
systemServicesAction  
systemServicesArg1
```

---

## show usb statistics

Displays the status USB setting and features.

**show usb statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show usb statistics
Filesystem          1K-blocks      Used Available Use% Mounted on
/dev/sdb1            500732        261216    239516   52% /vroot/uflash
  Host scsi6: usb-storage
    Vendor: Alcatel-Lucent
    Product: USB
  Serial Number: AA04012700031693
    Protocol: Transparent SCSI
    Transport: Bulk
      usb: enabled
usb auto-copy: disable
auto-copy in progress: No
```

### *output definitions*

---

<b>usb</b>	Status of USB device interface.
<b>usb auto-copy</b>	Status of USB auto-copy feature.
<b>auto-copy in progress</b>	Is the switch currently in the process of performing an auto-upgrade.

---

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**usb**

Enables access to the device connected to the USB interface.

**usb auto-copy**

Allows backup files from the USB device to be automatically copied to the switch immediately after the USB device is connected.

**mount**

Mounts the /uflash file system.

## MIB Objects

systemServices

systemServicesUsbEnable

systemServicesUsbAutoCopyEnable

systemServicesUsbDisasterRecoveryEnable

---

## show issu status

Displays the status of ISSU.

**show issu status**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K

### Usage Guidelines

N/A

### Examples

```
-> show issu status
Slot      ISSU-Status
-----+-----+
 1         ISSU Pending
 2         ISSU Pending
 3         ISSU Pending
```

```
-> show issu status
Slot      ISSU-Status
-----+-----+
 1         ISSU Complete
 2         ISSU Complete
 3         ISSU Complete
```

### *output definitions*

---

<b>Slot</b>	Specifies the slot number.
<b>ISSU-Status</b>	Indicates the ISSU status for a slot: <b>Pending</b> - Slot has not been reset; upgrade is not complete. <b>Complete</b> - Slot has been reset; upgrade is complete.

---

### Release History

Release 7.1.1; command was introduced.

**Related Commands****issu from**

# 41 Chassis Management and Monitoring Commands

Chassis Management and Monitoring commands allow you to configure and view hardware-related operations on the switch. Topics include basic system information, as well as Network Interface (NI) module and chassis management.

---

**Additional Information.** Refer to your separate *Hardware Users Guide* for detailed information on chassis components, as well as managing and monitoring hardware-related functions.

---

MIB information for the Chassis Management and Monitoring commands is as follows:

*Filename:* AlcatelIND1Chassis.mib  
*Module:* ALCATEL-IND1-CHASSIS-MIB

*Filename:* AlcatelIND1System.MIB  
*Module:* ALCATEL-IND1-SYSTEM-MIB

A summary of available commands is listed here:

---

<b>Management Commands</b>	<code>system contact</code> <code>system name</code> <code>system location</code> <code>system date</code> <code>system time</code> <code>system timezone</code> <code>system daylight-savings-time</code> <code>update uboot</code> <code>update fpga</code> <code>reload slot</code> <code>power slot</code> <code>temp-threshold</code> <code>powersupply enable</code> <code>hash-control</code>
<b>Monitoring Commands</b>	<code>license</code> <code>show hardware info</code> <code>show chassis</code> <code>show cmm</code> <code>show slot</code> <code>show module</code> <code>show module long</code> <code>show module status</code> <code>show powersupply</code> <code>show fan</code> <code>show fantray</code> <code>show temperature</code> <code>show hash-control</code>
<b>Licensing Commands</b>	<code>license</code> <code>show license info</code>

---

## system contact

Specifies the administrative contact for the switch. An administrative contact is the person or department in charge of the switch. If a contact is specified, users can easily find the appropriate network administrator if they have questions or comments about the switch.

**system contact** *text\_string*

---

### Syntax Definitions

*text\_string*

The administrative contact being specified for the switch. The system contact can range from 1 to 254 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, **“Jean Smith Ext. 477 jsmith@company.com”**.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> system contact "Jean Smith Ext. 477 jsmith@company.com"  
-> system contact engineering-test@company.com
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">system name</a>	Modifies the current system name of the switch.
<a href="#">system location</a>	Specifies the current physical location of the switch.
<a href="#">license</a>	Displays the basic system information for the switch.

### MIB Objects

system  
    systemContact

---

## system name

Modifies the current system name of the switch. The system name can be any simple, user-defined text description for the switch.

**system name** *text\_string*

---

### Syntax Definitions

*text\_string*

The new system name. The system name can range from 1 to 19 characters in length. No spaces are allowed in the system name.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Spaces are not allowed in the system name.

### Examples

```
-> system name OmniSwitch10K
-> system name OS10K
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[system contact](#)

Specifies the administrative contact of the switch (for example, an individual or a department).

[system location](#)

Specifies the current physical location of the switch.

[license](#)

Displays the basic system information for the switch.

### MIB Objects

system

    systemName

---

## system location

Specifies the current physical location of the switch. If you need to determine the location of the switch from a remote site, entering a system location can be very useful.

**system location** *text\_string*

---

### Syntax Definitions

*text\_string*

The physical location of the switch. For example, **TestLab**. The system location can range from 1 to 254 characters in length. Text strings that include spaces must be enclosed in quotation marks. For example, **“NMS Test Lab”**.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> system location "NMS Test Lab"  
-> system location TestLab
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[system contact](#)

Specifies the administrative contact of the switch (for example, an individual or a department).

[system name](#)

Modifies the current system name of the switch.

[license](#)

Displays the basic system information for the switch.

### MIB Objects

system

    systemLocation

---

## system date

Displays or modifies the current system date on the switch.

**system date** [*mm/dd/yyyy*]

---

### Syntax Definitions

*mm/dd/yyyy*

The new date being specified for the system. Enter the date in the following format: *mm/dd/yyyy*, where *mm* is the month, *dd* is the day, and *yyyy* is the year. For example, **08/08/2005**.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If you do not specify a new system date in the command line, the current system date is displayed.
- For more information on setting time zone parameters (for example, Daylight Savings Time), refer to the [system timezone](#) command on page 41-8.

### Examples

```
-> system date 08/08/2010
-> system date
08/08/2010
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[system time](#)

Displays or modifies the current system time on the switch.

[system timezone](#)

Displays or modifies the time zone for the switch.

### MIB Objects

systemServices

systemServicesDate

---

## system time

Displays or modifies the switch current system time.

**system time** [*hh:mm:ss*]

---

### Syntax Definitions

*hh:mm:ss*

The new time being specified for the system. To set this value, enter the current time in 24-hour format, where *hh* is the hour, *mm* is the minutes, and *ss* is the seconds. For example, **14:30:00**.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If you do not specify a new system time in the command line, the current system time is displayed.

### Examples

```
-> system time 14:30:00
-> system time
14:30:08
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[system date](#)

Displays or modifies the current system date on the switch.

[system timezone](#)

Displays or modifies the time zone for the switch.

### MIB Objects

systemServices

systemServicesTime

---

## system timezone

Displays or modifies the time zone for the switch.

**system timezone** [*timezone\_abbrev*]

---

### Syntax Definitions

*timezone\_abbrev*

Specifies a time zone for the switch and sets the system clock to run on UTC. If you specify a time zone abbreviation, the hours offset from UTC is automatically calculated by the switch.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The configuration must be saved after changing the timezone.
- To display the current time zone for the switch, enter the syntax **system timezone**.
- If the configured timezone supports DST it is automatically enabled and cannot be disabled.
- If the configured timezone does not support DST it is automatically disabled and cannot be enabled.
- Refer to the Switch Management Guide for a list of time zone abbreviations.

### Examples

```
-> system timezone mst
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[system date](#)

Displays or modifies the current system date on the switch.

[system time](#)

Displays or modifies the current system time on the switch.

### MIB Objects

systemServices

```
systemServicesTimezone  
systemServicesTimezoneStartWeek  
systemServicesTimezoneStartDay  
systemServicesTimezoneStartMonth  
systemServicesTimezoneStartTime
```

```
systemServicesTimezoneOffset  
systemServicesTimezoneEndWeek  
systemServicesTimezoneEndDay  
systemServicesTimezoneEndMonth  
systemServicesTimezoneEndTime  
systemServicesEnabledDST
```

---

## system daylight-savings-time

Displays the Daylight Savings Time (DST) setting for the configured timezone.

**system daylight-savings-time**

---

### Syntax Definitions

N/A

### Defaults

parameter	default
Timezone supports DST	enabled
Timezone does not support DST	disabled

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If the configured timezone supports DST it is automatically enabled and cannot be disabled.
- If the configured timezone does not support DST it is automatically disabled and cannot be enabled.
- DST will always display as ENABLED, the configured timezone determines its operation.

### Examples

```
-> system daylight-savings-time
Daylight Savings Time (DST) is ENABLED.
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">system time</a>	Displays or modifies the current system time on the switch.
<a href="#">system timezone</a>	Displays or modifies the timezone for the switch.
<a href="#">system date</a>	Displays or modifies the current system date on the switch.

### MIB Objects

```
systemServices
  systemServicesTimezone
  systemServicesEnabledDST
```

---

## update uboot

Updates the uboot versions of the CMM or NIs. Refer to the Release Notes and/or any available Upgrade Instructions for the new release before performing this type of update on the switch.

**update uboot** {cmm *slot* | ni {all | *slot*} file *filename*}

---

### Syntax Definitions

<b>cmm</b>	Specifies that the update is performed for the Chassis Management Module (CMM).
<b>all</b>	Specifies that the update is performed for all slots within a chassis.
<i>slot</i>	Specifies the slot number of the module within a chassis.
<i>filename</i>	Specifies the path and name of the upgrade file.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Note that when performing an update, it is important that the correct update file is used. Specifying the wrong file may impact the operation of the switch.

### Examples

```
OS10K-> update uboot ni all file 9999.tar.gz
OS10K-> update uboot cmm 1 file /flash/temp/9999.tar.gz
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

**reload slot** Reloads the specified NI module.

### MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

---

## update fpga

Updates the fpga versions of the CMM or NIs. Refer to the Release Notes and/or any available Upgrade Instructions for the new release before performing this type of update on the switch.

```
update fpga {cmm slot| ni {daughter | slot } file filename}
```

---

### Syntax Definitions

<b>cmm</b>	Specifies that the update is performed for the Chassis Management Module (CMM).
<b>daughter</b>	Specifies the number of the daughter board on the NI module.
<i>slot</i>	Specifies the slot number of the module within a chassis.
<i>filename</i>	Specifies the path and name of the upgrade file.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Note that when performing an update, it is important that the correct update file is used. Specifying the wrong file may impact the operation of the switch.

### Examples

```
OS10K-> update fpga ni 4 file 9999.vme
OS10K-> update fpga cmm 1 file /flash/temp/9999.vme
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[reload slot](#) Reloads the specified NI module.

### MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

---

## reload slot

Reloads or reboots a specified Network Interface (NI) module.

**reload slot** *slot*

---

### Syntax Definitions

*slot* Specifies the slot number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The **reload slot** command reboots only the specified NI. Other modules installed on the chassis, including primary and secondary CMMs, are not affected

### Examples

```
-> reload slot 2
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<a href="#">reload slot</a>	Reloads the specified NI module.
<a href="#">power slot</a>	Turns the power on or off for a specified Network Interface (NI) module.
<a href="#">show slot</a>	Shows the hardware information and the current status for Network Interface (NI) modules currently running in the chassis.

### MIB Objects

```
chasEntPhysicalTable  
  chasEntPhysAdminStatus  
  reset
```

---

## power slot

Turns the power on or off for a specified Network Interface (NI) module.

**power slot** *slot*

**no power slot** *slot*

---

### Syntax Definitions

*slot* The chassis slot number containing the NI module being powered on or off.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K

### Usage Guidelines

Use the **no** form of this command to power off an NI module.

### Examples

```
-> power slot 1  
-> power slot 7
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

**reload slot** Reloads the specified NI module.

**show slot** Shows the hardware information and current status for Network Interface (NI) modules currently running in the chassis.

### MIB Objects

```
chasEntPhysicalTable  
  chasEntPhysAdminStatus  
  powerOn  
  powerOff
```

---

## temp-threshold

Sets the warning temperature threshold for the switch.

**temp-threshold** *temp*

---

### Syntax Definitions

*temp* The new temperature threshold value, in Celsius.

### Defaults

parameter	default
<i>temp</i>	70

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> temp-threshold 45
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show temperature](#) Displays the ambient temperature of the current operating chassis, as well as current temperature threshold settings.

### MIB Objects

chasChassisTable  
chasTempThreshold

---

## **powersupply enable**

Enables the power supply unit identified by the PSU-ID.

**powersupply enable** [*slot*]

**no powersupply enable** [*slot*]

---

### **Syntax Definitions**

*slot* Slot number of power supply.

### **Defaults**

N/A

### **Platforms Supported**

OmniSwitch 10K

### **Usage Guidelines**

N/A

### **Release History**

Release 7.1.1; command introduced.

### **Related Commands**

[power slot](#) Turns the power on or off for a specified Network Interface (NI) module.

### **MIB Objects**

N/A

---

## hash-control

Configures the hash control method on the switch. Depending upon this configuration, hashing algorithm used by various applications for packet forwarding is affected.

**hash-control {brief | extended [udp-tcp-port] | load-balance non-ucast {enable | disable}}**

**hash-control extended no udp-tcp-port**

---

### Syntax Definitions

<b>brief</b>	Sets hashing to brief mode.
<b>extended</b>	Sets hashing to extended mode.
<b>udp-tcp-port</b>	Sets extending hashing to use UDP/TCP ports.
<b>enable   disable</b>	Enables or disables the the load balancing of non-unicast traffic on a link aggregate.

### Defaults

parameter	default
<b>hash-control</b>	brief
<b>udp-tcp-port</b>	disabled
<b>non-ucast</b>	disabled

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Disabling TCP-UDP port hashing is recommended when Server Load Balancing (SLB) is configured, because SLB dynamically assigns ports.
- The hash control setting also impacts the fabric load balancing for Chassis based products. It is recommended not to set brief hashing mode on Chassis based products.
- Changing the hash control mode affects the hashing algorithm for Link Aggregation, Server Load Balancing and ECMP.
- The hashing mode must be set to extended to enable UDP/TCP port hashing.
- Enabling or disabling the **load-balance non-ucast** option applies to all link aggregates. When this option is disabled (the default), link aggregation load balances only unicast packets; all non-unicast packets are sent through the primary port of the link aggregate.
- When the **load-balance non-ucast** option is enabled, all non-unicast traffic (broadcast, L2 multicast, L3 multicast, and unknown unicast) is load balanced over the link aggregate.

## Examples

```
-> hash-control brief
-> hash-control extended
-> hash-control extended udp-tcp-port
-> hash-control extended no udp-tcp-port
-> hash-control load-balance non-ucast enable
-> hash-control load-balance non-ucast disable
```

## Release History

Release 7.2.1; command introduced.

## Related Commands

[show hash-control](#) Displays the current hash control setting for the switch.

## MIB Objects

```
alaChasHashMode
alaChasUdpTcpPortMode
alachasNonUHashControl
```

---

## license

Activates the license for licensed protocols on the switch.

```
license {apply {file file_name | key key } | deactivate}
```

---

### Syntax Definitions

<i>file_name</i>	<i>The name of the license file containing the license keys.</i>
<i>key</i>	<i>The individual license key.</i>

### Defaults

By default licensed protocols are not activated on the switch.

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- The license file can have any name and be placed in any directory on the switch flash.
- The license file is only used to activate the licensed features and does not need to remain on the switch.
- The license key must be contained within single quotes when entered using the CLI.
- The switch must be rebooted to reflect the licensed feature set.

### Examples

```
-> license apply file /flash/swlicense.dat
The switch will reboot after the license is applied.
Are you sure you want to proceed(Y/N)?Y
```

```
-> license apply key 'p8S2-i3}p-&40s-%bOK-U9Ax-CxNT-h%jl-#JY'
The switch will reboot after the license is applied.
Are you sure you want to proceed(Y/N)?Y
```

### Release History

Release 7.2.1; command was introduced.

### Related Commands

[show license info](#) Displays all the licensed applications installed on the switch.

### MIB Objects

```
aluLicenseManagerApplyLicense
alaCapManSwLicensingActionArg
```

---

## show system

Displays basic system information for the switch. Information includes a user-defined system description, name, administrative contact, location, object ID, up time, and system services.

**show system**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show system
```

```
System:
```

```
Description: Alcatel-Lucent OS10K 7.1.1.999, February 21, 2010.,
Object ID: 1.3.6.1.4.1.6486.800.1.1.2.1.6.1.2,
Up Time: 0 days 5 hours 20 minutes and 49 seconds,
Contact: Alcatel-Lucent, www.alcatel-lucent.com/enterprise/en,
Name: OmniSwitch 10K,
Location: NMS_LABORATORY,
Services: 72,
Date & Time: FRI FEB 24 2006 16:21:30 (PST)
```

```
Flash Space:
```

Primary CMM:
```

```
Available (bytes): 31266816,
Comments : None
```

### *output definitions*

---

<b>System Description</b>	The description for the current system. This description shows the current software version and the system date.
<b>System Object ID</b>	The SNMP object identifier for the switch.
<b>System Up Time</b>	The amount of time the switch has been running since the last system reboot.
<b>System Contact</b>	An user-defined administrative contact for the switch. This field is modified using the <a href="#">system contact</a> command.
<b>System Name</b>	A user-defined text description for the switch. This field is modified using the <a href="#">system name</a> command.

*output definitions (continued)*

---

<b>System Location</b>	The user-defined physical location of the switch. This field is modified using the <b>system location</b> command.
<b>System Services</b>	The number of current system services.
<b>System Date &amp; Time</b>	The current system date and time. This field is modified using the <b>system date</b> and <b>system time</b> commands.
<b>Flash Space: Primary CMM: Available (bytes)</b>	The available flash memory space available on the <i>primary</i> management module of the switch.
<b>Flash Space: Primary CMM: Comments</b>	Comments regarding the available flash memory space available on the primary management module of the switch, if applicable.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<b>system contact</b>	Specifies the administrative contact for the switch(for example, an individual or a department).
<b>system name</b>	Modifies the current system name of the switch.
<b>system location</b>	Specifies the current physical location of the switch.

```

---

## show hardware info

Displays the current system hardware information. Includes CPU, flash, RAM, NVRAM battery, jumper positions, BootROM, and miniboot and FPGA information.

**show hardware info**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show hardware info
CPU Type                : PowerPC 8245,
Flash Manufacturer      : TOSHIBA,
Flash size              : 67108864 bytes (64 MB),
RAM Manufacturer        : (null),
RAM size                : 268435456 bytes (256 MB),
NVRAM Battery OK ?     : YES,
BootROM Version        : 6.1.2.20.R02 ,
Backup Miniboot Version : 6.1.2.20.R02,
Default Miniboot Version : 6.1.2.20.R02,
Product ID Register    : 54
Hardware Revision Register : 00
CPLD Revision Register : 06
XFP Module ID          : 02
```

### *output definitions*

---

<b>CPU Type</b>	The manufacturer and model number of the CPU used on the CMM.
<b>Flash Manufacturer</b>	The manufacturer of the flash memory used on the CMM.
<b>Flash size</b>	The total amount of flash memory (file space) on the CMM. This field specifies the total flash memory size only and does not indicate the amount of memory free or memory used.
<b>RAM Manufacturer</b>	The manufacturer of the RAM memory used on the CMM.
<b>RAM size</b>	The total amount of RAM memory on the CMM. This field specifies the total RAM memory only and does not indicate the amount of memory free or memory used.

*output definitions (continued)*

---

<b>NVRAM Battery OK</b>	The current status of the NVRAM battery. If the battery is OK, YES is displayed in this field. If the battery charge becomes low, NO is displayed in this field.
<b>BootROM Version</b>	The current BootROM version.
<b>Backup Miniboot Version</b>	The current backup miniboot version.
<b>Default Miniboot Version</b>	The current default miniboot version.
<b>Product ID Register</b>	The register number of the product ID.
<b>Hardware Revision Register</b>	The register number of the hardware revision.
<b>CPLD Revision Register</b>	The register number of the CPLD revision.
<b>XFP Module ID</b>	The ID number of the XFP module.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

-> show chassis

```
Chassis 1
  Model Name:           OS10K,
  Description:          Chassis,
  Part Number:          902274-10,
  Hardware Revision:    002,
  Serial Number:        E23L9052,
  Manufacture Date:     JUN 09 2004,
  Admin Status:         POWER ON,
  Operational Status:   UP,
  Free Slots:           5,
  Power Left:           200,
  Number Of Resets:     115,
  MAC Address           00:d0:95:87:14:33
```

### *output definitions*

---

<b>Model Name</b>	The factory-set model name for the switch. This field cannot be modified.
<b>Description</b>	The factory-set description for the switch. This field cannot be modified.
<b>Part Number</b>	The Alcatel-Lucent part number for the chassis.
<b>Hardware Revision</b>	The hardware revision level for the chassis.
<b>Serial Number</b>	The Alcatel-Lucent serial number for the chassis.
<b>Manufacture Date</b>	The date the chassis was manufactured.

*output definitions (continued)*

---

<b>Admin Status</b>	The current power status of the chassis. Chassis information is obtained from a running CMM. Hence the value is always POWER ON.
<b>Operational Status</b>	The current operational status of the chassis.
<b>Free Slots</b>	The number of free slots available for NIs.
<b>Power Left</b>	The power remaining for additional NIs.
<b>Number of Resets</b>	The number of times the CMM has been reset (reloaded or rebooted) since the last cold boot of the switch.
<b>MAC Address</b>	The base MAC address of the chassis.

---

---

## show cmm

Displays basic hardware and status information for the CMM modules in a standalone switch.

**show cmm** [*slot*]

---

### Syntax Definitions

*slot* Specifies the CMM by slot number or letter.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

On chassis-based switches, a CMM installed in the left CMM slot position is defined as CMM-A. A CMM installed in the right position is CMM-B.

```
-> show cmm 1
Module in slot CMM-A
  Model Name:           OS10K,
  Description:          CMM,
  Part Number:          902271-10,
  Hardware Revision:    002,
  Serial Number:        E23L9059,
  Manufacture Date:     JUN 08 2004,
  FPGA Physical-1      December 24 2009,
  Admin Status:         POWER ON,
  Operational Status:   UP,
  Power Consumption:    888,
  CPU Model             MPC8572 Motorola,
  MAC Address:          00:d0:95:a3:e5:09,
```

### output definitions

---

<b>Model Name</b>	The model name of the switch. Note that on chassis-based switches, CMM modules are made up of two major subcomponents: the fabric board and the processor board. Fabric boards are denoted as OS10*00-CMM and processor boards are denoted as CMM-PROC. Information for each board is displayed separately.
<b>Description</b>	A factory-defined description of the associated board (for example, BBUS Bridge or PROCESSOR).
<b>Part Number</b>	The Alcatel-Lucent part number for the board.
<b>Hardware Revision</b>	The hardware revision level for the board.
<b>Serial Number</b>	The Alcatel-Lucent serial number for the board.
<b>Manufacture Date</b>	The date the board was manufactured.
<b>FPGA Physical-1</b>	FPGA version.

*output definitions (continued)*

---

<b>Admin Status</b>	The current power status of the CMM. Information is obtained from a running CMM. Hence the value is always POWER ON.
<b>Operational Status</b>	The current operational status of the CMM.
<b>Power Consumption</b>	The current power consumption for the CMM.
<b>CPU Model</b>	The CPU Model type.
<b>MAC Address</b>	The MAC address assigned to the chassis.

---

**Release History**

Release 7.1.1; command introduced.

**Related Commands**

<a href="#">show chassis</a>	Displays the basic configuration and status information for the switch chassis.
<a href="#">show slot</a>	Displays the basic hardware and status information for Network Interface (NI) modules currently installed in the switch.
<a href="#">show module</a>	Displays the basic information for either a specified module or all the modules installed in the chassis.
<a href="#">show module long</a>	Displays the detailed information for either a specified module or all modules installed in the chassis.
<a href="#">show module status</a>	Displays the basic status information for either a specified module or all modules installed in the chassis.
<a href="#">license</a>	Displays the status and configuration of Switch Fabric Modules (SFMs) on chassis-based switches.

---

## show slot

Displays the basic hardware and status information for Network Interface (NI) modules currently installed in the chassis.

**show slot** [*slot*]

---

### Syntax Definitions

*slot* The slot number for a specific NI module installed in the chassis. If no slot number is specified, information for all the NI modules is displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show slot 1
Module in slot 1
  Model Name:                OS10-GNI-C48,
  Description:               10-1000 RJ45,
  Part Number:               902434-90,
  Hardware Revision:         A07,

## show module status

Displays the basic status information for either a specified module or all modules installed in a standalone switch chassis.

**show module status** [*slot*]

---

### Syntax Definitions

*slot* The slot number or CMM letter for a specific module installed in the chassis. If no slot number is specified, status information for all modules is displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show module status
```

Slot	Operational Status	Admin-Status	Firmware Rev	MAC
CMM-A	UP	POWER ON	N/A	00:d0:95:a3:e5:09
SLOT-1	UP	POWER ON	N/A	00:d0:95:a3:e5:0b

#### output definitions

---

<b>Slot</b>	The chassis slot position of the module. For detailed slot numbering information, refer to the “Chassis and Power Supplies” chapter of the <i>Hardware User Guide</i> . Refer to <a href="#">page 41-26</a> for additional information on CMM callouts.
<b>Operational Status</b>	The operational status of the module. Options include UP or DOWN. For NI and secondary CMM modules, the operational status can be DOWN while the power status is on, indicating a possible software issue.
<b>Admin-Status</b>	The current power status of the module. Options include POWER ON or POWER OFF.
<b>Firmware Rev</b>	The firmware version for module ASICs.
<b>MAC</b>	For the CMM, the base chassis MAC address is displayed. For NI modules, the MAC address for the corresponding NI is displayed.

---

## Release History

Release 7.1.1; command introduced.

## Related Commands

### [show module](#)

Displays the basic information for either a specified module or all the modules installed in the chassis.

### [show module long](#)

Displays the detailed information for either a specified module or all the modules installed in the chassis.

---

## show powersupply

Displays the hardware information and current status for chassis power supplies.

**show powersupply** [*slot*]

---

### Syntax Definitions

*slot* The slot number for a specific power supply installed in the chassis. If no power supply number is specified, information for all power supplies is displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Power supplies 5-8 are for the optional power supply shelf on OS10K.

### Examples

```
-> show powersupply
```

Slot	PS	Total Power	Power Used	Input Voltage	PS Type	Status	Location
1		2400	0	0	AC	UP	Internal
2		2400	0	0	AC	UNPLUG	Internal

## show fan

Displays the current operating status of chassis fans.

**show fan** [*slot*]

---

### Syntax Definitions

*slot* Specifies the slot number of the fantray.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guideline

N/A

### Examples

```
-> show fan
Chassis Fan  Status
-----+-----
  1      1  Running
  1      2  Running
  1      3  Running
  1      4  Not Running
```

### output definitions

---

<b>Chassis/Tray</b>	The chassis/tray ID.
<b>Fan</b>	The fan number describing the fan position.
<b>Status/Functional</b>	The current operational status of the corresponding fan.
<b>Speed</b>	The speed of the fan.
<b>Airflow</b>	-

---

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show fantray](#) Displays the current operating chassis ambient temperature, as well as current temperature threshold settings.

---

## show fantray

Displays the current operating status of chassis fantrays.

**show fantray** [*slot*]

---

### Syntax Definitions

*slot* Specifies the slot number of the fantray.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guideline

N/A

### Examples

```
-> show fantray
      | Working | Fan
Tray | Status | Fans  | Load %
-----+-----+-----+-----
  1   ON   4     50
```

### output definitions

---

<b>Chassis/Tray</b>	The chassis/Tray ID.
<b>Status</b>	The current operational status of the fantray.
<b>Working Fans</b>	The number of working fans.
<b>Fan Load %</b>	The load of the fantray.

---

### Release History

Release 7.1.1; command introduced.

### Related Commands

[show fantray](#) Displays the current operating chassis ambient temperature, as well as current temperature threshold settings.

---

## show temperature

Displays the ambient temperature of the current operating chassis, as well as current temperature threshold settings.

**show temperature** [**fabric** *[index]*] | **slot** *[index]*] | **fantray** *[index]*] | **cmm** *[index | cmm\_letter]*]

---

### Syntax Definitions

*index* Specifies the index number.

*number* Specifies the slot number.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

-> show temperature

Device	Current	Range	Thresh	Status
CMMA	45	15-60	55	UNDER THRESHOLD
FAB1	46	15-60	55	UNDER THRESHOLD
Slot1	43	15-60	55	UNDER THRESHOLD
Slot3	43	15-60	55	UNDER THRESHOLD
Slot4	43	15-60	55	UNDER THRESHOLD

### output definitions

---

<b>Device</b>	The device being measured ( CMM, Fabric, or NI)
<b>Current</b>	The current CPU temperature in Celsius.
<b>Range</b>	The supported threshold range.
<b>Thresh</b>	The warning temperature threshold, in degrees Celsius. If the switch reaches or exceeds this temperature, the primary switch or CMM TEMP LED displays amber and a warning is sent to the user.
<b>Status</b>	Whether the current temperature has reached the threshold.

---

### Release History

Release 7.1.1; command introduced.

NA

### Defaults

NA

### Platforms Supported

OmniSwitch 6900

### Usage Guidelines

- Use this command to verify which licenses are installed on the switch.
- The number of days remaining is only applicable for demo licenses.

### Examples

```
->show license info
License          Type                               Time (Days)
                                     Remaining
-----+-----+-----
Advanced        Permanent                           NA
```

### *output definitions*

---

<b>License</b>	Displays the feature license installed on the switch.
<b>Type</b>	The type of license: Demo or Permanent..
<b>Time (Days) Remaining</b>	Time of days remaining for a demo license. Display as 'NA' for permanent licenses.

---

### Release History

Release 7.2.1; command was introduced.

**Related Commands****show license info**

Activates the license for licensed protocols on the switch.

**MIB Objects**

```

# 42 Chassis MAC Server (CMS) Commands

The Chassis MAC Server (CMS) manages MAC addresses on the switch. The MAC addresses managed via the CMS are used as identifiers for the following functions:

- Base chassis MAC address
- Ethernet Management Port (EMP)
- VLAN router ports

Similar to IP addresses, MAC addresses are assigned by the Internet Assigned Numbers Authority (IANA) and distributed to users in sequential blocks. A sequential block of MAC addresses is referred to as a MAC address *range*.

The MAC address range is stored on the switch's EEPROM. The switch supports one MAC address range only. By default, this MAC address range contains thirty-two (32) factory-installed, contiguous MAC addresses.

MIB information for the Chassis MAC Server commands is as follows:

*Filename:* AlcatelIND1MacServer.MIB  
*Module:* Alcatel-IND1-MAC-SERVER-MIB

A summary of the available commands is listed here:

---

**mac-range eeprom**  
**show mac-range**  
**show mac-range alloc**

---

## mac-range eeprom

Modifies the default MAC range on the switch's EEPROM.

---

**Note.** Use caution when modifying the default MAC range. Improper use of this command can disable your system and adversely affect your network. Contact Alcatel-Lucent Customer Support for further assistance.

---

**mac-range eeprom** *start\_mac\_address* *count*

---

### Syntax Definitions

*start\_mac\_address*                      The first MAC address in the modified range. Enter the MAC address in the following format: **xx:xx:xx:xx:xx:xx**, where **x** is a hex value (0–f).

*count*                                      Specifies the number of MAC addresses in the range (1–256).

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Because the factory-installed 32 MAC addresses are sufficient for most network configurations, this command should only be used by qualified network administrators for special network requirements.
- After modifying a MAC address range by using the **mac-range eeprom** command, you must reboot the switch. Otherwise, MAC addresses for existing VLAN router ports will not be allocated properly.
- All MAC addresses in a range must be contiguous (i.e., there cannot be any gaps in the sequence of MAC addresses).

### Examples

```
-> mac-range eeprom 00:20:da:23:45:35 32
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

[show mac-range](#)

Displays the MAC range table.

## MIB Objects

chasMacAddressRangeTable

chasMacRangeIndex

chasGlobalLocal

chasMacAddressStart

chasMacAddressCount

---

## show mac-range

Displays the MAC range table.

**show mac-range** [*index*]

---

### Syntax Definitions

*index* Identifies the MAC range by referring to its position in the MAC range table.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Because the switch currently supports one MAC address range only, index position 1 displays.

### Examples

```
-> show mac range
```

Mac Range	Row Status	Local/Global	Start Mac Addr	End Mac Addr
01	ACTIVE	GLOBAL	00:d0:95:6a:79:6e	00:d0:95:6a:79:8d

#### output definitions

---

<b>Mac Range</b>	The MAC range index number (1). Because the switch currently supports one MAC address range only, index position 1 displays.
<b>Row Status</b>	The current status of the MAC range. The status <b>ACTIVE</b> refers to MAC addresses that are available for allocation to VLAN router ports and other applications.
<b>Local/Global</b>	The Local/Global status for MAC addresses in the range. Local MAC addresses have the local bit set in the first byte of the address. Global MAC addresses (also referred to as <i>EEPROM</i> MAC addresses) have the global bit set in the first byte of the address and are stored on the switch's EEPROM. Because the switch's default MAC range is stored on EEPROM, the status GLOBAL displays.
<b>Start Mac Addr</b>	The first MAC address in the MAC address range.
<b>End Mac Addr</b>	The last MAC address in the MAC address range.

---

### Release History

Release 7.1.1; command introduced.

## Related Commands

### **mac-range eeprom**

Modifies the default MAC range on the switch's EEPROM.

## MIB Objects

chasMacAddressRangeTable

  chasMacRangeIndex

  chasGlobalLocal

  chasMacAddressStart

  chasMacAddressCount

  chasMacRowStatus

---

## show mac-range alloc

Displays all allocated addresses from the MAC range table.

**show mac-range** [*index*] **alloc**

---

### Syntax Definitions

*index*

Identifies the MAC range by referring to its position in the MAC range table. Currently, index position 1 only is supported.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A.

### Examples

```
-> show mac-range alloc
Range      Mac Address          Application      Id
-----+-----+-----+-----
01         00:d0:95:6b:09:40  CHASSIS         0
01         00:d0:95:6b:09:41  802.1X          0
01         00:d0:95:6b:09:5f  CHASSIS         1
```

### output definitions

---

#### Range

The MAC range's index number. The index number refers to the position of the range in the MAC range table. Values may range from 1–20. MAC ranges are divided by index number into four distinct categories. Refer to [page 42-4](#) for more information.

#### Mac Address

Current MAC address allocated for a specific application.

*output definitions (continued)*

---

<b>Application</b>	The application for which the allocated MAC address is being used. Current options include <b>VLAN</b> , <b>802.1X</b> , and <b>CHASSIS</b> . <b>VLAN</b> refers to MAC addresses allocated to VLAN router ports in multiple MAC router mode. <b>CHASSIS</b> refers to MAC addresses used for the base chassis MAC address and the Ethernet Management Port (EMP).
<b>Id</b>	An ID number used to identify an allocated MAC address. ID numbers are used for the base chassis MAC address and Ethernet Management Port (EMP), as well as VLAN router ports. The ID value 0 is reserved for the switch's base chassis MAC address. The ID value 1 is reserved for the EMP MAC address. Router ports assigned to VLANs 2 through 4094 are given corresponding MAC IDs. For example, a router port configured on VLAN 44 receives an allocated MAC ID of 44. Because default VLAN 1 router ports use the base chassis MAC address by default, any router port configured on VLAN 1 is assigned the ID value 0.

---

**Release History**

# 43 Network Time Protocol Commands

The Network Time Protocol (NTP) is used to synchronize the time of a computer client or server to another server or reference time source, such as a radio or satellite receiver. It provides client time accuracies within a millisecond on LANs, and up to a few tens of millisecond on WANs. Typical NTP configurations utilize multiple redundant servers and diverse network paths in order to achieve high accuracy and reliability.

It is important for networks to maintain accurate time synchronization between network nodes. The standard timescale used by most nations of the world is based on a combination of Universal Coordinated Time (UTC) (representing the Earth's rotation about its axis) and the Gregorian Calendar (representing the Earth's rotation about the Sun). UTC time is disseminated by various means, including radio and satellite navigation systems, telephone modems, and portable clocks.

The MIB information for NTP is as follows:

*Filename:* AlcatelIND1Ntp.mib  
*Module:* alcatelIND1NTPMIB

A summary of available commands is listed here:

---

- ntp server**
- ntp server synchronized**
- ntp server unsynchronized**
- ntp client**
- ntp src-ip preferred**
- ntp broadcast**
- ntp broadcast-client**
- ntp broadcast-delay**
- ntp key**
- ntp key load**
- ntp authenticate**
- ntp master**
- ntp interface**
- ntp max-associations**
- ntp broadcast**
- ntp peer**
- show ntp status**
- show ntp client**
- show ntp client server-list**
- show ntp server client-list**
- show ntp server status**
- show ntp keys**
- show ntp peers**
- show ntp server disabled-interfaces**

---

## ntp server

Specifies an NTP server from which the switch will receive updates.

**ntp server** {*ip\_address*} [**key** *keyid*] [**minpoll** *poll*] [**version** *version*] [**prefer**]

**no ntp server** {*ip\_address*}

---

### Syntax Definitions

<i>ip_address</i>	The IP address of the NTP server to be added or deleted to the client's server list.
<i>key id</i>	The key identification number that corresponds to the specified NTP server. The value ranges from 1 to 65534.
<i>poll</i>	It specifies the minimum polling interval for NTP message. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the minimum poll time would be 16 seconds ( $2^4 = 16$ ). The maximum poll interval is fixed at 10 (1,024 s). The minimum poll interval defaults to 6 (64 s), but can be decreased by the minpoll option to a lower limit of 4 (16 s), or increase to the maximum limit of 10.
<i>version</i>	The version of NTP being used. This will be 1, 2, 3, or 4.
<b>prefer</b>	Marks this server as the preferred server. A preferred server's timestamp will be used before another server.

### Defaults

Parameter	Default
<i>version</i>	4
<i>exponent</i>	6
<b>prefer</b>	not preferred

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to clear an NTP server from the list of configured servers.
- To configure NTP in the client mode you must first define the NTP servers. Up to 3 NTP servers may be defined.
- Either an IP address or domain name for the specified server can be entered.
- The NTP key identification is an integer. It corresponds to an MD5 authentication key contained in an authentication file (.txt) located on the server. This file must be on both the server and the local switch, and match, for authentication to work. Enter the key identification using the **key** keyword if the server is set to MD5 authentication.

- An authentication key is composed of a 32-bit integer and 32-byte string of characters. The integer format is hexadecimal. For an NTP message to be authenticated the NTP client authentication key must match the key configured at the NTP server. This means the authentication keys must be distributed in advance of configuring the NTP client. If authentication is disabled but authentication key is present, the association will still be unauthenticated.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered. Therefore, if 4 were entered, the minimum poll time would be 16 seconds ( $2^4 = 16$ ). The client will poll the server for a time update when the **minpoll** time is exceeded.

## Examples

```
-> ntp server 1.1.1.1
-> ntp server spartacus
-> ntp server 1.1.1.1 key 1
-> ntp server 1.1.1.1 version 4
-> ntp server spartacus minpoll 5
-> no ntp server 1.1.1.1
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**ntp client** Enables or disables NTP operation on the switch.

## MIB Objects

```
alaNtpConfig
  alaNtpPeerAddressType
  alaNtpPeerType
  alaNtpPeerAuth
  alaNtpPeerMinpoll
  alaNtpPeerVersion
  alaNtpPeerPrefer
  alaNtpPeerAddress
```

---

## ntp server synchronized

Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.

**ntp server synchronized**

---

### Syntax Definitions

N/A

### Defaults

By default, NTP synchronization is enabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The NTP protocol discards the NTP servers that are unsynchronized. However, the unsynchronized NTP servers are used as network time sources.

### Examples

```
-> ntp server synchronized
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

#### [ntp server unsynchronized](#)

Disables an NTP client from invoking tests for NTP server synchronization. This allows the NTP client to synchronize with unsynchronized NTP servers in the network.

### MIB Objects

alaNtpConfig

alaNtpPeerTests

---

## ntp server unsynchronized

Disables an NTP client from invoking tests for NTP server synchronization. This allows the NTP client to synchronize with unsynchronized NTP servers in the network.

**ntp server unsynchronized**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

When NTP peer synchronization tests are disabled, the NTP client is able to synchronize with either an NTP peer that is not synchronized with an atomic clock or a network of NTP servers that will finally synchronize with an atomic clock.

### Examples

```
-> ntp server unsynchronized
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ntp server synchronized](#)

Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.

### MIB Objects

alaNtpConfig

alaNtpPeerTests

---

## ntp client

Enables or disables NTP time synchronization discipline.

**ntp client admin-state {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables NTP.
<b>disable</b>	Disables NTP.

### Defaults

NTP protocol is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command to enable or disable NTP. Before NTP can be enabled, an NTP server must be specified using the [ntp server](#) command. Up to 3 NTP servers may be defined.
- It is not necessary to specify an NTP server if the NTP client will only receive time updates from NTP broadcast servers.

### Examples

```
-> ntp client enable
-> ntp client disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ntp server](#) Specifies an NTP server from which the switch will receive updates.

### MIB Objects

alaNtpEnable

---

## ntp src-ip preferred

Configures the source IP address field of the NTP source

```
ntp src-ip preferred {default | no-loopback0 | ip_address}
```

```
no ntp src-ip preferred
```

---

### Syntax Definitions

<b>default</b>	The Loopback0 address, if configured, will be used for the source IP address field. If no loopback0 is configured, the vlan configured IP interface on the switch will be used.
<b>no-loopback0</b>	The Loopback0 address should not be used for the source IP address field and the first available IP address on the switch should be used for this field. It takes the vlan configured IP even if the loopback0 is configured on the switch.
<i>ip_address</i>	The IP address to be used in the source IP field.

### Defaults

By default, the NTP source ip preferred setting is set to the **default** parameter.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When configuring a specific IP address, that address must already exist on the switch.
- Use the **no** form of this command to clear a specific IP address and change the behavior back to default.

### Examples

```
-> ntp src-ip preferred 192.168.10.1  
-> ntp src-ip preferred no-loopback0  
-> ntp src-ip preferred default
```

### Release History

Release 7.1.1; command was introduced

## ntp broadcast-client

Enables or disables the NTP client to receive time updates from NTP broadcast servers.

**ntp broadcast-client** {enable | disable}

---

### Syntax Definitions

<b>enable</b>	Enables the client broadcast mode.
<b>disable</b>	Disables the client broadcast mode.

### Defaults

Broadcast mode is disabled by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Broadcast mode is intended for operation on networks with numerous workstations and where the highest accuracy is not required. In a typical scenario, one or more time servers on the network broadcast NTP messages that are received by NTP hosts. Correct time is determined from this NTP message based on a pre-configured latency or broadcast delay in the order of a few milliseconds.
- In order to configure NTP in broadcast client mode, it is required to define the network server to client broadcast delay.

### Examples

```
-> ntp broadcast-client enable
-> ntp broadcast-client disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**ntp broadcast-delay** Sets the broadcast delay time in microseconds.

### MIB Objects

alaNtpBroadcastEnable

---

## ntp broadcast-delay

Sets the broadcast delay time in microseconds of received NTP broadcast messages.

**ntp broadcast-delay** *microseconds*

---

### Syntax Definitions

*microseconds*                      The number of microseconds for the broadcast delay.

### Defaults

parameter	default
<i>microseconds</i>	4000

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

When running in the NTP client broadcast mode, a broadcast delay must be set. The broadcast delay is the number of microseconds added to the timestamp received from a broadcast NTP server.

### Examples

```
-> ntp broadcast-delay 1000  
-> ntp broadcast-delay 10000
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ntp broadcast](#)                      Enables or disables the client's broadcast mode.

### MIB Objects

alaNtpBroadcastDelay

---

## ntp key

Labels the specified authentication key identification as trusted or untrusted.

**ntp key** *key* [**trusted** | **untrusted**]

---

### Syntax Definitions

<i>key</i>	The key number matching an NTP server.
<b>trusted</b>	Signifies that the specified key is trusted and can be used for authentication.
<b>untrusted</b>	Signifies that the specified key is not trusted and cannot be used for authentication. Synchronization will not occur with an untrusted authentication key.

### Defaults

By default, all authentication key are untrusted.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Authentication keys are stored in a key file and loaded into memory when the switch boots. The keys loaded into memory are not trusted until this command is used. The location of the file containing set of generated authentication keys is /flash/network/ntp.keys.
- Once the keys are loaded into software (on boot up of the switch), they must be activated by being labeled as trusted. A trusted key will authenticate with a server that requires authentication as long as the key matches the server key.
- New keys must be added manually to the key file. A newly added key will not be loaded into the switch software until the **ntp key load** command is issued, or the switch is rebooted.
- An authentication key is composed of a 32-bit integer and 32-byte string of characters. The integer format is hexadecimal. For an NTP message to be authenticated the NTP client authentication key must match the key configured at the NTP server. This means the authentication keys must be distributed in advance of configuring the NTP client. If authentication is disabled but authentication key is present, the association will still be unauthenticated.
- By default all keys read from the ntp.conf key file are untrusted therefore keys must be set to 'trusted' status to allow NTP to use the key for authentication.

### Examples

```
-> ntp key 5 trusted
-> ntp key 2 untrusted
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

- ntp key** Sets the public key the switch uses when authenticating with the specified NTP server.
- ntp client** Enables or disables NTP operation on the switch.

## MIB Objects

```
alaNtpAccessKeyIdTable  
  alaNtpAccessKeyIdKeyId  
  alaNtpAccessKeyIdTrust
```

---

## ntp key load

Loads the current key file into memory.

**ntp key load**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command reloads the key file into the switch memory. This allows for new keys in the key file to be added to the list of keys the switch can use for authentication.
- Newly added keys must be labeled as **trusted** with the **ntp key** command before being used for authentication.
- By default, all authentication keys are untrusted therefore reloading a key file will change any current trusted keys to untrusted status.
- The file ntp.keys is used during the establishment of a set of authentication keys that are used by the NTP protocol. The location of this file is fixed in directory /flash/network.

### Examples

```
-> ntp key load
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- |                   |   |
|-------------------|---|
| <b>ntp key</b>    | Labels the specified authentication key identification as trusted or untrusted. |
| <b>ntp server</b> | Specifies an NTP server from which this switch will receive updates.            |

### MIB Objects

alaNtpAccessRereadkeyFile

---

## ntp authenticate

Enables or disables the authentication on a configured NTP server.

**ntp authenticate {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables authentication for NTP server.
<b>disable</b>	Disables authentication for NTP server.

### Defaults

By default, NTP authentication is disabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command to enable or disable authentication for NTP server.
- Before NTP authentication is enabled, NTP operation should be enabled by using [ntp client](#) command.
- Before enabling the NTP operation, NTP server must be specified using the [ntp server](#) command.

### Examples

```
-> ntp authenticate enable  
-> ntp authenticate disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ntp status](#) Displays the information about the current NTP status.

### MIB Objects

alaNtpAuthenticate

---

## ntp master

Specifies the stratum value for unsynchronized switch to act as an authoritative NTP source.

**ntp master** *{stratum-number}*

---

### Syntax Definitions

*stratum-number* Integer value ranging from 2 to 16

### Defaults

Parameter	Default
<i>stratum-number</i>	16

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command to synchronize improved clocks with lower strata value if any of the trustworthy NTP sources comes up.
- Use default value of 16 if switch is not synchronized with itself.
- When the switch is synchronized, the stratum number should correspond to peer/server.

### Examples

```
-> ntp master 4
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ntp status](#) Displays current NTP status.

### MIB Objects

alaNtpConfig  
alaNtpSysStratum

---

## ntp interface

Enables or Disables NTP server functionality for an interface.

**ntp interface** {*interface-ip*} {**enable** | **disable**}

---

### Syntax Definitions

<i>interface-ip</i>	IP address of an interface on which NTP server functionality is to be disabled.
<b>enable</b>	Enables NTP server functionality on an interface.
<b>disable</b>	Disables NTP sever functionality on an interface.

### Defaults

By default, NTP server functionality is enabled on all the interfaces.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command to enable or disable the incoming NTP request.
- Disabling the NTP server functionality drops the NTP request on an interface and synchronization information is not sent out.

### Examples

```
-> ntp interface 10.10.10.1 disable
-> ntp interface 10.10.10.1 enable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ntp status](#) Displays current NTP status.

### MIB Objects

alaNtpAccessRestrictedTable  
alaNtpAccessRestrictedIpAddress

---

## ntp max-associations

Configures the maximum number of associations on the switch.

**ntp max-associations** *{number}*

---

### Syntax Definitions

*number* Maximum no of client/server and peer associations. Integer value ranging from 0 to 64.

### Defaults

By default, 32 associations are allowed on the switch.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command to restrict the number of client/server and peer association.
- The command can be used to change the default value of 32 to any value between 0 to 64.
- The command protects the switch from overwhelming with the NTP requests. When the limit is reached, trap is sent to indicate the switch.

### Examples

```
-> ntp max-associations 20
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show ntp status](#) Displays current NTP status.

### MIB Objects

alaNtpConfig  
alaNtpMaxAssociation

---

## ntp broadcast

Enables NTP to broadcast synchronized information to all the clients in the subnet in the configured interval.

**ntp broadcast** {*broadcast-addr*} [**version** *version*] [**minpoll** *poll interval*]

**no ntp broadcast** {*broadcast-addr*}

---

### Syntax Definitions

<i>broadcast-addr</i>	Subnet for which broadcast updates are regularly sent.
<i>version</i>	NTP version on which the broadcast updates are sent out on the subnet for the clients. Value is 3 or 4.
<i>poll interval</i>	Polling interval for NTP broadcast message. This value is measured in seconds.

### Defaults

Parameter	Default
<i>version</i>	4
<i>poll interval</i>	6

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command to configure NTP to act in broadcast server mode.
- Use the **no** form of this command to remove the configured broadcast servers. This also disables NTP synchronization information being sent for that broadcast subset.
- The NTP broadcast address needs to be defined to enable NTP broadcast mode. A maximum of 3 broadcast addresses can be configured.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered.

### Examples

```
-> ntp broadcast 10.145.59.255 version 4 minpoll 5
-> no ntp broadcast 10.145.59.255
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[ntp broadcast](#)

Enables or disables the client's broadcast mode.

[ntp broadcast-delay](#)

Sets the broadcast delay time in microseconds

## MIB Objects

alaNtpPeerTable

  alaNtpPeerType

  alaNtpPeerVersion

  alaNtpPeerMinpoll

---

## ntp peer

Configures NTP to operate in the symmetric active peering mode. This also enables the establishment of an active symmetric association with the specified remote peer.

**ntp peer** {*ip-address*} [**key** *keyid*] [**version** *version*] [**minpoll** *poll interval*]

**no ntp peer** {*ip-address*}

---

### Syntax Definitions

<i>ip-address</i>	IP address of the remote peer.
<i>key-id</i>	Authentication key for the remote peer.
<i>version</i>	NTP packet version to be used for the peer association.
<i>poll interval</i>	Polling interval for NTP broadcast message. Poll interval which when expires, packets will be sent to the peer.

### Defaults

Parameter	Default
<i>version</i>	4
<i>poll interval</i>	6

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use **no** form of this command to remove the peers that are configured to act in symmetric active mode. This command deletes the symmetric active association with the remote peer.
- Use the **version** keyword to set the correct version of NTP.
- Use the **minpoll** keyword to set the minimum poll time for the server. This number is determined by raising 2 to the power of the number entered.
- The command should not be used for b(Broadcast), m(Multicast) or r(Reference clock address 127.127.x.x)
- *ip-address* is the mandatory parameter to be entered in the command while key id is the optional parameter. If key id is not specified, then peering will not be authenticated.

### Examples

```
-> ntp peer 172.18.16.112
-> no ntp peer 172.18.16.112
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[show ntp peers](#) Displays current NTP peer association.

## MIB Objects

```
alaNtpPeerTable  
  alaNtpPeerType  
  alaNtpPeerAuth  
  alaNtpPeerVersion  
  alaNtpPeerMinpoll
```

---

## show ntp status

Displays the information about the current NTP status.

**show ntp status**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command displays the information about the status of NTP, which is configured along with other global configuration. See the Examples section for more information.
- If the source IP Configuration is done in default or no-loopback0 then the source ip-address will not be displayed in the output of the **show ntp status** command.

### Example

```
-> show ntp status
Current time           : Tue APR 29 2003   18:48:01 (UTC),
Last NTP update       : Tue APR 29 2003   18:44:15 (UTC),
Server reference:     : 0.0.0.0,
Client mode           : enabled,
Broadcast client mode : disabled,
Broadcast mode delay (microseconds) : 4000,
Server qualification  : synchronized,
Stratum               : 16,
Max-Associations      : 32,
Authentication        : disabled,
Source IP Configuration : Preferred,
Source IP             : 10.145.15.15
```

### *output definitions*

---

<b>Current time</b>	The current time for the NTP client.
<b>Last NTP update</b>	The time of the last synchronization with an NTP server.
<b>Client mode</b>	Whether the NTP client software is enabled or disabled.
<b>Broadcast client mode</b>	What NTP mode the client is running in, either client or broadcast.
<b>Broadcast delay</b>	The number of microseconds in the advertised broadcast delay time. This field is absent if the client broadcast mode is disabled.

---

<b>server qualification</b>	Server qualification status.
<b>Stratum</b>	The stratum of the server. The stratum number is the number of hops from a UTC time source.
<b>Max-Association</b>	Maximum association on the switch that restricts the number of client/server and peer association
<b>Authentication</b>	Whether Authentication is enabled or disabled
<b>Source IP Configuration</b>	Source IP Configuration type which is configured.
<b>Source IP</b>	Source IP address for NTP that send updates to clients.

---

## Release History

Release 7.1.1; command was introduced.

## Related Command

<a href="#">ntp client</a>	Enables or disables NTP operation on the switch.
<a href="#">ntp server</a>	Specifies an NTP server from which the switch will receive updates
<a href="#">ntp server synchronized</a>	Enables an NTP client to invoke tests for NTP server synchronization as specified by the NTP protocol.
<a href="#">ntp max-associations</a>	Configures the maximum number of associations on the switch.
<a href="#">ntp master</a>	Specifies the stratum value for unsynchronized switch
<a href="#">ntp broadcast</a>	Enables or disables the client's broadcast mode.
<a href="#">show ntp client</a>	Displays information about the current client NTP configuration.
<a href="#">show ntp client server-list</a>	Displays a list of the servers with which the NTP client synchronizes
<a href="#">show ntp server client-list</a>	Displays the basic server information for a specific NTP server or a list of NTP servers

## MIB Objects

```

---

## show ntp client

Displays information about the current client NTP configuration.

```
show ntp client
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays the current configuration parameters for the NTP client. The display is slightly different depending on what has been configured on the client. See the Examples section for more information.

### Examples

```
-> show ntp client
Current time           : SAT APR 16 2005 00:19:02 (UTC)
Last NTP update       : SAT APR 16 2005 00:06:45 (UTC)
Client mode           : enabled
Broadcast client mode : disabled
Broadcast delay (microseconds): 4000
```

#### *output definitions*

---

<b>Current time</b>	The current time for the NTP client.
<b>Last NTP update</b>	The time of the last synchronization with an NTP server.
<b>Client mode</b>	Whether the NTP client software is enabled or disabled.
<b>Broadcast client mode</b>	What NTP mode the client is running in, either client or broadcast.
<b>Broadcast delay</b>	The number of microseconds in the advertised broadcast delay time. This field is absent if the client broadcast mode is disabled.
<b>Server Qualification</b>	Indicates whether they server must be synchronized or not.

## show ntp client server-list

Displays a list of the servers with which the NTP client synchronizes.

```
show ntp client server-list
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use this command to display tabular information on the current NTP client to server association status.

### Examples

```
-> show ntp client server-list
IP Address      Ver  Key  St   Delay      Offset      Disp
=====+====+=====+====+=====+=====+=====
*198.206.181.70  4    0   2    0.167      0.323      0.016
=198.206.181.123 4    0  16    0.000      0.000      0.000
```

### *output definitions*

---

<b>IP Address</b>	The server IP address. "+" indicates an active peer "-" indicates a pasive peer "=" indicates a client "*" indicates current system peer "^" indicates a broadcast server "\" indicates a broadcast client
<b>Ver</b>	The version of NTP the server is using. Versions 3 and 4 are valid.
<b>Key</b>	The NTP server's public key. This must be accurate and the same as the NTP server, or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
<b>St</b>	The stratum of the server.
<b>Delay</b>	The delay received from the server in its timestamp.
<b>Offset</b>	The offset received from the server in its timestamp.
<b>Disp</b>	The dispersion value received from the server in its timestamp.

## show ntp server status

Displays the basic server information for a specific NTP server or a list of NTP servers.

**show ntp server status** [*ip\_address*]

---

### Syntax Definitions

*ip\_address*                      The IP address of the NTP server to be displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command displays information on the status of any or all configured NTP servers/peers.
- To display a specific server, enter the command with the server's IP address. To display all servers, enter the command with no server IP address.

### Examples

```
-> show ntp server status
IP address      = 172.18.16.147,
Host mode       = server,
Peer mode       = unspec,

Bad authentication = 0,
Bad dispersion  = 0,
Last Event      = peer changed to reachable,
```

*output definitions*

---

<b>IP address</b>	The server IP address.
<b>Host mode</b>	The host mode of this remote association.
<b>Peer mode</b>	The peer mode of this remote association.
<b>Prefer</b>	Whether this server is a preferred server or not. A preferred server is used to synchronize the client before a non-preferred server.
<b>Version</b>	The version of NTP the server is using. Versions 3 and 4 are valid.
<b>Key</b>	The NTP server's public key. This must be accurate and the same as the NTP server, or the client switch will not be able to synchronize with the NTP server. A zero (0) means there is no key entered.
<b>Stratum</b>	The stratum of the server. The stratum number is the number of hops from a UTC time source.
<b>Minpoll</b>	The minimum poll time. The client will poll the server for a time update every time this limit has been exceeded.
<b>Maxpoll</b>	The maximum poll time.
<b>Delay</b>	The delay received from the server in its timestamp.
<b>Offset</b>	The offset received from the server in its timestamp.
<b>Dispersion</b>	The dispersion value received from the server in its timestamp.
<b>Root distance</b>	The total round trip delay (in seconds) to the primary reference source.
<b>Precision</b>	The advertised precision of this association.
<b>Reference IP</b>	The IP address identifying the peer's primary reference source.
<b>Status</b>	The peer selection and association status.
<b>Uptime count</b>	The time period (in seconds) during which the local NTP server was associated with the switch.
<b>Reachability</b>	The reachability status of the peer.
<b>Unreachable count</b>	Number of times the NTP entity was unreachable.
<b>Stats reset count</b>	The time delay (in seconds) since the last time the local NTP server was restarted.
<b>Packets sent</b>	Number of packets sent.
<b>Packets received</b>	Number of packets received.
<b>Duplicate packets</b>	Number of duplicated packets received.
<b>Bogus origin</b>	Number of bogus packets.
<b>Bad authentication</b>	Number of NTP packets rejected for not meeting the authentication standards.
<b>Bad dispersion</b>	Number of bad dispersions.
<b>Last Event</b>	The last event.

## show ntp keys

Displays information about all authentication keys.

**show ntp keys**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command displays the information on the current set of trusted authentication keys.

### Examples

```
-> show ntp keys
Key      Status
=====+=====
1        untrusted
2        untrusted
3        trusted
4        trusted
5        untrusted
6        untrusted
7        trusted
8        trusted
```

### *output definitions*

---

<b>Key</b>	The key number corresponding to a key in the key file.
<b>Status</b>	Whether the key is trusted or untrusted.

---

### Release History

Release 7.1.1; command was introduced.

**Related Command**

- ntp key** Labels the specified authentication key identification as trusted or untrusted.
- ntp key load** Loads the current key file into memory.

# 44 Session Management Commands

Session Management commands are used to monitor and configure operator sessions including FTP, Telnet, HTTP (WebView), console, Secure Shell, and Secure Shell FTP on the switch. (See the SNMP Commands chapter for SNMP session commands.) Maximum number of concurrent sessions allowed:

	OmniSwitch 10K
<b>Telnet(v4)</b>	4
<b>FTP(v4)</b>	4
<b>SSH + SFTP(v4)</b>	8
<b>HTTP</b>	4

MIB information for commands in this chapter are as follows:

*Filename:* AlcatelInd1SessionMgr.mib  
*Module:* AlcatelIND1SessionMgrMIB

*Filename:* AlcatelIND1AAA.mib  
*Module:* Alcatel-IND1-AAA-MIB

*Filename:* AlcatelIND1System.mib  
*Module:* Alcatel-IND1ConfigMgr.mib

*Filename:* AlcatelIND1Ssh.mib  
*Module:* ALCATEL-IND1-SSH-MIB

A summary of the available commands is listed here:

---

- session login-attempt**
- session login-timeout**
- session banner**
- session timeout**
- session prompt**
- session xon-xoff**
- show prefix**
- user profile save**
- user profile reset**
- history**
- command-log**
- kill**
- exit**
- who**
- whoami**
- show session config**
- show session xon-xoff**
- more**
- telnet**
- ssh**
- ssh enforce-pubkey-auth**
- show command-log status**

---

## session login-attempt

Sets or resets the number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

**session login-attempt** *integer*

---

### Syntax Definitions

*integer*

The number of times the user can attempt to log in to the switch before the TCP connection is closed. Valid range is 1 to 10.

### Defaults

Default is 3 login attempts.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> session login-attempt 5
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show session config](#)

Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

[session login-timeout](#)

Sets or resets the amount of time the user can take to accomplish a successful login to the switch.

[session timeout](#)

Configures the inactivity timer for a CLI, HTTP (including Web-View), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

### MIB Objects

sessionMgr

sessionLoginAttempt

---

## session login-timeout

Sets or resets the amount of time the user can take to accomplish a successful login to the switch. If the timeout period is exceeded, the TCP connection is closed by the switch.

**session login-timeout** *seconds*

---

### Syntax Definitions

*seconds*

The number of seconds the switch allows for the user to accomplish a successful login. Valid range is from 5 to 600 seconds.

### Defaults

Login timeout default is 55 seconds.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> session login-timeout 30
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show session config](#)

Displays Session Manager information such as banner file name, session timeout value, default prompt value, login timer, and login attempt number.

[session login-attempt](#)

Sets or resets the number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

[session timeout](#)

Configures the inactivity timer for a CLI, HTTP (including Web-View), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

### MIB Objects

sessionMgr

    sessionLoginTimeout

---

## session banner

Sets or resets the file name of the user-defined banner. The banner is a welcome banner that appears after the user successfully logs onto the switch.

**session** {cli | ftp | http} banner *file\_name*

**no session** {cli | ftp | http} banner

---

### Syntax Definitions

<b>cli</b>	Creates/modifies the CLI banner file name.
<b>ftp</b>	Creates/modifies the FTP banner file name.
<b>http</b>	Creates/modifies the HTTP banner file name.
<i>file_name</i>	Banner file name including the path from the switch's /flash directory. The maximum length of the filename and path is 255 characters.

### Defaults

- A default banner is included in one of the switch's image files. It is automatically displayed at login so no configuration is needed.
- The user has the option of defining a custom supplementary banner or of using the default banner.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The **no session banner** command is used to disable a user defined session banner file from displaying when you log onto the switch.
- The **session banner** command is used to configure or modify the banner file *name*. You must use a text editor to edit the file containing the banner text.

### Examples

```
-> session cli banner /switch/banner.txt
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [show session config](#)

Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

## MIB Objects

SessionConfigTable

  SessionType

  SessionBannerFileName

---

## session timeout

Configures the inactivity timer for a CLI, HTTP (including WebView), or FTP interface. When the switch detects no user activity for this period of time, the user is logged off the switch.

```
session {cli | http | ftp} timeout minutes
```

---

### Syntax Definitions

<b>cli</b>	Sets the inactivity timeout for CLI sessions.
<b>http</b>	Sets the inactivity timeout for HTTP sessions.
<b>ftp</b>	Sets the inactivity timeout for FTP sessions.
<i>minutes</i>	Inactivity timeout value (in minutes). Valid range 1 to 596523.

### Defaults

---

<b>parameter</b>	<b>default</b>
<i>minutes</i>	4

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The inactivity timer value may be different for each type of interface, such as CLI (Console, Telnet), HTTP (including WebView), and FTP.
- If you change the timer, the new value does not affect current sessions; the new timer is applied to new sessions only.

### Examples

```
-> session cli timeout 5
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### [show session config](#)

Displays Session Manager information, such as banner file name, session timeout value, and default prompt value.

## MIB Objects

SessionConfigTable

  SessionType

  SessionInactivityTimerValue

---

## session prompt

Configures the default CLI prompt for console and Telnet sessions. The prompt is the symbol and/or text that appears on the screen in front of the cursor.

**session prompt default** [*string*]

---

### Syntax Definitions

*string* Prompt string. Maximum length 31 characters.

### Defaults

parameter	default
<i>string</i>	->

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The new prompt will not take effect until you log off and back onto the switch.

### Examples

```
-> session prompt default -->
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show session config](#) Displays Session Manager information such as banner file name, session timeout value, and default prompt value.

### MIB Objects

SessionConfigTable  
SessionType  
sessionDefaultPromptString

---

## session xon-xoff

Enables/disables the XON-XOFF protocol on the console port.

```
session xon-xoff {enable | disable}
```

---

### Syntax Definitions

*enable* Enables XON-XOFF on the console port.

*disable* Disables XON-XOFF on the console port.

### Defaults

parameter	default
enable / disable	disable

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The switch may interpret noise from an RS232 line as Control-S (XOFF). If the **session console xon-xoff** command is enabled, traffic to the console port may be stopped.

### Examples

```
-> session xon-xoff enable
-> session xon-xoff disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show session xon-xoff** Displays whether the console port is enabled or disabled for XON-XOFF.

### MIB Objects

sessionXonXoffEnable

---

## show prefix

Shows the command prefix (if any) currently stored by the CLI. Prefixes are stored for command families that support the prefix recognition feature.

`show prefix`

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Prefixes are stored for command families that support the prefix recognition feature. These command families include AAA, Interface, Link Aggregation, QoS, Spanning Tree, and VLAN Management. Other command families do not store a prefix.

### Examples

```
-> show prefix
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show prefix](#)

This command defines the format of the CLI prompt. The prompt can be defined to include the command prefix.

### MIB Objects

N/A

---

## user profile save

Saves the user account settings for prompts and the more mode screen setting. These settings will be automatically loaded when the user account logs on.

user profile save

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command to save prompt definitions and more mode screen settings for use in future login sessions for the current user account.
- Use the **user profile reset** command to set values to their factory defaults.

### Examples

```
-> user profile save
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

- |                                    |  |
|------------------------------------|--|
| <a href="#">show prefix</a>        | Defines substitute command text for the switch's CLI command keywords. |
| <a href="#">user profile reset</a> | Resets the alias, prompt and more values to their factory defaults.    |

### MIB Objects

N/A

---

## user profile reset

Resets the alias, prompt, and more values to their factory defaults.

**user profile reset**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> user profile reset
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">show prefix</a>	Defines substitute command text for the switch's CLI command keywords.
<a href="#">user profile save</a>	Saves the user account settings for aliases, prompts and the more screen.

### MIB Objects

N/A

---

**!**

Recalls commands listed in the history buffer and displays them at the CLI prompt.

!{! | *n*}

---

## Syntax Definitions

- !** Recalls the last command listed in the history buffer and displays that command at the CLI prompt.
- n*** Identifies a single command in the history buffer by number and displays that command at the CLI prompt.

## Defaults

N/A

## Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- You can use the **history** command to list all commands in the history buffer, then use the **!*n*** syntax to issue a single command from the list.
- When you use **!*n*** or **!!** to recall a command in the history buffer list, you must press the Enter key to execute the command.

## Examples

```
-> history
1* show ip interface
2 show vlan
3 show arp
4 clear arp
->!2
show vlan
vlan  type  admin  oper  ip    mtu   name
-----+-----+-----+-----+-----+-----+-----
   1   std    Ena    Ena   Dis   1500  VLAN 1
  10   std    Ena    Ena   Ena   1500  VLAN 10
  12   std    Ena    Ena   Ena   1500  VLAN 12
  14   std    Ena    Ena   Ena   1500  VLAN 14
  30   vip    Ena    Ena   Ena   1500  VIP VLAN 30
  40   vip    Ena    Ena   Ena   1500  VIP VLAN 40
4094  mcm    Ena    Ena   Dis   9198  MCM IPC
```

## Release History

Release 7.1.1; command was introduced.

**Related Commands****history**

Sets the number of commands that will be stored in the CLI's history buffer.

**MIB Objects**

N/A

---

## command-log

Enables or disables command logging on the switch. When command logging is enabled, a **command.log** is automatically created; this file stores a comprehensive CLI command history for all active sessions since the function was *first* enabled.

**command-log** {enable | disable}

---

### Syntax Definitions

<b>enable</b>	Creates a file called <b>command.log</b> in the switch's <b>/flash</b> directory. Any configuration commands entered on the command line will be recorded to this file until command logging is disabled.
<b>disable</b>	Disables logging of current session commands to the <b>command.log</b> file.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The maximum log file size is 66,402 bytes; the file may hold up to 100 commands.

### Examples

```
-> command-log enable
-> command-log disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">show command-log</a>	Displays the contents of the <b>command.log</b> file.
<a href="#">show command-log status</a>	Shows the current status of the command logging function (i.e., enabled or disabled).

### MIB Objects

sessionCliCommandLogEnable

---

## kill

Kills an active session. The command takes effect immediately.

**kill** *session\_number*

---

### Syntax Definitions

*session\_number*                      Number of the session you want to kill.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **who** command to obtain the session number variable.
- You cannot kill your own session.
- You cannot kill a connected session where the user has not yet completed the login process. These sessions appear with username “(at login)” when displayed with the **who** command.

### Examples

```
-> kill 3
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**who**                                      Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP)

### MIB Objects

SessionMgr  
    sessionIndex  
    sessionRowStatus

---

## exit

Ends the current CLI session. If the CLI session to the switch was via Telnet, the connection is closed.

exit

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> exit
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**kill** Kills an active session. The command takes effect immediately.

### MIB Objects

```
SessionMgr  
  sessionIndex  
  sessionRowStatus
```

---

## whoami

Displays the current user session.

**whoami**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the **who** command to display all sessions on the switch.

### Examples

```
-> whoami
Session number = 5
  User name      = admin,
  Access type    = telnet,
  Access port    = NI,
  IP address     = 121.251.17.76,
  Read-only domains = None,
  Read-only families = ,
  Read-Write domains = All ,
  Read-Write families = ,
```

### *output definitions*

---

<b>Session Number</b>	The session number assigned to the user.
<b>User name</b>	User name.
<b>Access type</b>	Type of access protocol used to connect to the switch.
<b>Access port</b>	Switch port used for access during this session.
<b>Ip Address</b>	User IP address.
<b>Read-only domains</b>	The command domains available with the user's read-only access.
<b>Read-only families</b>	The command families available with the user's read-only access.
<b>Read-Write domains</b>	The command domains available with the user's read-write access.
<b>Read-Write families</b>	The command families available with the user's read-write access.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**who**

Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP).

**kill**

Kills another user's session.

**MIB Objects**

## SessionActive

- sessionIndex
- sessionAccessType
- sessionPhysicalPort
- sessionUserName
- sessionUserReadPrivileges
- sessionUserWritePrivileges
- sessionUserProfileNumber
- sessionUserIpAddress
- sessionRowStatus

---

## who

Displays all active login sessions (e.g., Console, Telnet, FTP, HTTP).

**who**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

You can identify your current login session by using IP address.

### Examples

```

-> who
Session number = 0
  User name   = (at login),
  Access type = console,
  Access port = Local,
  IP address  = 0.0.0.0,
  Read-only domains = None,
  Read-only families = ,
  Read-Write domains = None,
  Read-Write families = ,

Session number = 5
  User name   = admin,
  Access type = telnet,
  Access port = NI,
  IP address  = 128.251.17.176,
  Read-only domains = None,
  Read-only families = ,
  Read-Write domains = All ,
  Read-Write families = ,

```

### *output definitions*

---

<b>Session Number</b>	The session number assigned to the user.
<b>User name</b>	User name.
<b>Access type</b>	Type of access protocol used to connect to the switch.
<b>Access port</b>	Switch port used for access during this session.

*output definitions (continued)*

---

<b>Ip Address</b>	User IP address.
<b>Read-only domains</b>	The command domains available with the user's read-only access.
<b>Read-only families</b>	The command families available with the user's read-only access.
<b>Read-Write domains</b>	The command domains available with the user's read-write access.
<b>Read-Write families</b>	The command families available with the user's read-write access.

---

Possible values for command domains and families are listed here:

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<b>whoami</b>	Displays current user session.
<b>kill</b>	Kills another user's session.

**MIB Objects**

```

```

---

## show session config

Displays session manager configuration information (e.g., default prompt, banner file name, inactivity timer, login timer, and login attempts).

**show session config**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Use the configuration commands detailed in this section to modify any of the values displayed.

### Examples

```
-> show session config
```

```
Cli Default Prompt           = ->
Cli Banner File Name        = ,
Cli Inactivity Timer in minutes = 60
Ftp Banner File Name        = ,
Ftp Inactivity Timer in minutes = 60
Http Inactivity Timer in minutes = 60
Login Timer in seconds       = 60
Maximum number of Login Attempts = 2
```

#### *output definitions*

---

<b>Cli Default Prompt</b>	Default prompt displayed for CLI sessions.
<b>Cli Banner File Name</b>	Name of the file that contains the banner information that will appear during a CLI session.
<b>Cli Inactivity Timer in minutes</b>	Inactivity timer value (in minutes) for CLI sessions. The user is logged off when this value is exceeded.
<b>Ftp Banner File Name</b>	Name of the file that contains the banner information that will appear during an FTP session.
<b>Ftp Inactivity Timer in minutes</b>	Inactivity timer value (in minutes) for FTP sessions. The user is logged off when this value is exceeded.
<b>Http Inactivity Timer in minutes</b>	Inactivity timer value (in minutes) for HTTP (including WebView) sessions. The user is logged off when this value is exceeded.

---

*output definitions (continued)*

---

<b>Login Timer in seconds</b>	The amount of time the user can take to accomplish a successful login to the switch. If the timeout period is exceeded, the TCP connection is closed by the switch.
<b>Maximum number of Login Attempts</b>	The number of times a user can attempt unsuccessfully to log into the switch before the TCP connection is closed.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<a href="#">session prompt</a>	Configures the default CLI prompt for console and Telnet sessions.
<a href="#">session banner</a>	Sets the file name of the user-defined banner.
<a href="#">session timeout</a>	Configures the inactivity timer for a CLI, HTTP (including Web-View), or FTP interface.
<a href="#">session login-attempt</a>	Sets the number of times a user can attempt to log into the switch unsuccessfully before the TCP connection is closed.
<a href="#">session login-timeout</a>	Sets the amount of time the user can take to accomplish a successful login to the switch.

**MIB Objects**

```
SessionConfigTable  
  sessionType  
  sessionBannerFileName  
  sessionInactivityTimerValue  
  sessionDefaultPromptString
```

---

## show session xon-xoff

Displays whether the console port is enabled or disabled for XON-XOFF.

**show session xon-xoff**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The switch may interpret noise from an RS232 line as Control-S (XOFF). If the console port is enabled for XON-XOFF (through the [session xon-xoff](#) command), traffic to the console port may be stopped.

### Examples

```
-> show session xon-xoff
XON-XOFF Enabled
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[session xon-xoff](#) Enables/disables the XON-XOFF protocol on the console port.

### MIB Objects

```
sessionXonXoffEnable
```

---

## telnet

Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

```
telnet {port [default | service_port] | admin-state [enable | disable] | host_name | ip_address}
```

---

### Syntax Definitions

<b>default</b>	Sets the port back to the default of 23.
<i>service_port</i>	The TCP service port number. Must be 23 or between 20000-20999.
<b>enable   disable</b>	Enables or disables FTP access.
<i>host_name</i>	Specifies the host name for the Telnet session.
<i>ip_address</i>	Specifies the IPv4 or IPv6 address for the Telnet session.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The default directory for Telnet is **/flash**.

### Examples

```
-> telnet port 20999
-> telnet admin-state disable
-> telnet 172.17.6.228
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[ssh](#) Invokes the Secure Shell on the switch. A Secure Shell is used to make a secured connection to a remote system or device.

### MIB Objects

```
SystemServices
  systemServicesArg1
  systemServicesAction
```

---

## ssh

Invokes Secure Shell on the switch. Secure Shell is used to make a secured connection to a remote system or device.

```
ssh {port [default | service_port] | admin-state [enable | disable] | host_name | ip_address}
```

---

### Syntax Definitions

<b>default</b>	Sets the port back to the default of 23.
<i>service_port</i>	The TCP service port number. Must be 23 or between 20000-20999.
<b>enable   disable</b>	Enables or disables FTP access.
<i>host_name</i>	Specifies the host name for Secure Shell.
<i>ip_address</i>	Specifies the IPv4 or IPv6 address for Secure Shell.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- You must have a valid username and password for the specified host.

### Examples

```
-> ssh port 20000
-> ssh admin-state disable
-> ssh 172.155.11.211
login as:
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### **telnet**

Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

### **ssh enforce-pubkey-auth**

Invokes Secure Shellv6 on the switch. Secure Shellv6 is used to make a secured connection to an SSHv6 server.

### **show command-log**

Displays the status of Secure Shell, SCP/SFTP on the switch.

## MIB Objects

aaaAcctSatable

    aaacsInterface

alaSshConfigGroup

    alaSshAdminStatus

---

## ssh enforce-pubkey-auth

Enables or disables Secure Shell public key and password authentication. When enabled, password authentication is not allowed.

`ssh enforce-pubkey-auth {enable | disable}`

---

### Syntax Definitions

<b>enable</b>	Enforces only SSH public key authentication.
<b>disable</b>	Enforces both SSH public key and password authentication.

### Defaults

---

parameter	default
enable   disable	disable

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> ssh enforce-pubkey-auth enable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[telnet](#) Invokes a Telnet session. A Telnet session is used to connect to a remote system or device.

### MIB Objects

alaSshConfigGroup  
alaSshPubKeyEnforceAdminStatus

---

## show command-log

Displays the contents of the **command.log** file. This file contains a record of all CLI commands executed on the switch since the command logging function was enabled. For more information on enabling and disabling command logging, refer to [page 44-17](#).

**show command-log**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The most recent commands are listed first.
- The command history is archived to the **command.log** file. If this file is removed, the command history will no longer be available. In addition, the **command.log** file has a 66,402 byte capacity. This capacity allows up to 100 commands; if the maximum capacity is reached, only the 100 most recent commands display.

### Examples

```
-> show command-log
Command : ip interface Marketing address 17.11.5.2 vlan 255
  UserName : admin
  Date    : FRI JAN 09 00:20:01
  Ip Addr : 128.251.19.240
  Result  : SUCCESS

Command : ip interface "Distribution" 11.255.14.102 vlan 500 local-proxy-arp
  UserName : admin
  Date    : FRI JAN 09 00:19:44
  Ip Addr : 128.251.19.240
  Result  : ERROR: Ip Address must not belong to IP VLAN 44 subnet

Command : command-log enable
  UserName : admin
  Date    : FRI JAN 09 00:18:49
  Ip Addr : 128.251.19.240
  Result  : SUCCESS
```

---

*output definitions*

---

<b>Command</b>	The exact syntax of the command, as entered by the user.
<b>UserName</b>	The name of the user session that entered the command. For more information on different user session names, refer to the <a href="#">user command on page 31-21</a> , or the “Managing Switch User Accounts” chapter in the <i>Switch Management Guide</i> .
<b>Date</b>	The date and time, down to the second, when the command was entered.
<b>IpAddr</b>	The IP address of the terminal from which the command was entered.
<b>Result</b>	The outcome of the command entry. Options include <b>SUCCESS</b> and <b>ERROR</b> . For erroneous command entries, the same error details presented by the switch at the time the command was entered are also displayed in the log file.

---

**Release History**

Release 7.1.1; command was introduced.

**Related Commands**

<a href="#">command-log</a>	Enables or disables command logging on the switch.

# 45 File Management Commands

This chapter includes descriptions for CLI commands used to manage files on the switch. Several of these commands are used to create, move, and delete both files and directories in the OmniSwitch flash directory. Other commands allow you to change command privileges and to monitor the memory usage on the switch.

MIB information for the system commands is listed here:

*Filename:* AlcatelIND1System.mib  
*Module:* ALCATEL-IND1-SYSTEM-MIB

*Filename:* AlcatelIND1Chassis.mib  
*Module:* ALCATEL-IND1-CHASSIS-MIB

*Filename:* AlcatelIND1Ssh.mib  
*Module:* ALCATEL-IND1-SSH-MIB

A summary of the available commands is listed here:

---

<b>File System</b>	<b>cd</b> <b>pwd</b> <b>mkdir</b> <b>rmdir</b> <b>ls</b> <b>rm</b> <b>cp</b> <b>scp</b> <b>mv</b> <b>chmod</b> <b>freespace</b> <b>fsck</b> <b>newfs</b> <b>rcp</b> <b>rrm</b> <b>rls</b>
<b>System Services</b>	<b>vi</b> <b>tty</b> <b>show tty</b> <b>tftp</b> <b>sftp</b> <b>ftp</b>

---

## cd

Changes the current working directory of the switch.

**cd** [*path*]

---

### Syntax Definitions

*path*

Specifies the path to the working directory. If no path is specified, the current directory of the switch is changed to the higher directory level.

### Defaults

The default working directory of the switch is **/flash**.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Separate the multiple directory names that are part of the path with a slash (/).

### Examples

```
-> cd
-> cd /flash/certified
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<b>pwd</b>	Displays the current working directory of the switch.
<b>mkdir</b>	Creates a new directory.
<b>rmdir</b>	Deletes an existing directory.
<b>ls</b>	Displays the contents of a specified directory or the current working directory.
<b>rm</b>	Deletes the contents of a specified directory or the current working directory.

### MIB Objects

```
systemServices
  systemServicesWorkingDirectory
```

---

## pwd

Displays the current working directory of the switch.

**pwd**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The **pwd** command can also be used on the secondary CMM.

### Examples

```
-> pwd  
/flash
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

<b>cd</b>	Changes the current working directory of the switch.
<b>mkdir</b>	Creates a new directory.
<b>rmdir</b>	Deletes an existing directory.
<b>ls</b>	Displays the contents of a specified directory or the current working directory.
<b>rm</b>	Deletes the contents of a specified directory or the current working directory.

### MIB Objects

```
systemServices  
  systemServicesWorkingDirectory
```

---

## mkdir

Creates a new directory.

**mkdir** [*options*] [*path*] /*dirname*

---

### Syntax Definitions

<i>options</i>	Use the '?' on the command line for a list of options.
<i>path</i>	The path or location in which the new directory is to be created. If no path name is specified, the new directory is created in the current directory.
<i>dirname</i>	A user-defined name for the new directory.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Separate the directory names that are part of the path with a slash (/). Refer to the examples below.
- The **mkdir** command can also be used on the secondary CMM.

### Examples

```
-> mkdir test_directory
-> mkdir flash/test_directory
-> mkdir
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

Usage: mkdir [OPTIONS] DIRECTORY...

Create DIRECTORY

Options:

-m	Mode
-p	No error if exists; make parent directories as needed

### Release History

Release 7.1.1; command introduced.

**Related Commands**

<b>cd</b>	Changes the current working directory of the switch.
<b>pwd</b>	Displays the current working directory of the switch.
<b>rmdir</b>	Deletes an existing directory.
<b>ls</b>	Displays the contents of a specified directory or the current working directory.
<b>rm</b>	Deletes the contents of a specified directory or the current working directory.

**MIB Objects**

```
systemServices
  systemServicesArg1
  systemServicesAction
```

---

## rmdir

Deletes an existing directory.

**rmdir** [*options*] *dirname*

---

### Syntax Definitions

*options*                                    Use the '?' on the command line for a list of options.  
*dirname*                                    The name of the existing directory to be removed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Separate the directory names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

### Examples

```
-> rmdir ./working
-> rmdir flash/working
-> rmdir ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: rmdir [OPTIONS] DIRECTORY...
```

```
Remove DIRECTORY if it is empty
```

```
Options:
```

```
  -p|--parents      Include parents
  --ignore-fail-on-non-empty
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

<code>cd</code>	Changes the current working directory of the switch.
<code>pwd</code>	Displays the current working directory of the switch.
<code>mkdir</code>	Creates a new directory.
<code>ls</code>	Displays the contents of a specified directory or the current working directory.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

---

## ls

Displays the contents of a specified directory or the current working directory.

**ls** [*options*] [*path/filename*]

---

### Syntax Definitions

*options*                                    Use the '?' on the command line for a list of options.  
*filename*                                 Specifies the file or directory path.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Separate the multiple directory names that are part of the path with a slash (/).

### Examples

```
-> ls
-> ls -l /flash/certified
-> ls ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: ls [-lAacCdFilnpLRrSsTtuvwxXhk] [FILE]...
```

List directory contents

Options:

```
-l      List in a single column
-A      Don't list . and ..
-a      Don't hide entries starting with .
-C      List by columns
-c      With -l: sort by ctime
--color[={always,never,auto}] Control coloring
-d      List directory entries instead of contents
-e      List full date and time
-F      Append indicator (one of */=@|) to entries
-i      List inode numbers
-l      Long listing format
-n      List numeric UIDs and GIDs instead of names
-p      Append indicator (one of */=@|) to entries
-L      List entries pointed to by symlinks
-R      Recurse
-r      Sort in reverse order
-S      Sort by file size
-s      List the size of each file, in blocks
-T N    Assume tabstop every N columns
```

-t With -l: sort by modification time  
-u With -l: sort by access time  
-v Sort by version  
-w N Assume the terminal is N columns wide  
-x List by lines  
-X Sort by extension  
-h List sizes in human readable format (1K 243M 2G)

## Release History

Release 7.1.1; command introduced.

## Related Commands

<b>cd</b>	Changes the current working directory of the switch.
<b>pwd</b>	Displays the current working directory of the switch.
<b>mkdir</b>	Creates a new directory.
<b>rmdir</b>	Deletes an existing directory.
<b>rm</b>	Displays the contents of a specified directory or the current working directory.

## MIB Objects

systemServices  
  systemServicesArg1  
  systemServicesAction

---

## rm

Permanently deletes an existing file.

**rm** [*options*] [*path/filename*]

---

### Syntax Definitions

<i>options</i>	Use the '?' on the command line for a list of options.
<i>filename</i>	Specifies the file or directory path.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.
- Use care when deleting files. Depending on your switch and network configurations, specific configuration and image files must be present for your system to work properly.
- This command can also be used on the secondary CMM.

### Examples

```
-> rm test_config_file
-> rm flash/test_config_file
-> rm ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: rm [OPTIONS] FILE...
```

Remove (unlink) FILEs

Options:

-i	Always prompt before removing
-f	Never prompt
-R, -r	Recurse

### Release History

Release 7.1.1; command introduced.

**Related Commands****cp**

Copies an existing file or directory.

**MIB Objects**

systemServices

systemServicesArg1

    systemServicesAction

---

## cp

Copies an existing file. This command can also copy a directory if the `-r` keyword is used.

`cp [options] source destination`

---

### Syntax Definitions

<i>options</i>	Use the '?' on the command line for a list of options.
<i>source</i>	The name of the existing file to be copied.
<i>destination</i>	The new user-defined file name for the resulting file copy. If you are copying a file to the same directory as the original, the file name for the copy must be different from the original.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- You should verify that the **/flash** directory of your switch has enough available memory to hold the copies of the files and directories created.
- A file can be copied to a new directory location. Copy of a file can also be created in the same directory that contains the original file.
- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

### Examples

```
-> cp flash/snapshots/asc.1.snap flash/snapshot/snapshot_copy
-> cp flash/snapshots/asc.1.snap snapshot_copy
-> cp asc.1.snap flash/snapshot/snapshot_copy
-> cp asc.1.snap snapshot_copy
```

```
-> cp ?
```

```
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

Usage: cp [OPTIONS] SOURCE DEST

Copy SOURCE to DEST, or multiple SOURCE(s) to DIRECTORY

Options:

<code>-a</code>	Same as <code>-dpR</code>
<code>-R,-r</code>	Recurse
<code>-d,-P</code>	Preserve symlinks (default if <code>-R</code> )
<code>-L</code>	Follow all symlinks

```
-H      Follow symlinks on command line
-p      Preserve file attributes if possible
-f      Force overwrite
-i      Prompt before overwrite
-l, -s  Create (sym)links
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

**mv** Moves an existing file or directory to a new location.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesArg2
  systemServicesAction
```

---

## scp

Copies an existing file in a secure manner.

```
scp [options] user_name@remote_ip_addr:[path/]source [path/]target
```

```
scp [options] [path/]source user_name@remote_ip_addr:[path/]target
```

---

### Syntax Definitions

<i>options</i>	Use the '?' on the command line for a list of options.
<i>user_name@remote_ip_addr:</i>	The username along with the IPv4 or IPv6 address of the remote switch.
<i>path/</i>	Specifies the path containing the file to be copied and the path where the file will be copied.
<i>source</i>	The name of the file(s) to be copied.
<i>target</i>	The new user-defined file name for the resulting file copy.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- This command will prompt you to enter the admin password, and the names and the path of the files being copied will be displayed.
- A file may be copied to a new location; you are not required to copy a file to the same directory that contains the original.
- Separate the multiple directory names that are part of the path with a slash (/). Refer to the examples below.

## Examples

```
-> scp admin@172.17.11.13:/flash/working/Kos.img /flash/working/Kos.img
admin's password for keyboard-interactive method:
```

```
Fetching /flash/working/Kos.img to /flash/working/Kos.img
Connection to 172.17.11.13 closed.
```

```
-> scp /flash/working/Kos.img admin@172.17.11.13:/flash/working/Kos.img
admin's password for keyboard-interactive method:
```

```
Uploading /flash/working/Kos.img to /flash/working/Kos.img
Connection to 172.17.11.13 closed.
```

```
-> scp admin@172.17.11.13:/flash/working/*.img /flash/working
admin's password for keyboard-interactive method:
```

```
Fetching /flash/working/K2os.img to /flash/working/K2os.img
Fetching /flash/working/Kadvrout.img to /flash/working/Kadvrout.img
Fetching /flash/working/Kbase.img to /flash/working/Kbase.img
Fetching /flash/working/Keni.img to /flash/working/Keni.img
Fetching /flash/working/Kos.img to /flash/working/Kos.img
Fetching /flash/working/Krelease.img to /flash/working/Krelease.img
Fetching /flash/working/Ksecu.img to /flash/working/Ksecu.img
Connection to 172.17.11.13 closed.
```

```
-> scp ?
```

```
usage: scp [-1246BCpqrv] [-c cipher] [-F ssh_config] [-i identity_file]
          [-l limit] [-o ssh_option] [-P port] [-S program]
          [[user@]host1:]file1 ... [[user@]host2:]file2
```

## Release History

Release 7.1.1; command introduced.

## Related Commands

**mv** Moves an existing file or directory to a new location.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesArg2
  systemServicesAction
```

---

## mv

Moves an existing file or directory to a new location.

**mv** [*options*] *source destination*

---

### Syntax Definitions

<i>options</i>	Use the '?' on the command line for a list of options.
<i>source</i>	The name of the existing file to be copied.
<i>destination</i>	The new user-defined file name for the resulting file copy. If you are copying a file to the same directory as the original, the file name for the copy must be different from the original.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The **mv** command does not make a copy of the file or directory being moved. To copy a file or directory to the current path or to a new location, use the **cp** command.
- Separate the directory names and file names that are part of the path with a slash (/). Refer to the examples below.
- This command can also be used on the secondary CMM.

### Examples

```
-> mv flash/asc.1.snap flash/backup_files/asc.1.snap
-> mv ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: mv [OPTIONS] SOURCE DEST
or: mv [OPTIONS] SOURCE... DIRECTORY
```

Rename SOURCE to DEST, or move SOURCE(s) to DIRECTORY

Options:

```
-f      Don't prompt before overwriting
-i      Interactive, prompt before overwrite
```

### Release History

Release 7.1.1; command introduced.

**Related Commands**

- rm** Renames an existing file or directory.  
**cp** Copies an existing file or directory.

**MIB Objects**

```
systemServices  
  systemServicesArg1  
  systemServicesArg2  
  systemServicesAction
```

---

## chmod

Changes the write privileges for a specified file.

```
chmod {+w |-w} [path/]file
```

---

### Syntax Definitions

<code>+w</code>	Enables read-write privileges for the file.
<code>-w</code>	Disables write privileges for the file—i.e., the file becomes read-only.
<code>path/</code>	The path containing the file for which privileges are being changed.
<code>file</code>	The name of the file for which read-write privileges are being changed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

This command can also be used on the secondary CMM.

### Examples

```
-> chmod +w vlan.config
-> chmod -w flash/backup_configs/vlan.config
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

[freespace](#) Changes the write privileges for a specified file.

### MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

---

## freespace

Displays the amount of free space available in the **/flash** directory.

**freespace** [/flash | /uflash]

---

### Syntax Definitions

**/flash** The amount of free space is shown for the **/flash** directory.

**/uflash** The amount of free space is shown for the **/uflash** directory.

### Defaults

N/A

### Usage Guidelines

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Examples

```
-> freespace /flash  
/flash 3143680 bytes free
```

```
-> freespace  
/flash 3143680 bytes free
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

#### [fsck](#)

Performs a file system check, including diagnostic information in the event of file corruption. If the **fsck** command detects a problem with the **/flash** file system, a message is displayed indicating the problem, along with any steps needed to resolve it.

### MIB Objects

SystemFileSystemTable  
  systemFileSystemFreespace

---

## fsck

Performs a file system check, including diagnostic information in the event of file corruption.

**fsck /uflash {repair | no-repair}**

---

### Syntax Definitions

<b>/uflash</b>	Indicates that the file system check will be performed on the <b>/uflash</b> directory.
<b>repair</b>	Attempt to repair any problems found.
<b>no-repair</b>	Do not attempt to repair any problems found.

### Defaults

This command gives you the option of having the errors repaired automatically.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- N/A

### Examples

```
-> fsck /uflash repair
```

```
/uflash/ - disk check in progress ..  
/uflash/ - Volume is OK  
  
total # of clusters: 14,773  
# of free clusters: 4,132  
# of bad clusters: 0  
total free space: 8,264 Kb  
max contiguous free space: 5,163,008 bytes  
# of files: 46  
# of folders: 3  
total bytes in files: 21,229 Kb  
# of lost chains: 0  
total bytes in lost chains: 0
```

### Release History

Release 7.1.1; command introduced.

---

## Related Commands

### freespace

Displays the amount of free space available in the **/flash** directory.

## MIB Objects

systemServices

    systemServicesArg1

    systemServicesAction

---

## newfs

Deletes the complete **/uflash** file system and all files within it, replacing it with a new, empty **/uflash** file system. Use this command when you want to reload all files in the file system or in the unlikely event that the **/uflash** file system becomes corrupt.

**newfs /uflash**

---

### Syntax Definitions

**/uflash** This indicates that the complete file system will be replaced.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- It is recommended that you preserve all required image and configuration files by saving them to a remote host before executing the **newfs** command.
- Do not power-down the switch after running the **newfs** command until you reload all required image and configuration files.

### Examples

```
-> newfs /uflash
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

N/A

### MIB Objects

```
systemServices  
  systemServicesArg1  
  systemServicesAction
```

---

## rcp

Copies a file from a primary to a secondary CMM and vice versa.

**rcp** [**rem-slot:** *source\_filepath destination\_filepath*]

---

### Syntax Definitions

<i>slot</i>	The slot number of the non-primary switch in a stack.
<i>source_filepath</i>	The name and path of the source file.
<i>destination_filepath</i>	The name and path of the destination file.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K

### Usage Guidelines

- This command can be used to copy files between CMMs.

### Examples

```
-> rcp cmm-b:/flash/file.txt file.txt
```

```
-> rcp /flash/working/file.txt cmm-b:/flash/working/file.txt
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

  chasSupervisionRfsCommandsDestFileName
```

---

## rrm

Removes a file from a secondary CMM.

**rrm** *filepath*

---

### Syntax Definitions

*filepath*                                      The name and path of the file to be deleted.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K

### Usage Guidelines

- Use this command to delete a file from the secondary CMM.

### Examples

```
-> rrm /flash/boot.cfg
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

- rcp**                                      Copies a file between CMMs.
- rls**                                      Displays the contents of a secondary CMM.

### MIB Objects

  alcatelIND1ChassisSupervisionRfsCommands  
  chasSupervisionRfsCommandsSlot  
  chasSupervisionRfsCommandsCommand  
  chasSupervisionRfsCommandsSrcFileName
```

---

## rls

Displays the contents of the secondary CMM.

**rls** *directory* [*file\_name*]

---

### Syntax Definitions

*directory*                                    The name of the directory on the non-primary CMM or switch.  
*file\_name*                                    The file to be displayed on the non-primary CMM or switch.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K

### Usage Guidelines

- Use this command to display the directory content on the secondary CMM.

### Examples

```
-> rls /flash
drw      4096  Nov 11 10:00  ./
drw      0    Nov 11 09:55  ../

  chasSupervisionRfsLsFileIndex
  chasSupervisionRfsLsSlot
  chasSupervisionRfsLsDirName
  chasSupervisionRfsLsFileName
  chasSupervisionRfsLsFileType
  chasSupervisionRfsLsFileSize
  chasSupervisionRfsLsFileAttr
  chasSupervisionRfsLsFileDateTime
```

---

## vi

Launches the switch's Vi text editor. The Vi file editor allows you to view or edit the contents of a specified text file.

**vi** [*options*] [*path*]/*filename*

---

### Syntax Definitions

<i>options</i>	Use the '?' on the command line for a list of options.
<i>path</i>	The path (i.e., location) containing the file being viewed or edited. If no path is specified, the command assumes the current directory.
<i>filename</i>	The name of the existing file being viewed or edited.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Until you exit the switch's file editor, all keystrokes will be passed to the text editor rather than the switch's command line.
- This command can also be used on the secondary CMM.

### Examples

```
-> vi test_config_file
-> vi ?
BusyBox v1.16.1 (2010-12-06 23:23:38 PST) multi-call binary.
```

```
Usage: vi [OPTIONS] [FILE]...
```

```
Edit FILE
```

```
Options:
```

```
-c      Initial command to run ($EXINIT also available)
-R      Read-only
-H      Short help regarding available features
```

### Release History

Release 7.1.1; command introduced.

## Related Commands

**vi**

Allows you to view the contents of a specified file by invoking the Vi text editor in read-only mode.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesAction
```

---

## Related Commands

**tty**

Displays current TTY settings.

## MIB Objects

```
systemServices
  systemServicesTtyLines
  systemServicesTtyColumns
```

---

## tty

Specifies the number of lines and columns to be displayed on the terminal screen while the switch is in the edit file mode.

**tty** *lines columns*

---

### Syntax Definitions

*lines* The number of lines to be displayed on the terminal emulation screen for the current session. Values may range from 10 to 150.

*columns* The number of columns to be displayed for each line. One column is the same width as a single text character. Values may range from 20 to 150.

### Defaults

parameter	default
<i>lines</i>	24
<i>columns</i>	80

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The number of lines and columns set with this command controls the screen size when the switch is editing or viewing a text file with the **vi** or **tftp** commands.
- The values set with this command do not control the CLI screen when the switch is operating in normal mode.
- This command can also be used on the secondary CMM.

### Examples

```
-> tty 10 60
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**show tty** Displays current TTY settings.

## MIB Objects

```
systemServices
  systemServicesTtyLines
  systemServicesTtyColumns
```

---

## show tty

Displays current TTY settings.

```
show tty
```

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Shows the settings made with the `tty` command.
- This command can also be used on the secondary CMM.

### Examples

```
-> show tty  
lines = 24, columns = 80
```

### Release History

Release 7.1.1; command introduced.

### Related Commands

`tty` Specifies the number of TTY lines and columns to be displayed.

### MIB Objects

```
systemServices  
  systemServicesTtyLines  
  systemServicesTtyColumns
```

---

## tftp

Starts a TFTP client session that enables a file transfer to an TFTP server.

**tftp** [*options*] *host* [*port*]

---

### Syntax Definitions

<i>options</i>	Enter a question mark (?) to get a list of options.
<i>host</i>	Specifies the IP address of the TFTP server.
<i>port</i>	Specifies the port for the TFTP transfer.

### Defaults

- If a path is not specified with the filename, the current path is used by default (for example, /flash).
- If a local filename is not specified, the remote filename is used by default.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The OmniSwitch supports TFTP client functionality only.
- A TFTP server has no provisions for user authentication.
- When downloading a file to the switch, the file size must not exceed the available flash space.

### Examples

```
-> tftp -g -l local_file -r remote_file 198.51.100.100
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

<code>cd</code>	Changes the current working directory of the switch.
<code>pwd</code>	Displays the current working directory of the switch.
<code>ls</code>	Displays the contents of a specified directory or the current working directory.

## MIB Objects

```
systemServices
  systemServicesArg1
  systemServicesArg2
  systemServicesArg3
  systemServicesArg4
  systemServicesArg5
  systemServicesAction
```

---

## sftp

Starts an SFTP session. An SFTP session provides a secure file transfer method.

**sftp** [*options*] {*host\_name* | *ip\_address*}

---

### Syntax Definitions

<i>options</i>	Press “Enter” on the command line to get a list of options.
<i>host_name</i>	Specifies the host name for the SFTP session.
<i>ip_address</i>	Specifies the IPv4 or IPv6 address for the SFTP session.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- You must have a valid username and a password for the specified host.
- After logging in, SFTP commands are supported. Some of these commands are defined in the following table:

<b>cd path</b>	Change remote path to ‘path’.
<b>lcd path</b>	Change local directory to ‘path’.
<b>chmod mode path</b>	Change permissions of file ‘path’ to ‘mode’.
<b>help</b>	Display command help information.
<b>get remote-path [local path]</b>	Download a file from the remote path to the local path.
<b>lls [path]</b>	Display local directory listing.
<b>ln oldpath newpath</b>	Creates a symbolic link (symlink) to the remote file.
<b>symlink oldpath newpath</b>	Creates a symbolic link (symlink) to the remote file.
<b>mkdir path</b>	Create local directory.
<b>lpwd</b>	Print local working directory.
<b>ls [path]</b>	Display remote directory listing.
<b>mkdir path</b>	Create remote directory.
<b>put local-path [remote-path]</b>	Upload file.
<b>pwd</b>	Display remote working directory.
<b>exit</b>	Quit the sftp mode.
<b>quit</b>	Exit the sftp mode.

---

<b>rename oldpath newpath</b>	Rename a remote file.
<b>rmdir path</b>	Remove remote directory.
<b>rm path</b>	Delete remote file.
<b>version</b>	Show the current SFTP version.
<b>?</b>	Synonym for help. Displays command help information.

---

## Examples

```
-> sftp 12.251.11.122
login as:
-> sftp
usage: sftp [-lCv] [-B buffer_size] [-b batchfile] [-F ssh_config]
         [-o ssh_option] [-P sftp_server_path] [-R num_requests]
         [-S program] [-s subsystem | sftp_server] host
sftp [[user@]host[:file [file]]]
sftp [[user@]host[:dir[/]]]
sftp -b batchfile [user@]host
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**ftp** Starts an FTP session.

**ssh** Invokes Secure Shell on the switch. Secure Shell is used to make a secured connection to a remote system or device.

## MIB Objects

```
SystemServices
  systemServicesArg1
  systemServicesAction
```

---

## ftp

Starts an FTP session.

**ftp** {port [default | *service\_port*] | admin-state [enable | disable] | *host\_name* | *ip\_address*}

---

### Syntax Definitions

<b>default</b>	Sets the port back to the default of 21.
<i>service_port</i>	The TCP service port number. Must be 21 or between between 20000-20999.
<b>enable   disable</b>	Enables or disables FTP access.
<i>host_name</i>	Specifies the host name for the FTP session.
<i>ip_address</i>	Specifies the IPv4 address for the FTP session.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- You must have a valid username and password for the specified host.
- The default FTP directory is **/flash**.

### Examples

```
-> ftp port 20000
-> ftp admin-state disable
-> ftp 172.17.6.228
```

### Release History

Release 7.1.1; command introduced.

**Related Commands**

<b>cd</b>	Changes the current working directory of the switch.
<b>pwd</b>	Displays the current working directory of the switch.
<b>ls</b>	Displays the contents of a specified directory or the current working directory.

**MIB Objects**

```
systemServices
  systemServicesArg1

# 46 Web Management Commands

The switch can be configured and monitored using WebView, which is a web-based device management tool. Web Management CLI commands allow you to enable/disable web-based management and configure certain WebView parameters, such as Secure Socket Layer (SSL).

MIB information for the Web Management commands is as follows:

*Filename:* AlcatelInd1WebMgt.mib  
*Module:* alcatelIND1WebMgtMIB

A summary of the available commands is listed here:

---

[webview server](#)  
[webview access](#)  
[webview force-ssl](#)  
[webview http-port](#)  
[webview https-port](#)  
[show webview](#)

---

## webview server

Enables/disables the web management server on the switch.

**webview server enable**

**webview server disable**

---

### Syntax Definitions

**enable | disable** Enables or disables the web management server on the switch.

### Defaults

parameter	default
WebView Server	Enabled

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If the WebView Server is disabled, WebView Access is automatically disabled.

### Examples

```
-> webview server enable
-> webview server disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[webview access](#) Enables/disables webview access on the switch.  
[show webview](#) Displays web management configuration information.

### MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaInd1WebMgtServerStatus
```

---

## webview access

Enables/disables web management access on the switch.

**webview access enable**

**webview access disable**

---

### Syntax Definitions

**enable | disable** Enables or disables web management access on the switch.

### Defaults

parameter	default
WebView Access	Enabled

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

If Web Access is enabled, the WebView Server is automatically enabled.

### Examples

```
-> webview access enable
-> webview access disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[webview server](#) Enables/disables the web server on the switch.  
[show webview](#) Displays web management configuration information.

### MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaInd1WebMgtAdminStatus
```

---

## webview force-ssl

Enables/disables Force SSL on the switch. SSL is a protocol that establishes and maintains secure communication between SSL-enabled servers and clients.

**webview force-ssl enable**

**webview force-ssl disable**

---

### Syntax Definitions

**enable | disable**

Enabling this feature forces the user to use ssl to access the switch when using WebView.

### Defaults

parameter	default
Force SSL	Enabled

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

The switch contains a self-signed certificate that may prompt a certificate warning.

### Examples

```
-> webview force-ssl enable
-> webview force-ssl disable
```

Release 7.1.1; command was introduced.

### Related Commands

[webview access](#)

Enables/disables webview access on the switch.

[show webview](#)

Displays web management configuration information.

### MIB Objects

```
alaIND1WebMgtConfigMIBGroup
  alaInd1WebMgtSsl
```

---

## webview http-port

Changes the port number for the embedded web management server.

```
webview http-port {default | port port}
```

---

### Syntax Definitions

<b>default</b>	Restores the port to its default (80) value.
<i>port</i>	The desired port number for the embedded Web server. The number must be in the range 0 to 65535; well-known port numbers cannot be configured.

### Defaults

---

parameter	default
<i>port</i>	80

---

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

All WebView sessions must be terminated before entering this command.

### Examples

```
-> webview http-port port 1025  
-> webview http-port default
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">webview access</a>	Enables/disables webview access on the switch.
<a href="#">show webview</a>	Displays web management configuration information.

### MIB Objects

```
alaIND1WebMgtConfigMIBGroup  
  alaIND1WebMgtHttpPort
```

---

## webview https-port

Changes the default secure (HTTPS) port for the embedded web management server.

```
webview https-port {default | port port}
```

---

### Syntax Definitions

**default**

Restores the port to its default (443) value.

*port*

The desired HTTPS port number. The number must be in the range 0 to 65535; well-known port numbers cannot be configured.

### Defaults

parameter	default
<i>port</i>	443

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

All WebView sessions must be terminated before entering this command.

### Examples

```
-> webview https-port port 1026  
-> webview https https-port default
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[webview access](#)

Enables/disables webview access on the switch.

[show webview](#)

Displays web management configuration information.

### MIB Objects

```
alaIND1WebMgtConfigMIBGroup  
  alaIND1WebMgtHttpsPort
```

---

## show webview

Displays web management configuration information.

**show webview**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> show webview
```

```
WebView Server = Disabled
WebView Access = Disabled
WebView Force-SSL = Enabled
WebView HTTP-Port = 80
WebView HTTPS-Port = 4433
```

#### *output definitions*

---

<b>WebView Server</b>	Indicates whether web management server is enabled or disabled.
<b>WebView Access</b>	Indicates whether web management access is enabled or disabled.
<b>Force SSL</b>	Indicates whether Force SSL is enabled or disabled. If this is enabled it means that SSL is forced on an HTTP session and hence HTTPS protocol is negotiated between the client and server.
<b>Web Management Http Port</b>	The port configured for the HTTP connection.
<b>Web Management Https Port</b>	The port configured for a secure HTTP connection (SSL enabled).

---

### Release History

Release 7.1.1; command was introduced.

# 47 Configuration File Manager Commands

The Configuration Manager feature allows you to configure your switch using an ASCII-based text file. CLI commands may be typed into a text document—referred to as a *configuration file*—and then uploaded and applied to the switch.

MIB information for the Configuration Manager commands is as follows:

*Filename:* AlcatelIND1System.mib  
*Module:* Alcatel-IND1ConfigMgr.mib

A summary of the available commands is listed here:

---

**configuration apply**  
**configuration error-file-limit**  
**show configuration status**  
**configuration cancel**  
**configuration syntax-check**  
**configuration snapshot**  
**show configuration snapshot**  
**write terminal**

---

## configuration apply

Applies a configuration file to the switch. Files may be applied immediately or after a designated timer session. With the timer session option, files are applied either at a scheduled date and time or after a specified period of time (i.e., a countdown) has passed.

**configuration apply** *filename* [**at** *hh:mm month dd* [*year*]] | [**in** *hh[:mm]*] [**verbose**]

---

### Syntax Definitions

<i>filename</i>	The name of the configuration text file to be applied to the switch (e.g., <b>newfile1</b> ).
<b>at</b> <i>hh:mm</i> { <i>dd month</i>   <i>month dd</i> } [ <i>year</i> ]	Designates a timer session in which a configuration file is applied at a specified date and time in the future. Values for <i>hh</i> range from 00 through 23. Values for <i>mm</i> range from 00 through 59. Values for <i>dd</i> range from 01 through 31. Values for <i>month</i> range from january through december. The switch assumes either the current year or the next calendar year for month and day pairs that precede the current date.
<b>in</b> <i>hh[:mm]</i>	Designates a timer session in which the configuration file is applied after a specific amount of time (i.e., a countdown) has passed. Values for <i>hh</i> range from 00 through 23. Values for <i>mm</i> range from 00 through 59.
<b>verbose</b>	When <b>verbose</b> is entered, information is displayed on your workstation's console as each command in the configuration file is applied.

### Defaults

By default, **verbose** error checking is not performed.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- The **configuration apply** command only applies settings to the running configuration. The **boot.cfg** file does not get overwritten.
- It is recommended that you check all configuration files for syntax errors before applying them to your switch.
- To schedule a timer session in which a file is applied at a specific date and time, enter **at** followed by the hour, minute, month, day, and year. The switch assumes either the current calendar year or the next calendar year for dates beginning January 1.
- To schedule a timer session in which a file is applied after a specific amount of time (i.e., a countdown) has passed, enter **in** followed by the number of hours and minutes.
- Verbose mode is not supported for timer sessions.

- The keyword, **authkey**, along with a related alpha-numeric text string, are automatically included in many snapshot files (e.g., **configuration snapshot all**). The text string following the **authkey** keyword represents a login password that has been encrypted *twice*. (The first encryption occurs when a password is first created by a user; the second encryption occurs when a configuration snapshot is taken.) This dual encryption further enhances switch security. However, it is important to note that any configuration file (including a generated snapshot) that includes this dual-encrypted password information will result in an error whenever it is applied to the switch via the **configuration apply** command. This is a valid switch function and does not represent a significant problem. If an **authkey**-related error is the *only* error detected, simply remove all **authkey**-related syntax using a text editor. If a new password is required for the switch, include valid password syntax in the configuration file or immediately issue a new password by using the **password** command at the command prompt. For more information on passwords, refer to [page 31-24](#).

## Examples

```
-> configuration apply new_configuration at 12:00 15 november
-> configuration apply new_configuration at 12:00 november 15
-> configuration apply newfile1 in 01:30
-> configuration apply my_switch_config in 00:05
-> configuration apply asc.1.snap in 23:00
-> configuration apply aaa_config in 12
-> configuration apply vlan_config verbose
-> configuration apply vlan_config
...
```

---

**Note.** When the **configuration apply** command is entered *without at* or *in* syntax information, one or more dots “.” is displayed in the next line, immediately following the command line. This indicates command progress; each dot represents 256 text lines in the configuration file processed by the configuration apply mechanism.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

**configuration syntax-check** Performs a syntax and authorization check of all CLI commands contained in a configuration file.

## MIB Objects

```
alcatelIND1ConfigMgrMIBObjects
  configFileName
  configFileMode
  configFileAction
  configTimerFileName
  configTimerFileTime
```

---

## configuration error-file-limit

Specifies the maximum number of configuration error files allowed in the switch's **/flash** directory. Error files are normally generated when a configuration file is applied to the switch. Error files are identified by their **.err** extension. When the maximum number of **.err** files is exceeded, any new error file will overwrite the **.err** file with the oldest timestamp.

**configuration error-file-limit** *number*

---

### Syntax Definitions

*number* Indicate the number of error files allowed in the **/flash** directory. The valid range is from 1 to 25 files.

### Defaults

parameter	default
<i>number</i>	1

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When the error file limit is set to 1 (the default value), the next error file generated by the switch will replace the existing one.
- When the error file limit is set to a value greater than 1, when a new error file that exceeds the maximum limit is created, the switch will automatically remove the error file with the smallest timestamp.
- The error files generated by the switch have the **.err** extension.
- If you want to save an error file, you may change the file name so that it does not have the **.err** extension, or you can move it from the **/flash** directory.

### Examples

```
-> configuration error-file-limit 2
-> configuration error-file-limit 1
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**

**configuration apply** Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.

**configuration cancel** Cancels a pending timer session for a configuration file.

**MIB Objects**

alcatelIND1ConfigMgrMIBObjects  
configErrorFileMaximum

---

## show configuration status

Displays whether there is a pending timer session scheduled for a configuration file and indicates whether the running configuration and the saved configuration files are *identical* or *different*. This command also displays the number of error files that will be held in the flash directory.

**show configuration status**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- A timer session can be scheduled using the [configuration apply](#) command. For more information, refer to [page 47-2](#).
- The screen output **File configuration </path/filename>: scheduled at dd/mm hh:mm** indicates that a timer session has been scheduled for a later time.
- The output **No file configuration has been scheduled** indicates an idle timer session (i.e., no timer session has been scheduled for a configuration file).
- The output **File configuration is in progress** indicates that a file is currently being applied to the switch.
- The output **File configuration </path/filename>: completed with 2 errors** indicates that the named file was applied to the switch with two recorded errors.
- When the running and saved configurations are the same, the output **Running configuration and saved configuration are identical** will be displayed.
- When the running and saved configurations are the different, the output **Running configuration and saved configuration are different** will be displayed.
- To synchronize the running and saved configuration, use the [issu slot](#) command.

### Examples

```
-> show configuration status
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

- configuration apply** Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.
- configuration cancel** Cancels a pending timer session for a configuration file.
- configuration error-file-limit** Specifies the maximum number of configuration error files allowed in the switch's **/flash** directory.
- issu slot** Copies the running configuration (RAM) to the working directory.

## MIB Objects

```
configTimerFileGroup  
  configTimerFileStatus
```

---

## configuration cancel

Cancels a pending timer session for a configuration file.

**configuration cancel**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```
-> configuration cancel
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**configuration apply** Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file.

**show configuration status** Displays whether there is a pending timer session scheduled for a configuration file.

### MIB Objects

```
configTimerFileGroup  
configTimerClear
```

---

## configuration syntax-check

Performs a syntax and authorization check of all CLI commands contained in a configuration file.

**configuration syntax-check** *path/filename* [**verbose**]

---

### Syntax Definitions

*path/filename*

The configuration file being checked for syntax and authorization errors. If a configuration file is located in another directory, be sure to specify the full path. For example, **/flash/working/asc.1.snap**.

**verbose**

When **verbose** is specified in the command line, all syntax contained in the configuration file is printed to the console, even if no error is detected. When **verbose** is *not* specified in the command line, cursory information (number of errors and error log file name) will be printed to the console *only if a syntax or configuration error is detected*.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When an error is detected, an error file (**.err**) is automatically generated by the switch. By default, this file is placed in the root **/flash** directory. To view the contents of a generated error file, use the **view** command. For example, **view asc.1.snap.1.err**.
- The syntax, **mac alloc**, is automatically included in many snapshot files (e.g., **configuration snapshot all**). All **mac alloc**-related syntax is valid *during switch boot up only* (i.e., it cannot be applied while the switch is in run-time operation). Because snapshot files are commonly used as configuration files, syntax checks may detect **mac alloc** syntax and issue an error (along with a generated **.err** file). This is a valid switch function and does not represent a significant problem. If a **mac alloc**-related error is the *only* error detected, simply remove the syntax using a text editor, then re-check the file using the **configuration syntax-check** command.
- It is recommended that you check all configuration files for syntax errors before applying them to your switch.

### Examples

```
-> configuration syntax-check vlan_file1
..
```

---

**Note.** When the **configuration syntax-check** command is entered, one or more dots “.” is displayed in the command output. This indicates command progress; each dot represents 256 text lines in the configuration file processed by the syntax check mechanism.

---

## Release History

Release 7.1.1; command was introduced.

## Related Commands

- |   |  |
|---|--|
| <a href="#">configuration apply</a>       | Applies a configuration file to the switch. Also used for scheduling a timer session for a configuration file. |
| <a href="#">show configuration status</a> | Displays whether there is a pending timer session scheduled for a configuration file.                          |

## MIB Objects

```
configFileGroup
  configErrorFileName
  configErrorFileMaximum
  configFileMode
  configFileStatus
```

---

## configuration snapshot

Generates a snapshot file of the switch's non-default current running configuration. A snapshot can be generated for all current network features or for one or more specific network features. A snapshot is a single text file that can be viewed, edited, and reused as a configuration file.

**configuration snapshot** *feature\_list* [*path/filename*]

---

### Syntax Definitions

*feature\_list*

The description for the network feature(s) to be included in the snapshot. You may enter more than one network feature in the command line. Current snapshot-supported network features are listed below.

---

#### snapshot-supported features

<b>802.1q</b>	<b>ipmr</b>	<b>rdp</b>
<b>aaa</b>	<b>ipms</b>	<b>rip</b>
<b>aip</b>	<b>ipx</b>	<b>ripng</b>
<b>all</b>	<b>ipv6</b>	<b>session</b>
<b>bgp</b>	<b>linkagg</b>	<b>slb</b>
<b>bridge</b>	<b>module</b>	<b>snmp</b>
<b>chassis</b>	<b>ntp</b>	<b>stp</b>
<b>health</b>	<b>ospf</b>	<b>system</b>
<b>interface</b>	<b>ospf3</b>	<b>vlan</b>
<b>ip</b>	<b>pmm</b>	<b>vrrp</b>
<b>ip-helper</b>	<b>policy</b>	<b>webmgt</b>
<b>ip-routing</b>	<b>qos</b>	<b>udld</b>
<b>netsec</b>		

*path/filename*

A user-defined name for the resulting snapshot file. For example, **test\_snmp\_snap**. You may also enter a specific path for the resulting file. For example, the syntax **/flash/working/test\_snmp\_snap** places the **test\_snmp\_snap** file in the switch's **/flash/working** directory.

### Defaults

If a file name is not specified, the default file name **asc.#.snap** is used. Here, # indicates the order in which the default file is generated. For example, the first default file name to be generated is **asc.1.snap**, the second default file name to be generated is named **asc.2.snap**, etc. By default, all snapshot files are placed in the root **/flash** directory.

### Platforms Supported

OmniSwitch 10K, 6900

## Usage Guidelines

- Only current, non-default configuration settings are written to the snapshot file.
- You may enter more than one network feature in the command line. Separate each network feature with a space and no comma. Network features may be entered in any order.
- The snapshot file is automatically placed in the root **/flash** directory unless otherwise specified.

## Examples

```
-> configuration snapshot all
-> configuration snapshot new_file1 qos health aggregation
-> configuration snapshot snmp_snapshot snmp
-> configuration snapshot 802.1q
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

N/A

## MIB Objects

```

  configSnapshotRDPSelect
  configSnapshotIPv6Select
```

---

## show configuration snapshot

Displays the switch's current running configuration for all features or for the specified feature(s).

**show configuration snapshot** [*feature\_list*]

---

### Syntax Definitions

*feature\_list*

Specify the feature(s) for which you want to display the running configuration. List the features separated by a space with no comma.

---

#### snapshot-supported features

802.1q	ipmr	rdp
aaa	ipms	rip
aip	ipx	ripng
all	ipv6	session
bgp	linkagg	slb
bridge	module	snmp
chassis	ntp	stp
health	ospf	system
interface	ospf3	vlan
ip	pmm	vrrp
ip-helper	policy	webmgt
ip-routing	qos	udld
netsec		

---

### Defaults

By default, this command shows configuration information for *all* features.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use this command to view the current configuration for any feature shown in the table.
- To show a list of features on the switch, use the **show configuration snapshot ?** syntax.
- Configurations are listed below the name of each feature.
- Features with no current configuration show only the name of the feature.

## Examples

```
-> show configuration snapshot
-> show configuration snapshot aaa bridge
! Bridging :

! AAA :
aaa authentication default "local"
aaa authentication console "local"
user "public" read All write All no auth authkey 391b0e74dbd13973d703ccea4a8e30
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[write terminal](#) Displays the switch's current running configuration for all features.

configManager  
  mib_configSnapshotAllSelect
```

---

# 48 SNMP Commands

This chapter includes descriptions for Trap Manager and SNMP Agent commands. The commands are used for configuring SNMP settings on the switch.

- SNMP station commands can create, modify, or delete an SNMP station. Also included is a show command for monitoring current SNMP station status.
- SNMP trap commands configure SNMP trap settings. Traps can be replayed and filtered. Also, test traps can be generated to verify that individual traps are being correctly handled by the Network Management Station (NMS). The SNMP trap commands set includes show commands for monitoring SNMP trap information.
- SNMP agent commands configure SNMP security levels on the switch. Also includes show commands for monitoring the current SNMP security status.

MIB information for SNMP Community commands is as follows:

*Filename:* IETFsnmpCommunity.MIB  
*Module:* IETF SNMP-COMMUNITY.MIB

MIB information for Trap Manager commands is as follows:

*Filename* AlcatelIND1TrapMgr.MIB  
*Module:* ALCATEL-IND1-TRAP-MGR.MIB

MIB information for SNMP Agent commands is as follows:

*Filename:* AlcatelIND1SNMPAgent.MIB  
*Module:* ALCATEL-IND1-SNMP-AGENT.MIB

---

A summary of the available commands is listed here:

---

<b>SNMP station commands</b>	<b>snmp station</b> <b>show snmp station</b>
<b>SNMP community map commands</b>	<b>snmp community-map</b> <b>snmp community-map mode</b> <b>show snmp community-map</b>
<b>SNMP security commands</b>	<b>snmp security</b> <b>show snmp security</b> <b>show snmp statistics</b> <b>show snmp mib-family</b>
<b>SNMP trap commands</b>	<b>snmp-trap absorption</b> <b>snmp-trap to-webview</b> <b>snmp-trap replay-ip</b> <b>snmp-trap filter-ip</b> <b>snmp authentication-trap</b> <b>show snmp-trap replay-ip</b> <b>show snmp-trap filter-ip</b> <b>show snmp authentication-trap</b> <b>show snmp-trap config</b>

---

## snmp station

Adds a new SNMP station; modifies or deletes an existing SNMP station.

**snmp station** {*ip\_address* | *ipv6\_address*} [[*udp\_port*] [*username*] [**v1** | **v2** | **v3**] [**enable** | **disable**]]

**no snmp station** {*ip\_address* | *ipv6\_address*}

---

### Syntax Definitions

<i>ip_address</i>	The IP address to which SNMP unicast traps will be sent.
<i>ipv6_address</i>	The IPv6 address to which SNMP unicast traps will be sent.
<i>udp_port</i>	A UDP destination port.
<i>username</i>	The user name on the switch or external server used to send traps to the SNMP station(s). The username specified here must match an existing user account name.
<b>v1</b>	Specifies that traps are sent using SNMP version 1.
<b>v2</b>	Specifies that traps are sent using SNMP version 2.
<b>v3</b>	Specifies that traps are sent using SNMP version 3.
<b>enable</b>	Enables the specified SNMP station.
<b>disable</b>	Disables the specified SNMP station.

### Defaults

parameter	default
<i>udp_port</i>	162
<b>v1</b>   <b>v2</b>   <b>v3</b>	<b>v3</b>
<b>enable</b>   <b>disable</b>	<b>enable</b>

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the no form of the command to remove an existing SNMP station.
- When adding an SNMP station, you must specify an IP address *plus username parameters*. For example, the syntax **snmp station 1.2.3.4** is not a valid command entry; however, **snmp station 1.2.3.4 username1** is a valid command entry.
- When modifying an SNMP station, you must specify an IP address *plus at least one additional parameter*. For example, the syntax **snmp station 1.2.3.4** is not a valid command entry; however, **snmp station 1.2.3.4 v2** is a valid command entry.
- When the SNMP station is enabled, the switch transmits traps to the specified IP or IPv6 address.

## Examples

```
-> snmp station 168.22.2.2 111 username2 v1 disable
-> snmp station 168.151.2.101 "test lab"
-> snmp station 170.1.2.3 username1 enable
-> snmp station 1.1.2.2 v2
-> no snmp station 2.2.2.2
-> snmp station 300::1 enable
-> no snmp station 300::1
```

## Release History

---

## snmp community-map

Configures and enables a community string on the switch and maps it to an existing user account name.

```
snmp community-map community_string [{user useraccount_name] | {enable | disable}}
```

```
no snmp community-map community_string
```

---

### Syntax Definitions

<i>community_string</i>	A community string in the form of a text string. This string must be between 1 and 32 characters.
<i>useraccount_name</i>	A user name in the form of a text string. This name must match a user login account name already configured on the switch or configured remotely on an external AAA server. This user name must be between 1 and 32 characters.
<b>enable</b>	Enables SNMP community string mapping.
<b>disable</b>	Disables SNMP community string mapping.

### Defaults

By default, SNMP community map authentication is enabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Community strings configured on the switch are used for v1 and v2c SNMP managers only.
- The user account name must be a current user account recognized by the switch. For a list of current user names use the **show user** command. To create a new user account, use the **user** command.
- There is one to one mapping between each community string and a user account name.
- Privileges attached to the community string are the ones inherited from the user account name that created it.

### Examples

```
-> snmp community-map community1 user testname1  
-> snmp community-map community1 enable
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

**snmp community-map mode** Enables the local community strings database.

## MIB Objects

SNMPCommunityTable  
  snmpCommunityIndex  
  snmpCommunitySecurityName  
  snmpCommunityStatus

---

## snmp community-map mode

Enables the local community strings database.

**snmp community-map mode {enable | disable}**

---

### Syntax Definitions

**enable** Enables SNMP community map database.

**disable** Disables SNMP community map database.

### Defaults

By default, SNMP community strings database is enabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- When enabled, the community string carried over each incoming v1 or v2c SNMP request must be mapped to a user account name in order to be processed by the SNMP agent.
- When enabled, mapping is contained in the local community strings database populated by using the [snmp community-map](#) command.
- When disabled, the community strings carried over each incoming v1 or v2c request must be *equal to* a user account name in order to be processed by the SNMP agent.

### Examples

```
-> snmp community-map mode enable
-> snmp community-map mode disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[snmp community-map](#) Configures and enables a community string on the switch and maps it to an existing user account name.

### MIB Objects

```
SNMPCommunityTable
  snmpCommunityIndex
  snmpCommunitySecurityName
  snmpCommunityStatus
```

---

## show snmp community-map

Shows the local community strings database.

**show snmp community-map**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guideline

N/A

### Examples

```
-> show snmp community-map
Community mode : enabled
```

```
status  community string          user name
-----+-----+-----+-----
enabled test_string1              bb_username
enabled test_string2              rr_username
disabled test_string3              cc_username
disabled test_string4              jj_username
```

#### *output definitions*

---

<b>Status</b>	The Enabled/Disabled status of the community string.
<b>Community String</b>	The text that defines the community string.
<b>User Name</b>	The user account name.

---

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[snmp community-map](#) Configures and enables a community string on the switch and maps it to an existing user account name.

## snmp security

Configures SNMP security settings.

**snmp security {no-security | authentication set | authentication all | privacy set | privacy all | trap-only}**

---

### Syntax Definitions

<b>no-security</b>	The switch will accept all SNMP v1, v2, and v3 requests.
<b>authentication set</b>	The switch will accept all requests <i>except</i> v1, v2, and non-authenticated v3 set requests. SNMP v1, v2, and non-authenticated v3 set requests will be rejected.
<b>authentication all</b>	The switch will accept all requests <i>except</i> v1, v2, and non-authenticated v3 get, get-next, and set requests. SNMP v1, v2, and non-authenticated v3 get, get-next, and set requests will be rejected.
<b>privacy set</b>	The switch will accept <i>only</i> authenticated SNMP v3 get, get-next and encrypted v3 set requests. All other requests will be rejected.
<b>privacy all</b>	The switch will accept only encrypted v3 get, get-next, and set requests. All other requests will be rejected.
<b>trap-only</b>	All SNMP get, get-next, and set requests will be rejected.

### Defaults

By default, the SNMP security default is set to **privacy all**, which is the highest level of security.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Refer to the table below for a quick-reference list of security parameter and the SNMP request allowances for each parameter.

	v1 set v2 set v3 non-auth set	v1 get v2 get v3 non-auth get/ get-next	v3 auth set	v3 auth get/ get-next	v3 encryp set	v3 encryp get/ get-next
<b>no-security</b>	accepted	accepted	accepted	accepted	accepted	accepted
<b>authentication set</b>	rejected	accepted	accepted	accepted	accepted	accepted
<b>authentication all</b>	rejected	rejected	accepted	accepted	accepted	accepted
<b>privacy set</b>	rejected	rejected	rejected	accepted	accepted	accepted
<b>privacy all</b>	rejected	rejected	rejected	rejected	accepted	accepted
<b>trap-only</b>	rejected	rejected	rejected	rejected	rejected	rejected

## Examples

```
-> snmp security no-security
-> snmp security authentication set
-> snmp security authentication all
-> snmp security privacy set
-> snmp security trap-only
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

[show snmp security](#)                      Displays the current SNMP security status.

## MIB Objects

```
SNMPAgtConfig
    SnmpAgtSecurityLevel
```

---

## show snmp security

Displays the current SNMP security status.

**show snmp security**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

Refer to the command on page [48-11](#) for descriptions of the five SNMP security states: no security, authentication set, authentication all, privacy set, privacy all, and trap only.

### Examples

```
-> show snmp security
snmp security = no security
```

```
-> show snmp security
snmp security = authentication set
```

```
-> show snmp security
snmp security = authentication all
```

```
-> show snmp security
snmp security = privacy set
```

```
-> show snmp security
snmp security = privacy all
```

```
-> show snmp security
snmp security = trap only
```

### Release History

Release 7.1.1; command was introduced.

**Related Commands**[snmp security](#)Configures the SNMP security settings.

---

## show snmp statistics

Displays the current SNMP statistics.

**show snmp statistics**

---

### Syntax Definitions

N/A

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

N/A

### Examples

```

```

### *output definitions*

---

<b>From RFCxxxx</b>	Displays the RFC number that defines the SNMP MIB objects listed.
<b>MIB Objects</b>	Name of the MIB object listed as an SNMP statistic.
<b>= (integer)</b>	The number of times the MIB object has been reported to the SNMP management station since the last reset.

---

### **Release History**

Release 7.1.1; command was introduced.

### **Related Commands**

N/A

---

## show snmp mib-family

Displays SNMP MIB information. Information includes MIP ID number, MIB table name, and command family.

**show snmp mib-family** [*table\_name*]

---

### Syntax Definitions

*table\_name*                      The name of the MIB table to be displayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- If a table name is not specified in the command syntax, all MIB table names will be displayed.
- If the command family is not valid for the entire MIB table, the command family will be displayed on a per-object basis.
- Table names are case-sensitive. Therefore, use the exact table names from the MIB database.

### Examples

```
-> show snmp mib-family trapStationTable
MIP ID   MIB TABLE NAME                               FAMILY
-----+-----+-----
 73733   trapStationTable                               snmp
```

#### *output definitions*

---

<b>MIP ID</b>	Identification number for the MIP associated with this MIB Table.
<b>MIB Table Name</b>	Name of the MIB table.
<b>Family</b>	Command family to which this MIB table belongs.

---

### Release History

Release 7.1.1; command was introduced.

### Related Commands

[show snmp-trap filter-ip](#)              Displays the SNMP trap filter information.

---

## snmp-trap absorption

Enables or disables the trap absorption function.

**snmp-trap absorption {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables SNMP trap absorption. When trap absorption is enabled, identical, repetitive traps sent by applications during a pre-configured time period will be absorbed, and therefore not sent to SNMP Manager stations configured on the switch.
<b>disable</b>	Disables SNMP trap absorption.

### Defaults

By default, trap absorption is enabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

To view the current trap absorption status, use the **show snmp-trap config** command.

### Examples

```
-> snmp-trap absorption enable
-> snmp-trap absorption disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show snmp-trap config** Displays the SNMP trap information. Information includes trap ID numbers and corresponding trap names and families.

### MIB Objects

```
trapFilterTable
  trapAbsorption
```

---

## snmp-trap to-webview

Enables the forwarding of traps to WebView.

**snmp-trap to-webview {enable | disable}**

---

### Syntax Definitions

<b>enable</b>	Enables WebView forwarding. When WebView forwarding is enabled, all traps sent by switch applications are also forwarded to WebView. This allows a WebView session to retrieve the trap history log.
<b>disable</b>	Disables WebView forwarding.

### Defaults

By default, WebView forwarding is enabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

To view the current WebView forwarding status, use the **show snmp-trap config** command.

### Examples

```
-> snmp-trap to-webview enable
-> snmp-trap to-webview disable
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

**show snmp-trap config** Displays the SNMP trap information, including the current status for trap absorption and WebView forwarding.

### MIB Objects

```
trapFilterTable
  trapToWebView
```

---

## snmp-trap replay-ip

Replays stored traps from the switch to a specified SNMP station. This command is used to replay (to resend) traps on demand. This is useful in the event when traps are lost in the network.

```
snmp-trap replay-ip {ip_address | ipv6_address} [seq_id]
```

---

### Syntax Definitions

<i>ip_address</i>	The IP address for the SNMP station to which traps will be replayed from the switch.
<i>ipv6_address</i>	The IPv6 address for the SNMP station to which traps will be replayed from the switch.
<i>seq_id</i>	The sequence number from which trap replay will begin. Each trap sent by the switch to an SNMP station has a sequence number. The sequence number reflects the order in which the trap was sent to the SNMP station. For example, the first trap sent to an SNMP station has a sequence number of 1; the second trap has a sequence number of 2, etc. If no sequence number is entered, all stored traps are replayed.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the [show snmp station](#) command on [page 48-5](#) to display the latest stored sequence number for each SNMP station.
- The switch replays traps in the same order that they were previously sent, beginning from the specified sequence number.
- When traps are replayed, the original dates on which the trap was issued, rather than the current dates are used.
- If the specified sequence number is lower than the oldest trap sequence number stored in the switch, the switch replays all stored traps.
- If the specified sequence number is equal to or greater than the oldest trap sequence number stored, the switch replays all stored traps from the specified sequence number up to the latest sequence number.
- If the specified sequence number is greater than the latest sequence number, no traps are replayed.

### Examples

```
-> snmp-trap replay-ip 172.12.2.100  
-> snmp-trap replay-ip 300::1
```

## Release History

Release 7.1.1; command was introduced.

## Related Commands

- |  |  |
|--|--|
| <a href="#">show snmp station</a>        | Displays the current SNMP station status.  |
| <a href="#">show snmp-trap replay-ip</a> | Displays the SNMP trap replay information. |

## MIB Objects

```
trapStationTable
  trapStation Replay
AlaTrapInetStationEntry
  alaTrapInetStationReplay
  alaTrapInetStationNextSeq
```

---

## snmp-trap filter-ip

Enables or disables SNMP trap filtering. Trap filtering is used to determine whether a trap or group of traps will be sent from the switch to a specified SNMP station.

**snmp-trap filter-ip** {*ip\_address* | *ipv6\_address*} *trap\_id\_list*

**no snmp-trap filter-ip** {*ip\_address* | *ipv6\_address*} *trap\_id\_list*

---

### Syntax Definitions

<i>ip_address</i>	The IP address for the SNMP station for which trap filtering is being enabled or disabled.
<i>ipv6_address</i>	The IPv6 address for the SNMP station for which trap filtering is being enabled or disabled.
<i>trap_id_list</i>	Specifies the trap(s) for which filtering is being enabled or disabled. Traps must be specified using the numeric trap ID. You can specify more than one trap in the command line; separate each trap ID with a space and no comma.

### Defaults

By default, SNMP trap filtering is disabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- To *enable* trap filtering, use the syntax **snmp-trap filter-ip** *ip\_address* *trap\_id\_list*.
- To *disable* trap filtering, use the syntax **no snmp-trap filter-ip** *ip\_address* *trap\_id\_list*.
- When filtering is enabled, the specified trap(s) *will not* be sent to the SNMP station. When filtering is disabled, the specified traps *will* be sent to the SNMP station.
- To display a list of traps and their ID numbers, use the **show snmp-trap config** command.

### Examples

```
-> snmp-trap filter-ip 172.1.2.3 1
-> snmp-trap filter-ip 172.1.2.3 0 1 3 5
-> snmp-trap filter-ip 300::1 1 3 4
-> no snmp-trap filter-ip 172.1.2.3 1
-> no snmp-trap filter-ip 172.1.2.3 0 1 3 5
-> no snmp-trap filter-ip 300::1 1 3
```

## Release History

# 49 DNS Commands

A Domain Name System resolver is an internet service that translates host names into IP addresses. Every time you use a host name, a DNS service must resolve the name to an IP address. You can configure up to three domain name servers. If the primary DNS server does not know how to translate a particular host name, it asks the secondary DNS server (if specified). If this fails, it asks the third DNS server (if specified), until the correct IP address is returned (resolved). If all DNS servers have been queried and the name is still not resolved to an IP address, the DNS resolver will fail and issue an error message.

MIB information for the DNS commands is as follows:

*Filename:* AlcatelIND1System.mib  
*Module:* ALCATEL-IND1-SYSTEM.MIB

A summary of the available commands is listed here.

---

[ip domain-lookup](#)  
[ip name-server](#)  
[ipv6 name-server](#)  
[ip domain-name](#)  
[show dns](#)

---

## ip domain-lookup

Enables or disables the DNS resolver.

**ip domain-lookup**

**no ip domain-lookup**

---

### Syntax Definitions

N/A

### Defaults

By default, the DNS resolver is disabled.

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Use the **no** form of this command to disable the DNS resolver.
- You must use the **ip domain-name** command to set a default domain name for your DNS resolver(s) and the **ip name-server** command to specify up to three DNS servers to query on host lookups.
- The **ip domain-lookup** command enables the DNS resolver.

### Examples

```
-> ip domain-lookup  
-> no ip domain-lookup
```

### Release History

Release 7.1.1; command was introduced.

### Related Commands

<a href="#">ip name-server</a>	Specifies the IP addresses of up to three servers to query on a host lookup.
<a href="#">ipv6 name-server</a>	Specifies the IPv6 addresses of up to three IPv6 DNS servers to query on a host lookup.
<a href="#">ip domain-name</a>	Sets or deletes the default domain name for DNS lookups.
<a href="#">show dns</a>	Displays the current DNS resolver configuration and status.

### MIB Objects

```
systemDNS  
  systemDNSEnableDnsResolver
```

---

## ip name-server

Specify the IP addresses of up to three servers to query on a host lookup.

```
ip name-server server-address1 [server-address2 [server-address3]]
```

---

### Syntax Definitions

<i>server-address1</i>	The IP address of the primary DNS server to query for host lookup. This is the only address that is required.
<i>server-address2</i>	The IP address of the secondary DNS server to query for host lookup. This server will be queried only if the desired host name or host IP address is not located by the primary DNS server. A second IP address is optional.
<i>server-address3</i>	The IP address of the DNS server with the lower priority. This server will be queried only if the desired host name or IP address is not located by the primary and secondary DNS servers. A third IP address is optional.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Configuration of the DNS resolver to resolve any host query requires that you first set the default domain name with the **ip domain-name** command and enable the DNS resolver function with the **ip domain-lookup** command before you specify the IP addresses of the DNS servers by using the **ip name-server** command.
- You can configure up to three IPv4 DNS servers and three IPv6 DNS servers in a switch.

### Examples

```
-> ip name-server 189.202.191.14 189.202.191.15 188.255.19.1  
-> ip name-server 10.255.11.66
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

[ip domain-lookup](#)

Enables or disables the DNS resolver.

[ip domain-name](#)

Sets or deletes the default domain name for DNS lookups.

[show dns](#)

Displays the current DNS resolver configuration and status.

## MIB Objects

  systemDNSNsAddr1

  systemDNSNsAddr2

  systemDNSNsAddr3

---

## ipv6 name-server

Specifies the IPv6 addresses of up to three IPv6 DNS servers to query on a host lookup.

```
ipv6 name-server server-ipv6_address1 [server-ipv6_address2 [server-ipv6_address3]]
```

---

### Syntax Definitions

<i>server-ipv6_address1</i>	The IPv6 address of the primary IPv6 DNS server to query for host lookup. Specifying the primary IPv6 DNS address is mandatory.
<i>server-ipv6_address2</i>	The IPv6 address of the secondary IPv6 DNS server to query for host lookup. This server will be queried only if the desired host name is not able to be resolved by the primary IPv6 DNS server. A second IPv6 address is optional.
<i>server-ipv6_address3</i>	The IPv6 address of the IPv6 DNS server with the lower priority. This server will be queried only if the desired host name is not able to be resolved by both the primary and secondary IPv6 DNS servers. A third IPv6 address is optional.

### Defaults

N/A

### Platforms Supported

OmniSwitch 10K, 6900

### Usage Guidelines

- Configuration of the DNS resolver to resolve any host query requires that you first set the default domain name with the **ip domain-name** command and enable the DNS resolver function with the **ip domain-lookup** command before you specify the IPv6 addresses of the IPv6 DNS servers by using the **ipv6 name-server** command.
- You cannot use multicast, loopback, link-local and unspecified IPv6 addresses for specifying IPv6 DNS servers.
- You can configure up to three IPv6 DNS servers and three IPv4 DNS servers in a switch.

### Examples

```
-> ipv6 name-server fec0::2d0:d3:f3fc
-> ipv6 name-server fe2d::2c f302::3de1:1 f1bc::202:fd40:f3
```

### Release History

Release 7.1.1; command was introduced.

## Related Commands

### Examples

```
-> show dns
Resolver is          : enabled
domainName          : company.com
IPv4 nameServer(s) : 189.202.191.14
                   : 189.202.191.15
                   : 188.255.19.1
IPv6 nameServer(s) : fe2d::2c
                   : f302::3de1:1
                   : f1bc::202:fd40:f3
```

#### *output definitions*

---

<b>Resolver is</b>	Indicates whether the DNS resolver is enabled or disabled.
<b>domainName</b>	Indicates the default domain name assigned to the DNS lookups. This value is set using the <b>ip domain-name</b> command.
<b>IPv4 nameServer(s)</b>	Indicates the IP address(es) of the IPv4 DNS server(s). These addresses are set using the <b>ip name-server</b> command.
<b>IPv6 nameServer(s)</b>	Indicates the IPv6 address(es) of the IPv6 DNS server(s). These addresses are set using the <b>ipv6 name-server</b> command.

# A Software License and Copyright Statements

This appendix contains Alcatel-Lucent and third-party software vendor license and copyright statements.

## Alcatel-Lucent License Agreement

### ALCATEL-LUCENT SOFTWARE LICENSE AGREEMENT

---

**IMPORTANT.** Please read the terms and conditions of this license agreement carefully before opening this package.

---

**By opening this package, you accept and agree to the terms of this license agreement. If you are not willing to be bound by the terms of this license agreement, do not open this package. Please promptly return the product and any materials in unopened form to the place where you obtained it for a full refund.**

1. **License Grant.** This is a license, not a sales agreement, between you (the “Licensee”) and Alcatel-Lucent. Alcatel-Lucent hereby grants to Licensee, and Licensee accepts, a non-exclusive license to use program media and computer software contained therein (the “Licensed Files”) and the accompanying user documentation (collectively the “Licensed Materials”), only as authorized in this License Agreement. Licensee, subject to the terms of this License Agreement, may use one copy of the Licensed Files on the Licensee’s system. Licensee agrees not to assign, sublicense, transfer, pledge, lease, rent, or share their rights under this License Agreement. Licensee may retain the program media for backup purposes with retention of the copyright and other proprietary notices. Except as authorized under this paragraph, no copies of the Licensed Materials or any portions thereof may be made by Licensee and Licensee shall not modify, decompile, disassemble, reverse engineer, or otherwise attempt to derive the Source Code. Licensee is also advised that Alcatel-Lucent products contain embedded software known as firmware which resides in silicon. Licensee may not copy the firmware or transfer the firmware to another medium.

2. **Alcatel-Lucent’s Rights.** Licensee acknowledges and agrees that the Licensed Materials are the sole property of Alcatel-Lucent and its licensors (herein “its licensors”), protected by U.S. copyright law, trademark law, and are licensed on a right to use basis. Licensee further acknowledges and agrees that all rights, title, and interest in and to the Licensed Materials are and shall remain with Alcatel-Lucent and its licensors and that no such right, license, or interest shall be asserted with respect to such copyrights and trademarks. This License Agreement does not convey to Licensee an interest in or to the Licensed Materials, but only a limited right to use revocable in accordance with the terms of this License Agreement.

3. **Confidentiality.** Alcatel-Lucent considers the Licensed Files to contain valuable trade secrets of Alcatel-Lucent, the unauthorized disclosure of which could cause irreparable harm to Alcatel-Lucent. Except as expressly set forth herein, Licensee agrees to use reasonable efforts not to disclose the Licensed Files to any third party and not to use the Licensed Files other than for the purpose authorized by this License Agreement. This confidentiality obligation shall continue after any termination of this License Agreement.

4. **Indemnity.** Licensee agrees to indemnify, defend and hold Alcatel-Lucent harmless from any claim, lawsuit, legal proceeding, settlement or judgment (including without limitation Alcatel-Lucent's reasonable United States and local attorneys' and expert witnesses' fees and costs) arising out of or in connection with the unauthorized copying, marketing, performance or distribution of the Licensed Files.

5. **Limited Warranty.** Alcatel-Lucent warrants, for Licensee's benefit alone, that the program media shall, for a period of ninety (90) days from the date of commencement of this License Agreement (referred to as the Warranty Period), be free from defects in material and workmanship. Alcatel-Lucent further warrants, for Licensee benefit alone, that during the Warranty Period the Licensed Files shall operate substantially in accordance with the functional specifications in the User Guide. If during the Warranty Period, a defect in the Licensed Files appears, Licensee may return the Licensed Files to Alcatel-Lucent for either replacement or, if so elected by Alcatel-Lucent, refund of amounts paid by Licensee under this License Agreement. EXCEPT FOR THE WARRANTIES SET FORTH ABOVE, THE LICENSED MATERIALS ARE LICENSED "AS IS" AND ALCATEL-LUCENT AND ITS LICENSORS DISCLAIM ANY AND ALL OTHER WARRANTIES, WHETHER EXPRESS OR IMPLIED, INCLUDING (WITHOUT LIMITATION) ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. SOME STATES DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES SO THE ABOVE EXCLUSIONS MAY NOT APPLY TO LICENSEE. THIS WARRANTY GIVES THE LICENSEE SPECIFIC LEGAL RIGHTS. LICENSEE MAY ALSO HAVE OTHER RIGHTS WHICH VARY FROM STATE TO STATE.

6. **Limitation of Liability.** Alcatel-Lucent's cumulative liability to Licensee or any other party for any loss or damages resulting from any claims, demands, or actions arising out of or relating to this License Agreement shall not exceed the license fee paid to Alcatel-Lucent for the Licensed Materials. IN NO EVENT SHALL ALCATEL-LUCENT BE LIABLE FOR ANY INDIRECT, INCIDENTAL, CONSEQUENTIAL, SPECIAL, OR EXEMPLARY DAMAGES OR LOST PROFITS, EVEN IF ALCATEL-LUCENT HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. SOME STATES DO NOT ALLOW THE LIMITATION OR EXCLUSION OF LIABILITY FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATION OR EXCLUSION TO INCIDENTAL OR CONSEQUENTIAL DAMAGES MAY NOT APPLY TO LICENSEE.

7. **Export Control.** This product is subject to the jurisdiction of the United States. Licensee may not export or reexport the Licensed Files, without complying with all United States export laws and regulations, including but not limited to (i) obtaining prior authorization from the U.S. Department of Commerce if a validated export license is required, and (ii) obtaining "written assurances" from licensees, if required.

8. **Support and Maintenance.** Except as may be provided in a separate agreement between Alcatel-Lucent and Licensee, if any, Alcatel-Lucent is under no obligation to maintain or support the copies of the Licensed Files made and distributed hereunder and Alcatel-Lucent has no obligation to furnish Licensee with any further assistance, documentation or information of any nature or kind.

9. **Term.** This License Agreement is effective upon Licensee opening this package and shall continue until terminated. Licensee may terminate this License Agreement at any time by returning the Licensed Materials and all copies thereof and extracts therefrom to Alcatel-Lucent and certifying to Alcatel-Lucent in writing that all Licensed Materials and all copies thereof and extracts therefrom have been returned or erased by the memory of Licensee's computer or made non-readable. Alcatel-Lucent may terminate this License Agreement upon the breach by Licensee of any term hereof. Upon such termination by

Alcatel-Lucent, Licensee agrees to return to Alcatel-Lucent or destroy the Licensed Materials and all copies and portions thereof.

**10. Governing Law.** This License Agreement shall be construed and governed in accordance with the laws of the State of California.

**11. Severability.** Should any term of this License Agreement be declared void or unenforceable by any court of competent jurisdiction, such declaration shall have no effect on the remaining terms herein.

**12. No Waiver.** The failure of either party to enforce any rights granted hereunder or to take action against the other party in the event of any breach hereunder shall not be deemed a waiver by that party as to subsequent enforcement of rights or subsequent actions in the event of future breaches.

**13. Notes to United States Government Users.** Software and documentation are provided with restricted rights. Use, duplication or disclosure by the government is subject to (i) restrictions set forth in GSA ADP Schedule Contract with Alcatel-Lucent's reseller(s), or (ii) restrictions set forth in subparagraph (c) (1) and (2) of 48 CFR 52.227-19, as applicable.

**14. Third Party Materials.** Licensee is notified that the Licensed Files contain third party software and materials licensed to Alcatel-Lucent by certain third party licensors. Some third party licensors are third party beneficiaries to this License Agreement with full rights of enforcement. Please refer to the section entitled "[Third Party Licenses and Notices](#)" on page -4 for the third party license and notice terms.

## Third Party Licenses and Notices

Legal Notices applicable to any software distributed alone or in connection with the product to which this document pertains, are contained in files within the software itself located at: **/flash/foss**.

Also, if needed, we provide all FOSS (Free and Open Source Software) source code used into this release at the following URL: <https://service.esd.alcatel-lucent.com/portal/page/portal/EService/release>

# B CLI Change Guidelines

This appendix provides general guidelines for determining the CLI changes from AOS Release 6 to AOS Release 7. In addition, a summary of AOS Release 7 CLI command shortcuts is provided (see [“OmniSwitch CLI Short Cuts” on page B-29](#)).

For detailed explanations regarding commands and parameters, refer to the appropriate chapter in the *OmniSwitch CLI Reference Guide*.

## AOS Release 6 to AOS Release 7

### List of Changed CLI Commands

---

“AAA Commands”	“OSPF Commands”
“BFD Commands”	“OSPFv3 Commands”
“BGP Commands”	“PIM Commands”
“Configuration File Manager Commands”	“Port Security Commands”
“Chassis Management and Monitoring Commands”	“Policy Server Commands”
“CMM Commands”	“Port Manager Commands”
“DHCP Relay Commands”	“Port Mapping Commands”
“DVMRP Commands”	“Port Mirroring and Monitoring Commands”
“ERP Commands”	“QoS Commands”
“Ethernet Port Commands”	“RIP Commands”
“Health Monitor Commands”	“Sflow Commands”
“HTTP Commands”	“SLB Commands”
“IPsec Commands”	“SNMP Commands”
“IPv4 Commands”	“Source Learning Commands”
“IPv6 Commands”	“STP Commands”
“Link Aggregation Commands”	“System Services Command”
“802.1AB Commands”	“VLAN Manager Commands”
“Multicast Routing Commands”	“VLAN Stacking Commands”
“Network Time Protocol Commands”	“VRRP Commands”

---

## AAA Commands

AOS Release 6	AOS Release 7
aaa radius agent preferred {default   no-loopback   <ip_address>}	removed
no aaa radius agent preferred	removed
user <i>user_name</i> end-user-profile <string>	removed
user <i>user_name</i> no end-user-profile	removed
end-user profile	removed
no end-user profile	removed
show end-user profile	removed
show user password-expiration	removed
show user password-size	removed
aaa radius-agent	removed
aaa ace-server	removed

## BFD Commands

AOS Release 6	AOS Release 7
ip bfd-std status {enable   disable}	ip bfd admin-state {enable   disable}
ip bfd-std transmit-interval	ip bfd transmit <i>transmit_interval</i>
ip bfd-std receive receive-interval	ip bfd receive <i>receive_interval</i>
ip bfd-std mode {echo-only   demand echo {enable   disable}   asynchronous echo {enable   disable}}	ip bfd mode {echo-only   demand [echo-state {enable   disable}]   asynchronous [echo-state {enable   disable}]}
ip bfd-std echo status {enable   disable}	ip bfd echo-state {enable   disable}
ip bfd-std echo interval echo-interval	ip bfd echo-interval <i>echo_interval</i>
ip bfd-std 12-hold-timer 12-holdtimer-interval	ip bfd 12-hold-timer <i>12-holdtimer-interval</i>
ip bfd-std interface interface_name	ip bfd interface <i>if_name</i>
no ip bfd-std interface interface_name	no ip bfd interface <i>if_name</i>
ip bfd-std interface interface_name status {enable   disable}	ip bfd interface <i>if_name</i> admin-state {enable   disable}
ip bfd-std interface interface_name transmit transmit-interval	ip bfd interface <i>if_name</i> transmit <i>transmit_interval</i>
ip bfd-std interface interface_name receive receive-interval	ip bfd interface <i>if_name</i> receive <i>receive_interval</i>
ip bfd-std interface interface_name multiplier multiplier_value	ip bfd interface <i>if_name</i> multiplier <i>num</i>
ip bfd-std interface interface_name echo-interval echo-interval	ip bfd interface <i>if_name</i> echo-interval <i>echo_interval</i>

AOS Release 6	AOS Release 7
ip bfd-std interface interface_name mode {echo-only   demand [echo {enable   disable}]   asynchronous [echo {enable disable}]}	ip bfd interface <i>interface_name</i> mode {echo-only   demand [echo-state {enable   disable}]   asynchronous [echo-state {enable   disable}]}
ip bfd-std interface interface_name 12-hold-timer 12-holdtimer-interval	ip bfd interface <i>interface_name</i> 12-hold-timer <i>12-holdtimer-interval</i>
ip ospf bfd-std status {enable   disable}	ip ospf bfd-state {enable   disable}
[no] ip ospf bfd-std all-interfaces	ip ospf bfd-state all-interfaces {enable   disable}
ip ospf interface interface-name bfd-std {enable   disable}	ip ospf interface <i>interface-name</i> bfd-state {enable   disable}
ip ospf interface interface-name bfd-std drs-only	ip ospf interface <i>interface-name</i> bfd-state drs-only
ip ospf interface interface-name bfd-std all-nbrs	ip ospf interface <i>interface-name</i> bfd-state all-neighbors {enable   disable}
ip bgp bfd-std status {enable   disable}	ip bgp bfd-state {enable   disable}
[no] ip bgp bfd-std all-neighbors	ip bgp bfd-state all-neighbors {enable   disable}
ip bgp neighbor name bfd-std {enable   disable}	ip bgp neighbor <i>ip_address</i> bfd-state {enable   disable}
vrrp bfd-std {enable   disable}	vrrp bfd-state {enable   disable}
vrrp track num address address bfd-std {enable disable}	vrrp track <i>num</i> address <i>address</i> bfd-state {enable disable}
show ip bfd-std	show ip bfd
show ip bfd-std interfaces [interface-name]	show ip bfd interfaces [ <i>if-name</i> ]
show ip bfd-std [session <num> ] [sessions [slot <num>]]	show ip bfd sessions [ <i>session_num</i> ] [slot <i>slot_num</i> ]
n/a	ip bfd multiplier <i>num</i>
n/a	show ip bfd sessions statistics <i>session_num</i>
n/a	ip static-route <i>ipv4_prefix/pfx_length</i> gateway <i>ipv4_host_address</i> bfd-state {enable disable}

## BGP Commands

AOS Release 6	AOS Release 7
ip bgp status {enable   disable}	ip bgp admin-state {enable   disable}
ip bgp network network_address ip_mask status {enable   disable}	ip bgp network <network_address> <ip_mask> admin-state {enable   disable}
ip bgp neighbor ip_address status {enable   disable}	ip bgp neighbor <ip_address> admin-state {enable   disable}
ipv6 bgp neighbor ipv6_address [status {enable   disable}]	ipv6 bgp neighbor <ipv6_address> [admin-state {enable   disable}]

## Configuration File Manager Commands

AOS Release 6	AOS Release 7
show configuration snapshot [<appname>]	configuration apply <filename> [<time>]

## Chassis Management and Monitoring Commands

AOS Release 6	AOS Release 7
n/a	hash-control load-balance non-ucast {enable   disable}
n/a	show hash-control non-ucast
n/a	show escalation-strategy [<slot-id>]

## CMM Commands

AOS Release 6	AOS Release 7
reload [primary   secondary   all] [with-fabric] [in [hours:] minutes   at hour:minute [month day   day month]   cancel]	reload [primary   secondary   all] [in [hours:] minutes   at hour:minute [month day   day month]   cancel]
reload working {rollback-timeout minutes   no rollback-timeout} [in [hours:] minutes   at hour:minute]	reload from <image-dir> {rollback-timeout minutes   no rollback-timeout} [redundancy-time <redundancy-time>] [in [hours:] minutes   at hour:minute]
n/a	issu from <image-dir> redundancy-time <redundancy-time>
[configure] copy running-config working	removed
[configure] copy certified working	copy certified <image-directory>
takeover [with-fabric]	takeover
show microcode [issu   working   certified   loaded]	show microcode [issu   working   certified   loaded   <directory>]
show microcode history [working   certified]	removed
system time-and-date synchro	removed
system timezone [timezone_abbrev   offset_value   time_notation]	system timezone [timezone_abbrev   time_notation]
system daylight savings time [{enable   disable}   start {week} {day} in {month} at {hh:mm} end {week} {day} in {month} at {hh:mm} [by min]]	system daylight-savings-time
reload ni [slot] number	reload slot <number>
reload pass-through slot-number	removed
power ni [slot] slot-number	power slot <slot[-slot]>
no power ni [slot] slot-number	no power slot <slot[-slot]>
n/a	[no] powersupply enable [<psu-id>]

AOS Release 6	AOS Release 7
rdf	rdf [slot-nr]
rls <string> [<string>]	rls rem-slot <path> [<filename>]
rrm <string> <string>	rrm rem-slot <[path/]filename>
show cmm [number]	show cmm [<number>   <cmm_letter>]
show ni [number]	show slot [<slot-nr>]
n/a	show transceivers [slot <slot-nr> [transceiver <transceiver_num>]]
show module [number]	show module[<number>   <cmm_letter>]
show module long [number]	show module long [<number>   <cmm_letter>]
show module status [number]	show module status [<number>   <cmm_letter>]
show power [supply] [number]	show powersupply [<number>]
n/a	show fantray [<fantray-nr>]
show temperature [number]	show temperature [fabric [<index>]   slot [<index>]   fantray [<index>]   cmm [<index>   <cmm_letter>]]
show stack topology [slot-number]	removed
show stack status	removed
hash-control brief	moved to CapMan
hash-control extended [[no] udp-tcp-port]	moved to CapMan
show hash-control	moved to CapMan
n/a	show escalation-strategy [<slot-id>]
license apply	removed
show license info	removed
show license file	removed

## DHCP Relay Commands

AOS Release 6	AOS Release 7
ip helper no address [ip_address]	no ip helper address <ip_address>*
ip helper address ip_address vlan vlan_id	ip helper vlan <vlan1[-vlan2]> address <ip_address>*
ip helper no address ip_address vlan vlan_id	no ip helper vlan <vlan1[-vlan2]> address <ip_address>*
ip helper avlan only	removed
ip helper forward delay seconds	ip helper forward-delay <seconds>
ip helper maximum hops hops	ip helper maximum-hops <hops>
ip helper traffic-suppression {enable   disable}	removed
ip helper dhcp-snooping {enable   disable}	removed

AOS Release 6	AOS Release 7
ip helper dhcp-snooping mac-address verification {enable   disable}	removed
ip helper dhcp-snooping option-82 data-insertion {enable   disable}	removed
ip helper dhcp-snooping option-82 data-insertion format {base-mac   system-name   userstring string   interface-alias   auto-interface-alias}	removed
ip helper dhcp-snooping bypass option-82-check {enable   disable}	removed
ip helper dhcp-snooping vlan vlan_id [mac-address verification {enable   disable}] [option-82 data-insertion {enable   disable}]	removed
no ip helper dhcp-snooping vlan vlan_id	removed
ip helper dhcp-snooping port slot1/port1[-port1a] {block   client-only   trust}	removed
ip helper dhcp-snooping linkagg num {block   client-only   trust}	removed
ip helper dhcp-snooping port slot1/port1[-port1a] traffic-suppression {enable   disable}	removed
ip helper dhcp-snooping port slot1/port1[-port1a] ip-source-filtering {enable   disable}	removed
ip helper dhcp-snooping port binding {[enable   disable]   [mac_address port slot/port address ip_address vlan vlan_id]}	removed
no ip helper dhcp-snooping port binding mac_address port slot/port address ip_address vlan vlan_id	removed
ip helper dhcp-snooping port binding timeout seconds	removed
ip helper dhcp-snooping port binding action {purge   renew}	removed
ip helper dhcp-snooping binding persistency {enable   disable}	removed
ip udp relay {bootp   nbdd   nbnsnbdd   dns   tacacs   tftp   ntp   port [name]}	ip udp relay service {tftp   tacacs   ntp   nbns   nbdd   dns} [description <desc>]
n/a	ip udp relay port <port> [description <desc>]
no ip udp relay {bootp   nbdd   nbnsnbdd   dns   tacacs   tftp   ntp   port}	ip udp relay no service {tftp   tacacs   ntp   nbns   nbdd   dns}
n/a	ip udp relay no port <port>
ip udp relay {bootp   nbdd   nbnsnbdd   dns   tacacs   tftp   ntp   port} vlan vlan_id	ip udp relay service {tftp   tacacs   ntp   nbns   nbdd   dns} [description <desc>] vlan <vlan1[-vlan2]>

AOS Release 6	AOS Release 7
n/a	ip udp relay port <port> [description <desc>] vlan <vlan1[-vlan2]>
no ip udp relay {bootp   nbdd   nbnsnbdd   dns   tacacs   tftp   ntp   port} vlan vlan_id	ip udp relay service {tftp   tacacs   ntp   nbns   nbdd   dns} no vlan <vlan1[-vlan2]>
n/a	ip udp relay port <port> no vlan <vlan1[-vlan2]>
n/a	ip udp relay no statistics
ip helper no stats	no ip helper statistics
show ip helper dhcp-snooping vlan	removed
show ip helper dhcp-snooping port	removed
show ip helper dhcp-snooping binding	removed

## RIP Commands

AOS Release 6	AOS Release 7
ip rip interface {interface_name} status {enable   disable}	ip rip interface {interface_name} admin-state {enable   disable}

## Sflow Commands

AOS Release 6	AOS Release 7
sflow receiver <num> [name <string>   timeout {<seconds>   forever}   address {<ip_address>   <ipv6address>}   udp-port <port>   packet-size <size>   Version <num>]	sflow receiver <receiver_index> {name <string>   timeout {<seconds>   forever}   address {<ip_address>   <ipv6address>}   udp-port <port>   packet-size <size> Version <num>   release}
sflow receiver <receiver_index> [release]	sflow receiver <receiver_index> {name <string>   timeout {<seconds>   forever}   address {<ip_address>   <ipv6address>}   udp-port <port>   packet-size <size> Version <num>   release}
sflow sampler <num> <portlist> [receiver <receiver_index>   rate <value>   sample-hdr-size <size>]	sflow sampler <num> port <slot/port[-port]> {receiver <receiver_index>   rate <value>   sample-hdr-size <size>}
sflow poller <num> <portlist> [receiver <receiver_index>   interval <value>]	sflow poller <num> port <slot/port[-port]> {receiver <receiver_index>   interval <value>}

## SLB Commands

AOS Release 6	AOS Release 7
ip slb admin {enable   disable}	ip slb admin-state {enable   disable}
ip slb server ip ip_address cluster cluster_name [admin status {enable   disable}]	ip slb server ip <ip_address> cluster <cluster_name> [admin-state {enable   disable}]

## SNMP Commands

AOS Release 6	AOS Release 7
snmp community map <map> user <user>	snmp community-map <map> user <user_name>
snmp community map <map> user <user> {enable   disable}	snmp community-map <map> user <user_name> {enable   disable}
no snmp community map <string>	no snmp community-map <map>
show snmp community map	show snmp community-map
show snmp trap filter	show snmp-trap filter-ip
show snmp trap replay	show snmp-trap replay-ip
show snmp trap config	show snmp-trap config
snmp trap absorption {enable   disable}	snmp-trap absorption {enable   disable}
snmp trap to webview {enable   disable}	snmp-trap to-webview {enable   disable}

## Source Learning Commands

AOS Release 6	AOS Release 7
mac-address-table [permanent] mac_address {slot/port   linkagg link_agg} vid [bridging   filtering]	mac-learning vlan <vid> {port <slot/port>   linkagg <link_agg>} static mac-address <mac_address> [bridging   filtering]
no mac-address-table [permanent   learned] [mac_address {slot/port   linkagg link_agg} vid]	no mac-learning [vlan <vid>] [port <slot/port>   linkagg <link_agg>] {static   dynamic} [mac-address <mac_address>]
mac-address-table static-multicast multicast_address {slot1/port1[-port1a][slot2/port2[  linkagg link_agg]} vid	mac-learning vlan <vid> {port <slot1/port1[-port1]> <[slot2/port2]>   linkagg <link_agg>} multicast mac-address <multicast_address> [group <groupid>]
no mac-address-table static-multicast [<mac_address> {slot1/port1[-port1a][slot2/port2[  linkagg link_agg]} vid]	no mac-learning [vlan <vid>] [port <slot1/port1[-port1]> <[slot2/port2]>   linkagg <link_agg>] {multicast } [mac-address <multicast_address>]
source-learning {port <slot/port> linkagg <agg_num>} enable disable	mac-learning {port <slot/port>  linkagg <link_agg>} {enable disable}
show source-learning [port slot/port   linkagg link_agg]	show mac-learning learning-state [slot <slot>   port <slot/port>   linkagg <link_agg>]
show mac-address-table [permanent   learned   quarantined] [mac_address] [slot slot   slot/port] [linkagg link_agg][vid   vid1-vid2]	show mac-learning [summary] [multicast   static   dynamic   quarantined] [vlan <vid1[-vid2]>] [slot <slot>   port <slot/port>] [linkagg <link_agg>] [mac-address <mac_address>]
source-learning chassis-distributed {enable disable}	mac-learning mode [centralized   distributed]
show source-learning chassis-distributed	show mac-learning mode

## STP Commands

AOS Release 6	AOS Release 7
bridge mode {flat   1x1}	spantree mode {flat   per-vlan}
bridge protocol {stp   rstp   mstp}	spantree protocol {stp   rstp   mstp}
bridge <instance> protocol {stp   rstp   mstp}	removed
bridge cist protocol {stp   rstp   mstp}	spantree cist protocol {stp   rstp   mstp}
bridge 1x1 <vid> protocol {stp   rstp}	spantree vlan <vid> protocol {stp   rstp}
bridge mst <msti_id> region name <name>	spantree mst <msti_id> region name <name>
bridge mst <msti_id> region no name	no spantree mst <msti_id> region name
bridge mst <msti_id> region revision level <rev_level>	spantree mst <msti_id> region revision-level <rev_level>
bridge mst <msti_id> region max hops <max_hops>	spantree mst <msti_id> region max-hops <max_hops>
bridge msti <msti_id> [name <name>]	spantree msti <msti_id> msti_id [name <name>]

AOS Release 6	AOS Release 7
bridge no msti <msti_id>	no spantree msti <msti_id>
bridge msti <msti_id> no name	no spantree msti <msti_id> name
bridge msti <msti_id> vlan <vid_range>	spantree msti <msti_id> vlan <vid_range>
bridge msti <msti_id> no vlan <vid_range>	no spantree msti <msti_id> vlan <vid_range>
bridge priority <priority>	spantree priority <priority>
bridge <instance> priority <priority>	removed
bridge cist priority <priority>	spantree cist priority <priority>
bridge msti <msti_id> priority <priority>	spantree msti <msti_id> priority <priority>
bridge 1x1 <vid> priority <priority>	spantree vlan <vid> priority <priority>
bridge hello time <seconds>	spantree hello-time <seconds>
bridge <instance> hello time <seconds>	removed
bridge cist hello time <seconds>	spantree cist hello-time <seconds>
bridge 1x1 vid hello time <seconds>	spantree vlan <vid> hello-time <seconds>
bridge max age <seconds>	spantree max-age <seconds>
bridge <instance> max age <seconds>	removed
bridge cist max age <seconds>	spantree cist max-age <seconds>
bridge 1x1 <vid> max age <seconds>	spantree vlan <vid> max-age <seconds>
bridge forward delay <seconds>	spantree forward-delay <seconds>
bridge <instance> forward delay <seconds>	removed
bridge cist forward delay <seconds>	spantree cist forward-delay <seconds>
bridge 1x1 <vid> forward delay <seconds>	spantree vlan <vid> forward-delay <seconds>
bridge bpdu-switching {enable   disable}	spantree bpdu-switching {enable   disable}
bridge <instance> bpdu-switching {enable   disable}	removed
bridge cist bpdu-switching {enable   disable}	spantree cist bpdu-switching {enable   disable}
bridge 1x1 <vid> bpdu-switching {enable   disable}	spantree vlan <vid> bpdu-switching {enable   disable}
bridge path cost mode {auto   32bit}	spantree path-cost-mode {auto   32bit}
bridge [msti <msti_id>] auto-vlan-containment {enable   disable}	spantree [msti <msti_id>] auto-vlan-containment {enable   disable}
bridge instance {slot/port   logical_port} {enable   disable}	removed
bridge cist {slot/port   logical_port} {enable   disable}	spantree cist {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} {enable   disable}
bridge 1x1 <vid> {slot/port   logical_port} {enable   disable}	spantree vlan <vid> {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} {enable   disable}
bridge instance {slot/port   logical_port} priority priority	removed

AOS Release 6	AOS Release 7
bridge cist {slot/port   logical_port} priority priority	spantree cist {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} priority priority
bridge msti <msti_id> {slot/port   logical_port} priority priority	spantree msti <msti_id> {port <slot/port>   linkagg <linkagg1[-linkagg2]>} priority priority
bridge 1x1 <vid> {slot/port   logical_port} priority priority	spantree vlan <vid> {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} priority priority
bridge instance {slot/port   logical_port} path cost path_cost	removed
bridge cist {slot/port   logical_port} path cost path_cost	spantree cist {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} path-cost path_cost
bridge msti <msti_id> {slot/port   logical_port} path cost path_cost	spantree msti <msti_id> {port <slot/port>   linkagg <linkagg1[-linkagg2]>} path-cost path_cost
bridge 1x1 <vid> {slot/port   logical_port} path cost path_cost	spantree vlan <vid> {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} path-cost path_cost
bridge instance {slot/port   logical_port} mode {forwarding   blocking   dynamic}	removed
bridge cist {slot/port   logical_port} mode {dynamic   blocking   forwarding}	spantree cist {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} mode {dynamic   blocking   forwarding}
bridge 1x1 <vid> {slot/port   logical_port} mode {dynamic   blocking   forwarding}	spantree vlan <vid> {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} mode {dynamic   blocking   forwarding}
bridge instance {slot/port   logical_port} connection {noptp   ptp   autoptp   edgeport}	removed
bridge cist {slot/port   logical_port} connection {noptp   ptp   autoptp   edgeport}	spantree cist {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} connection {noptp   ptp   autoptp}
bridge 1x1 <vid> {slot/port   logical_port} connection {noptp   ptp   autoptp   edgeport}	spantree vlan <vid> {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} connection {noptp   ptp   autoptp}
bridge cist {slot/port   logical_port} admin-edge {on   off   enable   disable}	spantree cist {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} admin-edge {enable   disable}
bridge 1x1 <vid> {slot/port   logical_port} admin-edge {on   off   enable   disable}	spantree vlan <vid> {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} admin-edge {enable   disable}
bridge cist {slot/port   logical_port} auto-edge {on   off   enable   disable}	spantree cist {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} auto-edge {enable   disable}
bridge 1x1 <vid> {slot/port   logical_port} auto-edge {on   off   enable   disable}	spantree vlan <vid> {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} auto-edge {enable   disable}

AOS Release 6	AOS Release 7
bridge cist {slot/port   logical_port} {restricted-role   root-guard} {on   off   enable   disable}	spantree cist {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} {restricted-role   root-guard} {enable   disable}
bridge 1x1<vid> {slot/port   logical_port} {restricted-role   root-guard} {on   off   enable   disable}	spantree vlan <vid> {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} {restricted-role   root-guard} {enable   disable}
bridge cist {slot/port   logical_port} restricted-tcn {on   off   enable   disable}	spantree cist {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} restricted-tcn {enable   disable}
bridge 1x1<vid> {slot/port   logical_port} restricted-tcn {on   off   enable   disable}	spantree vlan <vid> {port <slot/port1[-port2]>   linkagg <linkagg1[-linkagg2]>} restricted-tcn {enable   disable}
bridge cist txholdcount value	spantree cist txholdcount value
bridge 1x1<vid> txholdcount {value}	spantree vlan <vid> txholdcount {value}
bridge port slot/port 10gig os8800optimized {enable   disable}	removed
bridge rrstp	removed
no bridge rrstp	removed
bridge rrstp ring ring_id port1 {slot/port   linkagg agg_num} port2 {slot/port   linkagg agg_num} vlan-tag vlan_id [status {enable   disable}]	removed
no bridge rrstp ring [ring_id]	removed
bridge rrstp ring ring_id vlan-tag vid	removed
bridge rrstp ring ring_id status {enable   disable}	removed
show spantree <instance>	removed
show spantree 1x1 [vid]	show spantree [vlan <vid>]
show spantree <instance> ports [forwarding   blocking   active   configured]	removed
show spantree 1x1 [vid] ports [forwarding   blocking   active   configured]	show spantree [vlan <vid>] ports [forwarding   blocking   active   configured]
show spantree mst port {slot/port   logical_port}	show spantree mst {port <slot/port>   linkagg <linkagg1[-linkagg2]>}
show bridge rrstp configuration	removed
show bridge rrstp ring [ring_id]	removed
show spantree map-msti	show spantree [vlan <vlan_id>] map-msti
bridge mode 1x1 pvst+ {enable   disable}	spantree pvst+compatibility {enable   disable}
bridge port {slot/port   agg_num} pvst+ {auto   enable   disable}	spantree pvst+compatibility {port <slot/port>   linkagg <linkagg1[-linkagg2]>} {enable   disable   auto}

## System Services Command

AOS Release 6	AOS Release 7
update {miniboot   uboot-miniboot}	removed
more [<string>   size]	Replaced by linux version of command: more
no more	removed
show more	removed
ls [-r] [<string>]	Replaced by linux version of command: ls
rm [-r] [<string>]	Replaced by linux version of command: rm
cp [-r] [<string>]	Replaced by linux version of command: cp
fsck /flash [repair   no-repair]	removed
newfs /flash	removed
dshell	removed
view <string>	removed
tftp {<string>   <ip_address>} {get   put} source-file <string> [ascii   destination-file <string>]	removed
backup <string> <string>	removed
restore <string> [display-only   <string>]	removed
freespace [/flash]	freespace [/flash   /uflash]
n/a	usb {enable   disable}
n/a	usb auto-copy {enable   disable}
n/a	show usb statistics
no ktrace	removed
ssh6 <dest_address>	removed
sftp6 <dest_address>	removed
show ssh config	removed
show history	history
show swlog	show swlog [appid {<appname>   all}]
show log swlog [timestamp <date> <time>   session <int>   appid <app>   level <level>]	show log swlog
swlog clear	swlog clear [slot {<int>   all}]
swlog output flash file-size integer	swlog output flash-file-size <size>
[no] swlog	swlog [appid {<appname>   all} subapp {<0-31>   all}] {enable   disable}
swlog appid appidlist level level	swlog appid <name> subapp <0-31> level <num> [vrf <vrf>]
no swlog appid appidlist	removed
n/a	[no] swlog preamble

AOS Release 6	AOS Release 7
n/a	[no] swlog duplicate-detect
n/a	swlog hash-time-limit <limit>
n/a	swlog output tty {enable   disable}
session banner {cli   ftp   http} <file_name >	session {cli ftp http} banner <file_name>
session banner no {cli   ftp   http}	no session {cli ftp http} banner
session timeout {cli   http   ftp} <minutes>	session {cli ftp http} timeout <minutes>
session {ftp   tftp   sftp   telnet} port <port>	ip service {ftp   ssh   telnet} port {default   <port>}
upgrade ni <int> license-key <"string">	removed
exit	Replaced by linux version of command: exit
kill <int>	Replaced by linux version of command: kill
alias <string> <string>	Replaced by linux version of command: alias
no alias [all   <string>]	Replaced by linux version of command: unalias
show alias [all   <string>]	Replaced by linux version of command: alias
cd [<directory>]	Replaced by linux version of command: cd
pwd	Replaced by linux version of command: pwd
mkdir [<directory>]	Replaced by linux version of command: mkdir
rmdir [<directory>]	Replaced by linux version of command: rmdir
dir [<directory>]	Replaced by linux version of command: ls
rename <file1> <file2>	Replaced by linux version of command: mv
delete <file>	Replaced by linux version of command: rm
mv <file1> <string>	Replaced by linux version of command: mv
move <file1> <string>	Replaced by linux version of command: mv
attrib {+w   -w} <string>	removed: same command as chmod
ftp {<string>   <ip_address>}	Replaced by linux version of command: ftp
vi <filename>	Replaced by linux version of command: vi
telnet {<string>   <ip_address>}	Replaced by linux version of command: telnet
scp {<string>   <ip_address>} {<string>   <ip_address>}	Replaced by linux version of command: scp
aclman	removed
rz	removed
install {<string>}+	removed
scp-sftp {enable   disable}	removed
ftp6 {<string>   <ipv6_address>} <interface>	removed
telnet6 {<string>   <ipv6_address>} <interface>	removed
prompt [none] [time   system   user   date   prefix   string <string>]*	removed

## VLAN Manager Commands

AOS Release 6	AOS Release 7
vlan <vid1[-vid2]> 802.1q {<slot/port1[-port2]>   <aggregate_id>}	vlan <vid1[-vid2]> members {port <slot/port1[-port2]>   linkagg <agg1[-agg2]>} tagged
no vlan <vid1[-vid2]> 802.1q {<slot/port[-port2]>   <aggregate_id>}	no vlan <vid1[-vid2]> members {port <slot/port1[-port2]>   linkagg <agg1[-agg2]>}
vlan <vid> port default {<slot/port>   <link_agg>}	vlan <vid> members {port <slot/port1[-port2]>   linkagg <agg1[-agg2]>} untagged
no vlan <vid1[-vid2]> port default {<slot/port>   <link_agg>}	no vlan <vid1[-vid2]> members {port <slot/port1[-port2]>   linkagg <agg1[-agg2]>}
vlan <vid1[-vid2]> [enable   disable]	vlan <vid1[-vid2]> [admin-state {enable   disable}]
no vlan vid mac mac_address	removed
no vlan vid mac range low_mac_address	removed
no vlan vid ip ip_address [subnet_mask]	removed
no vlan vid ipx ipx_net	removed
no vlan vid protocol {ip-e2   ip-snap   ipx-e2   ipx-nov   ipx-llc   ipx-snap   decnet   appletalk   ethertype type   dsapssap dsap/ssap   snap snaptype}	removed
no vlan vid port slot/port	removed
no vlan port mobile slot/port	removed
no vlan vid router ipx	removed
show vlan [<vid1[-vid2]>] [port [<slot/port>   <link_agg>]]	show vlan [<vid1[-vid2]>] [members [port <slot/port1[-port2]>   linkagg <agg1[-agg2]>]]
show vlan router mac-status	removed
vlan 802.1q slot/port frame type {all   tagged}	removed
show 802.1q {slot/port   aggregate_id}	removed
show vlan gvrp [vid1[-vid2]]	removed
show vlan ipmvlan [ipmvlan-id1[-ipmvlan-id2]]	removed
vlan vid1[-vid2] {1x1   flat} stp {enable   disable}	removed
vlan <vid1[-vid2]> stp {enable   disable}	spantree vlan <vid1[-vid2]> admin-state {enable   disable}
vlan vid1[-vid2] mobile-tag {enable   disable}	removed
vlan vid router ipx ipx_net [rip   active   inactive   triggered] [e2   llc   snap   novell] [timeticks ticks]	removed

## VLAN Stacking Commands

AOS Release 6	AOS Release 7
ethernet-service {svlan   ipmvlan   management-vlan} svid1[-svid2] [enable   disable] [[1x1   flat] stp {enable   disable}] [name description]	ethernet-service svlan <svlan1[-svlan2]> [admin-state {enable   disable}] [stp {enable   disable}] [name <description>]

<b>AOS Release 6</b>	<b>AOS Release 7</b>
no change	no change

---

# OmniSwitch CLI Short Cuts

The following table provides a list of some of the CLI command short cuts (hot keys):

<b>Delete Short Cuts</b>	<b>Description</b>
Delete	Removes one character to the right of the cursor.
Backspace	Removes one character to the left of the cursor.
Ctrl-U	Erases a line.
Ctrl-W	Erases a word.
Ctrl-K	Delete end of line.
Ctrl-X Backspace	Delete beginning of line.
Alt-D	Delete end of word.
Alt-Backspace	Delete beginning of word.
Ctrl-Y	Paste previously deleted/memorized word.
<b>Completion Short Cuts</b>	<b>Description</b>
TAB	Finishes a partial command.
Alt-?	Shows how a partial command would be finished.
Alt-*	Finishes a partial command with every word possible.
Ctrl-X /	Shows completion using filenames only
Alt-/	Performs completion using filenames only
<b>Cursor Short Cuts</b>	<b>Description</b>
Ctrl-A	Moves the cursor to the beginning of the current line.
Ctrl-E	Moves the cursor to the end of the current line.
Ctrl-X Ctrl-X	Moves the cursor to the beginning/previous position in the current line.
Ctrl-] <char>	Moves the cursor to the next occurrence of <char>
Ctrl-Alt-] <char>	Moves the cursor to the previous occurrence of <char>
Alt-B	Moves the cursor to beginning of word.
Alt-F	Moves the cursor to end of word.
<b>History Short Cuts</b>	<b>Description</b>
Up Arrow	Allows user to scroll forward through former commands.
Down Arrow	Allows user to scroll backward through former commands.
Ctrl-R	Start/Resume backward history search mode.
Ctrl-S	Start/Resume forward history search mode.
Ctrl-J	Start editing history entry found in search mode.
<b>Other Short Cuts</b>	<b>Description</b>
Ctrl-R	Redisplay a line.
Ctrl-L	Clears screen.

---

Ctrl-T	Swaps two characters.
Alt-T	Swaps two words.
Alt-C	Switches character to upper case.
Alt-U	Switches end of word to upper case.
Alt-L	Switches end of word to lower case.
Ctrl-_	Undo (e.g. backspaces)
Alt-#	Comment out current line.
Alt-<number>	Repeat next command.

# CLI Quick Reference

## Ethernet Port Commands

```
interfaces {slot/ slot/port[-port2]} {admin-state | autoneg } {enable|disable}
interfaces { slot / slot/port [-port2] } speed { 10 | 100 | 1000 | auto | max {10 | 100 | 1000}}
interfaces {slot/ slot/port[-port2]} crossover {auto | mdix | mdi}
interfaces {slot/ slot/port[-port2]} duplex {full | half | auto}
interfaces slot/port alias description

```
rmon probes {stats|history|alarm} [entry-number] {enable|disable}
show rmon probes [stats|history|alarm] [entry-number]
show rmon events [event-number]
```

## VLAN Stacking Commands

```
ethernet-service svlan {svlan_id [-svlan_id2]} [admin-state {enable|disable}] [stp {enable|
disable}] [name description]
no ethernet-service svlan {svlan_id [-svlan_id2]}
ethernet-service svlan svlan1[-svlan2] source-learning {enable|disable}
Creates a VLAN Stacking service and associates the service with an SVLAN. A service can
be carried only on a single SVLAN. All traffic within the associated service is carried on
the SVLAN.
ethernet-service service-name service-name svlan svlan_id
no ethernet-service service-name service-name svlan svlan_id

show command-log
show command-log status
```

## File Management Commands

```
cd [path]
pwd
mkdir [options] [path] /dirname
rmdir [options] dirname
ls [options] [path/filename]
rm [options] [path/filename]
cp [options] source destination
scp [options] user_name@remote_ip_addr:[path/]source [path/]target
scp [options] [path/]source user_name@remote_ip_addr:[path/]target
mv [options] source destination
chmod {+w | -w} [path/file]
freespace [/flash | /uflash]
newfs /uflash
rmp [rem-slot: source_filepath destination_filepath]
rmdir filepath
rmdir directory [file_name]
vi [options] [path/filename]
tty lines columns
show tty
tftp [options] host [port]
ftp {port [default | service_port] | admin-state [enable | disable] | host_name | ip_address}
```

## Web Management Commands

```
webview server enable
webview server disable
webview access enable
webview access disable
webview force-ssl enable
webview force-ssl disable
webview http-port {default | port port}
webview https-port {default | port port}
show webview
```

## Configuration File Manager Commands

```
configuration apply filename [at hh:mm month dd [year]] | [in hh[:mm]] [verbose]
configuration error-file-limit number
show configuration status
configuration cancel
configuration syntax-check path/filename [verbose]
configuration snapshot feature_list [path/filename]
show configuration snapshot [feature_list]
write terminal
```

## SNMP Commands

```
snmp station {ip_address | ipv6_address} {[udp_port] [username] [v1 | v2 | v3] [enable |
disable]}
no snmp station {ip_address | ipv6_address}
show snmp station
snmp community-map community_string {[user useraccount_name] | {enable | disable}}
no snmp community-map community_string
snmp community-map mode {enable | disable}
show snmp community-map
snmp security {no-security | authentication set | authentication all | privacy set | privacy all |
trap-only}
show snmp security
show snmp statistics
show snmp mib-family [table_name]
snmp-trap absorption {enable | disable}
snmp-trap to-webview {enable | disable}
snmp-trap replay-ip {ip_address | ipv6_address} [seq_id]
snmp-trap filter-ip {ip_address | ipv6_address} trap_id_list
no snmp-trap filter-ip {ip_address | ipv6_address} trap_id_list
snmp authentication-trap {enable | disable}
```

```
show snmp-trap replay-ip
show snmp-trap filter-ip
show snmp authentication-trap
show snmp-trap config
```

## DNS Commands

```
ip domain-lookup
no ip domain-lookup
ip name-server server-address1 [server-address2 [server-address3]]
ipv6 name-server server-ipv6_address1 [server-ipv6_address2 [server-ipv6_address3]]
ip domain-name name
no ip domain-name
show dns
```

  - administrative contact 41-3
  - date 41-6
  - location 41-5
  - name 41-4
  - time 41-6, 41-7
  - time zone 41-8

## T

- telnet 44-29
- timer session 47-6
- Time-To-Live
  - see* TTL
- ToS
  - mapped to 802.1p or DSCP 28-144
  - QoS port default 27-44
- TTL 26-5, 26-6

## U

- UDLD 2-1
  - clear UDLD statistics 2-11
  - probe-message advertisement timer 2-7
  - show global status 2-12
  - show neighbor ports 2-18
- user accounts
  - SNMP access 31-22
- UTC 43-1

## V

- VLAN rules
  - MAC address 30-17, 30-19, 30-21
- VLAN Stacking
  - display list of all or range of configured SVLANs 37-28, 37-32, 37-33, 37-45
  - ethernet-service sap 37-12
  - ethernet-service uni-profile 37-23
- VLANs 4-1, 4-2, 9-1
  - administrative status 4-2
  - default VLAN 4-4
  - description 4-2
  - port assignments 4-4
  - secondary VLAN 4-4
  - Spanning Tree status 6-7
- VRRP
