

# Cloudpath Enrollment System

# How to Set Up Clustering With Cloudpath ES Servers

Software Release 4.3 April 2016

**Summary:** This document describes the different topologies supported when clustering Cloudpath ES servers, how to prepare your system, how to configure clustering using the ES Admin UI, and how to monitor the status of the replication. **Document Type:** Configuration **Audience:** Network Administrator

# How to Set Up Clustering With Cloudpath ES Servers

Software Release 4.3 April 2016

# How to Set Up Clustering With Cloudpath ES Servers

In addition to VMware-based high availability, the Cloudpath Enrollment System (ES) supports replication (native clustering) capabilities. Clustering provides high-availability and high-scalability using two or more servers with all servers being available for active use.

# **Replication Topologies**

The ES supports replication between two servers, or between servers in a star pattern. Replication between two servers allows two master servers to replicate with both servers being available for active use. Replication in a star pattern allows 3 or more servers to replicate, with all servers being available for active use.

When using replication in ES, the data is pushed from one server to the other server(s).

- With the two-server configuration, the data is pushed from the server from which replication is configured to the second server.
- With the star-pattern configuration, the data is pushed from the hub server (the server from which replication is configured) to the other server nodes.

In both configurations, all nodes are active and the database is synchronized to all nodes. The ES does not support an active-passive configuration.

# **Two-Server Topology**

The two-server configuration is a master-master configuration, where the servers continuously replicate and both servers are available for active use, such as a live backup. A two-server configuration is useful when you have two sites and have active enrollments running on both sites simultaneously.

# **Star Topology**

A star pattern is useful when you want information shared between multiple data servers through a central hub. This allows information to be replicated to a central host and then replicated back out to the other server nodes. In a multi-site configuration the star pattern can be used to concentrate information at head office, while allowing the different locations and sites to also have a copy of all the data.

The star pattern is suitable for environments with a higher load, or where you need redundancy. We recommend using 3 servers, with two set up for load balancing and the third as the hub. Although the hub server can be used for enrollments, we suggest using it primarily for backup. With the star topology, the hub is the master server, and the database is copied from the master to the other server nodes (slaves).

#### FIGURE 2. Star Pattern Configuration

If the hub server becomes inoperable, replication stops, but the server nodes continue to onboard users. If a slave becomes inoperable, the hub and remaining servers continue to function normally.

# Prerequisites

To configure replication, set up 2 or more ES virtual appliances with the same OVA. When configuring these virtual appliances, all application and network properties must be the same for all servers in the cluster.

#### Note >>

For replication setup, all hosts must be able to communicate with all other nodes. However, after replication setup is complete, you can restrict communications, if needed. For replicated servers to continually sync, the hub must be able to access each server node, but each server node needs access only to the hub.

Each server must have a unique FQDN Hostname and network IP address. The DNS servers and gateway need not be the same as long as there is network connectivity between the servers. However, all server nodes must use the same SSH port as the hub.

Note >>

When using replication, the FQDN Hostname of your system cannot change.

### **Firewall Requirements**

The ES Admin UI provides a table that lists the inbound and outbound traffic of your Cloudpath ES. This information is dynamically generated based on the current system configuration and can changes as the system configuration is modified.

Go to Administration > Advanced > Firewall Requirements to ensure that your firewall ports have been correctly configured for replication.

### **Test Connectivity**

Be configuring replication, be sure that each system can resolve DNS and that each virtual appliance can communicate with the other server nodes to be replicated.

### Check OCSP

The ES provides a check status URL to allow a load balancer to query the status of the OCSP responder.

#### Note >>

This check is supported using **HTTP** only.

Use the format http://<ES hostname>/ocsp/ping. For example, enter http://test22.company.com/ocsp/ping. The return status should be a Success message.

For negative testing, use http://<ES hostname>/ocsp/pingFail. The return status is a 404 message.

# **Configuring Replication**

This section describes how to configure replication using the ES Admin UI.

# **Replication Setup**

Choose one VMware server as the Master node. This is the server from which you set up replication in the ES Admin UI.

- 1. Go to Administration > System > Replication.
- 2. Click the Edit icon.
- **3.** Select the replication pattern. See Replication Topologies for information about which topology to choose.

#### FIGURE 3. Configure Replication

tup	Status		
onfi <u>c</u>	gure Replication		Cancel Save
۲	Setup replication between tw Allows two servers to replicate with use.	<b>vo servers.</b> n both servers being available for active	Active
		External DNS	Local DNS
	Server: Server:	anna43.cloudpath.net	
0	Setup replication in star patter Allows more than two servers to re for active use. Intended for deploy one server each or (b) one datacer	Active Active Active Active	

4. Enter the *External Server DNS* for the nodes. This is the *FQDN Hostname* of the ES server configured in the initial system setup.

#### Note >>

If your environment is set up for Network Address Translation (NAT) behind a firewall, enter both the *External* and *Internal DNS* hostnames for the ES servers in the cluster.

5. Click Save.

The Cloudpath ES saves the data from the server node from which replication was configured, then copies the database to the other server nodes. This can take a while, depending on the number of server nodes and the size of the database.

The *Replication Setup* page displays the progress of the operation.

Replication Setup	
Setup SSH:	🗸 Successful.
Setup MySQL:	🗸 Successful.
Perform Validation:	🗸 Successful.
Database Copy:	🗸 Successful.
Install Replication:	<sup>\\\\</sup> \\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\
Setup Directories:	
Copy Configurations:	
Cleanup:	
Log:	Download

FIGURE 4. Replication In-Progress

When all processes are complete and display a Success status, click Next to return to the replication Setup page. The Setup Status should be in the Completed state and the Status in the Running state. The ES provides a log file for the replication setup process.

Component:	Replicatio	on		۵/		
5	etup Status:	Completed.	og			
Status: Running Details						
Load Balancer: Specify the hostname for the deployment location Enrollment URL Replication Servers						
	Status:	Action	Server	Status		
		٢	anna41.cloudpath.net	ONLINE		
		٨	anna42.cloudpath.net	ONLINE		
		٢	anna43.cloudpath.net	ONLINE		

#### FIGURE 5. Replication Enabled and Running

The Replication Servers table lists all servers in the cluster. After setup, all servers should be Enabled (green icon) and ONLINE. Click the Details button to view the replication Status page.

The Collect Replication Logs button is typically used for troubleshooting. This gathers the necessary log information and saves it to a tar.gz file. This file can be sent to the support team upon request.

### **Replication Status**

The Replication Status page (Administration > System > Replication > Status) displays the state of each server in the cluster and the applied latency.

#### FIGURE 6. Replication Status

When replication is running, you can make configuration changes on the ES Admin UI and the other nodes stay in sync with one another. Enrollments can be managed by any server in the cluster and all servers in the cluster maintain the enrollment records for all servers in the cluster.

### **Managing the Cluster**

Use the Replication Status to monitor the health of the ES servers in the cluster.

# **Replication States**

With replication, an Cloudpath ES server can be in one of several states:

- Not Setup The ES server has not been configured for replication.
- Running Replication has been set up and is currently running.
- Stopped Replication has been configured but the replication service is not running.
- Starting:Synchronizing The ES server was previously stopped or disabled and is in the process of synchronizing with the master server.
- Offline:Normal The server is configured for replication, but has been disabled.

• Offline:Error - The server is in an error state and will try to correct the issue. This can take 5 to 10 minutes. If the server is unable to resolve the issue, replication should be disabled for troubleshooting.

# **Enable or Disable Server**

You can enable or disable replication for individual servers or remove the replication configuration completely.

#### **Disabling a Server in the Cluster**

If you disable the cluster, this leaves all the replication functionality in place but stops the database updates between the server nodes. When you re-enable, the nodes process the database changes and eventually all servers are back in sync.

*Disable* is often used for troubleshooting individual server issues, and is required prior to upgrading the system.

To disable replication for a server:

- 1. Go to Administration > System > Replication and toggle the green Enabled icon.
- 2. Confirm that you want to disable replication.

The ES Admin UI displays the replication *Status* as *Stopped* and the *Enabled* icon clear, to indicate that replication has been disabled.

#### Note >>

After re-enabling replication, it takes a few minutes for the *Replication Status* page to show that all servers are back *Online*.

### **Remove Cluster**

To make topology changes, such as adding another server, or replacing an inoperable server in the cluster, you must take down the cluster configuration and rebuild it with the new servers.

#### How to Remove the Cluster Configuration

When you remove a cluster, the ES deletes all of the replication functionality, but leaves the database in the current state.

Use *Remove Cluster* to add new servers to the cluster. You must remove the cluster from all devices and install replication again on the new servers.

To remove a cluster configuration:

- 1. Go to Administration > System > Replication and click Remove Cluster in the Maintenance section.
- 2. Confirm that you want to uninstall replication.

FIGURE 7. Remove Cluster Confirmation

FIGURE 8. You are returned to the Replication Setup page.

# **Upgrading Replicated Systems**

# **Upgrades**

You do not need to disable or stop the replication service to upgrade your system.

- 1. Choose a time period with no enrollments.
- 2. Upgrade the primary server first. This is the server from which you configured replication.
- 3. Give the system time to finish the re-sync before you upgrade the secondary servers. Depending on your network environment and the number of servers in your cluster, this might take some time. The script that updates the database due to an upgrade, and then re-syncs the databases in the cluster, may require more than one pass to complete this process on all servers in the cluster.

### **Restart RADIUS Server**

You might be required to start the onboard RADIUS servers after replication is set up. The onboard RADIUS server on the master server, or hub should remain in a running state, but the server nodes, or slaves, may not start unless restarted from the Admin UI or from a console.

#### Note >>

Refer to the release notes or upgrade instructions for details about upgrading to a specific version.

# **Troubleshooting Replication**

This section describes issues to consider when testing or troubleshooting Cloudpath ES servers that have been configured for replication.

# **Enable/Disable Replication**

If replication is configured but does not appear to be working, try disabling and re-enabling individual servers from the *Administration > System > Replication* page.

### DNS

Verify that DNS is properly configured with the FQDN on all hosts.

### Hostname

The replication configuration in the Cloudpath ES is set up using the FQDN for each system. If you are running replication, changing the FQDN from the command line interface causes replication to become inoperable.

# Load Balancer Enrollment URL

If you are using a load balancer with your replication setup, the *Deployment Location Enrollment URL* must contain the hostname of the load balancer, and not the Cloudpath ES virtual appliance.

- 1. On the Replication Setup page, in the Load Balancer section, click Enrollment URL.
- 2. On Deployment Locations page, expand the Deployment Location, and click Change.
- 3. On the *Modify Enrollment URL* page, enter the hostname of the load balancer in the first (hostname) field.

#### Note >>

If you are not using a load balancer, the deployment URL for the master server becomes the deployment URL for all servers in the cluster.

# Check OCSP

The ES provides a check status URL to allow a load balancer to query the status of the OCSP responder. Use the format *http://<ES hostname>/ocsp/ping*. The return status should be a *Success* message.

For negative testing, use http://<ES hostname>/ocsp/pingFail. The return status is a 404 message.

# **Web Server Certificates**

If you are using a load balancer, the system displays a message when you log in that the URL is a mismatch with the server certificate. You can suppress this message by putting the load balancer URL in Administrative- > Company Info > Vanity URL.

# **Firewall Settings**

The ES Admin UI provides a table that lists the inbound and outbound traffic of your Cloudpath ES. This information is dynamically generated based on the current system configuration and can changes as the system configuration is modified.

Go to Administration > Advanced > Firewall Requirements to ensure that your firewall ports have been correctly configured for replication.

#### FIGURE 9. Firewall Requirements

Replication ports are provided when replication is configured and running.

### **Web Server SSL Ciphers**

The Apache SSL cipher, SSL protocol, and strict transport security settings are not replicated to the other servers in the cluster. If you make changes to these settings (*Administration > System > System Services > Web Server*), you must change them on each server individually.

# **Replication Commands**

The replication commands are designed for members of the support team to use for troubleshooting. Customers would typically not be required to run these commands unless requested by the support team.

#### Note >>

In most cases, gathering log data through the ES Admin UI, *Collect Replication Logs* button, is sufficient for troubleshooting purposes.

Replication commands are run from the command-line configuration utility prompt (#).

#### Tip >>

From the command-line configuration utility, enter the **console** command to access the Linux shell. From the Linux shell, enter the **config** command to access the command-line configuration utility.

Command	Description	Parameters and Examples
replication force-	Forces the removal of the	No parameters.
cleanup	replication setup.	replication force-cleanup
replication replicator	Perform an operation on the replication server.	[start][stop][restart][status][offline][on line]
		<pre>#replication replicator restart</pre>
		or
		<pre>#replication replicator status</pre>
replication show-	Displays the state of the	No parameters.
cluster	cluster.	<pre>#replication show-cluster</pre>
replication show-log	Show log.	No parameters.
		<pre>#replication show-log</pre>

#### TABLE 1. replication commands

13

Command	Description	Parameters and Examples
replication trepctl	Performs an operation on a service (ex. alpha, bravo,	[FQDN of the server node][service name][status/online/offline]
	charlie).	<pre>#replication trepctl test23.company.net alpha status</pre>
		or
		<pre>#replication trepctl test23.company.net bravo offline</pre>
replication validate-	Displays whether replication	No parameters.
cluster	can be set up on this server.	<pre>#replication validate-cluster</pre>
	<b>Note:</b> This command should only be used before replication is set up.	

#### TABLE 1. replication commands

# **Additional Documentation**

You can find detailed information in the Cloudpath ES configuration guides, located on the left-menu *Support* tab of the ES Admin UI.

# About Cloudpath

Cloudpath Networks, Inc. provides software solutions and services that simplify the adoption of standards-based security, including WPA2-Enterprise and 802.1X, in diverse BYOD environments. Our goal is to make secure as simple as insecure; simple for network administrators to deploy and simple for users to access.

To learn more about the Cloudpath ES and how it can simplify your wireless environment, visit <u>www.cloudpath.net</u> or contact a Cloudpath representative.

If you need technical assistance, discover a bug, or have other technical questions, email support at support@cloudpath.net.
