No part of this content may be reproduced in any form or by any means or used to make any derivative work (such as translation, transformation, or adaptation) without written permission from ARRIS International plc and/or its affiliates ("ARRIS"). ARRIS reserves the right to revise or change this content from time to time without obligation on the part of ARRIS to provide notification of such revision or change.

Export Restrictions

These products and associated technical data (in print or electronic form) may be subject to export control laws of the United States of America. It is your responsibility to determine the applicable regulations and to comply with them. The following notice is applicable for all products or technology subject to export control:

These items are controlled by the U.S. Government and authorized for export only to the country of ultimate destination for use by the ultimate consignee or end-user(s) herein identified. They may not be resold, transferred, or otherwise disposed of, to any other country or to any person other than the authorized ultimate consignee or end-user(s), either in their original form or after being incorporated into other items, without first obtaining approval from the U.S. government or as otherwise authorized by U.S. law and regulations.

Disclaimer

THIS CONTENT AND ASSOCIATED PRODUCTS OR SERVICES ("MATERIALS"), ARE PROVIDED "AS IS" AND WITHOUT WARRANTIES OF ANY KIND, WHETHER EXPRESS OR IMPLIED. TO THE FULLEST EXTENT PERMISSIBLE PURSUANT TO APPLICABLE LAW, ARRIS DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, TITLE, NON-INFRINGEMENT, FREEDOM FROM COMPUTER VIRUS, AND WARRANTIES ARISING FROM COURSE OF DEALING OR COURSE OF PERFORMANCE. ARRIS does not represent or warrant that the functions described or contained in the Materials will be uninterrupted or error-free, that defects will be corrected, or are free of viruses or other harmful components. ARRIS does not make any warranties or representations regarding the use of the Materials in terms of their completeness, correctness, accuracy, adequacy, usefulness, timeliness, reliability or otherwise. As a condition of your use of the Materials, you warrant to ARRIS that you will not make use thereof for any purpose that is unlawful or prohibited by their associated terms of use.

Limitation of Liability

IN NO EVENT SHALL ARRIS, ARRIS AFFILIATES, OR THEIR OFFICERS, DIRECTORS, EMPLOYEES, AGENTS, SUPPLIERS, LICENSORS AND THIRD PARTY PARTNERS, BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL, EXEMPLARY OR CONSEQUENTIAL DAMAGES, OR ANY DAMAGES WHATSOEVER, EVEN IF ARRIS HAS BEEN PREVIOUSLY ADVISED OF THE POSSIBILITY OF SUCH DAMAGES, WHETHER IN AN ACTION UNDER CONTRACT, TORT, OR ANY OTHER THEORY ARISING FROM YOUR ACCESS TO, OR USE OF, THE MATERIALS. Because some jurisdictions do not allow limitations on how long an implied warranty lasts, or the exclusion or limitation of liability for consequential or incidental damages, some of the above limitations may not apply to you.

Trademarks

ARRIS, the ARRIS logo, Ruckus, Ruckus Wireless, Ruckus Networks, Ruckus logo, the Big Dog design, BeamFlex, ChannelFly, Edgelron, FastIron, HyperEdge, ICX, IronPoint, OPENG, SmartCell, Unleashed, Xclaim, ZoneFlex are trademarks of ARRIS International plc and/or its affiliates. Document Conventions

The following table lists the text conventions that are used throughout this guide.

TABLE 1 Text Conventions

Convention	Description	Example
monospace	Identifies command syntax examples	device(config)# interface ethernet 1/1/6
bold	User interface (UI) components such as screen or page names, keyboard keys, software buttons, and field names	On the Start menu, click All Programs .
<i>italics</i>	Publication titles	Refer to the <i>Ruckus Small Cell Release Notes</i> for more information.

Notes, Cautions, and Warnings

Notes, cautions, and warning statements may be used in this document. They are listed in the order of increasing severity of potential hazards.

NOTE

A NOTE provides a tip, guidance, or advice, emphasizes important information, or provides a reference to related information.

ATTENTION

An ATTENTION statement indicates some information that you must read before continuing with the current action or task.

CAUTION

 A CAUTION statement alerts you to situations that can be potentially hazardous to you or cause damage to hardware, firmware, software, or data.

DANGER

 A DANGER statement indicates conditions or situations that can be potentially lethal or extremely hazardous to you. Safety labels are also attached directly to products to warn of these conditions or situations.

Command Syntax Conventions

Bold and italic text identify command syntax components. Delimiters and operators define groupings of parameters and their logical relationships.

Convention	Description
bold text	Identifies command names, keywords, and command options.
<i>italic</i> text	Identifies a variable.
[]	Syntax components displayed within square brackets are optional.
{ x y z }	Default responses to system prompts are enclosed in square brackets.
{ x y z }	A choice of required parameters is enclosed in curly brackets separated by vertical bars. You must select one of the options.
x y	A vertical bar separates mutually exclusive elements.
< >	Nonprinting characters, for example, passwords, are enclosed in angle brackets.
...	Repeat the previous element, for example, member[member...].
\	Indicates a “soft” line break in command examples. If a backslash separates two lines of a command input, enter the entire command at the prompt without the backslash.

Document Feedback

Ruckus is interested in improving its documentation and welcomes your comments and suggestions.

You can email your comments to Ruckus at ruckus-docs@arris.com.

When contacting us, include the following information:

- Document title and release number
- Document part number (on the cover page)
- Page number (if appropriate)

For example:

- Ruckus SmartZone Upgrade Guide, Release 5.0
- Part number: 800-71850-001 Rev A
- Page 7

Ruckus Product Documentation Resources

Visit the Ruckus website to locate related documentation for your product and additional Ruckus resources.

Release Notes and other user documentation are available at <https://support.ruckuswireless.com/documents>. You can locate the documentation by product or perform a text search. Access to Release Notes requires an active support contract and a Ruckus Support Portal user account. Other technical documentation content is available without logging in to the Ruckus Support Portal.

White papers, data sheets, and other product documentation are available at <https://www.ruckuswireless.com>.

Online Training Resources

To access a variety of online Ruckus training modules, including free introductory courses to wireless networking essentials, site surveys, and Ruckus products, visit the Ruckus Training Portal at <https://training.ruckuswireless.com>.

Contacting Ruckus Customer Services and Support

The Customer Services and Support (CSS) organization is available to provide assistance to customers with active warranties on their Ruckus products, and customers and partners with active support contracts.

For product support information and details on contacting the Support Team, go directly to the Ruckus Support Portal using <https://support.ruckuswireless.com>, or go to <https://www.ruckuswireless.com> and select **Support**.

What Support Do I Need?

Technical issues are usually described in terms of priority (or severity). To determine if you need to call and open a case or access the self-service resources, use the following criteria:

- Priority 1 (P1)—Critical. Network or service is down and business is impacted. No known workaround. Go to the **Open a Case** section.
- Priority 2 (P2)—High. Network or service is impacted, but not down. Business impact may be high. Workaround may be available. Go to the **Open a Case** section.
- Priority 3 (P3)—Medium. Network or service is moderately impacted, but most business remains functional. Go to the **Self-Service Resources** section.
- Priority 4 (P4)—Low. Requests for information, product documentation, or product enhancements. Go to the **Self-Service Resources** section.

Open a Case

When your entire network is down (P1), or severely impacted (P2), call the appropriate telephone number listed below to get help:

- Continental United States: 1-855-782-5871
- Canada: 1-855-782-5871
- Europe, Middle East, Africa, Central and South America, and Asia Pacific, toll-free numbers are available at <https://support.ruckuswireless.com/contact-us> and Live Chat is also available.
- Worldwide toll number for our support organization. Phone charges will apply: +1-650-265-0903

We suggest that you keep a physical note of the appropriate support number in case you have an entire network outage.

Self-Service Resources

The Ruckus Support Portal at <https://support.ruckuswireless.com> offers a number of tools to help you to research and resolve problems with your Ruckus products, including:

- Technical Documentation—<https://support.ruckuswireless.com/documents>

Preface

Contacting Ruckus Customer Services and Support

- Community Forums—<https://forums.ruckuswireless.com/ruckuswireless/categories>
- Knowledge Base Articles—<https://support.ruckuswireless.com/answers>
- Software Downloads and Release Notes—https://support.ruckuswireless.com/#products_grid
- Security Bulletins—<https://support.ruckuswireless.com/security>

Using these resources will help you to resolve some issues, and will provide TAC with additional data from your troubleshooting analysis if you still require assistance through a support case or RMA. If you still require help, open and manage your case at https://support.ruckuswireless.com/case_management.

GPB-MQTT Interface Implementation

• GPB-MQTT Overview.....	9
• Prerequisite Task.....	9
• Working with the GPB/MQTT Interface.....	11
• Enabling Authentication in the MQTT Broker.....	11
• Compiling Google Protobuf Binding Classes.....	14
• Executing the Test Subscriber.....	15

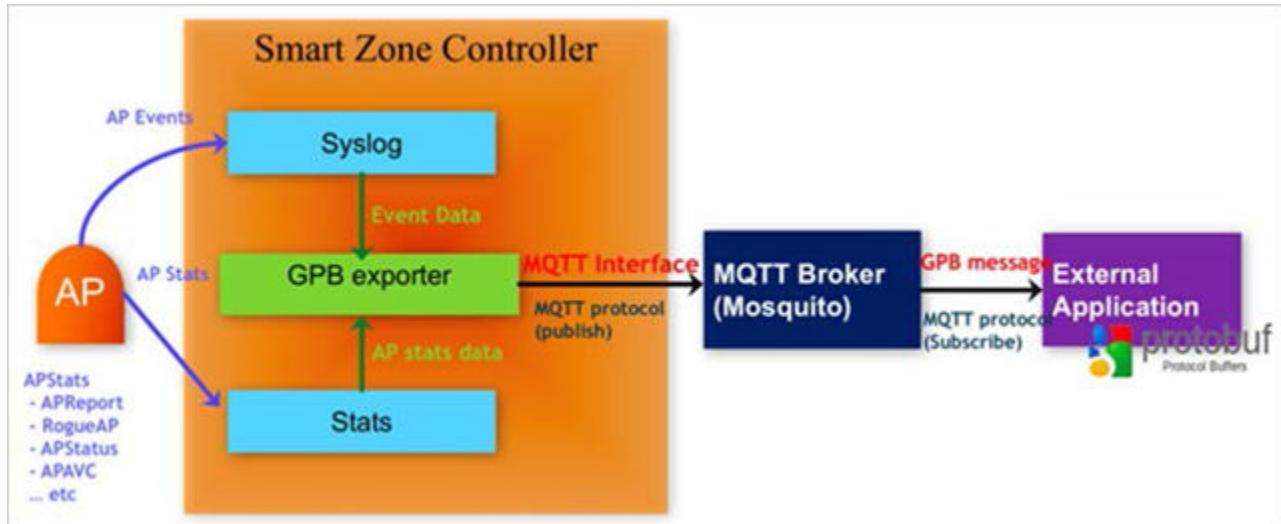

GPB-MQTT Overview

The Smart Zone (SZ) controller GPB/MQTT interface is an interface that allows an external application to receive the statistical data from an Access Point (AP) managed by an SZ controller.

The statistical data includes device information, event records, access point statistics, client statistics, wireless radio/network statistics and rogue AP data. The streaming data is presented in GPB (Google Protocol buffer) format. The external application can use the program library compiled with GPB data structure to read the data.

MQTT stands for MQ Telemetry Transport. It is a publish/subscribe, extremely simple and lightweight messaging protocol. It was designed as an extremely lightweight publish/subscribe messaging transport. It is useful for connections with remote locations where a small code footprint is required and/or network bandwidth is at a premium.

FIGURE 1 GPB/MQTT Interface Diagram

Prerequisite Task

Before implementing the GPB/MQTT interface, some background infrastructure must be installed and configured.

NOTE

Installation steps are provided for CentOS-6 and Ubuntu users. If you have different platform requirements, refer to the Mosquitto website for other installation guides: <https://www.mosquitto.org>

1. Use a Unix compatible Operating System (for example: DebianWheezy, DebianJessie, CentOS 6.6, Mac OSX 10.10, Mac OSX 10.11)
2. Download and install a compatible JDK version 1.8 (OpenJDK8, OracleJDK (Java SE 8u161/8u162)). You can also use JDK8.

If you are using a Linux OS, use OpenJDK 8 and download it from <http://openjdk.java.net/install/>. If you are working on Mac OS or Windows, please refer to Oracle for downloading the latest JDK 8 from <http://www.oracle.com/technetwork/java/javase/overview/index.html>

3. Download and install gradle version 2.9.x.

Download from here: <https://gradle.org/>

4. Download and install Mosquitto 1.4.x broker and client and requisite libraries.

Download from here: <http://mosquitto.org/download/>

5. If you are running Centos-6, follow these steps:

- a) Run the following command:

```
$ cd /etc/yum/yum.repos.d
```

- b) Add the following content into filehome-oojah-mqtt.repo.

```
[home_oojah_mqtt]
name=mqtt (CentOS_CentOS-6) type=rpm-md
baseurl=http://download.opensuse.org/repositories/home:/oojah:/mqtt/ CentOS_CentOS-6/
gpgcheck=1 gpgkey=http://download.opensuse.org/repositories/home:/oojah:/mqtt/C entos_CentOS-6//repodata/repo-md.xml.key
enabled=1
```

- c) Run the following command:

```
$ sudo yum update
```

- d) Run the following command:

```
$ sudo yum install mosquito mosquito-clients
```

6. If you are running Ubuntu, install Mosquitto MQTT broker with the following commands:

```
$sudo apt-add-repository ppa:mosquitto-dev/mosquitto-
ppa$sudo apt-get update
$sudo apt-get install mosquito mosquito-clients
```

7. Open the firewall to ports 1883 and 8883.

8. Start the mosquito broker on an instance which can be reached from the instance where the sample client is executed.

9. Configure the SZ with Mosquitto IP and port for it to transfer SCI data.

Refer to the SZ technical documentation to achieve this.

10. Enable SCI in the MQTT broker.

Refer to the "Working with the GPB/MQTT Interface" task.

Working with the GPB/MQTT Interface

To work with the GPB/MQTT interface use the following steps.

1. Set the MQTT broker to receive GPB data.
2. Configure the MQTT broker IP on the SmartZone (SZ) web user interface to publish to GPB data to MQTT broker.
3. Use the GPB compiler to get the library for reading the data with SZ data structure (.proto files). The SmartZone (SZ) GPB .proto files can be downloaded from the Ruckus support site at: <https://support.ruckuswireless.com>
4. The external application implements the MQTT protocol and subscribes the topic to MQTT broker.
5. The external application receives the GPB data from MQTT broker and then uses the GPB library to read the streaming data.
6. The external application converts the GPB data and saves it to its local system.

Enabling Authentication in the MQTT Broker

The current implementation of SmartZone (SZ) needs authentication to the MQTT Broker.

Perform the following steps to create a profile used in the authentication process with MQTT.

NOTE

Ruckus recommends that you do not start the Mosquitto MQTT broker by user root. If you startup Mosquitto MQTT broker by user root or with sudo, it will result in an incorrect startup environment or other error.

1. Startup MQTT broker with security enabled.

- a) After you install the mosquitto MQTT broker, you can start it up by the following command:

```
mosquitto -c /home/user/mosquitto.conf -p 1883
```

- b) Create a mosquitto configuration file, mosquitto.conf. Refer to the examples below.

```
listener 8883
psk_file /etc/mosquitto/pskfile
psk_hint hint
tls_version tlsv1.2
```

- c) According to the pskfile configuration of mosquitto.conf you need another pskfile to store the authentication pre-shared key. Here is another example for the pskfile:

```
testuser:7465737475736572
```

The value before the colon, ":" sign represents the username which in this example is testuser. The value after the colon refers to the password phrase which is converted to hex representation. The original password text before converting is testuser.

The password has to match with the setting configured on controller SZ web interface.

NOTE

You can terminate the MQTT broker by pressing Ctrl + C on the MQTT broker console.

GPB-MQTT Interface Implementation

Enabling Authentication in the MQTT Broker

2. After starting one MQTT subscriber, you can start another MQTT subscriber to connect to the MQTT broker via an un-authenticated port 1883 or authenticated port 8883.

- a) Here is an example to connect to the MQTT broker with un-authenticated version:

```
mosquitto_sub -h <mosquitto_ip> -p 1883 -t 'sci-topic'
```

- b) Here is an example to connect to the MQTT broker via an authenticated security channel:

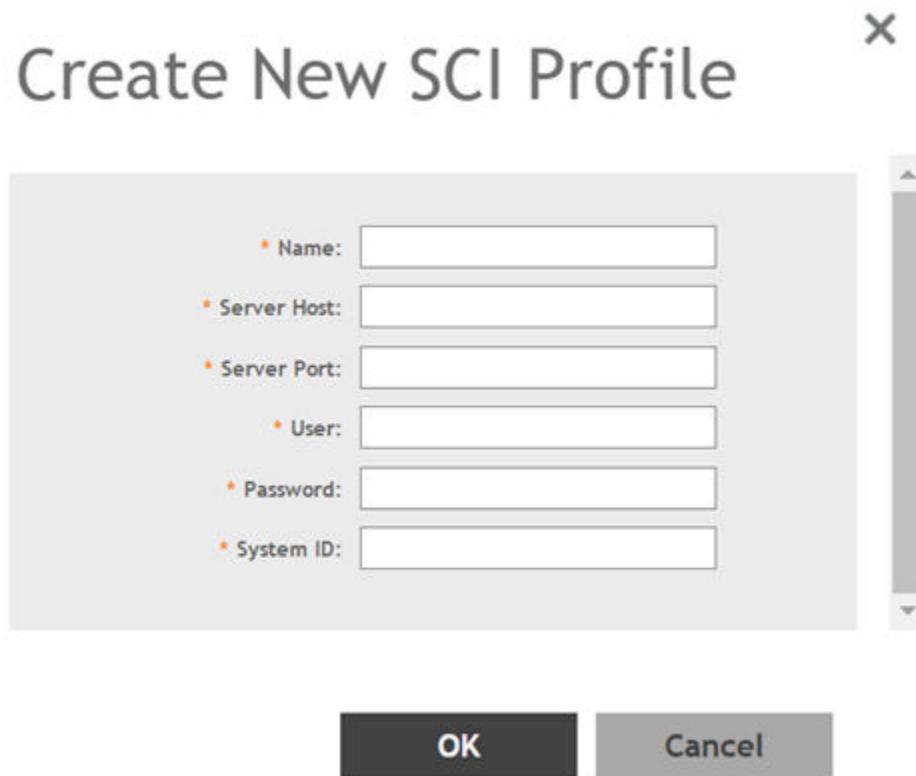

```
mosquitto_sub -h <mosquitto_ip> -p 8883 -t 'sci-topic' --psk-identity testuser --psk  
7465737475736572
```

You can find the difference between the un-authenticated and authenticated version of the mosquitto_sub function, where the psk-identity and psk attribute is connected to MQTT broker via port number 8883.

3. Use the content in the following steps to create or configure the MQTT connection profile :
 - a) MQTT server name.
 - b) MQTT server host / IP address.
 - c) MQTT server port number.
 - d) System ID—The backend system collects data from multiple SZs. The system identifier is used to distinguish the data source.
 - e) User credentials of login name and password.

In the authenticated mode of SCI profile you must provide the user name and password for TLSv1.2 with pre-shared key exchange standard. See the following figure.

FIGURE 2 Setting SCI Profile - Authenticated

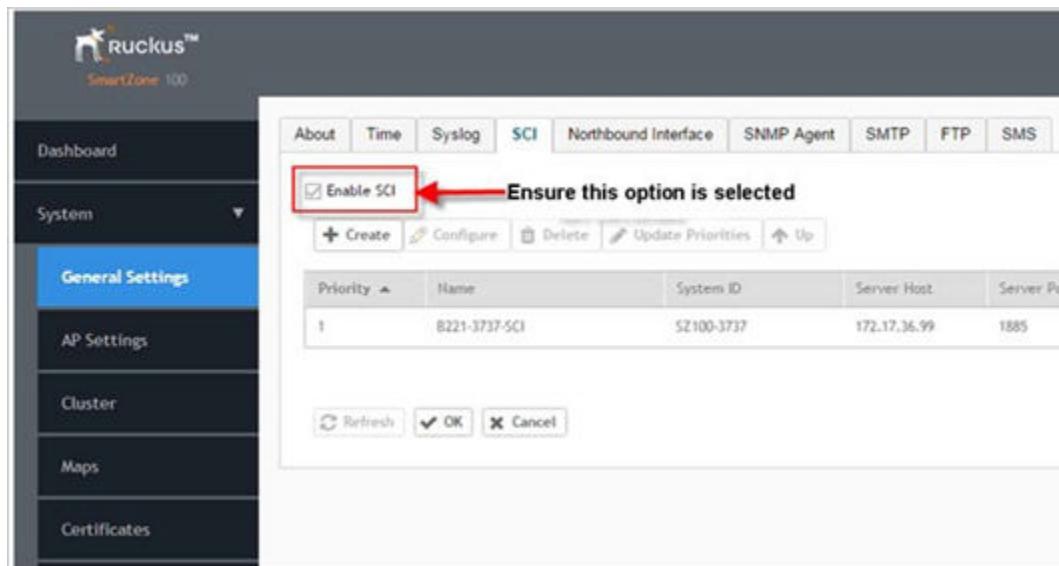

The SCI profile setting is used for allowing SZ to get the MQTT connection information. For example, IP address, port, user credential and so on. It does not mean that you must have a SCI setup to receive the GPB streaming data.

4. Save the SCI profile.

5. On the controller web user interface ensure the option **Enable SCI** is enabled. Navigate to **System > General Settings > SCI** on the controller web user interface as seen in Figure 2. Add the IP address for creating the MQTT channel to stream the data.

Ensure that you create the entry in the table to point the IP address to the installed MQTT server. For more details, refer to the *SmartZone Administration Guide*.

FIGURE 3 Enabling SCI Option

Compiling Google Protobuf Binding Classes

Protocol Buffers, referred to as Protobuf, is widely used at Google for storing and interchanging all kinds of structured information.

Perform the following steps to compile the Google Protobuf (GPB) binding class.

1. Download the latest SmartZone (SZ) GPB .proto files from the Ruckus support site at: <https://support.ruckuswireless.com/contact-us>.
2. Follow the compiling instructions for getting the binding classes for different language. For more information, refer to <https://developers.google.com/protocol-buffers/>.

We can use ap_client.proto as an example for this task. The following steps will refer to the ap_client.proto as the example; you can substitute any .proto file.

3. If you have not installed the compiler, [download the package](#) and follow the instructions in the README file.
4. Run the compiler, specifying the source directory where your application's source code lives (the current directory is used if you do not provide a value), the destination directory where you want the generated code to go (usually the same as SRC_DIR), and the path to your .proto.

In this example, use ap_client.proto.

5. Now that you have ap_client.proto file, the next step is to generate the classes for reading and writing the AP Client GPB messages. To do this, you need to run the protocol buffer compiler protoc on your .proto file by:

- a) Java—Run the following script using the *java_out* option for Java classes. Similar options are provided for other supported languages .

```
protoc -I=$SRC_DIR --java_out=$DST_DIR $SRC_DIR/ap_client.proto
```

This generates *com/ruckuswireless/scg/protobuf/APClient.java* in your specified destination directory.

- b) Python—Run the following script using the *python_out* option for Python classes. Similar options are provided for other supported languages.

```
protoc -I=$SRC_DIR --python_out=$DST_DIR $SRC_DIR/ap_client.proto
```

This generates *apclient_pb2.py* in your specified destination directory.

- c) C++—Run the following script using the *cpp_out* option for C++ classes. Similar options are provided for other supported languages .

```
protoc -I=$SRC_DIR --cpp_out=$DST_DIR $SRC_DIR/ap_client.proto
```

This generates the following files in your specified destination directory:

- apclient.pb.h—The header which declares your generated classes.
- apclient.pb.cc—Contains the implementation of your classes.

6. Copy the requisite technology stack GPB binding classes or source files to your project, which will be used for receiving SZ's GPB streaming data. It can be used to decode and parse the content of GPB message data.

Executing the Test Subscriber

The test subscriber is a utility provided by Ruckus to receive the GPB streaming data from SmartZone (SZ).

The test subscriber utility is written in Java. It uses the Java classes, which is compiled with Ruckus GPB .proto to read the content of GPB message.

NOTE

The test subscriber utility is designed only for test purposes and not for integrating with your application of SZ GPB/ MQTT interface.

Execution Script to Start Mosquitto MQTT

Execute the following command to start the Mosquitto MQTT broker .

```
mosquitto -c /etc/mosquitto/mosquitto.conf -p 1883 &
```

Execution Script Before Installing Release 5.0

Execute the following script to write all received messages to the SciTlsMessages folder in the program execution directory.

```
/execute-normal.sh <mqtt broker IP address> <mqtt port number of security channel> <s/n>
```

The option s/n refers to:

- s—Scaling mode which shows the statistical counter result.
- n— Normal mode which writes to the receiving file from the MQTT broker.

The following example shows where the script connects to a MQTT broker on 172.17.18.144:8883 in scaling mode.

```
./execute-normal.sh 172.17.18.144 8883 s
```

Download the subscriber software MockSCI-TLS-5.0.5.tar.gz.

Execution Script After Installing Release 5.0

Start the Mock SCI using the below scripts for different types of topic service subscriber.

- For SCI topic service, execute the below startup command with the arguments of MQTT broker IP address, port number and enable (true) or disable (false) the scaling mode.

```
# Execute in Normal Mode
```

```
./execute-sci.sh 172.17.18.144 8883 false
```

```
# Execute in Scaling Mode
```

```
./execute-sci.sh 172.17.18.144 8883 true
```

- For GStation topic service, execute the below startup command with the arguments of MQTT broker IP address, port number and enable (true) or disable (false) the scaling mode.

```
# Execute in Normal Mode
```

```
./execute-gstation.sh 172.17.18.144 8883 false
```

```
# Execute in Scaling Mode
```

```
./execute-gstation.sh 172.17.18.144 8883 true
```

Exit from the Test subscriber

Type **EXIT** and click on the **Enter** key to leave the test subscriber.

Execution Result

All receiving GPB messages from MQTT's publisher (example, SmartZone) will be saved to the SciTIsMessages folder.

Field Description

TABLE 5 AP Client information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
clientMac	string	snapshot	NULL	MAC address of the client
ipAddress	string	snapshot	NULL	IP address of the client
ipv6Address	string	snapshot	NULL	IPv6 address of the AP
wlanId	int	snapshot	NULL	WLAN interface ID
rssi	int	snapshot	AVG	Last recorded RSSI/SNR
receiveSignalStrength	int	snapshot	AVG	Last recorded signal strength received.
noiseFloor	int	snapshot	AVG	Last recorded noise floor
vlan	uint64	snapshot	NULL	Client VLAN ID
rxFrames	uint64	delta	SUM	Data frames received
rxBytes	uint64	delta	SUM	Data count received (in bytes)
txFrames	uint64	delta	SUM	Data frames transmitted
txBytes	uint64	delta	SUM	Data count transmitted (in bytes)
txMgmtFrames	uint64	snapshot	SUM	Accumulated number of transmitted packets
rxMgmtFrames	uint64	snapshot	SUM	Accumulated number of received packets
throughputEst	uint32	snapshot	AVG	Current throughput
txDropDataFrames	uint64	snapshot	SUM	Total Tx data frames dropped or dropped by MQ. In AP internal design, it has a messages queue (MQ) to queue all packets that AP plans to forward to clients. The AP transmit packets to clients according to the priority and scheduling. The MQ is Ruckus proprietary.

TABLE 5 AP Client information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
txDropMgmtFrames	uint64	snapshot	SUM	Total transaction management frames dropped (or dropped by MQ)
rxCRCERFrames	uint32	snapshot	SUM	Number of Rx frames with CRC errors
txRetry	uint32	snapshot	SUM	Number of retried frames
osType	string	snapshot	NULL	Client OS type, such as Windows7/Vista, Android.

TABLE 6 AP Client WLAN

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
ssid	string	snapshot	NULL	SSID of the WLAN
bssid	string	snapshot	NULL	BSSID of the WLAN
vlan	uint64	snapshot	NULL	Client VLAN ID
wsgWlanId	int	snapshot	NULL	Unique WLAN ID assigned by the controller
wlanId	int	snapshot	NULL	WLAN interface ID
wlangroup_id	string	snapshot	NULL	WLAN Group identifier
wlantenant_id	string	snapshot	NULL	WLAN tenant identifier
wlangroup_name	string	snapshot	NULL	WALN Group name
wlantenant_name	string	snapshot	NULL	WLAN tenant name

TABLE 7 AP Client Radio

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
radioid	int	snapshot	NULL	Radio ID number used by the AP
mode	string	snapshot	NULL	Radio mode used by the AP's wireless interface
80211RadioMode	string	snapshot	NULL	Radio mode used by the AP
channel	int	snapshot	NULL	Current radio channel used by the AP
channelWidth	uint32	snapshot	NULL	Channel width used by the AP's radio
wlan	Struct APClientWlan	snapshot	NULL	WLAN information for this client

TABLE 8 AP Client Status

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
ap	string	snapshot	NULL	MAC address of the AP

TABLE 8 AP Client Status (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
timeStamp	string	snapshot	NULL	Date and time this report was generated
seqNumber	uint64_t	snapshot	NULL	Counter for generating mesh statistics. The count increases by one whenever the AP generates mesh statistics. When the AP restarts, the counter also resets to zero(0).
zoneUUID	string	snapshot	NULL	Unique zone ID (for example, b381206b-2e5d-43dc-b249-e36ffae9855c) assigned by the controller

Field Description

TABLE 13 AP Report Bin WLAN Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
ap_mac	string	snapshot	NULL	MAC address of the AP
time	uint64_t	snapshot	NULL	First sample time in this bin. The AP samples stats every 90 seconds internally, when AP boots up. So if AP boots up at 10:08:00, then AP gets stats at 10:09:30, 10:11:00, 10:12:30, 10:14:00, 10:15:30. So the time is 10:09:30 in Bin (10:00~10:15), and the time is 10:15:30 in Bin (10:15~10:30)
binStartTime	uint64	snapshot	NULL	Bin start time. The start timestamp of each Bin. For example it is 00:00:00 in Bin1 (00:00~00:15), and it is 00:15:00 in Bin2(00:15~00:30)...
80211RadioMode	string	snapshot	NULL	Radio mode used by the AP
mode	string	snapshot	NULL	Radio mode used by the AP
channel	int	snapshot	NULL	Radio channel used by the AP

TABLE 13 AP Report Bin WLAN Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
ssid	string	snapshot	NULL	SSID of the WLAN
bssid	string	snapshot	NULL	BSSID of the WLAN
wsgWlanId	int	snapshot	NULL	WLAN ID assigned by the controller
wlanId	int	snapshot	NULL	WLAN interface ID
maxNumClients	uint32	snapshot	MAX	Highest number of clients during this sampling period
minNumClients	uint32	snapshot	MIN	Lowest number of clients during this sampling period
avgNumClients	int	snapshot	AVG	Average number of clients during this sampling period
rxBytes_r	uint64	delta	SUM	Total size of data and management packets received
rxFrames_r	uint64	delta	SUM	Total size of data and management frames received
txFrames_r	uint64	delta	SUM	Total size of data and management frames transmitted
txFail_r	uint64	snapshot	SUM	Total number of Tx errors
rxRateKbps	uint64	delta	SUM	Rx rate
txRateKbps	uint64	delta	SUM	Tx rate
newAssoc	uint32	Delta	AVG	Number of new client associations during this sampling period
failedAssoc	uint32	Delta	SUM	Failed associate number in bin period
rxFail_r	uint32	snapshot	SUM	No space in Linux buffers
peakRx_r	uint64	Delta	SUM	Total delta bytes in one din period for RX data and mgmt. frame
peakTx_r	uint64	Delta	SUM	Total delta bytes in one din period for TX data and mgmt.frame
rxDataFrames_r	uint64	snapshot	SUM	Accumulate Rx packet number
rxDataBytes_r	uint64	snapshot	SUM	Accumulate Rx data bytes
rxMgmtFrames_r	uint64	snapshot	SUM	Accumulate Rx packet number
rxMgmtBytes_r	uint64	snapshot	SUM	Accumulate Rx mgmt. bytes
txDataFrames_r	uint64	snapshot	SUM	Accumulate Tx packet number
txDataBytes_r	uint64	snapshot	SUM	Accumulate Tx data bytes
txMgmtFrames_r	uint64	snapshot	SUM	Accumulate Tx packet number
txMgmtBytes_r	uint64	snapshot	SUM	Accumulate Tx mgmt. bytes
rxBcastFrames_r	uint64	snapshot	SUM	Broadcast packets received
rxMcastFrames_r	uint64	snapshot	SUM	Multicast packets received
rxUcastFrames_r	uint64	snapshot	SUM	Received data packets that does not include bcast and multicast
txBcastFrames_r	uint64	snapshot	SUM	Broadcast packets transmitted

TABLE 13 AP Report Bin WLAN Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
txMcastFrames_r	uint64	snapshot	SUM	Multicast packets transmitted
txUcastFrames_r	uint64	snapshot	SUM	Transmit data packets that does not include bcast and multicast
txDropDataFrames_r	uint64	snapshot	SUM	Tx data frames that are dropped or dropped by MQ
txDropMgmtFrames_r	uint64	snapshot	SUM	Total Tx data frames dropped (or dropped by MQ. In AP internal design, it has a messages queue (MQ)to queue all packets that AP plans to forward to clients. Then AP transmit packets to clients as per the priority scheduling. The MQ is Ruckus proprietary internal design.
wlangroup_id	string	snapshot	NULL	WLAN Group identifier.
wlantenant_id	string	snapshot	NULL	WLAN tenant identifier.
wlangroup_name	string	snapshot	NULL	WLAN Group name.
wlantenant_name	string	snapshot	NULL	WLAN tenant name.
wlaneName	string	snapshot	NULL	WLAN name.
authFailureCount	uint32	Delta	SUM	802.11 authentication failure count on WLAN (delta value)
authSuccessCount	uint32	Delta	SUM	802.11 authentication success count on WLAN (delta value)
assocFailureCount	uint32		SUM	802.11 association failure count on WLAN (delta value)
assocSuccessCount	uint32	Delta	SUM	802.11 association success count on WLAN (delta value)
eapFailureCount	uint32	Delta	SUM	EAP authentication failure count on WLAN (delta value)
eapSuccessCount	uint32	Delta	SUM	EAP authentication success count on WLAN (delta value)

dhcpSuccessCount	uint32	Delta	SUM	DHCP success count on WLAN (delta value)

TABLE 14 AP Report Bin Radio Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
airtime	uint32	snapshot	Avg	Exponential average of total channel utilization

TABLE 14 AP Report Bin Radio Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
airtimeB	uint32	snapshot	Avg	Exponential average percentage of channel busy time
airtimeRx	uint32	snapshot	Avg	Exponential average of channel availability for receiving
airtimeTx	uint32	snapshot	Avg	Exponential average of channel availability for transmitting
phyError	uint32	snapshot	Sum	Accumulated number of Rx physical errors
rxBytes_r	uint64	Delta	Sum	Total data bytes received on radio
txBytes_r	uint64	Delta	Sum	Total data bytes transmitted on radio
rxFrames_r	uint64	Delta	Sum	Total number of data frames received
txFrames_r	uint64	Delta	Sum	Total number of data frames transmitted
noiseFloor	int	snapshot	Avg	Last recorded noise floor
retry	uint64	Sum	Null	Number of transmission retries
latency	uint32	snapshot	Sum	The time taken by a packet from Ethernet ingress to Radio egress or Tx complete
capacity	uint32	snapshot	Sum	The saturated throughput estimate of a link
connectionFailure	float	snapshot	Sum	The rate of client connection failure
connectionAuthFailureCount	uint32	Delta	Sum	802.11 authentication failure count on radio (delta value)
connectionAssocFailureCount	uint32	Delta	Sum	802.11 association failure count on radio (delta value)
connectionTotalCount	uint32	Delta	Sum	total client connection on radio, include success and failure counts(delta value)
connectionAuthSuccessCount	uint32	Delta	Sum	802.11 authentication success count on radio (delta value)
connectionAssocSuccessCount	uint32	Delta	Sum	802.11 association success count on radio (delta value)
connectionEAPFailureCount	uint32	Delta	Sum	EAP authentication failure count on radio (delta value)
connectionEAPSuccessCount	uint32	Delta	Sum	EAP authentication success count on radio (delta value)
connectionRadiusFailureCount	uint32	Delta	Sum	Radio failure count on radio (delta value)
connectionRadiusSuccessCount	uint32	Delta	Sum	Radio success count on radio (delta value)
connectionDHCPFailureCount	uint32	Delta	Sum	DHCP failure count on radio (delta value)

TABLE 14 AP Report Bin Radio Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
connectionDHCPSuccessCount	uint32	Delta	SUM	DHCP success count on radio (delta value)
connectionTotalSuccess	uint32	Delta	SUM	Total count for success connection (delta value)
connectionTotalFailure	uint32	Delta	SUM	Total count for failure connection (delta value)

TABLE 15 AP Report Bin Tunnel Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
gw	string	snapshot	NULL	Tunnel gateway address list
index	int	snapshot	NULL	Current tunnel index
isActive	int	snapshot	NULL	Current tunnel state (active or inactive)
cICMP	uint64	snapshot	MAX	Number of keepalive packets sent
cNonICMP	uint64	snapshot	MAX	Number of keepalive packets lost
cDisconnect	uint64	snapshot	MAX	Number of SoftGRE sessions terminated
rxBytes	uint64	snapshot	SUM	Total bytes received
rxPkts	uint64	snapshot	SUM	Total packets received
rxDropPkts	uint64	snapshot	SUM	No space in Linux buffers (frame equal to packet). The AP received a frame completely, and AP has to allocate a memory for this frame. Then pass to next handler who is interested in this frame. The AP drops the frame if it has not enough memory. The counter is plus one if this case happen.
rxErrPkts	uint64	snapshot	SUM	Number of bad packets received
txBytes	uint64	snapshot	SUM	Total bytes transmitted
txPkts	uint64	snapshot	SUM	Total packets transmitted
txDropPkts	uint64	snapshot	SUM	No space available in Linux. AP has to allocate a memory to store the packet that AP plans to transmit to client. The AP may drop it if AP has not enough memory. Then the counter is plus one.
txErrPkts	uint64	snapshot	SUM	Packet transmit problems. The AP plans to transmit packet to client. But somehow AP can't transmit to client successfully, and AP drops the packets at the end. Then the counter is plus one.

TABLE 15 AP Report Bin Tunnel Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
txFragPkts	uint64	snapshot	SUM	Total fragmented Tx packets
type	int	snapshot	NULL	Tunnel type: 0: rks_gre 1: soft_gre
apiIPAddress	string	snapshot	NULL	AP IP address

TABLE 16 Hccd Connection Message Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
timestamp	uint64	snapshot	NULL	The time for each message(packet) observed
message_id	int32	snapshot	NULL	Message identity for each packet
source	int32	snapshot	NULL	Message(packet) source module (like as client, AP, Cblade,...etc)
destination	int32	snapshot	NULL	Message(packet) destination module
status_code	int32	snapshot	NULL	Message status (success or failure)

TABLE 17 Hccd Client Connection Message Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
client_mac	string	snapshot	NULL	Client mac for each connection
timestamp	uint64	snapshot	NULL	The time that each connection started
connection_status	int32	snapshot	NULL	This connection session status - success or failure
failed_msg_id	int32	snapshot	NULL	The failure message identifier for this connection
wlan_id	uint32	snapshot	NULL	WLAN identifier for this client association
radio_id	uint32	snapshot	NULL	Radio identifier for this client association
ssid	string	snapshot	NULL	SSID for this client association
wlanType	string	snapshot	NULL	WLAN type used
snr	float	snapshot	NULL	Client SNR (not implemented)
failure_type	int32	snapshot	NULL	Category for the connection failure (auth/assoc/eap/radius/dhcp failure)
vlan	int32	snapshot	NULL	VLAN identifier value for this client
reason_code	int32	snapshot	NULL	Reason code for disconnection
info	string	snapshot	NULL	Reason for disconnect

TABLE 18 AP Report Bin IPSec Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
ipsecSessionTime	uint64	snapshot	MAX	Session time
ipsecTxPkts	uint64	snapshot	MAX	Total packets transmitted
ipsecRxPkts	uint64	snapshot	MAX	Total packets received
ipsecTxBytes	uint64	snapshot	MAX	Total bytes transmitted
ipsecRxBytes	uint64	snapshot	MAX	Total bytes received
ipsecTxDropPkts	uint64	snapshot	MAX	Total Tx packets dropped
ipsecRxDropPkts	uint64	snapshot	MAX	Total Rx packets dropped
ipsecTxIdleTime	uint64	snapshot	MAX	Tx idle time
ipsecRxIdleTime	uint64	snapshot	MAX	Rx idle time
apiIPAddress	string	snapshot	NULL	AP IP address
gw	string	snapshot	NULL	Tunnel gateway address list

TABLE 19 AP Report Bin Client Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
ap	string	snapshot	NULL	MAC address of the AP
binStartTime	uint64	snapshot	NULL	Bin start time The start timestamp of each Bin. For example it is 00:00:00 in Bin1 (00:00~00:15), and it is 00:15:00 in Bin2 (00:15~00:30)...
ap80211RadioMode	string	snapshot	NULL	Radio mode used by the AP. Possible values are "b", "b/g", "b/g/n", "g", "g/n", "a", "a/n", "a/n/ac", "n", "n/ac", "ac"
auth	string	snapshot	NULL	Authorization mode used by the AP xxx what are the possible values?
encryption	string	snapshot	NULL	Encryption method used by the AP
clientMac	string	snapshot	NULL	MAC address of the client
bssid	string	snapshot	NULL	BSSID
ssid	string	snapshot	NULL	SSID
username	string	snapshot	NULL	User name
clientIP	string	snapshot	NULL	IP address assigned to the client
clientVlan	uint64	snapshot	NULL	VLAN ID used by the client
osType	string	snapshot	NULL	Operating system used by the client
hostname	string	snapshot	NULL	Host name of the client
channel	int	snapshot	NULL	Current radio channel
channelWidth	uint32	snapshot	NULL	Channel width used by the WLAN
rssi	int	snapshot	Avg	Last recorded RSSI/SNR
maxRssi	int	snapshot	MAX	Highest RSSI ever recorded

TABLE 19 AP Report Bin Client Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
minRssi	int	snapshot	MIN	Lowest RSSI ever recorded
firstRssi	int	snapshot	AVG	Initial RSSI recorded
receiveSignalStrength	int	snapshot	AVG	Last received signal strength
firstReceiveSignalStrength	int	snapshot	MAX	Initial received signal strength
maxReceiveSignalStrength	int	snapshot	MIN	Highest received signal strength
minReceiveSignalStrength	int	snapshot	AVG	Lowest received signal strength
noiseFloor	int	snapshot	AVG	Last recorded noise floor
location	int	snapshot	NULL	Location of the AP
rxBytes_r	uint64	delta	SUM	Total bytes received
txBytes_r	uint64	delta	SUM	Total bytes transmitted
rxFrames_r	uint64	delta	SUM	Data frames received
txFrames_r	uint64	delta	SUM	Data frames transmitted
throughputEst	uint64	delta	SUM	Average of non-zero throughput estimate avg_throughput_estimate = sum_throughput_estimate / count_non_zero_throughput_estimate For example AP has client's throughput estimation of 10Mbps, 9Mbps, 9Mbps, 10Mbps, 0, 0, 0, 0, 0 . Then AP come out (10+9+9+10)/4 = 9.5Mbps for throughput Est.
firstSampleTime	uint64	snapshot	NULL	First sample time in this bin. The AP samples stats every 90 seconds internally, when AP boots up. So if AP boots up at 10:08:00. Then AP gets stats at 10:09:30, 10:11:00, 10:12:30, 10:14:00, 10:15:30. So the time is 10:09:30 in Bin(10:00~10:15), and the time is 10:15:30 in Bin(10:15~10:30)
txDropMgmtFrames_r	uint64	snapshot	SUM	Total Tx data frames dropped (or dropped by MQ. In AP internal design,it has a messages queue (MQ) to queue all packets that AP plans to forward to clients. Then AP transmit packets to clients as per the priority/scheduling/... The MQ is Ruckus proprietary internal design.
txDropDataFrames_r	uint64	snapshot	SUM	Total Tx management frames dropped (or dropped by MQ. In AP internal design, it has a messages queue (MQ)to queue all packets that AP plans to forward to clients. Then AP transmit packets to clients as per the priority/scheduling/... The

TABLE 19 AP Report Bin Client Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
				MQ is Ruckus proprietary internal design.
rxCRCERFrames_r	uint64	snapshot	SUM	CRC error for Rx data frame. Each 802.11 frame has 4 bytes FCS at tail. The AP recalculate the value when it received a frame completely. Then compare to the FCS in the frame. AP drops the frame if they are different. Then counter plus 1.
sessionId	string	snapshot	NULL	Session ID string
multiSessionId	string	snapshot	NULL	Multi-session ID string
firstConnection	uint64	snapshot	NULL	Date and time of initial connection
firstAuth	uint64	snapshot	NULL	Date and time of initial authorization
ipAssignTime	uint64	snapshot	NULL	Date and time client IP address was assigned
disconnectTime	uint64	snapshot	NULL	Date and time client was disconnected
sessionTime	uint64	snapshot	NULL	Duration of client session
radioid	uint32	snapshot	NULL	Radio interface identifier (0: 2.4G, 1 5G)
wsgWlanId	int	snapshot	NULL	WLAN ID assigned by the controller
wlangroup_id	string	snapshot	NULL	WLAN Group identifier
wlangroup_name	string	snapshot	NULL	WLAN Group name
disconnectReason	uint64	snapshot	NULL	Reason for disconnect from the controller.
wlanName	string	snapshot	NULL	WLAN name
wlantenant_id	string	snapshot	NULL	WLAN tenant identifier
wlantenant_name	string	snapshot	NULL	WLAN tenant name
rxBytes	uint64	snapshot	SUM	Total data bytes received for this client
txBytes	uint64	snapshot	SUM	Total data bytes transmitted by this client
rxRatebps	uint64	snapshot	Avg	Client receiving data rate in bin period
txRatebps	uint64	snapshot	Avg	Client transmitted data rate in bin period

TABLE 20 AP Report Bin Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
bin	int	snapshot	NULL	Bin data number xxx AP divides 24 hours into 96 bins, -1 bin is

TABLE 20 AP Report Bin Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
				15 minutes.Bin1 time period is 00:00~00:15, Bin2 time period is 00:15~00:30 and so on. It is a number from 1 to 96.Then one can see the stats time period according to this value.
uptime_r	int	snapshot	NULL	Uptime in one report duration Example: AP boots up at 10:08, so the uptime_r is 420 seconds(10:15 - 10:08) in Bin (10:00~10:15). If AP keeps work well, and now is 11:02, then uptime_r is 900 seconds in Bin (10:45~11:00)

TABLE 21 AP Report Stats Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
version	uint32	snapshot	NULL	GPB version
ap	string	snapshot	NULL	AP MAC address
timestamp	uint64	snapshot	NULL	Timestamp for this report
seqNumber	uint64	snapshot	NULL	Sequence record number for AP report.
zone_id	string	snapshot	NULL	Zone UUID
binCount	Struct APReportBin	snapshot	NULL	Total number of bin data.
binClient	Struct APReportBinClient	snapshot	NULL	Total number of Client bin data.
binIPSec	Struct APReportBinIPSec	snapshot	NULL	The number of IPSec tunnel.
binTunnel	Struct APReportBinTunnel	snapshot	NULL	The number of tunnel data.
binRadio	Struct APReportBinRadio	snapshot	NULL	The number of radio data.
deviceName	string	snapshot	NULL	AP devices configured by the administrator.
apgroup_id	string	snapshot	NULL	AP Group UUID
cluster_id	string	snapshot	NULL	Cluster UUID.
domain_id	string	snapshot	NULL	Domain UUID.
aptenant_id	string	snapshot	NULL	AP tenant UUID
map_id	string	snapshot	NULL	MAP UUID
aptenant_name	string	snapshot	NULL	AP tenant name.
zone_name	string	snapshot	NULL	Zone name.
apgroup_name	string	snapshot	NULL	AP Group name
domain_name	string	snapshot	NULL	Domain name

TABLE 21 AP Report Stats Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
sampleTime	uint64	snapshot	NULL	The timestamp for sampling stats data
aggregationInterval	uint32	snapshot	NULL	The interval time to aggregate stats together
apIpAddress	string	snapshot	NULL	IP address of the AP
apIpv6Address	string	snapshot	NULL	IPv6 address of the AP

Field Description

TABLE 24 AP Status Tunnel Information

Attribute Name	ValueType (size)	Property(Snapshot /Delta/ Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
gw	string	snapshot	NULL	Tunnel gateway address list
index	int	snapshot	NULL	Current tunnel index
type	int	snapshot	NULL	Tunnel type
isActive	int	snapshot	NULL	Current tunnel state (active or inactive)
cICMP	uint64	snapshot	MAX	Number of keepalive packets sent
cNonICMP	uint64	snapshot	MAX	Number of keepalive packets lost
cDisconnect	uint64	snapshot	MAX	Number of SoftGRE sessions terminated

TABLE 24 AP Status Tunnel Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot /Delta/ Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
rxBytes	uint64	snapshot	SUM	Total bytes received
rxPkts	uint64	snapshot	SUM	Total packets received
rxDropPkts	uint64	snapshot	SUM	No space in linux buffers. The AP received a frame completely, and AP has to allocate a memory for this frame. Then pass to next handler who interested to this frame. The AP drop the frame if it has no enough memory. The counter plus one if this case happen.
rxErrPkts	uint64	snapshot	SUM	Number of bad packets received
txBytes	uint64	snapshot	SUM	Total bytes transmitted
txPkts	uint64	snapshot	SUM	Total packets transmitted
txDropPkts	uint64	snapshot	SUM	No space available in linux AP has to allocate a memory to store the packet that AP plans to transmit to client. The AP may drop it if AP has no enough memory. Then the counter plus one.
txErrPkts	uint64	snapshot	SUM	Packet transmit problems. The AP plans to transmit packet to client. But somehow AP can't transmit to client successfully, and AP drops the packets at the end. Then the counter plus one.
txFragPkts	uint64	snapshot	SUM	Total fragmented Tx packets

TABLE 25 AP Status IPsec Statistics

Attribute Name	ValueType (size)	Property(Snapshot /Delta/ Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
ipsecSessionTime	uint64	snapshot	MAX	Session time
ipsecTxPkts	uint64	snapshot	MAX	Total packets transmitted
ipsecRxPkts	uint64	snapshot	MAX	Total packets received
ipsecTxBytes	uint64	snapshot	MAX	Total bytes transmitted
ipsecRxBytes	uint64	snapshot	MAX	Total bytes received
ipsecTxDropPkts	uint64	snapshot	MAX	Total Tx packets dropped
ipsecRxDropPkts	uint64	snapshot	MAX	Total Rx packets dropped
ipsecTxIdleTime	uint64	snapshot	MAX	Tx idle time
ipsecRxIdleTime	uint64	snapshot	MAX	Rx idle time

TABLE 26 AP Status WLAN Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
ssid	string	snapshot	NULL	SSID of the WLAN
bssid	string	snapshot	NULL	BSSID of the WLAN
ap	string	snapshot	NULL	MAC address of the AP
80211RadioMode	string	snapshot	NULL	Radio mode used by the AP
ap80211RadioMode	string	snapshot	NULL	Radio mode used by the AP
channel	int	snapshot	NULL	Radio channel used by the AP
rxBytes	uint64	delta	SUM	Total data and management packet data size received
txBytes	uint64	delta	SUM	Total data and management packet data size transmitted
rxFrames	uint64	delta	SUM	Total number of data and management packets received
txFrames	uint64	delta	SUM	Total number of data and management packets transmitted
txBcastFrames	uint64	snapshot	SUM	Total broadcast packets transmitted
txMcastFrames	uint64	snapshot	SUM	Total multicast packets transmitted
txDataFrames	uint64	snapshot	SUM	Accumulated number of packets transmitted
txDataBytes	uint64	snapshot	SUM	Accumulated data bytes transmitted
txMgmtFrames	uint64	snapshot	SUM	Accumulated number of packet transmitted
txMgmtBytes	uint64	snapshot	SUM	Accumulated management bytes transmitted
txDropDataFrames	uint64	snapshot	SUM	Total Tx data frames dropped (or dropped by MQ) . In AP internal design, it has a messages queue(MQ) to queue all packets that AP plans to forward to clients. Then AP transmit packets to clients accoring the priority / scheduling/... The MQ is Ruckus proprietary internal design.
txDropMgmtFrames	uint64	snapshot	SUM	Total Tx management frames dropped (or dropped by MQ) . In AP internal design, it has a messages queue(MQ) to queue all packets that AP plans to forward to clients. Then AP transmit packets to clients accoring the priority / scheduling/... The MQ is Ruckus proprietary internal design.
rxBcastFrames	uint64	snapshot	SUM	Total broadcast packets received
rxMcastFrames	uint64	snapshot	SUM	Total multicast packets received

TABLE 26 AP Status WLAN Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
rxDataFrames	uint64	snapshot	SUM	Accumulated number of packets received
rxDataBytes	uint64	snapshot	SUM	Accumulate data bytes received
rxMgmtFrames	uint64	snapshot	SUM	Accumulated number of packets received
rxMgmtBytes	uint64	snapshot	SUM	Accumulate management bytes received
totalNumClients	int	snapshot	NULL	Current client count
vlan	int	snapshot	NULL	VLAN ID of the WLAN
wsgWlanId	int	snapshot	NULL	WLAN ID assigned by the controller
wlanId	int	snapshot	NULL	WLAN interface ID
wlangroup_name	string	snapshot	NULL	WLAN Group name
wlangroup_id	string	snapshot	NULL	WLAN Group identifier
wlantenant_id	string	snapshot	NULL	WLAN tenant identifier
wlantenant_name	string	snapshot	NULL	WLAN tenant name
ftassoc_success	uint32	snapshot	NULL	802.11r fast roaming status success
ftassoc_failure	uint32	snapshot	NULL	802.11r fast roaming status failure
is_probe_withheld	uint32	snapshot	NULL	Probe resp withheld if this is a Probe Request, Client Load Balancing and Band Steering decide whether to withhold the response).
is_auth_withheld	uint32	snapshot	NULL	Auth resp withheld (If this is an Auth Request, Client Load Balancing and Band Steering decide whether to withhold the response).

TABLE 27 AP Status Radio Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
radioid	int	snapshot	NULL	Radio ID number used by the AP
Channel	int	snapshot	CONF	Radio channel used by the AP
mode	string	snapshot	NULL	Radio mode used by the AP
band	string	snapshot	NULL	Radio band used by the AP
80211RadioMode	string	snapshot	NULL	Radio mode used by the AP. Radio is 11bgn, means radio support 802.11B, 802.11G, and 802.11n. It has three capabilities. The 11bgn is not a good format if machine wants to parse. Because we have 11AC now. So we use "/" to separate each

TABLE 27 AP Status Radio Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
				capability and then the machine can parse the string easily.
txPower	string	snapshot	NULL	Tx power of the WiFi interface
phyError	uint32	snapshot	SUM	Accumulated number of Rx phy errors
channelBlacklist	string	snapshot	NULL	Channel blacklist
noiseFloor	int	snapshot	AVG	Last recorded noise floor
rxBytes	uint64	Delta	SUM	Total data bytes received on radio
rxFrames	uint64	Delta	SUM	Total data frames received on radio
rxRadioBytes	uint64	snapshot	SUM	Total data bytes received on radio
rxRadioFrames	uint64	snapshot	SUM	Number of fragmented frames received
txBytes	uint64	Delta	SUM	Total data bytes transmitted on radio
txFrames	uint64	Delta	SUM	Total data frames transmitted on radio
txRadioBytes	uint64	snapshot	SUM	Total data bytes received on radio
txRadioFrames	uint64	snapshot	SUM	Number of fragments transmitted
retry	uint64	snapshot	SUM	Number of transmission retries
drop	uint32	snapshot	SUM	Number of excessive transmission retries
rxMulticast	uint64	snapshot	SUM	Number of multicast packets received
txMulticast	uint64	snapshot	SUM	Number of multicast packets transmitted
total	uint32	snapshot	AVG	Exponential average of total channel utilization
busy	uint32	snapshot	AVG	Exponential average of channel busy time
rx	uint32	snapshot	AVG	Exponential average of channel availability for receiving
tx	uint32	snapshot	AVG	Exponential average of channel availability for transmitting
channelWidth	uint32	snapshot	NULL	Channel width
ap	string	snapshot	NULL	AP mac address
latency	uint32	snapshot	NULL	The time taken by a packet from ethernet ingress to Radio egress or Tx complete
capacity	uint32	snapshot	NULL	The saturated throughput estimate of a link

TABLE 27 AP Status Radio Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
connectionFailure	float	snapshot	NULL	The rate of client connection failure
connectionAuthFailureCount	uint32	snapshot	SUM	802.11 auth failure count on radio
connectionAssocFailureCount	uint32	snapshot	SUM	802.11 assoc failure count on radio
connectionTotalCount	uint32	snapshot	SUM	Total connection count on radio
numOfChannelChange	uint32	snapshot	SUM	Number of channel change on radio
isLatencyFlagged	bool	snapshot	SUM	Does the radio latency value exceed criteria or not
isCapacityFlagged	bool	snapshot	SUM	Does radio capacity value exceed criteria or not
isConnectionFailureFlagged	bool	snapshot	SUM	Does radio connection failure rate exceed criteria or not
isAirtimeFlagged	bool	snapshot	SUM	Does radio airtime utilization total value exceed criteria or not
isRadioEnabled	bool	snapshot	SUM	Is wifi interface up or not
secondaryChannel	uint32	snapshot	SUM	Second channel value for 80_80MHz channel width
eirp	int32	snapshot	SUM	Radio eirp value = tx_power +antenna gain
connectionTotalFailureCount	uint32	snapshot	SUM	Total connection failure count on radio

TABLE 28 AP Status Brownout Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
timeStamp	int	snapshot	NULL	Date and time of the brownout event
events	int	snapshot	NULL	Brown out event. It could be "Brownout Occurred" or "Brownout restored"
pwrType	int	snapshot	NULL	Brown out power. It could be "PoE" or "12VDC power supply"

TABLE 29 AP Status IPSec Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
ipsecActiveServerIP	string	snapshot	NULL	IPSec remote server IP address (only populated when IPSec is enabled)
ipsecVirtualIPv4	string	snapshot	NULL	IPSec virtual IPv4 address (only populated when IPSec is enabled)

TABLE 29 AP Status IPSec Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
ipsecVirtualIPv6	string	snapshot	NULL	IPSec virtual IPv6 address (only populated when IPSec is enabled)
ipsecEffectiveIKESA	string	snapshot	NULL	IPSec IKE SA (only populated when IPSec is enabled)
ipsecEffectiveESPSA	string	snapshot	NULL	IPSec child SA (only populated when IPSec is enabled)

TABLE 30 AP Status System Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
ap	string	snapshot	NULL	MAC address of the AP
usbDeviceVersion	string	snapshot	NULL	USB device version
usbDeviceVID	string	snapshot	NULL	USB device VLAN ID
usbDevicePID	string	snapshot	NULL	USB device product ID (PID)
gpsInfo	string	snapshot	NULL	GPS information
countryCode	string	snapshot	NULL	Country code
seqNumber	uint64	snapshot	NULL	Counter for generating mesh statistics. The count increases by one whenever the AP generates mesh statistics. When the AP restarts, the counter also resets to zero (0).
zoneUUID	string	snapshot	NULL	Unique zone ID (for example, b381206b-2e5d-43dc-b249-e36ffae9855c) assigned by the controller
zoneName	string	snapshot	NULL	Zone name assigned by the controller. The admin configures the Zone name via controller's user interface. The controller passes it to the AP, which the zone name.
timeZone	string	snapshot	NULL	Time zone. The admin configure the time zone via SCG UI. Then SCG pass the time zone to APs.
gatewayIp	string	snapshot	NULL	Default gateway IP address of the AP
lastRebootReason	string	snapshot	NULL	Reason the AP was last rebooted
totalBootCount	uint32	snapshot	NULL	Total number of reboots since the AP was last power cycled
mtuSize	uint32	snapshot	NULL	AP br0 mtu setting. MTU stands for Maximum transmission unit. The admin could configure the size of MTU via SCG UI. Then SCG pass configuration to APs. So the max pake size is 1400 bytes if admin configure configure the

TABLE 30 AP Status System Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,AVG,NULL)	Description
				MTU to 1400. The more details, see https://en.wikipedia.org/wiki/Maximum_transmission_unit .
rejoinCount	uint32	snapshot	NULL	Number of times the AP rejoined the controller
rejoinReason	string	snapshot	NULL	Reason the AP rejoined the controller
oops	string	snapshot	NULL	Kernel oops if there is kernel panic. The AP logs crash point when AP's kernel panic happened. Then AP report the crash point to SCG after AP boots up again.
lossConnectBootCnt	uint32	snapshot	NULL	Number of times the AP lost connection with the controller
deviceName	string	snapshot	NULL	Name of the AP
location	string	snapshot	NULL	Location of the AP
fwVersion	string	snapshot	NULL	Version of firmware installed on the AP
devSupportUsb	int	snapshot	NULL	Indicator for USB support on the AP . It could be 0 and 1. 0: not support, 1: support
deviceIpMode	int	snapshot	NULL	Current IP mode of the AP (IPv4 or IPv6)
ip	string	snapshot	NULL	IPv4 address of the AP
ipv6	string	snapshot	NULL	IPv6 address of the AP
ipseclp	string	snapshot	NULL	IPsec virtual IP address of the AP (only populated when IPsec is enabled)
apConnectedIp	string	snapshot	NULL	IP address the AP uses to connect to the controller.
uptime	long	snapshot	NULL	Duration since the AP was last rebooted . The unit is second.
mountState	string	snapshot	NULL	AP mount state
currentTemperature	int	snapshot	NULL	Current temperature inside the AP
lifeMaxTemperature	int	snapshot	NULL	Highest AP temperature ever recorded
lifeMinTemperature	int	snapshot	NULL	Lowest AP temperature ever recorded
dnatInfo	string	snapshot	NULL	rks_gre tunnel gateway IP address
rksDplp	string	snapshot	NULL	Data blade IP address and port number
rksDplpOnly	string	snapshot	NULL	Data blade IP address
ipType	string	snapshot	NULL	IPv4 or IPv6
islpTypeChanged	uint32	snapshot	NULL	Fake data; should be removed

TABLE 30 AP Status System Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
managementVlan	uint32	snapshot	NULL	AP management VLAN ID
apState	string	snapshot	NULL	AP KPI status
isConnectionTotalCountFlagged	boolean	snapshot	NULL	AP KPI attribute "client total connection" flagging status
totalConnectedClient	uint32	snapshot	NULL	AP KPI attribute "client total connection" number
crashDump	uint32	snapshot	NULL	Indicator if there is crash dump is generated on AP or not
altitudeUnit	string	snapshot	NULL	GPS attribute : floor or meters
altitudeValue	uint32	snapshot	NULL	GPS attribute: floor value
poeMode	uint32	snapshot	NULL	8023af PoE power source
poeModeSetting	uint32	snapshot	NULL	8023af PoE mode
ipv6Type	string	snapshot	NULL	AP IPv6 mode (static, pope, auto)

TABLE 31 LAN Port Status Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
port	uint32	snapshot	NULL	Port number for Ethernet interface
interface	string	snapshot	NULL	Interface name for lan device
dot1x	string	snapshot	NULL	Dot1X support mode (auth, sup, none)
logicLink	string	snapshot	NULL	Link status (up/down)
phyLink	string	snapshot	NULL	Link attributes (up/down, speed, duplex)
sfpInfo	string	snapshot	NULL	Sfp supported information

TABLE 32 Cable Modem Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
cmMac	string	snapshot	NULL	Cable modem device mac address
cmlp	string	snapshot	NULL	Cable modem IP address
cmFwVersion	string	snapshot	NULL	Cable modem version
cmUptime	uint32	snapshot	NULL	Cable modem alive time
cmSerialNumber	string	snapshot	NULL	Cable modem serial number
cmlpv6	string	snapshot	NULL	Cable modem IPv6 address
cmCapabilities	string	snapshot	NULL	Capabilities of cable modem
cmRangingTimeout	uint32	snapshot	NULL	Gets the data for ranging timeout
cmStatusValue	uint32	snapshot	NULL	Gets the data for status value.

TABLE 32 Cable Modem Information (continued)

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
cmStatusCode	string	snapshot	NULL	Gets the data for status code.
cmStatusTxPower	string	snapshot	NULL	Gets the data for <i>TxPower</i> .
cmStatusResets	uint32	snapshot	NULL	Gets the data for status reset.
cmStatusLostSyncs	uint32	snapshot	NULL	Gets the data for <i>StatusLostSyncs</i> .
cmStatusInvalidMaps	uint32	snapshot	NULL	Gets the data <i>StatusInvalidMap</i> .
cmStatusInvalidUcds	uint32	snapshot	NULL	Gets the data <i>StatusInvalidUcds</i> .
cmStatusInvalidRangingResponses	uint32	snapshot	NULL	Gets the data <i>StatusInvalidRangingResponses</i> .
cmStatusInvalidRegistrationResponses	uint32	snapshot	NULL	Gets the data for <i>StatusInvalidRegistrationResponses</i>
cmStatusT1Timeouts	uint32	snapshot	NULL	Gets the data for <i>StatusT1Timeouts</i> .
cmStatusT2Timeouts	uint32	snapshot	NULL	Gets the data <i>StatusT2Timeouts</i> .
cmStatusT3Timeouts	uint32	snapshot	NULL	Gets the data for <i>StatusT3Timeouts</i> .
cmStatusT4Timeouts	uint32	snapshot	NULL	Gets the data for <i>StatusT4Timeouts</i> .
cmStatusRangingAborteds	uint32	snapshot	NULL	Gets the data for <i>statusRangingAborteds</i>
cmStatusDocsisOperMode	uint32	snapshot	NULL	Gets the data for <i>StatusDocsisOperMode</i> .
cmStatusModulationType	uint32	snapshot	NULL	Gets the data for <i>CmStatusModulationType</i> .
cmStatusEqualizationData	string	snapshot	NULL	Gets the data for <i>CmStatusEqualizationData</i> .

TABLE 33 AP Status LBS Information

Attribute Name	ValueType (size)	Property(Snapshot/Delta/Serialization)	ValueAggregation Type(SUM,MAX,MIN,Avg,NULL)	Description
