What Support Do I Need?

Technical issues are usually described in terms of priority (or severity). To determine if you need to call and open a case or access the self-service resources, use the following criteria:

- Priority 1 (P1)—Critical. Network or service is down and business is impacted. No known workaround. Go to the **Open a Case** section.
- Priority 2 (P2)—High. Network or service is impacted, but not down. Business impact may be high. Workaround may be available. Go to the **Open a Case** section.
- Priority 3 (P3)—Medium. Network or service is moderately impacted, but most business remains functional. Go to the **Self-Service Resources** section.
- Priority 4 (P4)—Low. Requests for information, product documentation, or product enhancements. Go to the **Self-Service Resources** section.

Open a Case

When your entire network is down (P1), or severely impacted (P2), call the appropriate telephone number listed below to get help:

- Continental United States: 1-855-782-5871
- Canada: 1-855-782-5871
- Europe, Middle East, Africa, Central and South America, and Asia Pacific, toll-free numbers are available at https://support.ruckuswireless.com/contact-us and Live Chat is also available.
- Worldwide toll number for our support organization. Phone charges will apply: +1-650-265-0903

We suggest that you keep a physical note of the appropriate support number in case you have an entire network outage.

About This Guide

Introduction

This *SmartZone Alarm and Event Reference Guide* describes the various types of alarms and events that SmartZone 300 (SZ300) and Virtual SmartZone-High-Scale (vSZ-H) (collectively referred to as "the controller" throughout this guide) generates. For each alarm and event this guide provides the code, type, attributes, and description.

This guide is written for service operators and system administrators who are responsible for managing, configuring, and troubleshooting Ruckus devices. Consequently, it assumes a basic working knowledge of local area networks, wireless networking, and wireless devices.

NOTE
If release notes are shipped with your product and the information there differs from the information in this guide, follow the instructions in the release notes.

Most user guides and release notes are available in Adobe Acrobat Reader Portable Document Format (PDF) or HTML on the Ruckus Support Web site at https://support.ruckuswireless.com/contact-us.

Alarm and Event Management

Overview

This guide lists and describes the various types of alarm and event that the controller generates. For each alarm and event, this guide provides the code, type, attributes, and description.

NOTE
Refer to About This Guide on page 27 for the conventions used in this guide.

Alarm and Event Management

This subsystem contains set of functions that help users to detect, isolate, and eventually correct malfunctions in the managed network. This section covers:

- Event Categories on page 59
- Event Attributes on page 60
- Generation of Alarm and Event on page 60

Event Categories

Events are used for many different purposes, mainly for notifying users of certain conditions in the system components as well as the managed network. They can be classified into the following categories:

- Alarms: These are unexpected events indicating a condition that typically requires management attention.
- Configuration Change Events: Configuration change events are events that inform of a configuration change effect on the device.
- Threshold Crossing Alerts: These are events that inform of a performance-related state variable that has exceeded a certain value. These events point to conditions that might require management attention to prevent network and service degradation.
- Logging Events: These are events that occur regularly and are expected to occur during the operation of a network, that indicate what is currently going on in the network. Some examples of these events include:
  - Activity on the network and service
  - Operator activity
  - System activity
  - Informational events – Any other kind of event.
  - Debug and Informational events - All the debug and informational events pertaining to TTG modules like RADIUS proxy, HIP, CIP and AUT are not displayed on the Web Interface. This is because it reduces the performance of the system since its large in numbers. Enabling display of these events on the Web Interface is possible through CLI but it is not recommended.

Event Attributes

An event always includes the following attributes:

- Event Source: The identifier of the source component that generates the event
- Timestamp: The time when the event occurred
- Event Severity: Severity is classified as critical, major, minor, warning, informational or debug
- Event Type: The type of event that has occurred
- Event Information: Contains detail attribute fields in a key-value pair, where a list of field names is provided

Generation of Alarm and Event

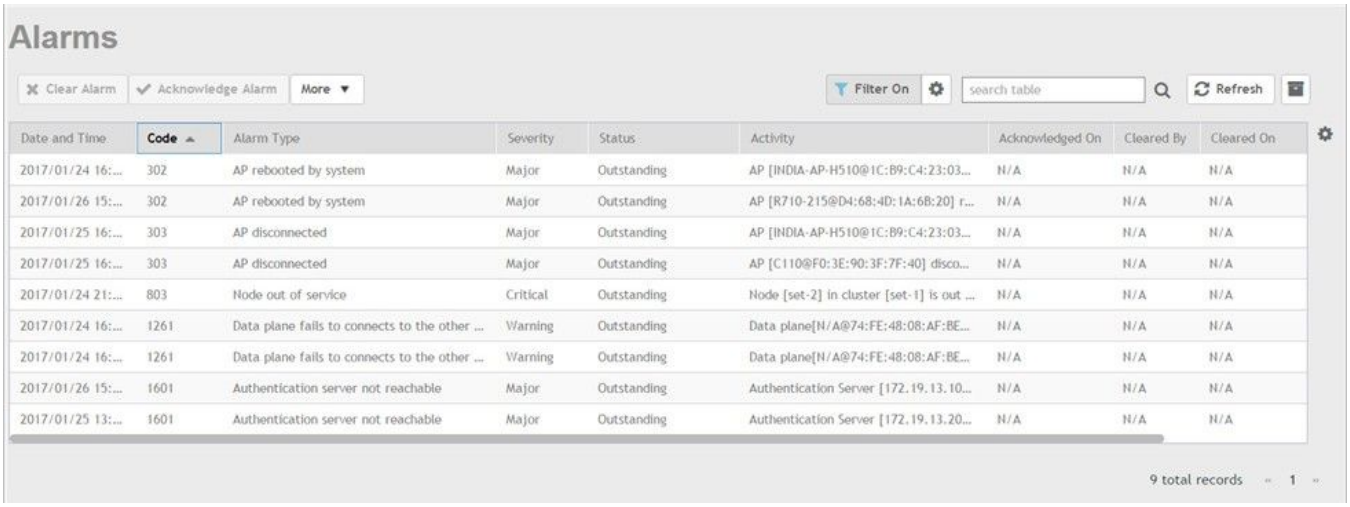
The following are the steps of how alarm and event are generated.

1. Alarm
    a. An alarm is a persistent indication of a fault that clears only when the triggering condition had been resolved.
    b. An alarm can be filtered in the controller web interface based on:
        - Alarm Category - Alarm classifications
        - Alarm Source: Source of the alarm
        - Alarm Status: Could either be outstanding or cleared
        - Acknowledge Time: The time when the alarm is acknowledged
        - Date and Time - Date and time when the alarm is acknowledged
        - Severity: Severity is classified as critical, major or minor
        - Status - Could either be cleared or outstanding
        - Type - Alarm type
    c. To view the below alarm information in the controller web interface navigate to **Events & Alarms** > **Alarms**
        - Date and Time
        - Code
        - Alarm Type
        - Severity
        - Status
        - Acknowledged on
        - Cleared By
        - Cleared On
        - Comments
        - Activity
        - Actions
    d. On an alarm generation, the controller web interface provides the following information as seen in the figure below.
        - Alarm console, which displays the cleared and outstanding alarms visible to the user who is currently logged on.
        - Alarm summary, which lists various information such as outstanding alarm counts, unacknowledged alarm counts, etc.
        - You may clear an alarm or a set of alarms to let other administrators know that you have already resolved the issue. When you select a group of alarms, the **Clear Alarm** button is activated. Click this button. A text box

appears where you can enter comments or notes about the resolved issue. Click Apply when done. To view the cleared alarms, select the cleared option.

- You may acknowledge an alarm or a set of alarms to let other administrators know that you have acknowledged it. When you select an alarm or group of alarms, the **Acknowledge Alarm** button is activated. Click this button. A text box appears where you need to confirm the acknowledgment. Click **Yes** when done. The **Acknowledged on** column in the Alarms table gets updated.
- Filtering features based on the alarm attributes.
  The **Filter** button is deactivated by default. Click this button if you want to turn on the filter. Click the gear icon to set the filter. A text box appears where you can enter the severity, status and start and end date and time. Click **OK** when done.
- You may also export the data as a CSV file.

FIGURE 1 Alarms



2. Event - On an event generation the following:
   a. The controller collects, receives, and maintains the raw events from the managed entities (control plane, data plane, access points, etc.). These raw events are kept in the database, and are automatically purged.
   b. The controller allows users to enable/disable certain event types from the managed entities.

      Events - The web interface provides event log window as seen in the figure below, for users to visualize and analyze the events. To view the event information in the controller web interface navigate to **Events & Alarms** > **Events**.

      - Date and Time
      - Code
      - Type
      - Severity
      - Activity

      Event Management lists the disabled events that are filtered at the source whenever possible to minimize resources for processing events. The SMTP server is disabled by default. You must enable and configure the SMTP server so notification emails can be delivered successfully.

      Threshold Events are triggered at the source whenever possible.

Users are able to perform various operations on the events, such as filtration, aggregation and counting. The **Filter** button is deactivated by default. Click this button if you want to turn on the filter. Click on the gear icon to set the filter. A text box appears where you can enter the severity, status and start and end date and time. Click **OK** when done.

The controller gives you the option of exporting the data as a CSV file.

IPMI Alarms

NOTE
This section is not applicable for vSZ-H.

Following are the alarms related to IPMIs.

The controller has redundant six-fan cooling with four 80x38mm fans and two 60x38mm fans. There are four main cooling zones, as shown in Figure 3:

- Zone 1 contains fans 0 and 1, which cool CPU1 and all the components in this zone.
- Zone 2 contains fans 2 and 3, which cool CPU2, low-profile PCI cards, and all the other components in this zone.
- Zone 3 contains fans 4 and 5, which cool full-height/length PCI cards and all the other components in this area.
- Zone 4 is cooled by the power supply fans. This zone contains the SAS RAID and SAS/SATA boards. Cooling redundancy in this zone is only achieved when there are two power supplies installed.
