About This Release	4
Supported Access Points	4
New Features	4
Resolved Issues	,5
Unresolved Issues	5
Limitation	5

### **About This Release**

This document provides release information for Ruckus LTE AP Release SC 02.03.01.0031, including information on new features, resolved issues, open issues, and other related details.

### **Supported Access Points**

Ruckus LTE AP Release SC 2.3.1 supports the following Access Point models:

P01-Q910-US02	
P01-Q710-US02	
P01-Q410-US01	

#### NOTE

P01-Q910-US00 and P01-Q710-US00 are also be supported.

### **New Features**

Following new features are introduced in Ruckus LTE AP Release SC 2.3.1:

• **Channel-based Power Selection:** With Release 2.3.1, Ruckus LTE AP calculates its transmit power based on the selected channel, bandwidth, and AP model. In an ideal situation, LTE AP can transmit at 24 dBm per antenna. With Channel-based power selection, LTE AP will transmit with lower power when operating on edge frequency of Citizen Broadband Radio Service (CBRS) range.

LTE APs use the following values for maximum power depending on the AP model and spectrum bandwidth being used.

Ruckus LTE AP		Power		
Single Channel (10 MHz)		22 dBm		
Single Channel (20 MHz)		23 dBm		
CA SDL - PCell and SCell both 20 MHz				
Q710		22 dBm		
Q910	Any channel at edge frequencies, i.e., 3560 MHz or 3690 MHz.	22 dBm		
	Any channel at 10 MHz from edge frequencies, i.e., 3570 MHz or 3680 MHz and other carrier is not at edge.	22.5 dBm		
	Any channel at 20 MHz from edge frequencies, i.e., 3580 MHz or 3670 MHz and other is not at the edge or within 10 MHz from edge.	23.5 dBm		
	Channels other than the above.	24 dBm		

• **Certificate updates:** Ruckus LTE AP supports ARRIS PKI and WINNFORUM PKI certificates. Two device entity certificates are generated (two for each PKI) corresponding to the two key-pairs specific to each LTE AP. For ARRIS PKI as well as WINNFORUM PKI, there is a dedicated root CA certificate and intermediate CA certificate. Thus, the following certificates are present on LTE AP supporting ARRIS PKI and WINNFORUM PKI certificates:

ARRIS PKI	<ul> <li>Two ARRIS PKI device entity certificates from ARRIS PKI associated with LTE AP serial number suffixed with indices 1 and 2 (corresponding to the two certificates generated - one each per key-pair).</li> <li>ARRIS PKI Root CA certificate</li> </ul>
	<ul> <li>ARRIS PKI ROOL CA Certificate</li> <li>ARRIS PKI Intermediate CA certificate</li> </ul>

WINNFORUM PKI	<ul> <li>Two WINNFORUM PKI device entity certificates from WINNFORUM PKI associated with LTE AP serial number suffixed with indices 1 and 2 (corresponding to the two certificates generated - one each per keypair).</li> <li>WINNFORUM PKI Root CA certificate</li> </ul>
	<ul> <li>WINNFORUM PKI Intermediate CA certificate</li> </ul>

### **Resolved Issues**

The following section lists resolved issues in SC 2.3.1:

- Resolved an issue that incorrectly reported number of active UEs as 0 when in fact 32 UEs are connected to a CAenabled LTE AP.
- Resolved an issue due to which LTE AP stops heartbeat request when Spectrum Access System (SAS) is unreachable for sometime.

### **Unresolved Issues**

Following are the unresolved issues in LTE AP SC 2.3.1.

• In certain scenarios, Time critical/admin based HO fails as UE reports own SCC (being strongest) repetitively in measurement report.

### Limitation

• TDD Configuration 2 support is turned off on this release to address critical bugs found during internal testing.
