Document Conventions

The following table lists the text conventions that are used throughout this guide.

TABLE 1 Text Conventions

Convention	Description	Example
monospace	Identifies command syntax examples	device(config)# interface ethernet 1/1/6
bold	User interface (UI) components such as screen or page names, keyboard keys, software buttons, and field names	On the Start menu, click All Programs .
<i>italics</i>	Publication titles	Refer to the <i>Ruckus Small Cell Release Notes</i> for more information.

Notes, Cautions, and Warnings

Notes, cautions, and warning statements may be used in this document. They are listed in the order of increasing severity of potential hazards.

NOTE

A NOTE provides a tip, guidance, or advice, emphasizes important information, or provides a reference to related information.

ATTENTION

An ATTENTION statement indicates some information that you must read before continuing with the current action or task.

CAUTION

 A CAUTION statement alerts you to situations that can be potentially hazardous to you or cause damage to hardware, firmware, software, or data.

DANGER

 A DANGER statement indicates conditions or situations that can be potentially lethal or extremely hazardous to you. Safety labels are also attached directly to products to warn of these conditions or situations.

Command Syntax Conventions

Bold and italic text identify command syntax components. Delimiters and operators define groupings of parameters and their logical relationships.

Convention	Description
bold text	Identifies command names, keywords, and command options.
<i>italic</i> text	Identifies a variable.
[]	Syntax components displayed within square brackets are optional.
{ x y z }	Default responses to system prompts are enclosed in square brackets.
{ x y z }	A choice of required parameters is enclosed in curly brackets separated by vertical bars. You must select one of the options.
x y	A vertical bar separates mutually exclusive elements.
< >	Nonprinting characters, for example, passwords, are enclosed in angle brackets.
...	Repeat the previous element, for example, <i>member</i> [<i>member</i> ...].
\	Indicates a “soft” line break in command examples. If a backslash separates two lines of a command input, enter the entire command at the prompt without the backslash.

What Support Do I Need?

Technical issues are usually described in terms of priority (or severity). To determine if you need to call and open a case or access the self-service resources, use the following criteria:

- Priority 1 (P1)—Critical. Network or service is down and business is impacted. No known workaround. Go to the **Open a Case** section.
- Priority 2 (P2)—High. Network or service is impacted, but not down. Business impact may be high. Workaround may be available. Go to the **Open a Case** section.
- Priority 3 (P3)—Medium. Network or service is moderately impacted, but most business remains functional. Go to the **Self-Service Resources** section.
- Priority 4 (P4)—Low. Requests for information, product documentation, or product enhancements. Go to the **Self-Service Resources** section.

Open a Case

When your entire network is down (P1), or severely impacted (P2), call the appropriate telephone number listed below to get help:

- Continental United States: 1-855-782-5871

Introduction

This SmartZone 300 (SZ300) and Virtualized SmartZone-High Scale (vSZ-H) SNMP MIB Reference Guide describes the SNMP Management Information Bases (MIBs) that SZ300/vSZ-E (collectively referred to as “the controller” throughout this guide) supports.

This guide is written for service operators and system administrators who are responsible for managing, configuring, and troubleshooting Ruckus devices. Consequently, it assumes a basic working knowledge of local area networks, wireless networking, and wireless devices.

NOTE

If release notes are shipped with your product and the information there differs from the information in this guide, follow the instructions in the release notes.

Most user guides and release notes are available in Adobe Acrobat Reader Portable Document Format (PDF) or HTML on the support site at <https://support.ruckuswireless.com/contact-us>.

SmartZone Version 3.6

1. Added the below MIB definitions. The purpose of these new tables is to let users get more information about the controller and real-time information of System Node, AP Wired Clients and Wired Clients.
 - [ruckusCtrlSystemNodeClusterHARoles](#) on page 221
 - [ruckusCtrlSystemNodeClusterHARState](#) on page 221
 - [AP Wired Client Table](#) on page 332
 - [Ruckus Wired Client Table](#) on page 333
2. Added a new section on [Frequently Asked Questions](#) on page 375.

Product MIBs

Following are the changes to Product MIBs in this release.

- Sample shell scripts are provided for querying all entries in RuckusCtrlAp related tables such as AP, AP Radio and AP WLAN.

These tables are not designed to query ALL APs in the tables, so it does not provide the snmpwalk functionality. These sample shell scripts demonstrate on querying all APs information only for ruckusCtrlApTable, ruckusCtrlApRadioTable, and ruckusCtrlApWlanTable.

NOTE

It takes an extremely long time for the controller to get all the information, which is managed by thousand or more APs.

- Support for new OID for Geo Redundancy. Users can now check the cluster HA roles and state using SNMP.
- Support for new table **AP wired Client Table** and **Wired Client Table**. Users can now query for statistical data of wired clients from APs.

NOTE

These tables are designed for debugging specific wired clients for a period of time. It is recommended that you do not use this for periodic and long time monitoring.

RuckOS Version 3.0

The following are the changes to version RuckOS 3.0.

1. Added a section on Decoding Traps

2. Added the following rows to the SCG event trap tables where necessary
 - Trap Severity
 - Cleared by Matching
 - Generated by Event Code
 - Cleared by SNMP Trap
3. A new binding “ruckusSCGEventCode” is added as the last position for each binding
4. Added the following SNMP traps.

Overview

This document describes the SNMP management information bases (MIBs) that the controller supports. It also describes the overall design of the controller SNMP agent.

The controller SNMP agent allows its northbound portal application to monitor the system via SNMP GET operation and also notifies the critical events by sending traps. The controller supports V2 community and V3 versions of SNMP. It also supports configuring the system via SNMP SET from this release. See [Updating SNMP V2 and V3 Configuration Flow and SNMP Logs](#) on page 44.

NOTE

For information on how to enable SNMP traps and configure the SNMP V2 and V3 settings on the controller web interface, refer to the *SmartZone Administrator Guide*.

NOTE

Refer to [About This Guide](#) on page 27 for conventions used in this guide.

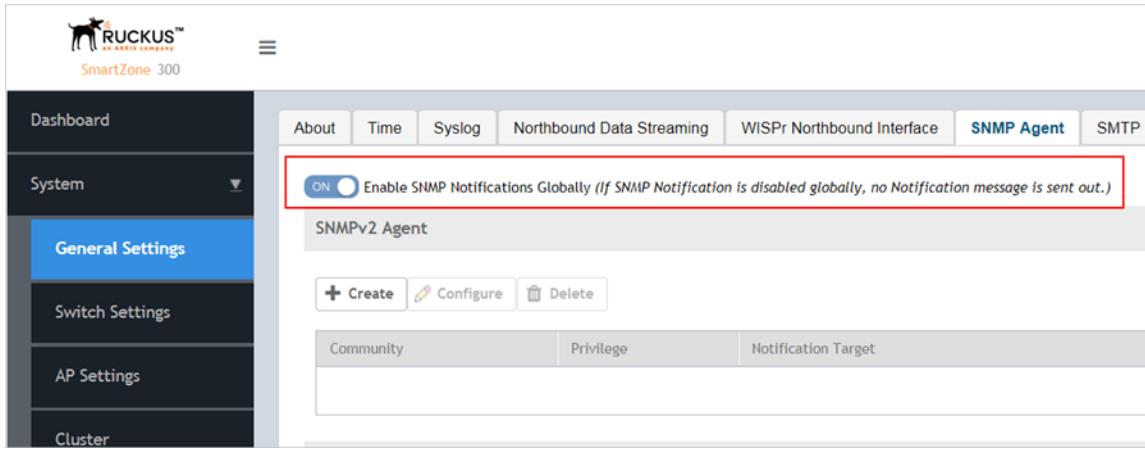

NOTE

For details on alarms and events refer to *SmartZone Alarms and Events Guide*.

Enabling and Disabling SNMP Traps

In the controller web interface navigate to **System> General Settings > SNMP Agent** to either enable or disable the SNMP notifications as shown in the following figure.

FIGURE 1 SNMP notifications

If the SNMP notification is disabled, it will not send any messages to the receiver. It also does not allow any community or a user to enable or configure the notification target address.

Updating SNMP V2 and V3 Configuration Flow and SNMP Logs

Using the controller web interface, you add or update V2 and V3 communities / users and set the operation (set/get/trap) configurations, as shown in [Figure 2](#) and [Figure 3](#). Navigate to **System > General Settings > SNMP Agent** to create SNMP V2 and V3 agents.

NOTE

For information on how to enable the SNMP V2 and V3 settings on the controller web interface, refer to the *Administrator Guide*.

The controller supports a maximum of eight SNMP user profiles and eight trap destinations for SNMPv2 and SNMv3. In the previous releases this was unlimited.

FIGURE 3 Create or enable SNMP V3

SNMP Logs

On the controller web interface, navigate to **Diagnostics > Application Logs** to view the SNMP logs. SNMP is listed in the *Application Name* column.

Standard MIB

Standard MIBs that the controller supports include:

- [Host Resource MIB](#) on page 46
- [UCD MIB](#) on page 47
- [SNMPv2 MIB \(RFC3418\)](#) on page 47
- [RFC1213 MIB \(RFC1213\)](#) on page 47

Host Resource MIB

Host resource MIB is a standard MIB for monitoring the resource status on controller. The term "host" refers to any computer that communicates with other similar computers attached to the Internet and that is directly used by one or more users.

NOTE

To get disk information use the Host Resource MIB OID.1.3.6.1.2.1.25.2.3.

UCD MIB

The UCD SNMP MIB contains system performance data, which was designed for ease of numerical management routines. This MIB is no longer maintained by the University of California. It is now on life support-mode and maintained by the NET-SNMP project.

- To get CPU information use the UCD SNM MIB OIDs.
 - .1.3.6.1.4.1.2021.10.1.3.1 (1 minute load)
 - .1.3.6.1.4.1.2021.10.1.3.2 (5 minute load)
 - .1.3.6.1.4.1.2021.10.1.3.3 (15 minute load)
- To get memory information use the OID.1.3.6.1.4.1.2021.4

SNMPv2 MIB (RFC3418)

SNMPv2-MIB (RFC3418) defines managed objects that describe the behavior of a Simple Network Management Protocol (SNMP) entity.

NOTE

RFC3418 obsoletes RFC1907 – the management information base for v2 of the Simple Network Management Protocol (SNMPv2).

RFC1213 MIB (RFC1213)

RFC1213-MIB (RFC1213) defines the second version of the management information base (MIB-II) for use with network management protocols on TCP/IP- based Internets. This RFC specifies an IAB standards track protocol for the Internet community, and requests discussion and suggestions for improvements.

NOTE

To get network information use the OID.1.3.6.1.2.1.2.2.

NOTE

For more information about RFC1213-MIB (RFC1213), refer to the current edition of the "IAB Official Protocol Standards" for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Ruckus private MIBs are categorized into the following types:

- [Ruckus Event MIB](#) on page 63
- [Ruckus System MIB](#) on page 215
- [Ruckus WLAN MIB](#) on page 225
- [Ruckus TTG MIB](#) on page 247
- [SmartZone Event Traps](#) on page 371

Decoding Traps

To extract the variable bindings from the trap, it is recommended to use the OID (of the variables) instead of their positions. The reason is that the OID never changes while the position may change when additional variables are added to the trap. For example, the ruckusSCGSystemMiscEventTrap trap may originally contain the following four variable bindings:

ruckusSCGEventSeverity

ruckusSCGEventType
 ruckusSCGEventDescription
 ruckusSCGEventCode

Assuming in a future release, a new variable binding - ruckusSCGEventReason, is added to this trap, then ruckusSCGSysSystemMiscEventTrap trap will have the following five variable bindings:

 ruckusSCGEventSeverity
 ruckusSCGEventType
 ruckusSCGEventReason
 ruckusSCGEventDescription
 ruckusSCGEventCode

If the variable bindings are extracted based on the position, the original logic fails when the binding - ruckusSCGEventReason is added.

Though a newly-added variable binding is normally added at the end of the existing binding, sometimes it may placed in the middle to make it consistent with other traps.

NOTE

For details on variable OIDs refer to [Ruckus Event Object](#) on page 192.

Generate Traps Using CLI

Using the CLI console execute the following commands to trigger SNMP traps. These set of commands is for testing purposes, where fake or test traps are generated manually to test communication and message parsing with upper systems.

NOTE

Make sure that the option *Enable SNMP* is enabled before running the following CLI commands. In the web interface navigate to **System > General Settings > SNMP Agent** to enable the option.

SNMP Agent for APs

APs by default have SNMP Agent disabled. This can be changed either using the controller's interface or CLI console.

Limitations

- Only one target notification is allowed in both SNMP v2 and v3 agents
- You can have a maximum count of three (3) each for community and user groups
- Community or users should not have the same privileges. For example:
 - Read or write or notification privileges should not be enabled in two communities
 - Read or write or notification should not be enabled in two users

Enable SNMP Agent

Option 1 - User Interface

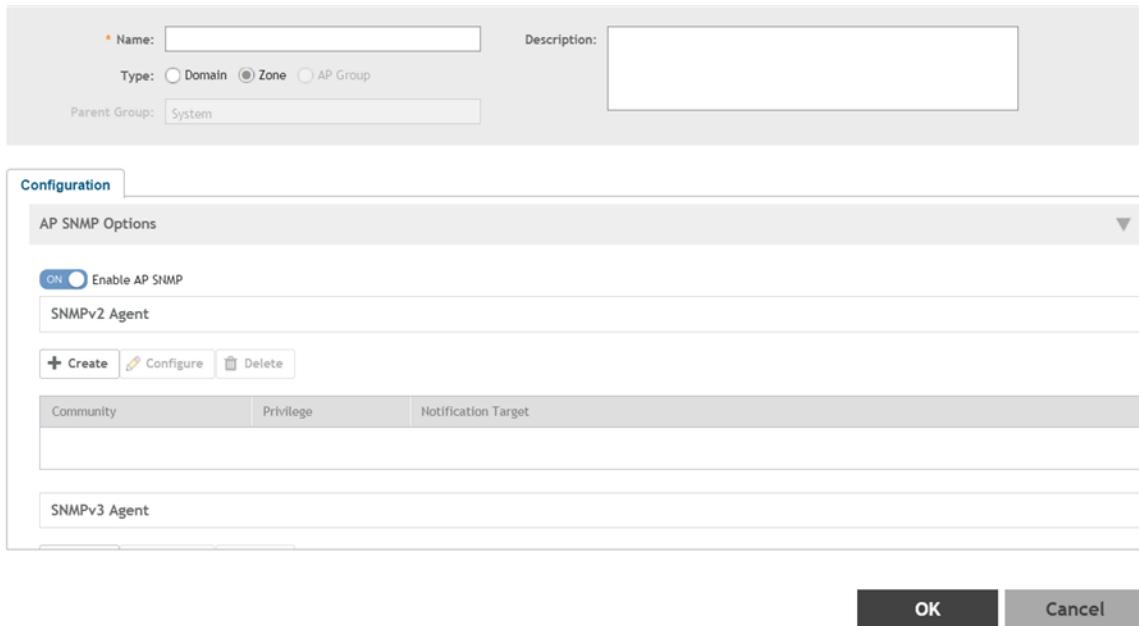

In the controller interface navigate to **Access Points > Zone**. Click on the + sign to add the zone. In the create Zone page select **AP SNMP Options** for all the APs in the controller as seen in the below screen.

Privilege option - **target** refers to adding SNMP target notification and **inform** refers to sending SNMP information notifications to the selected community.

NOTE

For AP SNMP Inform privilege option for SNMP v3 Agent is not supported.

FIGURE 6 Enabling SNMP options for Zone APs

To enable SNMP options in Zone templates navigate to **System >Templates > Zone Templates**. Select **AP SNMP Options** for all the APs in the controller as seen in the below figure.

FIGURE 7 Enabling SNMP options for Zone Templates

Option 2 - CLI Console

Using the CLI console login with your administrator user credentials. Execute the common settings AP SNMP options to enable the SNMP agents as seen in the following figure. This setting will be applied to all APs connected to the controller.

Using SNMP Walk Scripts

The following procedure helps you in creating sample shell scripts to query all entries in RuckusCtrlAp related tables (AP, AP Radio, AP WLAN).

Steps for using SNMP Walk Scripts

The following are the steps for using SNMP walk scripts.

1. Get the MAC list using ruckusCTRLSummaryApTable
2. Translate all output MAC addresses in the OID format
3. Utilize SNMP cache. It gets all the attributes (based on the rows first and not column) of an AP through snmpget or snmpwalk.

Do retry for unsuccessful APs if required.

NOTE

The below scripts are example codes for walking through all the APs in the controller.

Setup Environment

The following is the requirement to setup the required environment.

- **Shell:** Dash or bash
- **Operating System:** Linux

Procedure

1. Install NET SNMP client tools (snmpget and snmpwalk) by referring to <http://www.net-snmp.org/download.html>.
2. Save the downloaded MIB files in the MIB directory.
3. Ensure that the following MIB files are installed in the system
 - a. IANAIfType-MIB
 - b. IF-MIB
 - c. IPV6-TC
 - d. SNMPv2-CONF
 - e. SNMPv2-SMI
 - f. SNMPv2-TC

Installing SNMP Client Tool

Execute the following script to install SNMP client using:

Ubuntu

```
apt-get install snmp
```

RedHat

```
yum install net-snmp net-snmp-libs net-snmp-utils
```

Ruckus MIB files in the MIB directory

Execute the following script to save the Ruckus MIB files in the MIB directory using:

Ubuntu and RedHat

```
cd RUCKUS_MIB_Directory  
sudo cp RUCKUS-*.txt /usr/share/snmp/mibs/
```

Usage

Execute the following script to use the Ruckus MIB files.

```
sh <sample_script>.sh <SZ IP address> <snmpcmd options>
```

SNMP CMD Options

Refer to the OPTIONS section in "<http://net-snmp.sourceforge.net/docs/man/snmpcmd.html>". For example, using SNMPv2 with read community *public* for controller with the IP address 172.17.1.2.

```
sh walk_ruckusCTRLApTable_sample.sh 172.17.1.2 -mall -v2c -c public  
where -mall is an option required for these scripts or you may not be able to get the results.
```

Tips for Writing Your Own Scripts

1. Use -Oe with snmpget/snmpwalk to output index(MAC address) in OID format.
2. snmpget can send 128 OIDs at a time.
3. Always get all OIDs of the same AP first, instead of OIDs for all APs.
4. AP related tables cache data for 15 seconds. This means that you may get the same result if you do not wait for cache timeout.
5. You can use NET-SNMP-AGENT-MIB::nsCacheStatus to check cache status of a table. If your system supports snmpset, you can also force it to clean cache via snmpset
6. Be careful with the output format. Refer to OUTPUT OPTIONS link "<http://net-snmp.sourceforge.net/docs/man/snmpcmd.html>"

Ruckus Event MIB

• Introduction.....	63
• Ruckus Event Trap.....	63
• Ruckus Event Object.....	192

Introduction

The objects contained in the RUCKUS-SCG-EVENT-MIB group define the events for the controller to send trap event notifications.

NOTE

For details on alarms and events refer to *SmartZone Alarms and Events Guide*.

Ruckus Event Trap

The following tables list the MIB, OID, and description of each object in the RUCKUS-EVENT group.

NOTE

The **Cleared by Matching** row contains the information that a user can use to clear the corresponding trap.

Ruckus SCG Client Information

The following are the MIBs for client information nodes. These MIBs indicate information on the user equipment's MAC address and status. Operators would need to append the user equipment's MAC address to the string length of 6 (decimal format) as index after each OID to get the required information.

For MAC address of C8:AA:7C:8E:67:C4, it must be translated to equivalent decimal value of 202.170.124.142.103.196 for the query.

For example, use the following command to get the status of the client (with MAC C8:AA:7C:8E:67:C4):

```
snmpget -v2c -c public <ip_addr> RUCKUS-CTRL-MIB::ruckusCtrlClientStatus.  
6.202.170.124.142.103.196
```

NOTE

Length of the string index should always be 6. Read only indicates that the particular SNMP set will not be supported.

Ruckus Controller Radio Table

The following MIBs define the information for the controller AP Radio table (**rückusCtrlApRadioTable**) for users to easily access all information of the AP radio in the AP. Using the ApMac in this table, users get more details about this AP. The index of the table is the *ApMac* and *RadioIndex*.

A MAC address of C8:AA:7C:8E:67:C4 must be translated to the equivalent decimal value of 200.170.124.142.103.196 for the query.

For example:

- To get the radio index **1** of an AP with MAC C8:AA:7C:8E:67:C4, use the command format:

```
snmpget -v2c -c public <ip_addr> RUCKUS-CTRL-
MIB:::rückusCtrlApRadioApMac.6.200.170.124.142.103.196.1
```

where:

1: Radio index

6: Length of string index, which is always 6

```
200.170.124.142.103.196: MAC Address C8:AA:7C:8E:67:C4
in decimal form
```

- To get all Radio information of the AP with MAC C8:AA:7C:8E:67:C4, use the command format:

```
snmpwalk -v2c -c public <ip_addr> RUCKUS-CTRL-
MIB:::rückusCtrlApRadioApMac.6.200.170.124.142.103.196 where 6 is the length of string index.
```

```
200.170.124.142.103.196: MAC Address C8:AA:7C:8E:67:C4 in decimal form
```

- The MIB browser should also translate the MAC address into decimal form as:

```
.1.3.6.1.4.1.25053.1.8.1.1.1.9.1.6
.6.200.170.124.142.103.196.1

Ruckus Controller Client Table

The following MIBs define the information for the controller **Client** table (**ruckusCtrlClientTable**) for users to easily access information of a specific client.

In addition, if a client has successfully roamed from AP1 to AP2, only the information in AP2 will be returned. Using the **ClientMac** in this table, users get more details about this AP.

The index of the table is the *ClientMac*.

A MAC address of C8:AA:7C:8E:67:C4, must be translated to the equivalent decimal value of 200.170.124.142.103.196 for the query.

For example:

To get MAC C8:AA:7C:8E:67:C4, use the command format:

```
snmpget -v2c -c public <ip_addr> RUCKUS-CTRL-MIB::ruckusCtrlClientMac.6.200.170.124.142.103.196 where 6 is the length of the string index.

AP Wired Client Table

The following MIBs define the information for the controller **AP Wired Client (ruckusCtrlApWiredClientTable)** table for users to easily access information on all wired clients in a specific AP.

The index of the table is the *ApMac* and *WiredClientMac*.

To query all clients in a specific AP (ap1), use the command format:

```
snmpwalk ruckusCtrlApWiredClientMac.ap1
```

For MAC address of C8:AA:7C:8E:67:C4, it must be translated to equivalent decimal value of 202.170.124.142.103.196 for the query.

For example use the command format:

```
snmpget -v2c -c public <ip_addr>
RUCKUS-CTRL-MIB::ruckusCtrlApWiredClientMac.6.202.170.124.142.103.196
where 6 is the length of the string index
```

For MIB browser, it should translate the MAC address to the decimal form.

```
.1.3.6.1.4.1.25053.1.8.1.1.1.9.1.6.6.202.170.124.142.103.196

Ruckus Wired Client Table

The following MIBs define the information for the controller **Wired Client (ruckusCtrlWiredClientTable)** table for users to easily access information of a specific wired client.

The index of the table is *WiredClientMac*. This table supports only *snmpget* when the user knows the wired UE's MAC, where the first index should be provided.

To query MAC address of C8:AA:7C:8E:67:C4, it must be translated to an equivalent decimal value of 200.170.124.142.103.196.

For example, to get information of the wired UE with MAC address of C8:AA:7C:8E:67:C4 use the command format:

```
snmpget -v2c -c public <ip_addr> RUCKUS-CTRL-MIB::ruckusCtrlWiredClientMac.6.200.170.124.142.103.196
where 6 is the length of the string index
```

MAC Address C8:AA:7C:8E:67:C4 in decimal form is 200.170.124.142.103.196:

Timeout

Why does a *Timeout No Response* occur during a full SNMP MIB walk?

1. **Scenario 1 :** When querying full MIBs

Following are the solutions to resolve the timeout issue.

- Increase the timeout value of the SNMP client tools. Always try to increase the timeout value of the SNMP MIB browser or SNMP CLI commands based on the number of APs and UEs on the controller (SmartZone).
- Do a snmpwalk for a specified table. Otherwise, it is likely that SNMP will focus on the standard table *tcpConnTable*, which collects all the TCP connections of the controller. The table size could be large based on the large number of APs or UEs associated to a controller .

2. **Scenario 2 :** When querying AP related table for controllers with large number of APs and UEs

Following are the solutions to resolve the timeout issue.

- Increase the interval of the query scripts or tools to make sure there is only one SNMP client tool to query the controller at a time. Adjust the query interval of the query scripts or tools by the loading of the controller. Otherwise, SNMP daemon takes longer to complete all queries. It is recommended that you do not run multiple queries at the same time.
- Do not use MIB browser to monitor the APs. Most MIB browsers can only provide snmpwalk which is not an efficient for querying large volume of data and are unable to store large volumes of data.
- Increase the timeout value of the SNMP client tools. Always try to increase the timeout value of the SNMP MIB browser or SNMP CLI commands based on the number of APs and UEs on the controller.
- Get the table index by using snmpwalk and use snmpget to get multiple entries of same index at a time.
 - Step 1 - Use a script to query the index of the table using snmpwalk as seen in the below example.

Example:
snmpwalk <options> <IP> <table index 1 OID>snmpwalk <options> <IP> <table index 2 OID>

- Step 2 - Use a script to query multiple table entries for same index at a time using snmpget as seen in the below example.

Example:
snmpget <options> <IP> <table entry 1 OID>.index1 <table entry 2 OID>.index1 ...
<table entry N OID>.index1

SNMP Reports

Why is the response time slow when querying for SNMP reports ?

If the controller is busy collecting data for other tables and if the time taken is longer than the timeout setting for SNMP reports, then the SNMP client tool displays the *Timeout No Response* error.

Following are the solutions for the response time being slow.

1. Increase the interval of the query scripts or tools to make sure there is only one SNMP client tool to query the controller at a time. Adjust the query interval of the query scripts or tools by the loading of the controller. Otherwise, SNMP daemon takes longer to complete all queries. It is recommended that you do not run multiple queries at the same time.
2. Do not use MIB browser to monitor the APs. Most MIB browsers can only provide snmpwalk which is not an efficient for querying large volume of data and are unable to store large volumes of data.
3. Increase the timeout value of the SNMP client tools. Always try to increase the timeout value of the SNMP MIB browser or SNMP CLI commands based on the number of APs and UEs on the controller.
4. Get the table index by using snmpwalk and use snmpget to get multiple entries of same index at a time.
 - a. Step 1 - Use a script to query the index of the table using snmpwalk as seen in the below example.

Example:
snmpwalk <options> <IP> <table index 1 OID>snmpwalk <options> <IP> <table index 2 OID>

- b. Step 2 - Use a script to query multiple table entries for same index at a time using snmpget as seen in the below example.

Example:
snmpget <options> <IP> <table entry 1 OID>.index1 <table entry 2 OID>.index1 ...
<table entry N OID>.index1

Difference in SNMP Data

Why is there a difference between the SNMP reports and the web interface display?

- **Scenario 1:** Memory, disk space, and CPU usages are different from the web interface display.

The following are the reasons for this difference to occur.

Standard MIBs provide Linux level resource status. It is different from *usable resource* of the system.

The web interface shows the logically resource of the system, which is different from the physical status. Currently, it does not show in the Ruckus private MIBs.

- **Scenario 2:** Statistical data is different from the web interface display.

The following are the reasons for this difference to occur.

Most of the SNMP tables use cache mechanism.

SNMP daemon retains the data between 30 to 300 seconds.

There is a delayed response time from APs or UEs in reporting their statistical data.

Modifying SNMP HostName

Why cannot the SNMP hostname be modified through SNMPSET ?

Ruckus does not support setting the hostname through SNMP MIB. This is a read-only for all controller platforms. Use the CLI mode to modify the hostname.

Determining the Timeout Value

How to determine the minimum timeout value for a full MIB tree?

The minimum timeout value should be long to complete the *TCP-MIB::tcpConnectionTable* and *RUCKUS-SCG-CONFIG-WLAN-MIB::ruckusSCGConfigWLANTable* which is the bottle neck. An elapsed time results in a timeout response.

To determine this value, use the SNMP daemon, which caches the data in this table. Query this table within the cached timeout to get the value.

For example, in an environment with 10,000 APs and 1,000 WLANS, the values are:

MIB Table	Minimum Timeout
RUCKUS-SCG-CONFIG-WLAN-MIB::ruckusSCGConfigWLANTable	25+ seconds
TCP-MIB::tcpConnectionTable	14+ seconds

NOTE

The exact value should be tested in your own environments.

Determining the Query Interval

How to determine the query interval for a full MIB tree?

The exact value depends on too many factors such as network topology, congestion, and traffic. The precise to determine the query interval is by recording the longest time and adding some buffer time to complete a full MIB walk.

Determining the Query Interval for AP Related Tables

How to determine the query interval for AP related tables ?

Use snmpwalk to get an OID of the AP related table to determine the time to complete the snmpwalk for a single OID.

1. **Scenario 1 :** Using simple snmpwalk

If you are unable to write your own script as suggested in [Timeout](#) on page 375 the approximate time for an OID may be between the range of 1 to 4 minutes per seconds. This is based on lab environments tested in Ruckus.

The efficiency is improved in 3.6.1 as:

a: For 1,000 APs the minimum time is 54 seconds (< 1 minute) for a full table

b: For 10,000 APs the minimum time is 203 seconds (< 2 minutes) for a full table.

Frequently Asked Questions

Determining the Query Interval for AP Related Tables

For example, in an environment with 10,000 APs and 1000 WLANs, the values are:

MIB Table	SNMPWalk Elapsed Time	Comment
RUCKUS-SCG-WLAN-MIB::ruckusWLANTable	41 seconds	
RUCKUS-SCG-WLAN-MIB::ruckusSCGLANTable	42 seconds	
RUCKUS-SCG-WLAN-MIB::ruckusWLANAPTable	203 seconds	
RUCKUS-SCG-WLAN-MIB::ruckusSCGAPTable	107 seconds	
RUCKUS-SCG-CONFIG-WLAN-MIB::ruckusSCGConfigWLANTable	50 seconds	Timeout should be set as 25+ seconds.

NOTE

The exact value should be tested in your own environments.
