

RUCKUS SmartZone (ST-GA) WLAN Management Guide, 7.0.0

Supporting SmartZone Release 7.0.0

© 2024 CommScope, Inc. All rights reserved.

No part of this content may be reproduced in any form or by any means or used to make any derivative work (such as translation, transformation, or adaptation) without written permission from CommScope, Inc. and/or its affiliates ("CommScope"). CommScope reserves the right to revise or change this content from time to time without obligation on the part of CommScope to provide notification of such revision or change.

Export Restrictions

These products and associated technical data (in print or electronic form) may be subject to export control laws of the United States of America. It is your responsibility to determine the applicable regulations and to comply with them. The following notice is applicable for all products or technology subject to export control:

These items are controlled by the U.S. Government and authorized for export only to the country of ultimate destination for use by the ultimate consignee or end-user(s) herein identified. They may not be resold, transferred, or otherwise disposed of, to any other country or to any person other than the authorized ultimate consignee or end-user(s), either in their original form or after being incorporated into other items, without first obtaining approval from the U.S. government or as otherwise authorized by U.S. law and regulations.

Disclaimer

THIS CONTENT AND ASSOCIATED PRODUCTS OR SERVICES ("MATERIALS"), ARE PROVIDED "AS IS" AND WITHOUT WARRANTIES OF ANY KIND, WHETHER EXPRESS OR IMPLIED. TO THE FULLEST EXTENT PERMISSIBLE PURSUANT TO APPLICABLE LAW, COMMSCOPE DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, TITLE, NON-INFRINGEMENT, FREEDOM FROM COMPUTER VIRUS, AND WARRANTIES ARISING FROM COURSE OF DEALING OR COURSE OF PERFORMANCE. CommScope does not represent or warrant that the functions described or contained in the Materials will be uninterrupted or error-free, that defects will be corrected, or are free of viruses or other harmful components. CommScope does not make any warranties or representations regarding the use of the Materials in terms of their completeness, correctness, accuracy, adequacy, usefulness, timeliness, reliability or otherwise. As a condition of your use of the Materials, you warrant to CommScope that you will not make use thereof for any purpose that is unlawful or prohibited by their associated terms of use.

Limitation of Liability

IN NO EVENT SHALL COMMSCOPE, COMMSCOPE AFFILIATES, OR THEIR OFFICERS, DIRECTORS, EMPLOYEES, AGENTS, SUPPLIERS, LICENSORS AND THIRD PARTY PARTNERS, BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL, EXEMPLARY OR CONSEQUENTIAL DAMAGES, OR ANY DAMAGES WHATSOEVER, EVEN IF COMMSCOPE HAS BEEN PREVIOUSLY ADVISED OF THE POSSIBILITY OF SUCH DAMAGES, WHETHER IN AN ACTION UNDER CONTRACT, TORT, OR ANY OTHER THEORY ARISING FROM YOUR ACCESS TO, OR USE OF, THE MATERIALS. Because some jurisdictions do not allow limitations on how long an implied warranty lasts, or the exclusion or limitation of liability for consequential or incidental damages, some of the above limitations may not apply to you.

Trademarks

CommScope and the CommScope logo are registered trademarks of CommScope and/or its affiliates in the U.S. and other countries. For additional trademark information see <https://www.commscope.com/trademarks>. All product names, trademarks, and registered trademarks are the property of their respective owners.

Patent Marking Notice

For applicable patents, see www.cs-pat.com.

Contacting RUCKUS Customer Services and Support

The Customer Services and Support (CSS) organization is available to provide assistance to customers with active warranties on their RUCKUS products, and customers and partners with active support contracts.

For product support information and details on contacting the Support Team, go directly to the RUCKUS Support Portal using <https://support.ruckuswireless.com>, or go to <https://www.ruckusnetworks.com> and select **Support**.

What Support Do I Need?

Technical issues are usually described in terms of priority (or severity). To determine if you need to call and open a case or access the self-service resources, use the following criteria:

- Priority 1 (P1)—Critical. Network or service is down and business is impacted. No known workaround. Go to the **Open a Case** section.
- Priority 2 (P2)—High. Network or service is impacted, but not down. Business impact may be high. Workaround may be available. Go to the **Open a Case** section.
- Priority 3 (P3)—Medium. Network or service is moderately impacted, but most business remains functional. Go to the **Self-Service Resources** section.
- Priority 4 (P4)—Low. Requests for information, product documentation, or product enhancements. Go to the **Self-Service Resources** section.

Open a Case

When your entire network is down (P1), or severely impacted (P2), call the appropriate telephone number listed below to get help:

- Continental United States: 1-855-782-5871
- Canada: 1-855-782-5871
- Europe, Middle East, Africa, Central and South America, and Asia Pacific, toll-free numbers are available at <https://support.ruckuswireless.com/contact-us> and Live Chat is also available.
- Worldwide toll number for our support organization. Phone charges will apply: +1-650-265-0903

We suggest that you keep a physical note of the appropriate support number in case you have an entire network outage.

Self-Service Resources

The RUCKUS Support Portal at <https://support.ruckuswireless.com> offers a number of tools to help you to research and resolve problems with your RUCKUS products, including:

- Technical Documentation—<https://support.ruckuswireless.com/documents>
- Community Forums—<https://community.ruckuswireless.com>
- Knowledge Base Articles—<https://support.ruckuswireless.com/answers>
- Software Downloads and Release Notes—https://support.ruckuswireless.com/#products_grid
- Security Bulletins—<https://support.ruckuswireless.com/security>

Using these resources will help you to resolve some issues, and will provide TAC with additional data from your troubleshooting analysis if you still require assistance through a support case or RMA. If you still require help, open and manage your case at https://support.ruckuswireless.com/case_management.

Document Feedback

RUCKUS is interested in improving its documentation and welcomes your comments and suggestions.

You can email your comments to RUCKUS at #Ruckus-Docs@commscope.com.

When contacting us, include the following information:

- Document title and release number
- Document part number (on the cover page)
- Page number (if appropriate)

For example:

- RUCKUS SmartZone Upgrade Guide, Release 5.0
- Part number: 800-71850-001 Rev A
- Page 7

RUCKUS Product Documentation Resources

Visit the RUCKUS website to locate related documentation for your product and additional RUCKUS resources.

Release Notes and other user documentation are available at <https://support.ruckuswireless.com/documents>. You can locate the documentation by product or perform a text search. Access to Release Notes requires an active support contract and a RUCKUS Support Portal user account. Other technical documentation content is available without logging in to the RUCKUS Support Portal.

White papers, data sheets, and other product documentation are available at <https://www.ruckusnetworks.com>.

Online Training Resources

To access a variety of online RUCKUS training modules, including free introductory courses to wireless networking essentials, site surveys, and products, visit the RUCKUS Training Portal at <https://commscopeuniversity.myabsorb.com/>. The registration is a two-step process described in this [video](#). You create a CommScope account and then register for, and request access for, CommScope University.

Document Conventions

The following table lists the text conventions that are used throughout this guide.

TABLE 1 Text Conventions

Convention	Description	Example
monospace	Identifies command syntax examples	<code>device(config)# interface ethernet 1/1/6</code>
bold	User interface (UI) components such as screen or page names, keyboard keys, software buttons, and field names	On the Start menu, click All Programs .
<i>italics</i>	Publication titles	Refer to the <i>RUCKUS Small Cell Release Notes</i> for more information.

Notes, Cautions, and Safety Warnings

Notes, cautions, and warning statements may be used in this document. They are listed in the order of increasing severity of potential hazards.

NOTE

A NOTE provides a tip, guidance, or advice, emphasizes important information, or provides a reference to related information.

ATTENTION

An ATTENTION statement indicates some information that you must read before continuing with the current action or task.

CAUTION

A CAUTION statement alerts you to situations that can be potentially hazardous to you or cause damage to hardware, firmware, software, or data.

DANGER

A DANGER statement indicates conditions or situations that can be potentially lethal or extremely hazardous to you. Safety labels are also attached directly to products to warn of these conditions or situations.

Command Syntax Conventions

Bold and italic text identify command syntax components. Delimiters and operators define groupings of parameters and their logical relationships.

Convention	Description
bold text	Identifies command names, keywords, and command options.
<i>italic text</i>	Identifies a variable.
[]	Syntax components displayed within square brackets are optional. Default responses to system prompts are enclosed in square brackets.
{x y z}	A choice of required parameters is enclosed in curly brackets separated by vertical bars. You must select one of the options.
x y	A vertical bar separates mutually exclusive elements.
< >	Nonprinting characters, for example, passwords, are enclosed in angle brackets.
...	Repeat the previous element, for example, <i>member[member...]</i> .
\	Indicates a "soft" line break in command examples. If a backslash separates two lines of a command input, enter the entire command at the prompt without the backslash.

About This Guide

- [New in This Document](#)..... 9

New in This Document

TABLE 2 Key Features and Enhancements in SmartZone 7.0.0 Rev A (February 2024)

Feature	Description	Reference
R770 AP MSCS/Smartcast support (QoS Mirroring)	New: For client devices that support the Mirrored Stream Classification Service (MSCS), this feature enables the AP to apply the client's uplink QoS classification to the client's downlink packets, using a mirrored stream, thereby reducing latency and improving both performance and user experience.	<ul style="list-style-type: none"> • Quality of Service (QoS) on page 129 • Creating a WLAN Configuration on page 17
Increase per AP scalability of Dynamic VLANs	Updated: The maximum number of VLANs supported in Dynamic VLAN is increased 128.	How Dynamic VLAN Works on page 132
[R770] :MLO feature development for Wi-Fi7 APs	Updated: Supports client devices switching between multiple bands with increased throughput and reduced latency.	Creating a WLAN Configuration on page 17
BSS Priority	Updated: The Priority feature from the Wireless Client Isolation section is renamed as BSS Priority and is moved to the Advanced Options section for WLAN Configuration .	Creating a WLAN Configuration on page 17
External DPSK without having a proxy RADIUS	New: Allows users to choose an authentication service for an external DPSK.	Creating a WLAN Configuration on page 17
Steering Mode	New: Steering mode allows the access point to disable lower bandwidth from probing the client device.	Load Balancing on page 57
Sticky Client	New: There are instances where some client devices connects to an AP and stay connected to the same servicing AP, and does not change its association to the closer APs. These clients are referred as sticky clients.	Load Balancing on page 57
Wifi7 backward compatibility flag for WLAN	New: Allows Wi-Fi 6/7 client devices and legacy Wi-Fi 5 client devices to interoperate with the Wi-Fi 6/7 APs and utilize Wi-Fi 6/7 features.	<ul style="list-style-type: none"> • Creating a WLAN Configuration on page 17 • Wi-Fi 6 or Wi-Fi 7 Support on page 131
LPI (Low Power Indoor) Mode	Removed: The support for LPI mode is removed.	
M510 AP	Removed: The support for M510 AP is removed.	
Encryption Method	Removed: Support for Encryption options WEP-64 and WEP-128 options are removed.	

Wireless Network

- Domains, Zones, WLAN Groups, and WLANs..... 11

Domains, Zones, WLAN Groups, and WLANs

If your wireless network covers a large physical environment (for example, a multi-floor building or multi-building office) and you want to manage and provide different WLAN services to different areas of your environment, you can virtually split them using the following hierarchy:

- Domains: Geographical grouping for regulatory operation
- Zones: Consists of multiple WLAN groups
- WLAN Groups: Consists of multiple WLANs
- WLANs: Provides wireless network service

Viewing Modes

The **View Mode** on the upper-right corner of the page provides two options to view the WLANs available in the system:

- **List**—Displays the list of all WLANs irrespective of the Zone or Group they belong.
- **Group**—Displays the list of WLANs that belong to a specific Zone or Group.

The following WLAN details can be viewed regardless of the mode selected:

- **Name**
- **Alert**
- **SSID**
- **Auth Method**
- **Encryption Method**
- **Clients**
- **Traffic**
- **VLAN**
- **Application Recognition**
- **Tunneled**

Creating a WLAN Domain for an MSP

A Managed Service Provider (MSP) manages and assumes a defined set of responsibilities. You can create an MSP managed domain, to manage all their settings within that domain.

NOTE

This feature is applicable only for RUCKUS SZ300 physical controller and Virtual SmartZone-High Scale (vSZ-H) platforms.

To create a WLAN Domain for an MSP, perform the following:

1. Click **Network > Wireless > Wireless LANs** .

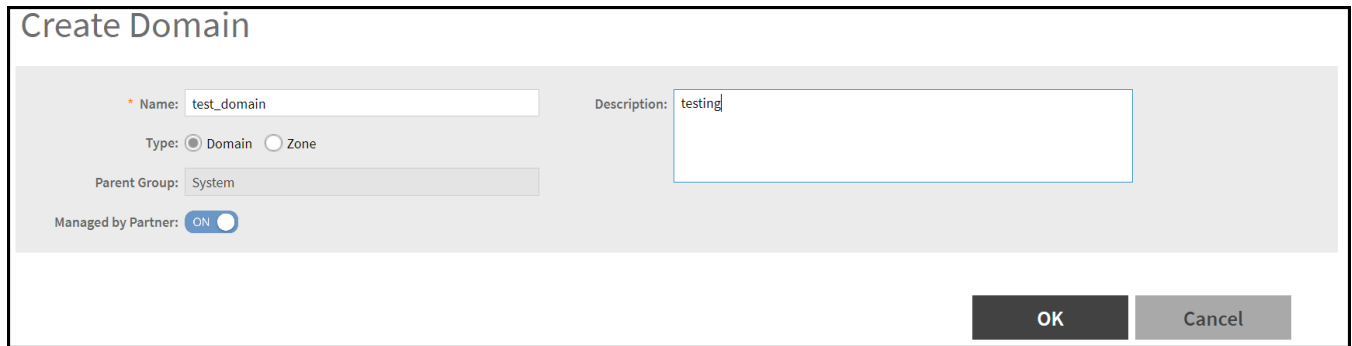

This displays **Wireless LANs** page.

Wireless Network

Domains, Zones, WLAN Groups, and WLANs

2. Select **System** as parent group and click the **Create Domain/Zone/Group (+)** image button.
This displays **Create Domain** page.

FIGURE 1 Create MSP Domain

The screenshot shows a 'Create Domain' dialog box. It contains the following fields and controls:

- Name:** test_domain
- Description:** testing
- Type:** Domain (selected), Zone
- Parent Group:** System
- Managed by Partner:** ON
- Buttons:** OK, Cancel

3. Enter the following details:
 - a) **Name:** Type a name to identify the domain.
 - b) **Description:** Enter a short description for the domain.
 - c) **Parent Group:** Displays the selected parent group name.
 - d) **Managed by Partner:** Click to enable the Managed Service Provider (MSP).
4. Click **OK**, the newly created MSP domain is displayed in the left pane.

Managing WLANs

This section explains how to maintain a robust wireless network for your organization.

On the Wireless LANs page select a system, domain, zone, or WLAN group from the hierarchy tree, respective contextual tabs appear at the bottom of the page. The tabs are used to monitor the selected group. The following table lists the tabs that appear for system, zone, and WLAN group.

TABLE 3 System, Domain, Zone, and WLAN Groups Monitoring Tabs

Tabs	Description	System	Domain (Only for SZ300 and vSZ-H)	Zone	WLAN Groups
Configuration	Displays the respective configuration information.	Yes	Yes	Yes	Yes
Traffic	Displays the respective historical traffic information.	Yes	Yes	Yes	Yes
Alarm	Displays the respective alarms information.	Yes	Yes	Yes	Yes
Event	Displays the respective event information.	Yes	Yes	Yes	Yes
APs	Displays the respective AP information.	Yes	Yes	Yes	N/A
Clients	Displays the respective client information.	Yes	Yes	Yes	N/A
Services	Displays the respective services information.	Yes	Yes	Yes	N/A
Administrators	Displays the respective administrator account information.	Yes	N/A	N/A	N/A

When you can select a zone and click **More**, you can perform the following operations:

- Move a WLAN to a different zone (applicable only for SZ300 and vSZ-H)

- Extract a WLAN Template
- Apply a WLAN Template
- Change the AP Firmware
- Switch over a Cluster
- Trigger a preferred node (applicable only for SZ300 and vSZ-H)

NOTE

WLANs can be disabled or enabled at the AP. For more information, refer *Configuring Access Points*.

Moving a WLAN to a different WLAN Zone

You can move a wireless network from one zone to another.

NOTE

The WLAN that you move inherits the configuration of the new WLAN zone. This feature is applicable only for SZ300 and vSZ-H platforms.

To move a WLAN from its current WLAN zone to a different zone, perform the following:

1. Click **Network > Wireless > Wireless LANs**, and select the WLAN zone from the list to move another WLAN zone.
2. Click **More** and select **Move**.

This displays the **Select Destination Management Domain** dialog box.

3. Select the destination WLAN zone and click **OK**.

A confirmation message is displayed.

4. Click **Yes**.

The WLAN is moved to the destination location.

Extracting a WLAN Template

You can extract only the WLAN-related configuration to a WLAN template.

Complete the following steps to extract a WLAN template.

1. Click **Network > Wireless > Wireless LANs** and select the zone to extract the WLAN template.
2. Click **More** and select **Extract WLAN Template**. The **Extract WLAN Template** dialog box is displayed.
3. For **WLAN Template Name**, enter a name for the template.
4. Click **OK**. A message is displayed stating that the WLAN template was extracted successfully.
5. Click **OK**.

The extracted WLAN template can be viewed at **Administration > System > Templates > WLAN Templates**.

Applying a WLAN Template

You can apply only the WLAN-related configuration to an AP zone using a WLAN template. You can apply the WLAN template to zones where the firmware version of the AP is later than the Zone template's firmware version. An unsupported firmware version of the WLAN template is automatically upgraded to its next version before being upgraded to the current version.

Complete the following steps to apply a WLAN template.

1. Click **Network > Wireless > Wireless LANs** and locate the zone from where you want to extract the WLAN template.
2. Click **More** and select **Apply WLAN Template**. The **Apply WLAN Template** dialog box is displayed.

Wireless Network

Domains, Zones, WLAN Groups, and WLANs

3. From the **Select a WLAN template** list, select the template.
4. Click **Next**. The **Apply WLAN template to selected zone** dialog box is displayed.
5. Complete the required options:
 - Create all WLANs and WLAN profiles from the template if they do not already exist in the target zones.
 - If the target zones have a WLAN or WLAN profile with the same name as the template, overwrite the current settings with settings from the template.
 - Click **OK**. A confirmation dialog box is displayed.
6. Click **OK**.

Changing the AP's Firmware

Each firmware version has its own set of functionality, security, and performance. Selecting a particular firmware version enable access to resources specific to that firmware.

Complete the following steps to change the AP's firmware.

1. From the main menu, go to **Network > Wireless > Wireless LANs** and locate the zone from where you want to change the AP firmware.
2. Click **More** and select **Change AP Firmware**.
3. Choose the AP firmware that you want to change.

Configuring Cluster Switchover

Cluster switchover is moving the APs between clusters.

Complete the following steps to choose the APs to switch over a cluster.

1. From the main menu, go to **Network > Wireless > Access Points** and locate the zone that you want to switch.
2. Click **More** and select **Switch Over Clusters**. The **Switch Over Clusters** dialog box is displayed.
3. For **Switch Over Clusters**, enter the IP address or the FQDN of the new controller.
4. Click **OK**. A message stating the APs are moved to the new cluster is displayed .
5. Click **OK**.

The AP can be viewed in the new controller under the default zone.

Triggering a Preferred Node

You can trigger an AP that belonging to its current zone to connect to the preferred node. First, you must enable Node Affinity, which gives the AP the priority of the preferred nodes.

NOTE

This feature is applicable only for SZ300 and vSZ-H platforms.

Complete the following steps to trigger a preferred node.

NOTE

You must enable the Node Affinity before triggering nodes.

1. Click **Network > Wireless > Wireless LANs** and select zone.
2. Click **More** and select **Trigger Preferred Node**. A confirmation dialog box is displayed.

3. Click **OK**.

WLAN Groups

WLAN groups are configured at the zone level. A default WLAN group (called "default") exists, and the first 27 WLANs that you create are automatically assigned to this default WLAN group. A WLAN group can include a maximum of 27 member WLANs. For dual or tri-band radio APs, each radio can be assigned to only one WLAN group (single radio APs can be assigned to only one WLAN group).

Creating WLAN groups is optional. If you do not need to provide different WLAN services to different areas in your environment, you do not need to create a WLAN group.

A WLAN group is a way of specifying which APs or AP groups provide which WLAN services. For example, if your wireless network covers three floors of a building and you want to provide wireless access to visitors only on the first floor, take the following action.

1. Create a WLAN service (for example, Guest Only Service) that provides guest-level access only.
2. Create a WLAN group (for example, Guest Only Group).
3. Assign Guest Only Service (WLAN service) to Guest Only Group (WLAN group).
4. Assign APs on the first floor (where visitors need wireless access) to your Guest Only Group.

Any wireless client that associates with APs assigned to the Guest Only Group will get the guest-level access privileges defined in your Guest Only Service. APs on the second and third floors can remain assigned to the default WLAN group and provide normal-level access.

Creating a WLAN Group

If your wireless network covers a large physical environment and you want to provide different WLAN services to different areas, you may want to create WLAN groups.

Complete the following steps to create a WLAN group.

1. From the main menu, go to **Network > Wireless > Wireless LANs**.
2. From the **System** tree hierarchy, select the zone where you want to create a WLAN group.
3. Click the add button . The **Create WLAN Group** dialog box is displayed.
4. In the **Name** field, enter a name for the WLAN group.
5. In the **Description** field, enter a brief description of the WLAN group.
6. From the **Available WLANs** list, perform one of the following options:
 - Select the required WLAN and click **Move**. The WLAN will move to the **Selected WLANs** list.
 - Click the add button  to create a new WLAN service. Create WLAN Configuration dialog box is displayed.. Refer [Creating a WLAN Configuration](#) on page 17.

NOTE

To edit or delete a WLAN configuration, select the WLAN from the **Available WLANs** list and click the **Configure** or **Delete** options respectively.

7. Click **Next**. The **Create WLAN Group** dialog box is displayed.

Wireless Network

Domains, Zones, WLAN Groups, and WLANs

8. Click **OK**.

NOTE

You can also edit, clone, and delete a WLAN group by selecting the options **Configure**, **Clone**, and **Delete** options respectively, from the **Wireless LANs** page.

WLAN Configuration

- [Creating a WLAN Configuration.....](#) 17
- [Working with WLAN Templates.....](#) 131
- [How Dynamic VLAN Works.....](#) 132

Creating a WLAN Configuration

An AP zone functions as a way of grouping RUCKUS APs and applying settings including WLANs to these groups of RUCKUS APs.

Complete the following steps to create a WLAN configuration for an AP zone.

1. Go to **Network > Wireless > Wireless LANs** page, from the **System** tree hierarchy, select the **Zone** to create a WLAN.
2. Click **Create**. The **Create WLAN Configuration** page is displayed.

FIGURE 2 Create WLAN Configuration Page

3. Set the required configurations as detailed in the following table.

TABLE 4 WLAN Configuration for SZ100 and vSZ-E

Field	Description	Your Action
General Options		
Name	Indicates the user-friendly administrative name for the WLAN.	Enter a name.
SSID	Indicates the SSID for the WLAN.	Enter the SSID.
Description	Indicates a user-friendly description of the WLAN settings or function.	Enter a short description.

WLAN Configuration

Creating a WLAN Configuration

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
Zone	Indicates the zone to which the WLAN belongs.	Select the zone to which the WLAN settings apply.
WLAN Group	Indicates the WLAN groups to which the WLAN applies.	Select the WLAN groups.
Authentication Options		

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
Authentication Type	<p>Defines the type of authentication flow for the WLAN.</p> <p>NOTE Authentication types such as Web Authentication, and Guest Access except WeChat are supported by APs in IPv6 mode.</p>	<p>Select the required option:</p> <ul style="list-style-type: none"> ● Standard Usage—This is a regular WLAN suitable for most wireless networks. ● Hotspot (WISPr)—Click this option if want to use a hotspot service (use this type for external captive portal workflows) or WISPr. <p style="text-align: center;">NOTE Hotspot (WISPr) applies to WLAN traffic that is tunneled and not tunneled.</p> <ul style="list-style-type: none"> ● Guest Access—Click this option if you want guest users to use this WLAN. After you complete creating this WLAN for guest access, you can start generating guest passes. <p>For more information about Hotspot 2.0 online signup, refer to the Hotspot 2.0 Reference Guide for this release.</p> <ul style="list-style-type: none"> ● Web Authentication—Click this option if you want to require all WLAN users to complete a web-based logon to this network every time they attempt to connect. ● Hotspot 2.0 Access—Click this option if you want a Hotspot 2.0 operator profile that you previously created to use this WLAN. Refer to the Hotspot 2.0 Reference Guide for this release. <p style="text-align: center;">NOTE You can select 8021.X EAP + “WPA3” or “WPA2/WPA3-Mixed” for HS2.0 access WLAN to add more security.</p> <ul style="list-style-type: none"> ● Hotspot 2.0 Onboarding—Click this option if you want to use this WLAN for Hotspot 2.0 onboarding. Refer to the Hotspot 2.0 Reference Guide for this release for more information. Hotspot 2.0 onboarding allows for Open and 802.1x EAP authentication methods. <p style="text-align: center;">NOTE This authentication type cannot be reconfigured to use a different authentication type due to differences in how Authentication and Accounting profiles are stored and subsequently mapped to WLAN configurations.</p> <ul style="list-style-type: none"> ● WeChat—Click this option if you want the WLAN usage through WeChat.

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
<p>Method</p>	<p>Specifies the authentication mechanism.</p>	<p>Select the following option:</p> <ul style="list-style-type: none"> ● Open (Default)—No authentication mechanism is applied to connections. If WPA or WPA2 encryption is used, this implies WPA-PSK authentication. If you clicked Web Authentication in Authentication Type, Open is the only available authentication option, even though PSK-based encryption can be supported. ● 802.1X EAP—A very secure authentication/ encryption method that requires a back-end authentication server, such as a RADIUS server. Your choice mostly depends on the types of authentication the client devices support and your local network authentication environment. If you select Enable RFC Location Delivery Support for Authentication & Accounting Server, enter the Operator Realm. Selecting the authentication method as Hotspot (WISPr) also allows you to select 802.1x EAP as an authentication option. This enables a two-step authentication method when shared and pre-authenticated devices are used, or when user equipment is shared among multiple users. The device access is successful when both authentication processes are completed successfully: 802.1x EAP authentication first, followed by Hotspot (WISPr) authentication. ● MAC Address—Authenticates clients by MAC address. <ul style="list-style-type: none"> - MAC Authentication—Requires a RADIUS server and uses the MAC address as the user logon name and password. Select Use user defined text as authentication password (default is device MAC address) and enter the format. - MAC Address Format—Choose the MAC address format from the drop-down menu.

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
		<ul style="list-style-type: none"> ● 802.1X EAP & MAC—Selecting this option indicates that the 802.1x EAP and MAC address authentication methods must both pass for a user to successfully authenticate. First, MAC address authentication is verified; if that passes, 802.1x EAP authentication is processed. After the two authentication methods succeed, the user equipment gains access to the WLAN. Authentication is handled by a back-end RADIUS server. <p>When this authentication method is selected, the MAC Authentication and MAC Address Format fields will be shown within the Authentication Options section.</p>
Reserve SSID	<p>The Reserve SSID is broadcasted in case the AP loses its SSH Control connection to the controller, or Dataplane if it is tunneling traffic. The Reserve SSID will typically become operational within 3 minutes, depending upon when the lost heartbeat is detected.</p> <p>This allows Open, WPA2/WPA3, WPA2/WPA3 mixed or WPA-mixed mode to be used as back up SSID. Reserve SSID is limited to only one WLAN per Zone.</p>	By default it is disabled.
Encryption Options		
Method	<p>Specifies the encryption method. WPA, WPA2, WPA3, WPA2/WPA3-Mixed and OWE (Opportunistic Wireless Encryption) are the encryption methods certified by the Wi-Fi Alliance; WPA2, WPA3, WPA2/WPA3-Mixed and OWE with AES is the recommended encryption method. The Wi-Fi Alliance will be mandating the removal of WEP due to its security vulnerabilities, and RUCKUS recommends against using WEP if possible.</p>	<p>Select the option:</p> <ul style="list-style-type: none"> ● WPA2—Enhanced WPA encryption using AES encryption algorithm. Choose the following: <ul style="list-style-type: none"> - AES: <ol style="list-style-type: none"> Enter PassPhrase. Select or clear Show. Select the Enable 802.11r Fast BSS Transition check box and enter the Mobility Domain ID. Select the required 802.11w MFP option. - AUTO: <ol style="list-style-type: none"> Enter Passphrase. Enter SAE Passphrase Select or clear Show.

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
Reserve SSID	Is a limited to only one WLAN per Zone. The Reserve SSID option is displayed only when standard + open + (WPA2/ WPA3 or WPA2/ WPA3-Mixed or WPA mixed is enabled.	By default it is disabled.
Data Plane Options		
Access Network	Defines the data plane tunneling behavior.	<p>Enable Tunnel WLAN traffic through Ruckus GRE.</p> <p>Configure the following options as appropriate:</p> <ul style="list-style-type: none"> ● GRE Tunnel Profile: Manages AP traffic. Select the profile from the list. ● Split Tunnel Profile: Enables split tunneling to manage user traffic between corporate and local traffic. Enable the profile from the list. Click  to create a new profile or click  to edit a profile. By default, the option is disabled. <p>NOTE RuckusGRE or SoftGRE must be enabled on the WLAN before mapping it to a Split Tunnel Profile.</p>
vSZ-D DHCP/NAT	Enables tunneling option for DHCP/NAT.	<p>Select the required check boxes:</p> <ul style="list-style-type: none"> ● Enable Tunnel NAT ● Enable Tunnel DHCP
RADIUS based DHCP/NAT	Enables RADIUS-based DHCP/NAT settings. DHCP server authorizes remote clients and allocates addresses based on replies from a RADIUS server.	<p>Select the required check boxes:</p> <ul style="list-style-type: none"> ● Enable RADIUS based NAT ● Enable RADIUS based DHCP
Authentication & Accounting Server (for WLAN Authentication Type: Standard)		
Authentication Server	Specifies the server used for authentication on this network. By enabling proxy, authentication requests will flow through the controller. In a non-proxy mode, the AP will communicate directly with the authentication server without going through the controller.	<ol style="list-style-type: none"> a. Select the Use controller as proxy check box. Beginning with SmartZone 7.0.0, the User controller as proxy option can be disabled to allow non-proxy AAA service. b. Select the server from the menu. c. Select the Enable RFC Location Delivery Support..
Accounting Server	Specifies the server used for accounting messages. By enabling proxy, accounting messages are sent by the controller. In a non-proxy mode, the AP will communicate accounting messages directly.	<ol style="list-style-type: none"> a. Select the Use controller as proxy check box. b. Select the server from the menu.
Hotspot Portal (for WLAN Authentication Type: Hotspot (WISPr))		
Hotspot (WISPr) Portal	Defines hotspot behavior, such as redirects, session timers, and location information, among others.	Select the hotspot portal profile that you want this WLAN to use.
Bypass CNA	Bypasses the Apple CNA feature on iOS and OS X devices that connect to this WLAN.	Select the Enable check box.

WLAN Configuration

Creating a WLAN Configuration

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
Authentication Server	Indicates the authentication server that you want to use for this WLAN.	<p>Choose the option. Options include Local DB, Always Accept, and any AAA servers that you previously added. Additionally, if you want the controller to proxy authentication messages to the AAA server, select the Use Controller as Proxy check box.</p> <p>When the SSH tunnel between the AP and the controller is down, you can enable Backup Authentication Service to back up the AP's authentication services to a secondary device.</p> <p>NOTE For WISPr survivability, the customer portal must use the AP WISPr ZD-Style API/Backup AAA authentication to continue the WISPr service.</p>
Accounting Server	Indicates the RADIUS Accounting server that you want to use for this WLAN.	<p>Choose the option. You must have added a RADIUS Accounting server previously. Additionally, if you want the controller to proxy accounting messages to the AAA server, select the Use the Controller as Proxy check box.</p> <p>When the SSH tunnel between the AP and the controller is down, you can enable Backup Accounting Service to back up the AP's accounting services to a secondary device.</p> <p>NOTE For WISPr survivability, the customer portal must use the AP WISPr ZD-Style API/Backup AAA authentication to continue the WISPr service.</p>
Guest Access Portal (for WLAN Authentication Type: Guest Access)		
Guest Portal Service	Indicates the guest access portal to be used on this WLAN.	Choose the guest portal service.
Bypass CNA	Bypasses the Apple CNA feature on iOS and OS X devices that connect to this WLAN.	Select the Enable check box.
Guest Authentication	Manages guest authentication.	<p>Select:</p> <ul style="list-style-type: none"> ● Guest to require users to enter their guest pass credentials. Guest passes are managed directly on the controller. ● Always Accept to allow users without guest credentials be authenticated.
Guest Accounting	Indicates the RADIUS Accounting server that you want to use for this WLAN.	Choose the server. You must have added a RADIUS Accounting server previously. Additionally, if you want the controller to proxy accounting messages to the AAA server, select the Use the Controller as Proxy check box.
Authentication & Accounting Server (for WLAN Authentication Type: Web Authentication)		
Web Authentication Portal	Indicates the web authentication portal to use for this WLAN.	Choose the web authentication portal from the drop-down menu.
Bypass CNA	Bypasses the Apple CNA feature on iOS and OS X devices that connect to this WLAN.	Select the Enable check box.

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
Authentication Server	Indicates the authentication server that you want to use for this WLAN.	Choose the option. Options include Local DB , Always Accept , and any AAA servers that you previously added. Additionally, if you want the controller to proxy authentication messages to the AAA server, select the Use the Controller as Proxy check box.
Accounting Server	Indicates the RADIUS Accounting server that you want to use for this WLAN.	Choose the server. You must have added a RADIUS Accounting server previously. Additionally, if you want the controller to proxy accounting messages to the AAA server, select the Use the Controller as Proxy check box.
Hotspot 2.0 Profile (for WLAN Authentication Type: Hotspot 2.0 Access)		
Hotspot 2.0 Profile	Indicates the profile, which includes operator and identify provider profiles.	Choose the profile.
Authentication Server RFC 5580	Supports RFC 5580 location delivery on the WLAN, which carries location information in RADIUS exchanges.	Select the check box.
Accounting Server Updates	Indicates the frequency to send interim updates. Configure the account update interval for accounting servers defined in the Hotspot 2.0 Identity Provider profile.	Enter the duration in minutes. Range: 0 through 1440.
WeChat Portal (for WLAN Authentication Type: WeChat)		
WeChat Portal	Defines the WeChat authentication URL, DNAT destination, and other information.	Select a WeChat portal service.
Accounting Server	Indicates the RADIUS Accounting server that you want to use for this WLAN.	Choose the server. You must have added a RADIUS Accounting server previously. Additionally, if you want the controller to proxy accounting messages to the AAA server, select the Use the Controller as Proxy check box.
Forwarding Profile (for WLAN Usage > Access Network)		
Forwarding Policy	Defines special data packet handling to be taken by the data plane when the traffic is tunneled.	Forwarding Profile is Factory Default . It is disabled.
Wireless Client Isolation		

WLAN Configuration

Creating a WLAN Configuration

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
Client Isolation	Prevents wireless clients from communicating with each other. By default this option is disabled.	<p>Enable Client Isolation to separate wireless client traffic from all hosts on the same VLAN/subnet.</p> <p>When Client Isolation is enabled the below options are available to enable or disable as appropriate:</p> <ul style="list-style-type: none"> • Isolate unicast packets: Isolates only unicast packets between a client isolation-enabled WLAN and other clients of the AP. • Isolate multicast/broadcast packets: By default, this option is disabled, when enabled, only multicast packets between a client isolation and other clients of the AP are separated. • Automatic support for VRRP/HSRP: By default, this option is disabled, when enabled, allows you to have isolation without adding physical MAC addresses of VRRP/HSRP routers. Client isolation only discovers virtual IP and MAC in VRRP/HSRP.
Isolation Whitelist	Isolation whitelist allows you to manually specify a list of MAC and IP Addresses that override the blocked list.	<p>Click on the Add icon corresponding to the field to manually enter the MAC and IP addresses to the isolation whitelist.</p> <p>NOTE Specify a default gateway that splits IP address into the host and network addresses in the whitelist.</p>
RADIUS Option		
NAS ID	Defines the ID sent to the RADIUS server, which will identify the AP.	<p>Choose the option:</p> <ul style="list-style-type: none"> • WLAN BSSID • AP MAC • User-defined
NAS Request Timeout	Indicates the duration after which an expected RADIUS response message is considered to have failed.	<p>Enter the timeout period (in seconds).</p> <p>NOTE It is recommended to configure the same values for NAS Request Timeout, NAS Max Number of Retries, and NAS Reconnect Primary.</p>
NAS Max Number of Retries	Indicates the maximum number of failed connection attempts after which the controller will fail over to the backup RADIUS server.	<p>Enter the maximum number of failed connection attempts.</p> <p>NOTE It is recommended to configure the same values for NAS Request Timeout, NAS Max Number of Retries, and NAS Reconnect Primary.</p>

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
NAS Reconnect Primary	Indicates the time interval after which the controller will recheck if the primary RADIUS server is available when the controller has failed over to the backup RADIUS server.	Enter the duration in minutes. Range: 1 through 60 minutes. The default interval is 5 minutes. NOTE It is recommended to configure the same values for NAS Request Timeout , NAS Max Number of Retries , and NAS Reconnect Primary .
Called Station ID	Indicates the format for the called station ID, which is sent to the RADIUS server as an attribute, and can be used in policy decisions.	Select a format: <ul style="list-style-type: none"> ● WLAN BSSID ● AP MAC ● AP GROUP ● NONE
Single Session ID Accounting	Enabling this feature allows the APs to maintain one accounting session for a client roaming between APs. If the client roams from one AP to another, the accounting session ID and statistics will be carried while roaming from one AP to the other. If the feature is not enabled, the accounting session ID is regenerated and statistics are also reset, essentially resetting the accounting.	Select the Enable check box to use this feature.
NAS IP	Indicates the NAS IP address.	Select the option: <ul style="list-style-type: none"> ● Disabled ● SZ Control IP ● SZ Management IP ● User-defined
Vendor Specific Attribute Profile	Indicates the VSA profile	Select from the following options: <ul style="list-style-type: none"> ● VSA profiles NOTE VSA profiles are configured at the zone level. ● Disabled (default) NOTE Click  to edit the VSA profile.
Firewall Options		
Firewall Profile	Indicates the zone for which the firewall profile applies.	Select the option.

WLAN Configuration

Creating a WLAN Configuration

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
Enable WLAN specific	Applies the firewall profile to the WLAN.	Select the option and update the following: <ol style="list-style-type: none"> In the Rate Limiting field, select the Uplink and Downlink option to specify and apply rate limit values for the device policy to control the data rate. Select the L3 Access Control Policy from the drop-down list or click  to create a new policy. Select the L2 Access Control Policy from the drop-down list or click  to create a new policy. Select the Application Policy from the drop-down list or click  to create a new policy. Select the URL Filtering Profile from the drop-down list or click  to create a new profile. Select the Device Policy from the drop-down list or click  to create a new policy.
Application Recognition and Control (ARC)	Enables DPI-based Layer 7 application recognition, and if enabled, an application control policy. Recognition and control are performed on the AP.	Select the option.
Client Virtual ID Extraction	Extracts the Virtual IDs of the users who login into the social media , public email such as WeChat, WhatsApp, hotmail, and cloud disk, and send these virtual ids to the auditing system.	<p>NOTE</p> <p>To enable the Client Virtual ID Extraction, enable Application Recognition Control, and ensure that Siggpack contains regular version.</p>
URL Filtering	Enables URL filtering on the WLAN controller to block or allow access to specific websites or web pages.	Select the option.
Advanced Options		
BSS Priority	Determines the traffic transmit preference of one WLAN compared to another. Traffic for the high priority WLANs are always sent before the low priority WLANs in the same QoS category (background, best effort, video, voice).	Choose the priority: <ul style="list-style-type: none"> • High—Enabled by default. • Low
Client Fingerprinting	Enables the AP to attempt to utilize DHCP fingerprinting to identify client devices by their operating system, device type, and host name.	Select the check box.
Access VLAN	Tags the WLAN traffic with a VLAN ID from 2 through 4094. By default, all client traffic will be assigned to the native (untagged) VLAN on the AP's Ethernet port, which is represented as VLAN ID 1.	Select the check box and enter the VLAN ID .

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
Hotspot 2.0 Onboarding	Allows devices to connect to a Wi-Fi network automatically, wherein the service providers engage in roaming partnerships to provide seamless access to Wi-Fi networks. The devices are authenticated using credentials or certificates.	Select the check box to allow Hotspot 2.0 Onboarding for the WISPr WLAN.
Hide SSID	Removes the SSID from Beacon frames. By removing the SSID, in most cases, clients will not show this SSID in their scan list unless the device is already configured to connect. This can simplify the network decision for an end user.	Select the check box.
Client Load Balancing	Disables client load balancing on this WLAN if the option is selected.	Select the check box to disable client load balancing on this WLAN.
Proxy ARP	Enables proxy ARP. When proxy ARP is enabled on a WLAN, the AP provides proxy service for stations when receiving neighbor discovery packets (for example, ARP request and ICMPv6 Neighbor Solicitation messages), and acts on behalf of the station in delivering ARP replies. When the AP receives a broadcast ARP/Neighbor Solicit request for a known host, the AP replies on behalf of the host. If the AP receives a request for an unknown host, it forwards the request.	Select the check box.
DGAF	Disables AP from forwarding downstream group-addressed frames. This option is available only when proxy ARP is enabled.	Select the option.
MAX Clients	Limits the number of clients that can associate with this WLAN per AP radio (default is 100). Every connection attempt after this maximum value will not be permitted to connect.	Enter the number of clients allowed.
802.11d	Adds additional regulatory information to AP beacons and probe responses. This compliance information provides country-specific guidance such as permitted channels and transmit power, to ensure that the devices operate within the legal boundaries of the country 802.11d is helpful for many devices that cannot independently determine their operating country.	Select the check box to enable this option.
802.11k Neighbor Report	Enhances roaming by providing a list of neighbor APs to the client device. APs build a neighbor AP list via background scanning, and when the client plans to roam, it will request this list from the AP. This list is then used to perform efficient scanning to find a roaming candidate.	Select the check box.

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
Anti-spoofing	Prevents attacks on genuine clients from rogue clients that could lead to service disruption, data loss, and so on. This is achieved by matching the MAC address or IP address (IPv4) of the client with the address in the RUCKUS database. If the addresses do not match, the packet is dropped. These checks are also performed on ingress data packets to catch spoofed data packets early.	<p>Enable the option. By default, the following options are also enabled:</p> <ul style="list-style-type: none"> • ARP request rate limit: Enter the packets to be reviewed for Address Resolution Protocol (ARP) attacks per minute. In ARP attacks, a rouge client sends messages to a genuine client to establish connection over the network. • DHCP request rate limit: Enter the packets to be reviewed for DHCP pool exhaustion per minute. When rouge clients send a DHCP request with a spoofed address, an IP address from the DHCP pool is assigned to it. If this happens repeatedly, the IP addresses in the DHCP pool are exhausted, and genuine clients may miss out on obtaining the IP addresses. <p>NOTE When you enable anti-spoofing, an ARP request and DHCP request rate limiter are automatically enabled with default values (in packets per minute, or ppm) that are applied per client; implying that each client connected to an interface enabled with anti-spoofing is allowed to send a maximum of "X" ARP/DHCP request ppm. The value "X" is configured on the interface to which the client is connected.</p> <p>NOTE The Force-DHCP option will be enabled by default when anti-spoofing is enabled, and it cannot be changed after anti-spoofing is enabled.</p>
Force DHCP	Requires the clients to obtain a valid IP address from DHCP within the specified number of seconds. This prevents clients configured with a static IP address from connecting to the WLAN. Additionally, if a client performs Layer 3 roaming between different subnets, in some cases the client sticks to the former IP address. This mechanism optimizes the roaming experience by forcing clients to request a new IP address.	Select the check box.
DHCP Option 82	Enables an AP to encapsulate additional information (such as VLAN ID, AP name, SSID, and MAC address) into the DHCP request packets before forwarding them to the DHCP server. The DHCP server can then use this information to allocate an IP address to the client from a particular DHCP pool based on these parameters.	Select the option.

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
DHCP Option 82 Format	Enables an AP to encapsulate additional information (such as VLAN ID, AP name, SSID, MAC address, IF name, AP model, Location, Privacy type and Area name) into the DHCP request packets before forwarding them to the DHCP server. The DHCP server can then use this information to allocate an IP address to the client from a particular DHCP pool based on these parameters.	Enable the required format: <ul style="list-style-type: none"> ● Subopt-1 with format and select the option. ● Subopt-2 with format and select the option. ● Subopt-150 with VLAN-ID. ● Subopt-151 with format and select the option.
DTIM Interval	Indicates the frequency at which the Delivery Traffic Indication Message (DTIM) will be included in Beacon frames.	Enter the frequency number. Range: 1 through 255.
Directed MC/BC Threshold	Defines the per-radio-client count at which an AP stops converting group-addressed data traffic to unicast. However, the Directed Threshold logic is only one part of the APs' multicast handling logic, which means there may be other factors that determine whether a frame is transmitted as unicast or multicast. APs support a feature called Directed Multicast (configurable only on AP CLI, enabled by default), which adds additional logic to the multicast flow. If Directed Multicast is disabled, the AP uses the Directed Threshold as the only criteria to determine whether to transmit a multicast packet as unicast. However, when Directed Multicast is enabled, the flow is changed. Directed Multicast is a feature that checks to see if a multicast packet is well-known or not. For well-known multicast packets, for example, Bonjour, uPNP, most IPv6 link- and node-local, and Spectralink, the AP still applies the Directed Threshold logic to determine conversion to unicast. For non well-known types, the AP monitors and maintains a database of client subscriptions using IGMP and MLD. If associated clients are subscribed to the multicast stream, then the AP always converts these packets to unicast, regardless of the Directed Threshold configuration. If there are no clients subscribed to the multicast stream, the AP drops these packets. It is important to be aware of this behavior when validating multicast operation in a deployment.	Enter the client count number. Range: 0 through 128.
Client Tx/Rx Statistics	Stops the controller from monitoring traffic statistics for unauthorized clients.	Select the check box.
Inactivity Timeout	Indicates the duration after which idle clients will be disconnected.	Enter the duration. Range: 60 through 86400 seconds

WLAN Configuration

Creating a WLAN Configuration

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
User Session Timeout	<p>Indicates the duration after which the client gets disconnected.</p> <p>NOTE Before getting disconnected the client can be either in an idle state or connected to the WLAN (SSID).</p>	<p>Enter the duration.</p> <p>Range: 120 to 864000 seconds (10 days).</p> <p>Default Value: 172800 seconds (2 days).</p> <p>NOTE The default value will remain effected only when the session timeout is not applied from the Radius server.</p> <p>NOTE The user session timeout is displayed only for those WLANs in which 802.1X or MAC authentication is enabled.</p>
WiFi 6/7	<p>Controls how the Wi-6/7 AP radios operate to support clients of various capabilities on a specific WLAN.</p> <p>By default, this feature enabled (ON), allowing Wi-Fi 6/7 client devices and legacy Wi-Fi 5 client devices to interoperate with the Wi-Fi 6/7 APs and utilize Wi-Fi 6/7 features (such as OFDMA, TWT, 6GHz operation, Preamble Puncturing, 320MHz bandwidth, and MLO) available on the WLAN.</p> <p>When disabled (OFF), the Wi-Fi 6/7 APs are downgraded to support Wi-Fi 4/5 capabilities. This allows Wi-Fi 6/7 and legacy client devices to interoperate with the Wi-Fi 6/7 APs on the WLAN; however, the Wi-Fi 6/7 features are not available for use. Disabling this feature is recommended when client drivers are not up to date or if the client device drivers have bugs Refer to Wi-Fi 6 or Wi-Fi 7 Support on page 131 for further feature information and the Wi-Fi support matrix.</p> <p>NOTE From releases 5.2.1 through 6.1.2, this option was labeled as Wi-Fi 6. Beginning with release 7.0.0, this option is renamed as Wi-Fi 6/7.</p>	<p>Default setting: Enabled (toggled ON).</p> <p>Click the toggle button to OFF to downgrade the Wi-Fi 6/7 AP functionality, allowing support for Wi-Fi 6/7 and legacy client devices.</p>
MLO (Multi Link Operation)	<p>Allows client devices to seamlessly associate across multiple bands and facilitates smooth switch between these links. The Multi-Link Operation (MLO) feature enhances peak throughput by efficiently sending packets from the same flow across multiple links. It also minimizes latency due to increased channel access opportunities through these multiple links. Furthermore, it enables swift and seamless traffic routing based on channel capacity for load balancing without the need for disassociation and reassociation.</p>	<p>Default radio frequency: 2.4GHz + 5GHz</p> <p>You can also select a combination of two radio frequency. For example, 2.4 GHz + 5 GHz, 2.4 GHz + 6 GHz or 5 GHz + 6 GHz.</p>

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
OFDM Only	Disconnects 802.11b devices from the WLAN and all devices are forced to use higher data rates for more efficient airtime usage. This setting only affects the 2.4-GHz radio. OFDM is used by 802.11a, g, n, and ac, but is not supported by 802.11b.	Select the option.
BSS Min Rate	Forces client devices to both be closer to the AP and to use higher, more efficient rates when you increase the BSS minimum rate above the default (all rates) setting. The BSS minimum rate is the lowest data rate supported on the WLAN. When OFDM-only is enabled, it takes higher priority than BSS minimum rate settings.	Select the option.
Mgmt Tx Rate	Sets the transmit rate for management frame types such as beacon and probes.	Select the value.
6G BSS Min Rate	Forces client devices to both be closer to the AP and to use higher, more efficient rates when you increase the BSS minimum rate above the default (all rates) setting. The BSS minimum rate is the lowest data rate supported on the WLAN. When OFDM-only is enabled, it takes higher priority than BSS minimum rate settings.	Select one of the following option: <ul style="list-style-type: none"> ● 6 mbps ● 9 mbps ● 12 mbps ● 18 mbps ● 24 mbps
6G Mgmt Tx Rate	Sets the transmit rate for management frame types such as beacon and probes.	Select one of the following option: <ul style="list-style-type: none"> ● 6 mbps ● 9 mbps ● 12 mbps ● 18 mbps ● 24 mbps
Service Schedule	<p>Controls when the WLAN service is active. The purpose of this setting is to automatically enable or disable a WLAN based on a predetermined schedule. By default, the service is Always On. Always Off can be checked in order to create a WLAN and apply it, but prevent it from advertising until ready. The Specific setting allows a configurable schedule based on time of day and days of the week.</p> <p style="text-align: center;">NOTE When a service schedule is created, it is saved by the controller and AP using time zone of the browser. When it is enforced by the AP, the AP will enforce it according to the time zone of the browser when it was configured.</p>	Choose the option: <ul style="list-style-type: none"> ● Always On ● Always Off ● Specific and select a schedule profile from the drop-down list.
Band Balancing	Disables band balancing only for this WLAN, if you select the check box.	Select the Disable band balancing for this WLAN service check box.

WLAN Configuration

Creating a WLAN Configuration

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
Qos Map Set	<p>Reprioritizes downlink packets based on the configured mappings. When an AP receives a downlink packet, it checks the existing DSCP (Layer 3 QoS) marking, compares it to this map set and then changes the user priority (Layer 2 QoS) values for transmission by the AP.</p> <p>To configure this feature, select the User Priority (UP) from the table (0-7) and configure the DSCP (0-64) range that will be mapped to this UP.</p> <p>Exceptions can also be added such that the original DSCP and UP tagging are preserved and honored by the AP.</p>	Select Enable QOS Map Set .
Multicast Filter	Drops the broadcast and multicast from the associated wireless clients.	Click to enable this option.
SSID Rate Limiting	Enforces an aggregate rate limit for all users of the WLAN. The purpose of this feature is to prevent the combined throughput from all users of an SSID from exceeding this threshold. This feature is different from per-user rate limiting, which enforces the same rate limit for each individual device.	Select Uplink and Downlink check boxes and enter the limiting rates in mbps respectively. Range: 1 mbps through 1000 mbps.
Multicast Rate Limiting	<p>Multicast rate limit can be configured at WLAN level. The UplinkDownlink values are displayed only if the multicast rate limit is enabled.</p> <p>The Downlink traffic is limited to 50% of the configured multicast rate limiting. For example, if multicast rate limiting downlink traffic is set to 6Mbps, only 50 percent of the traffic, a maximum of 3.00Mbps to 4.00Mbps traffic passes per second. This limit is only for downlink and shall not be affected by BSS Min Rate setting.</p> <p>NOTE SSID Rate Limit always take precedence, if, Mutlicast Rate Limit is also configured.</p>	<p>Select the Uplink and Downlink check boxes and enter the limiting rates in Mbps, respectively. Range: 1 through 100 Mbps.</p> <p>NOTE Multicast Rate Limit value cannot exceed SSID Rate Limit values for respective Uplink and Downlink direction.</p>
DNS Server Profile	Allows the AP to inspect DHCP messages and overwrite the DNS servers with the DNS server configured in this profile. This allows for policy-based DNS application in which unique users/roles should use a different DNS server than others.	<p>Select a profile from the drop-down menu. Select Disable from the drop-down menu if you want to disable the DNS Server profile for the WLAN service. Click  to add a new profile or click  to edit a profile.</p>

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
DNS Spoofing Profile	<p>When an AP receives a DNS packet all the fields in the packet are validated.</p> <p>NOTE Only A/AAAA DNS query packets are considered. When same domain name is present in both DNS spoofing profile and walled garden table in WISPr WLAN then AP DNS cache is updated with the IP address present in the DNS spoofing profile.</p> <p>If DNS spoof and URL filtering with safe search is enabled, URL filtering(safe search) takes the precedence for "goggle", "You Tube", "Bing" domain names. If safe search is not enabled, DNS-Spoof takes the precedence. If safe search is not enabled and URL filtering is enabled also DNS-Spoof takes the precedence.</p>	<p>Select a profile from the drop-down menu. Select Disable from the drop-down menu if you want to disable the DNS Spoofing profile for the WLAN service. Click  to add a new profile or click  to edit a profile.</p>
Precedence Profile	<p>Defines the relative policy assignment priority for some specific settings. For example, if a WLAN is configured to use VLAN 10, and an AAA/role policy is configured for VLAN 20, and a device OS policy is configured for VLAN 30, and a user/device connects to the WLAN matching all of these policies, which VLAN should be assigned? The precedence policy determines which setting takes priority.</p>	<p>Select the required option. Click  to add a new profile or click  to edit a profile.</p>
Client Flow Data Logging	<p>Sends a log message with source MAC, destination MAC, source IP, destination IP, source port, destination port, L4 protocol, and AP MAC of each packet session to the external syslog server. This function is provided by the AP syslog client (not the controller syslog client), which must be enabled at the zone level in order to support this client flow logging.</p>	<p>Select the check box to log the client-flow data to the external syslog server. Then enable AP syslog functionality from the Zone settings.</p>
Airtime Decongestion	<p>Mitigates airtime congestion caused by management frames in high density deployments.</p>	<p>Select the check box.</p>
Join RSSI threshold	<p>Indicates the signal threshold that could connect to the Wi-Fi. If Airtime Decongestion is enabled, Join RSSI threshold is automatically disabled.</p>	<p>Enter the Client RSSI threshold to allow joining. Range: -60 through -90 dBm.</p>
Transient Client Management	<p>Discourages transient clients from joining the network.</p>	<p>Select the Enable Transient Client Management check box and set the following parameters:</p> <ul style="list-style-type: none"> ● Join wait time—Enter the wait time before a client can be permitted to join. Range: 1 through 60 secs. ● Join expire time—Enter the time during which a rejoin request is accepted without delay. Range: 1 through 300 secs. ● Join wait threshold—Enter the number of join attempts after which a client is permitted to join even before the join wait time expires.

WLAN Configuration

Creating a WLAN Configuration

TABLE 4 WLAN Configuration for SZ100 and vSZ-E (continued)

Field	Description	Your Action
Optimized Connectivity Experience (OCE)	OCE enables probe response suppression and prevents devices with marginal connectivity from joining the network. Optimizes the connectivity experience for OCE-enabled APs and stations.	Select Optimized Connectivity Experience (OCE) and set the following parameters: <ul style="list-style-type: none"> ● Broadcast Probe Response Delay - Indicates the time delay to transmit probe response frames in milliseconds. ● RSSI-based Association Rejection Threshold - Indicates the minimum threshold value to connect to the network (in dBm). If the value entered is less than the minimum threshold value, then any RSSI-based association is rejected.
AP Host Name Advertisement in Beacon	AP host name is included in beacon. By default this feature is disabled.	Enable this option to view the AP host name.
QoS Mirroring	This feature allows an AP to use a client's uplink Quality of Service (QoS) classification (Voice, Video, Best Effort or Background) to classify the client device's downlink packets in the mirrored (reverse direction) stream. The AP assigns the downlink packets to the same QoS category as the uplink packets.	<ul style="list-style-type: none"> ● Disabled - QoS mirroring is disabled for all the clients. ● Enabled via Protocol - QoS mirroring is enabled only for clients that send Mirrored Stream Classification Service (MSCS) requests. Legacy clients are not supported with QoS preference. This is the default setting. ● Enabled for All - Unilateral mirroring is applied for this option and QoS mirroring is enabled for all the clients.

TABLE 5 WLAN Configuration for SZ300 and vSZ-H

Field	Description	Your Action
General Options		
Name	Indicates the user-friendly administrative name for the WLAN.	Enter a name.
SSID	Indicates the SSID for the WLAN.	Enter the SSID.
Description	Indicates a user-friendly description of the WLAN's settings or function.	Enter a short description.
Zone	Indicates the zone to which the WLAN configuration applies.	Select the zone to which the WLAN settings apply.
WLAN Groups	Indicates the WLAN groups to which the WLAN applies.	Select the WLAN groups to which the WLAN configuration applies.
Authentication Options		

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
Authentication Type	<p>Defines the type of authentication flow for the WLAN.</p> <p>NOTE Authentication types such as WeChat, Web Authentication, and Guest Access are not supported by APs in IPv6 mode.</p>	<p>Select the required option:</p> <ul style="list-style-type: none"> ● Standard Usage—This is a regular WLAN suitable for most wireless networks. ● Hotspot (WISPr)—Click this option if want to use a hotspot service (use this type for external captive portal workflows) or WISPr. <ul style="list-style-type: none"> NOTE Hotspot (WISPr) applies to WLAN traffic that is tunneled and not tunneled. ● Guest Access—Click this option if you want guest users to use this WLAN. After you complete creating this WLAN for guest access, you can start generating guest passes. For more information about Hotspot 2.0 online signup, see the Hotspot 2.0 Reference Guide for this release. ● Web Authentication—Click this option if you want to require all WLAN users to complete a web-based logon to this network every time they attempt to connect. ● Hotspot 2.0 Access—Click this option if you want a Hotspot 2.0 operator profile that you previously created to use this WLAN. See the Hotspot 2.0 Reference Guide for this release. <ul style="list-style-type: none"> NOTE You can select 8021.X EAP + “WPA3” or “WPA2/WPA3-Mixed” for HS2.0 access WLAN to add more security. ● Hotspot 2.0 Onboarding—Click this option if you want to use this WLAN for Hotspot 2.0 onboarding. See the Hotspot 2.0 Reference Guide for this release for more information. Hotspot 2.0 onboarding allows for Open and 802.1x EAP authentication methods. <ul style="list-style-type: none"> NOTE This authentication type cannot be reconfigured to use a different authentication type due to differences in how Authentication and Accounting profiles are stored and subsequently mapped to WLAN configurations. ● WeChat—Click this option if you want the WLAN usage through WeChat.

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
<p>Method</p>	<p>Specifies the authentication mechanism.</p>	<p>Select the following option:</p> <ul style="list-style-type: none"> ● Open (Default)—No authentication mechanism is applied to connections. If WPA or WPA2 encryption is used, this implies WPA-PSK authentication. If you clicked Web Authentication in Authentication Type, Open is the only available authentication option, even though PSK-based encryption can be supported. ● 802.1X EAP—A very secure authentication/encryption method that requires a back-end authentication server, such as a RADIUS server. Your choice mostly depends on the types of authentication the client devices support and your local network authentication environment. If you select Enable RFC Location Delivery Support for Authentication & Accounting Server, enter the Operator Realm. Selecting the authentication method as Hotspot (WISPr) allows you to select 802.1x EAP as an authentication option. This enables a two-step authentication method when shared and pre-authenticated devices are used, or when user equipment is shared among multiple users. The device access is successful when both authentication processes are completed successfully: 802.1x EAP authentication first, followed by Hotspot (WISPr) authentication. Selecting the authentication method as Hotspot 2.0 Access with support of WPA3 allows you to select 802.1x EAP as an authentication option. ● MAC Address—Authenticate clients by MAC address. <ul style="list-style-type: none"> - MAC Authentication—Requires a RADIUS server and uses the MAC address as the user logon name and password. <ul style="list-style-type: none"> › Select Use user defined text as authentication password (default is device MAC address) and enter the format. - MAC Address Format—Choose the MAC address format from the drop-down menu. ● 802.1X EAP & MAC—Selecting this option indicates that the 802.1x EAP and MAC address authentication methods must both pass for a user to successfully authenticate. First, MAC address authentication is verified; if that passes, 802.1x EAP authentication is processed. After the two authentication methods succeed, the user equipment gains access to the WLAN. Authentication is handled by a back-end RADIUS server. When this authentication method is selected, the MAC Authentication and MAC Address Format fields will be shown within the Authentication Options section.
<p>Encryption Options</p>		

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
Method	Specifies the encryption method. WPA and WPA2 are both encryption methods certified by the Wi-Fi Alliance; WPA2 with AES is the recommended encryption method. The Wi-Fi Alliance will be mandating the removal of WEP due to its security vulnerabilities, and RUCKUS recommends against using WEP, if possible.	<p>Select the option:</p> <ul style="list-style-type: none"> ● WPA2—Enhanced WPA encryption using AES encryption algorithm. <ul style="list-style-type: none"> a. Choose Algorithm: <ul style="list-style-type: none"> - AES: <ol style="list-style-type: none"> 1. Enter Passphrase. 2. Select or clear Show. 3. Select <ul style="list-style-type: none"> › the Enable 802.11 Fast BSS Transition check box and enter the Mobility Domain ID. › the required 802.11w MFP option. 4. Reserve SSID	<p>The Reserve SSID is broadcasted in case the AP loses its SSH Control connection to the controller or Dataplane if it is tunneling traffic.</p> <p>The Reserve SSID will typically become operational within 3 minutes, depending upon when the lost heartbeat is detected.</p> <p>This allows Open, WPA2/WPA3, WPA2/WPA3 mixed or WPA-mixed mode to be used as back up SSID. Reserve SSID is limited to only one WLAN per Zone.</p>	By default it is disabled.
Data Plane Options		
Access Network	Defines the data plane tunneling behavior.	<p>Enable Tunnel WLAN traffic through Ruckus GRE. Configure the following options as appropriate:</p> <ul style="list-style-type: none"> • GRE Tunnel Profile: Manages AP traffic. Select the profile from the list. • Split Tunnel Profile: Enables split tunneling to manage user traffic between corporate and local traffic. Enable the profile <p>from the list. Click  to create a new profile or click  to edit a profile. By default, the option is disabled.</p>
Core Network	Defines the network mode.	<p>Select the option:</p> <ul style="list-style-type: none"> • Bridge • L2oGRE

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
vSZ-D DHCP/NAT	Enables tunneling option for DHCP/NAT.	Select the required check boxes: <ul style="list-style-type: none"> • Enable Tunnel NAT • Enable Tunnel DHCP
RADIUS based DHCP/NAT	Enables RADIUS-based DHCP/NAT settings. The DHCP server authorizes remote clients and allocates addresses based on replies from a RADIUS server.	Select the required check boxes: <ul style="list-style-type: none"> • Enable RADIUS based NAT • Enable RADIUS based DHCP
Flexi-VPN Profile	Enables forwarding of tunneled traffic to another remote DP instance through inter-DP RuckusGRE Tunnel (Flexi). NOTE If there are more than 40 DPs approved, the controller limits the user to use Flexi-VPN feature.	Select the profile from the list.
Authentication & Accounting Server (for WLAN Authentication Type: Standard usage)		
Authentication Server	Specifies the server used for authentication on this network. By enabling Proxy, authentication requests will flow through the controller. In a non-proxy mode, the AP will communicate directly with the authentication server without going through the controller.	<ol style="list-style-type: none"> a. Select the Use controller as proxy check box. Beginning with SmartZone 7.0.0, the User controller as proxy option can be disabled to allow a non-proxy AAA service. b. Select the server from the menu. c. Select Enable RFC Location Delivery Support.
Accounting Server	Specifies the server used for accounting messages. By enabling Proxy, accounting messages are sent by the controller. In a non-proxy mode, the AP will communicate accounting messages directly.	<ol style="list-style-type: none"> a. Select the Use controller as proxy check box. b. Select the server from the menu.
Hotspot Portal (for WLAN Authentication Type: Hotspot (WISPr))		
Hotspot (WISPr) Portal	Defines hotspot behavior such as redirects, session timers, and location information among others.	Select the hotspot portal profile that you want this WLAN to use.
Bypass CNA	Bypasses the Apple CNA feature on iOS and OS X devices that connect to this WLAN.	Select the Enable check box.
Authentication Service	Indicates the authentication server that you want to use for this WLAN.	<p>Choose the option. Options include Local DB, Always Accept, and any AAA servers that you previously added. Select:</p> <ul style="list-style-type: none"> • Use Controller as Proxy for the controller to proxy authentication messages to the AAA server • Use Realm-based profile to list contents the realm-based profile <p>When the SSH tunnel between the AP and the controller is down, you can enable Backup Authentication Service to back up the AP's authentication services to a secondary device.</p> <p>NOTE The customer portal must use AP WISPr ZD-Style API/ Backup AAA to continue to provide the WISPr service for WISPr survivability.</p>

WLAN Configuration

Creating a WLAN Configuration

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
Accounting Service	Indicates the RADIUS Accounting server that you want to use for this WLAN.	<p>Choose the option. You must have added a RADIUS Accounting server previously.</p> <p>Additionally, if you want the controller to proxy accounting messages to the AAA server, select the Use the Controller as Proxy check box.</p> <p>Select:</p> <ul style="list-style-type: none"> • Use Controller as Proxy for the controller to proxy authentication messages to the AAA server • Use Realm-based profile to list contents the realm-based profile <p>When the SSH tunnel between the AP and the controller is down, you can enable Backup Accounting Service to back up the AP's accounting services to a secondary device.</p> <p>NOTE The customer portal must use AP WISPr ZD-Style API/ Backup AAA to continue to provide the WISPr service for WISPr survivability.</p>
Guest Access Portal (for WLAN Authentication Type: Guest Access)		
Guest Access Service	Indicates the guest access portal to be used on this WLAN.	Choose the guest portal service.
Bypass CNA	Bypasses the Apple CNA feature on iOS and OS X devices that connect to this WLAN.	Select the Enable check box.
Guest Authentication	Manages guest authentication.	<p>Select:</p> <ul style="list-style-type: none"> • Guest to require users to enter their guest pass credentials. Guest passes are managed directly on the controller. • Always Accept to allow users without guest credentials to receive authentication.
Guest Accounting	Indicates the RADIUS Accounting server that you want to use for this WLAN.	Choose the server. You must have added a RADIUS Accounting server previously. Additionally, if you want the controller to proxy accounting messages to the AAA server, select the Use the Controller as Proxy check box.
Authentication & Accounting Service (for WLAN Authentication Type: Web Authentication)		
Web Authentication Portal	Indicates the web authentication portal to use for this WLAN.	Choose the web authentication portal from the list.
Bypass CNA	Bypasses the Apple CNA feature on iOS and OS X devices that connect to this WLAN.	Select the Enable check box.
Authentication Service	Indicates the authentication server that you want to use for this WLAN.	Choose the option. Options include Local DB , Always Accept , and any AAA servers that you previously added. Additionally, if you want the controller to proxy authentication messages to the AAA server, select the Use the Controller as Proxy check box.
Accounting Service	Indicates the RADIUS Accounting server that you want to use for this WLAN.	Choose the server. You must have added a RADIUS Accounting server previously. Additionally, if you want the controller to proxy accounting messages to the AAA server, select the Use the Controller as Proxy check box.
Hotspot 2.0 Profile (for WLAN Authentication Type: Hotspot 2.0 Access)		
Hotspot 2.0 Profile	Indicates the profile, which includes the operator and identifies provider profiles.	Choose the profile.

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
Accounting Service (RFC 5580)	Supports RFC 5580 location delivery on the WLAN, which carries location information in RADIUS exchanges.	Select the check box.
Accounting Service (Updates)	Indicates the frequency to send interim updates. Configures the account update interval for accounting servers defined in the Hotspot 2.0 Identity Provider profile.	Enter the duration in minutes. Range: 0 through 1440.
WeChat Portal (for WLAN Authentication Type: WeChat)		
WeChat Portal	Defines the WeChat authentication URL, DNAT destination, and other information.	Select a WeChat portal service.
Accounting Server	Indicates the RADIUS Accounting server that you want to use for this WLAN.	Choose the server. You must have added a RADIUS Accounting server previously. Additionally, if you want the controller to proxy accounting messages to the AAA server, select the Use the Controller as Proxy check box.
Forwarding Profile (for WLAN Usage > Access Network)		
Forwarding Policy	Defines special data packet handling to be taken by the data plane when the traffic is tunneled.	Forwarding Profile is Factory Default . It is disabled.
Wireless Client Isolation		
Client Isolation	Prevents wireless clients from communicating with each other.	Enable Client Isolation to separate wireless client traffic from all hosts on the same VLAN/subnet. When client isolation is enabled the below options are available to enable or disable as appropriate: <ul style="list-style-type: none"> ● Isolate unicast packets: Isolates only unicast packets between a client isolation-enabled WLAN and other clients of the AP. ● Isolate multicast/broadcast packets: By default, this option is disabled, when enabled, only multicast packets between a client isolation and other clients of the AP are separated. ● Automatic support for VRRP/HSRP: By default, this option is disabled, when enabled, allows you to have isolation without adding physical MAC addresses of VRRP/HSRP routers. Client isolation only discovers virtual IP and MAC in VRRP/HSRP.
Isolation Whitelist	Isolation whitelist allows you to manually specify a list of MAC and IP Addresses that override the blocked list.	Click on the Add icon corresponding to the field to manually enter the MAC and IP addresses to the isolation whitelist. NOTE Specify a default gateway that splits IP address into the host and network addresses in the whitelist.
RADIUS Option		
NAS ID	Defines the ID sent to the RADIUS server, which will identify the AP.	Choose the option: <ul style="list-style-type: none"> ● WLAN BSSID ● AP MAC ● User-defined
NAS Request Timeout	Indicates the duration after which an expected RADIUS response message is considered to have failed.	Enter the timeout period (in seconds). NOTE It is recommended to configure the same values for NAS Request Timeout , NAS Max Number of Retries , and NAS Reconnect Primary .

WLAN Configuration

Creating a WLAN Configuration

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
NAS Max Number of Retries	Indicates the maximum number of failed connection attempts after which the controller will fail over to the backup RADIUS server.	Enter the maximum number of failed connection attempts. NOTE It is recommended to configure the same values for NAS Request Timeout , NAS Max Number of Retries , and NAS Reconnect Primary .
NAS Reconnect Primary	Indicates the time interval after which the controller will recheck if the primary RADIUS server is available when the controller has failed over to the backup RADIUS server.	Enter the duration in minutes. Range: 1 through 60 minutes. The default interval is 5 minutes. NOTE It is recommended to configure the same values for NAS Request Timeout , NAS Max Number of Retries , and NAS Reconnect Primary .
Called Station ID	Indicates the format for the called station ID, which is sent to the RADIUS server as an attribute, and can be used in policy decisions.	Select a format: <ul style="list-style-type: none"> • WLAN BSSID • AP MAC • AP GROUP • NONE
Single Session ID Accounting	Allows the APs to maintain one accounting session for a client roaming between APs. If the client roams from one AP to another, the accounting session ID and statistics will be carried while roaming from one AP to the other. If the feature is not enabled, the accounting session ID is regenerated and the statistics are also reset, essentially resetting the accounting session.	Select the Enable check box.
NAS IP	Indicates the NAS IP address.	Select the option: <ul style="list-style-type: none"> • Disabled • SZ Control IP • SZ Management IP • User-defined
Vendor Specific Attribute Profile	Indicates the VSA profile	Select from the following options: <ul style="list-style-type: none"> • VSA profiles NOTE VSA profiles are configured at the zone level. • Disabled (default) NOTE Click  to edit the VSA profile.
Firewall Options		
Firewall Profile	Indicates the zone for which the firewall profile applies.	Select the option.

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
Enable WLAN specific	Applies the firewall profile to the WLAN.	Select the option and update the following: <ol style="list-style-type: none"> a. In the Rate Limiting field, select the Uplink and Downlink option to specify and apply rate limit values for the device policy to control the data rate. b. Select the L3 Access Control Policy from the drop-down list or click  to create a new policy. c. Select the L2 Access Control Policy from the drop-down list or click  to create a new policy. d. Select the Application Policy from the drop-down list or click  to create a new policy. e. Select the URL Filtering Profile from the drop-down list or click  to create a new profile. f. Select the Device Policy from the drop-down list or click  to create a new policy.
Application Recognition and Control	Enables DPI-based Layer 7 application recognition, and if enabled, an application control policy. Recognition and control are performed on the AP.	Select the option.
Client Virtual ID Extraction	Extracts the Virtual IDs of the users who login into the social media , public email such as WeChat, Whats App, hotmail, and cloud disk, and send these virtual ids to the auditing system.	NOTE To enable the Client Virtual ID Extraction, enable Application Recognition Control, and ensure that Sigpack contains regular version.
URL Filtering	Enables URL filtering on the WLAN controller to block or allow access to specific websites or web pages.	Select the option.
Advanced Options		
BSS Priority	Determines the traffic transmit preference of one WLAN compared to another. Traffic for the high priority WLANs are always sent before the low priority WLANs in the same QoS category (background, best effort, video, voice).	Choose the priority: <ul style="list-style-type: none"> • High—Enabled by default. • Low
Client Fingerprinting	Enables the AP to attempt to utilize DHCP fingerprinting to identify client devices by their operating system, device type, and host name.	Select the check box.
Access VLAN	Tags the WLAN traffic with a VLAN ID from 2 through 4094. By default, all client traffic will be assigned to the native (untagged) VLAN on the AP's Ethernet port, which is represented as VLAN ID 1.	Select the check box and enter the VLAN ID .

WLAN Configuration

Creating a WLAN Configuration

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
Hotspot 2.0 Onboarding	Allows devices to connect to a Wi-Fi network automatically, wherein the service providers engage in roaming partnerships to provide seamless access to Wi-Fi networks. The devices are authenticated using credentials or certificates.	Select the check box to allow Hotspot 2.0 Onboarding for the WISPr WLAN.
Hide SSID	Removes the SSID from beacon frames. By removing the SSID, in most cases, clients will not show this SSID in their scan list unless the device is already configured to connect. This can simplify the network decision for an end user.	Select the check box.
Client Load Balancing	Disables client load balancing on this WLAN if the option is selected.	Select the check box to disable client load balancing on this WLAN.
Proxy ARP	Enables proxy ARP. When proxy ARP is enabled on a WLAN, the AP provides ARP response service for stations. When the AP receives an ARP request for a known host, it replies with an ARP response on behalf of the host. If the AP receives a request for an unknown host, it forwards the request.	Select the check box.
DGAF	Disables AP from forwarding downstream group-addressed frames. This option is available only when proxy ARP is enabled.	Select the option.
ND Proxy	Enables Neighbor Discovery proxy. When ND proxy is enabled on a WLAN, the AP provides Neighbor Advertisement service for stations. When the AP receives a Neighbor solicitation request for a known host, it replies with a Neighbor Advertisement on behalf of the host. If the AP receives a request for an unknown host, it forwards the request. NOTE This feature is available only on IPv6 and Dual zone and is enabled by default.	Enable the option.
Suppress NS	Suppress Network Solicitation (NS) on a wireless medium when there is no Station entry available in the cache. This feature can be configured only when the ND Proxy option is enabled. NOTE This feature is available only on IPv6 and Dual zone and is disabled by default.	Enable the option.

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
RA Proxy	<p>Enables Router Advertisement proxy. When RA proxy is enabled on a WLAN, the AP provides Router Advertisement service for wireless stations. When the AP receives a Router solicitation request on a WLAN, it replies with a Router Advertisement on behalf of the routers available on the network learned by the AP. If the router entries are not found in the cache, the AP forwards the request.</p> <p style="text-align: center;">NOTE This feature is available only on IPv6 and Dual zone and is enabled by default.</p>	Enable the option.
RS/RA Guard	<p>Prevents Router Solicitation (RS) from the wired side of the network to a wireless side. Also prevents Router Advertisement (RA) from a wireless side of the network to the wired side. This feature can be configured only when the RA Proxy option is enabled.</p> <p style="text-align: center;">NOTE This feature is available only on IPv6 and Dual zone and is disabled by default.</p>	Enable the option.
RA Throttling	<p>Regulates the multicast Router Advertisement (RA) from a wired medium to a wireless medium based on the configured Max Allowed RA and Interval. This feature can be configured only when RA Proxy is enabled.</p> <p style="text-align: center;">NOTE This feature is available only on IPv6 and Dual zone and is disabled by default.</p>	<ul style="list-style-type: none"> ● Max Allowed RA: Enter the maximum number of Router Advertisements (RAs) allowed per minute. Range: 1 through 1440, default 10 ● Interval: Enter the regulating frequency in minutes. Range: 1 through 256, default 10
MAX Clients	<p>Limits the number of clients that can associate with this WLAN per AP radio (default is 100). Every connection attempt after this maximum value will not be permitted to connect.</p>	Enter the number of clients allowed.
802.11d	<p>Adds additional regulatory information to AP beacons and probe responses. This compliance information provides country-specific guidance such as permitted channels and transmit power, to ensure that the devices operate within the legal boundaries of the country. 11d is helpful for many devices that cannot independently determine their operating country.</p>	Enable the option.

WLAN Configuration

Creating a WLAN Configuration

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
802.11k Neighbor Report	Enhances roaming by providing a list of neighbor APs to the client device. APs build a neighbor AP list via background scanning, and when the client plans to roam, it will request this list from the AP. This list is then used to perform efficient scanning to find a roaming candidate.	Enable the option.
Anti-spoofing	Prevents attacks on genuine clients from rogue clients that could lead to service disruption, data loss, and so on. This is achieved by matching the MAC address or IP address (IPv4) of the client with the address in the RUCKUS database. If the addresses do not match, the packet is dropped. These checks are also performed on ingress data packets to catch spoofed data packets early.	<p>Enable the option. By default, the following options are also enabled:</p> <ul style="list-style-type: none"> • ARP request rate limit: Enter the packets to be reviewed for Address Resolution Protocol (ARP) attacks, per minute. In ARP attacks a rouge client sends messages to a genuine client to establish connection over the network. • DHCP request rate limit: Enter the packets to be reviewed for DHCP pool exhaustion per minute. When rouge clients send a DHCP request with a spoofed address, an IP address from the DHCP pool is assigned to it. If this happens repeatedly, the IP addresses in the DHCP pool are exhausted, and genuine clients may miss out on obtaining the IP addresses. <p>NOTE When you enable anti-spoofing, an ARP request and DHCP request rate limiter is automatically enabled with default values (in packets per minute, or ppm) which are applied per client; implying that each client connected to an interface enabled with anti-spoofing is allowed to send a maximum of "X" ARP/DHCP request ppm. The value "X" is configured on the interface that the client is connected.</p> <p>NOTE The Force-DHCP option will be enabled by default when anti-spoofing is enabled, and it cannot be changed after anti-spoofing is enabled.</p>
Force DHCP	Requires the clients to obtain a valid IP address from DHCP within the specified number of seconds. This prevents clients configured with a static IP address from connecting to the WLAN. Additionally, if a client performs Layer 3 roaming between different subnets, in some cases the client sticks to the former IP address. This mechanism optimizes the roaming experience by forcing clients to request a new IP address.	Select the check box.
DHCP Option 82	Enables an AP to encapsulate additional information (such as VLAN ID, AP name, SSID, and MAC address) into DHCP request packets before forwarding them to the DHCP server. The DHCP server uses this information to allocate an IP address to the client from a particular DHCP pool based on these parameters.	<p>Enable the On/Off button.</p> <p>NOTE The options are displayed only if the On is enabled.</p>

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
DHCP Option 82 Format	Enables an AP to encapsulate additional information into DHCP request packets before forwarding them to the DHCP server. The DHCP server uses this information to allocate an IP address to the client from a particular DHCP pool based on these parameters.	<p>Enable the required format:</p> <ul style="list-style-type: none"> ● Subopt-1 with format and select the option. The options are : <ul style="list-style-type: none"> - AP-MAC - AP-MAC ESSID - AP-NAME ESSID ● Subopt-2 with format and select the option. The options are: <ul style="list-style-type: none"> - Client-MAC - AP-MAC - AP-MAC ESSID - AP-NAME ● Subopt-150 with VLAN-ID. ● Subopt-151 with format and select the option. ● Mac format delimiter, choose the MAC format from the drop-down list.
DTIM Interval	Indicates the frequency at which the Delivery Traffic Indication Message (DTIM) will be included in Beacon frames.	Enter the frequency number. Range: 1 through 255.
Directed MC/BC Threshold	Defines the per-radio-client count at which an AP stops converting group-addressed data traffic to unicast. However, the Directed Threshold logic is only one part of the access points' multicast handling logic, which means there may be other factors that determine whether a frame is transmitted as unicast or multicast. APs support a feature called Directed Multicast (configurable only on AP CLI, enabled by default), which adds additional logic to the multicast flow. If Directed Multicast is disabled, the AP uses the Directed Threshold as the only criteria to determine whether to transmit a multicast packet as unicast. However, when Directed Multicast is enabled, the flow is changed. Directed Multicast is a feature that checks to see if a multicast packet is well-known or not. For well-known multicast packets, for example, Bonjour, uPNP, most IPv6 link- and node-local, and Spectralink, the AP still applies the Directed Threshold logic to determine conversion to unicast. For non well-known types, the AP monitors and maintains a database of client subscriptions using IGMP and MLD. If associated clients are subscribed to the multicast stream, then the AP always converts these packets to unicast, regardless of the Directed Threshold configuration. If there are no clients subscribed to the multicast stream, the AP drops these packets. It is important to be aware of this behavior when validating multicast operation in a deployment.	Enter the client count number. Range: 0 through 128.

WLAN Configuration

Creating a WLAN Configuration

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
Client Tx/Rx Statistics	Stops the controller from monitoring traffic statistics for unauthorized clients.	Select the check box.
User Session Timeout	<p>Indicates the duration after which idle clients will be disconnected.</p> <p>NOTE Before getting disconnected the client can be either in an idle state or connected to the WLAN (SSID).</p>	<p>Enter the duration. Range: 120 to 864000 seconds (10 days). Default Value: 172800 seconds (2 days).</p> <p>NOTE This default value will remain effected only when the session timeout is not applied from the Radius server.</p> <p>NOTE The user session timeout is displayed only for those WLANs in which 802.1X or MAC authentication is enabled.</p>
User Session Timeout	<p>Indicates the duration after which the client gets disconnected.</p> <p>NOTE Before getting disconnected the client can be either in an idle state or connected to the WLAN.</p>	<p>Enter the duration. Range: 120 to 864000 seconds (10 days). Default Value: 172800 seconds (2 days).</p> <p>NOTE This default value will remain effected only when the session timeout is not applied from the Radius server.</p>
WiFi 6/7	<p>Controls how the Wi-6/7 AP radios operate to support clients of various capabilities on a specific WLAN.</p> <p>By default, this feature enabled (ON), allowing Wi-Fi 6/7 client devices and legacy Wi-Fi 5 client devices to interoperate with the Wi-Fi 6/7 APs and utilize Wi-Fi 6/7 features (such as OFDMA, TWT, 6GHz operation, Preamble Puncturing, 320MHz bandwidth, and MLO) available on the WLAN.</p> <p>When disabled (OFF), the Wi-Fi 6/7 APs are downgraded to support Wi-Fi 4/5 capabilities. This allows Wi-Fi 6/7 and legacy client devices to interoperate with the Wi-Fi 6/7 APs on the WLAN; however, the Wi-Fi 6/7 features are not available for use. Disabling this feature is recommended when client drivers are not up to date or if the client device drivers have bugs Refer to Wi-Fi 6 or Wi-Fi 7 Support on page 131 for further feature information and the Wi-Fi support matrix.</p> <p>NOTE From releases 5.2.1 through 6.1.2, this option was labeled as Wi-Fi 6. Beginning with release 7.0.0, this option is renamed as Wi-Fi 6/7.</p>	<p>Default setting: Enabled (toggled ON).</p> <p>Click the toggle button to OFF to downgrade the Wi-Fi 6/7 AP functionality, allowing support for Wi-Fi 6/7 and legacy client devices.</p>

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
MLO (Multi Link Operation)	Allows client devices to seamlessly associate across multiple bands and facilitates smooth switch between these links. The Multi-Link Operation (MLO) feature enhances peak throughput by efficiently sending packets from the same flow across multiple links. It also minimizes latency due to increased channel access opportunities through these multiple links. Furthermore, it enables swift and seamless traffic routing based on channel capacity for load balancing without the need for disassociation and reassociation.	Default radio frequency: 2.4GHz + 5GHz You can also select a combination of two radio frequency. For example, 2.4 GHz + 5 GHz, 2.4 GHz + 6 GHz or 5 GHz + 6 GHz.
OFDM Only	Disconnects 802.11b devices from the WLAN and all devices are forced to use higher data rates for more efficient airtime usage. This setting only affects the 2.4-GHz radio. OFDM is used by 802.11a, g, n, and ac, but is not supported by 802.11b.	Select the check box.
BSS Min Rate	Forces client devices to be both closer to the AP and to use higher, more efficient rates when you increase the BSS minimum rate above the default (all rates) setting. The BSS minimum rate is the lowest data rate supported on the WLAN. When OFDM-only is enabled, it takes higher priority than BSS minimum rate settings.	Select the option.
Mgmt Tx Rate	Sets the transmit rate for management frame types such as beacon and probes.	Select the value.
6G BSS Min Rate	Forces client devices to both be closer to the AP and to use higher, more efficient rates when you increase the BSS minimum rate above the default (all rates) setting. The BSS minimum rate is the lowest data rate supported on the WLAN. When OFDM-only is enabled, it takes higher priority than BSS minimum rate settings.	Select one of the following option: <ul style="list-style-type: none"> • 6 mbps • 9 mbps • 12 mbps • 18 mbps • 24 mbps
6G Mgmt Tx Rate	Sets the transmit rate for management frame types such as beacon and probes.	Select one of the following option: <ul style="list-style-type: none"> • 6 mbps • 9 mbps • 12 mbps • 18 mbps • 24 mbps

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
Service Schedule	<p>Controls when the WLAN service is active. The purpose of this setting is to automatically enable or disable a WLAN based on a predetermined schedule. By default, the service is Always On.</p> <p>Always Off can be selected in order to create a WLAN and apply it, but prevent it from advertising until ready. The Specific setting allows a configurable schedule based on time of day and days of the week.</p> <p>NOTE When a service schedule is created, it is saved by the controller and AP using the time zone of the browser. When it is enforced by the AP, the AP will enforce it according to the time zone of the browser when it was configured.</p>	<p>Choose the option:</p> <ul style="list-style-type: none"> • Always On • Always Off • Specific and select a schedule profile from the drop-down list.
Band Balancing	<p>Disables band balancing only for this WLAN, if you select the check box.</p>	<p>Select the Disable band balancing for this WLAN service check box.</p>
Qos Map Set	<p>Reprioritizes downlink packets based on the configured mappings. When an AP receives a downlink packet, it checks the existing DSCP (Layer 3 QoS) marking, compares it to this map set, and then changes the user priority (Layer 2 QoS) values for transmission by the AP.</p> <p>To configure this feature, select the User Priority (UP) from the table (0-7) and configure the DSCP (0-64) range that will be mapped to this UP.</p> <p>Exceptions can also be added such that the original DSCP and UP tagging are preserved and honored by the AP.</p>	<p>To configure this feature, select the User Priority (UP) from the table (0-7) and configure the DSCP (0-64) range that will be mapped to this UP.</p> <p>Select Enable QOS Map Set.</p>
Multicast Filter	<p>Drops the broadcast and multicast from the associated wireless clients.</p>	<p>Click to enable this option.</p>
SSID Rate Limiting	<p>Enforces an aggregate rate limit for all users of the WLAN. The purpose of this feature is to prevent the combined throughput from all users of an SSID from exceeding this threshold. This feature is different from per-user rate limiting, which enforces the same rate limit for each individual device.</p>	<p>Select the Uplink and Downlink check boxes and enter the limiting rates in mbps, respectively. Range: 1 through 1000 Mbps.</p> <p>NOTE Rate limit supports maximum of 100 clients per WLAN per radio. After the threshold, the system displays client failure (203) error.</p>

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
Multicast Rate Limiting	<p>Multicast rate limit can be configured at WLAN level. The UplinkDownlink values are displayed only if the multicast rate limit is enabled.</p> <p>The Downlink traffic is limited to 50% of the configured multicast rate limiting. For example, if multicast rate limiting downlink traffic is set to 6Mbps, only ~50%, .for example. 3.00Mbps to 4.00Mbps max per second traffic passes. This limit is only for downlink and shall not be affected by BSS Min Rate setting.</p> <p style="text-align: center;">NOTE SSID Rate Limit always take precedence, if, Mutlicast Rate Limit is also configured.</p>	<p>Select the Uplink and Downlink check boxes and enter the limiting rates in Mbps, respectively. Range: 1 through 100 Mbps.</p> <p style="text-align: center;">NOTE Multicast Rate Limit value cannot exceed SSID Rate Limit values for respective Uplink and Downlink direction.</p>
DNS Server Profile	<p>Allows the AP to inspect DHCP messages and overwrite the DNS servers with the DNS server configured in this profile. This allows for policy-based DNS application in which unique users/roles should use a different DNS server than others.</p>	<p>Select a profile from the menu. Select Disable from the menu if you want to disable the DNS Server profile for the WLAN service. Click  to add a new profile or click  to edit a profile.</p>
DNS Spoofing Profile	<p>When an AP receives a DNS packet, all the fields in the packet are validated.</p> <p style="text-align: center;">NOTE Only A/AAA server DNS query packets are considered. When same domain name is present in both DNS spoofing profile and walled garden table in the WISPr WLAN, then the AP DNS cache is updated with the IP address present in the DNS spoofing profile.</p> <p>If DNS spoofing and URL filtering with safe search is enabled, URL filtering (safe search) takes precedence for the Google, YouTube, and Bing domain names. If safe search is not enabled, DNS spoofing takes the precedence. If safe search is not enabled and URL filtering is enabled also DNS-Spoof takes the precedence.</p>	<p>Select a profile from the menu. Select Disable from the menu if you want to disable the DNS Spoofing profile for the WLAN service. Click  to add a new profile or click  to edit a profile</p>

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
Precedence Profile	Defines the relative policy assignment priority for some specific settings. For example, if a WLAN is configured to use VLAN 10, and an AAA/role policy is configured for VLAN 20, and a device OS policy is configured for VLAN 30, and a user/device connects to the WLAN matching all of these policies, which VLAN should be assigned. The precedence policy determines which setting takes priority.	Select the option. Click  to add a new profile or click  to edit a profile.
CALEA (This feature is supported only for SZ300 controllers.)	Intercepts traffic, a requirement enforced on some networks by government agencies. To utilize CALEA, you must support a vSZ-D and configure the CALEA settings in the Services & Profiles > Tunnels & Ports menu.	Select the check box. NOTE If there are more than 40 DPs been approved, the controller limits the user to use the CALEA feature.
Client Flow Data Logging	Sends a log message with the source MAC address, destination MAC address, source IP address, destination IP address, source port, destination port, Layer 4 protocol, and AP MAC address of each packet session to the external syslog server. This function is provided by the AP syslog client (not the controller syslog client), which must be enabled at the zone level in order to support this client flow logging.	Select the check box to log the client-flow data to the external syslog server. Then enable AP syslog functionality from the Zone settings.
Airtime Decongestion	Mitigates airtime congestion caused by management frames in high-density deployments.	Select the check box.
Join RSSI threshold	Indicates the signal threshold that could connect to the Wi-Fi. If Airtime Decongestion is enabled, Join RSSI threshold is automatically disabled.	Enter the Client RSSI threshold to allow joining. Range: -60 through -90 dBm.
Transient Client Management	Discourages transient clients from joining the network.	Select enable Transient Client Management and set the following parameters: <ul style="list-style-type: none"> • Join wait time—Enter the wait time before a client can be permitted to join. Range: 1 through 60 secs. • Join expire time—Enter the time during which a rejoin request is accepted without delay. Range: 1 through 300 secs. • Join wait threshold—Enter the number of join attempts after which a client is permitted to join even before the join wait time expires.
Optimized Connectivity Experience (OCE)	OCE enables probe response suppression and prevents devices with marginal connectivity from joining the network. Optimizes the connectivity experience for OCE-enabled APs and stations.	Select Optimized Connectivity Experience (OCE) and set the following parameters: <ul style="list-style-type: none"> • Broadcast Probe Response Delay: Indicates the time delay to transmit probe response frames in milliseconds. • RSSI-based Association Rejection Threshold: Indicates the minimum threshold value to connect to the network (in dBm). If the value entered is less than the minimum threshold value, then any RSSI-based association is rejected.

TABLE 5 WLAN Configuration for SZ300 and vSZ-H (continued)

Field	Description	Your Action
QoS Mirroring	This feature allows an AP to use a client's uplink Quality of Service (QoS) classification (Voice, Video, Best Effort or Background) to classify the client device's downlink packets in the mirrored (reverse direction) stream. The AP assigns the downlink packets to the same QoS category as the uplink packets.	<ul style="list-style-type: none"> • Disabled - QoS mirroring is disabled for all the clients. • Enabled via Protocol - QoS mirroring is enabled only for clients that send Mirrored Stream Classification Service (MSCS) requests. Legacy clients are not supported with QoS preference. This is the default setting. • Enabled for All - Unilateral mirroring is applied for this option and QoS mirroring is enabled for all the clients.

4. Click **OK**.

For SZ300 and vSZ-H, you can also migrate the WLAN configuration from a regular Domain to a Partner Domain. For more information, see <https://support.ruckuswireless.com/answers/000006414>.

NOTE

You can edit, clone, and delete WLANs by selecting the options **Configure**, **Clone**, and **Delete** respectively, from the **Wireless LANs** page.

NOTE

From the **Wireless LANs** page, you can also select **More** and perform the following operations:

- **Select All:** Select all WLANs in the list.
- **Deselect All:** Clear all WLAN selections from the list.
- **Enable:** Enable a WLAN from the list.
- **Disable:** Disable a WLAN from the list.

In the WLAN list, the **Status** column indicates whether the WLAN configuration is active or inactive. Though a WLAN is disabled by a time schedule, its configuration will remain active.

Creating 802.1X WLAN. 802.1X WLAN Configuration.

[Click to play video in full screen mode.](#)

802.11r Fast BSS Transition

802.11r Fast BSS Transition is a fast roaming protocol that reduces the number of frame exchanges required for roaming and allows the clients and APs to reuse the master keys obtained during a prior authentication exchange. 802.11r is most helpful for 802.1X networks. Client support is required for 802.11r to work.

A Mobility Domain ID is used by 802.11r to define a scope of the network in which fast roaming is supported. Master keys are shared within the Mobility Domain, allowing clients to support fast roaming.

Mobility Domain ID

A Mobility Domain ID is used by 802.11r to define a scope of the network in which an 11r fast roaming is supported. Master keys are shared within the Mobility Domain, allowing clients to support fast roaming.

802.11w Management Frame Protection

802.11w Management Frame Protection (MFP) provides additional security measures for management frames. Not all client devices support 802.11w.

Check your client devices before enabling 11watts. If “Required” is selected, client device must support 11watts in order to connect. If “Capable” is selected, client device with or without 11watts should be able to connect. However, note that some client devices with poor driver software may have connection issues even if 11watts is set to “Capable”.

Multiple Basic Service Set Identifier (MBSSID)

The Multiple BSSID was specified in the IEEE 802.11v and is mandatory feature in Wi-Fi capable APs. By default, MBSSID is enabled on 6GHz radio. Typically an access point uses one beacon for advertising a BSSID. MBSSID reduces this overhead of the AP by integrating multiple beacons into one beacon.

The rule for Multi BSSID is a user must assign BSSIDs from a sufficiently large set of MAC addresses so that each assigned BSSID is unique and each of them must have the same 48 - n msbs for all 2n BSSID group.

The Multiple BSSID capability enables the advertisement of information for BSSIDs using a single beacon or probe response frame instead of multiple beacon and probe response frames. A 32-bit bitmask, the lower 16 bits of which specifies the pdevs for which the feature needs to be enabled.

A Bit corresponding to 6GHz radio is reserved as MBSSID and it is mandatory for 6GHz.

The MBSSID set is characterized as follows:

- All members of the set use a common operating class, channel, channel access functions, and antenna connector.
- MaxBSSID indicator contains n, with 2n maximum number of BSSIDs in the set.
- Members of the set have the same 47-n MSBs in their BSSIDs.

FIGURE 3 Multi BSSID

Multiple BSSID Configuration

Multiple BSSID configuration element.

- Element ID - 255
- Element ID extension - 55
- BSSID count - Carries the total number of active BSSIDs in the MBSSID set.

- Profile periodicity - Indicates the least number of beacon frames a STA needs to receive in order to discover all the active non transmitted BSSIDs in the set.

Ext Tag: Multiple BSSID Configuration

```
Tag number: Element ID Extension (255)
Ext Tag length: 3
Ext Tag number: Multiple BSSID Configuration (55)
BSSID count: 16
Profile Periodicity: 3
```

FIGURE 4 Multiple BSSID Configuration

Enhanced Multi-BSSID Advertisement (EMA)

Due to the beacon size limitation, RUCKUS supports a maximum of 6 SSIDs per MBSSID beacon in a primary group. Out of which 5 SSIDs are used for user configured WLANs and the first SSID (RKS_TX_VAP) is reserved for TxVAP. This RKS_TX_VAP is created when a user brings up the first WLAN. The RKS_TX_VAP is pulled down, if the user brings down all the remaining WLANs in the 6GHz.

If mesh WLAN is enabled, secondary group contains MBSSID beacon.

Airtime Decongestion

NOTE

Before enabling airtime decongestion you must enable **Background Scan**.

Airtime Decongestion optimizes the Wi-Fi management traffic in a network where the amount of management traffic can potentially consume a significant portion of airtime, and thereby reduce the amount of time available for traffic. The Airtime Decongestion controls the RSSI threshold setting for Transient Client Management. Enabling Airtime Decongestion disables the RSSI threshold configuration.

VIDEO

Airtime Decongestion Overview. This video provides a brief overview of Airtime Decongestion.

Load Balancing

Load balancing is a solution used to distribute traffic across the application servers. This feature helps to control and direct traffic.

Enabling load balancing improves the WLAN performance by directing the wireless client load between the access points. Load balancing can be controlled from within the controller web interface to balance the number of clients per radio on adjacent APs.

Adjacent APs are determined by the controller at startup by measuring the RSSI during channel scans. After startup, the controller uses subsequent scans to update the list of adjacent APs periodically and when a new AP sends its first scan report. When an AP leaves, the controller immediately updates the list of adjacent APs and refreshes the client limits at each affected AP.

After the controller is aware of which APs are adjacent to each other, it begins to manage the client load by sending the configured client limits to the APs. These limits are soft values that can be exceeded in several scenarios, including:

- Client signal is weak that it cannot support a link with another AP.

WLAN Configuration

Creating a WLAN Configuration

- Client signal is strong and belongs to this AP.

The APs maintain these configured client limits and enforce them after they reach the limits by withholding probe responses and authentication responses on any radio that has reached its limit.

NOTE

Adaptive Client Load Balancing (ACLB) is not supported on AP R730 in SmartZone 5.1.1 release. The R730 AP supports only legacy client load balancing (CLB). The R730 AP is supported only in SZ6.1.0 firmware zone. ACLB is disabled by default if capacity mode is configured on the controller. If station mode is configured, ACLB acts as legacy CLB on the AP.

NOTE

Load balancing and Steering mode configuration are at Zone level and Client Load Balancing is at WLAN level.

To enable **Load Balancing** following are the considerations:

- The load balancing rules apply only to client devices; the AP always responds to another AP that is attempting to set up or maintain a mesh network.
- Load balancing does not disassociate clients already connected.
- Load balancing takes action before a client association request, reducing the chance of client misbehavior.
- Load balancing does not require any time-critical interaction between APs and the controller.
- Provides control of adjacent AP distance with safeguards against abandoning clients.
- Load balancing can be disabled on a per-WLAN basis. For instance, on a voice WLAN, load balancing may not be desired due to voice roaming considerations.
- Background scanning must be enabled on the WLAN for load balancing to work.

Enable Load Balancing

By default the Load Balancing is disabled, enable the feature by choosing the appropriate functionalities:

- **Based on Client Count:** Access points are set to a client threshold. If a client wants to associate with an AP whose current count is less, then the client is allowed to associate with the AP. If not then client evaluates the neighbouring APs.
- **Based on Capacity:** The capacity quantifies the maximum data transmitted over a network. Capacity determination is based on bandwidth, data rate and number of streams.
- **Limit 2.4Ghz Clients to:** By default, the functionality is disabled, click the toggle button to enable and set the percentage.

Steering Mode

Steering mode allows the access point to disable lower bandwidth from probing the client device. This allows the access point to respond to only one bandwidth. This helps in reducing congestion and take advantage of the higher bandwidth and improves user experience.

There are three modes in Steering Mode, choose the appropriate mode by clicking on the functionality:

- **Basic:** Withhold probe and authentication responses at connection time in heavily loaded band to balance clients to the other band.
- **Proactive:** Uses **Basic** functionality and actively rebalances clients through 802.11v BSS Transition Management (BTM).
- **Strict:** Uses **Proactive** functionality and forcefully rebalances clients through 802.11v BSS Transition Management (BTM).

Sticky Client Detection

There are instances where some client devices connects to an AP and stay connected to the same servicing AP, and does not change its association to the closer APs. These clients are referred as sticky clients.

These clients may experience degradation in service because of lower throughput resulting in poor user experience. The purpose of the sticky client detection is to identify these clients and assist in transition to a better AP.

By default, the sticky client steering is disabled, click the toggle button to enable and enter the following:

- **SNR Threshold:** Signal-to-Noise (SNR) ratio value evaluates signal based on the noise. Enter the value between 5db to 30db.
- **NBRAP % Threshold:** Network Based Application Recognition Protocol (NBRAP) is used to calculate a base SNR and compare it to the SNR received from a neighboring AP. The percentage range is between 10-40.

Client Admission Control

Client admission control allows APs to adaptively allow or deny the association of clients based on the potential throughput of the currently associated clients. This helps prevent APs from becoming overloaded with clients and improves user experience for wireless users.

As an administrator, you can help maintain a positive user experience for wireless users on the network by configuring the following client admission control settings:

- Minimum client count: 0 to 100 (To set the minimum client control to 0, select the Client Admission Control threshold.)
- Maximum radio load (%) - 50 to 100
- Minimum client throughput (Mbps) - 0 to 100

Client admission control is implemented on a per radio basis and is supported on 802.11n and 802.11ac APs.

NOTE

Client admission control cannot be enabled if client load balancing or band balancing (or both) is enabled.

Creating an AP Zone

An AP zone functions as a way of grouping RUCKUS wireless APs and applying settings which includes WLANs to these groups. Each AP zone can have up to six WLAN services.

To create an AP zone, complete the following steps:

1. On the menu, click **Network > Wireless > Access Point**.

FIGURE 5 Access Points Page

MAC Address	AP Name	Zone	IP Address	AP Firmware	Configuration Status	Last Seen	Data Plane	Administrative State	Registration State	Model
D8:38:FC:36:89:70	AP16-R610	FR-5604-Bing-v4	100.102.20.16	6.1.1.0.1068	Up-to-date	2022/10/14 15:20:05	[100.102.40.228]:23...	Unlocked	Approved	R610

2. From the **System** tree hierarchy, select the location where you want to create the zone (for example, System or Domain), and click .

FIGURE 6 Create Zone Page

- Configure the zone by completing the settings listed in the following table:

TABLE 6 AP Zone Details for SZ300 and vSZ-H platforms

Field	Description	Your Action
Name	Indicates the name of the zone or an AP group.	Enter a name.
Description	Indicates the short description assigned to the zone or AP group.	Enter a brief description
Type	Indicates if you are creating a domain, zone, or an AP group.	Appears by default. You can also choose the option.
Parent Group	Indicates the parent AP group.	Appears by default.

TABLE 6 AP Zone Details for SZ300 and vSZ-H platforms (continued)

Field	Description	Your Action
Link Switch Group	Allows to create a link between the switch group and an AP.	You can enable or disable the option. When the link state is enabled, you can modify the name and description of the switch group, the AP zone will change accordingly. When the link is disabled, the AP zone and switch group no longer share same name and description, but the link between them still exists. To delete the link, modify the name of AP zone or switch group. After successful deletion of the link, the Link AP Zone option is unavailable.
General Options		
AP Firmware	Indicates the firmware to which it applies.	Select the firmware.
Country Code	Indicates the country code. Using the correct country code helps ensure that APs use only authorized radio channels.	Select the country code.
Location	Indicates the generic location.	Enter the location.
Location Additional Information	Indicates detailed location.	Enter additional location information.
GPS Coordinates	Indicates the geographical location.	Enter the following coordinates: <ul style="list-style-type: none"> ● Longitude ● Latitude ● Altitude
AP Admin Logon	Indicates the administrator logon credentials.	Enter the Logon ID and Password .
AP Time Zone	Indicates the time zone that applies.	Select a time zone, and enter the details as required.
AP IP Mode	Indicates the IP version that applies.	Select the IP version. IPv6, IPv4, and dual addressing modes are supported.
Historical Connection Failures	Allows the zone APs to report client connection failures so that the administrator can view past connection problems from the Troubleshooting menu. NOTE For enterprise profile (vSZ-E) is 5 days, for carrier profile (vSZ-H) is 3 days.	Click the button.
DP Group	Specifies the group for the zone. NOTE This option is supported only on vSZ-H.	Select the DP group from the list.
SSH Tunnel Encryption	Specifies the encryption that reduces the load on controller control of SSH traffic.	Select the required option: <ul style="list-style-type: none"> ● AES 128 ● AES 256
Cluster Redundancy	Provides cluster redundancy option for the zone. NOTE Cluster redundancy is supported only on SZ300 and vSZ-H.	Select the required option: <ul style="list-style-type: none"> ● Zone Enable ● Zone Disable
Mesh Options		

TABLE 6 AP Zone Details for SZ300 and vSZ-H platforms (continued)

Field	Description	Your Action
<p>NOTE Regardless of Single or Dual band, APs mesh with only there channel of radio which is in range.</p>		
Enable mesh networking in this zone	Enables managed APs to automatically form a wireless mesh network, in which participant nodes (APs) cooperate to route packets.	Click the button.
Zero Touch Mesh	Enables a new AP to join the network using wireless connection.	Click the button.
Mesh Name (ESSID)	Indicates the mesh name.	Enter a name for the mesh network. Alternatively, do nothing to accept the default mesh name that the controller has generated.
Mesh Passphrase	Indicates the passphrase used by the controller to secure the traffic between Mesh APs.	Enter a passphrase that contains at least 12 characters. Alternatively, click Generate to generate a random passphrase with 32 characters or more.
Mesh Radio Option	Indicates the channel range configured.	Select the channel option: 2.4 GHz or 5 GHz/6 GHz.
Radio Options		
Dual-5G Mode	<p>Enables third radio operator in 2.4 GHz, Lower 5 GHz, and Upper 5 GHz. By default, the Dual-5G Mode is enabled. In the enabled mode, radio-0 will be on 2.4GHz band, radio-1 will be on 5G Lower band and radio-2 will be on 5G Upper band.</p> <ul style="list-style-type: none"> 5G Lower BAND : UNII-1, UNII-2A 5G Upper BAND : UNII-2C, UNII-3 <p>In the disabled mode, the radio-0 will be on 2.4GHz band, radio-1 will be on 5G band and radio-2 will be on 6G band. This also depends on the country code.</p>	Select or keep the default Dual-5G Mode option.
Band/Spectrum Configuration > 2.4 GHz		
Channelization	Helps manage and allocate radio frequency resources. A lower channel width allows the zone to potentially serve more clients, whereas a higher channel width improves throughput, but potentially serves fewer clients and increases the possibility of interference. The Auto setting defaults to 20 MHz channelization.	<p>Set the channel bandwidth used during transmission to either 20 or 40 (MHz), or select Auto to set it automatically.</p> <p>NOTE By default, for the Country Code Indonesia, the Channelization width is set to 20 MHz only for outdoor APs.</p>
Channel	Indicates the channel to use.	Select one of the options: Auto , 1 , 6 or 11 .
Auto Cell Sizing	<p>Enables the AP to share information on interference seen by each other and dynamically adjust their radio Tx power and Rx parameters to minimize interference. Enabling this option disables the TX Power Adjustment configuration.</p> <p>NOTE Ensure that Background Scan is enabled.</p>	Select the option.

TABLE 6 AP Zone Details for SZ300 and vSZ-H platforms (continued)

Field	Description	Your Action
TX Power Adjustment	<p>Allows to manually configure the transmit power on the 2.4 GHz radio. By default, the TX power is set to Full on the 2.4 GHz radio.</p> <p>NOTE If you choose Min, the transmit power is set to 0dBm (1mW) per chain for 11n APs, and 2dBm per chain for 11ac APs. If you choose Max, the transmit power is set to the maximum allowable value according to the AP's capability and the operating country's regulations.</p>	Select the preferred TX power.
Protection Mode	Indicates the mechanism to reduce frame collision.	Choose one of the following options: <ul style="list-style-type: none"> • None • RTS/CTS • CTS Only
Background Scan	Allows the AP radio to scan other channels in the band for accessing channel health and capacity, detecting rogue devices, optimizing and maintaining mesh links and to discover AP neighbors.	Enter the duration in seconds. Range: 1 through 65535.
Auto Channel Selection	<p>Automatically adjusts the channel for network self-healing and performance optimization. ChannelFly is set as the default option. For the ChannelFly option, you may also modify the default settings for the Channel Change Frequency and Full Optimization Period.</p> <p>The Channel Change Frequency sidebar allows you to specify the responsiveness of ChannelFly to interference (with consideration for the impact on associated clients), ranging from Minimal to Very Often.</p> <p>The Full Optimization Period timeslot bar allows you to specify one or more periods of time when ChannelFly is allowed to fully optimize the channel plan, ignoring the impact of channel changes on associated clients. Select time periods when the wireless network is servicing the fewest clients.</p>	Select the required option. <ul style="list-style-type: none"> • Background Scanning: Changes the AP channel when there is interference. • ChannelFly: Monitors potential throughput and will change channels to learn each channel's capacity, optimize throughput, and to avoid interference.
Band/Spectrum Configuration > 5 GHz		
Channelization	<p>Helps manage and allocate radio frequency resources. A lower channel width allows the zone to potentially serve more clients, whereas a higher channel width improves throughput, but potentially serves fewer clients and increases the possibility of interference. Prior to SmartZone release 7.0.0, the Auto setting defaulted to 80 MHz channelization. Beginning in SmartZone release 7.0.0, the Auto setting defaults to 40 MHz channelization.</p>	Set the channel bandwidth used during transmission: Auto, 20, 40, 80 and 160. <p>NOTE By default, for the Country Code Indonesia, the Channelization width is set to 20 MHz only for outdoor APs.</p>
Channel	Indicates the channel to use.	Select the required options for the Indoor and Outdoor APs.

WLAN Configuration

Creating a WLAN Configuration

TABLE 6 AP Zone Details for SZ300 and vSZ-H platforms (continued)

Field	Description	Your Action
Secondary Channel	Indicates the secondary channel to used.	By default, the Indoor and Outdoor option is set to Auto.
Allow DFS Channels	Allows ZoneFlex APs to use DFS channels.	Click to enable the option.
Allow Channel 144	<p>Provides channel 140 and 144 support for 11ac and 11ax APs. Enabling this option supports 20 MHz, 40 MHz, or 80 MHz channel modes. The 160 MHz mode is supported if the AP supports this mode. Disabling this option provides Channel 140 support only to 20 MHz mode.</p> <p>NOTE This option is available for selection only if you enable the DFS Channels option.</p> <p>NOTE This feature is currently supported only in the United States.</p>	Click to enable the option.
Allow Indoor Channels	Allows outdoor APs to use channels regulated as for indoor use only.	Click to enable the option.
Auto Cell Sizing	<p>Enables the AP to share information on interference seen by each other and dynamically adjust their radio Tx power and Rx parameters to minimize interference. Enabling this option disables the TX Power Adjustment configuration.</p> <p>NOTE Ensure that Background Scan is enabled.</p>	Select the option.
TX Power Adjustment	<p>Allows to manually configure the transmit power on the 5 GHz radio. By default, the TX power is set to Full on the 5 GHz radio.</p> <p>NOTE If you choose Min, the transmit power is set to 0dBm (1mW) per chain for 11n APs, and 2dBm per chain for 11ac APs. If you choose Max, the transmit power is set to the maximum allowable value according to the AP's capability and the operating country's regulations.</p>	Select the preferred TX power.
Background Scan	Allows the AP radio to scan other channels in the band for accessing channel health and capacity, detecting rogue devices, optimizing and maintaining mesh links and to discover AP neighbors.	Enter the duration in seconds. Range: 1 through 65535.

AP GRE Tunnel Options		
Ruckus GRE Profile	Indicates the GRE tunnel profile.	Choose the GRE tunnel profile from the list.
Ruckus GRE Forwarding Broadcast	Forwards the broadcast traffic from network to tunnel.	Click the option to enable forwarding broadcast.
Soft GRE Profiles	Indicates the SoftGRE profiles that you want to apply to the zone.	<ol style="list-style-type: none"> a. Click the Select check box, a form is displayed. b. From the Available Profiles, select the profile and click the -> icon to choose it. You can also click the + icon to create a new SoftGRE profile. c. Click OK.
IPsec Tunnel Mode	Indicated the tunnel mode for the Ruckus GRE and SoftGRE profile.	<p>Select an option:</p> <ul style="list-style-type: none"> ● Disable ● SoftGRE ● Ruckus GRE
IPsec Tunnel Profile	<p>Indicates the tunnel profile for SoftGRE.</p> <p>NOTE Select the same tunnel type for IPsec tunnel profile in WLAN configuration.</p>	Choose the option from the drop-down.
Syslog Options		
Enable external syslog server for APs	Enables the AP to send syslog data to the syslog server on the network.	Select the option.

TABLE 6 AP Zone Details for SZ300 and vSZ-H platforms (continued)

Field	Description	Your Action
Config Type	Allows to customize or select an external syslog server profile.	<p>Select the option:</p> <ul style="list-style-type: none"> ● Custom: Configure the details for the AP to send syslog messages to syslog server. <p style="margin-left: 20px;">NOTE The IP address format that you enter here will depend on the AP IP mode that you selected earlier in this procedure. If you selected IPv4 Only, enter an IPv4 address. If you selected IPv6 Only, enter an IPv6 address.</p> <ul style="list-style-type: none"> - Primary Server Address: If the primary server goes to send syslog messages. <ul style="list-style-type: none"> › Port: enter the syslog port number on the respective servers. › Protocol: select between UDP and TCP protocols. - Secondary Server Address: If the primary server goes down, the AP sends syslog messages to the secondary server as backup. <ul style="list-style-type: none"> › Port: Enter the syslog port number on the respective servers. › Protocol: Select between UDP and TCP protocols. - Event Facility: Select the facility level that will be used by the syslog message. Options include: Keep Original, Local0 (default), Local1, Local2, Local3, Local4, Local5, Local6, and Local7. - Priority: Select the lowest priority level for which events will be sent to the syslog server. For example, to only receive syslog messages for events with the warning (and higher) priority, select Warning. To receive syslog messages for all events, select All. - Send Logs: Select the type of messages to be sent to the syslog server. For example, General Logs, Client Logs or All Logs. ● AP External Syslog Profile: Select the profile from the drop-down or click  Add to create a new profile.
AP SNMP Options		
Enable AP SNMP	Indicates if the AP SNMP option is enabled.	Select the check box.
Config Type	Enables custom or AP SNMP Profile Agent.	<p>Select the check box.</p> <ul style="list-style-type: none"> ● Custom: Select this option to create customized SNMPv2 and SNMPv3 profile agents. ● AP SNMP Profile Agent: Select this option to create AP SNMPv2 and SNMPv3 profile agents directly.

TABLE 6 AP Zone Details for SZ300 and vSZ-H platforms (continued)

Field	Description	Your Action
SNMPv2 Agent	Indicates if the SNMPv2 agent is enabled.	If the SNMPv2 agent is enabled, configure the community settings. a. Click Create and enter Community . b. Select the required Privilege . If you select Notification , enter the Target IP . c. Click OK .
SNMPv3 Agent	Indicates the SNMPv3 Agent is applied.	If the SNMPv3 agent is enabled, configure the community settings. a. Click Create and enter User . b. Select the required Authentication . c. Enter the Auth Pass Phrase . d. Select the Privacy option. e. Select the required Privilege . If you select Notification , select the option Trap or Inform and enter the Target IP and Target Port . f. Click OK .
Advanced Options		
Restricted AP Access Profile NOTE This feature is available from 5.2 release and onwards.	Restricted AP Access blocks access to the AP's standard well know open ports to protect the APs and enhance their security.	Select the Restricted AP Access profile from the dropdown. You can also create a new profile by clicking + icon. NOTE By default this feature is disabled. NOTE You can add maximum five Restricted AP Access profiles for a zone.
Channel Mode	Indicates if location-based service is enabled. If you want to allow indoor APs that belong to this zone to use wireless channels that are Channel Mode regulated as indoor-use only.	Select the Allow indoor channels check box.
Smart Monitor	Indicates AP interval check and retry threshold settings.	Select the check box and enter the interval and threshold.
AP Ping Latency Interval	Measures the latency between the controller and AP periodically, and sends this data to SCI.	Enable by moving the button to ON to measure latency.
AP Management VLAN	Indicates the AP management VLAN settings.	Choose the option. Click VLAN ID , and then type the VLAN ID that you want to assign (valid range is from 1 to 4094). To keep the same management VLAN ID that has been configured on the AP, click Keep AP's settings. ATTENTION For standalone APs, set the AP Ethernet port to trunk before changing the AP Management VLAN settings.

TABLE 6 AP Zone Details for SZ300 and vSZ-H platforms (continued)

Field	Description	Your Action
Rogue AP Detection	<p>Indicates rogue AP settings.</p> <p>NOTE Rogue detection AP in active-active mode cluster redundancy environment is restricted from storing its own BSSIDs to avoid considering its own APs as rogues attacking.</p>	Enable the option.
Rogue Classification Policy	Indicates the parameters used to classify rogue APs. This option is available only if you enable the Rogue AP Detection option.	<p>Select the options for rogue classification policy:</p> <ul style="list-style-type: none"> ● - Enable events and alarms for all rogue devices ● - Enable events and alarms for malicious rogues only ● Report RSSI Threshold: Enter the threshold. Range: 0 through 100. ● Protect the network from malicious rogue access points: Enable the option and choose one of the following: <ul style="list-style-type: none"> - Aggressive - Auto - Conservative ● Radio Jamming Detection: Enable the option and enter the Jamming Threshold in percentage.
DoS Protection	Indicates settings for blocking a client.	Select the check box and enter the duration in seconds.
Load Balancing	Balances the number of clients or the available capacity across APs.	<p>Select the required option:</p> <ul style="list-style-type: none"> ● Based on Client Count ● Based on Capacity ● Disabled
Band Balancing	Balances the client distribution across frequency bands.	Enter the 2.4G client percentage to control the 2.4G clients limit and to enforce band balance.

TABLE 6 AP Zone Details for SZ300 and vSZ-H platforms (continued)

Field	Description	Your Action
Steering Mode	Controls the APs' steering behavior for load balancing and band balancing.	<p>Select the option and use the slider to actively control associated stations to meet the distribution requirements allowing band balancing and load balancing:</p> <ul style="list-style-type: none"> ● Basic (default): During heavy load conditions, this option withholds probe and authentication responses in order to achieve load balance. ● Proactive: This is a dynamic form of band balancing where some selected associated clients are rebalanced on the AP or across APs utilizing the 802.11v BTM. The AP sends a BTM message to the client to roam and it is left to the client's discretion to make its roaming decision. ● Strict: This is an aggressive form of balancing where some selected associated clients are forced to rebalance utilizing the 802.11v BTM. The AP sends a BTM message to the client to roam. If the client does not roam, the client is forced to disconnect after 10 seconds. Additionally, some selected non-802.11v clients are forcefully disconnected directly to force them to roam. <p style="text-align: center;">NOTE The band change is applicable only for those connected clients that support the 802.11v standard.</p> <p>Enter the percentage of client load on the 2.4 GHz band.</p>
Location Based Service	Indicates that the location-based service is enabled.	<ul style="list-style-type: none"> ● Select the check box and choose the options. ● Click Create, in the Create LBS Server form: <ul style="list-style-type: none"> a. Enter the Venue Name. b. Enter the Server Address. c. Enter the Port number. d. Enter the Password.
Client Admission Control	Indicates the load thresholds on the AP at which it will stop accepting new clients.	<p>Select the check box and update the following settings:</p> <ul style="list-style-type: none"> ● Min Client Count ● Max Radio Load ● Min Client Throughput
AP Reboot Timeout	Indicates the AP reboot settings.	<p>Choose the required option:</p> <ul style="list-style-type: none"> ● Reboot AP if it cannot reach default gateway after ● Reboot AP if it cannot reach the controller after
Recovery SSID	Allows you to enable or disable the Recovery (Island) SSID broadcast on the controller.	Enable Recovery SSID Broadcast .
My.Ruckus support for Tunnel-WLAN/ VLAN	By default, support for LBO, tunneled-WLAN, and non-default management VLAN is disabled because it adds an ACL which affects the LBO and tunneled-WLAN performance. Enabling this support may have a 10 percent impact on the Wi-Fi performance.	Enable the option for support.

WLAN Configuration

Creating a WLAN Configuration

TABLE 7 AP Zone Details for SZ100 and vSZ-E platforms

Field	Description	Your Action
Name	Indicates the name of the zone or AP group.	Enter a name.
Description	Indicates the short description assigned to the zone or AP group.	Enter a brief description
Type	Indicates if you are creating a domain, zone, or an AP group.	Appears by default. You can also choose the option.
Parent Group	Indicates the parent AP group.	Appears by default.
Link Switch Group	Allows to create a link between the switch group and an AP.	<p>You can enable or disable the option. When the link state is enabled, you can modify the name and description of the switch group, the AP zone will change accordingly.</p> <p>When the link is disabled, the AP zone and switch group no longer share same name and description, but the link between them still exists.</p> <p>To delete the link, modify the name of AP zone or switch group. After successful deletion of the link, the Link AP Zone option is unavailable.</p>
General Options		
AP Firmware	Indicates the firmware to which it applies.	Select the firmware.
Country Code	Indicates the country code. Using the correct country code helps ensure that APs use only authorized radio channels.	Select the country code.
Location	Indicates the generic location.	Enter the location.
Location Additional Information	Indicates detailed location.	Enter additional location information.
GPS Coordinates	Indicates the geographical location.	Enter the following coordinates: <ul style="list-style-type: none"> • Longitude • Latitude • Altitude
AP Admin Logon	Indicates the administrator logon credentials.	Enter the Logon ID and Password .
AP Time Zone	Indicates the time zone that applies.	Select a time zone, and enter the details as required.
AP IP Mode	Indicates the IP version that applies.	Select the IP version. IPv6, IPv4, and dual addressing modes are supported.
Historical Connection Failures	Allows the zone APs to report client connection failures so that the administrator can view past connection problems from the Troubleshooting menu.	Click the button.
SSH Tunnel Encryption	Specifies the encryption that reduces the load on controller control of SSH traffic.	Select the required option: <ul style="list-style-type: none"> • AES 128 • AES 256
Mesh Options		
Enable mesh networking in this zone	Enables managed APs to automatically form a wireless mesh network, in which participant nodes (APs) cooperate to route packets.	Click the button.
Zero Touch Mesh	Enables a new AP to join the network using wireless connection.	Click the button.
Mesh Name (ESSID)	Indicates the mesh name.	Enter a name for the mesh network. Alternatively, do nothing to accept the default mesh name that the controller has generated.

TABLE 7 AP Zone Details for SZ100 and vSZ-E platforms (continued)

Field	Description	Your Action
Mesh Passphrase	Indicates the passphrase used by the controller to secure the traffic between Mesh APs.	Enter a passphrase that contains at least 12 characters. Alternatively, click Generate to generate a random passphrase with 32 characters or more.
Mesh Radio Option	Indicates the channel range configured.	Select the channel option: 2.4 GHz or 5 GHz/6 GHz.
Radio Options		
Dual-5G Mode	<p>Enables third radio operator in 2.4 GHz, Lower 5 GHz, and Upper 5 GHz. By default, the Dual-5G Mode is enabled. In the enabled mode, radio-0 will be on 2.4GHz band, radio-1 will be on 5G Lower band and radio-2 will be on 5G Upper band.</p> <ul style="list-style-type: none"> ● 5G Lower BAND : UNII-1, UNII-2A ● 5G Upper BAND : UNII-2C, UNII-3 <p>In the disabled mode, the radio-0 will be on 2.4GHz band, radio-1 will be on 5G band and radio-2 will be on 6G band. This also depends on the country code.</p>	Select or keep the default Dual-5G Mode option.
Band/Spectrum Configuration > 2.4 GHz		
Channelization	Helps manage and allocate radio frequency resources. A lower channel width allows the zone to potentially serve more clients, whereas a higher channel width improves throughput, but potentially serves fewer clients and increases the possibility of interference. The Auto setting defaults to 20 MHz channelization.	<p>Set the channel bandwidth used during transmission to either 20 or 40 (MHz), or select Auto to set it automatically.</p> <p style="text-align: center;">NOTE By default, for the Country Code Indonesia, the Channelization width is set to 20 MHz only for outdoor APs.</p>
Channel	Indicates the channel to use.	Select one of the options: Auto, 1, 6 or 11.
Auto Cell Sizing	<p>Enables the AP to share information on interference seen by each other and dynamically adjust their radio Tx power and Rx parameters to minimize interference. Enabling this option disables the TX Power Adjustment configuration.</p> <p style="text-align: center;">NOTE Ensure that Background Scan is enabled.</p>	Select the option.
TX Power Adjustment	<p>Allows to manually configure the transmit power on the 2.4 GHz radio. By default, the TX power is set to Full on the 2.4 GHz radio.</p> <p style="text-align: center;">NOTE If you choose Min, the transmit power is set to 0dBm (1mW) per chain for 11n APs, and 2dBm per chain for 11ac APs. If you choose Max, the transmit power is set to the maximum allowable value according to the AP's capability and the operating country's regulations.</p>	Select the preferred TX power.
Protection Mode	Indicates the mechanism to reduce frame collision.	<p>Choose one of the following options:</p> <ul style="list-style-type: none"> ● None ● RTS/CTS ● CTS Only

TABLE 7 AP Zone Details for SZ100 and vSZ-E platforms (continued)

Field	Description	Your Action
Background Scan	Allows the AP radio to scan other channels in the band for accessing channel health and capacity, detecting rogue devices, optimizing and maintaining mesh links and to discover AP neighbors.	Enter the duration in seconds. Range: 1 through 65535.
Auto Channel Selection	<p>Automatically adjusts the channel for network self-healing and performance optimization. ChannelFly is set as the default option. For the ChannelFly option, you may also modify the default settings for the Channel Change Frequency and Full Optimization Period.</p> <p>The Channel Change Frequency sidebar allows you to specify the responsiveness of ChannelFly to interference (with consideration for the impact on associated clients), ranging from Minimal to Very Often.</p> <p>The Full Optimization Period timeslot bar allows you to specify one or more periods of time when ChannelFly is allowed to fully optimize the channel plan, ignoring the impact of channel changes on associated clients. Select time periods when the wireless network is servicing the fewest clients.</p>	<p>Select the required option.</p> <ul style="list-style-type: none"> ● Background Scanning: Changes the AP channel when there is interference. ● ChannelFly: Monitors potential throughput and will change channels to learn each channel's capacity, optimize throughput, and to avoid interference.
Band/Spectrum Configuration > 5 GHz		
Channelization	Helps manage and allocate radio frequency resources. A lower channel width allows the zone to potentially serve more clients, whereas a higher channel width improves throughput, but potentially serves fewer clients and increases the possibility of interference. Prior to SmartZone release 7.0.0, the Auto setting defaulted to 80 MHz channelization. Beginning in SmartZone release 7.0.0, the Auto setting defaults to 40 MHz channelization.	<p>Set the channel bandwidth used during transmission: Auto, 20, 40, 80 and 160.</p> <p>NOTE By default, for the Country Code Indonesia, the Channelization width is set to 20 MHz only for outdoor APs.</p>
Channel	Indicates the channel to use.	Select the required options for the Indoor and Outdoor APs.
Secondary Channel	Indicates the secondary channel to used.	By default, the Indoor and Outdoor option is set to Auto.
Allow DFS Channels	Allows ZoneFlex APs to use DFS channels.	Click to enable the option.
Allow Channel 144	<p>Provides channel 140 and 144 support for 11ac and 11ax APs. Enabling this option supports 20 MHz, 40 MHz, or 80 MHz channel modes. The 160 MHz mode is supported if the AP supports this mode. Disabling this option provides Channel 140 support only to 20 MHz mode.</p> <p>NOTE This option is available for selection only if you enable the DFS Channels option.</p> <p>NOTE This feature is currently supported only in the United States.</p>	Click to enable the option.

TABLE 7 AP Zone Details for SZ100 and vSZ-E platforms (continued)

Field	Description	Your Action
Allow Indoor Channels	Allows outdoor APs to use channels regulated as for indoor use only.	Click to enable the option.
Auto Cell Sizing	Enables the AP to share information on interference seen by each other and dynamically adjust their radio Tx power and Rx parameters to minimize interference. Enabling this option disables the TX Power Adjustment configuration. NOTE Ensure that Background Scan is enabled.	Select the option.
TX Power Adjustment	Allows to manually configure the transmit power on the 5 GHz radio. By default, the TX power is set to Full on the 5 GHz radio. NOTE If you choose Min, the transmit power is set to 0dBm (1mW) per chain for 11n APs, and 2dBm per chain for 11ac APs. If you choose Max, the transmit power is set to the maximum allowable value according to the AP's capability and the operating country's regulations.	Select the preferred TX power.
Background Scan	Allows the AP radio to scan other channels in the band for accessing channel health and capacity, detecting rogue devices, optimizing and maintaining mesh links and to discover AP neighbors.	Enter the duration in seconds. Range: 1 through 65535.
Auto Channel Selection	Automatically adjusts the channel for network self-healing and performance optimization. ChannelFly is set as the default option. For the ChannelFly option, you may also modify the default settings for the Channel Change Frequency and Full Optimization Period . The Channel Change Frequency slider allows you to specify the responsiveness of ChannelFly to interference (with consideration for the impact on associated clients), ranging from Minimal to Very Often. The Full Optimization Period timeslot bar allows you to specify one or more periods of time when ChannelFly is allowed to fully optimize the channel plan, ignoring the impact of channel changes on associated clients. Select time periods when the wireless network is servicing the fewest clients.	Select the required option. <ul style="list-style-type: none"> ● Background Scanning: Changes the AP channel when there is interference. ● ChannelFly: Monitors potential throughput and will change channels to learn each channel's capacity, optimize throughput, and to avoid interference.
Band/Spectrum Configuration > 6 GHz NOTE This tab is available only if the Tri-band Dual-5G Mode option is not enabled.		

TABLE 7 AP Zone Details for SZ100 and vSZ-E platforms (continued)

Field	Description	Your Action
Channelization	Helps manage and allocate radio frequency resources. A lower channel width allows the zone to potentially serve more clients, whereas a higher channel width improves throughput, but potentially serves fewer clients and increases the possibility of interference. The Auto setting defaults to 160 MHz channelization.	Set the channel bandwidth used during transmission: Auto, 20, 40, 80, 160 and 320 . NOTE The 320 MHz-radio frequency is available only for the R770 AP 6 GHz radio frequency.
Channel	Indicates the channel to use. The 320 MHz channelization supporting the R770 AP has two types of channel; the 320 Mhz-1 channel with channel center frequency numbered 31, 95, and 159, and the 320 Mhz-2 channel with channel center frequency numbered 63, 127, and 191.	Select the required channel for the APs. NOTE If 320 channelization is selected, then the selected channel may also require a Group selection. <ul style="list-style-type: none"> • Auto: Group selection is not available. • Channels 1 through 29: Group 1 is the default selection. Group 2 cannot be selected. • Channels 33 through 189: Group 1 is the default selection, but you may select either Group 1 or Group 2. • Channels 193 through 221: Group 2 is the default selection. Group 1 cannot be selected.
Auto Cell Sizing	Enables the AP to share information on interference seen by each other and dynamically adjust their radio Tx power and Rx parameters to minimize interference. Enabling this option disables the TX Power Adjustment configuration. NOTE Ensure that Background Scan is enabled.	Select the option.
TX Power Adjustment	Allows to manually configure the transmit power on the 6 GHz radio. By default, the TX power is set to Full on the 6 GHz radio. NOTE If you choose Min, the transmit power is set to 0dBm (1mW) per chain for 11n APs, and 2dBm per chain for 11ac APs. If you choose Max, the transmit power is set to the maximum allowable value according to the AP's capability and the operating country's regulations.	Select the preferred TX power.
Background Scan	Allows the AP radio to scan other channels in the band for accessing channel health and capacity, detecting rogue devices, optimizing and maintaining mesh links and to discover AP neighbors.	Enter the duration in seconds. Range: 1 through 65535.

IPsec Tunnel Profile	<p>Indicates the tunnel profile for SoftGRE.</p> <p>NOTE Select the same tunnel type for IPsec tunnel profile in WLAN configuration.</p>	Choose the option from the list.
Syslog Options		
Enable external syslog server for APs	Enables the AP to send syslog data to the syslog server on the network.	Select the option.

TABLE 7 AP Zone Details for SZ100 and vSZ-E platforms (continued)

Field	Description	Your Action
Config Type	Allows to customize or select an external syslog server profile.	<p>Select the option:</p> <ul style="list-style-type: none"> ● Custom: Configure the details for the AP to send syslog messages to syslog server. <ul style="list-style-type: none"> NOTE The IP address format that you enter here will depend on the AP IP mode that you selected earlier in this procedure. If you selected IPv4 Only, enter an IPv4 address. If you selected IPv6 Only, enter an IPv6 address. - Primary Server Address: If the primary server goes to sends syslog messages. <ul style="list-style-type: none"> › Port: enter the syslog port number on the respective servers. › Protocol: select between UDP and TCP protocols - Secondary Server Address: If the primary server goes down, the AP sends syslog messages to the secondary server as backup. <ul style="list-style-type: none"> › Port: enter the syslog port number on the respective servers. › Protocol: select between UDP and TCP protocols - Event Facility: Select the facility level that will be used by the syslog message. Options include: Keep Original, Local0 (default), Local1, Local2, Local3, Local4, Local5, Local6, and Local7. - Priority: Select the lowest priority level for which events will be sent to the syslog server. For example, to only receive syslog messages for events with the warning (and higher) priority, select Warning. To receive syslog messages for all events, select All. - Send Logs: Select the type of messages to be sent to the syslog server. For example, General Logs, Client Logs or All Logs. <ul style="list-style-type: none"> ● AP External Syslog Profile: Select the profile from the drop-down or click Add to create a new profile.
AP SNMP Options		
Enable AP SNMP	Indicates if the AP SNMP option is enabled.	Select the check box.
SNMPv2 Agent	Indicates if the SNMPv2 agent is enabled.	<p>If the SNMPv2 agent is enabled, configure the community settings.</p> <ol style="list-style-type: none"> a. Click Create and enter Community. b. Select the required Privilege. If you select Notification, enter the Target IP. c. Click OK.

TABLE 7 AP Zone Details for SZ100 and vSZ-E platforms (continued)

Field	Description	Your Action
SNMPv3 Agent	Indicates SNMPv3 agent is applied.	If the SNMPv3 agent is enabled, configure the community settings. a. Click Create and enter User . b. Select the required Authentication . c. Enter the Auth Pass Phrase . d. Select the Privacy option. e. Select the required Privilege . If you select Notification , select the option Trap or Inform and enter the Target IP and Target Port . f. Click OK .
DHCP Service for Wi-Fi Clients		
Enable DHCP Service in this zone	Enables the DHCP service for this zone.	Select the check box.
Advanced Options		
Restricted AP Access Profile NOTE This feature is available from 5.2 release and onwards.	Restricted AP Access blocks access to the AP's standard well know open ports to protect the APs and enhance their security.	Select the Restricted AP Access profile from the drop-down. You can also create a new profile by clicking + icon. NOTE By default this feature is disabled. NOTE You can add maximum five Restricted AP Access profiles for a zone.
Channel Mode	Indicates if location-based service is enabled. If you want to allow indoor APs that belong to this zone to use wireless channels that are Channel Mode regulated as indoor-use only.	Select the Allow indoor channels check box.
Smart Monitor	Indicates AP interval check and retry threshold settings.	Select the check box and enter the interval and threshold.
AP Ping Latency Interval	Measures the latency between the controller and AP periodically, and sends this data to SCI.	Enable by moving the button to ON to measure latency.
AP Management VLAN	Indicates the AP management VLAN settings.	Choose the option. Click VLAN ID , and then type the VLAN ID that you want to assign (valid range is from 1 to 4094). To keep the same management VLAN ID that has been configured on the AP, click Keep AP's settings . ATTENTION For standalone APs, set the AP Ethernet port to trunk before changing the AP Management VLAN settings.
Rogue AP Detection	Indicates rogue AP settings. NOTE Rogue detection AP in active-active mode cluster redundancy environment is restricted from storing its own BSSIDs to avoid considering its own APs as rogues attacking.	Enable the option.

TABLE 7 AP Zone Details for SZ100 and vSZ-E platforms (continued)

Field	Description	Your Action
Rogue Classification Policy	Indicates the parameters used to classify rogue APs. This option is available only if you enable the Rogue AP Detection option.	<p>Select the options for rogue classification policy:</p> <ul style="list-style-type: none"> ● Enable events and alarms for all rogue devices ● Enable events and alarms for malicious rogues only ● Report RSSI Threshold - enter the threshold. Range: 0 through 100. ● Protect the network from malicious rogue access points - Enable the option and choose one of the following: <ul style="list-style-type: none"> - Aggressive - Auto - Conservative ● Radio Jamming Detection - Enable the option and enter the Jamming Threshold in percentage.
DoS Protection	Indicates settings for blocking a client.	Select the check box and enter the duration in seconds.
Load Balancing	Balances the number of clients or the available capacity across APs.	<p>Select the required option:</p> <ul style="list-style-type: none"> ● Based on Client Count ● Based on Capacity ● Disabled
Band Balancing	Balances the client distribution across frequency bands.	Enter the 2.4G client percentage to control the 2.4G clients limit and to enforce band balance.
Steering Mode	Controls the APs' steering behavior for load balancing and band balancing.	<p>Select the option and use the slider to actively control associated stations to meet the distribution requirements allowing band balancing and load balancing:</p> <ul style="list-style-type: none"> ● Basic (default): During heavy load conditions, this option withholds probe and authentication responses in order to achieve load balance. ● Proactive: This is a dynamic form of band balancing where some selected associated clients are rebalanced on the AP or across APs utilizing the 802.11v BTM. The AP sends a BTM message to the client to roam and it is left to the client's discretion to make its roaming decision. ● Strict: This is an aggressive form of balancing where some selected associated clients are forced to rebalance utilizing the 802.11v BTM. The AP sends a BTM message to the client to roam. If the client does not roam, the client is forced to disconnect after 10 seconds. Additionally, some selected non-802.11v clients are forcefully disconnected directly to force them to roam. <p style="text-align: center;">NOTE The band change is applicable only for those connected clients that support the 802.11v standard.</p> <p>Enter the percentage of client load on the 2.4 GHz band.</p>

WLAN Configuration

Creating a WLAN Configuration

TABLE 7 AP Zone Details for SZ100 and vSZ-E platforms (continued)

Field	Description	Your Action
Location Based Service	Indicates that the location-based service is enabled.	<ul style="list-style-type: none">• Select the check box and choose the options.• Create, In the Create LBS Server form:<ol style="list-style-type: none">a. Enter the Venue Name.b. Enter the Server Address.c. Enter the Port number.d. Enter the Password.
Client Admission Control	Indicates the load thresholds on the AP at which it will stop accepting new clients.	Select the check box and update the following settings: <ul style="list-style-type: none">• Min Client Count• Max Radio Load• Min Client Throughput
AP Reboot Timeout	Indicates the AP reboot settings.	Choose the required option: <ul style="list-style-type: none">• Reboot AP if it cannot reach default gateway after• Reboot AP if it cannot reach the controller after
Recovery SSID	Allows you to enable or disable the Recovery (Island) SSID broadcast on the controller.	Enable Recovery SSID Broadcast . NOTE The Recovery SSID is available when an AP does not get a reply back for unicast ARP to its configured gateway.
My.Ruckus support for Tunnel-WLAN/ VLAN	By default, support for LBO, tunneled-WLAN, and non-default management VLAN is disabled because it adds an ACL which affects the LBO and tunneled-WLAN performance. Enabling this support may have a 10 percent impact on the Wi-Fi performance.	Enable the option for support.

4. Click **OK**.

For SZ300 and vSZ-H, you can also migrate the zone configuration from a regular Domain to a Partner Domain. For more information, see <https://support.ruckuswireless.com/answers/000006414>.

NOTE

You can also edit, clone or delete an AP Zone by selecting the options Configure , Clone  or Delete  respectively, from the Access Points page.

NOTE

Starting with 7.0 release, the support for **Cellular Options** while configuring or creating a zone is removed from the controller web interface.

Auto Cell Sizing

NOTE

Before enabling auto cell sizing, you must enable **Background Scan**.

When Wi-Fi is deployed in a high-density environment, despite the use of auto-channel selection, multiple APs operating on the same channel face a significant overlap of coverage regions. This could happen more so in a 2.4 GHz band where there is limited number of available channels and band path loss is lower than 5 GHz band. In such circumstances, the performance could be affected by AP to AP co-channel interference. To overcome this circumstance, the Auto Cell Sizing feature uses AP to AP communication to share information on the degree of interference seen by

each other. Based on this information, the APs dynamically adjust their radio Tx power and Rx parameters (or cell size) to mitigate interference. Enabling the Auto Cell Sizing option, disables the TX Power Adjustment configuration.

ChannelFly and Background Scanning

The controller offers the ChannelFly and Background Scanning automatic channel selection methods for spectrum utilization and performance optimization.

ChannelFly has undergone significant changes in SmartZone 5.2.1 release, combining the benefits of the Background Scanning method and the original Legacy ChannelFly. ChannelFly is the recommended method for all deployments.

TABLE 8

Channel Selection Method	When to Use
ChannelFly	Recommended method for most deployments.
Background Scanning	For existing deployments that currently use Background Scanning
Legacy ChannelFly (Accessible only from AP CLI)	When Background Scan is not allowed – Legacy ChannelFly excels at avoiding excessive interference without the need of <i>Background Scan</i>

NOTE

Both channel selection methods require *Background Scan*, ideally with the default 20 second scan interval. Background Scan is accessible from the zone configuration, advanced settings.

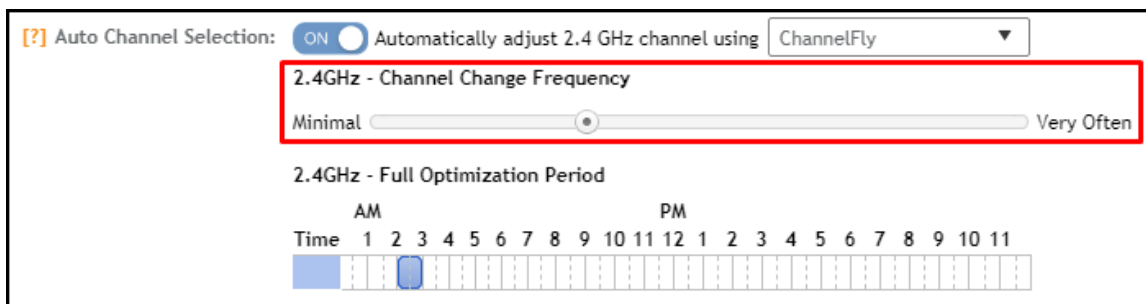

ChannelFly

ChannelFly uses Background Scan to collect information on the presence of neighboring APs and to assess how busy the channel is. The algorithm focuses on placing neighboring APs on different channels and avoiding busy channels. A Background Scan interval of 20 seconds is recommended for most deployments. In deployments where a larger interval is necessary, ChannelFly will still work but will take longer to settle upon a channel plan and may be less responsive to interference.

ChannelFly uses 802.11h channel change announcements to minimize the impact of channel changes on the wireless client. Despite 802.11h, channel changes still run the risk of disrupting wireless clients, and ChannelFly takes into the account the impact on associated clients.

The *Channel Change Frequency* (CCF) configuration allows the user to specify the responsive of ChannelFly to interference with consideration for the impact on associated clients. ChannelFly will avoid performing channel changes when a certain number of clients are associated to the AP on a per-radio basis. This threshold is defined by the CCF. **With the default CCF of 33, channel changes may occur only when there are 3 or fewer associated clients.** The CCF also affects the probability that a channel change occurs when a better channel is found. However, a channel change will only occur when the number of associate clients is below the client threshold as defined in [Table 9](#).

WLAN Configuration

Creating a WLAN Configuration

The following table details the threshold for each CCF. It provides the number of associated clients that would bar ChannelFly from performing a channel change.

TABLE 9 Client Threshold Table

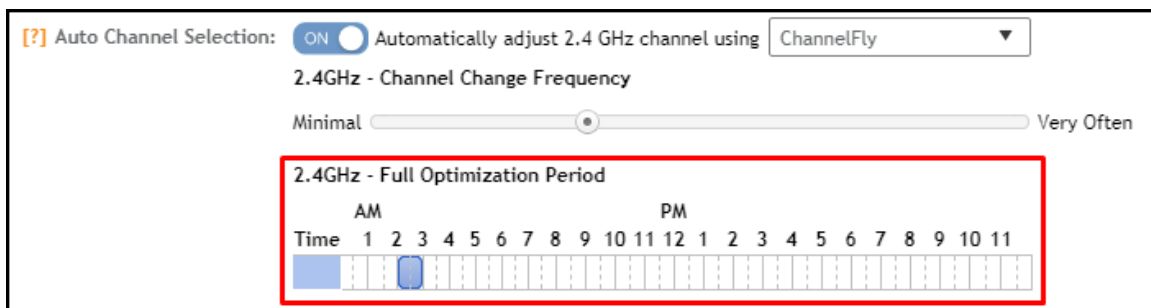

CCF	100	90	80	70	60	50	40	30	20	10	1
Client Threshold	10	9	8	7	6	5	4	3	2	1	0

For deployments where impact on the clients is less of a consideration and avoiding interference is paramount, higher values of CCF are recommended.

For deployments with low client counts, two or fewer associated clients per AP on average, a CCF of 10 or 20 is recommended. For deployments where channel changes are not allowed to impact any associate client, a CCF of 0 is recommended.

The *Full Optimization Period* configuration specifies a period of time where ChannelFly is allowed to ignore the impact of channel changes on associated clients. During this time, preferably when the wireless network is not expected to be actively servicing clients such as the middle of the night, ChannelFly will be free to full optimize the channel plan. A higher number of channel changes may be observed during this time.

The *Full Optimization Period* can be specified by clicking specific hours or by clicking-and-dragging across the time bar to affect multiple hours. The time periods can be non-contiguous, and the period can be disabled entirely by clicking the blue box under *Time*.

For the first hour following the reboot of an AP, ChannelFly may perform up to six channel changes in order to quickly settle upon a channel plan. During this period, ChannelFly will ignore the impact of channel changes on associated clients.

The table below summarizes the channel change behavior for each of the ChannelFly states.

TABLE 10 ChannelFly State and its Behavior

State	Behavior
AP reboot	Channel changes may occur at higher frequency for the first hour
Normal operation	Channel changes may occur only when the number of associated clients is lower than the client threshold based on the <i>Channel Change Frequency</i>
Full Optimization Period	Channel changes may occur at higher frequency

ChannelFly can be enabled/disabled per band. If there are 2.4 GHz clients do not support 802.11h on the wireless network, RUCKUS recommends disabling ChannelFly for 2.4 GHz but leaving it enabled for the 5 GHz band.

To revert to Legacy ChannelFly, first select ChannelFly from the controller, then from AP CLI:

```
rksccli: set channselectmode wifi<0/1> <mode>
  wifi0 - 2.4 GHz
  wifi1 - 5 GHz
  <mode> - 1: ChannelFly
          0: Legacy ChannelFly
```

Background Scanning

Background Scanning is a channel selection method, and *Background Scan* is the AP functionality where the AP briefly leaves the home channel to scan another channel.

Background Scanning uses Background Scan to collect information on the presence of neighboring APs. Background Scanning focuses on finding a channel with the fewest number of neighbors.

When the AP is rebooted, Background Scanning will enter a training period where the number of channel changes may be elevated in the first hour.

Background Scan is required, with the recommended default scan interval of 20 seconds. In situations where a larger scan interval is necessary, Background Scan will require a longer training period.

NOTE

In order to detect rogue APs on the network, you must enable Background Scan on the controller.

VIDEO

ChannelFly Overview. This video provides a brief overview of ChannelFly.

VLAN Pooling

When Wi-Fi is deployed in a high density environment (such as a stadium) or on a university campus to provide access for students, the number of IP addresses required for client devices can easily run into several thousands.

Allocating a single large subnet results in a high probability of degraded performance due to factors like broadcast/multicast traffic.

To address this problem, VLAN pooling provides a method by which administrators can deploy pools of multiple VLANs from which clients are assigned, thereby automatically segmenting large groups of clients into smaller subgroups, even when connected to the same SSID.

As the client device joins the Wi-Fi network, the VLAN is assigned based on a hash of the client's MAC address (by default).

Creating an AP Group

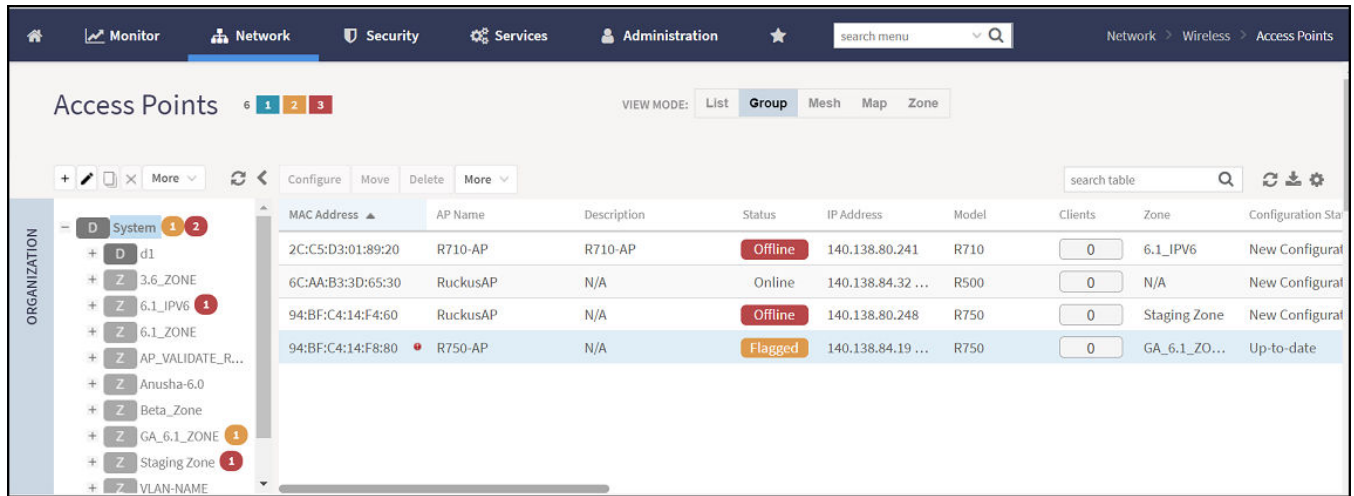

By creating an AP group, you can configure a profile that defines the channels, radio settings, Ethernet ports and other configurable fields for all members of the group or for all APs of a specific model in the group.

To create an AP Group, perform the following:

1. Click **Network > Wireless > Access Point**.

This displays **Access Points** page.

FIGURE 7 Access Point Page

2. From the System tree hierarchy, select the zone and click . The **Create AP Group** page is displayed.
3. Enter the details as explained in the following table.

NOTE

You can also edit the configuration of default APs by selecting the AP and clicking the  icon.

4. Click **OK**.

TABLE 11 AP Group Details

Field	Description	Your Action
Name	Indicates a name for the Zone/AP group.	Enter a name.
Description	Indicates a short description.	Enter a brief description
Type	Indicates if you are creating a domain, zone or an AP group.	Appears by default. You can also choose the option.
Parent Group	Indicates the parent group that this AP group belongs.	Appears by default.
General Options		
Location	Indicates generic location.	Enter the location.
Location Additional Information	Indicates detailed location.	Enter additional location information.
GPS Coordinates	Indicates the geographical location.	Enter the following coordinates in meters or floor: <ul style="list-style-type: none"> • Longitude • Latitude • Altitude
Radio Options		

TABLE 11 AP Group Details (continued)

Field	Description	Your Action
Dual-5G Mode	<p>Enables third radio operator in 2.4 GHz, Lower 5 GHz, and Upper 5 GHz. By default, the Dual-5G Mode is enabled. In the enabled mode, radio-0 will be on 2.4GHz band, radio-1 will be on 5G Lower band and radio-2 will be on 5G Upper band.</p> <ul style="list-style-type: none"> • 5G Lower BAND : UNII-1, UNII-2A • 5G Upper BAND : UNII-2C, UNII-3 <p>In the disabled mode, the radio-0 will be on 2.4GHz band, radio-1 will be on 5G band and radio-2 will be on 6G band. This also depends on the country code.</p>	Select or keep the default Dual-5G Mode option.
Band/Spectrum Configuration > 2.4 GHz		
Channelization	<p>Helps manage and allocate radio frequency resources. A lower channel width allows the zone to potentially serve more clients, whereas a higher channel width improves throughput, but potentially serves fewer clients and increases the possibility of interference. The Auto setting defaults to 20 MHz channelization.</p>	<p>Set the channel bandwidth used during transmission to either 20 or 40 (MHz), or select Auto to set it automatically.</p> <p>NOTE By default, for the Country Code Indonesia, the Channelization width is set to 20 MHz only for outdoor APs.</p>
Channel	Indicates the channel to use.	Select one of the options: Auto, 1, 6 or 11.
Auto Cell Sizing	<p>Enables the AP to share information on interference seen by each other and dynamically adjust their radio Tx power and Rx parameters to minimize interference. Enabling this option disables the TX Power Adjustment configuration.</p> <p>NOTE Ensure that Background Scan is enabled.</p>	Select the option.
TX Power Adjustment	<p>Allows to manually configure the transmit power on the 2.4 GHz radio. By default, the TX power is set to Full on the 2.4 GHz radio.</p> <p>NOTE If you choose Min, the transmit power is set to 0dBm (1mW) per chain for 11n APs, and 2dBm per chain for 11ac APs. If you choose Max, the transmit power is set to the maximum allowable value according to the AP's capability and the operating country's regulations.</p>	Select the preferred TX power.
Protection Mode	Indicates the mechanism to reduce frame collision.	<p>Choose one of the following options:</p> <ul style="list-style-type: none"> • None • RTS/CTS • CTS Only
Background Scan	Allows the AP radio to scan other channels in the band for accessing channel health and capacity, detecting rogue devices, optimizing and maintaining mesh links and to discover AP neighbors.	Enter the duration in seconds. Range: 1 through 65535.

Hotspot 2.0 Venue Profile	Indicates the hotspot profile that you want to assign to the group.	Select the required option or click Create and update the following details: <ul style="list-style-type: none"> • Enter the Name. • Enter the Description. • Enter the Venue Names. • Select the Venue Category. • Select the Type. • Enter the WLAN Metrics.
AP Management VLAN	Indicates the AP management VLAN settings.	Choose the option. Click VLAN ID , and then type the VLAN ID that you want to assign (valid range is from 1 to 4094). To keep the same management VLAN ID that has been configured on the AP, click Keep AP's settings . <p>ATTENTION For standalone APs, set the AP Ethernet port to trunk before changing the AP Management VLAN settings.</p>
Client Admission Control	Indicates the load thresholds on the AP at which it will stop accepting new clients.	Select the Override check box respective to 2.4 GHz Radio or 5 GHz Radio and update the following details: <ul style="list-style-type: none"> • Enable <p>NOTE Client load balancing and band balancing will be disabled for this AP group.</p> <ul style="list-style-type: none"> • Min Client Count • Max Radio Load • Min Client Throughput
Rogue Classification Policy	Indicates the parameters used to classify rogue APs. This option is available only if you enable the Rogue AP Detection option.	Select the options for rogue classification policy: <ul style="list-style-type: none"> • Enable the Override option and select the rogue classification policy from the list to override for this group. • Enable the Override option and enter the Report RSSI Threshold. Range: 0 through 100. • Enable the Override option to override the aggressiveness of protecting the network and choose one of the following: <ul style="list-style-type: none"> - Aggressive - Auto - Conservative • Enable the Override option and enter the Jamming Threshold in percentage.
Recovery SSID	Allows you to enable or disable the Recovery(Island) SSID broadcast on the controller.	Enable Recovery SSID Broadcast
Direct Multicast	Indicates whether multicast traffic is sent from a wired device, wireless device or from the network.	Select one or more of the following: <ul style="list-style-type: none"> • Multicast Traffic from Wired Client • Multicast Traffic from Wireless Client • Multicast Traffic from Network

TABLE 11 AP Group Details (continued)

Field	Description	Your Action
Venue Code	Indicates the venue code.	You can choose to override this setting and enter the code in the field provided.
BSS Coloring	Indicates the BSS coloring settings.	<ul style="list-style-type: none"> Select the Override zone configuration check box. Select the Enable BSS Coloring check box.

NOTE

You can also edit, clone or delete an AP Group by selecting the options Configure , Clone  or Delete  respectively, from the Access Points page.

NOTE

Starting with the 7.0 release, the support for **Cellular Options** while configuring or creating an AP Group is removed from the controller web interface.

Configuring Model-Based Settings

You can apply a set of settings to all APs of a particular model, use the **Model Specific Options** section.

Complete the following steps to configure model based settings.

1. Click **Network > Wireless > Access Points**.
2. From the list, select AP for which you want to apply model-based settings and click **Configure**. This displays **Edit AP**.
3. Scroll down to **Model Specific Options** section, expand the section.
4. In **Model Specific Control**, select **Override zone config** check box. The settings available for the AP model are displayed.
5. In the **General Options** section, configure the following settings.

NOTE

The options that appear in the **Model Specific Options** section depend on the AP model that you select. Not all the options described in the following table are displayed for every AP model.

TABLE 12 Configuring the Model Specific Options

Option	Description
USB Port	To disable the USB port on the selected AP model, select the Disable USB port check box. USB ports are enabled by default.
Status LEDs	To disable the status LED on the selected AP model, select the Disable Status LEDs check box.
LLDP	<p>To enable Link Layer Discovery Protocol (LLDP) on the selected AP model, select the Enable Link Layer Discovery Protocol check box.</p> <ul style="list-style-type: none"> Enter the Advertise Interval duration in seconds. Enter the Hold Time duration in seconds. Select the Enable Management IP TLV check box.

TABLE 12 Configuring the Model Specific Options (continued)

Option	Description
PoE Operating Mode	<p>Click the drop-down to view the available options. Options are:</p> <ul style="list-style-type: none"> • Auto (default) • 802.3at • 802.3af • 802.3bt/Class 5 • 802.3bt/Class 6 • 802.3bt/Class 7 <p>NOTE If 802.3af PoE Operating Mode PoE is selected, this AP model will operate in 802.3af mode and will consume less power than in 802.3at mode. However, when this option is selected, some AP features, such as the USB port and one of the Ethernet ports, are disabled to reduce power consumption.</p> <p>For AP model R640, if 802.3at PoE Operating Mode PoE is selected and the USB Port option is enabled, the second Ethernet port and any devices running on that port will be disabled.</p>
PoE out port	<p>To enable the PoE out port on the selected AP model, select the Enable PoE out ports (specific ZoneFlex AP models only) .</p> <p>NOTE If the controller country code is set to United Kingdom, an additional Enable 5.8 GHz Channels option will be available for outdoor 11n and 11ac APs. Enabling this option allows the use of restricted C-band channels. These channels are disabled by default and should only be enabled by customers with a valid license to operate on these restricted channels.</p>
Internal Heater	<p>To enable the heater that is built into the selected AP model, select the Enable internal heaters (specific AP models only) check box.</p>
External Antenna (2.4 GHz)	<p>To enable the external 2.4-GHz antenna on the selected AP model, select the Enable external antenna check box, and then set the gain value (between 0 and 90dBi) in the field provided.</p>
External Antenna (5 GHz)	<p>To enable the external 5-GHz antenna on the selected AP model, select the Enable external antenna check box, and then set the gain value (between 0 and 90dBi) in the field provided.</p>

NOTE

For H series AP models such as H500 and H510, you can disable LAN5.

- In the **Port Settings** section, configure the following options for each LAN port.

NOTE

The number of LAN ports that appear in this section correspond to the physical LAN ports that exist on the selected AP model.

NOTE

When trunk port limitation is enabled, the controller does not validate the port settings configured in the AP or the AP group with no members.

TABLE 13 Configuring the Options for LAN Port

Option	Description
Enable	<p>Use this option to enable and disable this LAN port on the selected AP model. By default, this check box is selected. To disable this LAN port, clear this check box.</p>

TABLE 13 Configuring the Options for LAN Port (continued)

Option	Description
Profile	Use this option to select the Ethernet port profile that you want this LAN port to use. Two default Ethernet port profiles exist: Default Trunk Port (selected by default) and Default Access Port . If you created Ethernet port profiles (see <i>Creating an Ethernet Port Profile</i>), these profiles will also appear on the drop-down list. NOTE If you recently created an Ethernet port profile and it does not appear on the drop-down menu, click Reload on the drop-down menu to refresh the Ethernet port profile list.
Overwriter VLAN	Select the Overwriter VLAN check box and enter: <ul style="list-style-type: none"> • Untag ID—Default: 1 • Members—Range: 1 through 4094.

7. Click **OK**.

Supported LLDP Attributes

The Link Layer Discovery Protocol (LLDP) is a vendor-neutral Layer 2 protocol that allows a network device (for example, a RUCKUS AP) to advertise its identity and capabilities on the local network.

LLDP information is sent by devices from each of their interfaces at a fixed interval (default is 30 seconds), in the form of an Ethernet frame. Each LLDP Ethernet frame contains a sequence of type-length-value (TLV) structures starting with Chassis ID, Port ID and Time to Live (TTL) TLV. The following table lists the LLDP attributes supported by the controller.

TABLE 14 LLDP Attributes

Attribute (TLV)	Description
Chassis ID	Indicates the MAC address of the AP's br0 interface
Port ID	Identifies the port from which the LLDP packet was sent
Time to Live	Same as LLDP Hold Time. Indicates the length of time (in seconds) that a receiving device will hold the LLDP information sent by the selected AP model before discarding it. The default value is 120 seconds.
System Name	Indicates the name assigned to the AP. The default name of RUCKUS APs is RuckusAP.
System Description	Indicates the AP model plus software version
System Capabilities	Indicates the AP's capabilities (Bridge, WLAN AP, Router, Docsis), and which capabilities are enabled
Management Address	Indicates the management IP address of the AP
Port Description	Indicates the description of the port in alphanumeric format

Configuring the Port Settings of a Particular AP Model

Use Port Settings in the AP Model-Specific Configuration section to configure the Ethernet ports of a particular AP model.

Follow these steps to configure the port settings of a certain AP model.

1. All ports are enabled by default (the Enable check boxes are all selected). To disable a particular port entirely, clear the Enable check box next to the port name (LAN1, LAN2, etc.)
2. For any enabled ports, you can choose whether the port will be used as a Trunk Port, Access Port, or General Port.

The following restrictions apply:

- All APs must be configured with at least one Trunk Port.

WLAN Configuration

Creating a WLAN Configuration

NOTE

You cannot move an AP model to an AP group and configure the AP model to use a trunk port at the same time, if general ports are enabled when trunk port limitation is disabled. You must configure the selected AP model to use at least one trunk port, and then move the AP model to the AP group.

- For single port APs, the single LAN port must be a trunk port and is therefore not configurable.
- For ZoneFlex 7025/7055, the LAN5/Uplink port on the rear of the AP is defined as a Trunk Port and is not configurable. The four front-facing LAN ports are configurable.
- For all other APs, you can configure each port individually as either a Trunk Port, Access Port, or General Port. For more information, refer the *Designating an Ethernet Port Type*.

Configuring Access Points

Once you have created registration rules and the AP zones to which joining access points can be assigned automatically, access points will be able to join or register with the controller automatically.

After an access point registers successfully with the controller, you can update its configuration by completing the following steps.

1. From the list, select the AP that you want to configure and click **Configure**. The **Edit AP** page is displayed.
2. Edit the parameters as explained in **Access Point Edit Parameters** table below.
3. Click **OK**.

NOTE

Select the **Override** check box if you want to configure new settings.

TABLE 15 Access Point Edit Parameters

Field	Description	Your Action
AP Configuration > General Options		
AP Name	Indicates the name of the AP.	Enter a name.
Description	Gives a short description of the AP.	Enter a short description.
Location	Indicates a generic location.	Select the check box and enter the location.
Location Additional Information	Indicates a specific location.	Select the check box and enter the location.
GPS Coordinates	Indicates the geographical location.	Select the option. For the Manual option, enter the following details: <ul style="list-style-type: none">• Latitude• Longitude• Altitude
User Location Information	Indicates the demographic information.	Enter the Area Code and Cell Identifier .
AP Admin Logon	Indicates the administrator logon credentials.	Select the check box and enter the Logon ID and Password .
AP Configuration > Radio Options		

TABLE 15 Access Point Edit Parameters (continued)

Field	Description	Your Action
Dual-5G Mode	<p>Enables third radio operator in 2.4 GHz, Lower 5 GHz, and Upper 5 GHz. By default, the Dual-5G Mode is enabled. In the enabled mode, radio-0 will be on 2.4GHz band, radio-1 will be on 5G Lower band and radio-2 will be on 5G Upper band.</p> <ul style="list-style-type: none"> ● 5G Lower BAND : UNII-1, UNII-2A ● 5G Upper BAND : UNII-2C, UNII-3 <p>In the disabled mode, the radio-0 will be on 2.4GHz band, radio-1 will be on 5G band and radio-2 will be on 6G band. This also depends on the country code.</p>	Select or keep the default Dual-5G Mode option.
AP Configuration > Band/Spectrum Configuration > 2.4 GHz		
Channelization	<p>Helps manage and allocate radio frequency resources. A lower channel width allows the zone to potentially serve more clients, whereas a higher channel width improves throughput, but potentially serves fewer clients and increases the possibility of interference. The Auto setting defaults to 20 MHz channelization.</p>	<p>Set the channel bandwidth used during transmission to either 20 or 40 (MHz), or select Auto to set it automatically.</p> <p>NOTE By default, for the Country Code Indonesia, the Channelization width is set to 20 MHz only for outdoor APs.</p>
Channel	Indicates the channel to use.	Select one of the options: Auto, 1, 6 or 11.
Auto Cell Sizing	<p>Enables the AP to share information on interference seen by each other and dynamically adjust their radio Tx power and Rx parameters to minimize interference. Enabling this option disables the TX Power Adjustment configuration.</p> <p>NOTE Ensure that Background Scan is enabled.</p>	Select the option.
TX Power Adjustment	<p>Allows to manually configure the transmit power on the 2.4 GHz radio. By default, the TX power is set to Full on the 2.4 GHz radio.</p> <p>NOTE If you choose Min, the transmit power is set to 0dBm (1mW) per chain for 11n APs, and 2dBm per chain for 11ac APs. If you choose Max, the transmit power is set to the maximum allowable value according to the AP's capability and the operating country's regulations.</p>	Select the preferred TX power.
Protection Mode	<p>Allows to manually override the protection mode and select from the options -</p> <ul style="list-style-type: none"> ● None ● RTS/CTS ● CTS Only 	Select the preferred protection mode.
WLAN Group	Allows to manually configure the WLAN Group. To add a WLAN group, refer to the Creating a WLAN group section of the <i>RUCKUS SmartZone (LT-GA) WLAN Management Guide (SZ300/vSZ-H)</i> .	Add a WLAN group to the AP Group.
WLAN Service	By default it is ON.	

WLAN Configuration

Creating a WLAN Configuration

TABLE 15 Access Point Edit Parameters (continued)

Field	Description	Your Action
Background Scan	Allows the AP radio to scan other channels in the band for accessing channel health and capacity, detecting rogue devices, optimizing and maintaining mesh links and to discover AP neighbors.	Enter the duration in seconds. Range: 1 through 65535.
Auto Channel Selection	<p>Automatically adjusts the channel for network self-healing and performance optimization. ChannelFly is set as the default option.</p> <p>For the ChannelFly option, you may also modify the default settings for the Channel Change Frequency and Full Optimization Period.</p> <p>The Channel Change Frequency sidebar allows you to specify the responsiveness of ChannelFly to interference (with consideration for the impact on associated clients), ranging from Minimal to Very Often.</p> <p>The Full Optimization Period timeslot bar allows you to specify one or more periods of time when ChannelFly is allowed to fully optimize the channel plan, ignoring the impact of channel changes on associated clients. Select time periods when the wireless network is servicing the fewest clients.</p>	<p>Select the required option.</p> <ul style="list-style-type: none"> • Background Scanning: Changes the AP channel when there is an interference. • ChannelFly: Monitors potential throughput and will change channels to learn each channel's capacity, optimize throughput, and to avoid interference.
AP Configuration > Band/Spectrum Configuration > 5 GHz		
Channelization	Helps manage and allocate radio frequency resources. A lower channel width allows the zone to potentially serve more clients, whereas a higher channel width improves throughput, but potentially serves fewer clients and increases the possibility of interference. Prior to SmartZone release 7.0.0, the Auto setting defaulted to 80 MHz channelization. Beginning in SmartZone release 7.0.0, the Auto setting defaults to 40 MHz channelization.	<p>Set the channel bandwidth used during transmission: Auto, 20, 40, 80 and 160.</p> <p>NOTE By default, for the Country Code Indonesia, the Channelization width is set to 20 MHz only for outdoor APs.</p>
Channel	Indicates the channel to use.	Select the required options for the Indoor and Outdoor APs.
Secondary Channel	Indicates the secondary channel to used.	By default, the Indoor and Outdoor option is set to Auto.
Allow DFS Channels	Allows ZoneFlex APs to use DFS channels.	Click to enable the option.
Allow Channel 144	<p>Provides channel 140 and 144 support for 11ac and 11ax APs. Enabling this option supports 20 MHz, 40 MHz, or 80 MHz channel modes. The 160 MHz mode is supported if the AP supports this mode. Disabling this option provides Channel 140 support only to 20 MHz mode.</p> <p>NOTE This option is available for selection only if you enable the DFS Channels option.</p> <p>NOTE This feature is currently supported only in the United States.</p>	Click to enable the option.
Allow Indoor Channels	Allows outdoor APs to use channels regulated as for indoor use only.	Click to enable the option.

Config Type	Allows to customize or select an external syslog server profile.	<p>Select the option:</p> <ul style="list-style-type: none"> • Custom: Configure the details for the AP to send syslog messages to syslog server. <p style="text-align: center;">NOTE The IP address format that you enter here will depend on the AP IP mode that you selected earlier in this procedure. If you selected IPv4 Only, enter an IPv4 address. If you selected IPv6 Only, enter an IPv6 address.</p> <ul style="list-style-type: none"> - Primary Server Address: If the primary server goes to sends syslog messages. <ul style="list-style-type: none"> › Port: enter the syslog port number on the respective servers. › Protocol: select between UDP and TCP protocols - Secondary Server Address: If the primary server goes down, the AP sends syslog messages to the secondary server as backup. <ul style="list-style-type: none"> › Port: enter the syslog port number on the respective servers. › Protocol: select between UDP and TCP protocols - Event Facility: Select the facility level that will be used by the syslog message. Options include: Keep Original, Local0 (default), Local1, Local2, Local3, Local4, Local5, Local6, and Local7. - Priority: Select the lowest priority level for which events will be sent to the syslog server. For example, to only receive syslog messages for events with the warning (and higher) priority, select Warning. To receive syslog messages for all events, select All. - Send Logs: Select the type of messages to be sent to the syslog server. For example, General Logs, Client Logs or All Logs. <ul style="list-style-type: none"> • AP External Syslog Profile: Select the profile from the drop-down or click  Add to create a new profile.

WLAN Configuration

Creating a WLAN Configuration

TABLE 15 Access Point Edit Parameters (continued)

Field	Description	Your Action
Hotspot 2.0 version Profile	Indicates the hotspot profile that you want to assign to the group.	Select the required option or click Create and update the following details: <ul style="list-style-type: none"> • Enter the Name. • Enter the Description. • Enter the Venue Names. • Select the Venue Category. • Select the Type. • Enter the WLAN Metrics.
AP Management VLAN	Indicates the AP management VLAN settings.	Select the check box and choose the option. <p>ATTENTION For standalone APs, set the AP Ethernet port to trunk before changing the AP Management VLAN settings.</p>
Client Admission Control	Indicates the load thresholds on the AP at which it will stop accepting new clients.	Select the check boxes and update the following details: <ul style="list-style-type: none"> • Min Client Count • Max Radio Load • Min Client Throughput
Rogue Classification Policy	Indicates the parameters used to classify rogue APs. This option is available only if you enable the Rogue AP Detection option.	Select the options for rogue classification policy: <ul style="list-style-type: none"> • Enable the Override option and enter the Report RSSI Threshold. Range: 0 through 100. • Enable the Override option to override the aggressiveness of protecting the network and choose one of the following: <ul style="list-style-type: none"> - Aggressive - Auto - Conservative • Enable the Override option and enter the Jamming Threshold in percentage.
Recovery SSID	Allows you to enable or disable the Recovery(Island) SSID broadcast on the controller.	Enable Recovery SSID Broadcast
Direct Multicast	Indicates whether multicast traffic is sent from a wired device, wireless device or from the network.	Select one or more of the following: <ul style="list-style-type: none"> • Multicast Traffic from Wired Client • Multicast Traffic from Wireless Client • Multicast Traffic from Network
Test Speed	Measures the connection performance of the AP. The option must be enabled to run the SpeedFlex traffic test between wireless clients and the AP.	Enable the option.
Swap Configuration		
Add Swap-In AP	Allows to swap APs.	Select the check box and enter the Swap-in AP MAC details.

NOTE

- You can also move the location of an AP or delete an AP. To do so, select the AP from the list and click **Move** or **Delete** as required.
- A maximum of 50 APs in a specific group can be moved from one zone to another by using an API command. APs that fail to move return an error code indicating the failure and the AP count. Select **Administration > Help > REST API** to refer to the API command. In the *SmartZone 300 Public API Reference Guide*, refer to **Access Point Configuration > Move multiple APs**.

Creating Zone Templates

A zone template contains configuration settings (radio, AP GRE tunnel, channel mode, and background scanning) that you can apply to all access points that belong to a particular AP zone. Applying a zone template to an AP zone will overwrite all settings on all access points that belong to the AP zone.

To create a zone template:

1. Go to **Administration > System > Templates > Zone Templates**.
2. Click **Create**, the Create Zone Template form is displayed.
3. Enter the template details as explained in the following table.

TABLE 16 Zone Template Details

Field	Description	Your Action
General Options		
Zone Name	Indicates a name for the Zone.	Enter a name.
Description	Indicates a short description.	Enter a brief description
AP Firmware	Indicates the firmware to which it applies.	Select the firmware.
Country Code	Indicates the country code to ensure that this zone uses authorized radio channels.	Select the country code.
Location	Indicates generic location.	Enter the location.
Location Additional Information	Indicates detailed location.	Enter additional location information.
GPS Coordinates	Indicates the geographical location.	Enter the following coordinates in meters or floor: <ul style="list-style-type: none"> • Longitude • Latitude • Altitude
AP Admin Logon	Indicates the admin logon credentials. For the Default Zone, the controller's cluster name is used as the default login ID and password.	Enter the Logon ID and Password .
Time Zone	Indicates the time zone that applies.	Select the option: <ul style="list-style-type: none"> • System Defined: Select the time zone. • User defined: <ol style="list-style-type: none"> a. Enter the Time Zone Abbreviation. b. Choose the GMT Offset time. c. Select Daylight Saving Time.
AP IP Mode	Indicates the IP version that applies.	Select the option: <ul style="list-style-type: none"> • IPv4 only • IPv6 only • Dual

TABLE 16 Zone Template Details (continued)

Field	Description	Your Action
Historical Connection Failures	Allows the zone APs to report client connection failures so that the administrator can view past connection problems from the Troubleshooting menu.	Click the button.
DP Zone Affinity Profile	Specifies the DP affinity profile for the zone. NOTE This option is supported only on vSZ-H.	Select the zone affinity profile from the list.
SSH Tunnel Encryption	Specifies the encryption that reduces the load on control of SSH traffic.	Select the required option: <ul style="list-style-type: none"> • AES 128 • AES 256
Cluster Redundancy	Provides cluster redundancy option for the zone. NOTE Cluster redundancy is supported only on SZ300 and vSZ-H.	Select the required option: <ul style="list-style-type: none"> • Zone Enable • Zone Disable
Radio Options		
Channel Range	Indicates that you want to override the 2.4GHz channel range that has been configured for the zone.	Select Select Channel Range (2.4G) check boxes for the channels on which you want the 2.4GHz radios to operate. Channel options include channels 1 to 11. By default, all channels are selected.
DFS Channels	Allows ZoneFlex APs to use DFS channels.	Click to enable the option.
Channel 144	Provides channel 140 and 144 support for 11ac and 11ax APs. Enabling this option supports 20 MHz, 40 MHz, or 80 MHz channel modes. The 80+80 MHz and 160 MHz modes are supported if the AP supports these modes. Disabling this option provides Channel 140 support only to 20 MHz mode. NOTE This option is available for selection only if you enable the DFS Channels option. NOTE This feature is currently supported only in the United States.	Click to enable the option.
Channel Range (5G) Indoor	Indicates for what channels want the 5GHz radios to operate.	Select the check boxes.
Channel Range (5G) Outdoor	Indicates for what channels want the 5GHz radios to operate.	Select the check boxes.

TABLE 16 Zone Template Details (continued)

Field	Description	Your Action
Radio Options b/g/n (2.4 GHz)	Indicates the radio option 2.4 GHz configurations.	<p>Select the following options:</p> <ul style="list-style-type: none"> ● Channelization—Set the channel width used during transmission to either 20 or 40 (MHz), or select Auto to set it automatic. ● Channel—Select the channel to use for the b/g/n (2.4GHz) radio, or select Auto to set it automatic. ● TX Power Adjustment—Select the preferred TX power, if you want to manually configure the transmit power on the 2.4GHz radio. By default, TX power is set to Full/Auto on the 2.4GHz radio. <p style="text-align: center;">NOTE If you choose Min, the transmit power is set to 0dBm (1mW) per chain for 11n APs, and 2dBm per chain for 11ac APs. If you choose Max, the transmit power is set to the max allowable value according to the AP's capability and the operating country's regulations.</p>
Radio Options a/n/ac (5 GHz)	Indicates the radio option 5 GHz configurations.	<p>Select the following options:</p> <ul style="list-style-type: none"> ● Channelization—Set the channel width used during transmission to either 20, 40, 80, 80+80 or select Auto. ● Channel—For Indoor and Outdoor, select the channel to use for the a/n/c (5GHz) radio, or select Auto. ● TX Power Adjustment—Select the preferred TX power, if you want to manually configure the transmit power on the 5GHz radio. By default, TX power is set to Full/Auto on the 5GHz radio. <p style="text-align: center;">NOTE If you choose Min, the transmit power is set to 0dBm (1mW) per chain for 11n APs, and 2dBm per chain for 11ac APs. If you choose Max, the transmit power is set to the max allowable value according to the AP's capability and the operating country's regulations.</p>
AP GRE Tunnel Options		
Ruckus GRE Profile	Indicates the GRE tunnel profile.	Choose the GRE tunnel profile from the drop-down.
Ruckus GRE Forwarding Broadcast	Forwards the broadcast traffic from network to tunnel.	Click the option to enable forwarding broadcast.
Soft GRE Profiles	Indicates the SoftGRE profiles that you want to apply to the zone.	<ol style="list-style-type: none"> a. Click the Select checkbox, a form is displayed. b. From the Available Profiles, select the profile and click the -> icon to choose it. You can also click the + icon to create a new SoftGRE profile. c. Click OK.

WLAN Configuration

Creating a WLAN Configuration

TABLE 16 Zone Template Details (continued)

Field	Description	Your Action
IPsec Tunnel Mode	Indicated the tunnel mode for the Ruckus GRE and SoftGRE profile.	Select an option: <ul style="list-style-type: none"> • Disable • SoftGRE • Ruckus GRE
IPsec Tunnel Profile	Indicates the tunnel profile for SoftGRE. NOTE Select the same tunnel type for IPsec tunnel profile in WLAN configuration.	Choose the option from the drop-down.
Syslog Options		
Enable external syslog server for Aps	Indicates if an external syslog server is enabled.	Select the check box and update the following details for the AP to send syslog messages to syslog server. If the primary server goes down, the AP send syslog messages to the secondary server as backup: <ul style="list-style-type: none"> • Primary Server Address • Secondary Server Address • Port for the respective servers • Portocol: select between UDP and TCP protocols • Event Facility • Priority • Send Logs: you can choose to send the General Logs, Client Logs or All Logs
AP SNMP Options		
Enable AP SNMP	Indicates if the AP SNMP option is enabled.	Select the check box.
SNMPv2 Agent	Indicates SNMPv2 Agent is applied.	<ol style="list-style-type: none"> Click Create and enter Community. Select the required Privilege: Read or Write. Click OK.
SNMPv3 Agent	Indicates SNMPv3 Agent is applied.	<ol style="list-style-type: none"> Click Create and enter User. Select the required Authentication: <ul style="list-style-type: none"> • None • SHA <ol style="list-style-type: none"> Enter the Auth Pass Phrase Select the Privacy option. For DES and AES options, Enter the Privacy Phrase. • MD5 <ol style="list-style-type: none"> Enter the Auth Pass Phrase Select the Privacy option. For DES and AES options, Enter the Privacy Phrase. Select the required Privilege: Read or Write. Click OK.
Advanced Options		
Channel Mode	Indicates if location-based service is enabled.	Select the check box and choose the option.
Auto Channel Selection	Indicates auto-channel settings.	Select the required check boxes and choose the option.
Background Scan	Runs a background scan.	Select the respective check boxes and enter the duration in seconds.

TABLE 16 Zone Template Details (continued)

Field	Description	Your Action
Smart Monitor	Indicates AP interval check and retry threshold settings.	Select the check box and enter the duration and threshold.
AP Ping Latency Interval	Measures the latency between the controller and AP periodically, and send this data to SCI	Enable by moving the radio button to ON to measure latency.
AP Management VLAN	Indicates the AP management VLAN settings.	Choose the option. If you select VLAN ID , enter the VLAN ID that you want to assign (valid range is from 1 to 4094). To keep the same management VLAN ID that has been configured on the AP, click Keep AP's settings . ATTENTION For standalone APs, set the AP ethernet port to trunk before changing the AP Management VLAN settings.
Rogue AP Detection	Indicates rogue AP settings. NOTE Rogue detection AP in active-active mode cluster redundancy environment is restricted from storing its own BSSIDs to avoid considering its own APs as rogues attacking.	Enable the option.
Rogue Classification Policy	Indicates the parameters used to classify rogue APs. This option is available only if you enable the Rogue AP Detection option.	Select the options for rogue classification policy: <ul style="list-style-type: none"> ● - Enable events and alarms for all rogue devices - Enable events and alarms for malicious rogues only ● Report RSSI Threshold - enter the threshold. Range: 0 through 100. ● Protect the network from malicious rogue access points - Enable the option and choose one of the following: <ul style="list-style-type: none"> - Aggressive - Auto - Conservative ● Radio Jamming Detection - enable the option and enter the Jamming Threshold in percentage.
DoS Protection	Indicates settings for blocking a client.	Select the check box and enter the: <ul style="list-style-type: none"> ● duration in seconds to Block a client for ● number of repeat authentication failures ● duration in seconds to be blocked for every repeat authentication failures.
Load Balancing	Balances the number of clients across APs.	Select one of the following options and enter the threshold: <ul style="list-style-type: none"> ● Based on Client Count ● Based on Capacity ● Disabled <p style="text-align: center;">NOTE If Based on Capacity is selected, Band Balancing is disabled.</p>
Band Balancing	Balances the bandwidth of the clients.	Select the check box and enter the percentage.

TABLE 16 Zone Template Details (continued)

Field	Description	Your Action
Location Based Service	To disable the LBS service for this AP group, clear the Enable LBS service check box. To use a different LBS server for this AP group, select the Enable LBS service check box, and then select the LBS server that you want to use from the drop-down list.	Select the check box and choose the options.
Client Admission Control	Indicates the load thresholds on the AP at which it will stop accepting new clients. NOTE Client admission cannot be enabled when client load balancing or band balancing is enabled.	Select the Enable check box 2.4 GHz Radio or 5GHz Radio and update the following details: <ul style="list-style-type: none"> • Min Client Count • Max Radio Load • Min Client Throughput
AP Reboot Timeout	Indicates AP reboot settings.	Choose the required option for: <ul style="list-style-type: none"> • Reboot AP if it cannot reach default gateway after • Reboot AP if it cannot reach the controller after
Recovery SSID	Allows you to enable or disable the Recovery(Island) SSID broadcast on the controller.	Enable Recovery SSID Broadcast
Direct Multicast	Indicates whether multicast traffic is sent from a wired device, wireless device or from the network.	Select one or more of the following: <ul style="list-style-type: none"> • Multicast Traffic from Wired Client • Multicast Traffic from Wireless Client • Multicast Traffic from Network

4. Click **OK**.

NOTE

You can select a zone from the list and edit, clone or delete its template by selecting the options **Configure**, **Clone** or **Delete** respectively.

Changing the AP Firmware Version of the Zone

The controller supports multiple firmware versions. You can manually upgrade or downgrade the AP firmware version of the zone.

Complete the following steps to change the AP firmware version of the zone.

1. From the **Access Point** page, locate a zone for which you want to upgrade the AP firmware version.

NOTE

To upgrade multiple zones, click the **Zone** view mode and select the zones by holding down the Ctrl key and clicking each of the zones.

2. Click **More** and select **Change AP Firmware**. The **Change AP Firmware** dialog box displays the current AP firmware version.
3. Select the firmware version you need. If you upgrade to a new firmware version, a backup configuration file will be created. You can use this backup file to downgrade to the original firmware version.

NOTE

If the multiple zones do not have the same supported firmware version, the dialog box displays the following message: These Zones do not have same supported AP firmware available for upgrade/downgrade.

4. Click **Yes**, and a confirmation message is displayed stating that the firmware version was updated successfully.

NOTE

If any zone fails to upgrade, a dialog box displays to download an error CSV list.

5. Click **OK**. You have completed changing the AP firmware version of the zone.

Switching Over Clusters

Switchover helps move individual switches or switches in a switch groups across clusters.

NOTE

Ensure that a switch registration rule is created on the target cluster before switching over to another cluster. For more information, refer to the topic "Creating Switch Registration Rules" in the *RUCKUS SmartZone Switch Management Guide*.

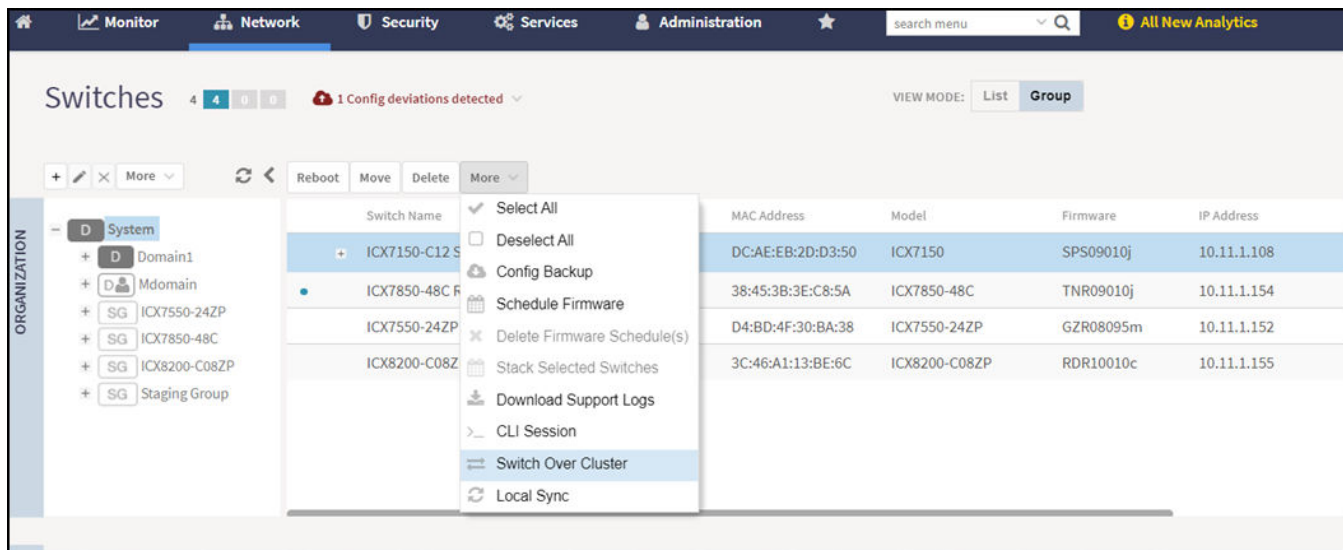

NOTE

Depending on the switch High Availability license on the standby cluster switches must be approved so that it can be discovered and monitored by the controller. For more information, refer to the topic "Approving Switches" in the *RUCKUS SmartZone Switch Management Guide*.

Complete the following steps to switch over from one cluster to another.

1. On the menu, click **Network > Switches > Switches** to display the **Switches** window.
2. From the system tree, select a **Domain > Switch Group** or **Switch Group** and select the **Switch**.

FIGURE 8 Switch Over Cluster

3. Click **More**. Select **Switch Over Cluster** from the list.
The **Switch Over Cluster** dialog box is displayed.
4. In the **Control IP** field, enter the control IP address of the switchover target cluster.
5. Click **OK**. A **Confirmation** dialog box is displayed.
6. Click **YES** to confirm.

Band Balancing

Band balancing balances the client load on radios by distributing clients between the 2.4-GHz and 5-GHz radios.

Band balancing is enabled by default and set to a target of 25 percent of clients connecting to the 2.4-GHz band. You must enable this setting in the advanced option that comes under zone configuration. To balance the load on a radio, the AP encourages dual-band clients to connect to the 5-GHz band when the configured percentage threshold is reached. To turn-off the band balancing, go to the advanced option in WLAN configuration.

FIGURE 9 Load Balancing

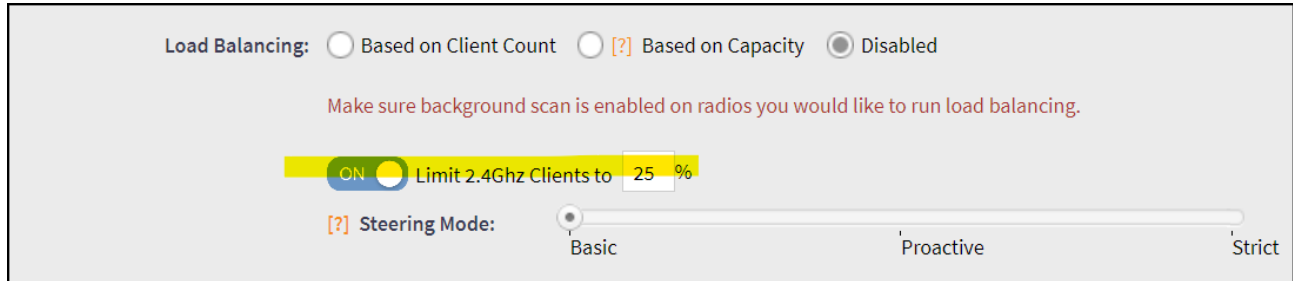

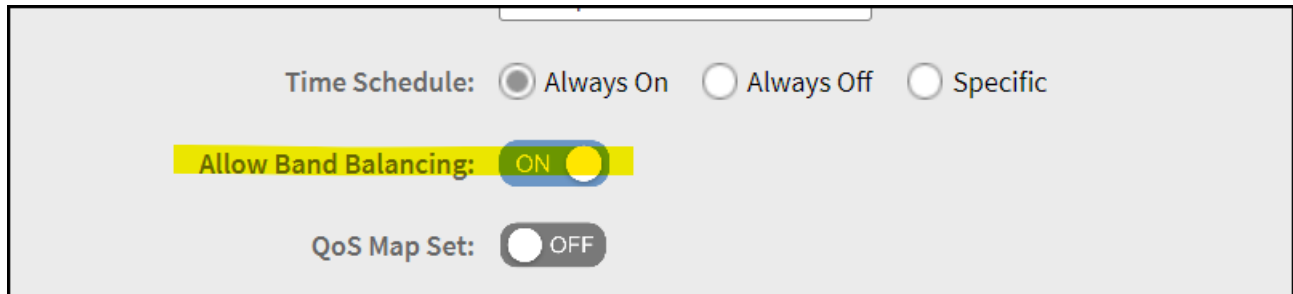

FIGURE 10 Band Balancing

Mobility Domain ID

A Mobility Domain ID is used by 802.11r to define a scope of the network in which an 11r fast roaming is supported. Master keys are shared within the Mobility Domain, allowing clients to support fast roaming.

Bypassing Apple CNA

Some Apple iOS and OS X clients include Captive Network Assistant (CNA), which allows clients to connect to an open captive portal WLAN without displaying the login page.

When a client connects to a wireless network, the CNA launches a pre-browser login utility and it sends a request to a success page on the Apple® website. If the success page is returned, the device assumes it has network connectivity and no action is taken. However, this login utility is not a fully functional browser, and does not support HTML, HTML5, PHP, or other embedded video. In some situations, the ability to skip the login page for open WLANs is a benefit. However, for other guest or public access designs, the lack of ability to control the entire web authentication process is not desirable.

The controller provides an option to work around Apple CNA if it is not desirable for your specific deployment. With CNA bypass enabled, captive portal (web-based authentication) login must be performed by opening a browser to any unauthenticated page (HTTP) to get redirected to the login page.

Band or Spectrum Configuration

Band or spectrum configuration is a method of statistically picking the most potent channel for an AP.

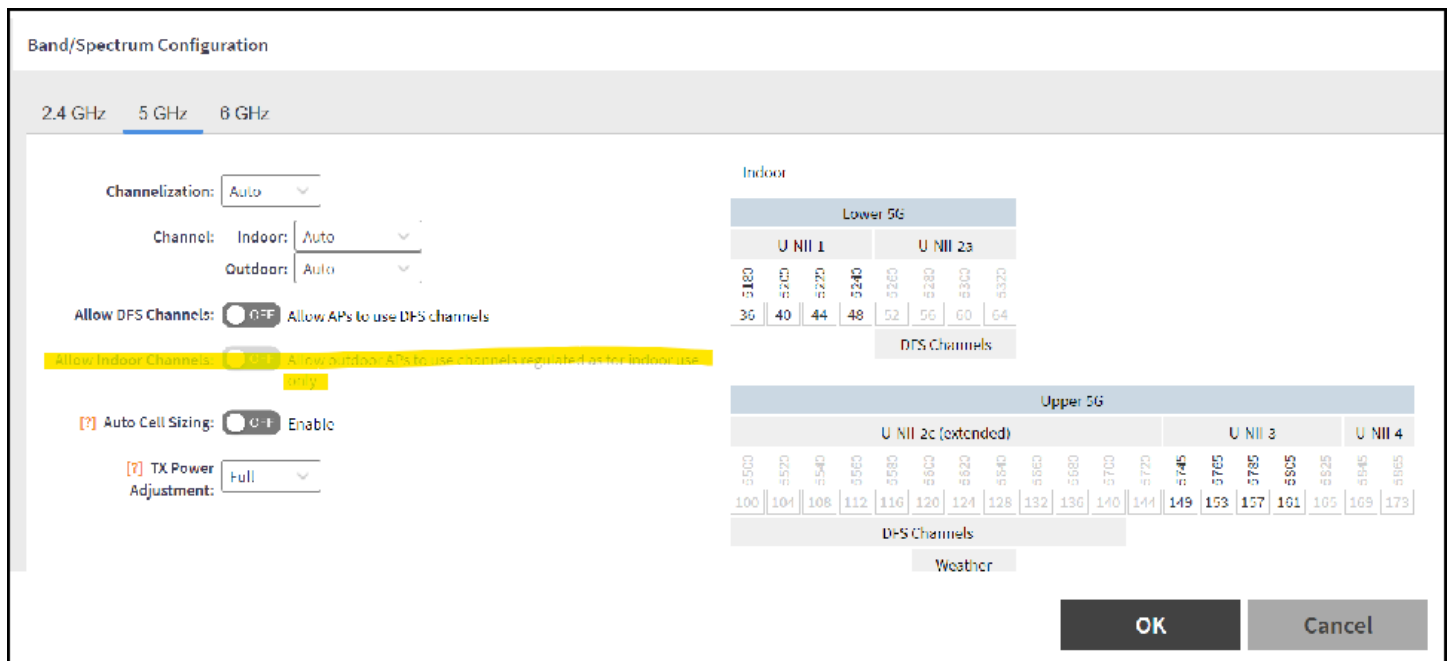

NOTE

This feature is applicable only for SZ300 and vSZ-H platforms.

Some countries restrict certain 5-GHz channels to indoor use only. For instance, Germany restricts channels in the 5.15-GHz to 5.25-GHz band to indoor use. When ZoneFlex Outdoor APs and Bridges with 5-GHz radios (ZoneFlex 7762, 7762-S, 7762-T, 7761-CM, and 7731) are set to a country code where these restrictions apply, the AP or Bridge can no longer be set to an indoor-only channel and will no longer select from amongst a channel set that includes these indoor-only channels when SmartSelect or Auto Channel selection is used, unless the administrator configures the AP to allow use of these channels.

For instance, if the AP is installed in a challenging indoor environment (such as a warehouse), the administrator may want to allow the AP to use an indoor-only channel. These channels can be enabled for use through the AP CLI or the controller web interface.

FIGURE 11 Band or Spectrum Configuration

Portal-Based WLANs

There are many types of portal-based WLANs and they can be distinguished based on where the user credentials are stored, and where the portal page is hosted.

TABLE 17 Portal-based WLANs

WLAN Type	User Credential	Portal on Which WLAN is Hosted
Guest	Guest passes on the controller	AP
Hotspot (WISPr)	RADIUS server; LDAP/Active Directory from SmartZone 3.2 and later	External portal server or internal portal on the controller
WebAuth	RADIUS/LDAP/Active Directory	AP

WLAN Configuration

Creating a WLAN Configuration

Guest and WebAuth WLAN portals are hosted on the controller AP with limited customization.

WISPr WLANs are usually hosted on external portal servers providing the flexibility to customize. WISPr WLANs allow for sophisticated customization such as providing a customized login page which could include locale information, advertisements and so on.

WISPr WLANs can also be configured to bypass the authentication portal so that if the MAC address of an end user device (used as a credential) is stored on a RADIUS server, there is no need to redirect the end user to the portal server for authentication.

Portal-Based WLANs Characteristics

Portal-based WLANs have the following characteristics:

WebAuth WLANs have the following characteristics:

- Does not provide an option to modify the portal (WYSIWYG)
- Handles user authentication by the RADIUS server, LDAP, and Active Directory
- Allows redirecting of user web pages

Guest WLANs have the following characteristics:

- Provides an option to modify the portal elements such as the logo, Terms and Conditions, title, and so on
- Handles user authentication by using guest passphrases (or selecting the **Always Accepted** option)
- Allows redirecting of user web pages
- Does not possess a local database, LDAP, Active Directory, or RADIUS server

Hotspot (WISPr) WLANs (Internal Portal) have the following characteristics:

- Internal Portal
 - Provides an option to modify the portal elements such as the logo, Terms and Conditions, title, and so on
 - Handles user authentication by the local database, LDAP, Active Directory, RADIUS server (or selecting the **Always Accepted** option)
 - Allows redirecting user web pages
 - Supports the Walled Garden approach to allow user access to specific areas within the network
- Hotspot (WISPr) WLANs (External Portal) have the following characteristics:
 - Allows customization of the portal pages through external services
 - Supports Northbound Portal Interface for authentication
 - Handles user authentication by the local database, LDAP, Active Directory, RADIUS server (or selecting the **Always Accepted** option)
 - Allows redirecting of user web pages
 - Supports the Walled Garden approach to allow user access to specific areas within the network

Multicast Rate Filter

All the controller managed APs support this feature. The GUI for rate limit control is designed as:

- **FIGURE 12** Multicast Rate Limiting

Configuring the Multicast rate limit

- Multicast Downlink/Uplink Rate Limit should be configured at WLAN level.
- Multicast Rate Limit and Drop Multicast/Broadcast Traffic from Associated Wireless Clients are mutually exclusive feature.

- Multicast UL/DL values should be shown only if Multicast Rate limit is enabled.
- Downlink value default is up to 6 mbps. The range of multicast values depends on the BSS minimum rate selection in the wlan and a maximum of half of the BSS minimum rate.
- SSID Rate Limit will always take precedence if Multicast Rate Limit is also configured.

Add Multicast Rate Limiting Uplink and Downlink Fields in Advanced Option of WLAN

FIGURE 13 Configuring the Multicast Rate Limit

Advanced Options			
User Traffic Profile	System Default	Inactivity Timeout	120 seconds
L2 Access Control	Disabled	Client Fingerprinting	Enabled
OS Policy	Disabled	OFDM Only	Disabled
Application Recognition & Control	Disabled	BSS Min Rate	Default
URL Filtering Profile	Disabled	Mgmt Tx Rate	2mbps
Access VLAN	1	Time Schedule	Always On
Hide SSID	Disabled	Band Balancing	Enabled
Client Load Balancing	Enabled	QoS Map Set	Enabled
Proxy ARP	Disabled	Precedence Profile	System Default
ND Proxy	Disabled	DNS Server Profile	Disabled
RA Proxy	Disabled	DNS Spoofing Profile	Disabled
Uplink Limit (mbps)	0	Multicast Uplink Limit (mbps)	20
Downlink Limit (mbps)	0	Multicast Downlink Limit (mbps)	50
Max Clients	100	Wi-Fi Calling profile	Disabled
802.11d	Enabled	CALEA	Disabled
802.11k Neighbor Report	Enabled	Venue Code	Disabled
Force DHCP	Disabled	Client Flow Data Logging	Disabled
DHCP Option 82	Disabled	Airtime Decongestion	Disabled
DTIM Interval	1	Transient Client Management	Disabled
Directed MC/BC Threshold	5	Optimized Connectivity Experience(OCE)	Disabled
Client TX/RX Statistics	Disabled		

User can check multicast uplink and downlink fields in WLAN preview.

WLAN Configuration

Creating a WLAN Configuration

FIGURE 14 WLAN Preview

The screenshot displays the WLAN Configuration interface with the following settings:

- OFDM Only: OFF
- * [?] BSS Min Rate: 24 mbps
- Mgmt Tx Rate: 24 mbps
- * Time Schedule: Always On Always Off Specific
- Band Balancing: Disable band balancing for this WLAN service
- QoS Map Set: OFF
- Multicast Filter: OFF Drop the broadcast/multicast packets from associated clients.
- [?] SSID Rate Limiting: Uplink: OFF 0 mbps (1-200) Downlink: OFF 0 mbps (1-200) **Rate limiting in user traffic profile will not work if SSID rate limiting is enabled.**
- [?] Multicast Rate Limiting: Uplink: ON 6 mbps (1-100) Downlink: ON 6 mbps (1-12) **Multicast rate limiting and Multicast Filter are mutually exclusive feature. SSID rate limiting will always take precedence if Multicast rate limiting is also configured. Multicast downlink rate limiting should not greater than 50% of BSS min rate.**
- DNS Server Profile: Disable
- DNS Spoofing Profile: Disable
- Precedence Profile: System Default
- [?] CALEA: OFF
- Venue Code: OFF
- Client Flow Data Logging: OFF
- Airtime Decongestion: OFF
- * Join RSSI threshold: OFF 0 dBm (-60 to -90)
- Transient Client Management: OFF
- Optimized Connectivity Experience(OCE): OFF

Transient Client Management

Transient Client Management allows only those clients that stay within the coverage region of the AP for a minimum period of time to associate with the AP and use the network service. For example, in a train station or downtown area, there may be passersby who do not intend to connect and utilize the network service. However, their Wi-Fi devices may conduct an active/passive scanning and may be roaming from cellular to Wi-Fi, from one Wi-Fi AP to another Wi-Fi AP, or from Wi-Fi to cellular, which could compromise the experience of users who are connected and using the network service. First-time client association may be delayed.

Transient Client Management uses statistical methods to delay the association of transient clients to an AP. Venue administrators will be able to tune configuration parameters based on typical observed dwell times and RSSI of transient clients. Transient Client Management delivers efficient airtime utilization and minimizes cellular-to-Wi-Fi handoffs and AP-to-AP roaming of transient clients.

Optimized Connectivity Experience

Optimized Connectivity Experience (OCE) delivers a better overall connectivity experience by enabling probe response suppression and by preventing devices with marginal connectivity to join the network.

When OCE is enabled, the affected APs and stations are excluded from Airtime Decongestion and Transient Client Management, resulting in reduction in probe response. Probe response suppression optimizes airtime for data traffic. OCE solves connectivity issues by rejecting any association with clients with poor signals.

VIDEO

Optimized Connectivity Experience. This video provides a brief overview of Optimized Connectivity Experience.
[Click to play video in full screen mode.](#)

Fast Initial Link Setup (FILS)

Enable Fast Initial Link Setup (FILS) for 802.1X EAP WLAN and select the realm-based AAA configuration and DHCP server IP address.

Combines the authentication, authorization, and DHCP to reduce EAP frames and skip EAPOL 4-way handshake when station reconnects or roams. It requires AAA to support Higher Layer Protocol (HLP) and EAP-RP. The DHCP server requires the Rapid commit. The following WLAN feature combinations are supported by FILS:

- 802.1x(FILS) + WISPr
- 802.1x(FILS) + MAC Auth
- 802.1x(FILS) + 802.11w
- 802.1x(FILS) + FT

NOTE

FILS provides MAC support. When FILS is enabled, the DHCP Rapid Commit Proxy is also enabled by default. However, it is hidden in the screen.

Create Fast Initial Link Setup (FILS) Realm Profile

Complete the following steps to create Fast Initial Link Setup (FILS) Realm Profile.

1. Go to **Security > Authentication > FILS Realm Proxy**.

This displays **Create FILS Realm Profile** screen.

2. In the **Create FILS Realm Profile** screen, enter the following details:

- Name: Name the profile.
- Description: Short description for the profile.
- Realms: Name the Realm and click **Add**.

The Realm Name is displayed below.

- Click **Ok**.

The new profile is displayed in the **FILS Realm Profile** screen.

NOTE

The **FILS Realm Profile** can be created from the **Fast Initial Link Setup** by clicking + corresponding to the **Realm Profile**.

Configuring Traffic Analysis Display for WLANs

Using traffic analysis you can measure the total volume of traffic sent or received by WLANs.

You can view historical and real-time data of the WLANs. Throughput and the number of clients connected to the WLANs are displayed in a bar chart. You must configure the WLAN settings to view its traffic analysis.

WLAN Configuration

Creating a WLAN Configuration

Complete the following steps to configure the WLAN settings.

1. From the WLAN area, click settings .

The WLAN settings form displays.

FIGURE 15 WLAN Settings Form

2. In the **Show top** box, enter the number of WLANs for which the traffic must be analyzed. Range: 5 through 20.
3. Select the **Type** radio button for the type of display you want to view. The choices are **Chart** or **Table**.
4. Select the **WLAN** identification option to be displayed. The choices are **Name** or **SSID**.
5. Click **OK**.

Working with Time Schedule Profiles

A **Time Schedule** profile specifies the hours of the day or week during which a WLAN service is enabled or disabled.

For example, a WLAN for student use at a school can be configured to provide wireless access only during school hours. This example involves creating a time schedule profile, and when configuring a WLAN, selecting the schedule profile to enable or disable the WLAN service during those days and hours.

NOTE

Creating a Time Schedule profile will not work properly if the system does not have the correct time. To ensure that the system always maintains the correct time, configure an NTP server and point the system to the IP address of the NTP server.

NOTE

When configuring the WLAN time schedule, all times are based on the time zone setting of your browser. If your browser and the target AP and WLAN are in different time zones, configure the on and off times according to the desired schedule according to your local browser. For example, if you want a WLAN in Los Angeles to turn on at 9 AM and your browser is set to New York time, configure the WLAN time schedule to enable the WLAN at noon.

Creating a Time Schedule Profile

Complete the following steps to create a Time schedule profile.

1. From the main menu, go to **Network > Wireless > Wireless LANS**, and select a WLAN.
2. Click **Configure**. The **Edit WLAN Configuration** dialog box is displayed.

3. Go to **Advanced Options**.
4. For **Time Schedule**, select **Specific**.

NOTE

By default, **Always On** is selected.

5. Click **Create (+)**. The **Create Time Based Access Table** dialog box is displayed.
6. In the **General Options**, enter the schedule name and schedule description.
7. In the **Schedule Table**, create a WLAN schedule profile for the selected wireless LAN.
8. To create the time-based access table for a WLAN, perform the following actions:
 - To enable or disable the WLAN for an entire day, click the day of the week under the **Time** column.
 - To enable or disable the WLAN for specific hour of a specific day, select the squares in the table. A single square represents 30 minutes (two 15-minute blocks).

Blue-colored cells indicate the hours when the WLAN is enabled. Clear (or white) cells indicate the hours when the WLAN is disabled.
9. Click **Ok**. The schedule is submitted and the schedule name is displayed.

Quality of Service (QoS)

Quality of Service (QoS) classifies each traffic type entering a device into access category (Voice, Video, Best Effort or Background) and treats it with the priorities assigned to that access category.

NOTE

The order of precedence applied for QoS priority is Application Recognition and Control (ARC) (app-specific QoS) > QoS Map Set > SmartCast > MSCS > RUCKUS Unilateral. The ARC, QoS Map Set, and RUCKUS Unilateral features apply only when they are enabled. The SmartCast and MSCS features are enabled by default.

RUCKUS SmartCast™

RUCKUS SmartCast™ is a Quality of Service (QoS) engine that provides QoS classification and directed multicast features to maximize the reliability and performance of delay-sensitive applications, such as IP-based voice and video over 802.11 networks.

SmartCast provides packet inspection, automatic traffic classification, prioritization, advanced queuing, and scheduling.

Comprising the IEEE 802.11e/WMM hardware-based queuing standard, SmartCast is enabled by default on every RUCKUS access point and requires no GUI configuration.

Quality of Service (QoS) Mapping

When the QoS Map Set feature is enabled, the AP maps the DSCP of each packet to the user priority TID automatically before sending the packet to the wireless client. Beginning with release 7.0, SmartCast supports all 64 DSCP values and all 8 TID values (0-8), ensuring application of the appropriate access category queue (best effort, background, video, or voice) to each packet. The following table depicts how SmartCast handles DSCP to TID mapping.

WLAN Configuration

Creating a WLAN Configuration

TABLE 18 DSCP to TID Mapping

SmartCast (for SmartZone release until 6.1.2)				SmartCast (for SmartZone release 7.0 and onward)			
Access Category	ToS (Hexadecimal)	DSCP (Decimal)	TID/UP	Access Category	ToS (Hexadecimal)	DSCP (Decimal)	TID/UP
Voice	0xE0	56	6				
Voice	0xC0	48	6	Voice	0xC0 to 0xFC	48 to 63	7
Voice	0xB8	46	6	Voice	0xA8 to 0xBC	42 to 47	6
Video	0xA0	40	5	Video	0xA0 to 0xA4	40 to 41	5
Video	0x80	32	5	Video	0x5C to 0x9C	23 to 39	4
Best Effort (Data)	0x60	24	0	Background	0x44 to 0x40	17 to 22	3
Background	0x40	16	1	Best Effort (Data)	0x24 to 0x40	9 to 16	0
Background	0x20	8	1	Background	0x4 to 0x20	1 to 8	1
Best Effort (Data)	0x00	0	0	Best Effort (Data)	0x0	0	0

Quality of Service (QoS) Mirroring

The Quality of Service (QoS) Mirroring feature enables the AP to apply identical traffic priorities (Voice, Video, Best Effort or Background) to downlink flows so that they correspond to their respective uplink flows. Due to either deliberate or unintentional factors, downlink packets frequently lack priority markings. With QoS Mirroring, the AP gives precedence to real-time flows, such as voice, video conferencing, and gaming, over asynchronous flows like file downloads and movie streaming, in accordance with the associated upstream traffic flows within the WLAN.

The following QoS mirroring modes are implemented:

- Mirrored Stream Classification Service (MSCS) implemented as per IEEE standards
- RUCKUS Unilateral QoS mirroring implemented as a RUCKUS Proprietary

Mirrored Stream Classification Service

The Mirrored Stream Classification Service (MSCS) is a WI-FI CERTIFIED QoS Management™ technology that allows each client device to request the AP to assign priorities to specified downlink traffic flows, aligning the priorities with what the client initially assigned to the corresponding uplink traffic flows. In this operational mode, the client prompts the AP to initiate mirroring by sending the AP an MSCS request.

The AP performs QoS treatment for certain uplink IP flows that results in reduced latency and a better end-user experience with real-time applications. For example, a client can request that gaming traffic has a higher priority on the network than other traffic associated with watching streaming content or browsing the web. Even if there are other clients using the same network to the maximum, the game traffic is given the highest priority, resulting in reduced latency and a better gaming experience.

MSCS begins only when the downlink packet from the server is tagged as differentiated services code point (DSCP) 0x00 (in other words, the packet is not classified). The client devices use a dedicated frame exchange to trigger the MSCS process. The MSCS functionality works only for client devices that support MSCS.

RUCKUS Unilateral Mirroring

Unilateral Mirroring is an exclusive RUCKUS feature that provides QoS mirroring without requiring signaling between the AP and the client, extending the advantages of mirroring to legacy clients that lack support for MSCS. When QoS Mirroring is enabled for all clients, the AP automatically assigns an equivalent priority to each downlink flow for a legacy client, mirroring each of its flow with the priority of its corresponding uplink flow. Clients with MSCS support explicitly initiate mirroring by sending an MSCS request to the AP.

The Unilateral mirroring feature mirrors the downlink user priority (UP) or traffic identifier (TID) corresponding to its uplink UP/TID, and the AP does not expect any request from the station (STA). The AP mirrors uplink UP/TID to downlink UP/TID when the downlink packets from the server are

DSCP 0x00. The client devices do not use a dedicated frame exchange to trigger the Unilateral QoS process. This mode supports both MSCS clients and non-MSCS clients.

Wi-Fi 6 or Wi-Fi 7 Support

The Wi-Fi 6/7 feature controls how the Wi-6/7 AP radios operate to support clients of various capabilities on a specific WLAN.

When the Wi-Fi 6/7 option is enabled on the WLAN (default setting), the Wi-Fi 6/7 AP radios operate in their normal Wi-Fi 6 or Wi-Fi 7 modes. Wi-Fi 6/7 features (such as OFDMA, TWT, 6GHz operation, Preamble Puncturing, 320MHz bandwidth, and MLO) are available to all client devices that support Wi-Fi 6/7. However, legacy Wi-Fi 5 client devices that have outdated or problematic drivers cannot interoperate with the Wi-Fi 6/7 APs.

When the Wi-Fi 6/7 option is disabled on the WLAN, then all Wi-Fi 6/7 AP radios are downgraded to operate in accordance with legacy Wi-Fi 4 and Wi-Fi 5 standards. The Wi-Fi 6/7 features are no longer available to any clients on the network. However, legacy Wi-Fi 5 client devices that have outdated or problematic drivers can interoperate with the Wi-Fi 6/7 APs.

You may configure multiple WLANs on an AP. So you could have one WLAN that supports Wi-Fi 6/7 clients and another WLAN that supports legacy clients. [Table 19](#) provides a side-by-side comparison of the Wi-Fi standards version supported by each radio band, based on the Wi-Fi 6/7 option setting.

TABLE 19 Wi-Fi and Radio Support Matrix

Radio	Wi-Fi 7 AP		Wi-Fi 6E AP		Wi-Fi 6 AP	
Wi-Fi 6/7 option	On	Off	On	Off	On	Off
2.4 GHz	Wi-Fi 7	Wi-Fi 4	Wi-Fi 6	Wi-Fi 4	Wi-Fi 6	Wi-Fi 4
5 GHz	Wi-Fi 7	Wi-Fi 5	Wi-Fi 6	Wi-Fi 5	Wi-Fi 6	Wi-Fi 5
6 GHz	Wi-Fi 7	OFF	Wi-Fi 6E	OFF	N/A	N/A

Working with WLAN Templates

You can create, configure, and clone a WLAN template.

To view details about a WLAN template, go to **Administration > System > Templates > WLAN Templates** and click a zone. The respective contextual tabs are displayed at the bottom of the page.

TABLE 20 WLAN Templates: Contextual Tabs

Tab	Description
General	Displays details of the respective WLAN template.
WLAN	Displays details of the respective WLAN. You can create or configure a WLAN. Refer to <i>Creating a WLAN Configuration</i> .
Hotspots and Portals	Displays details of the respective hotspots and portals. Refer to <i>Working with Hotspots and Portals</i> .
Access Control	Displays details of the respective access control. Refer to <i>Configuring Access Control</i> .
Authentication and Accounting	Displays details of the respective authentication and accounting servers. Refer to <i>Authentication and Accounting</i> respectively.
Tunnels & Ports	Displays details of the respective tunnels and ports. Refer to <i>Working with Tunnels and Ports</i> .
Radius	Displays details of the respective VSA profiles. You can create or configure a VSA profile. Refer to <i>Creating a Vendor-Specific Attribute Profile</i> .

Creating WLAN Templates

To create a WLAN template:

1. Go to **Administration > System > Templates > WLAN Templates**.
2. Click **Create**, the Create WLAN Template form is displayed.
3. Enter a **Template Name**.
4. Enter a **Description**.
5. Select the **Template Firmware**.
6. Choose the **AP IP Mode**.
7. Select **AP SoftGRE Tunnel** to enable all WLANs defined in this template to tunnel traffic to SoftGRE through the AP.
8. Click **OK**.

NOTE

You can select a WLAN and edit, clone or delete its template by selecting the options **Configure**, **Clone** or **Delete** respectively.

Applying a WLAN Template

You can apply the WLAN template to zones where the AP's firmware version is later than the Zone templates firmware version. An unsupported firmware version of the WLAN template is automatically upgraded to its next version before being upgraded to the current version.

To Apply a WLAN template to a zone:

1. Go to **Administration > System > Templates > WLAN Templates**.
2. From the list, select the WLAN template that you want to apply and click **Apply**. The Apply WLAN Template to selected zones form appears.
3. From **Available AP Zones**, select the required zone and click the  Move button.
4. Click **Next**, the **Apply WLAN template to selected zones** form appears.
5. Select the required options:
 - Create all WLANs and WLAN profiles from the template if they don't already exist in the target zone(s)
 - If the target zone(s) has WLANs or WLAN profile with the same name as the template, overwrite current settings with settings from the template.
6. Click **OK**, you have applied the template to the zone.

How Dynamic VLAN Works

Dynamic VLAN can be used to automatically and dynamically assign wireless clients to different VLANs based on RADIUS attributes. The maximum number of VLANs supported in Dynamic VLAN per 11ax Virtual AP (VAP) is increased to 128 VLANs.

Dynamic VLAN Requirements:

- A RADIUS server must have already been added to the controller
- WLAN authentication method must be set to 802.1X, MAC address or 802.1X + MAC address

To enable Dynamic VLAN for a WLAN:

1. Go to **Network > Wireless > Wireless LANs**.
2. Click **Configure** for the WLAN you want to configure.
3. In **Authentication Server**, select the AAA profile.
4. Expand the **Advanced Settings** section and click the **Enable Dynamic VLAN box** next to Access VLAN.
5. Click **OK** to save your changes.

FIGURE 16 Enabling Dynamic VLAN

How It Works

- User associates with a WLAN on which Dynamic VLAN has been enabled.
- The AP requires the user to authenticate with the RADIUS server.
- When the user completes the authentication process, the AP will approve the user along with the VLAN ID that has been assigned to the user on the RADIUS server.
- User joins the AP and is segmented to the VLAN ID that has been assigned to him.

Required RADIUS Attributes

For dynamic VLAN to work, you must configure the following RADIUS attributes for each user:

- **Tunnel-Type:** Set this attribute to VLAN.
- **Tunnel-Medium-Type:** Set this attribute to IEEE-802.
- **Tunnel-Private-Group-ID:** Set this attribute to the VLAN ID to which you want to segment this user.

Depending on your RADIUS setup, you may also need to include the user name or the MAC address of the wireless device that the user will be using to associate with the AP. The following table lists the RADIUS user attributes related to dynamic VLAN.

WLAN Configuration

How Dynamic VLAN Works

TABLE 21 RADIUS user attributes related to dynamic VLAN

Attribute	Type ID	Expected Value (Numerical)
Tunnel-Type	64	VLAN (13)
Tunnel-Medium-Type	65	802 (6)
Tunnel-Private-Group-Id	81	VLAN ID

Here is an example of the required attributes for three users as defined on Free RADIUS:

```
0018ded90ef3
  User-Name = user1,
  Tunnel-Type = VLAN,
  Tunnel-Medium-Type = IEEE-802,
  Tunnel-Private-Group-ID = 0014
00242b752ec4
  User-Name = user2,
  Tunnel-Type = VLAN,
  Tunnel-Medium-Type = IEEE-802,
  Tunnel-Private-Group-ID = 0012
013469acee5
  User-Name = user3,
  Tunnel-Type = VLAN,
  Tunnel-Medium-Type = IEEE-802,
  Tunnel-Private-Group-ID = 0012
```

NOTE

The values in bold are the users' MAC addresses.

Bonjour

- [Bonjour Gateway](#)..... 135
- [Bonjour Fencing](#)..... 137

Bonjour is the Apple implementation of a zero-configuration networking protocol for Apple devices over IP. Bonjour allows OS X and iOS devices to locate other devices such as printers, file servers, and other clients on the same broadcast domain and use the services offered without any network configuration required.

Multicast applications such as Bonjour require special consideration when being deployed over wireless networks. Bonjour only works within a single broadcast domain, which is usually a small area. This is by design to prevent flooding a large network with multicast traffic. However, in some situations, you may want to offer Bonjour services from one VLAN to another.

The controller provides two features for controlling how and where Bonjour services are available to clients:

- [Bonjour Gateway](#) on page 135: Bridges Bonjour services from one VLAN to another.
- [Bonjour Fencing](#) on page 137: Limits the range in physical space at which Bonjour services are available to clients.

Bonjour Gateway

Bonjour Gateway policies enable APs to provide Bonjour services across VLANs.

Bonjour Gateway on the controller provides an multicast DNS (mDNS) proxy service configurable from the web interface to allow administrators to specify which types of Bonjour services can be accessed from and to which VLANs.

For the Bonjour Gateway to function, the following network configuration requirements must be met:

- The target networks must be segmented into VLANs.
- VLANs must be mapped to different SSIDs.
- The controller must be connected to a VLAN trunk port.

Additionally, if the VLANs to be bridged by the Bonjour Gateway are on separate subnets, the network must be configured to route traffic between them.

Creating Bonjour Gateway Policies

A Bonjour Gateway policy must be created for an AP zone before the policy can be deployed to an AP or group of APs.

Complete the following steps to create a Bonjour Gateway policy.

1. From the main menu, go to **Services > Others > Bonjour > Gateway**.
2. Select the zone for which you want to create the policy.
3. Select the **Enable Bonjour gateway on the AP** option.

4. Click **Create**.

The **Create Bonjour Policy** dialog box is displayed.

FIGURE 17 Creating a Bonjour Gateway Policy

Priority	Bridge Service	From VLAN	To VLAN	Notes
----------	----------------	-----------	---------	-------

5. Configure the following options:

- **Name:** Enter a name for the policy.
- **Description:** Enter a description for the policy.
- **Rules:** Create the policy rule by configuring the following

6. Under **Rules**, click **Create**. The **Create Bonjour Policy Rule** dialog box is displayed.

7. Configure the following options:

- **Bridge Service:** Select the Bonjour service from the list.
- **From VLAN:** Select the VLAN from which the Bonjour service will be advertised.
- **To VLAN:** Select the VLAN to which the service will be made available.

NOTE

Add optional notes for this rule.

8. Click **OK**.

9. Click **OK** to save your Bonjour policy rule.

You have created a Bonjour policy with a rule.

NOTE

You can also edit, clone, and delete the policy by selecting the **Configure**, **Clone**, and **Delete** respectively, from the **Gateway** tab.

You may now continue to apply this Bonjour Gateway policy to an AP or AP group, as described in [Applying a Bonjour Gateway Policy to an Individual AP](#) on page 137.

Applying a Bonjour Gateway Policy to an Individual AP

Once a Bonjour Gateway policy is created, you can select which AP will serve as the gateway for Bonjour services.

Complete the following steps to apply a Bonjour Gateway policy to an AP.

1. From the main menu, go to **Network > Wireless > Access Points**.
2. Select the AP that you want to configure from the zone in which the AP exists.
3. Click **Configure**.
4. Go to **Advanced Options**
5. Under **Bonjour Gateway**, select the check box next to **Enable as Bonjour Gateway with policy**, and select the policy you created from the list.
6. Click **OK** to save your changes.

Bonjour Fencing

Bonjour Fencing provides a mechanism to limit the scope of Bonjour (mDNS) service discovery in the physical and spatial domain.

While Bonjour Fencing is related to Bonjour Gateway, they are designed for different purposes. Bonjour Gateway bridges mDNS services across VLANs, and is useful because mDNS or Bonjour packets are restricted to the same VLAN or subnet and cannot be routed to other VLANs. Bonjour Fencing limits the range of Bonjour service discovery within a physical space, which is useful because logical network boundaries (for example, VLANs) do not always correlate well to physical boundaries within a building or floor.

The following considerations should be taken into account before deploying Bonjour Fencing policies:

- Bonjour Fencing is not supported on Mesh APs.
- Switch interfaces to which APs are connected must be configured in VLAN trunk mode so that Bonjour traffic gets forwarded across VLANs based on Bonjour Gateway policies.
- Bonjour Fencing is implemented at the AP, not at the controller.
- Fencing policies can be applied on a zone level only, and cannot be configured per AP group.
- For a wired fencing policy to work properly, wireless fencing for the same mDNS service must also be enabled. If wired fencing is enabled but wireless is disabled, APs that are not the "closest AP" will be unable to determine whether the source of the mDNS advertisement is wired or wireless.
- Bonjour Fencing works for local breakout scenarios, but does not work for tunnel-based configuration. (This feature is supported only for SZ300 controllers)

NOTE

If hop 0 and hop 1 service records come in the same packet from a Bonjour server, the AP will always give priority to the hop 1 service record. Because tagging occurs for hop1 service, hop 0 service can also be discovered by Bonjour clients.

Creating Bonjour Fencing Policies

Bonjour Fencing policies can be created and applied to a zone at the same time using the **Fencing** tab on the **Services > Bonjour** page.

NOTE

Bonjour Fencing for a particular service does not work if another service from the same server, which is not fenced, is enabled simultaneously.

Bonjour
Bonjour Fencing

Complete the following steps to create a Bonjour Fencing policy.

1. From the main menu, go to **Services > Others > Bonjour > Fencing**.
2. Select the zone for which you want to create the policy.
3. Click **Create**.

The **Create Bonjour Fencing Policy** dialog box is displayed.

FIGURE 18 Creating a Bonjour Fencing Policy

Create Bonjour Fencing Policy

Name:

Description:

Fencing Rule ▼

+ Create **Configure** **Delete**

Device Type	Device MAC	Closest AP	Service	Fencing Range	Description
Wireless	N/A	N/A	Other (asdsds)	Same AP	N/A

Custom Services Mapping ▼

+ Create **Configure** **Delete**

Service	Custom String List
AirPlay	"_sdsd__tcp."

OK **Cancel**

4. Configure the following options:
 - **Name:** Enter a name for the policy.
 - **Description:** Type a description for the policy.
 - **Fencing Rule:** Create the policy rule by configuring the following:

- Under **Fencing Rule**, click **Create**. The **Fencing Rule** dialog box is displayed.

FIGURE 19 Creating a Fencing Rule

The screenshot shows a 'Fencing Rule' dialog box with the following fields and options:

- Device Type:** Wired (dropdown)
- Closest AP:** No data available (dropdown)
- Service:** Other (dropdown)
- Custom Service Name:** (text input)
- Fencing Range:** Same AP (dropdown)
- Description:** (text input)
- Device MAC:** * MAC (text input) with + Add, X Cancel, and Delete buttons.

At the bottom of the dialog are two large buttons: **OK** and **Cancel**.

- Configure the following options:
 - Device Type:** Select **Wireless** or **Wired** network connection method for the device advertising Bonjour services.
 - Closest AP:** Select the closest AP to create a physical anchor point for fencing; the closest AP is auto-detected for wireless devices, based on the AP association.
 - Service:** Select one of the Bonjour services from the list. In SmartZone 5.0, two new services, **Chromecast** and **Other** were added. Chromecast behaves as the standard service. If you select **Other**, the custom service name that is used for service mapping is displayed. Regardless of the selected device type, only three services with the same custom service name can be created.
 - Custom Service Name:** Enter a name for mapping services other than the custom services regardless of the device type. You can create a maximum of three services with the same custom service name.
 - Fencing Range:** Select Same AP or 1-Hop AP Neighbors as the fencing range.
 - Description:** Enter any description you may have for the fencing rule.
 - Device MAC:** Enter the MAC address of the device advertising Bonjour services. This option is available only for the Wired device type; it supports up to four wired MAC addresses.
- Click **OK** to save the Bonjour Fencing rule.

NOTE

Each policy can contain up to 32 rules.

- Under **Custom Services Mapping**, click **Create**.
The **Custom Services Mapping** dialog box is displayed.

FIGURE 20 Creating a Custom Services Mapping

The screenshot shows a dialog box titled "Custom Services Mapping" with a close button (X) in the top right corner. The dialog contains the following fields and controls:

- Service:** A dropdown menu with "Other" selected.
- Custom Service Name:** A dropdown menu with "No data available" selected.
- Custom String List:** A dropdown menu with "Custom String List" selected. To its right are three buttons: "+ Add", "X Cancel", and a trash icon "Delete".
- Below the "Custom String List" dropdown is a large, empty text area labeled "Custom String List".
- At the bottom right of the dialog are two large buttons: "OK" and "Cancel".

- Configure the following options:

- **Service:** Select one of the Bonjour services from the list.

Per Service has only one entry for custom services mapping. For example, **AppleTV** and **Chromecast** have only one entry with custom strings (three at most) and the **Other** type has one entry with custom strings (three at most) because it allows three other rules.

- This field is available only if you select the **Other** option from the **Service** list. **Custom Service Name** lists all the custom service names with the service type **Other** created in the fencing rule.
- **Custom String List:** Enter the name of the string list in the format **_xxxx._xtcp** or **_xxxx._xudp**. You can create only one entry for Custom service and three entries for an **Other** service.

- Click **OK** to save the services mapping policy.

- Click **OK** to save the policy.

NOTE

You can also edit or delete the policy by selecting the **Configure** or **Delete** respectively, from the **Fencing** tab.

Northbound Data Streaming

- [Configuring Northbound Data Streaming Settings.....](#) 141
- [Setting the Northbound Portal Password.....](#) 143

SmartCell Insight (SCI) and other third-party Google Protocol Buffers (GPB) listeners use data from the controller to analyze performance and generate reports about the Wi-Fi network.

Configuring Northbound Data Streaming Settings

Configuring the Northbound Data Streaming settings in the controller enables data transfer from the controller to the Northbound Data Streaming server using the Message Queuing Telemetry Transport (MQTT) protocol.

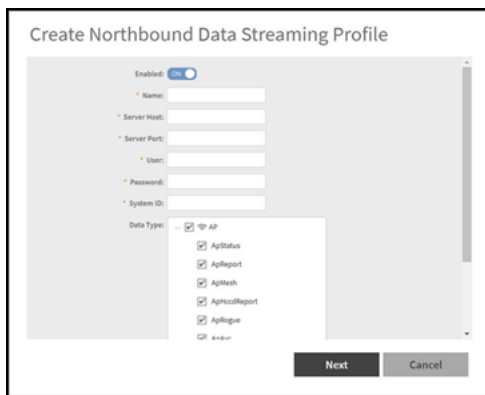

NOTE

You can create a maximum of two SCI profiles simultaneously.

Complete the following steps to configure the Northbound Data Streaming server settings.

1. From the main menu, go to **Administrator > External Services > Northbound Data Streaming**.
2. Click **Create**. The **Create Northbound Data Streaming Profile** dialog box is displayed.

FIGURE 21 Creating a Northbound Data Streaming Profile

Northbound Data Streaming

Configuring Northbound Data Streaming Settings

3. Complete the following options:

- **Enabled:** Set to **ON** to configure the Northbound Data Streaming profile.
- **Name:** Enter the profile name.
- **Server Host:** Enter the IP address of the Northbound Data Streaming host server.

NOTE

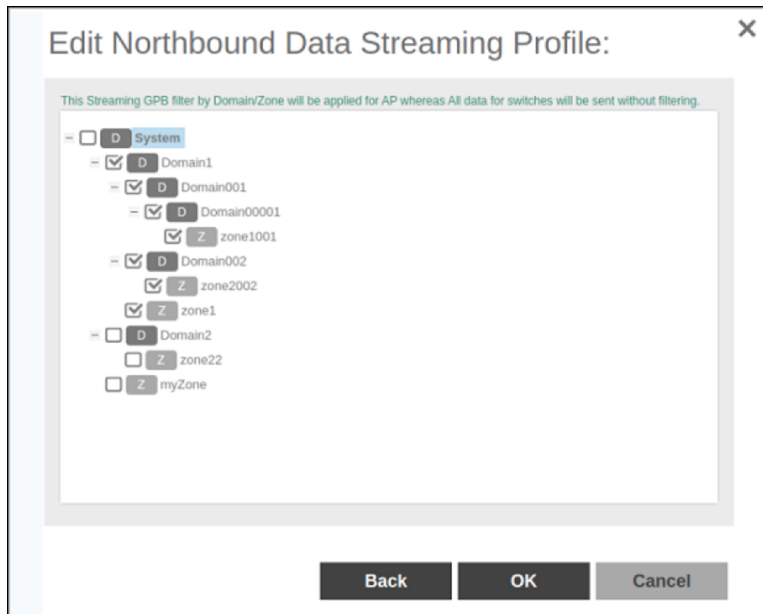

An SCI profile supports only the IPv4 format.

- **Server Port:** Enter the port number using which the Northbound Data Streaming server and the controller can communicate and transfer data. The ports must be allowed on the firewall.
- **User:** Enter the name of the user.
- **Password:** Enter the password for the user.
- **System ID:** Enter the ID of the Northbound Data Streaming system to access.
- **Data Type:** Select the required options for the specific data types that must be sent to the Northbound Data Streaming server from the SCI server.

4. Click **Next**.

5. For APs, from the **System** tree, select the required domain or zone to send KPIs or statistics to the Northbound Data Streaming server. For switches, KPIs or the statistics are sent to SCI or Northbound Data Streaming server without filtering.

FIGURE 22 Selecting the Zone or Domain

6. Click **OK**.

The Northbound Data Streaming profile is listed on the Northbound Data Streaming page.

The **Status** column displays the current connection status of the SCI profile.

NOTE

You can also edit or delete a Northbound Data Streaming profile by selecting the Northbound Data Streaming profile and clicking the **Configure** or **Delete** option.

Setting the Northbound Portal Password

Third-party applications use the northbound portal interface to authenticate users and retrieve user information during the user equipment (UE) association.

Complete the following steps to configure the northbound portal interface.

1. From the main menu, go to **Administrator > External Services > WISPr Northbound Interface**.
2. Set to **ON** to enable the **Enable Northbound Portal Interface Support**.
3. For **User Name**, enter the name of the user.
4. For **Password**, enter the password of the user.
5. Click **OK**.

Dynamic PSK

- [Generating Dynamic PSKs.....](#) 145
- [Importing Dynamic PSKs.....](#) 146
- [Viewing Generated DPSKs.....](#) 148

Dynamic PSKs (DPSKs) are unique PSKs per user or device. You can create or import new DPSKs or view the existing DPSKs on the system.

Generating Dynamic PSKs

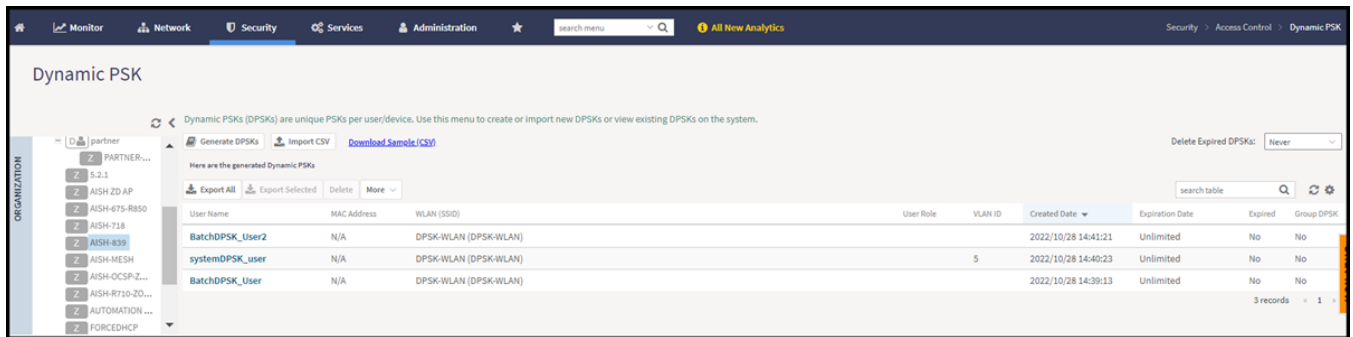

You can generate new dynamic pre-shared keys (PSKs) to secure the Wi-Fi network.

Complete the following steps to generate dynamic PSKs.

1. From the main menu, go to **Security > Access Control > Dynamic PSK**. The **Dynamic PSK** page is displayed.
2. Click **Generate DPSKs**.

The **Generate DPSKs** dialog box is displayed.

FIGURE 23 Dynamic PSK Page

3. Configure the following options:
 - **WLAN:** Select a DPSK-enabled WLAN from the list.
 - **Number of DPSKs:** Enter the number of DPSKs to be created in a zone. A maximum of 500 Unbound or Group DPSKs can be created in one form submission.

There are three types of DPSKs:

 - Unbound DPSK (DPSK not binding to a specific device yet): Once an unbound DPSK is used by a device, it becomes a bound DPSK and releases one slot from the maximum limit of 500.
 - Group DPSK (DPSK that can be shared between devices): A group DPSK never becomes bound; it always occupies one slot of the 500 limit until deleted by the administrator.
 - Bound DPSK (DPSK bound to a specific device): An administrator can import bound DPSKs using a CSV file by specifying the MAC Address and create bound DPSKs regardless of the 25,000 limitation.

TABLE 22 Maximum DPSK per zone

Controller version	Max DPSK per zone	Max Unbound DPSK per zone	Max Group DPSK per zone
3.4.x	10000	256	X

Dynamic PSK

Importing Dynamic PSKs

TABLE 22 Maximum DPSK per zone (continued)

Controller version	Max DPSK per zone	Max Unbound DPSK per zone	Max Group DPSK per zone
3.5.x	10000	256	64
3.6.x	10000	Share 320 slots for Unbound and Group DPSKs	
5.1	25000	Share 500 slots for Unbound and Group DPSKs	
6.1.0	25000	Share 5,000 slots for Unbound and Group DPSKs	

NOTE

For the SZ300/vSZ-H platform, the maximum number of DPSKs is 25,000 per zone or domain and 50,000 for the system.

- **User Name:** Enter a user name or leave it blank if you want the controller to auto-generate the user name.
 - **Passphrase:** Enter a passphrase or leave it blank if you want the controller to auto-generate the passphrase.
 - **User Role:** If you have created user roles, select the user role to assign to the device that connects to the controller network using this DPSK. The device will be assigned the same attributes and permissions (VLAN, UTP, time restrictions, and so on) that have been defined for the assigned user role.
 - **VLAN ID:** Enter a VLAN ID within the range 1 through 4094.
 - **Group DPSK:** Click **Yes** if you want multiple devices to be able to use this DPSK or click **No** if it is to be used by a single device.
4. Click **Generate**.

To delete a DPSK, select the DPSK from the list, and click the **Delete**  icon.

Importing Dynamic PSKs

You can import CSV files to create DPSKs to secure the Wi-Fi network.

Follow these steps to import dynamic PSKs (DPSKs):

1. Click **Security > Access Control > Dynamic PSK**. This displays **Dynamic PSK** screen.
2. Click **Download Sample (CSV)** to download the CSV template for generating DPSKs.

The following figure shows a sample CSV file.

FIGURE 24 Sample CSV File

A	B	C	D	E	F
User Name	MAC Address	VLAN ID	User Role	Passphrase	Group DPSK
DPSK-User-1	00:11:22:33:44:44				
DPSK-User-2	00:11:22:33:44:55	1		passphrase02	
DPSK-User-3	11:22:33:44:55:66	2	testUserRole	passphrase03	
Group-DPSK-1					Y

3. Modify the CSV file as appropriate and save it. The following fields must be completed in the CSV file:
 - **User Name:** (Mandatory) Enter the user name.
 - **MAC Address:** (Optional) Enter the MAC address of the device for which to generate a DPSK (bound DPSK). If you leave the **MAC Address** field empty, the controller will generate an unbound DPSK.
 - **VLAN ID:** (Optional) Enter a value to overwrite the WLAN VLAN ID, or leave it empty if you do not want to overwrite the WLAN VLAN ID.
 - **User Role:** (Optional) If you have created user roles, enter the name of the user role that you want to assign to the device that connects to the controller network using this DPSK. The device will be assigned the same attributes and permissions (VLAN, UTP, time restrictions, and so on) that have been defined for the assigned user role.
 - **Passphrase:** (Optional) Enter a passphrase or leave it blank if you want the controller to auto-generate the passphrase.
 - **Group DPSK:** (Optional) Enter **Y** to indicate the entry is a Group DPSK if you want multiple devices to use this DPSK.

4. Click **Import CSV**.

The **Import CSV** dialog box is displayed.

NOTE

Importing a CSV file that contains a MAC address to which an existing DPSK (on the same target WLAN) is already assigned will replace the existing DPSK on the controller database.

5. From the **DPSK Enabled WLAN**, select a WLAN. Only WLANs that support DPSK must be selected.
6. For **Choose File**, click **Browse** to choose the CSV file (or click **Clear** if you want to replace the CSV file).

You can also specify **Group DPSK** in the CSV file.

7. Click **Upload**.

The generated DPSKs are displayed on the **Dynamic PSK** page.

NOTE

You can import up to 1,000 DPSKs (not over 25K unbound + group DPSKs) at a time.

8. Click **Download CSV** to download a CSV that contains the generated DPSKs.

The CSV file is displayed in the format shown in the following figure.

FIGURE 25 New CSV Format

User Name	MAC	WLAN (SSID)	Passphrase	VLAN ID	Created Date	Expiration Date
DPSK-User-1	00:11:22:33:44:44	joe-wlan (joe-wlan)	4#4BSXMe		3/17/2016 18:55	Unlimited
DPSK-User-2	00:11:22:33:44:55	joe-wlan (joe-wlan)	rE<r0[]y	1	3/17/2016 18:55	Unlimited
DPSK-User-3	11:22:33:44:55:66	joe-wlan (joe-wlan)	'q=7vqfE	2	3/17/2016 18:55	Unlimited

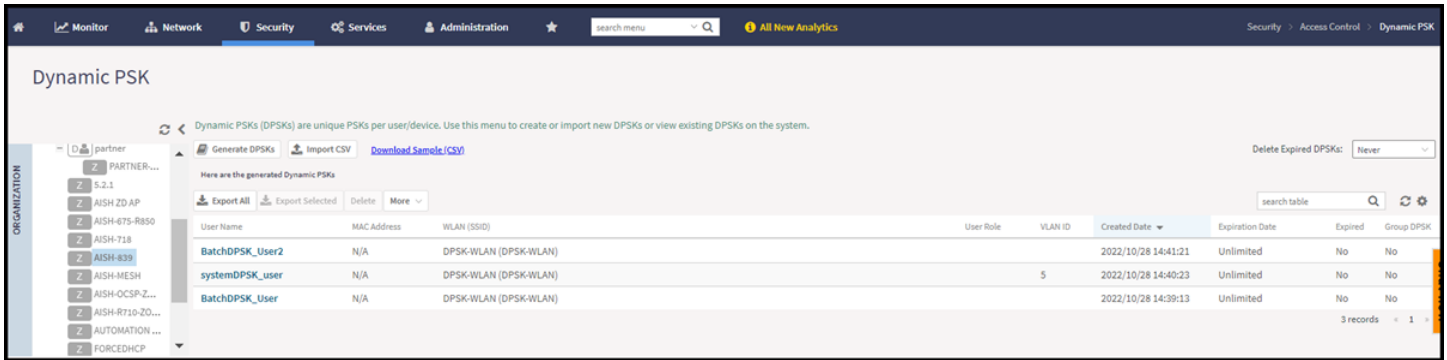

NOTE

Click **Export All** to export all the dynamic PSKs to a CSV file. You can also export specific dynamic PSKs by selected them and clicking **Export Selected**.

Viewing Generated DPSKs

In addition to downloading the generated DPSK record in CSV format, you can also view the DPSKs that have been generated from the **Generated Dynamic PSKs** tab.

FIGURE 26 Viewing Generated DPSKs

Printing a QR Code

A WLAN-supported DPSK has the **Show QR Code** option in the **Generated Dynamic PSKs** tab to join a Wi-Fi network.

Click **Show QR Code** and the QR Code page is displayed. Click **Print** to print the QR code or scan the QR code using a smartphone camera.

FIGURE 27 QR Code Page

Click **Export to CSV** option to export all the generated DPSKs to a CSV file.

Location Services

If your organization purchased the RUCKUS Smart Positioning Technology (SPoT) location service, the controller must be configured with the venue information that is displayed in the SPoT Administration Portal.

After completing purchase of the SPoT location service, you will be given account login information that you can use to log in to the SPoT Administration Portal. The SPoT Administration Portal provides tools for configuring and managing all of your venues (the physical locations in which SPoT service is deployed). After a venue is successfully set up, you must enter the same venue information in the controller.

1. From the main menu, go to **Administration > External Services > Ruckus Service > Ruckus Location Services (SPoT)**.
The **Ruckus Location Services (SPoT)** tab is displayed.
2. Click **Create**.
The **Create LBS Server** dialog box is displayed.

FIGURE 28 Creating a Location-Based Server

The screenshot shows a dialog box titled "Create LBS Server". It contains the following fields:

- * Venue Name: [Text Input]
- * Server Address: [Text Input]
- * Port: [Text Input with value 8883]
- * Password: [Text Input]
- * TLS Version: [Dropdown Menu with value tlsv1.2]

At the bottom of the dialog are two buttons: "OK" and "Cancel".

3. In the **Venue Name** field, type the venue name for the server.
4. In the **Server Address** field, type the server IP address.

NOTE

The server address must be entered in IPv4 address format. The LBS server does not support configuration of IPv6 addresses.

Location Services

5. In the **Port** field, type the port number to communicate with the server.

NOTE

The default port number is 8883.

6. In the **Password** field, type the password to access the server.
7. From the **TLS Version** list, select the TLS version.
8. Click **OK**.

NOTE

You can also edit, clone, and delete the location-based services by selecting the **Configure**, **Clone**, and **Delete** options respectively from the **Ruckus Location Services (SPoT)** tab.

NOTE

The connection between the controller and vSPoT is an outbound connection, so it depends on the destination IP address. If the destination IP address falls in the subnet of one interface, it is routed to that interface. Otherwise, it is routed through the default route.
